| Credential ID   | Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. This is the ID passed to the Java class in the parameter map: public static final String ARG_ID = "id"; The MID Server uses this identifier to resolve the actual credentials on the repository.

Note: This field is only visible when the External credential store check box is selected.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tag</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin is activated.</td>
</tr>
</tbody>
</table>

**Note:** Currently, the only supported external storage system is CyberArk.

<table>
<thead>
<tr>
<th>Applies to</th>
<th>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID servers</td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order (sequence) in which the platform tries this credential as it attempts to log onto devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), Discovery or Orchestration tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

**Configure the credential identifier for AWS**

Configure your instance to obtain credentials from a remote repository.

Role required: cloud_admin

Verify that these plugins are active, and the MID Server has been installed:

- Discovery (com.snc.discovery)
- Cloud Management (com.snc.cloud.mgmt)
- External Credential Storage (com.snc.discovery.external_credentials)

These procedures assume that you already have an external repository configured with the credentials you want to protect. The credential identifier configured in the ServiceNow instance must be mapped to the actual credential in the repository through the JAR file.

1. Navigate to Discovery > Credentials.
2. Select a credential that your external credential storage provider supports.
3. Complete the form, using the fields from the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for this credential. For example, Amazon Web Services.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use these credentials. The choices are All MID Servers or Specific MID Servers. If you select the latter, the MID Servers field appears.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to enable or disable the credential.</td>
</tr>
<tr>
<td>AWS Account</td>
<td>Enter your AWS account ID if your AWS credentials are on an external storage provider.</td>
</tr>
<tr>
<td>MID Servers</td>
<td>Select one or more MID Servers that can use these credentials.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the Name under which this credential is stored in the external credential storage provider.</td>
</tr>
<tr>
<td>Privacy Credential ID</td>
<td>Enter the name of an SNMPv3 privacy key from CyberArk. This field is only visible for SNMPv3 when you select CyberArk from the Credential Store Type field. If you are not using a privacy key for CyberArk, leave this field empty.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Select an alias for this credential that contains specific behaviors. See Credential aliases for Discovery for more information.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When external storage is enabled, the Credential ID field appears. If this check box is not visible, click the menu icon in the header bar and select View &gt; External Storage from the context menu.</td>
</tr>
<tr>
<td>Credential Store Type</td>
<td>Select CyberArk only if you are using a CyberArk SNMPv3 privacy key. The Privacy Credential ID field appears to allow entry of the key.</td>
</tr>
</tbody>
</table>

4. Click Submit.

CyberArk credential storage integration

The MID Server integration with the CyberArk vault enables Orchestration, Discovery, and Service Mapping to run without storing any credentials on the instance.

Introduction to CyberArk

CyberArk’s Application Identity Management (AIM) product uses the Privileged Account Security solution to eliminate the need to store application passwords embedded in applications, scripts or configuration files, and allows these highly-sensitive passwords to be centrally stored, logged and managed within the CyberArk vault. This approach enables organizations to comply with internal and regulatory requirements of periodic password replacement and to monitor activities associated with all types of privileged identities, whether on-premise or in the cloud.

The instance maintains a unique identifier for each credential, the credential type (such as SSH, SNMP, or Windows), and any credential affinities. The MID Server obtains the credential identifier, credential type, and IP address from the instance, and then uses the CyberArk vault to resolve these elements into a usable credential.

The CyberArk integration requires the ServiceNow® External Credential Storage plugin, which is available by request.

Installed with CyberArk

- **Business rule**: The External Credential Storage business rule performs the following tasks when an administrator makes any change to the external credential storage property:
• Changes the view for the Credentials record list and form to the External Storage view. This view enables users to see the Credential ID column in the list.
• Instructs the MID Server to refresh its credentials cache in preparation for a change in the way credentials are obtained.

• **System property**: A property called Enable External Credential Storage (com.snc.use_external_credentials) enables or disables the External Credential Storage plugin after it is activated. This property is located in Discovery Definition > Properties and Orchestration > MID Server Properties, and is enabled when you activate the plugin.

**Note**: If you disable external credential storage with the system property, the system automatically sets all the external credentials to inactive in the instance. If you re-enable the feature with this property, the system does not reset the external credential records to active. You must reactivate each credential record manually.

### Supported credential types

The CyberArk integration supports these ServiceNow credential types:

- CIM
- JMS
- SNMP forum
- SNMPv3
- SSH
- SSH Private Key (with key only)
- VMware
- Windows

Orchestration activities that use these network protocols support the use of credentials stored on a CyberArk vault:

- SOAP (with **basic authentication overrides**)
- REST (with **basic authentication overrides**)
- JDBC
- SSH
- PowerShell
- JMS
- SFTP

**Important**: You cannot manage credentials stored on a CyberArk vault and a custom external credential storage system using the same MID Server. To use both types of external storage, install and configure a dedicated MID Server for each. The MID Server must be installed on the same machine as the CyberArk AIM API/client.
CyberArk architecture
How the MID Server handles Windows accounts

Credential lookup initially attempts to match the specified credential ID to an existing value in the CyberArk vault Name field. If a match is found, that credential is returned. If no match is found, the credential lookup attempts to find a match using the IP address. If the IP address lookup matches more than one credential, such as Windows and Tomcat on the same server, the lookup fails. To avoid this issue, set the ext.cred.type_specifier parameter in the MID Server config.xml file to True to force CyberArk to return credentials that match both the credential type and the IP address. For example, if an IP address is shared by both Windows and Tomcat, a credential type of Windows returns the Windows credential only.

CyberArk integration configuration

These procedures include both CyberArk and ServiceNow configuration tasks, including references to the appropriate CyberArk documentation.

The credential identifier configured in the ServiceNow instance must be mapped to the credential name in the CyberArk vault. When looking up a credential, the MID Server finds the credential by matching the credential identifier to a name in vault, which must be unique. If the credential identifier is blank, then the MID Server finds the credential by IP address. To identify the credential by IP address, the system looks at the credential type to ensure that there is only one credential of that type at that address. An example of this might be when a Windows server and vCenter are both running on the same IP address. To support strict credential requirements like this in an SSH environment, a MID Server configuration parameter allows you to require that the credential type requested matches the type returned by CyberArk.

Note: The Credential ID field is the only field necessary to map your credentials to CyberArk, in all cases except for SNMPv3. The Privacy Credential ID field is optional and is required only when using SNMPv3 credentials and using a privacy protocol for the credentials. See Configure the CyberArk credential identifier for more details.

To configure your instance to obtain credentials from a CyberArk vault, complete these tasks in the order in which they appear below.

Configure the CyberArk vault and install the AIM API

Configure the CyberArk vault to allow MID Server access and install the CyberArk AIM API on the MID Server machine.

Role required: admin

Before starting this procedure, ensure that the External Credential Storage plugin is activated.

1. Configure the CyberArk vault with the application ID and authentication details that all MID Servers requesting credentials will use.
   For details, refer to the CyberArk Credential Provider and ASCP Implementation Guide.
   a) Ensure that CyberArk is configured to allow the MID Server to access the vault by creating an App-ID in CyberArk called ServiceNow_MID_Server.
   b) Make sure that every credential the MID Server needs is granted access to the ServiceNow_MID_Server App-ID.

   Note: You can override the default ServiceNow_MID_Server App-ID in the MID Server config.xml file using the ext.cred.app_id parameter. If you change the value in this parameter, make sure to configure a matching value in the vault.

2. Install the CyberArk Credential Provider, including the AIM API, on each machine that hosts a MID Server service that is used to access the credential store.
3. Provision CyberArk accounts and set permissions for application access.
For details, refer to the CyberArk Privileged Account Security Implementation Guide.

a) In the CyberArk Password Safe, create the privileged accounts required by Discovery, Orchestration, or Service Mapping to access different devices and ensure that these accounts are members of the safes in which the necessary credentials are stored.

b) Add the Credential Provider and application users as members of the Password Safes where the application passwords are stored.

Import the CyberArk JAR file

Import the CyberArk JavaPasswordSDK.jar file into the instance to make it accessible to the MID Server.

Role required: agent_admin or admin

Before starting this procedure, ensure that CyberArk is configured to allow the MID Server access to credentials. Ensure that the CyberArk AIM API is installed on each server hosting a MID Server that is used to access the vault.

Use this process even if the JavaPasswordSDK.jar file already exists on the MID Server.

1. Navigate to MID Server > JAR Files.
2. Click New.
3. Complete the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>Optional version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Provider of the JAR file. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Optional short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

4. Attach the JAR file to this record.

The AIM JavaPasswordSDK.jar file comes with the AIM SDK installation files and is typically located on the MID Server in the AIM installation directory at <install_dir>/CyberArk/ApplicationPasswordSdk.

5. Click Submit.
6. Restart the MID Server service.

The platform makes the JAR file available to any MID Server configured to communicate with the instance.

Configure the MID Server for CyberArk

Configure the config.xml file to grant the MID Server access to the CyberArk vault.

Role required: admin

Before starting this procedure, import the JavaPasswordSDK.jar file into the instance.

Manually configure the MID Server config.xml file with these parameters.

This configuration cannot be done from the instance.
### Required configuration parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ext.cred.safe_folder</td>
<td>NameOfFolder</td>
<td>Folder to use for all credential lookups. For example, <code>root</code>.</td>
</tr>
<tr>
<td>ext.cred.use_cyberark</td>
<td>true</td>
<td>Boolean parameter indicating that this MID Server is integrated with CyberArk.</td>
</tr>
</tbody>
</table>

### Optional configuration parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ext.cred.safe_timeout</td>
<td>5 (sec)</td>
<td>Timeout of each credential lookup in the vault, specified in seconds.</td>
</tr>
<tr>
<td>ext.cred.safe_name</td>
<td>NameOfSafe</td>
<td>Default safe name used for all credential lookups. If parameters are in multiple safes, the credential ID may be specified in the format <code>&lt;safeName&gt;:&lt;CredentialID&gt;</code>. When configured like this, the NameOfSafe field is ignored. If all external credentials have their credential IDs specified in this format, then leave out the NameOfSafe field.</td>
</tr>
<tr>
<td>ext.cred.app_id</td>
<td>ServiceNow_MID_Server</td>
<td>Specifies the App-ID used to grant permission to the MID Server to access the CyberArk vault. The default value, <code>ServiceNow_MID_Server</code>, must be defined in the CyberArk vault. You can use this parameter to override the default and specify your own App-ID. If you edit the App-ID in this parameter, make sure to configure CyberArk to match.</td>
</tr>
<tr>
<td>ext.cred.type_specifier</td>
<td>true</td>
<td>Forces an IP address lookup to return credentials that match both the CyberArk platform ID and the IP address. For example, if an IP address is shared by both Windows and Tomcat, a credential with a platform ID starting with <code>Win</code> returns the Windows credential only. When this parameter is set to true, CyberArk looks for platform IDs that begin with:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Win: Windows</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Unix: SSH</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- VMWare: VMware</td>
</tr>
</tbody>
</table>

**Note:** By default the separator character in this format is a colon. To assign any character you want as a separator, add this line to the `CredMap.properties` file:

```plaintext
safe.cred.split.string=<string>.
```
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ext.cred.check_ssh_type</td>
<td>false</td>
<td>When set to true, requires that the type of SSH credential returned from CyberArk matches the type of credential requested. For example, if a normal SSH username/password credential is requested and only SSH keys are available, the credential lookup fails.</td>
</tr>
</tbody>
</table>

Configure CyberArk for SNMPv2 credentials

If your system uses SNMPv2, you can create a special file to map the attribute in a credential to the community string.

Role required: admin

Before starting this procedure, configure the MID Server to have access to the CyberArk vault.

**Note:** If the community string appears in the password field of the CyberArk credential, it is not necessary to perform this procedure.

SNMPv2 is not natively supported in CyberArk. If your organization has created custom SNMPv2 credentials in which the community string does not appear in the password field of the credential, use this procedure to map the attribute in the credential to the community string.

1. In a text editor, create a file called CredMap.properties, containing this code:
   ```
   SNMPv2.Community=attribute_name
   ```
2. Save the file to the /agent directory of your MID Server installation.
   
   On credential lookup, the MID Server attempts to find this attribute for the credential. If the attribute is not found, the MID Server then looks in the password field. If the password field is empty, the credential lookup fails.

Configure the CyberArk credential identifier

Create the unique key that CyberArk can use to identify specific credentials in the external repository.

Role required: admin

Before starting this procedure, ensure that the External Credential Storage plugin is activated, and the `com.snc.use_external_credentials` system property is set to true.

1. Navigate to Discovery > Credentials or Orchestration > Credentials.
2. Click New.
3. From the list of credential types, select a type that supports CyberArk external storage.
4. Complete the form using the fields from your credential type.
5. Select the External credential store check box.
   
   The User name and Password fields are replaced with the Credential ID field.

   **Note:** If the check box is not visible, click the menu icon in the header bar and select View > External Storage.

6. In the Credential ID field, enter an expression using one of these formats:
   - If all your credentials are in the same safe, configure this safe name in the MID Server config.xml file using the `ext.cred.safe_name` parameter, and then specify the credential ID by name only, as <credential ID>.
To name credentials for a given platform that reside in a specific safe, define the credential ID as `<safe>:<credential ID>:<platform ID>.

If your credentials are in multiple safes, specify the credential ID in this format: `<safe>:<credential ID>`.

If you want CyberArk to look up the credential by IP address, using an alternate safe, specify the credential ID in this format: `<safe>:`.

If you want CyberArk to look up the credential for an alternate platform ID in the same safe, use this format: `::<platform ID>`.

If you want CyberArk to look up the credential in a configured safe by the IP address rather than the credential ID, leave this field blank. This is the best practice for handling installations in which each server has a unique credential. Without this type of lookup, you must create a credential ID record in your instance for every server in your environment.

**Note:** The credential ID must match the value in the Name field for the CyberArk account. The Credential ID field has a limit of 180 characters.

7. If you are storing SNMPv3 credentials in CyberArk and are using the privacy protocol and privacy key, configure the ID as follows:
   a) In the Credential Store Type field, select CyberArk.
      The Privacy Credential ID field appears.
   b) Enter the Name of the CyberArk SNMPv3 privacy account in the Privacy Credential ID field.

8. Click Submit.

Configure AWS credentials on a CyberArk vault

Configure your CyberArk vault with the AWS credentials to be retrieved for use by your instance.

Store the credentials as an SSH key on the CyberArk vault. When you configure access to the vault on your instance, the name you give to the SSH key must also be used as the credential ID.

1. In CyberArk, go to Accounts > Add SSH Key.
2. Enter the following information:

   **CyberArk credentials**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Type</td>
<td>Select Cloud Service.</td>
</tr>
<tr>
<td>Platform Name</td>
<td>Select Amazon Web Services - AWS - Access Keys.</td>
</tr>
<tr>
<td>AWS Access Key ID</td>
<td>Enter the AWS Access Key, as provided by AWS.</td>
</tr>
<tr>
<td>AWS IAM Username</td>
<td>Enter the AWS IAM Username, as you configured in CyberArk.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the AWS Secret Access Key, as provided by AWS.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a name for this key.</td>
</tr>
</tbody>
</table>

3. Choose Save.
If you have not done so already, create a credential identifier on your instance to configure access to the CyberArk vault. For more details, see Configure access to external credential storage for AWS.

**Configure an authentication algorithm**

Configure an authentication algorithm so that you can sign outbound HTTP requests. You should have a Script Include configured before you configure an authentication algorithm.

Role required: admin

2. Complete the form using the fields in the table.
   
   The database selection in the Format field determines which fields are available.
   
   **Authentication fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this algorithm.</td>
</tr>
<tr>
<td>Algorithm</td>
<td>Outbound request type.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of what your algorithm does.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope your application runs in.</td>
</tr>
<tr>
<td>Instance Authentication Script</td>
<td>Script you select from the Script Includes table.</td>
</tr>
<tr>
<td>MID Authentication Script</td>
<td>Script you select from the MID Server Script Includes (Discovery view) table.</td>
</tr>
</tbody>
</table>

3. Click Submit.

**Check IP service affinity for Discovery and Orchestration**

You can check the IP Services table for a list of IP addresses that are associated with a protocol.

Role required: admin

The IP Services table maps a port to a protocol. Several mappings are provided by default for commonly used port-protocol combinations, such as port 80 for HTTP, port 22 for SSH, and port 161 for SNMP.

A system property called glide.discovery.ip_service_affinity allows Discovery to remember the last port of the IP address that was discovered. This property is set to false by default.

**Caution:** You should not modify IP services unless your organization uses custom ports.

1. Navigate to Discovery Definition > IP Services.
2. Filter the list to find the appropriate IP service.
3. Click the name of the service to go to that IP service page.
4. Click the IP Service Affinities tab for the list of IP addresses associated with that service.
### IP Service Affinities

<table>
<thead>
<tr>
<th>IP address</th>
<th>Domain</th>
</tr>
</thead>
<tbody>
<tr>
<td>10.0.101.1</td>
<td>global</td>
</tr>
<tr>
<td>192.168.1.1</td>
<td>global</td>
</tr>
</tbody>
</table>
Decision Tables

Use decision tables to help you resolve a complex decision that depends on multiple factors. Use decisions tables to help you reach outcomes that depend on multiple factors. In these tables, each factor is a decision input. For example, if you are trying to make a decision about car insurance coverage, your inputs might include the location where the insured person lives, the age and accident history of the insured person, the car make, the car model, and the car year. This logic can save time and present a more organized, readable format than using a script. Decision tables provide a single point where you can create, view, and modify decisions.

To interact with Decision Tables in script, use the Decision Table API.

Components of a decision

Decision Table (sys_decision) records

Decision table records represent a single decision. In this record, you specify which table you want to use for your answers. This record also contains related lists where you can create your decision inputs and decisions.

Decision inputs (sys_decision_input) records

Decision input records represent your inputs that are used to obtain answers in a decision. These inputs can include a variety of types, including strings, references, true/false inputs, and dates. Each decision input has a specified input type and can be assigned a default value.

Decision (sys_decision_question) records

Each decision record represents a decision that is based on your inputs. Use the condition builder on the decision record form to create a condition that is based on the inputs for this decision. Then, you can select an answer record for this decision. The answer record can be any record from the table that you have defined in the Decision Table record. You can select the same answer record for more than one decision.

Answer records

Answer records represent answers that are reached using different decision input values. Answers records can be records on any table, but you need to choose the table when creating your Decision Table record. You could, for example, use the sys_choice table to use existing choice records. From the example about insurance coverage, you could create a table where each record contains details about the levels of insurance coverage.

Use a decision table to determine a discount rate

The following example shows a decision table. In this example, you see two inputs, Units Ordered and Cash on Delivery. The two possible answers, Yes and No, are reached depending on the answers to the two questions. For example, a customer would qualify for a silver discount when ordering more than 50 items or paying in cash, and get a gold discount if doing both.

Sample decision table — discount rates

<table>
<thead>
<tr>
<th>Decision inputs</th>
<th>Decision input entries</th>
</tr>
</thead>
<tbody>
<tr>
<td>More than 50 units ordered</td>
<td>No</td>
</tr>
</tbody>
</table>
Create a decision table to resolve complex decisions

Create a decision table to help you resolve a complex decision that depends on multiple factors.

Role required: decision_table_admin

1. Create or select a table to use for your decision answer records. You will associate an answer record to each decision on your decision table in later steps. This answer record is returned when that decision is reached based on your inputs. For information on creating a table, see Create a table.

2. Ensure that one field on the table that you use for your decision records has been set as the display value. This field is used as a label when you display decision answers in Flow Designer. You can use an existing table or create a new table to use for your decision records.

3. Create a record on this table to each answer in your decision.
   If you have modified an existing table, you may need to customize the form to show the new fields that you have added.

4. Create a decision table record.
   a) Navigate to System Definition > Decision Tables, and click New.
   b) On the form, fill in the fields.

   **Decision Table form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive label for this decision.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of this decision. This field defaults to the current scope.</td>
</tr>
<tr>
<td>Answer table</td>
<td>Table that this decision uses for answer records. Select the table that you created in the previous steps.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Option to limit the availability of this decision to the current scope. Select All application scopes or This application scope only.</td>
</tr>
</tbody>
</table>

   c) Right-click the form header and select Save.
   The form refreshes with the Decision Inputs and Decisions related lists.

5. Create decision input records.
   a) In the Decision Inputs related list, click New.
   b) On the decision input form, fill in the fields.
### Decision Input form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the decision that is associated to this decision input. This field is automatically populated.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of this decision input. This field defaults to the current scope.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of data that is used for this input. When you use this decision in a flow, you can only use data pills that match this type.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this input. This field is selected by default.</td>
</tr>
<tr>
<td>Label</td>
<td>Descriptive label for this input.</td>
</tr>
<tr>
<td>Read only</td>
<td>Check box to make this decision input read-only.</td>
</tr>
<tr>
<td>Column name</td>
<td>Column name for this input. This field is automatically populated when you give the Label field a value.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to make this decision input mandatory.</td>
</tr>
<tr>
<td>Display</td>
<td>Check box to indicates that this decision input is the display value for reference fields.</td>
</tr>
<tr>
<td>Choice</td>
<td>Select a method for users to see a list of suggested values:</td>
</tr>
<tr>
<td></td>
<td>- List menu without -- None --</td>
</tr>
<tr>
<td></td>
<td>- List menu with -- None --</td>
</tr>
<tr>
<td></td>
<td>- Suggestion field type</td>
</tr>
<tr>
<td></td>
<td>If a choice is used, define your choices in the Choices related list at the bottom of the form.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Default value for this input.</td>
</tr>
</tbody>
</table>

c) Click **Submit**.

Your changes are saved and the decision table record reopens.

6. Create decision records.
a) In the Decisions related list, click **New**.
b) On the Decision form, fill in the fields.

### Decision form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Descriptive label for this decision table.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of this decision. This field defaults to the current scope.</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Order in which the flow evaluates decisions. The order can be important in flows that use the First decision that matches option and ends after the first match is found.</td>
</tr>
<tr>
<td>Answer</td>
<td>Answer that is used when the conditions in this decision are met.</td>
</tr>
<tr>
<td>Default Answer</td>
<td>Check box to enable this decision as the default for your decision table.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions that are needed to reach this decision. The fields available for your condition are the Decision inputs that are associated with this decision table.</td>
</tr>
</tbody>
</table>

C) Click **Submit**.  
Your changes are saved and the decision table record reopens.

With Flow Designer, you can add your decision to the **Make a decision** flow logic. For more information about the **Make a decision** flow logic, see **Make a decision flow logic**.

**Decision table properties**

Use decision table properties to set limits on the maximum number of allowed inputs and questions for decision records.

These properties are available for decision tables.

**Note:** To open the System Properties (sys_properties) table, enter `sys_properties.list` in the navigation filter.

**Properties for decision tables**

</thead>
</table>
| com.glide.decision_table.max_inputs | Maximum number of decision inputs that can be defined on a model (sys_decision) record.  
  - Type: integer  
  - Default value: Empty. There are no limits on inputs when this property is left empty.  
  - Location: System Property (sys_properties) table |
### E-signature

Sign electronic documents from any desktop or mobile device with e-signature. E-signature is a scoped application that enables users to sign managed documents or knowledge articles with their typed or drawn e-signature, credentials, or as an acknowledgment.

#### Role assignment

Before you begin using e-signature, you must assign the e-signature roles to the appropriate roles, groups, or users in your application. See *Components installed with e-signature* for more information.

#### How to use e-signature templates

Users with the e-signature administrator (sn_esign.admin) or manager (sn_esign.config_manager) role can create e-signature templates. Each e-signature template pairs a document type to sign (managed document or knowledge article) with a signature type (signature, credential, or acknowledgment). For example, you could create an e-signature template for a non-disclosure agreement that requires a typed or drawn signature.

- **Configure an e-signature template**

You can then use the e-signature template in task forms to request electronic signatures from users. In the HR Service Delivery application, for example, you can add HR tasks to HR cases or configure HR task templates to request electronic signatures per the selected e-signature template. See *HR e-signature* for HR-specific examples.

#### Activation information

To use e-signature in your application, you must **activate e-signature**. For information on what components are installed with the feature, see *Components installed with e-signature*.

#### Activate e-signature

You can activate the e-signature plugin (com.snc.esign) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.glide.decision_table.max_questions</td>
<td>Maximum number of decision questions that can be defined on a decision table (sys_decision) record.</td>
</tr>
<tr>
<td></td>
<td>- Type: integer</td>
</tr>
<tr>
<td></td>
<td>- Default value: Empty. There are no limits on inputs when this property is left empty.</td>
</tr>
<tr>
<td></td>
<td>- Location: System Property (sys_properties) table</td>
</tr>
</tbody>
</table>
E-signature activates these related plugins if they are not already active.

### Plugins for E-signature

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow document viewer</td>
<td>Document viewer is a platform feature that will enable users to view enterprise class documents inline within the platform attachment instead of downloading it to the local device and then opening the documents with a locally installed viewer.</td>
</tr>
<tr>
<td>Managed documents</td>
<td>Managed Documents application. To enable the ability to publish to the knowledge base, activate the knowledge document plugin.</td>
</tr>
<tr>
<td>Signature pad</td>
<td>Provides a tool to allow a digital signature in a .pdf document. The Human Resources application uses this with various documents.</td>
</tr>
</tbody>
</table>

1. **Navigate to System Definition > Plugins.**

   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

2. **Find the plugin using the filter criteria and search bar.**

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. **Activate the plugin.**

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.
To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the Activate/Update related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.
4. If demo data is available and you want to install it, click Load demo data.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
5. Click Activate.

Components installed with e-signature

Several types of components are installed with activation of e-signature, including tables and user roles.

Note: The Application Files table lists the components installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.
Roles installed

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>E-signature administrator (sn_esign.admin)</td>
<td>Can manage the e-signature module.</td>
<td>● sn_esign.config_manager</td>
</tr>
<tr>
<td>E-signature manager (sn_esign.config_manager)</td>
<td>Can manage the e-signature configurations.</td>
<td>● None</td>
</tr>
</tbody>
</table>

You can assign these roles to the appropriate roles, groups, or users in your application.

- To assign a role to another role, see *Add a role to an existing role.*
- To assign a role to a group, see *Assign a role to a group.*
- To assign a role to a user, see *Assign a role to a user.*

For further information on user administration and how to manage users, see *User administration.*

Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E-Signature Configuration (sn_esign_configuration)</td>
<td>E-signature configuration table.</td>
</tr>
<tr>
<td>E-Signature Acknowledgement (sn_esign_acknowledgement)</td>
<td>E-signature acknowledgment table.</td>
</tr>
</tbody>
</table>

For further information on table administration and how to manage data, see *Table administration.*

Configure an e-signature template

Create or modify an e-signature template to define an electronic document and signature configuration for use in task forms. Each template is associated with a document type such as a managed document or knowledge article, and you can configure the template so that the signatory is required to sign the document with their typed or drawn signature, credentials, or as an acknowledgment.

Role required: sn_esign.admin or sn_esign.config_manager

1. Navigate to **E-signature > E-signature template.**
2. Click **New** or open a record.
3. Fill in the fields on the form.

E-signature template form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the e-signature template.</td>
</tr>
<tr>
<td>Task table</td>
<td>Task table that the e-signature template is associated with.</td>
</tr>
<tr>

Understanding Edge Encryption

Edge Encryption is a network encryption system that resides on your network and that encrypts and decrypts sensitive data as it travels between your data center and the ServiceNow cloud.

What is Edge Encryption

The Edge Encryption proxy server is a network encryption application that, through encryption in motion, encrypts data within your network before it is sent over the Internet to your instance, where it remains encrypted at rest. When requested, the encrypted data is sent back to the Edge Encryption proxy server, which in turn decrypts your data before serving it to your web browser.

Who uses Edge Encryption

Only a user logged into the instance through a proxy server on your network can view encrypted data in clear text. Likewise, only a security_admin user logged in to an instance through a proxy server in your network can configure and administer Edge Encryption.

Because the proxy server resides in your network, you own and manage the encryption keys, and they are never sent to the instance. As a result, ServiceNow never shows sensitive data in clear text.
Encryption and tokenization

Edge Encryption supports both encryption (through encryption configurations) and tokenization (through encryption patterns) as a means of protecting your sensitive information.

Encryption configurations

You can encrypt individual fields using encryption configurations. Edge Encryption supports AES 128-bit and AES 256-bit encryption keys. Edge Encryption supports standard, equality-preserving, and order-preserving encryption types.

In addition to attachments, you can encrypt the following field types:

- String
- Date
- Date/Time
- Journal
- Journal Input
- URL

If a Journal field marked for encryption is added to the activity stream, all user input to the field is encrypted in the activity stream.

Note: Multi-byte characters within supported field types can be encrypted.

Encryption patterns

You can use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While encryption configurations should be the primary method of encryption, use encryption patterns as a supplement to secure sensitive information found outside of encrypted fields.

Note: The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see Edge Encryption components.
Edge Encryption on the Now Platform

Edge Encryption acts as a gateway between your browser and your ServiceNow instance. Traffic from your browser passes through the gateway on its way to the ServiceNow instance. The gateway, in turn, is configured to encrypt outbound data that is marked for encryption. Inbound traffic is decrypted through the gateway, and the end user sees clear text in the browser. The advantage of this implementation from a security control perspective is that the encryption and key management are handled externally from ServiceNow.

What to know before you begin

Because encryption and tokenization change the nature of your data, Edge Encryption can affect other instance processes. Before using Edge Encryption, carefully consider the impact on your instance.
Because the proxy server is installed and maintained in your network, Edge Encryption requires network administration and management. Review the network requirements to ensure a smooth implementation.

Review the following topics to understand the impact of Edge Encryption on your instance:

- Planning for Edge Encryption
- Edge Encryption system requirements
- Sizing your Edge Encryption environment
- Calculate the order-preserving and tokenization database size
- Edge Encryption limitations
- Key management

Edge Encryption components

Edge Encryption is comprised of the Edge Encryption proxy server that runs on a server in your network, and the Edge Encryption plugin that must be installed on your ServiceNow instance. If using order-preserving encryption types or encryption patterns, a proxy database must also be installed in your network.

Proxy application

When going through the Edge Encryption proxy server, the Edge Encryption plugin allows you to specify which fields, patterns, and attachments should be encrypted. You can also manage encryption rules to encrypt specific requests and schedule mass encryption jobs.

Proxy server

The Edge Encryption proxy server uses encryption rules to identify in an HTTP request what, if anything, needs to be encrypted and encrypts it before forwarding the request to the instance. For decryption, the Edge Encryption proxy server looks at the HTTP responses for any encrypted data and decrypts it before sending the response back to the client. In order for this to happen, all HTTP requests and responses must go through the Edge Encryption proxy server. This includes any requests originating from a browser, as well as any SOAP or REST requests.

Proxy database

If using order preserving encryption or encryption patterns, your proxy servers rely on a MySQL database located in your network. All proxy servers in your network must use the same database.

The proxy database contains these tables.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>db_id</td>
<td>Unique database ID</td>
</tr>
<tr>
<td>edge_token_map</td>
<td>Encryption pattern data</td>
</tr>
<tr>
<td>token_map</td>
<td>Order-preserving encryption data</td>
</tr>
</tbody>
</table>

Backing up your proxy database
Because encryption patterns rely on tokenization, clear text values are stored in your proxy database. If the database is lost, clear text values cannot be restored. It is critical that you maintain regular backups. To avoid data loss, back up your proxy database according to ServiceNow recommendations.

- Back up your database every 24 hours.
- Retain MySQL database binary log files for at least two days. After a backup has been restored, use the binary log to regenerate any data lost since the most recent backup. Refer to MySQL database backup best practices for your database version.

## Edge Encryption clients

Edge Encryption uses three clients to inform the instance that the proxy is running, to synchronize requests between the proxy and the instance, and to forward all end user requests to the instance after any potential encryption.

<table>
<thead>
<tr>
<th>Client</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>heartbeat/keepalive client</td>
<td>In charge of sending a request to the ServiceNow instance every 5 seconds to let the instance know that this proxy is up and running. The requests drive the last_response_on field on the Edge proxy table, and as a consequence drive the state of the proxy. If your system has issues sending the requests, or if the request or request processing is delayed, the instance may mark the proxy as unresponsive, even if the other clients (including the one for user traffic) are up and running. This client also controls the online status of the proxy on the instance. The <code>edgeencryption.proxy.keepalive.interval</code> property controls the polling rate for this client. The default is 5 (seconds).</td>
</tr>
<tr>
<td>polling/sync client</td>
<td>In charge of various requests the proxy sends to the instance to synchronize on the Edge Encryption configuration (for example, which table, column, or attachment to encrypt, keys, jobs, rules, and tokenization patterns). The <code>edgeencryption.config.poll.interval</code> property controls the polling rate for this client. <strong>Warning:</strong> Do not change this setting. Changing the default setting of the proxy poll interval may result in synchronization delays when updating Edge Encryption settings on the instance.</td>
</tr>
<tr>
<td>default/user traffic client</td>
<td>For everything else, this client handles all end user requests and forwards them to the ServiceNow instance after any potential encryption. This client also handles responses from the instance, forwarding them to the end user after any potential decryption.</td>
</tr>
</tbody>
</table>
Key management

You are responsible for providing and managing the encryption keys used by Edge Encryption.

When obtaining and creating encryption keys to support the encryption types used by Edge Encryption, consider the following:

- Whether to use AES 128-bit or AES 256-bit. You must define a default AES 128-bit encryption key, even if it is not used.
- Whether to use file system, Java KeyStore, or Enterprise Key Management (EKM).
- When to rotate encryption keys.
- When and if to use a mass encryption job to re-encrypt data using the new key.

Before removing a key from the proxy configuration files and the keystore, it is critical that you decrypt all data on the instance that uses the key. You can do this by adding a new encryption key and scheduling a mass key rotation job.

Keystores

Edge Encryption supports the following types of key storage.

File store

Keys are stored in a file in a file system that is accessible by the Edge Encryption proxy. Encryption keys stored in a file are not encrypted, so it is your responsibility to protect these files.

Java KeyStore

Keys are stored in Java’s JCEKS KeyStore. A Java KeyStore is protected by a password, so it is more secure than storing keys in a file in the file store. A single Java KeyStore can store multiple keys, and the keys are identified by a key alias, making it easier to manage multiple keys.

Enterprise Key Management (EKM)

Keys are stored and retrieved with the SafeNet KeySecure or Unbound Technology key management systems.

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

Note: If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is servicenow.

In addition to the encryption keys, the Java JCEKS KeyStore is used to store the RSA key pair for digitally signing the encryption configuration and encryption rules that are stored in the instance, and the digital certificate that the Edge Encryption proxy uses to establish a secure connection with the browsers and any other clients.

SafeNet key versioning

Use SafeNet key versioning to simplify changing keys. Instead of creating a new alias for every new key, SafeNet key versioning keeps the same alias and increments the version.

You must set up key versioning in SafeNet before you can configure SafeNet key versioning on the Edge proxy server.

Note: Edge proxies installed before the London release support SafeNet keys, but do not support SafeNet key versioning. If you mistakenly use a versioned key on a Kingston or
earlier proxy, when you upgrade to a London or later release, the London or later proxy detects this problem, and to prevent potential data loss the proxy does not start.

You must first schedule a mass key rotation job or a single key rotation job to replace the old SafeNet versioned key with a non-versioned key, and then create a new SafeNet versioned key, if needed. This new versioned key is safe to use with the London or later proxy, and you can restart the proxy.

Encryption key configuration

If using SafeNet versioned keys, the Change Default Keys section of the Encryption Key Configuration form includes new fields for the Key version of the default 128-bit and 256-bit keys. Key version fields are grayed out and cannot be edited.

For procedures, see Configure encryption keys on the instance.

Versioned keys

If using SafeNet versioned keys, when you navigate to Edge Encryption Configuration > Encryption Key Configuration > All Keys, versioned keys include the Key version.
A version number does not appear for the initial entries you make in the Change Default Keys section of the Encryption Key Configuration form. When the proxy server requests a key from SafeNet, the system adds a new line for the alias and adds the **Key version**.

In the above example, **AES128key** is listed three times:

- The first listing, with no **Key version** indicated, is the initial entry.
- The second listing, with **1** in the **Key version** column, is the first version of the key returned from SafeNet.
- The third listing, with **2** in the **Key version** column, is the second version of the key returned from SafeNet.
- As other versions of the key are returned from SafeNet, new lines are added to record the **Key version** now in use.

### Encryption configurations and patterns

With Edge Encryption, you can encrypt fields and tokenize strings.

### Encryption configurations

You can encrypt individual fields using encryption configurations. Edge Encryption supports AES 128-bit encryption keys. If the Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy files are installed, Edge Encryption supports AES 256-bit encryption keys for each encryption type. Edge Encryption supports the following types of encryption configurations.

#### Standard encryption
The encrypted value of a field is different each time the field is encrypted, even when the field value remains the same. Standard encryption is the most robust form of encryption. Fields using standard encryption cannot be sorted, grouped by, or filtered on.

**Equality-preserving encryption**

The encrypted value of a field is the same when the field value remains the same. Supports equality comparisons and group by operations on a field.

**Note:** When equality-preserving encryption is selected for a field that already contains data, performing a group by action on the field may not group fields with the same value if one is encrypted and the other is not.

**Order-preserving encryption**

Uses tokens and encryption to secure data in your proxy database. Supports equality comparisons, group by operations, and the ability to sort data. The order preserving encryption type is only supported if there is a MySQL database configured for the Edge Encryption proxy server.

**Note:** When using order-preserving encryption and the proxy database is down, updates can be made to fields using order-preserving encryption. However, the sort order will not be correct when trying to sort data based on those fields. Groups also will not work as expected. When the proxy database is again operational, schedule an order token repair job to repair missing tokens.

### Encryption types

The following encryption types are listed in decreasing security quality.

<table>
<thead>
<tr>
<th>Encryption type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard AES 256</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Standard AES 128</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Equality preserving AES 256</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Equality preserving AES 128</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Order preserving AES 256</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
<tr>
<td>Order preserving AES 128</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
</tbody>
</table>

### Encryption Patterns

You can secure sensitive data found in strings using encryption patterns. Once an encryption pattern is stored and activated, the Edge Encryption proxy server identifies strings that match the pattern in requests. Once located, the clear text string is stored in the proxy database and replaced on the instance with a token. Use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While we recommend that
encryption configurations be the primary method of encryption, use encryption patterns as a supplement to locate and secure sensitive information found outside of encrypted fields.

**Note:** The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see *Edge Encryption components.*

**Installed with Edge Encryption**

Edge Encryption installs tables to store encryption-related data, system properties to configure default behavior, and the edge_encryption role to administer Edge Encryption.

**Tables installed with Edge Encryption**

Edge Encryption adds the following tables.

**Edge Encryption Configuration** *(sys_encryption_configuration)*
Contains encrypted fields and tables for which attachments are encrypted.

**Edge Encryption Rule** *(sys_encryption_rule)*
Contains a record for each rule. A rule has a name, the condition when it is used, a script, and an order field.

**Edge Encryption Invalid Insert Log** *(sys_edge_encryption_invalid_insert_log)*
Contains log messages created for attempts to save unencrypted data to an encrypted field.

**Edge Encryption Proxy** *(sys_encryption_proxy)*
Contains information about the encryption proxy application.

**Edge Proxy Encryption Type** *(sys_proxy_encryption_type)*
Used for enabling and disabling encryption types on the encryption form.

**Encryption Job Execution** *(sys_encryption_job_execution)*
Supports mass encryption jobs.

**Encryption Job Execution Chunk** *(sys_encryption_job_execution_chunk)*
Supports mass encryption jobs.

**Scheduled Encryption Job** *(sysauto_encryption_job)*
Lists scheduled jobs for encryption, decryption, key rotation, order token repair, and database recovery.

**Encryption Key Configuration** *(sys_encryption_key_configuration)*
Lists default encryption keys.

**Encryption Key** *(sys_encryption_key)*
Lists available keys and key attributes.

**Proxy Encryption Key** *(sys_encryption_proxy_key)*
Lists proxy encryption keys.
Properties installed with Edge Encryption

Edge Encryption adds the following properties.

**Note:** To open the System Properties (sys_properties) table, enter `sys_properties.list` in the navigation filter.

**glide.edge.pattern.disallowed.chars**
A list of characters that are not allowed in patterns.
- **Type:** a string of a comma-separated list of values
- **Location:** System Properties (sys_properties) table

**glide.edge.pattern.min.size**
The minimum pattern size allowed. Allowing smaller patterns means finding more matches, which increases overhead.
- **Type:** number
- **Default value:** 5
- **Location:** System Properties (sys_properties) table

**sn_edge_encryption.logging.destination**
Where messages are logged.
- **Type:** string
- **Default value:** file
- **Location:** System Properties (sys_properties) table

**sn_edge_encryption.logging.verbosity**
The logging level to use.
- **Type:** string
- **Default value:** info
- **Location:** System Properties (sys_properties) table

**sn_edge_encryption.encryption.proxy.buildtag**
The proxy version registered with your instance.
- **Type:** string
- **Location:** System Properties (sys_properties) table

**sn_edge_encryption.cleartext.allowed**
When true, allows clear text to be saved in an encrypted field. This happens when a user is accessing the instance without going through the Edge Encryption proxy. When false, the system prevents clear text from being saved in an encrypted field.
- **Type:** Boolean
- **Default value:** false
- **Location:** System Properties (sys_properties) table
Role installed with Edge Encryption

*edge_encryption*

Edge Encryption proxies log into the instance as a user, with a user name and password. The user must have this role assigned.

Contains roles: None

Planning for Edge Encryption

Successful implementation of Edge Encryption requires planning and preparation. Answer the following questions in the planning stage.

- Which fields are to be encrypted?
- Which encryption types are to be used?
- How many Edge Encryption proxies are needed? See *Sizing your Edge Encryption environment* for recommendations and considerations.
- If an order preserving encryption type or encryption patterns are to be used, where is the MySQL database located?
- Which key management system is to be used?

System administrators, network administrators, and security team members have different tasks to fulfill for implementing Edge Encryption.

- System administrators need the security-admin role. The system administrator needs to:
  - Download the Edge Encryption proxy application.
  - Set up an Edge Encryption user account for the proxies to use to connect to the instance. The user must be assigned the edge_encryption role.
  - Configure encryption keys, and set the default keys.
  - Configure Edge Encryption on the instance.
  - Schedule encryption jobs.
  - Monitor Edge Encryption.
  - Create and edit encryption rules.

- Your network administrator needs to:
  - Install the Edge Encryption proxy application.
  - Know the network addresses for the proxy servers and the proxy database used for order-preserving encryption and encryption patterns.
  - Install the proxy database to be used for order-preserving encryption and encryption patterns.
  - Start and stop the proxy applications.
  - Perform encryption key management.
  - Determine how to map users to encryption proxy applications. This can be done with DNS settings or routing rules, and is specific to each network.
  - Manage multiple proxy servers.
  - Configure load balancer pools and settings.

- Your security administrator must determine the encryption types to be assigned to each field.
Edge Encryption system requirements

You can run the Edge Encryption proxy application on servers or virtual machines that run on Microsoft Windows or Linux operating systems. For optimum performance, ensure that your configuration meets these requirements.

Java requirements

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or later

**Note:** Java 8 update 131 (8u131) is not supported.

**Note:** Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

<table>
<thead>
<tr>
<th>Java Version</th>
<th>Enabling AES 256-bit Encryption</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java 8 update 141 (8u141) or earlier</td>
<td>Install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the &lt;Java-home-directory&gt;/jre/lib/security folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier.</td>
</tr>
</tbody>
</table>
Java Version | Enabling AES 256-bit Encryption
---|---
Java 8 update 151 (8u151) or later | A java.security file is downloaded with the update. Edit the java.security file to enable AES 256-bit encryption.

To edit the java-security file, see Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later.

**Note:** If upgrading an Edge Encryption proxy server running on Windows to a new version of Java, you may need to copy the JCE policy files from your previous Java folder to the new Java folder.

---

**Note:** Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

---

Support for OpenJDK

Starting with the Orlando release, the Now Platform supports the following versions of openJDK:

- OpenJDK version 8
- AdoptOpenJDK version 8

Proxy server minimum configuration

A proxy server requires this minimum configuration:

- 4 GB of RAM per proxy server (6 GB is recommended for most deployments).

**Note:** The proxy server host requires at least 1 GB of RAM more than the proxy server. The proxy server host needs the extra 1 GB for operating system services. For example, if you configure a proxy server to use 4 GB of RAM, you must install at least 5 GB of RAM on the proxy server host.

Because the proxy server requires at least 4 GB of memory, 32-bit JREs and 32-bit operating systems are no longer supported starting with the London release.

- 3 or more GHz CPU (4-core CPU preferred for optimum performance).
- Multiple proxy servers behind a load balancer. The number of proxy servers you need depends on the number of application nodes, the number of simultaneous users, and the number of servers needed for failover. See Sizing your Edge Encryption environment for more information.
- Ability to run concurrently with other services, depending on the server utilization and resource availability.
- Java 8.
Proxy server supported systems

The following systems are supported:

<table>
<thead>
<tr>
<th>Supported System</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows Server 2012, 2012-R2, and 2016 editions</td>
<td>· Virtual machines or physical hardware</td>
</tr>
<tr>
<td></td>
<td>· 64-bit systems</td>
</tr>
<tr>
<td>Linux</td>
<td>· Virtual machines or physical hardware</td>
</tr>
<tr>
<td></td>
<td>· 64-bit systems</td>
</tr>
</tbody>
</table>
|                                                  | On 64-bit Linux systems, you must install the 32-bit GNU C library (glibc). The installation command for CentOS is `yum install glibc.i686`.

Proxy server connection requirements

The proxy server that runs the Edge Encryption application must be able to communicate with machines in your network. Make sure that the proxy server has these network privileges:

<table>
<thead>
<tr>
<th>Network Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firewall access</td>
<td>Configure any firewalls between the proxy server and the client devices to allow a connection. If your network uses a DeMilitarized Zone (DMZ) to add an extra layer of security to your Local Area Network (LAN), and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a proxy server to a machine within the DMZ.</td>
</tr>
<tr>
<td>Network access</td>
<td>Configure each client to enable the proxy server to connect with it. If network security prevents you from configuring new machines that can connect to the clients, install the proxy server on an existing machine with connection privileges.</td>
</tr>
<tr>
<td>Instance access</td>
<td>Ensure that the proxy server has network access to the instance. Make sure that you configure the proxy server network to allow traffic over TCP port 443.</td>
</tr>
<tr>
<td>Network account</td>
<td>Install the proxy server with either a local or domain administrator.</td>
</tr>
</tbody>
</table>

Order-preserving and tokenization database system requirements

Order-preserving encryption and encryption patterns require that you configure an Oracle MySQL database for the Edge Encryption proxy server. Order-preserving encryption allows any comparison operation to be directly applied on encrypted data, without first decrypting the data. Encryption patterns let you replace string patterns with tokens (called tokenization) before
they are sent to and stored in the database. Because of the size of the MySQL database, use a dedicated proxy server to run the order-preserving and tokenization database.

The minimum database system requirements include:

<table>
<thead>
<tr>
<th>MySQL Database</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>MySQL database versions 5.5 to 5.7</td>
</tr>
<tr>
<td>OS</td>
<td>64-bit systems</td>
</tr>
<tr>
<td>CPU</td>
<td>2 or more GHz CPU (4-core CPU preferred for optimum performance)</td>
</tr>
<tr>
<td>RAM</td>
<td>16 GB</td>
</tr>
<tr>
<td>Disk</td>
<td>Storage Area Network (SAN) or local storage (RAID 10 recommended)</td>
</tr>
<tr>
<td>Size</td>
<td>Determined by the number of potential records multiplied by the record size. See Calculate the order-preserving and tokenization database size.</td>
</tr>
<tr>
<td>Configuration</td>
<td>High availability cluster. If you are unsure of how to configure your MySQL server, contact MySQL for configuration information.</td>
</tr>
</tbody>
</table>

Sizing your Edge Encryption environment

Choosing the number of proxy servers for your environment is an important task. Consider the number of users, redundancy needs, and acceptable latency.

Redundancy

Maintain redundant proxy servers in case of hardware failure. Proxy servers should be located behind a load balancer to provide a functional path for all users if a proxy server is unreachable. At a minimum, ensure that two proxy servers are always available.

Size

Size refers to the number of proxy servers required to avoid additional latency that the encryption of data produces. Depending on use, you may want to reduce the amount of latency by adding additional proxy servers. For example, if regular mass encryptions are run, add additional proxy servers to handle the load, or run the mass encryptions when the user load is light. In addition, the hardware that the proxy server runs on influences performance and latency. Proxy servers running on hardware with faster CPUs, more CPUs, and more RAM have higher throughput than slower, limited systems.

The following guidelines assume that your proxy server is running on at least the minimum hardware requirements. To determine the number of proxy servers:

- Consider setting up one proxy server for every two application nodes on the instance.
- For redundancy, set up a minimum of two proxy servers behind a load balancer.
- Add an extra proxy server for every 500 simultaneous users.
- Depending on the desired redundancy, add additional proxy servers for failover.
For example, for an instance with 2,000 users, you should have at least five proxy servers behind a load balancer. This calculation includes one proxy server for every 500 users, with an extra proxy server for failover. Determine ahead of time when you will approach a threshold of 500 users and place another proxy server in the load balancer pool.

**Load balancers**

To balance requests and improve server response time, distribute proxy servers in a load balancer pool. Configure load balancers to use the "least connections" method. This method connects requests to the proxy server with the fewest active connections, preventing the overloading of a single proxy.

**CPU utilization**

Because data encryption and tokenization are CPU intensive operations, CPU spikes while encrypting data are normal and expected. When CPU utilization is over 80% for several minutes at a time, it likely means that the proxy server has too much work to do. When this happens, latency increases for the period that the CPU utilization is high. If latency persists, adding another proxy server may help decrease the latency.

**Memory**

The proxy server must have a minimum of 4 GB of RAM available (6 GB recommended). Set the proxy server initial and upper bound memory limits to the recommended settings.

**Calculate the order-preserving and tokenization database size**

If using order-preserving encryption or encryption patterns, determine the size of your MySQL database by multiplying the number of potential records by record size.

Use a dedicated machine to run the order-preserving and tokenization database. Do not run the database on the same hardware as the proxy server.

1. Determine the potential number of records that could include fields encrypted with order-preserving encryption.
   a) Multiply the number of encryption configurations using order-preserving encryption by the number of records each configuration is applied to.
   b) To allow for growth, multiply the result by three.

2. Multiply the result of step 1 by 1,536.
   1,536 is the average size of a record in bytes.

3. If using encryption patterns, perform steps 1–2 for tokenized records and add the result to the total.

The calculated value is the recommended size in bytes for your order-preserving and tokenization database.

**Edge Encryption limitations**

Edge Encryption impacts system functions. Carefully evaluate the impact of encrypting a field.
Field type restrictions

You can encrypt only the following field types:

- String
- Date
- Date/Time
- Journal
- Journal Input
- URL

You cannot encrypt the following field types:

- Choice fields
- Virtual fields
- Fields in system tables, except for certain fields in sys_user
- System fields in tables
- Number fields or fields associated with an auto-numbering scheme
- Any other field type not listed above

Additional restrictions:

- When a Journal field is encrypted, the Post button is disabled, even if there are multiple Journal fields and only one of those fields is encrypted.
- Encrypted fields are not available in Go to and header filter boxes.
- When encrypting fields used as an index, you can use only order-preserving and equality-preserving encryption types. Indexed fields cannot be encrypted using the standard encryption type.

For more information, see Field types.

Filtering and searching restrictions

Standard encryption

When you select a String, Date, Date/Time, or URL field with a standard encrypted field configuration as the left operand in a filter, no filtering options are available.

Equality-preserving encryption

When you select a String, Date, Date/Time, or URL field with an equality-preserving encrypted field configuration as the left operand in a filter, the following operators are available:

- is
- is not
- is empty
- is not empty

Order-preserving encryption

When you select a String field with an order-preserving encrypted field configuration as the left operand in a filter, the following operators are available, in addition to is, is not, is empty, and is not empty:

- greater than
• less than

When you select a Date or Date/Time field with an order-preserving encrypted field configuration as the left operand in a filter, the following operators are available, in addition to is, is not, is empty, and is not empty:

• after
• before
• after or on
• before or on

Date and Time pickers
For Date fields, use the date picker to specify the date:

For Date/Time fields, use the date and time picker to specify the date and time:

List condition filters
The Show Matching and Filter Out options are supported in lists. Only exact matches are returned or filtered out.
Note: Adding encrypted fields in condition filters is supported in scripts such as UI policies and business rules.

Configuration restrictions

Restrictions and behavior of encryption configurations:

- After you add a field to the Edge Encryption Configuration table, you cannot delete the configuration record. If you no longer want a field to be encrypted, deactivate the record in the Edge Encryption Configuration table and schedule an encryption job to decrypt the data.
- If a field in a parent table is marked to be encrypted, the field is also encrypted in all inherited tables. For example, if the Short description field in the Task table is encrypted, then the contents of the Short description field in the Incident table are encrypted.
- If a field inherited from a parent table is marked to be encrypted, the field in the parent table cannot be encrypted. For example, if the Short description in the Incident table is marked to be encrypted, then the Short description in the Task table cannot be encrypted. In this example, you can encrypt the Short description in the Problem table.
- When a field with an encryption configuration defined is exported to any format, the output includes encrypted values even when exported through the proxy server.
- You cannot import data to a field with an encryption configuration defined.
- You cannot encrypt inherited Date and Date/Time fields. Date or Date/Time fields inherited from a parent table are not listed on the Column field drop-down list, and you cannot create Date or Date/Time encryption configurations for those fields.
- You can encrypt a String or URL field only from a parent table or a child table, but not both.

Instance restrictions

Impact of using Edge Encryption on the instance:

- Back-end logic cannot process encrypted data. When the instance contains encrypted data, any business rule, back-end script, or back-end feature that relies on evaluating the data in the encrypted field does not run correctly.

Note: Data encrypted with equality-preserving or order-preserving encryption still passes equivalence checks when compared against an identical encrypted value.

- Since email processing goes from the mail systems straight to the instance and cannot pass through the Edge proxy, data sent in or out via email cannot be encrypted or decrypted by the Edge proxy.
  - Data and attachments in inbound emails are not encrypted.
  - Data and attachments in outbound emails remain encrypted and cannot be decrypted.
- Scripts run on the server cannot change encrypted data.
- Global search is not supported. Because global search attempts to search both encrypted and clear text data, the results may not be as expected.
- Encrypted data cannot be copied and pasted into a record where the field is not encrypted.
- Depending on the type of encryption selected, the user interface functionality for the encrypted fields is reduced. For example, being able to compare, group by, sort, and search may be impacted. Generally, the stronger the encryption selected, the more functionality is reduced.
- Except for Java KeyStore, SafeNet, and Unbound Technology, no third-party software or hardware encryption key management is supported.
Although multiple proxy servers connected to a single instance are supported, encryption proxy cluster management and monitoring are not available. Each proxy must be managed separately.

System configurations such as workload and the number of encrypted fields can impact the performance of encrypted fields.

The Edge Encryption proxy server can only connect to a single instance.

If your instance uses an Oracle database and the String field you are marking to be encrypted is greater than 2925 characters, that field cannot be sorted even when order preserving encryption is selected.

If your instance uses an Oracle database, Unicode AL32UTF8 is the only supported character set.

Encrypted data cannot be used in reports.

**Edge Encryption installation**

You can install an Edge Encryption proxy manually or using the Edge Encryption interactive installer.

**Java requirements**

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or later

*Note: Java 8 update 131 (8u131) is not supported.*

*Note: Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.*

**Installing the proxy server**

Installing Edge Encryption includes these steps:

- Install the Edge Encryption proxy application on a server in your network using the interactive installer or the manual installer.
- Generate the RSA key pair for digitally signing encryption configurations and encryption rules.
- Install the Java Cryptography Extension (JCE), if you plan to use AES 256 encryption.
- If you are using a secure SSL connection, obtain a server certificate and import it to the Java KeyStore.
- Set up your keystore and encryption key.
- If order preserving encryption types or encryption patterns are to be used, set up a MySQL database on a machine in your network.
Set the desired properties. Properties are located in the `edgeencryption.properties` configuration file.
Specify that a proxy server is a trusted source so that Edge Encryption can process requests coming from that proxy server.

**Accessing the proxy server**

Once installation is complete, point each user's browser to an Edge Encryption proxy using the URL format: `<host>:`<port>. Values are determined by the *host and port properties* in the `edgeencryption.properties` file.

As an example with the following values:

<table>
<thead>
<tr>
<th>Property</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy.host</code></td>
<td><code>hostname.mycompany.com</code></td>
</tr>
<tr>
<td><code>edgeencryption.proxy.http.port</code></td>
<td><code>8081</code></td>
</tr>
</tbody>
</table>

A client will access the proxy server using the following address: http://hostname.mycompany.com:8081/.

*Note:* DNS settings and routing rules may be used. Host and port values are determined by your network administrator.

**Request Edge Encryption**

The Edge Encryption plugin (com.glide.edgeencryption) is available as a separate subscription.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

**Role required:** none

1. From your instance, navigate to **System Definition > Plugins**.
2. On the All Applications page, click **Request Plugin** to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments. |

5. Click **Submit**.

**Set up an Edge Encryption user account**

The Edge Encryption proxies connect to the instance as a user to obtain and update encryption configuration information. Create a user account for this purpose and give the edge_encryption role to the user.

The Edge Encryption plugin must be installed before you can assign the role.

Role required: admin

1. On your ServiceNow instance, create a user account to be used by the Edge Encryption proxy applications.
2. Assign the edge_encryption role to the user.
Download the Edge Encryption proxy server

Download the Edge Encryption proxy server application from your instance, and then copy the file to each computer that is to run the Edge Encryption proxy server.

Before starting this procedure, the Edge Encryption plugin must be installed and activated on your instance.

⚠️ **Note:** The Edge Encryption proxy is officially supported only on Oracle JRE.

Role required: security_admin

1. Navigate to Encryption Configuration > Installation & Downloads > Downloads.
2. If using the interactive installer, click Download. If manually installing the proxy server, select the OS version for your proxy server.

⚠️ **Note:** Because the proxy server requires at least 4 GB of memory to run, 32-bit JREs and 32-bit operating systems are no longer supported starting with the Orlando release.

3. Copy the installer to each computer that is to run the Edge Encryption proxy server. If manually installing the Edge Encryption proxy server, copy the ZIP file to each computer that is to run the Edge Encryption proxy server.

After downloading the Edge Encryption installer, install the Edge Encryption proxy server using the interactive installer. If installing manually, install the Edge Encryption proxy server using the command line installer.

Install the Edge Encryption proxy server using the interactive installer

Install the Edge Encryption proxy server on a Windows or Linux computer using the interactive installer.

⚠️ **Note:** SafeNet KeySecure keystore files are not supported by the Edge Encryption installer. To use a SafeNet KeySecure keystore, install the Edge Encryption proxy server using the command line installer.

The Edge Encryption plugin must be installed and activated on your instance before you start this procedure. Ensure that the latest version of Java 8 is installed on the machine running the Edge Encryption installer.

The latest version of Java 8 is Java SE 8u171 / 8u172.

- Java SE 8u171 includes important bug fixes. Oracle strongly recommends that all Java SE 8 users upgrade to this release.
- Java SE 8u172 is a patch-set update, including all of 8u171 plus additional bug fixes.

Role required:

- security_admin on your ServiceNow instance
- local or domain administrator on a Windows host
- service user with full file system access on a Linux host

After installing a new proxy server, you can run the installer again to perform tests to detect issues with an installation or modify current settings. Your options include:

- **Install New:** Install a new proxy server.

© 2020 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
- **Verify Installation**: Perform tests to detect and fix issues in a previous installation.
- **Reinstall Existing**: Perform tests to detect and fix issues in a previous installation and view or modify existing settings.

**Note**: If installing the proxy server on a Linux machine on a privileged port (port 80 or 443), you must run the installer as a root user with full file system access. To restrict file system access after the proxy server is installed, you can use the SetUID feature in the proxy installer. To enable this feature, start the installer as root or sudo root. When prompted by the installer, provide the username and usergroup of an unprivileged user. The proxy server will install with file system privileges of the given user. You can skip this step to continue the default installation with root privileges.

Use the installer to install multiple proxies for your instance on multiple machines, ensuring that the following criteria apply:

- All proxies must have the same encryption keys and the same RSA key pair used to digitally sign encryption configurations and rules.
- The encryption key must be the default key configured on the instance.
- When a proxy database is set up as part of the installation, all proxies must use the same proxy database.

You may need a proxy database for equality-preserving encryption, order-preserving encryption, or tokenization. If you do not use any of these features, you do not need a proxy database.

To use NVDA, an Assistive Technology screen reader designed to read accessibility-enabled Java applications built for keyboard users, see [Configure a Windows 64-bit host to use 32-bit NVDA with Java applications](#).

After installing the Edge Encryption proxy server, **Set the proxy server initial memory limit and upper bound memory limit**.

**Install the Edge Encryption proxy server (interactive installer)**

Install the Edge Encryption proxy on a Windows or Linux computer.

1. **Download the Edge Encryption proxy server installer**.
2. Open the Edge Encryption proxy installer.

**Note**: If installing on a Windows machine, you must run the installer as Administrator.

- a) To run the installer as Administrator on a Windows machine, right-click the Command Prompt and select **Run as administrator**.
- b) From the command line, navigate to the directory that contains the downloaded .jar file.
- c) Run the following command: `java -jar <file name>.jar`.
3. To install a new proxy server, select **Install New**. 
   If a proxy is already installed, you can run the installer to:
   - **Verify Installation**: Perform tests to detect and fix issues in a previous installation.
   - **Reinstall Existing**: Perform tests to detect and fix issues in a previous installation and view or modify existing settings.

4. Configure the **Installation Location** and **Target ServiceNow Instance**.
   a) Click **Browse** to select an installation location or manually enter an installation path.
   b) Enter the URL of the target ServiceNow instance. Include the protocol and port number.
      https://example.servicenow.com:443
   c) Enter the user name and password for a user with the edge_encryption role on the target ServiceNow instance.

5. Click **Next**.
6. Configure the **Connection Settings** and **Proxy Settings**.
### Setting

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy Host</td>
<td>Fully qualified domain name of the machine on which you are installing the proxy server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Click Detect FQDN to look up the machine’s fully qualified domain name and auto-populate the Proxy Host field.</td>
</tr>
<tr>
<td></td>
<td>Along with the port, this property defines the URL used by the client to access the proxy server.</td>
</tr>
<tr>
<td>HTTP Port</td>
<td>Port on the proxy for HTTP communication.</td>
</tr>
<tr>
<td>HTTPS Port</td>
<td>Port on the proxy for HTTPS communication.</td>
</tr>
<tr>
<td>Proxy Name</td>
<td>Name of the proxy and the service. The proxy name must be unique.</td>
</tr>
<tr>
<td>Proxy Poll Interval</td>
<td>Poll interval in seconds. With the default setting, it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect proxies that have come online.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Changing the default setting of the Proxy Poll Interval can result in detection delays when a proxy comes online.</td>
</tr>
<tr>
<td>Proxy Keep-Alive Ping Interval</td>
<td>Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance. The default value is 10. The minimum value is 5.</td>
</tr>
</tbody>
</table>

7. Click **Install**.  
The Edge Encryption proxy server installs. The installation may take a few minutes.

**Configure CyberArk properties protection**

Optionally, configure CyberArk properties protection to securely store Edge Encryption passwords in a centralized and secure digital vault.

You must purchase and configure CyberArk AIM (Application Identity Management) before you can configure CyberArk connection parameters and protected credentials for a proxy server. As part of the installation of the AIM client, the `JavaPasswordSDK.jar` file is installed in the AIM client installation directory. The CyberArk vault is installed on an independent hardened server, and the AIM clients allow secure access to that server.

**Note:** You must install the CyberArk AIM client on every host computer where an Edge proxy is installed.

In the Edge installer, you must specify the location of the `JavaPasswordSDK.jar` file to set up the CyberArk connection to the Edge proxy. You must also enter other values you defined during the AIM client installation.
Setting up CyberArk password storage is optional. If you do not want to set up CyberArk password storage, click Skip through the CyberArk screens.

1. On the CyberArk Connection page of the Edge Encryption installer, enter the CyberArk connection parameters.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path to PasswordSDK.jar</td>
<td>The path to the JavaPasswordSDK.jar file installed on the host Windows machine during CyberArk configuration.</td>
</tr>
<tr>
<td>App ID</td>
<td>The App ID entered during CyberArk configuration.</td>
</tr>
<tr>
<td>Safe Name</td>
<td>The Safe Name entered during CyberArk configuration.</td>
</tr>
</tbody>
</table>

2. Click Next.

3. On the CyberArk Protected Credentials page of the installer, enter the credentials to be protected by CyberArk.

   - To use a single credential name for all protected passwords, select the Apply one Credential Name to all Credentials check box, enter the credential name, and click Apply.
   - Enter the credential name for one or more of the following fields. Credential names are the usernames entered for the SSH keys during CyberArk configuration.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption User</td>
<td>The CyberArk credential name for an Edge Encryption user.</td>
</tr>
<tr>
<td>Signature Key Keystore</td>
<td>The CyberArk credential name for the signature key keystore.</td>
</tr>
<tr>
<td>HTTPS Cert Keystore</td>
<td>The CyberArk credential name for the HTTPS certification keystore.</td>
</tr>
<tr>
<td>Encryption Key Keystore</td>
<td>The CyberArk credential name for the encryption key keystore.</td>
</tr>
<tr>
<td>Database</td>
<td>The CyberArk credential name for the database keystore.</td>
</tr>
<tr>
<td>SafeNet HTTPS Cert Keystore</td>
<td>The CyberArk credential name for the SafeNet HTTPS certification keystore.</td>
</tr>
<tr>
<td>SafeNet Server</td>
<td>The CyberArk credential name for the SafeNet server.</td>
</tr>
<tr>
<td>Forward Proxy</td>
<td>The CyberArk credential name for the forward proxy.</td>
</tr>
</tbody>
</table>

4. Click Next.

**Configure the signature key**

Configure the signature key after installing the proxy server through the Edge Encryption proxy installer.
The signature key signs changes to configurations and properties made by the proxy server. The signature key must be an asymmetric RSA key pair in a JCEKS KeyStore.

**Note:** If installing multiple proxies, each proxy must use the same signature key.

1. On the Signature Key page of the Edge Encryption installer, select the keystore on the host machine to store the signature key.
   - **Create New Java KeyStore:** Enter the directory location, name, and password for the new keystore.
   - **Use Existing Keystore:** Enter the keystore file location and password.
2. Click **Next**.
3. Select or create a signature key.
   - **New Key:** Create a signature key for this proxy.
   - **Use Existing Key:** Use an RSA key-pair from the selected keystore.
   - **Import Existing Key:** Import an RSA key-pair from a different keystore. Browse to the keystore file, enter the password for the keystore, and select the key alias. Provide a new alias for the key.
4. Click **Next**.

**Configure the HTTPS certificate**

To enable clients to connect to the Edge Encryption proxy server using a secure SSL connection, import the HTTPS certificate to the proxy server.

The Edge Encryption proxy provides the HTTPS certificate to clients trying to connect.

1. On the HTTPS Certificate page of the Edge Encryption installer, select the keystore to store the certificate.
   - **Create New Java KeyStore:** Enter the directory location, name, and password for the new keystore.
   - **Use Existing Keystore:** Enter the keystore file location and password.
2. Click **Next**.
3. Select or import a certificate.
   - The key alias is the given alias for the certificate.
   - **Use Existing Certificate:** Use an existing certificate in the selected keystore.
   - **Import from File or KeyStore:** Import a certificate from a different keystore or a .cer file. Browse to the keystore or .cer file, enter the password, and select the alias. You must provide a new alias for the certificate.
4. Click **Next**.

**Configure the AES 128-bit encryption key**

After you configure the HTTPS certificate through the Edge Encryption proxy installer, configure the AES 128-bit encryption key to encrypt your data.

The encryption key is either a plain text file inside the `/keys` directory or a secret key inside a keystore. If you use a keystore for your AES 128-bit and AES 256-bit encryption keys, they must both use the same keystore.

If you are updating an SSL certificate on an Edge proxy server, see **Update SSL certificate**.

1. Select the encryption key location.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Store</td>
<td>Use a file to store a single encryption key. You can use an existing file in the /keys directory, or you can generate a new file. To generate a new file, enter an alias and click Generate. A file containing an encryption key is created.</td>
</tr>
</tbody>
</table>

**Note:** This choice designates both the storage location and the encryption key. If you select File Store, click Next and go to step 5.

<table>
<thead>
<tr>
<th>Create New Java KeyStore</th>
<th>Create a keystore to store the encryption key.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java KeyStore File</td>
<td>Store the encryption key in an existing Java KeyStore file.</td>
</tr>
</tbody>
</table>

2. Click Next.
3. Select or create the encryption key.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Key</td>
<td>Create an encryption key and alias.</td>
</tr>
</tbody>
</table>

**Note:** You must use lowercase letters and numbers for the alias name (key name, key alias), per Java KeyStore requirements. To find out more about the keytool utility, see the Java SE Documentation.

<table>
<thead>
<tr>
<th>Use Existing Key</th>
<th>Use an existing encryption key in the selected keystore.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import Existing Key</td>
<td>Import an encryption key from a different keystore.</td>
</tr>
</tbody>
</table>

4. Click Next.
5. Configure the key on the instance according to the requirements defined in your installer.

To configure the key on the instance, navigate to the instance and define a default key. See Configure encryption keys on the instance. Ensure that the key alias, size, and type match the requirements defined in the installer.
Default Encryption Key

This step requires you to go to your instance and create a default key. Click the links below and follow the instructions. Click 'Next' when you are done setting up the default key on your instance.

The 'Key alias' must be: `aes128`
The 'Key size' must be: `128`
The 'Type' must be: `Keystore`

Click here for documentation
Click here to go to your default keys

6. Once the key is configured on the instance, return to the installer and click **Next**.
Configure the AES 256-bit encryption key

After you configure the AES 128-bit key through the Edge proxy installer, you can optionally configure an AES 256-bit encryption key to encrypt your data.

The encryption key is either a plain text file inside the /keys directory or a secret key inside a keystore. If you use a keystore for your AES 128-bit and AES 256-bit encryption keys, both keys must use the same keystore. If you do not want to configure an AES 256-bit encryption key, click Skip to continue installing the proxy server.

If you are updating an SSL certificate on an Edge proxy server, see Update SSL certificate.

1. Select the encryption key location.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Store</td>
<td>Use a file to store a single encryption key. You can use an existing file in the /keys directory, or you can generate a new file. To generate a new file, enter an alias and click Generate. A file containing an encryption key is created.</td>
</tr>
</tbody>
</table>

**Note:** This choice designates both the storage location and the encryption key. If you select File Store, click Next and go to step 5.

<table>
<thead>
<tr>
<th>Create New Java KeyStore</th>
<th>Create a keystore to store the encryption key.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java KeyStore File</td>
<td>Store the encryption key in an existing Java KeyStore file.</td>
</tr>
</tbody>
</table>

2. Click Next.

3. Select or create the encryption key.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Key</td>
<td>Create an encryption key and alias.</td>
</tr>
</tbody>
</table>

**Note:** You must use lowercase letters and numbers for the alias name (key name, key alias), per Java KeyStore requirements. To find out more about the keytool utility, see the Java SE Documentation.

<table>
<thead>
<tr>
<th>Use Existing Key</th>
<th>Use an existing encryption key in the selected keystore.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import Existing Key</td>
<td>Import an encryption key from a different keystore.</td>
</tr>
</tbody>
</table>

4. Click Next.

5. Optional: If you want to use AES 256-bit encryption, do the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java 8 update 141 or earlier</td>
<td>Install the Java Cryptography Extension (JCE) and overwrite the policy files in the Java home directory. See Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier.</td>
</tr>
<tr>
<td>Java 8 update 151 or later</td>
<td>Edit the java.security policy file to allow the use of unlimited strength keys. See Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later.</td>
</tr>
</tbody>
</table>
6. To use AES 256-bit encryption, you must also configure the AES 256-bit default encryption key on the instance by navigating to the instance and defining a default key.

See Configure encryption keys on the instance. Ensure that the key alias, size, and type match the requirements defined in the installer.

7. After the key is configured on the instance, return to the installer and click Next.

**Update SSL certificate**

When updating an SSL certificate on an Edge proxy server, you must delete the old one.

Role required: admin

When updating the SSL certificate on the Edge proxy server, you must also delete the old certificate. If you don't, the old certificate (in the form of an alias in the KeyStore file) continues to be used even though the Edge proxy server is configured to use the new certificate.

1. On the Edge proxy server, list the entries in the Java KeyStore:

```
keytool -list -keystore keystore.jceks -storetype jceks -storepass MY_SUPER_PASSWORD
```

2. Remove the old SSL certificate:

```
keytool -delete -alias MY_OLD_ALIAS -keystore keystore.jceks -storetype jceks -storepass MY_SUPER_PASSWORD
```

3. Add the new SSL certificate into the Java KeyStore.

**Configure the Edge Encryption proxy database**

If using order-preserving encryption types or encryption patterns, you can optionally configure the Edge Encryption proxy database properties.

To use order-preserving encryption types or encryption patterns, a MySQL database running in your network is mandatory. This task connects the proxy to the database, but it does not install or configure the database.

**Note:** If using multiple proxy servers, all proxy servers must use the same proxy database. The values entered in the installer must be the same for all proxy servers.

1. Confirm or change the database URL. This URL is the location of the proxy database.
2. In the Name field, enter the name of the proxy database. The default value is edgeencryption.
3. Enter the username and password for accessing the proxy database.
4. Click Next.

**Launch the Edge Encryption proxy server**

After an Edge Encryption proxy is installed and configured, you can start the proxy from the installer.

1. After configuring keys on the instance and optionally configuring the proxy database, return to the Edge Encryption proxy installer and click Launch.
2. If an issue is detected, or to check the status of your proxy server, you can click Check Status to verify that the proxy is running. A message displays the proxy status.
After successfully installing the Edge Encryption proxy server, **set the proxy server initial memory limit and upper bound memory limit.**

**Verify and troubleshoot the Edge Encryption proxy server installation**

After your Edge Encryption proxy is installed, you can verify the installation to locate problems or start and stop the proxy.

1. Open the Edge Encryption proxy installer.
2. Select **Verify Installation**.
3. Click **Proxy Directory** and select the proxy directory.
4. Click **Run Tests**.
   Test results display.
Edge Encryption proxy installation tests

5. Click Next.
If an issue is encountered, you can move through the installer to correct the configuration. If no issues are encountered, the installer jumps to the **Launch** page. You can check the proxy status, stop the proxy, or start the proxy from the **Launch** page.

### Install the Edge Encryption proxy server using the command line installer

Manually install multiple Edge Encryption proxy servers in your network.

Roles required: security_admin on your ServiceNow instance and local administrator on the host machine.

If order preserving encryption types or encryption patterns are to be used, set up a MySQL database on a machine in your network if not already present.

**Note:** If using Unbound Technology encryption keys with Edge Encryption, install the proxy server using the command line installer on the Unbound client machine. The Edge Encryption proxy server must run on the same machine as the Unbound technology client.

First, set up a single Edge Encryption proxy server. After your first proxy server is successfully running, add additional proxy servers for one instance to ensure an optimal environment. See **Sizing your Edge Encryption environment** to determine the number of additional proxy servers needed.

### Install the Edge Encryption proxy server (command line installer)

Install an Edge Encryption proxy on a 64-bit Windows or Linux computer.

Java 8 is required to run the installer.

Install the Edge Encryption proxy server on a machine in your network using the appropriate command for your target machine. If installing the Edge Encryption proxy server on a Windows machine, you must additionally install the proxy server as a Windows service.

When you upgrade the Edge Encryption proxy server, the system backs up the old proxy in the `backup.dist-upgrade-<timestamp>` directory under the current installation directory. The backup directory is generated during the upgrade process and stores the old proxy information.

When you run an upgrade via the command line, a `dist-upgrade.log` may be generated in the directory where the command runs. The `dist-upgrade.log` contains logs for the upgrade process.

In case of a failed upgrade, the system creates a `failed-backup.dist-upgrade-<timestamp>` directory. In addition, `logs/wrapper.log` in the original proxy directory may also contain failure information.

1. Create the installation directory.
2. Download the Edge Encryption proxy archive file to the installation directory.
3. Open the terminal and change to the installation directory.

**Note:** If installing on a Windows machine, you must start the Windows Command Prompt with administrator privileges.

4. Run this command for the target machine and change the variables according to your configuration:

   ```
   java -jar edgeencryption-<version>-all.jar -m install -n <ProxyName> --instancehost <host> -p <InstancePort> --protocol https
   ```

<table>
<thead>
<tr>
<th>Option</th>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>version</td>
<td>Version number of the Edge Encryption proxy being used to perform the current operation.</td>
</tr>
<tr>
<td>-m</td>
<td>mode</td>
<td>The operation or mode to run in (install or dist-upgrade).</td>
</tr>
<tr>
<td>-n</td>
<td>ProxyName</td>
<td>The name of the encryption proxy instance. Use a unique ProxyName to be able to identify specific proxy instances.</td>
</tr>
<tr>
<td>--instancehost</td>
<td>host</td>
<td>The host name of your ServiceNow instance (for example, mycompany.service-now.com).</td>
</tr>
<tr>
<td>-p</td>
<td>InstancePort</td>
<td>The port of your instance. When the protocol is https, the port is normally 443.</td>
</tr>
<tr>
<td>--protocol</td>
<td>protocol</td>
<td>The protocol used to access your ServiceNow instance (typically https).</td>
</tr>
</tbody>
</table>

**Note**: Do not copy and paste commands from the browser. Occasionally, copy/paste operations cause unexpected characters to be pasted to the target machine and results in the command being executed incorrectly. It is best to type out the command by hand using documentation as a reference.

To see the help screen, execute this command without arguments: `java -jar edgeencryption-<version>-all.jar`

5. If installing on a Windows machine, install the Edge Encryption proxy as a Windows service.
   a) Optionally change the name of the service. Open the `conf/wrapper.conf` file on the new proxy and set the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description (Optional)</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

   If this step is not performed, the Edge Encryption proxy service is installed under the name **Edge Encryption**.
   b) Save and close the file.
   c) Open the Windows Command Prompt and cd to `ServerName_port/bin`.
   d) Execute `edgeencryption.bat install`.

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The ProxyName_port directory is created in the current directory. The edgeencryption.properties file is updated with the host, port, and protocol values from the command line.

Create and configure the RSA key pair for the digital signature

Create an RSA key pair that the proxy server can use to create the digital signature for signing changes to the encryption properties and configuration.

To generate and validate the digital signature, an RSA key pair must be generated and stored in the JCEKS Java KeyStore and each proxy must be configured to use this key pair. Generate an encryption key pair using the keytool command.

To use the keytool utility with a proxy installed on SELinux (CentOS), you must enable loading of shared libraries from the proxy java-installation directory. To do this, run the following command as root.

```
chcon -R -t texrel_shlib_t proxy_install_dir/java/jre /lib
```

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in <proxy install dir>java/jre/bin/keytool.

1. Change to the KeyStore directory in the proxy download directory.
2. Change the default password.
   - The default password ischangeme.

```
keytool -keystore keystore.jceks -storetype jceks -storepasswd -new <newpassword>
```

3. Create an encryption key pair.

   **Note:** Do not enter a password for the key when the keytool utility prompts for one.

Enter this command on a single line.

```
keytool -genkeypair -alias <key alias> -keyalg rsa -keystore keystore.jceks -storetype jceks -storepass <keystore password> -keysize 2048
```

4. Update the encryption proxy property file (edgeencryption.properties).
   a) Change to the <installation directory>/conf/ directory.
   b) Open the edgeencryption.properties file.
   c) Enter the properties for the digital signature.

   These properties must be the same for all proxies.

5. Save and close the edgeencryption.properties file.

Import and configure the certificate for secure SSL connection

To use a secure SSL connection, import a server certificate and add it to the Java KeyStore.

You must obtain the server certificate before you can add it to the Java KeyStore.

1. Add a server certificate to the Java KeyStore.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you have the RSA private key in the Java Keystore and generated the certificate from that key.</td>
<td>keytool -import -alias keyname -file server.cert -storetype JCEKS -keystore keystore.jceks -storepass pwd</td>
</tr>
<tr>
<td>If you have a PKCS12 (.pfx) file that contains the RSA key and the certificate.</td>
<td>keytool -importkeystore -destkeystore keystore.jceks -deststoretype jceks -srcstoretype pkcs12 &lt;PKCS12 filename&gt; -srcstoretype pkcs12</td>
</tr>
</tbody>
</table>

Make sure that the private key password is the same as the Java KeyStore password. You can run this command to change the password.

```
keytool -keypasswd -keystore keystore.jceks -alias <key alias>
```

For testing, you can use this command to generate a self-signed certificate.

```
keytool -genkeypair -alias cert -keystore keystore.jceks -storetype jceks -keyalg rsa
```

2. Update the edgeencryption.properties file.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the edgeencryption.properties file.
   c) Enter the properties for the SSL certificate.
      The certificate must be the same for all proxies connecting to the same instance.

3. Save and close the edgeencryption.properties file.

Enable AES 256-bit encryption

256-bit encryption is more secure than 128-bit encryption, and you can optionally configure AES 256-bit encryption on the Edge Encryption proxy server host. How you enable AES 256-bit encryption depends on the Java update installed on each proxy server host.

Edge Encryption supports only AES 128-bit and AES 256-bit keys.

**Note:** Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

Follow the procedure for the Java version that is installed on your proxy server host:

- Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier
- Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later

Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier
Copy the Java Cryptography Extension (JCE) jurisdiction policy files to the Java home directory of each Edge Encryption proxy server host to enable AES 256-bit encryption for Java update 141 or earlier. 256-bit keys provide greater security than 128-bit keys.

Role required: admin

Your Java home directory includes the AES 128-bit policy files by default. To enable AES 256-bit encryption, you must overwrite the Java home directory policy files with the AES 256-bit policy.
files. You only need to download the JCE once, but you must update every Edge Encryption proxy server host.

**Note:** Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

1. Download the JCE policy 8 ZIP file from Oracle.
2. Unzip the file.
3. On each proxy server host, copy the `local_policy.jar` and `US_export_policy.jar` files into the `<Java-home-directory>/jre/lib/security` folder.

*Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later*

Edit the `java.security` policy file to enable AES 256-bit encryption for Java update 151 or later. 256-bit keys provide greater security than 128-bit keys.

**Role required:** admin

Perform this task in the Java home directory of each Edge Encryption proxy server host on which you want to enable AES 256-bit encryption.

**Note:** Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

1. Navigate to `<jre_home>/lib/security/java.security` on the proxy server host, where `JRE_HOME` is an environment variable for both Microsoft Windows and Linux.
2. Open the `java.security` policy file and find the line for the `crypto.policy` parameter, which is commented out by default.
3. Remove the `#` character from the beginning of the `crypto.policy` line to uncomment the line, and then save the file.

**Note:** If you do not uncomment the `crypto.policy` line, Java uses `crypto.policy=limited`, which restricts encryption to AES 128-bit keys.

---

**Set up a keystore and encryption keys**

Set up the keystore and encryption keys used by the Edge Encryption proxy server.

1. Carefully determine the appropriate type of keystore to use based on your organization's needs.

<table>
<thead>
<tr>
<th>Supported keystore</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>File store</strong></td>
<td>Keys are stored in a file in a file system accessed by the Edge Encryption proxy server. Because encryption keys stored in a file are not encrypted, it is your responsibility to protect these files.</td>
</tr>
<tr>
<td>Supported keystore</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Java KeyStore</td>
<td>A Java KeyStore:</td>
</tr>
<tr>
<td></td>
<td>· Stores keys in a Java JCEKS KeyStore.</td>
</tr>
<tr>
<td></td>
<td>· Is password protected and more secure than storing keys in a file in the file system.</td>
</tr>
<tr>
<td></td>
<td>· Can store multiple keys. A key alias represents each key, making it easier to manage multiple keys.</td>
</tr>
<tr>
<td></td>
<td>The Edge Encryption proxy ships with the Java JCEKS KeyStore file named keystore.jceks in the keystore directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.</td>

<tr>
<td></td>
<td>Keys are stored and retrieved with SafeNet KeySecure key management.</td>
</tr>
<tr>
<td></td>
<td>You must secure a license with Gemalto, download the libraries, and install the SafeNet KeySecure keystore on a host machine in your network before configuring the keystore on the Edge Encryption proxy server.</td>
</tr>
<tr>
<td></td>
<td><strong>Unbound Technology</strong></td>
</tr>
<tr>
<td></td>
<td>The base64-encoded wrapped encryption key is stored as text file on the Edge Encryption proxy server. The Unbound Technology implementation (previously Dyadic Security) maintains control of the wrapping key.</td>
</tr>
<tr>
<td></td>
<td>The Edge Encryption proxy server must run on the same machine as the Unbound technology client.</td>
</tr>
</tbody>
</table>

**Note:** If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is `servicenow`.

2. Set up the keystore and encryption keys in your local network.

**Set up a Java KeyStore keystore**
You can use a Java KeyStore keystore to store encryption keys.

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named `keystore.jceks` in the `keystore` directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

1. Set up the keystore properties.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
c) Enter the properties for the Java KeyStore.

2. Save and close the `edgeencryption.properties` file.

After setting up the Java KeyStore, Create encryption keys using the Java KeyStore keytool. You can use the keytool shipped with the encryption proxy distribution to create AES 128-bit and AES 256-bit encryption keys.

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

To find out more about the keytool utility, see the Java SE Documentation.

**Note:** The Java KeyStore requires that the alias name (key name, key alias) use lowercase letters and numbers.

1. Change to the keystore directory, `<installation directory>/keystore/`.
2. To create the encryption key, run one of the following commands.

   **Option** | **Description**
   --- | ---
   AES 128 | `keytool -genseckey -alias 128bitkey -keyalg aes -keysize 128 -keystore keystore.jceks -storetype jceks`
   AES 256 | `keytool -genseckey -alias 256bitkey -keyalg aes -keysize 256 -keystore keystore.jceks -storetype jceks`

You add the alias on the instance when you assign default keys.

**Note:** The key password must be the same as the keystore password.

Set up a SafeNet KeySecure keystore

If you are using a SafeNet keystore, copy a set of libraries into the proxy distribution directory.

You must install and set up the SafeNet keystore before performing this step. Secure a license with Gemalto in order to download the libraries.

**Note:** On Linux, file paths use a forward slash (/).

1. Copy these files to the `<installation directory>/lib` directory:
   - `ingrianNAE-<version>.jar`
   - `ingrianlog4j-api-<version>.jar`
   - `ingrianlog4j-core-<version>.jar`

2. Change to the `<installation directory>/conf/` directory, and open the `edgeencryption.properties` file.
3. Enter the properties for the SafeNet keystore.

An example for a SafeNet keystore using username and password authentication.

```config
edgeencryption.nae.retries = 3
edgeencryption.nae.enabled = true
edgeencryption.nae.server = url
edgeencryption.nae.port = 9000
edgeencryption.nae.protocol = ssl
edgeencryption.nae.keystore.path = keystore/safenet_truststore
edgeencryption.nae.keystore.password = password
edgeencryption.nae.user = safenet_user
edgeencryption.nae.password = safenet_password
```

An example for a SafeNet keystore using client certificate authentication. This authentication method eliminates the need to store the SafeNet server username and password in the properties file.

```config
edgeencryption.nae.retries = 3
edgeencryption.nae.enabled = true
edgeencryption.nae.server = url
edgeencryption.nae.port = 9000
edgeencryption.nae.protocol = ssl
edgeencryption.nae.keystore.path = keystore/safenet_clientcert
edgeencryption.nae.keystore.password = password
edgeencryption.nae.client.certificate = cert_name
```

4. Add or create a key in the SafeNet keystore.

You add the key name (alias) on the instance when you assign default keys.

5. Save and close the edgeencryption.properties file.

Upgrade from Kingston or lower to London or higher

If you use a SafeNet NAE server for key storage with Edge, before upgrading the proxy from Kingston or lower to London or higher, you must copy Gemalto SafeNet client ProtectApp JAR files and add new properties.

**Note:** On Linux, file paths use a forward slash (/).

1. Copy the following files from `<installation directory>/lib` to a directory path that is completely outside of the proxy installation directory path:

   - ingrianNAE-<version>.jar
   - ingrianlog4j-api-<version>.jar
   - ingrianlog4j-core-<version>.jar

2. On the current version (not upgraded) of the proxy, update the `<installation directory>/conf/edgeencryption.properties` file by adding the following two properties:

   - `edgeencryption.ekm.provider.classname = com.snc.edgeencryption.encryption.CloudEdgeNaeKeyProvider`
   - `edgeencryption.thirdparty.vendor.library.path = <directory path to the directory where you copied the jar files in step 1>`

3. Save the changes.
4. Proceed with the upgrade to London or higher.
Set up Unbound Technology keys
To use Unbound Technology (previously Dyadic Security) keys with Edge Encryption, store the base64-encoded wrapped encryption key as text file on the Edge Encryption proxy server and provide the wrapping key alias. The Unbound Technology implementation maintains control of the wrapping key.

Role required: security_admin

In your Unbound Technology implementation, identify both the wrapping key and the wrapped key. Use the RSA/ECB/OAEPWITHSHA-256ANDMGF1PADDING algorithm for wrapping and padding. Export the wrapped key in base64-encoded text format. Save the file using the key alias as the name with no file extension.

- Note: If using Unbound Technology encryption keys with Edge Encryption, install the proxy server using the command line installer on the Unbound client machine. The Edge Encryption proxy server must run on the same machine as the Unbound technology client.

1. Add the wrapped encryption key in base64-encoded text format to the `<proxy-installation-directory>/keys` directory. The name of the file must be the key alias with no file extension.
2. Update the `edgeencryption.properties` file.
   a) Change to the `<proxy-installation-directory>/conf` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the File store properties. Set the value of `edgeencryption.keyfile.directory` to `keys`. This property directs the proxy server to look for the encryption key in the `<Java-home-directory>/keys` directory.
      For more information on Edge Encryption properties, see `Edge Encryption proxy server properties`.
   d) Uncomment the properties for the Dyadic provider configuration. Set the value of `edgeencryption.ekm.provider.rsa.wrapping.key.alias` to the wrapping key alias in your Unbound implementation.
   e) Save and close the file.

Add the encryption key alias to the instance. The encryption key alias is the file name of the wrapped encryption key added to the `<proxy-installation-directory>/keys` directory. For example, if the file in the directory is named `myunboundkey`, add this name to the `Key alias` field. See `Configure encryption keys on the instance`.

This step creates both the key storage and the encryption key.

- Note: The name of the key file must match the key alias specified in the encryption keys table in the instance. See `Configure encryption keys on the instance`.

1. Create a file in the `/keys` folder of the proxy server installation directory.
2. Add the encryption key to the file.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>Place the encryption key, exactly 16 bytes, into the file.</td>
</tr>
<tr>
<td>AES 256</td>
<td>Place the encryption key, exactly 32 bytes, into the file.</td>
</tr>
</tbody>
</table>
3. Update the edgeencryption.properties file.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the edgeencryption.properties file.
   c) Enter the properties for the file store.
   d) Save and close the file.

**Configure encryption keys on the instance**

Edge Encryption provides the tools to manage encryption keys without taking the proxy offline.

Role required: security_admin

Before setting up new encryption keys on the instance:

1. Create the encryption key.
2. Make the new key available to all encryption proxies. Either copy the file or Java KeyStore file to each proxy, or ensure that each proxy has access to the Java KeyStore or Enterprise Key Management (EKM) device.

Key aliases must be unique. Each key alias must have the same key size and type on each proxy, or the key cannot be assigned as the default.

1. Navigate to Edge Encryption Configuration > Encryption Key Configuration > Set Up Keys.
2. On the Add New Keys section of the form, complete the following steps to add a new key.

   a) Double-click in the row that says Insert a new row....
   b) In the edit box, enter a name for the key, then click the check mark.

   Key aliases are lowercase letters and numbers. Capital letters are changed to lowercase letters when you click Update. Key aliases must be unique.

   c) In the same row, double-click in the Key size column.
   d) In the select box, select a key size, either 128 bits or 256 bits, then click the check mark.
   e) In the same row, double-click in the Type column.
   f) In the select box, select a key type, either File, Keystore, SafeNet, or Unbound, then click the check mark.
   g) When you are done adding keys, click Next Step.
You must specify an alias, key size, and key type for each key before moving on.

3. On the Keys Status section of the form, check the State of the key and ensure that it is Available. This may take a few minutes. When the key is Available, click Next Step.

Note: If using SafeNet versioned keys, an additional column appears for the Key version. The Key version cannot be edited.

The instance tracks the status of every encryption key available to any proxy. When a key is available on all proxies, its state becomes Available. If the state does not change after a few minutes, check to ensure that the key is available on all proxies. If the state remains Unavailable, one or more of the proxies does not have the key.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available</td>
<td>All online proxies have the key.</td>
</tr>
<tr>
<td>Unavailable</td>
<td>This is a new key and the proxies have not yet loaded the key, or at least one proxy failed to load the key.</td>
</tr>
</tbody>
</table>

4. On the Change Default Keys section of the form, do one of the following:
   - Type in the key alias.
   - Click the magnifying glass icon and select an alias.

Note: If using SafeNet versioned keys, an additional field appears for the Key version. The Key version is grayed out and cannot be edited.

Note: If using SafeNet versioned keys, choose only the most recent key version. If you choose an earlier version, the following message appears when you click Update or Next Step:

One of the default keys chosen is not the latest version available for the key. Please use the latest version.

Note: If using SafeNet versioned keys, and if the default keys are not the latest versions of the SafeNet keys, an Update default keys to latest version link appears in the Related Links. Click the link to update the default keys to use the latest version.

Click Next Step.

5. On the Schedule Key Rotation section of the form, schedule a mass key rotation job or single key rotation job to encrypt existing data using the new encryption key.

If you do not run a mass key rotation job or single key rotation job, existing data remains encrypted with the old key until the data is accessed again.
Configure additional properties in the Edge Encryption properties file

After installing the Edge Encryption proxy server in your network and setting up your keystore and keys, configure the additional Edge Encryption properties.

1. Open the `<installation directory>/conf/edgeencryption.properties` file and configure the following Edge Encryption proxy server properties:
   - Target (instance) properties
   - User account properties
   - Proxy properties
   - If using order preserving encryption types or encryption patterns, configure the Proxy database properties
   - Clear text and static IV properties

2. Save and close the file.

Configure a web proxy

If your network uses a web proxy, you can set up the Edge Encryption proxy to use the web proxy.

If your network does not use a web proxy, leave the web proxy properties in the configuration file commented out.

The Edge Encryption proxy server supports HTTP connection to and basic authentication with the web proxy.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Configure the web proxy properties.
4. Save and close the `edgeencryption.properties` file.
5. If the web proxy is using a customer-specific server certificate, add this certificate to the JVM used by the Edge Encryption proxy server to establish trust between the web proxy and the Edge Encryption proxy server.
   a) cd to `<Java home directory>/jre/lib/security/cacerts`
   b) Execute the command: `keytool -keystore cacerts -importcert -alias <chooseAlias> -file <certificateFile>

Set the proxy server initial memory limit and upper bound memory limit

Set the initial memory limit and upper bound memory limit to specify how much memory the proxy server can consume. Set these limits to avoid performance issues in your Edge Encryption implementation.

As a guideline, set both the initial memory limit and the upper bound memory limit to the same value. On any machine, allocate 2 GB of the physical memory to the operating system (OS). Then allocate the rest of the physical memory to the heap using the initial memory limit and upper bound memory limit properties. For example, on a machine with 8 GB of memory, allocate 2 GB to the OS, and allocate the remaining 6 GB (6144 m) to the initial and upper bound memory.

Important: If your Edge Encryption proxy server is running, you must stop and restart the proxy server after updating these properties.

1. In your proxy server directory, open `<install dir>/conf/wrapper.conf`. 
2. To set the initial memory limit, add the following line at the end of the file:

```
wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m
```

Set `<number>` to the next available `<number>` in the sequence of `wrapper.java.additional.<number>` properties defined in the `wrapper.conf` file.

For example, you have the following list of `wrapper.java.additional.<number>` properties:

```
wrapper.java.additional.1=
wrapper.java.additional.2=
```

The maximum `<number>` in the above list is 2. When you add the `wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m` line, set `<number>` to 3, the next available number.

**Important:** Do not leave gaps in the numbering sequence.

Set `<min_memory_in_MB>` to the number of megabytes of memory remaining after allocating 2 GB of memory to the OS.

3. Set the upper bound memory limit.

Because an upper bound memory limit is not set in the base system, the proxy server can use all available memory. If other services are running on the server, you may want to set the upper bound memory limit.

Add the following line at the end of the file:

```
wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m
```

Set `<number>` to the next available `<number>` in the sequence of `wrapper.java.additional.<number>` properties defined in the `wrapper.conf` file.

For example, you have the following list of `wrapper.java.additional.<number>` properties:

```
wrapper.java.additional.1=
wrapper.java.additional.2=
```

The maximum `<number>` in the above list is 2. When you add the `wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m` line, set `<number>` to 3, the next available number.

**Note:** Do not leave gaps in the numbering sequence.

Set `<max_memory_in_MB>` to the number of megabytes of memory remaining after allocating 2 GB of memory to the OS.

4. Save and close the file.

**Example: Setting proxy server initial and upper bound memory limits**

```
wrapper.java.additional.1 = -Djava.io.tmpdir=./tmp
wrapper.java.additional.2 = -Dcloudedge.home.dist=..
# must ensure UTF8 encoding when running on Windows
wrapper.java.additional.3 = -Dfile.encoding=UTF8
# additional properties for heap settings
wrapper.java.additional.4 = -Xms6144m
wrapper.java.additional.5 = -Xmx6144m
```
Start the Edge Encryption proxy.

Start the Edge Encryption proxy

After an Edge Encryption proxy is installed and configured, you can start the proxy from the command line.

Before starting the encryption proxy, verify the following:

- The Edge Encryption plugin is activated on the instance.
- The `edgeencryption.properties` file on this machine has been configured.
- If using an order preserving encryption type or encryption patterns, the proxy database is running.

Note: The first time you set up the `edgeencryption.properties` file or change properties, you may not want to set the password encryption property. After you have verified that everything is working, you can set the password encryption property, shut down the proxy, and then restart the proxy.

1. Run the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>On a Linux machine</strong></td>
<td>1. cd to ServerName_port</td>
</tr>
<tr>
<td></td>
<td>2. Execute <code>./startup.sh</code></td>
</tr>
<tr>
<td><strong>On a Windows machine</strong></td>
<td>Perform the following steps from the command line as admin:</td>
</tr>
<tr>
<td></td>
<td>1. cd to ServerName_port/bin</td>
</tr>
<tr>
<td></td>
<td>2. Execute <code>edgeencryption.bat start</code></td>
</tr>
</tbody>
</table>

2. Check the log on the proxy server to verify that the proxy is running.

Obfuscate passwords in the properties file

You can obfuscate passwords in the `edgeencryption.properties` file to share the properties file without revealing clear text passwords.

Make sure that the Edge Encryption proxy server is set up and successfully running before you set this property. Before setting this property, Stop the Edge Encryption proxy.

Setting this property may make it difficult to debug connection and access issues during initial startup. Only set this property in production environments after the proxy has been set up and tested successfully.

1. Change to the `<installation directory>/conf/` directory.
2. In the `conf` directory, create a text file containing a complex string or phrase that can be used as a passphrase which the proxy uses to obfuscate the passwords in the `edgeencryption.properties` file. This passphrase should be a random and complex phrase not related to the passwords themselves.
3. Open the `edgeencryption.properties` file.
4. Set the `password encryption property`.
5. Save and close the `edgeencryption.properties` file.

After setting this property, you can Start the Edge Encryption proxy.
Manually add an additional proxy

After the first Edge Encryption proxy is properly configured and tested, you can set up additional proxies on a Linux or Windows machine. Installing multiple proxies on the same machine is not recommended.

Add additional proxy servers on additional machines to ensure an optimal environment. See *Sizing your Edge Encryption environment* to determine the number of additional proxies needed.

**Note:** Make sure that all proxies have the same encryption keys and the same RSA key pair used to digitally sign encryption configuration and encryption rules. If a proxy database was set up as part of the installation, all proxies must use the same proxy database.

1. Install the proxy using the appropriate command. See *Install the Edge Encryption proxy server (interactive installer)*.
2. Copy all the encryption keys and the `edgeencryption.properties` file from the first proxy to the new proxy.
   Encryption keys may be located in the proxy keystore, in the `/keys` directory, or in a SafeNet KeySecure keystore.
3. Open the `edgeencryption.properties` file on the new proxy.
4. Change the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.name</td>
<td>Unique name of the proxy server</td>
</tr>
<tr>
<td>edgeencryption.proxy.host</td>
<td>The server name, IP address, or fully-qualified domain name of the computer running the proxy.</td>
</tr>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>Port on the proxy for HTTP communication. Must be unique across all processes on the machine.</td>
</tr>
<tr>
<td>edgeencryption.proxy.https.port</td>
<td>Port on the proxy for HTTPS communication. Must be unique across processes on the machine.</td>
</tr>
</tbody>
</table>

5. If installing the proxy server on a Windows machine, you must change the name of the service. Open the `conf/wrapper.conf` file on the new proxy and add the following properties.

   **Note:** You must perform this step before launching the proxy server.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description (Optional)</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

6. Save and close the file.
7. Launch the proxy using the appropriate command. See *Start the Edge Encryption proxy*.
Authenticate an Edge Encryption proxy server

Specify that a proxy server is a trusted source so that Edge Encryption can process requests coming from that proxy server.

If a proxy server is not authenticated, the console log includes the following message:

```
WARN This Edge Encryption proxy has not yet been authenticated by the instance. Please navigate to the matching Proxy record on your ServiceNow instance and authenticate it.
```

If you attempt to access the proxy, you receive the following message: This site can't be reached.

To maintain the proxy in an operational state during the upgrade process, authentication is not required until after the proxy update is successful.

Role required: admin

1. Navigate to **Edge Encryption Configuration > Proxies**.
2. Select the proxy and click **Authenticate**.

The proxy moves from **Unauthenticated** to **Pending** to **Authenticated**. The status changes from **Unauthenticated** to **Pending** when you start the authentication. When authentication is complete, the status changes from **Pending** to **Authenticated**, and you can access the proxy and Edge Encryption can accept requests from the proxy.

**Note:** If you stop and restart the proxy, the proxy remains **Authenticated** and restarts successfully.

Stop the Edge Encryption proxy

You can stop an Edge Encryption proxy from the command line.

1. Stop the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On a Linux machine</td>
<td>Execute &quot;./shutdown.sh&quot;</td>
</tr>
<tr>
<td>On a Windows machine</td>
<td>Execute <code>edgeencryption.bat stop</code> To remove the Windows service, execute <code>edgeencryption.bat remove</code></td>
</tr>
</tbody>
</table>

2. Check the log on the proxy server to verify that the proxy has stopped.

Uninstall the Edge Encryption proxy on Linux

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

The encryption proxy running on Linux operates as a single process. You can end this process to accommodate such tasks as redeploying the encryption proxy to another host machine,
updating the proxy version, updating the Java version, or changing the unique name of the encryption proxy when deploying the encryption proxy on multiple proxy servers.

1. You may want to save the *edgeencryption.properties* file before deleting the distribution directory.
2. Execute the `shutdown.sh` shell script.
3. Check the log on the proxy server to verify that the proxy server is shut down.
4. Delete the files in the distribution folder.

**Uninstall the Edge Encryption proxy on Windows**

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

1. You may want to save the *edgeencryption.properties* file before deleting the distribution directory.
2. Execute `edgeencryption.bat stop`
3. Execute `edgeencryption.bat remove`
4. Check the log on the proxy server to verify that the proxy server is shutdown.
5. Delete the files in the distribution folder.

**Set up multiple provider SSO with Edge Encryption**

If implementing multiple provider single sign-on (SSO) with Edge Encryption enabled, some users may need to log in to your instance through the Edge Encryption proxy server, while other users may not. Set up multiple provider SSO to enable logging in through the Edge Encryption proxy server URL or the instance URL.

- Role required: admin
- Enable the Edge Encryption plugin (`com.glide.edgeencryption`) and ensure that one or more proxy servers are set up in your network.
- Determine the URL for the Edge Encryption proxy server that users will log in through using multiple provider SSO. To determine the URL of an Edge Encryption proxy server, see Edge Encryption installation.

- If routing all users through the Edge Encryption proxy server, set up your identify provider record and define the proxy server URL in the ServiceNow Homepage, Entity ID / Issuer, and Audience URI fields.
- To route some users through the proxy server and some users to the instance, create two identify provider records. Both records use the same value in the Identity Provider URL field. However, one of the records routes through the proxy server, while the other routes to the instance.

1. Enable the duplication of identity provider URLs in identity provider records.
   A unique constraint prevents duplication of the identity provider URL in two different identity provider records. You can enable duplication of the identity provider URL in multiple IdP records by setting a field to false.
a) Navigate to System Definition > Dictionary.

b) Open the definition record for the idp field of in the Identity Providers table (saml2_update1_properties).

c) Configure the form to add the Unique field.

d) Ensure that the value of the Unique field is set to false.

2. Navigate to Multi-Provider SSO > Identity Providers.

3. Create two identity provider records for the same identity provider: one using the instance URL and one using the Edge Encryption proxy server URL.

To create an identity provider record, see Create and update identity providers.

a) For the Edge Encryption proxy server URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>The URL for your proxy server homepage. For example: https://&lt;proxy hostname&gt;:&lt;port&gt;/navpage.do</td>
</tr>
<tr>
<td>Entity ID / Issuer</td>
<td>https://&lt;proxy hostname&gt;:&lt;port&gt;</td>
</tr>
<tr>
<td>Audience URI</td>
<td>https://&lt;proxy hostname&gt;:&lt;port&gt;</td>
</tr>
</tbody>
</table>

b) Click Submit.

c) For the instance URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Entity ID / Issuer</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Audience URI</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
</tbody>
</table>

d) Click Submit.

4. Optional: If using more than one identity provider, modify the MultiSSO installation exit.

a) Navigate to System Definition > Installation Exits.

The system displays the current list of installation exits.

b) Open the MultiSSO installation exit.

c) Locate the following statement in the Script field.

```javascript
var samlResponseTxt = request.getParameter("SAMLResponse");
if (!GlideSession.get().isLoggedIn() &&
    GlideStringUtil.notNull(samlResponseTxt)) {
    var idpRecord = this.getIdPRecord(request);
    if (idpRecord) {
        SSO_Helper.debug("IdP found based on SAML response: " +
            idpRecord.getUniqueValue());
        return new SSO_Helper(idpRecord.getUniqueValue(), false, null, true);
```
d) Replace the statement with the following code.

```javascript
var samlResponseTxt = request.getParameter("SAMLResponse");
if (!GlideSession.get().isLoggedIn() &&
  GlideStringUtil.notNil(samlResponseTxt)) {
  /* // You have two profiles that use the same IdP entity id it
     cannot use
     // the IdP issuer / entity id from the response otherwise it may
     result in the
     // wrong IdP profile. IdP initiated login will not work
     var idpRecord = this.getIdPRecord(request);
     if (idpRecord) {
       SSO_Helper.debug("IdP found based on SAML response: "+
                       idpRecord.getUniqueValue());
       return new SSO_Helper(idpRecord.getUniqueValue(), false, null,
                              true);
     }*/
  return new SSO_Helper(null, true);
}
```

**Note:** IdP initiated login does not work in this configuration.

e) Click **Update**.

5. Optional: If using more than one company, **Configure users for Multi-Provider SSO.** Update the **sys_id** of the identity provider record depending on the user.

- To configure a user to log in through the Edge Encryption proxy server, use the **sys_id** of the identity provider record that uses the Edge Encryption proxy server URL.
- To configure a user to log in to the instance, use the **sys_id** of the identity provider record that uses the instance URL.

### Login URLs

<table>
<thead>
<tr>
<th>URL</th>
<th>Login destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>https://&lt;instance name&gt;.service-now.com/login_with_sso.do?glide_sso_id=&lt;sys_id of IdP record for the instance URL&gt;</td>
<td>Logs in through the instance.</td>
</tr>
</tbody>
</table>

### Edge Encryption proxy server properties

The `edgeencryption.properties` configuration file located in the `<installation directory>/conf/` folder contains properties used to configure your environment.

You must restart the proxy server after making changes to any proxy server properties. Changes on the instance and changes to the `log4j.properties` do not require a proxy restart.
Target (instance) properties

**edgeencryption.target.host**
Host name for the instance. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. For example, `instancename.servicenow.com`

**edgeencryption.target.port**
Instance port. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed.

**edgeencryption.target.protocol**
Instance protocol. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. Options include:
- http
- https

User account properties

**edgeencryption.target.username**
User name that the proxy uses to log in to the instance. The user must have the edge_encryption role. See [Set up an Edge Encryption user account](#).

**edgeencryption.target.password**
Password that the proxy uses to log in to the instance.

Proxy properties

**edgeencryption.proxy.host**
Server name, IP address, or fully qualified domain name of the computer running the proxy. Along with the port, this property defines the URL used by the client to access the proxy server.

**edgeencryption.proxy.name**
Proxy name. Must be unique for each proxy.

**edgeencryption.proxy.http.port**
Port on the proxy for HTTP communication.

**edgeencryption.proxy.https.port**
Port on the proxy for HTTPS communication.

SSL certificate properties

Restart your proxy if you change the value of any SSL certificate property. The system uses the HTTPS keypair on startup to establish the proxy server connection and determine how the proxy answers client requests.

**edgeencryption.proxy.https.cert.alias**
Alias of the certificate provided by the proxy server to connecting clients.

**edgeencryption.proxy.https.keystore.path**
Path to the keystore that contains the HTTPS certificate.

**edgeencryption.proxy.https.keystore.password**
Password for the keystore that contains the HTTPS certificate.

**Proxy configuration locked property**

**edgeencryption.proxy.locked**
When true, the proxy does not accept encryption configuration changes or encryption rule changes from the instance. Set this property on the production instance after all encryption configurations and rules are final.

**Proxy database properties**

**edgeencryption.db.url**
Proxy database location. Must be the same for all encryption proxies connecting to the same instance.

**edgeencryption.db.user**
User name for accessing the proxy database. Must be the same for all encryption proxies connecting to the same instance.

**edgeencryption.db.password**
Password to access the proxy database. Must be the same for all encryption proxies connecting to the same instance.

**edgeencryption.db.name**
Proxy database name. Must be the same for all encryption proxies connecting to the same instance.
- Default value: edgeencryption

**edgeencryption.db.bootstrap.file**
Bootstrap file for the proxy database. The file is relative to the `sql/` directory. Must be the same for all encryption proxies connecting to the same instance.

**Warning:** Under normal circumstances, do not change this parameter.

**Digital signature properties**

**edgeencryption.proxy.signature.keystore.path**
Path and Java KeyStore file name.

**edgeencryption.proxy.signature.keystore.password**
Password. The default password is `<changeme>`. Change the password after installing the Java KeyStore.

**edgeencryption.proxy.signature.keystore.keyalias**
The key alias given as the `-alias` argument when the RSA key pair is generated.

NAE device keystore properties:

**edgeencryption.nae.retries**
Number of retries to make.

**edgeencryption.nae.enabled**
Setting indicates whether an NAE device is available.

**edgeencryption.nae.server**
Name of the NAE server.

**edgeencryption.nae.port**
Port used by the NAE server.

**edgeencryption.nae.protocol**
Protocol used by the NAE server.

**edgeencryption.nae.keystore.path**
Path to the keystore on the NAE server.

**edgeencryption.nae.keystore.password**
NAE keystore password.

**edgeencryption.nae.username**
User name to use to authenticate with the NAE device.

**edgeencryption.nae.password**
Password to use to authenticate with the NAE device.

**edgeencryption.nae.client.certificate**
Certificate located in the keystore on the NAE server. Set this property to authenticate using a certificate instead of a username and password.

Clear text and static IV properties:

**edgeencryption.customer.assigned.known.cleartext**
Clear text to let the instance verify that all proxies are using the same keys. At startup, the proxy encrypts the clear text and sends the encrypted text to the instance. The instance does not know the clear text, nor are keys sent to the instance. This property must be the same for all proxies.

**edgeencryption.encrypter.static.iv**
Static IV (initialization vector) used in equality-preserving and order-preserving encryption. This property must be the same for all proxies and must be exactly 16 bytes (16 ASCII characters).
Password property

`edgeencryption.encryter.properties.password`
Name of the file in the conf folder that contains a string used within a secure process to obfuscate passwords in the edgeencryption.properties file.
If this property is not set, passwords in your properties file appear in clear text. Leave this property blank until after the proxy configuration has been set up and tested.

Web proxy properties

`edgeencryption.webproxy.host`
Web proxy name or IP address.

`edgeencryption.webproxy.port`
Port on the web proxy.

`edgeencryption.webproxy.user`
User name used to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.

`edgeencryption.webproxy.password`
Password to use to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.

Java KeyStore properties

`edgeencryption.keystore.path`
Path to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out.
Example:

```
edgeencryption.keystore.path = keystore/keystore.jceks
```

`edgeencryption.keystore.password`
Password the proxy uses to connect to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out.

File store property

`edgeencryption.keyfile.directory`
The directory specifies where key files are stored. If using the Java KeyStore or a SafeNet KeySecure keystore, leave this property commented out.
Example:

```
edgeencryption.keyfile.directory=keys
```
If using Unbound Technology keys, uncomment this property and set the value to the keys directory.

Unbound Technology provider properties

edgeencryption.ekm.provider.classname
Internal class name for the implementation.

⚠️ Warning: Do not change this property.

edgeencryption.thirdparty.vendor.library.path
Path to the Unbound API JAR file on the Unbound client machine.

edgeencryption.ekm.provider.rsa.wrapping.key.alias
Wrapping key alias in the Unbound Technology implementation. Must be the same for all proxies.

General configuration properties

edgeencryption.config.poll.interval
Poll interval in seconds. The default setting means that it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect an offline proxy.

⚠️ Warning: Do not change this property. Changing the default setting of the Proxy Poll Interval can result in detection delays when a proxy comes online.

edgeencryption.rules.dir
Folder where the encryption rules are stored on the proxy.

edgeencryption.encryption.order_preserving.cache.enable
Setting determines whether caching is used to support order-preserving encryption types.

edgeencryption.encryption.order_preserving.cache.size
Maximum cache size, in bytes.

edgeencryption.jobs.concurrency
Maximum number of mass encryption jobs that can run concurrently on this proxy.

edgeencryption.jobs.requests_per_second
Number of http job requests per second that can be sent to the instance by this proxy.

edgeencryption.attachments.request.timeout.seconds
Attachment upload request timeout in seconds.

edgeencryption.request.buffer.size
Size of an encryption request. If an encryption request is larger than this size, the excess is saved to disk.
Warning: Do not change this property.

edgeencryption.httpclient.request.buffer.size
Size of the client request. If the client request is larger than this size, the excess is saved to disk.

Warning: Do not change this property.

edgeencryption.proxy.idle.timeout
Time in seconds after which a transaction times out.
- Default value: 300 (seconds)

edgeencryption.proxy.keepalive.interval
Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance.
- Default value: 10 (seconds)
- Minimum value: 5 (seconds)

edgeencryption.register.retry.count
Maximum number of times the proxy pings the instance to try to register.
- Default value: 0 (no limit)

edgeencryption.tokenization.exclusion.list
Encryption patterns cannot tokenize strings found in these fields.

Proxy server performance properties

Proxy server performance properties are not present in the configuration file by default. To change the default values, you must add the properties and restart the proxy server. For more information, see Edge Encryption diagnostics and performance.

edgeencryption.stat.collection.enabled
Enables the collection of statistics used by the Edge Encryption proxy server performance dashboard.
- Default value: true

Add this property and set the value to false to disable the collection of statistics used by the Edge Encryption proxy server performance dashboard.

edgeencryption.stat.collection.interval
Interval length in seconds during which the Edge Encryption proxy server collects statistics. The value cannot be less than 30 seconds.
- Default value: 30 (seconds)
Deprecated proxy encryption properties

edgeencryption.encrypter.default.key128
Specifies the name of the current AES 128 key. An AES 128 key must be available even if it is not used. Must be the same for all proxies.
Perform maintenance of these keys on the instance.

edgeencryption.encrypter.default.key256
Specifies the name of the current AES 256 key. Must be the same for all proxies.
Perform maintenance of these keys on the instance.

edgeencryption.encrypter.key
Specifies the key name for each key and is used to specify the default keys. This is the key alias integrated with the metadata that is included with each encrypted item and, therefore, is stored on the instance. The key name must use lowercase letters.

edgeencryption.encrypter.type
Specifies the type of encryption keystore system.

edgeencryption.encrypter.file
Specifies the path and file name of the text file associated with the key.

edgeencryption.encrypter.password
Specifies the password for accessing the keystore.

CyberArk integration with the Edge proxy server

Use CyberArk to store passwords in a centralized and secure digital vault to secure passwords that were previously stored in clear text and secured by file access, or that were previously encrypted via a second file.

CyberArk AIM (Application Identity Management) prevents unauthorized access by eliminating hard-coded and visible passwords. AIM stores passwords in a digital vault on an independent hardened server, where the passwords are represented as digital credentials. The AIM clients (the Edge proxy servers) use CyberArk digital credentials and access the independent server to retrieve the secured passwords. No passwords are stored on the Edge proxy servers or in the instance.

CyberArk digital vault credentials

You must purchase and configure CyberArk before you can set up CyberArk integration with the Edge proxy server.

To add a credential to CyberArk (which is read by the Edge proxy), set the Platform Name of the credential to Unix via SSH and make sure you either create a Custom credential Name or write down the Auto-generated credential Name. When you configure the Edge proxy to use this credential, the proxy server matches this credential Name to the setting in the proxy.
Each credential entry holds a **Password** that is being secured, as well as a credential **Name** used by an application to access that password.

**Note:** CyberArk credentials are not encryption keys.

**Adding CyberArk during an Edge proxy installation**

The proxy installer includes a new configuration page for a CyberArk integration. This page is optional if you do not want to include CyberArk when installing your proxy with the proxy installer. You can also manually set up and configure CyberArk integration in the configuration file.
The proxy installer also includes a new page for CyberArk protected credentials. This page allows configurations of different properties using a single credential name or multiple credential names. This page is optional if you do not want to include CyberArk when installing your proxy with the proxy installer.
CyberArk password protection

Any password field in the Edge proxy installer that has a CyberArk credential configured in the CyberArk vault and specified on the CyberArk Protected Credentials page of the installer is grayed out and contains the message Protected by CyberArk.
Using a load balancer with the Edge proxy server

You can use a load balancer to balance the load across the proxy servers in your Edge Encryption proxy setup. If the load balancer and proxy servers are using different ports, specify the host name and HTTPS port of the load balancer to enable users to view responses on their browser.

Important: All production environments should include at least two Edge Encryption proxy servers for redundancy.

Edge request processing without a load balancer

If you are not using a load balancer, a request is processed as described below.

1. The user issues a request from a browser.
2. The browser sends the request to the Edge proxy server.
3. The proxy server sends the request to the ServiceNow instance.
4. The ServiceNow instance returns the response to the proxy server.
5. The proxy server adds its own port number in the response header before returning the response to the user's browser.

The request is completed successfully because the user can view the response from the proxy server at the port number specified in the response header.
Edge request processing with a load balancer

However, if you are using a load balancer, the user’s browser communicates directly with the load balancer, not with the proxy server. A request is processed as described below.

Note: The following example uses 1025 as the proxy server port number.

1. The user issues a request from a browser.
2. The browser sends the request to a load balancer Virtual IP (VIP), also known as a Virtual Server.
3. The VIP is configured to point to the proxy server (for example, 10.2.200.148:1025), so the load balancer forwards the request to the proxy server.
4. The proxy server sends the request to the ServiceNow instance.
5. The ServiceNow instance returns the response to the proxy server.
6. The proxy server rewrites the location header in the response with values configured in the properties for risk-servicenow.dev.echonet:1025.
   - Host: edgencryption.proxy.host
   - HTTP port: edgencryption.proxy.http.port
   - HTTPS port: edgencryption.proxy.https.port
7. The proxy server forwards the response to the load balancer with the location header pointing to the proxy server port.

The outcome depends on whether the load balancer and proxy servers are using the same port.
- If the load balancer and proxy servers are using the same port, the request succeeds because the user receives the response from the same port identified in the response header.
- If the load balancer and proxy servers are using different ports, the request fails because the user’s browser communicates only with the load balancer, but the response is on the proxy server.

Solution

You could resolve the issue by simply using the load balancer and all Edge proxy servers on the same port, but this is not an ideal solution. A better solution is to enable the system to know which port the load balancer uses.

The following properties enable the Edge proxy server to reroute response messages to the load balancer if the proxy server and load balancer are using different ports.
- edgeencryption.proxy.rewrite.location.host specifies the host name used to access ServiceNow through the load balancer.
- edgeencryption.proxy.rewrite.location.https.port specifies the HTTPS port used to access ServiceNow through the load balancer.

Configure the load balancer

If the load balancer and proxy servers are using different ports, specify the host name and HTTPS port of the load balancer to enable users to view responses on their browser.

Roles required:
- local or domain administrator on a Windows host
- service user with full file system access on a Linux host

1. Login to the proxy server host as admin, domain admin, or a service user.
2. Navigate to the installation directory for the Edge proxy and select `conf/edgeencryption.properties`.
3. Set the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy.rewrite.location.host</code></td>
<td>If your Edge configuration includes a load balancer to balance the load among proxy servers, rewrites responses to the load balancer so requests can be completed.</td>
</tr>
<tr>
<td></td>
<td>- If there is a load balancer in the proxy setup, specify the host name used to access ServiceNow through the load balancer.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Optional</strong>: If there is no load balancer in the proxy setup, can be set to the host name used by the proxy server.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.rewrite.location.https.port</code></td>
<td>If your Edge configuration includes a load balancer to balance the load among proxy servers, specifies the HTTPS port used to access ServiceNow through the load balancer.</td>
</tr>
<tr>
<td></td>
<td>- If there is a load balancer in the configuration, specify the HTTPS port used to access ServiceNow through the load balancer.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Optional</strong>: If there is no load balancer in the configuration, can be set to the HTTPS port used by the proxy server.</td>
</tr>
</tbody>
</table>

4. Save the file.

Requests can be completed because users can now view responses on their browser.

**Edge Encryption upgrades**

Both instance upgrades and proxy server upgrades require special consideration in an Edge Encryption environment.

**Instance upgrades**

Instance upgrades in an Edge Encryption environment require caution to ensure that Edge controls work properly after the instance upgrade.

During an instance upgrade, you should not add, edit, or delete the following:

- Edge Encryption configurations
- Edge Encryption rules
- Edge Encryption tokenization patterns
- Edge Encryption scheduled jobs
• Edge Encryption key configurations
• Edge Encryption scheduled upgrades
• Edge Encryption blacklist IP configurations

Any scheduled job running during the instance upgrade will not complete. To complete the interrupted job, rerun the job once the instance is upgraded. When you reschedule the job, the processing that occurred before the instance upgrade is not lost, and the job continues to process only the data that has not yet been processed.

**Proxy server upgrades**

Schedule a proxy upgrade to enable the instance to upgrade the Edge Encryption proxy server, or manually upgrade the proxy server at any time.

**Third party libraries**

Third party libraries, such as Gemalto, are lost during instance and proxy server upgrades if they are kept in the same directory. You can perform the following to prevent the loss of third party libraries during upgrades:

1. Manually add the following property to edgeencryption.properties:

   ```
   edgeencryption.ekm.provider.classname = com.snc.edgeencryption.encryption.CloudEdgeNaeKeyProvider
   ```

2. Add the `edgeencryption.thirdparty.vendor.library.path` vendor library location property and set it to `/path/to/jars`.

   For example:

   ```
   edgeencryption.thirdparty.vendor.library.path = /app/servicenow/libs
   ```

3. Copy the SafeNet JARs into that path.

After you install the third party libraries outside of the Edge Encryption installation, they are no longer lost during upgrades.

**Scheduled upgrades**

Schedule an upgrade to allow the instance to upgrade the proxy server at the scheduled time. This functionality is available by default after upgrading. A scheduled upgrade includes these events:

1. The proxy server checks with the instance to see if there is a new version available for upgrade. New versions generally become available when the instance is upgraded.

2. The administrator receives a notification upon logging in when a new version of the proxy server is available.

3. The administrator can Schedule an Edge Encryption proxy server upgrade for each proxy server.

   **Note:** Only users with the security_admin role can create an upgrade schedule through the proxy server.
4. Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the upgrade, the proxy server is offline for only a short time. 

   **Note:** Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of time is determined by your environment and how long it takes to stop and restart the proxy service.

5. During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the new directory. New properties are written to your existing properties file. The following files or directories in your old proxy directory are copied to the new proxy directory.
   - `/conf` directory
   - `/keys` directory
   - `/keystore` directory
   - `java/jre/lib/security/cacerts` file

As a result, your keys, keystores, settings, and certificates are preserved.

   **Note:** Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory are not preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: `<original-proxy-directory>/tmp/upgrade-wrapper/bin`.

---

**Prerequisites for scheduled upgrades**

Before scheduling an upgrade for an Edge Encryption proxy, ensure the following:

1. The `JAVA_HOME` environment variable points to a java installation on the machine that is outside the Edge Encryption proxy’s directory structure.
2. The `JAVA_HOME` environment variable points to a java installation that is at version 1.8_u144 or higher.
3. The `-Djava.io.tmpdir` parameter in the wrapper.conf file of the Edge Encryption proxy points to a directory that is OUTSIDE the Edge Encryption proxy’s directory structure, and the proxy has read/write/execute permissions on the directory. Optionally, you could comment out the parameter entirely so that Java uses its default tmp location.

---

**Manual upgrades**

Instead of creating an upgrade schedule, you can manually upgrade each proxy server through the command line. See [Manually upgrade an Edge Encryption proxy server running on Linux](#) or [Manually upgrade an Edge Encryption proxy server running on Windows](#).

---

**Proxy build status**

You can easily identify whether a proxy server is out of date by navigating to Edge Encryption Configuration > Proxies > All. The status of your proxy build is indicated in the **Proxy build** column by the following colors:

- **Green**
Your proxy server is up-to-date.

**Yellow**
Your proxy server is out-of-date and an upgrade is needed.

**Orange**
Upgrade failed. Your proxy server reverts to the old version to ensure that there is no downtime.

Troubleshoot a failed scheduled proxy upgrade

When a scheduled proxy upgrade fails, the proxy server reverts to the version you are upgrading from. All original data, keys, and configuration files are preserved. This process may take several minutes. Contact ServiceNow Technical Support to ensure a successful upgrade.

To determine the reason for the failure, you can check the **Failure Reason** in the upgrade schedule. In addition, the installation directory for the failed upgrade is maintained so that log files are available for troubleshooting.

**Note:** Before deleting any extra proxy directories, always confirm which directory is current by reviewing the log files. If the log files have recent activity, the proxy might be connected to your instance.

If a scheduled proxy upgrade fails repeatedly, you can manually upgrade your proxy server. See *Manually upgrade an Edge Encryption proxy server running on Linux* and *Manually upgrade an Edge Encryption proxy server running on Windows*.

Java minimum requirements

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or later

**Note:** Java 8 update 131 (8u131) is not supported.

**Note:** Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see [Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower](#).

**Mixed proxy-version environments**

Although an environment running old versions of the proxy server with up-to-date versions of the proxy server is not recommended, it is supported if all proxy servers are within the same version family as your instance. For example, if you have an instance on the Orlando release, your environment supports proxy servers from any Orlando patch or hotfix. However, the following limitations apply:

- If one proxy server supports functionality that another proxy does not support, you will see inconsistent behavior, depending on which proxy server is used.
- If a proxy server is out-of-date, it may not include recent security enhancements.

If a proxy server from a previous release is registered with a newer release of the instance, you will receive regular notifications that the proxy server is out-of-date. To ensure an optimal and secure environment, ServiceNow recommends always upgrading your proxy server to the most recent version of the software supported by your instance.

**Schedule an Edge Encryption proxy server upgrade**

Create an upgrade schedule to enable the instance to upgrade an out-of-date proxy server. To schedule an upgrade, you must be logged in to your instance through the proxy server.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see [Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower](#).

Role required: security_admin

Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the upgrade, the proxy server is offline for only a short time.
Note: Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of time is determined by your environment and how long it takes to stop and restart the proxy service.

During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the new directory. New properties are written to your existing properties file. The following files or directories in your old proxy directory are copied to the new proxy directory.

- /conf directory
- /keys directory
- /keystore directory
- java/jre/lib/security/cacerts file

As a result, your keys, keystores, settings, and certificates are preserved.

Note: Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory will not be preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: <original-proxy-directory>/tmp/upgrade-wrapper/bin.

If multiple proxy servers are out-of-date, you must schedule an upgrade for each proxy server individually.

Note: Avoid hosting multiple proxy servers on the same machine. However, if your environment includes this configuration, do not schedule upgrades to multiple proxies on the same machine at the same time.

1. Navigate to Edge Encryption Configuration > Proxies > Upgrade Schedules.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>Proxy server being upgraded.</td>
</tr>
<tr>
<td>Target version</td>
<td>Version to which you are upgrading your proxy server. This value is read-only and set to the most up-to-date proxy version available for your instance.</td>
</tr>
<tr>
<td>Scheduled Start Time</td>
<td>Date and time on which to start the upgrade.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the scheduled upgrade is active. If this field is not selected, the upgrade will not perform on the scheduled date and time.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the upgrade. This value is read-only. Possible statuses include: Pending, Running, Complete, Failed</td>
</tr>
</tbody>
</table>
4. Click Submit.

After an upgrade is executed, you can review the upgrade details to learn more about it. If your upgrade failed, review the Failure Reason to determine next steps.

**Upgrade details**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Version</td>
<td>The version that the server was upgraded from.</td>
</tr>
<tr>
<td>To Version</td>
<td>The version that the server was upgraded to.</td>
</tr>
<tr>
<td>Actual Start Time</td>
<td>Time that the upgrade began.</td>
</tr>
<tr>
<td>End Time</td>
<td>Time that the upgrade ended.</td>
</tr>
<tr>
<td>Failure Reason</td>
<td>Reason that the upgrade failed.</td>
</tr>
</tbody>
</table>

**Manually upgrade an Edge Encryption proxy server running on Linux**

Update a proxy running on Linux.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see *Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower*.

Role required: security_admin or local administrator on the host machine

1. Copy the Edge Encryption update-archive file to the installation directory.
2. Change to the installation directory.
3. Run the following command:

   ```sh
   java -jar edgeencryption-dist-<version>-linux-x86-64.jar -m dist-upgrade -c <proxy directory>
   ```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy directory</td>
<td>The directory in the installation directory where the proxy was initially installed. This directory is created by the install.</td>
</tr>
</tbody>
</table>

   If you want to see the help screen, execute this command without arguments: `java -jar edgeencryption-dist-<version>-linux-x86-64.jar`

   A new proxy directory is created with a current timestamp. A backup of the old proxy directory is maintained as backup.dist-upgrade_timestamp in the new proxy installation directory. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

4. Check the proxy log in the new directory and the instance to verify that the new proxy is running.

**Manually upgrade an Edge Encryption proxy server running on Windows**

Update a proxy running on Windows.
If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Role required: security_admin or local administrator on the host machine

1. Download the Edge Encryption proxy-update archive file to the installation directory.
2. Start the Windows cmd terminal program with administrator privileges.
3. Change to the installation directory.
4. Run the following command:
   ```
   java -jar edgeencryption-dist-<version>-all.jar -m dist-upgrade -c <proxy directory>
   ```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy directory</td>
<td>The directory in the installation directory where the proxy was initially installed. This directory is created by the install.</td>
</tr>
</tbody>
</table>

If you want to see the help screen, execute this command without arguments: `java -jar edgeencryption-dist-<version>-all.jar`

A new proxy directory is created with a current timestamp. A backup of the old proxy directory is maintained as `backup.dist-upgrade_timestamp` in the new proxy installation directory. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

5. Check the proxy log in the new directory and the instance to verify that the proxy has been updated and is running.

Roll back an Edge Encryption proxy server upgrade

If an upgrade fails when using the scheduled upgrade feature in the Orlando release, the proxy server will automatically roll back to the old version. The old proxy server is stored unmodified in a backup directory.

If you would like to roll back a manual upgrade, you can follow these steps.

1. Shut down the proxy.
2. Delete the new proxy directory.
3. Rename the backup directory to the proxy name.
   ```
   The backup directory is in the proxy installation directory with the name `<proxy name>_backup`
   ```
4. Start the proxy.
5. Check the proxy log and the instance to verify that the proxy is online.

Edge Encryption configuration

After the Edge Encryption proxy server is installed and running, manage Edge Encryption through the proxy server.
You must complete all the steps in Edge Encryption installation before creating encryption configurations and encryption patterns on the instance.

**Note:** To access the Edge Encryption configuration, you must log in through the proxy server and elevate to the security_admin role.

### Rotate encryption keys

Perform encryption key rotation from the instance. Add a new key, change the default key assignment, and then schedule a mass key rotation or a single key rotation.

Before setting an encryption key as the default key, make the key available to each proxy. This ensures that the proxies have the key to encrypt data when the key is assigned as the default key. All proxies must have access to a key before that key can be assigned as the default key.

**Warning:** Before deleting a key from the proxy, set up and run a mass key rotation job to ensure that no data on the instance uses the key. If any information is still encrypted with that key, you cannot decrypt the information after you delete the key.

### Edge filtering and sorting behavior

Whenever you change default keys, be sure to perform a key rotation (either mass or single key rotation). Otherwise, you may receive unexpected results when sorting and filtering records. For example, consider the following scenario:

1. You create encrypted records using one encryption key.
2. You create a new key and set it as default.
3. You create a new set of encrypted records using the new encryption key.

If you filter by any encrypted field when connected through the Edge proxy, all records may not be filtered out correctly, or records may appear unexpectedly. The filter works only for records encrypted using the current default key. The records encrypted using the previous default key still appear in the list view.

If you sort by any encrypted field when connected through the Edge proxy, you see two groups of records with the same human readable text in the encrypted field.

### Schedule a single key rotation job

Schedule a job to find data encrypted using a specified key alias and then re-encrypt the data with the current default encryption key. The data is decrypted before it is re-encrypted with the default key.

Role required: security_admin

Before scheduling this job, update the default key in Edge Encryption Configuration > Encryption Key Configuration > Set Default Keys.

1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Single Key Rotation.
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Single Key Rotation.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Key</td>
<td>Enter the key to be retired. Verify that this key is no longer the default key in Edge Encryption Configuration &gt; Encryption Key Configuration &gt; Set Default Keys.</td>
</tr>
<tr>
<td>Estimate record count</td>
<td>Total estimated number of records to process. Not available when running a single key rotation.</td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. This field is read only and active. To learn more about audited fields, see Auditing.</td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Not available when running a single key rotation.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save. Estimate Record Count is not supported when processing audited fields.

**Schedule a mass key rotation job**

Schedule a job to find data encrypted with any previous key, and then re-encrypt the data with the current default encryption keys. The data is decrypted before it is re-encrypted with the current default key.

Role required: security_admin

1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Mass Key Rotation.
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Mass Key Rotation.</td>
</tr>
<tr>
<td>Estimate record count</td>
<td>Total estimated number of records to process. Not available when running a mass key rotation.</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. This field is read only and active. To learn more about audited fields, see Auditing.</td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Not available when running a mass key rotation.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.

**Estimate Record Count** is not supported when processing audited fields.

**Schedule an attachment key rotation job**

Schedule a job to find attachments encrypted using a specified key alias, and then re-encrypt the attachments with the current default encryption key. The attachment is decrypted before it is re-encrypted with the default key.

Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Attachment Key Rotation**.
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Attachment Key Rotation</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.
4. To see an estimated count of records to be updated, click **Estimated Record Count**.
5. To run the job immediately, click **Execute Now**.

**Encrypt fields using encryption configurations**

Encrypt fields by creating encryption configurations.
To configure Edge Encryption, you must be connected to the instance through the proxy. Test all changes on a non-production instance before making the changes to the production instance.

**Define encryption keys**

After setting up one or more proxies and configuring a default encryption key, the instance verifies that the keys are available to all proxies. You cannot make an encryption key the default key unless all proxies have the key. Once a default key is defined, you can create encryption configurations.

**Assign fields and attachments to be encrypted**

Assigning fields and attachments to be encrypted means assigning an encryption type to the field or attachment. Before marking a field as encrypted, evaluate these issues.

- Determine what system features might be impacted.
- Examine all scripts for use of the field.
- Make any desired adjustments to the field size. After a field has been configured for encryption, the field size cannot be changed.

Marking a field to be encrypted expands the field size to store the encrypted data. The process of expanding the field size can take a long time, depending on the number of records in the table.

**Create an encryption configuration**

Select the fields to be encrypted and identify the encryption type.

Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Edge Encryption Configurations > Create New.**
2. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table that contains the field to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select <strong>Column.</strong></td>
</tr>
</tbody>
</table>
### Table: Encryption Configuration Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column</td>
<td>The field to be encrypted. Appears only when the Type is Column. Only String, Date, Date/Time, Journal, Journal Input, and URL fields are supported.</td>
</tr>
<tr>
<td></td>
<td>- <strong>String and URL fields</strong>: You can add an encryption configuration to either a parent table or a child table.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Date and Date/Time fields</strong>: You can add an encryption configuration to a parent table only. You cannot add a new encryption configuration to a child table.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use.</td>
</tr>
</tbody>
</table>

#### Note:
A specific table and field combination can have only one active configuration at a time.

3. Click **Submit**.

After you add the encryption configuration record, you can create an encryption job to encrypt existing data. If you do not run an encryption job, Edge encrypts the existing data the next time the data changes.

### Deactivate an encryption configuration

After configuring a field or a table's attachments to be encrypted, you can stop encryption by deactivating the encryption configuration. After deactivating encryption, you can run a Decryption job for fields or an Attachment Decryption job for attachments to remove the encrypted data from the instance.

Role required: security_admin

#### Warning:
Deactivating an encryption configuration does not delete the encryption record and the encryption type cannot be changed.

1. Navigate to **Edge Encryption Configuration > Edge Encryption Configurations > All**. The **Edge Encryption Configurations** list is shown.
2. Click on the encryption configuration to be deactivated. The **Edge Encryption Configuration** form is shown.
3. Click on the **Active** box. The **Active** box is clear.
4. Click **Update**.
The Edge Encryption Configurations list is shown.

You can run a Decryption or Attachment Decryption job to decrypt data on the instance. If you do not run a job, the encrypted data is decrypted the next time it is changed.

**Schedule an encryption job**

You can schedule a job to find and encrypt any unencrypted data in a specified field, using the default encryption key configured for the field. If you do not create an encryption job after configuring a field for encryption, only new values are encrypted.

Role required: security_admin

1. Navigate to **Edge Encryption Configuration** > **Encryption Configurations** > **All**.
2. Click the field that you want to schedule an encryption job for.

   The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for any previous job executions.
4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Encryption</strong>.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Estimated record count</td>
<td>Total estimated number of records to process. Populates after selecting <strong>Estimate Record Count</strong>.</td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. To learn more about audited fields, see <strong>Auditing</strong>.</td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Populates after selecting <strong>Estimate Record Count</strong>. This field is only visible when <strong>Process Historical Records</strong> is selected.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select **Save**.
6. To see an estimated count of records to be updated, click **Estimate Record Count**.
7. To run the job immediately, click **Execute Now**.

**Schedule a decryption job**

You can schedule a job to decrypt data in an encrypted field, to store clear data in the instance.

[Note: You must mark the encryption record for the field as inactive (clear the **Active** box) in order to run the decryption job.]

Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All.**
2. Click the field that you want to decrypt.
3. Under **Related Links**, click **Schedule Mass Decryption Job**.

The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Decryption</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Estimated record count</td>
<td>Total estimated number of records to process. Populates after selecting <strong>Estimate Record Count.</strong></td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. To learn more about audited fields, see <strong>Auditing.</strong></td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Populates after selecting <strong>Estimate Record Count.</strong> This field is only visible when <strong>Process Historical Records</strong> is selected.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select **Save**.
6. To see an estimated count of records to be updated, click **Estimate Record Count.**
7. To run the job immediately, click *Execute Now*.

**Encrypt attachments using standard encryption**

You can encrypt attachments for specific tables.

All attachments to a table use the same encryption type. Encrypted attachments are not searched when performing a text search. Only the standard encryption types are allowed for attachments. The order preserving or equality preserving encryption types are not allowed.

For a session bypassing the Edge Encryption proxy:

- On a record with attachment encryption activated:
  - The user can see that there are attachments and the attachment names.
  - The user cannot open or download the attachments.
  - The user cannot add new attachments.

- On a record without attachment encryption activated:
  - The user can open and download existing attachments.
  - The user can add new attachments.

For a session using the encryption proxy, the user can open and download existing attachments and add new attachments.

**Configure attachment encryption**

Select the tables whose attachments are to be encrypted and identify the encryption type.

Role required: security_admin

1. Navigate to *Edge Encryption Configuration > Edge Encryption Configurations > Create New*.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table whose attachments are to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select Attachment.</td>
</tr>
<tr>
<td>Column</td>
<td>The table field to be encrypted. This field appears when the Type is Column, and not when Type is Attachment.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use. For attachments, only Standard AES128 and Standard AES256 are allowed.</td>
</tr>
</tbody>
</table>

3. Click *Submit*.

After the encryption record has been added, you can create an attachment encryption job to encrypt existing attachments. If you do not run an attachment encryption job, the system encrypts new attachments when you attach them.
Schedule an attachment encryption job

You can schedule a job to find and encrypt any unencrypted attachments for a specified table, using the default encryption key configured for the table.

Role required: security_admin

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the table you want to schedule an encryption job for.

   The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Encryption.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

Schedule an attachment decryption job

You can schedule a job to decrypt any encrypted attachments for a specified table, to store clear attachments in the instance.

**Note:** You must mark the encryption record for the table as inactive (clear the Active box) before the decryption job runs, otherwise, nothing happens.

Role required: security_admin

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the table with the attachments that you want to decrypt.

   The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Decryption.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
</tbody>
</table>
5. Click the menu icon in the form header and select **Save**.
6. To see an estimated count of records to be updated, click **Estimate Record Count**.
7. To run the job immediately, click **Execute Now**.

### Change a field or attachment's encryption type

You can change a field or attachment's encryption type by selecting a new encryption type in the existing encryption configuration record. A specific table and field combination can only have one active configuration at a time.

Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Encryption Configurations > All**. The **Edge Encryption Configurations** list is shown.
2. Open the record for the encryption configuration to be changed.
3. Click the **Encryption type** dropdown and select a new encryption type.

   **Note:** For attachments, only Standard AES128 and Standard AES256 are allowed.

4. If needed, run an **encryption** or **attachment encryption** job.
   
   It is not necessary to run an encryption job. If you do not run an encryption job, the field or attachment is encrypted using the new encryption type the next time the field or attachment is changed.

### Tokenize strings using encryption patterns

You can replace string patterns with tokens before they are sent to and stored in the instance.

To use encryption patterns, you must install and set up a MySQL database in your network. This is the same database used for order-preserving encryption. To create or edit encryption patterns, you must be connected to the instance through the proxy.

Role required: security_admin

You can use base system patterns, or create your own patterns. Base system patterns are advanced patterns. Encryption patterns include the following limitations.

- A pattern of all alpha characters is not allowed.
- The minimum pattern size is five characters. You can change this setting using a system property.
- The * and + quantifiers are forbidden in encryption patterns.
- Encryption patterns match complete words, not parts of strings embedded in a larger string. Words are defined by spaces and characters not available for inclusion in a pattern.
- If the same string is sent to the instance multiple times, it is replaced with the same token.
- Text search on exact matches is supported. The query string is exchanged with a token when sent to the instance, the search is performed on tokens, and when the search results are
returned to the proxy server, the tokens are replaced with the clear text. Features such as stemming are not supported.

When using patterns, the clear text never leaves your network. When the proxy server matches a pattern in a request going to the instance, the proxy replaces the string with a token of the same size. The token is sent to instance instead of the clear text string. When the response is sent from the instance to the proxy server, the proxy replaces the token with the string. When viewed through the proxy server, the string displays as clear text.

**Note:** Encrypted fields are not checked for encryption patterns.

1. Navigate to **Edge Encryption Configuration > Encryption Patterns > Create New**. Alternatively, you can navigate to **Advanced Patterns** to activate or edit a preconfigured pattern.
2. Enter the pattern name.
3. Define the **Edge pattern input type**.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic</td>
<td>A series of character types. In the Basic Pattern Input tab, click Add and select a character type. The Sample pattern displays the pattern as characters are added. Click New Block to move the next character to the next line. This enables you to group characters in a long pattern. Click X to delete the last character in the pattern.</td>
</tr>
<tr>
<td>Advanced</td>
<td>A Java RegEx expression. If advanced is selected, you cannot change the input type back to basic. In the Sample match field, enter a sample pattern to test the RegEx expression. In the Pattern field, enter a Java RegEx expression. Click Validate to verify that the expression matches the sample pattern.</td>
</tr>
</tbody>
</table>

The input type defines how you are going to enter the pattern. It does not impact how the pattern is used.

4. Click **Submit**.

**Repair or recover order-preserving encrypted data**

If you have the security-admin role, you can schedule jobs performed by the Edge Encryption proxy to repair or recover fields that use order preserving encryption.

You can schedule jobs to:

- Repair order tokens.
- Recreate the proxy database.

Running these jobs can be a time-consuming operation which might impact the performance of the Edge Encryption proxy. Schedule these jobs at a time when no users or a minimum set of users are using the system, such as midnight on the weekend.
Schedule an order token repair job
You can schedule a job to find and repair fields where the order token is missing.
Role required: security_admin
Use these jobs to repair individual fields in a table or to repair all fields using order preserving encryption. Run this job when the proxy database has been offline while the instance has been running, which results in order preserving fields that are missing order tokens.
1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Order Token Repair.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Order Token Repair</td>
</tr>
<tr>
<td>All fields</td>
<td>Select this check box to repair all tables.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.
4. To see an estimated count of records to be updated, click Estimated Record Count.

Schedule a proxy-database recovery job
Run this job when the proxy database has lost data. This job finds all records that have been encrypted with a token (order preserving encryption type) and sends them to the proxy so that the proxy database can be rebuilt.
Role required: security_admin
1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Database Recovery.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Database Recovery</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run this job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.
4. To see an estimated count of records to be updated, click Estimate Record Count.
Blacklist requests from an IP address in your network

Because the Edge Encryption proxy server resides in your network, it may be subject to vulnerability scans by your network software. To prevent IP scanner or other requests from being forwarded to your ServiceNow instance, you can blacklist IP addresses, IP ranges, or network masks. Any connection to the proxy server from a blacklisted address is terminated and is not forwarded to your instance.

Role required: security_admin

To blacklist an IP address, you must be logged in to your instance through the proxy server.

**Important:** Ensure that you understand your network topology before blacklisting IP addresses in your network. If an IP address is added to the blacklist, any user with that IP address will be blocked from accessing the Edge Encryption proxy server.

1. Navigate to **Edge Encryption Configuration > Maintenance > Blacklist IP Addresses.** The Encryption Proxy IP Blacklists (edge_encryption_ip_blacklist) list view opens.
2. Click **New.**
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>The Edge Encryption proxy server that is prevented from forwarding requests from blacklisted addresses.</td>
</tr>
</tbody>
</table>
| IP, IP range, or net-mask | Requests from this IP address, range, or network mask are not forwarded to your ServiceNow instance. Example values include:  
  - IP address: 10.10.10.5  
  - IP range: 10.10.10.1-15  
  - Network mask: 10.10.10.0/24 |
| Active                 | Whether the record is active. Only IP addresses from active records are prevented from sending requests to the instance. |
| Description            | Description of the blacklist record.                                         |

4. Click **Submit.**
5. Repeat these steps for all other proxies for which an IP address should be blacklisted.

The Edge Encryption proxy server terminates any connection from a blacklisted IP addresses, range, or network mask and cannot forward the request to the instance.

Encrypt data from a record producer

Record producers allow end users to create task-based records, such as incident records, from the Service Catalog and Service Portal. If a record producer attempts to insert data into a field marked for encryption, an invalid insert message displays and the data is not saved to the field. To configure your Edge Encryption proxy server to allow inserts from a record producer, create encryption rules from the record producer record.

Role required: security_admin

Encrypting data from a record producer requires an encryption configuration defined for the target field. Check that you have created an encryption configuration for the target field and table before creating an encryption rule from a record producer. See **Create an**
encryption configuration. To encrypt attachments from a record producer, Configure attachment encryption.

1. Log in to your instance through the Edge Encryption proxy server.
2. Navigate to Service Catalog > Catalog Definitions > Record Producers.
3. Create a record producer record or open an existing record producer record.

Two inactive encryption rules are automatically created to encrypt data sent from the record producer to the field marked for encryption.

<table>
<thead>
<tr>
<th>Encryption rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;RecordProducerName&gt;</code></td>
<td>Rule created to process POST parameters from the Service Catalog and map variables to fields in the instance.</td>
</tr>
<tr>
<td><code>&lt;RecordProducerName&gt;Json</code></td>
<td>Rule created to process a JSON payload from the Service Portal and map variables to fields in the instance.</td>
</tr>
</tbody>
</table>

5. Activate the necessary encryption rules created by the record producer.
   a) Navigate to Edge Encryption Configuration > Rules > All.
   b) Depending on where the record producer will be used, open the associated encryption rule created by the record producer and select the Active flag.
      If using the record producer in the Service Catalog, activate the `<RecordProducerName>` encryption rule. If using the record producer in the Service Portal, activate the `<RecordProducerName>Json` encryption rule.

6. Optional: Examine the Encryption rule Action field and add any necessary field names or statements.

   If a record producer directly maps a variable to a field in a table, the encryption rule automatically maps the variable to the correct field. However, if a variable is indirectly mapped through various scripts on the platform, you may need to update the rules to map each variable to the correct field.

   The below encryption rule was created from the Report Outage record producer and processes POST parameters from the Service Catalog to map variables to fields in the instance. Replace 'FILL ME IN' with the target field.
The below encryption rule was created from the Report Outage record producer and processes a JSON payload from the Service Portal to map variables to fields in the instance. Add additional statements to map any scripted variables to the target fields.
<table>
<thead>
<tr>
<th>Name: ReportOutage.json</th>
<th>Request type: HTTP Post</th>
</tr>
</thead>
</table>

**Condition**

```javascript
function ReportOutageJSONCondition(request) {
  if (request.path.indexOf('/servicecatalog/items') > -1 && request.path.split('/')[1] == '3c1f0d4ad1b203952c294f5f46f8') {
    return true;
  }
  return false;
}
```

**Action**

```javascript
function ReportOutageJSONAction(request) {
  var tableName = 'incident';
  // Some fields are set in script, additional parameter lines may need to be added
  // current.comments is accessed via script from notes; // assignment to current.comments does NOT replace existing values
  // current.short_description is accessed via script from short_description,
  // current.description is accessed via script from current.item_description;
  // current.item_id is accessed via script from ps.getter(id);
  var isNextElement = request.psNext mannenishContent();
  for (var jsonElementIter = jsonContent.getIterator('variables'), jsonElementIter.hasNext(); ) {
    jsonElementIter.next();
    jsonElement.valueFor(tableName, jsonElement.getName());
  }
}
```

**Order:** 100
When the payload from the record producer is examined, the error_message element contains the value for the short_description field. By adding the following statement, you can map the scripted variable error_message to the short_description field.

```javascript
if (jsonElement.getName() == 'error_message')
    jsonElement.valueFor(tableName, 'short_description');
```

The value of the Action field becomes:

```javascript
function ReportOutageJsonAction(request) {
    var tableName = 'incident';
    // Some fields are set in script, additional parameter lines may need to be added
    // current.comments is accessed via script from notes; // assignment to current.comments does NOT replace existing values
    // current.short_description is accessed via script from short_description;
    // current.description is accessed via script from current.short_description;
    // current.caller_id is accessed via script from gs.getUserID();
    var jsonContent = request.getAsJsonContent();
    for (var jsonElementItr = jsonContent.getIterator('variables'); jsonElementItr.hasNext();)
        var jsonElement = jsonElementItr.next();
        if (jsonElement.getName() == 'error_message')
            jsonElement.valueFor(tableName, 'short_description');
        else {
            jsonElement.valueFor(tableName, jsonElement.getName());
        }
}
```

The two encryption rules enable the record producer to insert values into fields marked for encryption from either the Service Catalog or Service Portal.

**Define a custom encryption rule**

It may be necessary to identify and encrypt sensitive information in HTTP requests on the way to your instance. You can write encryption rules to identify, interpret, and encrypt data in such requests, mapping fields in the request to table-field names on your instance.

**What is an encryption rule**

Encryption rules are scripts executed on the Edge Encryption proxy server to map fields in a request to fields in a table on your ServiceNow instance. An encryption rule tells the Edge Encryption proxy server how to encrypt data in custom payloads.

*Note:* Encryption rules only support ECMAScript 3 and below.

**When to use custom rules**

A set of encryption rules is included as part of the Edge Encryption plugin. These rules handle core platform use cases such as editing a field from the list edit form, updating a record from the record form, managing direct web services, and processing data from the REST API. Applications created using standard forms and lists should work without custom encryption rules.
If you develop scripted processors, scripted web services, scripted REST APIs, UIs, or Ajax scripts that contain data that should be encrypted, you must write encryption rules to find and map the data to Glide table-field names.

**Format of an encryption rule**

Rules include three parts:

- **Condition**: Identifies the type of request.
- **Action**: Maps fields in the request to fields in a table, encrypting values that map to fields with encryption configurations defined.
- **Order**: Priority of the rule. The lowest priority rule with a satisfied condition is the only rule that runs. Like business rules, rules run from lowest to highest.

Except for attachment requests, when an HTTP request hits the Edge Encryption proxy server, the Edge Encryption proxy server evaluates all encryption rule conditions in priority order until either all conditions return false, or one condition returns true. When a condition returns true, the action is executed on the request and the result is forwarded to the instance. No other conditions are evaluated. As a result, encryption rule conditions should be as specific as possible. A generic rule might evaluate as true for a request meant to be processed by another rule, causing the request to be processed by the wrong action. If a generic condition is unavoidable, the rule should be marked with a high-order value so that more specific rules are evaluated first.

**Guidelines for creating encryption rules**

Creating efficient, optimized encryption rules can reduce processing time for script validation.

**Overall guideline**: When rules get very long, do your best to minimize the number of blocks and break the rules apart whenever possible. Ideally, custom rules should apply to specific use cases, rather than encompassing several cases, with `if`s or switch statements in the action script.

1. **Split rules whenever possible.** For example,
   - Create different rules for different tables and ensure that each rule runs only on its respective table.
   - Create different rules for each record producer you are targeting, or at least for each subset of record producers. Instead of one rule targeting dozens of `sys_ids`, you could create several different rules targeting smaller subsets of record producers, or even create one rule per `sys_id`.

   **Note**: Creating multiple rules requires more maintenance. The trade-off is that multiple, simpler rules can be validated more efficiently than longer, more complex rules.

2. **Minimize the number of blocks.** Because the processing engine scans each block while evaluating scripts, a large number of blocks causes delays in validation. For example,
   - Replace all `if` blocks with an array lookup, and replace all blocks in the array lookup with just one `if` block.
   - Combine `if` blocks whenever it is possible to group them.
Encryption rule APIs

Encryption rules are written in JavaScript and utilize Edge Encryption APIs to locate and encrypt sensitive information in the body of a request. The API uses expressions similar to xPath to navigate through both JSON and XML content.

Edge Encryption APIs process the request off the stream as it is being written to the output stream. Stream parsing allows encryption rules to be network performant. However, fetching and parsing content from the body multiple times could lead to unexpected results. To account for this, requests should be processed by the action in a single pass.

When creating encryption rules, you cannot use Glide APIs, script includes, business rules, or any global parameters such as `current`. Because the rules are created for HTTP objects, a global request object is available.

When creating encryption rules, you cannot use APIs from the white list manager or scoped applications.

Error handling

If an encryption rule condition or action throws an exception, check the proxy log for troubleshooting information.

Inspect the client request

Before creating a custom encryption rule, you must determine the format of the client request entering the Edge Encryption proxy server.

Because encryption rules iterate over client requests and determine what, if anything, needs to be encrypted, you must understand the type of request you are creating a rule for. The format of the client request determines the structure of your encryption rule and the APIs available for use in the rule.

1. Inspect the client request.

   Depending on the source of the request, the following tools are available to inspect the request and determine the format.

<table>
<thead>
<tr>
<th>Source of request</th>
<th>Available tools</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client browser</td>
<td>Use the developer console in your browser to inspect the client request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>· Firefox Network Monitor</td>
</tr>
<tr>
<td></td>
<td>· Chrome Network Panel</td>
</tr>
<tr>
<td>Third-party/external source</td>
<td>Use an HTTP protocol analyzer to inspect the request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>· Wireshark</td>
</tr>
<tr>
<td></td>
<td>· HTTP Scoop</td>
</tr>
<tr>
<td></td>
<td>Alternatively, you can often use documentation for the external source to determine the format of the request.</td>
</tr>
</tbody>
</table>

2. From the client request, inspect the packet and determine:
   - The client request method
- The URL path of the request
- The URL parameters
- The POST parameters, if any
- The format of the request body, if included

Inspecting the request provides an understanding of the fields you need to filter for and iterate over in your encryption rule. To understand the fields in the request object, see request.

Create an encryption rule

Encryption rules are used by the proxy to find content in HTTP requests that should be encrypted.

Role required: security_admin

Before creating an encryption rule, you must Inspect the client request to determine the format.

To create or edit encryption rules, you must be connected to the instance through an encryption proxy.

1. Navigate to Edge Encryption Configuration > Rules > Create New.
2. In the Name box, enter a name.
3. In the Request Type, select an HTTP method.
   - HTTP Post
   - HTTP Get
   - HTTP Put
   - HTTP Patch
   - HTTP Delete

   Note: Pre-Jakarta instances allow only HTTP Get and HTTP Post methods.
4. In the Condition box, enter a JavaScript statement defining when the rule should run.
5. In the Action box, enter a JavaScript function to be executed when the condition is true.
6. In the Order box, enter the relative priority of the rule.
7. Click Submit, or save the form.

Encryption rule conditions

Encryption rule conditions determine if the rule should be executed.

An encryption rule condition must return true if the rule is to handle the HTTP request; otherwise, it must return false.
As you build your condition, keep in mind that only one rule is executed per request. As a result, the condition must be as general or specific as needed to run under the intended circumstances.

**Note:** Be careful when performing checks on content in the condition. Excessive checks can be expensive for the proxy server and may cause increased latency when handling complex requests.

The condition can use the method type, content type, URL path, or any URL query string parameters to determine if the rule should handle the request. The condition has access to these fields via the `request` object. Be sure that, prior to creating an encryption rule condition, you have inspected the client request and understand the conditions needed to trigger the rule.

**Note:** To build efficient rules, consider easy ways to rule out requests that you do not want to be evaluated by a rule. Build your condition to return false for those requests first. This method increases performance and quickly routes the request to the correct rule faster.

*Encryption rule objects and APIs* are available to encryption rule conditions.

### Example using path and postParams

```javascript
/*This condition checks if the request coming in has a path ending in "/sample_processor.do" and if a post parameter exists in that request called myPostParam */

function SampleCondition(request) {
    if (endsWith(request.path, "/sample_processor.do") &&
        request.postParams.myPostParam) {
        return true;
    } else {
        return false;
    }
}
```

### Example using urlParams and contentType

```javascript
/* This condition checks if a url parameter exists in the query called myUrlParam and if the content type contains 'xml' (if so, you can expect the body to be an XML payload). Then, it checks if the xml payload contains myXmlTag */

function SampleCondition2(request) {
    if (request.urlParams.myUrlParam &&
        request.contentType.indexOf('xml') > -1 &&
        request.xmlContains('myXmlTag')) {
        return true;
    } else {
        return false;
    }
}
```

### Encryption rule actions

An encryption rule maps fields in a client request to fields in a table on your instance and identifies fields marked for encryption.

An encryption rule action only runs when the encryption rule condition returns true. An encryption rule identifies the data to be encrypted in your request payload. Because the rule iterates over the content in the request object, you must understand the form and structure of your request.
body and determine what in the request needs to be encrypted. The data to be encrypted might be located within:

- A POST or URL parameter.
- JSON or XML content within a POST or URL parameter.
- A JSON payload.
- An XML payload.

Before writing an encryption rule action, be sure to:

- Inspect the client request.
- Identify where the sensitive data is located in the request object.
- Determine the field and table name to insert data into, or understand how to dynamically pull this from the request.

Encryption rule objects and APIs are available to encryption rule actions and conditions.

**Encryption rule objects and APIs**

Use encryption rule APIs to parse and encrypt values in requests moving through the Edge Encryption proxy server to the instance.

The APIs available for your encryption rule depend on the format of the request object. For example, if the contentType parameter of the request object is XML, you can use the XML APIs to parse and encrypt values in the payload. After you determine the type of object in your request, you can build an encryption rule using the available APIs.

Encryption rule APIs are available in both encryption rule condition and action scripts. The `request` object is a global object available in Edge Encryption rule action and condition scripts. The `request` object is a JavaScript object that represents the client request coming in to the Edge Encryption proxy server. You must build your encryption rule to parse the request object, map request object values to fields in a table on the instance, and encrypt any sensitive data in the request object.

The request object includes the following attributes and data from the client request:

### Request object fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The path portion of the URL.</td>
</tr>
<tr>
<td>requestMethod</td>
<td>GET, POST, PUT, PATCH, DELETE.</td>
</tr>
<tr>
<td>contentType</td>
<td>The Content-Type header field.</td>
</tr>
<tr>
<td>urlParams</td>
<td>The parameters in the query string. This can also be evaluated to a String.</td>
</tr>
<tr>
<td>postParams</td>
<td>If this is a form post, this contains the post parameters.</td>
</tr>
</tbody>
</table>

**request - getAsJsonContent()**

Returns the request as an iterable object of type `JsonNode`.

This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the contentType field on the request object.
Once the request is returned as a `JsonNode` object, you can use the `JSON APIs` to iterate over the object and encrypt fields.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request as an iterable <code>JsonNode</code>.</td>
</tr>
</tbody>
</table>

**request - getAsXmlContent()**

Returns the request content as an iterable object of type `XMLContent`.

This method is available only in an Edge Encryption rule if the request body is a valid XML payload. If you are not sure what format the request body includes, check the `contentType` field on the `request` object.

Once the request is returned as an `XMLContent` object, you can use the `XML APIs` to iterate over the object and encrypt fields.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type <code>XMLContent</code>.</td>
</tr>
</tbody>
</table>

**request - XMLContains(String path)**

Returns true if the given path exists in the XML DOM.

This method is available only if the request body is a valid XML payload. If you are not sure what format the request body includes, check the `contentType` field on the `request` object.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>String</td>
<td>XPath statement you are searching for.</td>
</tr>
</tbody>
</table>
POST and URL parameter APIs

POST and URL parameters can be accessed as properties of the request object using request.postParams and request.urlParams.

Any single parameter can be accessed as a property of the postParams and urlParams parent objects by calling request.postParams.myParam. Any parameter accessed this way is an object of the underlying class ParameterValue. Any APIs in this class can be called on any parameter.

After inspecting the client request, it may be necessary to access and encrypt parameter values from the request object. Depending on the data in the client request, you can encrypt values and map them to fields on the instance in multiple ways.

Encrypt the value of a known table and field

If you know the name of the instance table and field that will hold the encrypted data, you can explicitly define them in the encryption rule. For example, you may know that the request will be processed on the instance to create an incident and you want to encrypt the text parameter in the description field. In this case, you can create the following action.

```javascript
function SampleAction1() {
    request.postParams.text.valueFor('incident', 'description');
}
```

Encrypt the value of a dynamically defined table and field

If, conversely, you do not know the name of the field that the encrypted data will populate, you can dynamically define them using tableName and fieldName.

The below example processes a generic request that might store data in different task tables (such as incident, problem, and change_request) on the instance.

```javascript
function SampleAction2() {
    var tableName = request.urlParams.table;
    for (var parameter in request.postParams) {
        var currentParam = request.postParams[parameter];
        var fieldName = currentParam.toString();
        if (fieldName == 'text') {
            currentParam.valueFor(tableName, 'description')
        } else {
            currentParam.valueFor(tableName, fieldName);
        }
    }
}
```

This action:
- Gets the destination table from the URL parameters.
- Iterates over the URL parameters.
- Asks the Edge Encryption proxy server to encrypt any URL parameter with a name that matches a field marked for encryption.
• Looks for a specific parameter called \texttt{text} and asks the Edge Encryption proxy to encrypt the value based on the encryption configuration for the description field on the incident table.

In this example, the \texttt{valueFor()} method is not actually performing any encryption. Rather, the method asks the Edge Encryption proxy server to check whether the table/field pair in the request object is marked for encryption with an encryption configuration and, if applicable, encrypt it.

**Encrypt JSON or XML within a parameter**

A POST or URL parameter might include JSON or XML content. In this case, you can process the content within the parameter, iterate over the values, and encrypt required fields. In this example, the \texttt{tableName} is still accessed from a POST parameter, but the value of the field is the JSON object \texttt{data}.

```javascript
function SampleAction3() {
    var tableName = request.postParams.table;
    var data = request.postParams.data;
    var dataIterator = data.getAsJsonContent().iterator();
    while (dataIterator.hasNext()) {
        var jsonElement = dataIterator.next();
        var fieldName = jsonElement.getName();
        if (fieldName == 'text') {
            jsonElement.valueFor(tableName, 'description');
        } else {
            jsonElement.valueFor(tableName, fieldName);
        }
    }
}
```

An example of an encryption rule action that processes XML within a POST parameter.

```javascript
function SampleAction4() {
    var tableName = request.postParams.table;
    var data = request.postParams.data;
    var dataIterator = data.getAsXmlContent().getIteratorOverAllChildren();
    while (dataIterator.hasNext()) {
        var jsonElement = dataIterator.next();
        var fieldName = jsonElement.getName();
        if (fieldName == 'text') {
            jsonElement.valueFor(tableName, 'description');
        } else {
            jsonElement.valueFor(tableName, fieldName);
        }
    }
}
```

**Encrypt a query**

You might encounter an encoded query within a parameter in the client request that contains sensitive data. To match a field in a query to an encrypted value in the instance database, you must create an encryption rule that asks the proxy to check whether a field in the query is marked for encryption. The \texttt{encodedQueryFor()} method parses an encoded query on a given table, and checks if any fields in the query have encryption configurations.
In this example, the rule iterates over the parameters looking for the `filter` parameter, which is expected to be a Glide encoded query.

```javascript
function SampleAction5() {
    var tableName = request.urlParams.table;
    for (var parameter in request.postParams) {
        var currentParam = request.postParams[parameter];
        var fieldName = currentParam.toString();
        if (fieldName == 'filter') {
            currentParam.encodedQueryFor(tableName);
        } else {
            currentParam.valueFor(tableName, fieldName);
        }
    }
}
```

For example, if the value of `filter` is: `short_description=My sensitive information^number=INC000056^category=Outage`, the query would become `short_description=<Encrypted(My sensitive information)>^number=INC000056^category=Outage` on the instance.

**ParameterValue - toString()**

Converts the POST or URL parameter value to a string.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The parameter value as a string.</td>
</tr>
</tbody>
</table>

**ParameterValue - getAsJsonContent()**

Returns the request as an iterable object of type `JsonNode`. This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the `contentType` field on the `request` object.

Once the request is returned as a `JsonNode` object, you can use the `JSON APIs` to iterate over the object and encrypt fields.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request as an iterable JsonNode.</td>
</tr>
</tbody>
</table>
ParameterValue - getAsXmlContent()

Returns the request content as an iterable object of type XMLContent.

This method is available only in an Edge Encryption rule. This method assumes that the request body is a valid XML payload. You can check the contentType to make sure.

Once the request is returned as an XMLContent object, you can use the XML APIs to iterate over the object and encrypt fields.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type XMLContent.</td>
</tr>
</tbody>
</table>

ParameterValue - encodedQueryFor(String tableName)

Specifies that the value of the element is an encoded query on the specified table.

Calling this function on a parameter tells the proxy that the value of the parameter is an **encoded query** for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

ParameterValue - valueFor(String tableName, String fieldName)

Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>
XML APIs
XML APIs can be used after calling `getAsXmlContent()` on either the `request` object or a `ParameterValue` property.

When using XML APIs to write your encryption rule, you can follow a general format:

1. Call `getAsXmlContent()` on the `request` object or `ParameterValue` property. This returns an iterable object of the `XMLContent` underlying class.
2. Call `getIterator()` or `getIterator(String xPath)` on the `XMLContent` object. This returns an `XMLElementIterator` object that can be used to iterate over XML elements.
3. Call the `hasNext()` method on the `XMLElementIterator` object to determine whether another element is available.
4. Call `next()` on the `XMLElementIterator` object to return the next XML element. You cannot call `next()` without first calling `hasNext()`.
5. Call `valueFor(String tableName, String fieldName)` on the XML element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

Note: To determine if you want to call `valueFor(String tableName, String fieldName)` on an XML element, you can use the `getName()` method to return the name of the element.

Mapping to a known table-field on the instance

In this example, the XML payload will be processed on the instance to insert records in the `incident` table. The description field will populate `short_description` on the incident.

```xml
<data>
  <record>
    <name>'Test Record 1'</name>
    <description>'Test Record 1 Description'</description>
    <tag>critical</tag>
  </record>
  <record>
    <name>'Test Record 2'</name>
    <description>'Test Record 2 Description'</description>
    <tag>security</tag>
  </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction1() {
  var xmlContent = request.getAsXmlContent();
  // This loop iterates over all description tags that match the given path
  var xmlElementIterator = xmlContent.getIterator('data/record/description');
```
```javascript
while (xmlElementIterator.hasNext()) {
    var xmlElement = xmlElementIterator.next();
    xmlElement.valueFor('incident', 'short_description');
}
```

This action iterates through the **description** tags and asks the proxy server to encrypt the values and insert them into **incident.short_description** on the instance.

**Note:** This rule finds all **description** tags within all **record** tags in the XML payload. If there is only one occurrence of a tag to encrypt, the rule still uses the XPath and iterator structure. However, it iterates only once in the loop.

### Mapping to an unknown table-field on the instance

In this example, the rule iterates over the **record** tags, but does not know what tags to expect within the **record** tag. The only known is that the tags within the **record** tags match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is **incident**, then the data in the **description** tag should be encrypted and stored in the **short_description** field on the instance.

```javascript
function sampleXmlAction2() {
    var xmlContent = request.getAsXmlContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var xmlElementIterator = xmlContent.getIterator('data/record');
    while (xmlElementIterator.hasNext()) {
        encryptFieldsInRecord(xmlElementIterator.next());
    }
}
```

```javascript
function encryptFieldsInRecord(xmlElement) {
    // Then, iterate over all tags representing fields in the table
    var fieldIterator = xmlElement.getIteratorOverAllChildren();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldName = childElement.getName();
        // if table is incident, then description is encrypted for the short_description field
        if (tableName == 'incident' && fieldName == 'description') {
            field.valueFor(tableName, 'short_description');
        } else {
            // if table is not incident, ask the proxy to check if the given field is encrypted for the given table
            field.valueFor(tableName, fieldName);
        }
    }
}
```

In the **encryptFieldsInRecord()** function, the **valueFor()** method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the tag does not match a field in the table, the proxy skips that tag. If the tag matches a field marked for encryption, then the Edge Encryption proxy server encrypts the value.
Using an encoded query

In this example, all tags have the filter attribute, which indicates whether the tag contains an encoded query.

```xml
<data>
  <record>
    <name filter="false">'Test Record 1'</name>
    <description filter="false">'Test Record 1 Description'</description>
    <query filter="true">category=1^name=edge</query>
  </record>
  <record>
    <name filter="false">'Test Record 2'</name>
    <description filter="false">'Test Record 2 Description'</description>
    <query filter="true">category=2^severity=3</query>
  </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction3() {
  var xmlContent = request.getAsXmlContent();
  var tableName = request.urlParam.table;
  // This first iterator will iterate over all record elements
  var xmlElementIterator = xmlContent.getIterator('data/record');
  while (xmlElementIterator.hasNext()) {
    encryptFieldsInRecord(xmlElementIterator.next());
  }
}

function encryptFieldsInRecord(xmlElement) {
  // this time we want to iterate over all tags representing fields in the table
  var fieldIterator = xmlElement.getIteratorOverAllChildren();
  while (fieldIterator.hasNext()) {
    var field = fieldIterator.next();
    var fieldname = childElement.getName();
    // let's look at the filter attribute, if true, then encrypt as encoded query
    if (field.getAttributeValue('filter') == 'true') {
      field.encodedQueryFor(tableName);
    } else {
      // if it is false then check if the field should be encrypted
      field.valueFor(tableName, fieldName);
    }
  }
}
```

If the filter attribute value is true, the rule asks the proxy server to encrypt the values in the encoded query. If false, the rule asks the proxy to check whether the field should be encrypted.

**XMLContent**

A global object that provides methods to iterate over the XML content.

You can access an XMLContent object by calling `getAsXmlContent()` on a request object.

You access XML data in a POST or URL parameter by calling `request.postParams.<parameter name>.getAsXmlContent()` or `request.urlParams.<parameter name>.getAsXmlContent()`.

XMLContent - getIterator()
Returns an `XMLElementIterator` object for the XML content.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

**XMLContent - getIterator(String xPath)**

Returns an `XMLElementIterator` object for the XML content based on the specified parameter.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath-like expression that specifies where in the XMLContent object to start.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

**XMLElementIterator**

Provides methods for iterating over XML elements.

You get an `XMLElementIterator` object by calling the `getIterator()` method of the `XMLContent` class.

**XMLElementIterator - hasNext()**

Determines if there is another element available.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another element is available.</td>
</tr>
</tbody>
</table>
XMLElementIterator - `next()`

Returns the next element in the iterator.

You cannot call `next()` without first calling `hasNext()`.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElement</td>
<td>The next XML element.</td>
</tr>
</tbody>
</table>

XMLElement

Provides methods for iterating through XML elements and mapping values to fields in a table.

You get an `XMLElement` object by calling the `next()` method of an `XMLElementIterator` object.

XMLElement - `getIterator(String xPath)`

Returns an `XMLElementIterator` object for the XML element based on the specified parameter.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An XPath-like expression that specifies where in the XMLElement object to start.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLElement object.</td>
</tr>
</tbody>
</table>

XMLElement - `getIteratorOverAllChildren()`

Returns an `XMLElementIterator` object that includes all sub-elements for the XML element based on the specified parameter.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
XMLElement - valueFor(String tableName, String fieldName)

Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted. If the table and field names are unknown, you can call the `valueFor()` method on a table and a field that are *dynamically assigned* based on the request.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

XMLElement - encodedQueryFor(String tableName)

Specifies that the value of the element is an encoded query for the specified table.

Calling this function on an element tells the proxy that the value of the element is an *encoded query* for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

XMLElement - getName()

Returns the element name.
Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The element name.</td>
</tr>
</tbody>
</table>

XMLElement - getAttributeValue(String attribute)
Returns the value of the specified attribute.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>String</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The attribute value.</td>
</tr>
</tbody>
</table>

JSON APIs

JSON APIs can be used after calling getAsJsonContent() on either the request object or a ParameterValue property.

When using JSON APIs to write your encryption rule, you can follow a general format:

1. Call getAsJsonContent() on the request object. This returns an iterable object of the JsonNode underlying class.
2. Call getIterator() or getIterator(String xPath) on the JsonNode object. This returns a JsonNodeIterator object that can be used to iterate over nodes in the JSON object.
3. Call the hasNext() method on the JsonNodeIterator object to determine whether another element is available.
4. Call next() on the JsonNodeIterator object to return the next JSON element. You cannot call next() without first calling hasNext().
5. Call valueFor(String tableName, String fieldName) on the JSON element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks whether the field must be encrypted.

Note: To determine if you want to call valueFor(String tableName, String fieldName) on a JSON element, you can use the getName() method to return the name of the element.
Mapping to a known table-field on the instance

In this example, the JSON payload is processed on the instance to insert records in the incident table. The description field populates short_description on the incident.

```json
{
  data: {
    records: [
      {
        "name": "Test Record 1",
        "description": "Test Record 1 Description",
        "tag": "security"
      },
      {
        "name": "Test Record 1",
        "description": "Test Record 1 Description",
        "tag": "security"
      }
    ],
    "query": "assigned_to=3D4860165813e63a00d00ab322244b092^category=vulnerability",
    "source": "10.11.13.14"
  }
}
```

The following rule can apply:

```javascript
function sampleJsonAction1() {
  var jsonContent = request.getAsJsonContent();
  // This loop iterates over all description elements in the records array
  var jsonNodeIterator = jsonContent.getIterator('/data/records/description');
  while (jsonNodeIterator.hasNext()) {
    var jsonNode = jsonNodeIterator.next();
    jsonNode.valueFor('incident', 'short_description');
  }
}
```

This action iterates through the `description` nodes and asks the proxy server to encrypt the values and insert them into incident.short_description on the instance.

**Note:** This rule finds all `description` nodes within the JSON payload. If there is only one occurrence of a node to encrypt, the rule still uses the XPath and iterator structure. However, it iterates only once in the loop.

Mapping to an unknown table-field on the instance

In this example, the rule iterates over `records`, but is not sure what nodes to expect. The only known is that for each object within `records`, the nodes match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is incident, then the data in the `description` node should be encrypted and stored in the short_description field on the instance.

```javascript
function sampleJsonAction2() {
  var jsonContent = request.getAsJsonContent();
  var tableName = request.urlParam.table;
  // This first iterator will iterate over all record elements
  var jsonNodeIterator = jsonContent.getIterator('data/records');
...
In the `encryptFieldsInRecord()` function, the `valueFor()` method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the node name does not match a field in the table, the proxy skips that node. If the node name matches a field marked for encryption, then the proxy encrypts the value.

Using an encoded query

```javascript
function sampleJsonAction3() {
  var jsonContent = request.getAsJsonContent();
  var tableName = request.urlParam.table;
  // This first iterator will iterate over all record elements
  var jsonNodeIterator = jsonContent.getIterator('data');
  while (jsonNodeIterator.hasNext()) {
    var jsonNode = jsonNodeIterator.next();
    if (jsonNode.getName() == 'records')
      encryptRecords(jsonNodeIterator.next());
    else if (jsonNode.getName() == 'query')
      jsonNode.encodedQueryFor(tableName);
  }
}

function encryptRecords(jsonNode) {
  // we iterate over all fields in the node
  var recordIterator = jsonNode.iterator();
  while (recordIterator.hasNext()) {
    encryptFieldsInRecord(recordIterator.next());
  }
}

function encryptFieldsInRecord(jsonNode) {
  // this time we want to iterate over all nodes
  var fieldIterator = jsonNode.iterator();
  while (fieldIterator.hasNext()) {
    var field = fieldIterator.next();
    var fieldname = childElement.getName();
    if (fieldName == 'description') {
      field.valueFor(tableName, 'short_description');
    } else {
      field.valueFor(tableName, fieldName);
    }
  }
}
```
In this example, the rule iterates over **data**. As it finds **records**, it performs the same logic as in the second example, iterating over fields in each node. When it finds the **query** node, it calls `encodedQueryFor()` to encrypt values that should be encrypted in the query.

**JsonNode**

A global object that provides methods to iterate over the JSON content.

You can access a `JsonNode` object by calling `getAsJsonContent()` on a request object.

You access JSON content from a `POST or URL parameter` by calling `request.postParms.<parameter name>.getAsJsonContent()` or `request.urlParms.<parameter name>.getAsJsonContent()`.

**JsonNode - getIterator(String xPath)**

Returns a `JsonNodeIterator` object for the JSON content.

This method can only be used on the root node, but can be used to traverse deep into the JSON object. Subsequent traversals must use the `iterator()` method.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>xPath</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>JsonNodeIterator</td>
</tr>
</tbody>
</table>

**JsonNode - iterator()**

Returns a `JsonNodeIterator` object that iterates over all child nodes of the current node.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>JsonNodeIterator</td>
</tr>
</tbody>
</table>

**JsonNode - getAsString()**

Returns the current node value as a string.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>None</td>
</tr>
<tr>
<td>Returns</td>
</tr>
<tr>
<td>---------------------------------------------</td>
</tr>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

**JsonNode - getAsString(String propertyName)**
Returns the string value of the specified property.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>propertyName</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

**JsonNode - getName()**
Returns the name of the current JSON node.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
</tr>
<tr>
<td>String</td>
</tr>
</tbody>
</table>

**JsonNode - valueFor(String tableName, String fieldName)**
Specifies that the JSON property maps to the specified field in the specified table.
Calling this method on a JSON property tells the proxy that the value for this property maps to the specified field in the specified table. The proxy then decides if the field must be encrypted. If the table and field names are unknown, you can call the `valueFor()` method on a table and a field that are dynamically assigned based on the request.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>tableName</td>
</tr>
<tr>
<td>fieldName</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - encodedQueryFor(String tableName)

Specifies that the value of the JSON property is an encoded query for the specified table.

Calling this function on a JSON node tells the proxy that the value is an *encoded query* for the specified table. The proxy parses the encoded query and encrypts the values for fields in the encoded query that must be encrypted.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

JsonNodeIterator

You get a `JsonNodeIterator` object by calling the `getIterator()` or `iterator()` methods of the `JsonNode` class.

JsonNodeIterator - hasNext()

Determines if there is another property available.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another property is available.</td>
</tr>
</tbody>
</table>

JsonNodeIterator - next()

Returns the next property in the iterator.

You cannot call `next()` without first calling `hasNext()`.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The next JsonNode.</td>
</tr>
</tbody>
</table>

`print(String message)`  
Prints a message to the wrapper log file: `<proxy server directory>/logs/wrapper_<date>.log`.

This method is available only in an Edge Encryption rule action script.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to be written to the wrapper log file.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

Prohibited keywords

The Edge Encryption proxy validates encryption rule scripts before saving the rule. Many JavaScript keywords are not allowed in encryption rule scripts.

Prohibited keywords

<table>
<thead>
<tr>
<th>Keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DIR</strong></td>
</tr>
<tr>
<td><strong>FILE</strong></td>
</tr>
<tr>

</tr>
<tr>
<td>Error</td>
</tr>
<tr>
<td>eval</td>
</tr>
<tr>
<td>getClass</td>
</tr>
<tr>
<td>getPrototypeOf</td>
</tr>
<tr>
<td>Java</td>
</tr>
<tr>
<td>javax</td>
</tr>
<tr>
<td>javafx</td>
</tr>
<tr>
<td>JavaImporter</td>
</tr>
<tr>
<td>load</td>
</tr>
</tbody>
</table>
Edge Encryption dictionary attributes

You can add Edge Encryption dictionary attributes to tables and fields.

To set an Edge Encryption dictionary attribute to true, you must enter `attribute=true` in the Attributes field. To add a dictionary attribute to a record, see Dictionary attributes.

**Edge Encryption Excluded (edge_encryption_excluded)**

When set to true, the field or table cannot be encrypted.

- Value: true/false
- Target element: field or table
- Default value: false

**Edge Encryption Enabled (edge_encryption_enabled)**

When set to true, the field is eligible for encryption through an encryption configuration. Because this attribute is used by the system and cannot be modified, it is not always displayed to the user.

**Note:** This attribute does not indicate that a field is encrypted, nor does it trigger any encryption logic on the field. Rather, the attribute determines the possibility of the field being encrypted by a user.

- Value: true/false
- Target element: field
- Default value: true for String fields

**Edge Encryption Clear Text Allowed (edge_encryption_clear_text_allowed)**

When set to true, allows server-side scripts to append non-encrypted data to an encrypted string within the field for user actions performed through the proxy server, or any server-side automated scripts, such as scheduled jobs.

- Value: true/false
- Target element: field
- Default value: false
Domain separation in Edge Encryption

Edge Encryption provides the ability to encrypt data from within the customer's environment through the use of specific configurations, rules, and keys defined on the Edge Encryption proxy. The Edge Encryption proxy is not domain aware and cannot support domain-specific settings. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

No support

- The domain field may exist on data tables, but no logic exists to manage data.
- This level is not considered domain-separated.

How domain separation works in Edge Encryption

Edge Encryption can be used where domain-specific keys, configurations, and rules are not required.

Data integration with Edge Encryption

To integrate third-party data with an instance using Edge Encryption, you must route the data through the Edge Encryption proxy server using supported integrations. Supported integrations use base system encryption rules that map data in each payload to fields in a table.

Upload data to fields marked for encryption

Edge Encryption does not support importing data from or exporting data to Excel, CSV, XML, or other file types to or from fields with encryption configurations defined.

ODBC driver

Encrypt requests and query data through the Edge Encryption proxy server using the ODBC driver.

Learn more: Edge Encryption ODBC driver integration

MID Server

You can configure the MID Server to route data through an Edge Encryption proxy server. However, some restrictions apply.

Learn more: Edge Encryption MID Server integration

REST/SOAP web services

Use REST/SOAP web services to update or retrieve record data through the Edge Encryption proxy server.

Learn more: Web services

JSONv2 web service

Use JSONv2 web service APIs to update or retrieve record data through the Edge Encryption proxy server. Base system encryption rules support data retrieval and data modification APIs.
To insert a single record using the data modification API, use the `insert()` or `insertMultiple()` methods.

To insert multiple records using the data modification API, use the `insertMultiple()` method.

Learn more: JSONv2 Web Service

To encrypt data from custom third-party integrations not listed above, create custom encryption rules. See Define a custom encryption rule.

Upload attachments to records marked for encryption

Attachments can be uploaded to tables with attachment encryption configured using REST and SOAP web services.

Edge Encryption ODBC driver integration

Configure your ODBC driver to query data encrypted by Edge Encryption. The Edge Encryption proxy server encrypts ODBC driver requests to the ServiceNow instance when Edge Encryption is integrated with the ODBC driver.

Encrypted responses from the instance are decrypted through the Edge Encryption proxy server before passing to the ODBC driver in your network.
For a successful integration, the ODBC driver must trust the Edge Encryption proxy server certificate. If the Edge Encryption proxy server certificate is signed by a Certificate Authority trusted by the ODBC driver, the Edge Encryption proxy server is automatically trusted. However, if a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import the self-signed certificate to the ODBC truststore.
Import a self-signed certificate to the ODBC truststore

If a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import a self-signed certificate to the ODBC truststore. You can export the certificate from the Edge Encryption proxy server and import it into the ODBC truststore.

To determine whether a Certificate Authority trusted by the ODBC driver has signed the Edge Encryption proxy server certificate, run the following command in the keystore directory in the proxy home directory to view a list of Certificate Authorities trusted by the ODBC driver:

```
keytool -keystore "<ODBC directory>\ip\Java\jre\lib\security\cacerts" -list
```

1. Change to the keystore directory in the proxy home directory.
2. Check the keystore for the self-signed certificate.
   a) To check the keystore for the certificate, you can run the following command to list all the items in the keystore.
      ```
      keytool -list -keystore keystore.jceks -storetype jceks -v
      ```
   b) Locate the key alias in the list of items.
3. Using the key alias, export the certificate to a .cer file.
   ```
   keytool -export -alias <key alias> -keystore keystore.jceks -storetype jceks -rfc -file <file name>.cer
   ```
4. Change to your ODBC truststore directory: ODBC\ip\Java\jre\lib\security\cacerts.
5. Import the certificate to your ODBC truststore.
   ```
   keytool -keystore cacerts -importcert -alias $<key alias> -file <file name>.cer
   ```

Set the ODBC driver properties

Set the ODBC driver properties to route requests through the Edge Encryption proxy server.

1. In Windows, navigate to Start > Programs > ServiceNow ODBC Management Console.
2. Expand the console tree root to: ServiceNow ODBC Manager\Manager\<installation location>\Services\ServiceNow_ODBC\Data Source Settings\ServiceNow\IP Parameters.
3. Double-click the DataSourceIPProperties attribute.
4. Change the Value to the URL of your Edge Encryption proxy server, such as https://<IP address>:<port>
5. Click **OK**.

The ODBC driver is now configured to route requests to the instance through the Edge Encryption proxy server.

### Edge Encryption MID Server integration

Configure the MID Server to route data through an Edge Encryption proxy server.

When integrated with the MID Server, the Edge Encryption proxy server acts as the MID Server’s endpoint. The Edge Encryption proxy server then encrypts and decrypts data passing between the ServiceNow instance and the MID Server.

#### Limitations when integrating with the MID Server

When MID Server data is configured to pass through the Edge Encryption proxy server, the following limitations apply:

- Encryption of ECC Queue fields is not supported.
- Encrypted data cannot be used with Discovery or Service Mapping.

### Point the MID Server to the Edge Encryption proxy server

To pass data from the MID Server through the Edge Encryption proxy server, update the MID Server configuration file to point the MID Server to the Edge Encryption proxy server.

When configuring the MID Server to pass through the Edge Encryption proxy server, you cannot use the web proxy properties in the MID Server configuration file to route traffic through the Edge Encryption proxy server to your instance. Instead, you must set the Edge Encryption proxy server as the MID Server's endpoint.

1. Navigate to your local MID Server directory and open the `config.xml` file.
2. Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value property to the URL of your Edge Encryption proxy server. For example, `http://hostname.mycompany.com:8081`.
   
   This step directs the MID Server to pass traffic to the Edge Encryption proxy server instead of the instance. The Edge Encryption proxy server in turn encrypts any necessary fields and passes the payload to the instance.
3. Save and close the file.
4. If running, restart the MID Server.

### Edge Encryption diagnostics and performance

Monitor Edge Encryption proxy server performance trends and drill into errors generated by the Edge Encryption proxy server.

#### Edge proxy performance

View key Edge Encryption proxy server performance trends using the Edge Proxy graph set on the ServiceNow Performance homepage. Monitored trends include:

- Maximum and average response times between the client, proxy server, and instance.
- CPU, disk space, and memory usage of the host machine.
- Maximum and average network latency between the proxy server and the ServiceNow instance.

**Note:** Edge Encryption proxy servers with duplicate names do not report performance trends.
Maximum and average time in milliseconds to process a request. These data points are general trends over time.

- **Total Time**: Time for the proxy server to receive a request from a client and send a response. This data point is the sum of the subsequent data points.
- **Proxy Response**: Time for the proxy server to process a response from the instance.
- **Proxy-Instance Round Trip**: Time for the proxy server to send a request to the instance and receive a response. Includes network latency between the proxy server and the instance and time spent by the instance to process the request.
- **Rules**: Time for the proxy server to evaluate a request using defined encryption rules.
- **Proxy Request**: Time for the proxy server to process a client request and forward it to the instance.

**Edge Proxy Performance (Max and Average)**

Maximum and average percentage of resources used on the host machine.

- CPU Usage
- Memory Usage
- Disk Usage

**Edge Proxy Latency**

Maximum and average network latency in milliseconds at a given point in time. Latency is determined by round-trip time for a proxy server to send a simple ping to the instance and receive a response.

**Proxy Error Reports**

Navigate to **Edge Encryption Configuration > Diagnostics and Troubleshooting > Proxy Error Reports** to view all proxy server errors collected over the past seven days.
Errors are collected over a one-minute period. Each minute, an error report is generated. The vertical axis displays the number of error reports over the last seven days that include each error. For example, even if the DEFAULT_ERROR_CODE error is thrown multiple times over a one-minute report period, the DEFAULT_ERROR_CODE bar will only reach one on the Number of Error Reports axis.

From this view, you can:

- Click each proxy error code bar to see the report on a single error for each proxy server. From this view, you can click the bar again to view the error text in the Edge Encryption Proxy Stat table (edge_encryption_stat). Follow links in the error text to see more information and possible remediation steps.
- Click Other to see page two of the error report.

**Note:** If you have more than one proxy server with the same name, a single DUPLICATE_PROXY_NAME error appears in the Proxy Error Report. No other errors are reported for proxy servers with duplicate names. If you encounter this error, make sure that all proxy servers have unique names.

**Additional monitoring resources**

The instance tracks all encryption proxies. Each Edge Encryption proxy server registers when it starts up. The instance is notified when:

- A new Edge Encryption proxy server starts up.
- An Edge Encryption proxy server is intentionally shut down.
If an Edge Encryption proxy server attempts to register with an instance that does not have Edge Encryption installed, the proxy does not start.

All encryption configuration files are audited. Deleted records are audited on all encryption configuration files. Audit records are put in the sys_audit table. To view the history of a specific configuration record, view the record, and click **History > List** in the menu. The Mass Encryption Job is not audited.

Use the following additional resources to monitor you proxy servers.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invalid Insert Attempts</td>
<td>List of attempts to save the following data to encrypted fields:</td>

</table>

### Disable or reduce Edge Proxy statistic collection

Prevent the Edge Encryption proxy server from sending Edge Proxy Graph Set statistics to the ServiceNow Performance homepage, or reduce the frequency of statistic collection.

Role required: admin or security_admin

By adding properties in the `edgeencryption.properties` configuration file, you can:

- Disable the Edge Proxy graph set.
- Change the interval during which statistics are collected by the Edge Encryption proxy server.
  
  By default, statistics are collected every 30 seconds.

1. In your proxy server installation directory, open the `edgeencryption.properties` configuration file located in the `<installation directory>/conf/` folder.
2. Add one of the **Edge Encryption proxy server properties**.
3. Restart the proxy server.

### Flow Designer

Flow Designer is a Now Platform® feature for automating processes in a single design environment. Flow Designer lets process owners use natural language to automate approvals, tasks, notifications, and record operations without coding.
You can expand Flow Designer to communicate with external instances and third-party systems by requesting a separate subscription to IntegrationHub.

Watch this seven-minute video to learn how to create and test a flow in Flow Designer.

For developer training, see Using Flow Designer on the ServiceNow® Developer Site.

**Benefits**

Flow Designer provides process owners and developers these benefits.

- Consolidates multiple Now Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes from a single interface. Includes flows and actions triggered by ServiceNow® Service Catalog events. See Create a flow with a Service Catalog trigger.
- Consolidates configuration and runtime information into a single environment so process owners and developers can create, operate, and troubleshoot flows from a single interface.
- Provides natural-language-descriptions of flow logic to help non-technical users understand triggers, actions, inputs, and outputs.
- Promotes process automation by enabling subject matter experts to develop and share reusable actions with flow designers.
- Reduces upgrade costs, with upgrade-safe Now Platform logic replacing complex custom script.
- Reduces development costs by providing a library of reusable actions.
- Enables extending Flow Designer content by subscribing to ServiceNow IntegrationHub or installing spokes.

**Interactions with existing automation processes**

While learning Flow Designer, make sure that you understand how existing Now Platform automation processes such as business rules and workflows change records to avoid creating conflicting logic. See the Architecture Overview to understand how Flow Designer works within the Now Platform. Avoid duplicating existing business logic from business rules and workflows. If you’re replacing an existing automation process, you may need to deactivate it before replacing it with Flow Designer flows and actions.

**Flow Designer content**

Flow Designer consists of the following content types.

**Flows**

A flow is an automated process consisting of a sequence of actions and a trigger. Flows automate business logic for a particular application or process. For example, the VTB Sample Flow creates and assigns a VTB card whenever a priority 1 incident is created. Flows require some familiarity with the Now Platform tables and fields that the application or process uses. Process analysts can create flows using available actions or copy an existing flow to use it as a template. You can add application-specific flows by activating the associated spoke.

**Subflows**

A subflow is an automated process consisting of a sequence of reusable actions and specific data inputs that allow the process to be started from a flow, subflow, or script. Subflows automate generic business logic that can be applied to multiple applications or processes.
example, you could create a subflow to notify users of record changes. Subflows require some familiarity with the Now Platform tables and fields that the application or process uses. Process analysts can create subflows using available actions or use an existing flow as a template.

**Actions**

An *action* is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the *Create Record* action allows process analysts to generate records in a particular table with particular values when certain conditions occur. ServiceNow core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to preset configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

**Core actions**

A *ServiceNow core action* is a ServiceNow-provided action available to any flow that cannot be viewed or edited from the Action Designer design environment. For example, the *Ask for Approval* action is a ServiceNow core action that allows process analysts to use Now Platform approvals. Flow Designer provides a set of ServiceNow core actions to automate Now Platform processes. You can add application-specific ServiceNow core actions by activating the associated spoke.

**Action steps**

An *action step* or step is a single reusable operation within an action. For example, the *Create Record* step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of ServiceNow core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

**Spokes**

A *spoke* is a scoped application containing Flow Designer content dedicated to a particular application or record type. For example, the *ITSM Spoke* contains actions for managing Task records such as the *Create Task* action. Spokes are activated when their parent application is activated. For example, the *ITSM Spoke* is activated when the Incident, Problem, and Change applications are activated. Creating a spoke requires familiarity with application development because developers must add Flow Designer content to a scoped application. See *Spokes* for a list of available spokes.

**Consolidated design and operation environment**

The design environment consists of these components.

**Landing page**

Access or create actions, flows, subflows, or their execution details.

**Flow Designer**

Create and edit flows by defining a trigger and adding actions. Test flows to see if they complete successfully and to review the runtime values they generate. Activate flows to make them available for execution on your instance and to preserve their current actions, inputs, and sequence as a snapshot separate from further configuration changes.

**Action Designer**
Create and edit actions by defining inputs and adding action steps. Test actions to verify if they complete successfully and review the runtime values they generate. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

**Flow and action execution details**

View runtime information about an action or flow directly from the design environment such as the current state, actions or steps run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

**Operations dashboard**

Identify and troubleshoot potential issues by reviewing action and flow executions, their result state, and their runtime duration.

**Getting started with flows**

Create a sample flow with a trigger and base system actions that requires an approval.

Role required: admin

Note: While Flow Designer is designed to use the flow_designer and delegated_developer roles in most scenarios, this tutorial uses the admin role to illustrate functionality without requiring additional roles to set up records and approve requests.

The ITSM application is required to access the Task table.

Watch this 11-minute video for an introduction to using the flow designer.

A flow can include these components:

- **Trigger**: An activity that initiates the flow, such as a record created in a specified table or a scheduled job.
- **Conditions**: Statements that determine when or how an action runs. For example, run an action only if a field is over a certain value.
- **Actions**: Operations executed by the system, such as a field value updated, approval requested, or a value logged.

To understand basic flows, create an expense approval flow. This flow:

1. Runs when an Expenses record is created.
2. Uses the total amount to determine which action to run.
3. Approves the request if it is under the specified dollar amount.
4. Requires manager approval if it is over a specified dollar amount. Another approver can be manually added.

1. Create a custom application for the flow. Creating flows and actions within an application enables you to publish flows and actions to an application repository and deploy them on other instances. While this example does not use delegated development, you can optionally delegate action and flow designer development by assigning developers to the application.
   a) Navigate to **System Applications > Studio**.
   b) Create a custom application called **Expenses Getting Started**.
2. In Studio, create an Expenses table.
a) Click **Create Application File**.

b) Under Data Model, select Table and click **Create**.

A Table form opens.

c) Complete the form with the following values.

- **Label**: Expenses
- **Extends table**: Task

d) Save the form.

e) Add three additional columns to the table.

<table>
<thead>
<tr>
<th>Column label</th>
<th>Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>Floating point number</td>
<td>None</td>
</tr>
<tr>
<td>Destination</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Requested for</td>
<td>Reference</td>
<td>User (sys_user)</td>
</tr>
</tbody>
</table>

3. Add four records to the Expenses table to use in Flow Designer tests. When you test your flow in later steps, you can specify which record is used as the trigger, enabling you to test specific record values.

a) On the Expenses table record, click the **Show list** related link.

b) Click **New**.

c) Configure the form to add the **Amount**, **Destination**, and **Requested for** fields, and the **Approvers** related list.

d) Complete the **Destination** and **Requested for** fields. In the **Amount** field, add a value under 100.00.

Make sure that the user in the **Requested for** field in the test record has a manager assigned in the system. If the user in the test record does not have a manager, configure the User form to add the **Manager** field, and assign a manager to the user.

e) Submit the form.

f) Add another record to the table with an amount under 100.00.

g) Add two more records to the table with a value over 100.00 in the **Amount** field.

4. In Studio, create a new flow.

a) Click **Create Application File**.

b) Under Flow Designer, select Flow and click **Create**.

c) Select the **Flow** option, click **Next**.

d) In the **Flow Name** field, enter Expense Approval.

e) Click **Submit**.

An Expense Approval flow is created in the Expenses Getting Started scope.

5. Create a trigger that runs the flow when a record is created in the Expenses table.

- **Trigger**: Created
- **Table**: Expenses (x_expenses_getting_expenses)
6. Add an if condition to the flow.
   a) Select **Flow Logic > If**.
   b) In the right-hand pane, expand the **Trigger - Record Created** category and the **(Expenses Record)** pill. Drag-and-drop the **(Amount)** pill into **Condition 1**. A data pill represents the value of a record or a field at a particular stage in your flow. Dragging the **(Amount)** data pill from the trigger populates the condition with the value of the field in the triggering record.
   c) Set Condition 1 to **(Trigger->Expenses Record->Amount) (less than) (100.00)**.
7. Underneath action 1, click + to add an action that runs when the If condition is met.

8. Create an Update Record action that approves the request.

   - Action: Update Record
   - Record: Expand the Trigger - Record Created category and drag the (Expenses Record) data pill from the right-hand pane.
   - Table: Set to Expenses (x_expenses_getting_expenses).
   - Fields:
     - Approval: Approved
     - Work notes: Auto-approved. Amount less than $100.00
9. Add an else condition to the flow.
   a) Select Flow Logic > Else.

10. Underneath action 2, click + to add an Ask for Approval action that runs when the Else condition is met.
    a) Complete the fields in the Ask for Approval step.
       - Action: Ask for Approval
       - Record: Expand the (Trigger - Record Created) category and drag the (Expenses Record) data pill from the right-hand pane.
       - Table: Set to Expenses [x_expenses_getting_expenses].
       - Approval Field: Set to Approval.
       - Journal Field: Set to Approval history.
b) Define the rules in the Ask for Approval step.

- **(Approve)** when **(Anyone approves)** from the field **(Trigger->Expenses Record->Requested for->Manager)**. (OR)

- **(Anyone approves)** from the **(Manual User(s))** list. Select 📌 to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see [Generate approvals using the approvers related list](#).

Select **Add another OR rule set** to define rejection rules. When defining approvals, make sure to include rejection rules to avoid creating flows that remain in a waiting state if there are no matching approval rules.

- **(Reject)** when **(Anyone rejects)** from the field **(Trigger->Expenses Record->Requested for->Manager)**. (OR)
- **(Anyone rejects)** from the **(Manual User(s))** list.
c) Define a due date to automatically approve, cancel, or reject an approval if the request is not approved or denied by the designated time. Adding a due date ensures that the flow does not remain in a waiting state.

- **(Approve)** if pending by **(Relative date) 1(Days)** from **(Trigger->Expenses Record->Requested for->Manager >Created)**.
- **Days schedule (8-5 weekdays excluding holidays).**

This due date automatically approves all requests that have not been approved or denied within one day from when the request was created.

11. **Click Save.**
12. **Test the flow using a record with an amount below the designated limit.**
   a) From the flow, click **Test.**
   The Test flow modal appears.
   b) In the **Record** field, select a record you created in earlier steps that has value in the **Amount** field under the 100.00 limit. This field is a reference to the table defined in the trigger.

**Note:** Testing a flow bypasses the trigger conditions and immediately runs it. To test a flow with a record-based trigger, you must select a specific record to act as the trigger.
c) Select **Run Test**.

d) After the flow executes, click **Flow has been executed. To view the flow, click here**.

The Execution Details open.

Because the amount is less than 100.00, the first condition is met and the request is approved.

13. Navigate back to the flow and run the test again using a record with an amount over the designated amount.

14. After the flow executes, open the flow Execution Details.

   Because the amount is over the designated limit, the request must be approved. Until a manager or a manual approver approves the request, the state is **Waiting**.
Approve the request. In an active flow, a user from the Approvers list would approve or reject the request. However, because the flow is being tested, an admin can approve the flow.

a) Navigate to the test record. The associated manager appears in the Approvers related list with Requested in the State field. Alternatively, you can edit the list to add manual approvers.

b) Change the value of the State field in the Approvers related list to Approved.

c) Navigate back to the flow Execution Details and refresh the browser. Because the request is approved, the flow completes.
Transform the Ask for Approval action into a reusable action using Action Designer. Actions enable flow designers to add complex actions to multiple flows with minimal configuration. See *Getting started with actions*.

### Getting started with actions

Transform the Ask for Approval action into a reusable action that always requires manager approval.

Role required: admin

**Note:** While Action Designer is designed to use the action_designer and delegated_developer roles in most scenarios, this tutorial uses the admin role to illustrate functionality without requiring additional roles to set up records and approve requests.

Complete the steps in *Getting started with flows*. This tutorial replaces the Ask for Approval action in the Expense Approval flow.

Actions are made up of:

- **Inputs:** Data variables used in your action.
• Steps: Operations on the inputs or results from a prior step that generate data that can be used in later steps.
• Outputs: Data variables that represent the results of the action. These results are available to other actions in a flow.

Unlike the core Ask for Approval action where flow designers must manually configure the approval rules, this custom action always uses the same approval rules when added to a flow. You might create a reusable action if your flow designers often use an action with the same configuration. For example, if your flow designers always use the request manager approval and due date options, this action automatically uses them and therefore requires less flow configuration.

1. Open the Expenses Getting Started application in Studio.
   Alternatively, you can navigate to Flow Designer > Designer and select New Action to access Action Designer in the platform. In the Action Properties, select your scoped application in the Application field.

2. Create an action.
   a) Click Create Application File.
   b) Under Flow Designer, select Action and click Create.
   c) In the Name field, enter Ask for Manager Approval.
   d) In the Description field, enter Approve or reject a request based on manager approval or rejection. Allow manual approvers to be added.
   e) Click Submit.

   An Ask for Manager Approval action is created in the Expenses Getting Started scope.

3. Define the inputs in the Ask for Manager Approval action.
   a) Select + Create Input and add the following values.
      • Name: Request
      • Type: Reference
      • Reference Table: Expenses (x_expenses_getting_expenses)

   This input enables you to reference any field or record from the Expenses table. Use the data pills on the right-hand side to add the record or its fields to action steps.
4. Add an Ask for Approval step.
   a) Click the + underneath Inputs in the Action Outline.
   b) Select Ask for Approval.
   c) Complete the fields in the Ask for Approval step.
      - Record: Under the Input Variables category, drag the (Request) data pill from the right-hand pane.
      - Table: Set to Expenses (x_expenses_getting_expenses).
      - Approval Field: Set to Approval.
      - Journal Field: Set to Approval history.

d) Define rules in the Ask for Approval step. You can use the data pill picker, or drag the data pills from the right-hand pane to select the data you need.
   - (Approve) when (Anyone approves) from the field (action->Request->Requested for->Manager), (OR)
   - (Anyone approves) from the field (Manual User(s)).

Select Add another OR rule set to define rejection rules:
   - (Reject) when (Anyone rejects) from the field (action->Request->Requested for->Manager), (OR)
   - (Anyone rejects) from the field (Manual User(s)).
e) Define a due date in the Ask for Approval step.

- **(Approve)** if pending by (Relative date) (1)(Days) from (action->Request->Created).
- Days schedule **(8-5 weekdays excluding holidays)**.

This due date automatically approves all requests that have not been approved or denied within one day from when the request was created.

5. Define the outputs in the Ask for Manager Approval action. Adding an output makes data available to a flow. For example, this action outputs the approval state of the record.
   a) Select **Create Outputs** and add the following values.
   - Name: **Approval state**
- Value: In the right-hand pane, expand the **Ask for Approval step** category and drag the **(Approval State)** data pill.

<table>
<thead>
<tr>
<th>Action Outline</th>
<th>Action Output</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Action Outline" /></td>
<td><img src="image" alt="Action Output" /></td>
</tr>
</tbody>
</table>

b) Click **Save**.

6. **Add a custom icon for your application that displays in Flow Designer. All actions in the application scope use the custom icon.**
   a) In Studio, navigate to **File > Settings**. The application settings open.
   b) In the **Logo** field, select **Click to add...**
   c) Upload an icon to use with your reusable actions.

7. **Test the reusable action within your flow.**
   a) Return to the Expense Approval flow.
   b) Remove the 2.1 Ask for Approval action from the flow. This action will be replaced by the reusable Ask for Manager Approval action.
   c) Set **Show draft actions** to true.
   d) Add the Ask for Manager Approval action to your flow.
   e) In the right-hand pane, expand the **Trigger - Record Created** category and drag the **(Expenses Record)** data pill into the **Request (Expenses)** field.
8. Click **Save**.
9. Test the flow using a record with an amount below the designated limit.
   a) From the flow, click **Test**.
      The Test flow modal appears.
b) In the **Record** field, select a record you created in earlier steps that has value in the **Amount** field under the 100.00 limit. Verify that you have not already run tests using this record.

c) Select **Run Test**.

d) After the flow executes, click **Flow has been executed. To view the flow, click here**. The Execution Details open.

Because the amount is less than 100.00, the first condition is met and the request is approved. The Else condition is not evaluated.

10. Test a record with an amount over the designated limit. Verify that you have not already run a test on the test record.

Because the amount is over the designated limit, the second condition is evaluated.
11. Approve the request.
   a) Navigate to the test record and change the value of the State field in the Approvers related list to Approved.
   
   b) Navigate back to the flow execution details and refresh the browser. Because the request is approved, the flow completes.
12. Navigate to the Ask for Manager Approval action and click Publish. Publishing an action enables you to activate any flow that uses it.

13. Navigate to the flow and set Show draft actions to false.

14. Click Activate. Activating a flow sets it to run every time the trigger conditions are met.

The Expense Approval flow runs every time a record is created in the Expenses table. Now that the flow is activated and working as expected, you can publish it to the application repository and deploy it to other instances.

**Architecture Overview**

Understand how Flow Designer works within the Now Platform to activate, trigger, and process flows and actions.

A flow consists of a trigger and one or more actions. The trigger specifies when to start the flow, which can be record-based, schedule-based, or application-based. Record-based triggers run a flow after a record has been created, updated, or deleted. The flow can use the triggering record as input for actions. Schedule-based triggers run a flow at the specified date and time. The flow can use the execution time as input for actions. Application triggers are added when the associated application is activated. For example, the MetricBase trigger is present when the MetricBase application is active.
Flow processing

Flow processing occurs in this sequence.

1. When the flow trigger conditions occur or an API directly calls the flow, the system creates an entry in the event queue to start the flow.
2. The scheduler processes the event and starts the flow in the background.
3. The system builds a process plan from the flow.
4. The system runs the process plan using the record that triggered the flow.
5. The system stores the execution details in a context record.

1. Process flow triggers and API calls

Each time trigger conditions are met or an API directly calls a flow, Flow Designer creates an event entry. The system processes triggers after database operations. To learn more, see Execution order of scripts and engines. Typically, business rules and workflows that run synchronously run before a triggered flow.

2. Process events in the queue

Each flow event contains a reference to the flow to start and a reference to either the triggering record or the execution time. The system processes these events using Standard event processing where a scheduler periodically works through the current items in the event queue in the order in which they were added. Depending on what other events are in the queue, the system may not immediately start a flow. Flow designers should expect some lag time between when the trigger conditions occur and when the flow actually starts.

3. Build the process plan

When Flow Designer pulls an event from the queue, it builds a process plan to actually run the flow. A process plan contains all the information necessary to execute a flow such as the sequence of published actions or subflows, the input values for each subflow or action, the action steps to run for each action, and the data provided by the trigger or subflow output.
Flow Designer uses a just-in-time compilation scheme to ensure that process plans contain the latest changes to flows, subflows, and actions. If no changes are detected, Flow Designer uses a cached copy of the process plan. Otherwise, it builds a new process plan.

By automatically checking for updated flows, subflows, and actions with process plans, Flow Designer enables you to apply changes from update sets and upgrades without having to edit current flows. If you move published actions to a target instance, every flow that uses the published action will automatically update the next time it is executed.

**Warning:** If changing subflows or actions used in activated flows, do not change the inputs and outputs used in the subflow or action. Changing inputs and outputs may cause errors when the activated flow is next triggered because it has not been configured to use the new inputs and outputs. Any currently running flows are unaffected by changes to inputs or outputs as the flow uses the compiled subflows and actions from the process plan.

4. Run the process plan

Flow Designer runs the process plan as the **System** user within the flow application scope.

When running a flow with a record-based trigger, Flow Designer stores the triggering record in memory as an **instance** that is represented in the interface as a **data pill**.

The instance contains the record values from when the flow started, which may be different than the current record stored in the database. For example, suppose that creating an incident record triggers a flow. Any changes a user makes to the incident record after the flow has started do not update the triggering record unless an action specifically looks up the current record value.

5. Store flow execution details

Flow Designer stores flow execution details in a **flow context record**, which contains this information.

- Flow outcome state
- Flow runtime duration
- Flow log messages
- Flow configuration and runtime values

Each time a flow runs, Flow Designer adds an entry to the **Flow Executions** list. Each entry has its own context record and matching execution details page.

**Note:** A flow execution context runs in a single thread. However, there may be times when you want to run flows within separate contexts even though this may consume more of your instance's resources. To run subflows in separate flow contexts within the same flow, see **Dynamic flows**.

A flow can have one of these outcome states.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The flow completed successfully.</td>
</tr>
<tr>
<td>In Progress</td>
<td>The flow is running. By default, a transaction quota rule prevents flows from running longer than an hour.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The flow is waiting for another event to occur. For example, a user must update a task or approval, or a record must reach a specific state. When in the waiting state, the flow is quiesced and serialized into a context record.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Canceled</td>
<td>The flow was canceled by a user.</td>
</tr>
<tr>
<td>Error</td>
<td>The flow encountered an error and has stopped running. For example, an action is missing an input value, or a quota transaction rule has stopped the flow.</td>
</tr>
</tbody>
</table>

## Flow, subflow, and action life cycle

Flow Designer uses the flow or action status to describe the current state of configuration changes.

### Flow and subflow status and activation state

The **Status** field indicates whether there is a process plan associated with the flow or subflow.

<table>
<thead>
<tr>
<th>Flow status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>Indicates that there are unsaved changes to a flow or subflow. Modified flows or subflows have not been saved.</td>
</tr>
<tr>
<td>Draft</td>
<td>Indicates that there are saved changes to a flow or subflow, which have not been stored in a process plan. Draft flows have been saved but not activated. Draft subflows have been saved but not published.</td>
</tr>
<tr>
<td>Published</td>
<td>Indicates that there is a stored process plan for the flow or subflow. Published flows have either been activated or deactivated.</td>
</tr>
</tbody>
</table>

The **Active** field indicates whether the system runs a flow or subflow.

<table>
<thead>
<tr>
<th>Active</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>True</td>
<td>Indicates that the flow or subflow is active and runs when triggered or called. The flow has been activated or the subflow has been published. Active flows run when the trigger conditions are met or when called. Active subflows run when called.</td>
</tr>
<tr>
<td>False</td>
<td>Indicates that the flow is inactive and does not run when triggered or called. An inactive flow has either never been activated or has been deactivated. An inactive subflow has never been published.</td>
</tr>
</tbody>
</table>

When working with flows, you can:

- **Save** a flow: Creates a draft of the flow.
- **Activate** a flow: Enables the flow trigger and transform the flow into a process plan.
- **Deactivate** a flow: Disables the flow trigger and prevents new flow executions. Currently running flows continue to run.

When working with subflows, you can:

- **Save** a subflow: Creates a draft of the subflow. If the subflow is modified after being published, the subflow moves into a draft state. Any active flows that use the subflow only run the published subflow.
• **Publish** a subflow: Enables you to activate a flow containing the subflow. Publishing adds the subflow to the list of available subflows in a flow.

![Flow life cycle diagram](image)

**Action status**

The Action Designer interface does not display the configuration status of actions. To view action status, navigate to the Action Types table (`sys_hub_action_type_definition`) and display the **Draft state** field.

<table>
<thead>
<tr>
<th>Action Draft status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>Indicates that there are changes to an action that have not been published. Draft actions are only available to flows when the <strong>Show draft actions</strong> option is enabled. You cannot activate a flow containing draft actions.</td>
</tr>
<tr>
<td>Published</td>
<td>Indicates that the action has been published. Published actions are available to all flows and allow flows to be activated.</td>
</tr>
</tbody>
</table>

When working with actions, you can:

- **Save** an action: Creates a draft of the action that is only available to flows when **Show draft actions** is enabled. If the action is modified after being published, the action moves into a draft state. Any active flows that use the action only run the published action.

- **Publish** an action: Enables you to activate a flow containing the action. Publishing adds the action to the list of available actions in a flow. Only actions in a published state run during flow execution.

![Action life cycle diagram](image)

**Application development**

When designing an action or a flow, use these design considerations as a guide.

Use standard Now Platform application development capabilities to create, manage, protect, and deploy Flow Designer content. Flow and action designers typically perform these application development tasks.
- Create a custom application to store flows and actions.
- Set application permissions to share or restrict access to application data.
- Grant application developers access to Flow Designer.
- Publish custom applications to the application repository to deploy flows and actions on other instances.

Security

Control access to Flow Designer processes and records.
- Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer delegated development permission. Delegated development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. See Developer and deployment permissions.
- Administrators can also grant access to Flow Designer by directly assigning users the flow_designer user role, which includes the role to view flow execution details.

Warning: Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer can run flows as the System user, which has access to all tables and all database operations.

- Flow and action designers can use standard Application access settings to manage how their content interacts with other applications.

Action limit

By default, flows can have no more than 50 actions. To change the default behavior, increase the value of the sn_flow_designer.max_actions system property. However, consider the performance impact that a large flow may have on your instance.

Trigger options for record updates

Flow designers can specify how often a flow can update a particular record with the Run Trigger option. Use the Once option when you want a flow to run only once. The first time a record is updated, the flow runs, but any further record updates do not trigger the flow. Use the Always option when you want the flow to run every time a record is updated and there is not already an active flow running for it. For example, you might set a flow that assigns an incident record to run only once, and set a flow that notifies the incident watch list to always run. The Run Trigger field is only available for these trigger types.
- Created or Updated
- Updated

Direct recursion prevention and indirect recursion limit

To prevent instance outages and consumption of system resources, Flow Designer ignores any request to start a flow that is the result of direct recursion. Direct recursion occurs under these conditions.
• An action calls the same flow that it is part of. For example, a script step makes an API call to a flow.

• An action or subflow produces a result matching the flow trigger. For example, a flow that runs when an incident record is updated contains an update record action that updates an incident record.

Flow Designer also limits the number of times a flow can be started from indirect recursion. Indirect recursion occurs under these conditions.

• The same flow is called multiple times in a chain of subflow calls. For example, if subflow A calls subflow B, and subflow B calls subflow A, then calling either subflow produces indirect recursion.

• The same flow is triggered multiple times in a chain of subflows. For example, suppose that there are two flows triggered by record creation. Suppose that creating record A triggers flow A and also creates record B. Furthermore, creating record B triggers flow B and creates record A. Creating either record type produces indirect recursion.

By default, the system stops triggering flow runs after the run count reaches the indirect recursion limit of three runs. Administrators can change the limit by setting the system property `com.glide.hub.flow_engine.indirect_recursion_limit` to an integer value equal to or greater than one. The system ignores any property value less than one and instead uses a limit of one. Consider the performance impact that increasing the indirect recursion limit may have on your instance.

Note: By default, a transaction quota rule prevents flows from running longer than an hour.

Flow and action testing

Testing a flow bypasses the trigger conditions and immediately runs it. Testing a flow with a record-based trigger requires selecting a specific record to act as the trigger. Flow designers should generate appropriate sample records prior to testing.

During the design phase, you can test an inactive flow and unpublished actions by setting Show draft actions on the flow. If testing with draft actions, use these guidelines.

• Design flows and actions on a non-production instance. Only deploy active, working flows to your production instance.

• Leave Show draft actions set to true until your draft is in a final state. Once final, publish each action, set Show draft actions to false, and activate the flow.

Warning: Disabling Show draft actions before publishing your actions removes all draft actions from your flow.

• Any change you make to an active flow or published action causes it to return to a draft state. If the flow is triggered, the system only runs the activated flow and published actions, and the flow execution details only display what was run. When there is a draft of an active flow, the trigger and actions listed in the flow execution details may be different than those listed in the draft flow.

Flow Designer data

Each time you add an action to a flow, Flow Designer adds a data pill to store its results. The data pill name indicates its sequence in the flow and its data type.

Flow designers use action result data pills to provide input for other flows, actions, or subflows. Flow designers can use the sequence value in the data pill name to ensure that they select the
correct data pill as an input value. When a flow runs an action, it generates the data pill runtime value, which remains the same for the duration of the flow. For example, if a data pill for (Trigger->Incident record) gets populated with incident record values at the start of a flow, the data pill preserves these values for the rest of the flow.

**Data pill population**

Flow Designer populates data pill values as soon as the data becomes available regardless of where the data pill is located in the flow sequence. For example, suppose that you have a flow triggered by the creation of an incident record with the following actions.

1. Update (Incident) Record that adds a text string to (Trigger->Incident Record->Short description).
2. Log the value of (Trigger->Incident Record->Short description).
3. Log the value of (1->Incident Record->Short description).

Action-1 and Action-2 both use the data pill (Trigger->Incident Record->Short description). Since the trigger record is available as soon as the flow starts, these values are set before running these actions.

**Delayed data pill population**

When an action, flow logic, or step includes more than one data pill in the same input, the system delays running it until all data pill values have been populated. This delay might produce unexpected values or prevent flow logic from running at all.

For example, this flow produces unexpected values.

1. Update (Incident) Record that adds a text string to (Trigger->Incident Record->Short description).
2. Log the value of (Trigger->Incident Record->Short description).
3. Log the value of (1->Incident Record->Short description).
4. Log the value of (Trigger->Incident Record->Short description) and (1->Incident Record->Short description).

This flow produces the unexpected result of both data pills in Action-4 evaluating to the same value.

**Flow administration modules**

Identify and troubleshoot potential issues by reviewing action and flow executions, their result state, and their runtime duration.

Flow Designer provides administrators and flow operators these modules to manage flows.

**Today's Executions**

Displays a list of flow context records for flows run today. Use this information to identify flows run today.

**Active flows**

Displays a list of flow context records for running flows where the State is Waiting. Use this information to identify flows that are waiting for a trigger or condition to continue.
Event Queue
Displays a filtered list of event records where the Queue is flow_engine and the State is Ready. Use this information to identify flows that are waiting on event processing.

Operations Dashboard
Displays a responsive dashboard containing a count of flows run and the average flow runtime. View statistics for today or over the last 30 days. Use this information to determine the health and performance of flow execution.

Settings
Displays the list of Flow and Action Settings records. Use this table to identify which actions and flows have had reporting disabled. Create records on this table to control whether reporting is done on an action or flow.

Properties
Displays the system properties used to configure how the system processes flows.

Usage Overview
Displays transaction counts between your instance and third-party systems. The Usage Overview is not available in the base system and requires the ServiceNow® IntegrationHub subscription.

Flow Designer landing page
Access or create actions, flows, subflows, or their execution details.

Flows
The Flows screen contains all the flows that your installation of Flow Designer can use. Selecting a flow opens the flow in a new tab. You can see the scope the flow was created in, the internal name of the flow, whether the flow is published or in draft status, whether the flow is active, and update information.

Subflows
The Subflows screen contains all the subflows that your installation of Flow Designer can use. Selecting a subflow opens the subflow in a new tab. You can see the scope the subflow was created in, the internal name of the subflow, whether the subflow is published or in draft status, whether the subflow is active, and update information.

Actions
The Actions screen contains all the actions that your installation of Flow Designer can use. Selecting an action opens the action in a new tab. You can see the scope the action was created in, where the action is accessible from, whether the action is active, and update information.

Executions
The Executions screen shows a history of actions and flows run, including the current state and duration of each run.

Help
The Help landing page contains links to Flow Designer Guided Tour, Documentation, Videos, and Forum Discussion.

+ New
You can create a new flow or action by selecting an action from the list.
Flow Designer system properties

Configure how the system processes flows.

These properties are available for Flow Designer.

To set Flow Designer system properties, click Flow Designer > Properties or navigate to the System Properties (sys_properties) table.

Properties for Flow Designer

<table>

### Flows

Automate processes with a sequence of reusable actions such as manage records, ask for approvals, create tasks, and send notifications. Define trigger conditions to start a flow and variables to pass information between actions.

All flows consist of **properties**, a **trigger**, a sequence of **actions**, and the **data** collected or created.

### Flow properties

The flow properties information about the flow.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the flow</td>
</tr>
<tr>
<td>Protection</td>
<td>Choose whether the flow is read only by choosing from None or Read-only</td>
</tr>
<tr>
<td>Application</td>
<td>Select an application for the flow. This property is set when creating the flow and cannot be changed afterwards.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the flow.</td>
</tr>
<tr>
<td>Run As</td>
<td>Choose whether the flow runs as System User or the user who initiates the session.</td>
</tr>
</tbody>
</table>

### Triggers

The trigger specifies the conditions that start the flow. When the trigger condition is true, the system starts the flow.
Flow Designer supports record-based, schedule-based, and application-based trigger types. For detailed descriptions of trigger types, see *Flow trigger types*.

**Actions**

Within *Actions*, flow designers can add actions, flow logic, subflows, or other flows.

Each action is a set of reusable business logic that produces a specific outcome when provided with its input values. Flow designers configure actions by specifying where they go in a flow sequence and by selecting the data they use as input values. As a flow runs, actions earlier in the sequence generate outcomes or output values that become available as data to actions later in the flow.

By default, the system provides a collection of core actions that can be added to any flow. Core actions cannot be viewed or edited from the Action Designer interface. Some applications include spokes which add application-specific flows and actions. Spoke actions are typically read-only but can be copied and customized. Developers may also create their custom actions from the Action Designer interface.

**Flow data**

Flows store any data gathered or generated as variables in the *Data* pane. Each variable has its own pill that Flow designers can use to drag the variable value to an action input or output. Flow Designer generates the pill name based on the contents and its data type. The system specifies the variable data type next to the pill.
Example flow data

Flow logic

Flows may contain flow logic to specify conditional or repeated actions. The system provides these flow logic options.

For detailed descriptions of flow logic types, see Flow logic.

Testing flows

After adding a trigger and one or more actions, flow designers can test a flow. Testing a flow sets the trigger conditions to true and runs all actions. For flows that have record-based triggers, flow designers may specify an existing test record to use as input. Flow designers should always test flows on non-production instances containing relevant demonstration data since testing a flow creates or changes records on the instance.

Flow execution details

The system generates flow execution records, log messages, and reports for each flow run. The flow context is a related record containing the current state and runtime values of the flow. The system generates a context record each time a flow is run.
Roles

To access Flows, a user must have the flow_designer or admin roles.

Design considerations

Create a subflow when you only want a flow to run from a script

A flow runs whenever its trigger conditions are met. If you want a flow to run only when it is called from a script, create a subflow instead. Since a subflow has no trigger conditions, it will only run when called by another flow or a script call.

Use flow logic or a schedule-based trigger to control flow timing

To pause a flow for a specific duration, use Wait for a duration flow logic. To run a flow at a specific time, use a schedule-based trigger. Avoid using the gs.sleep() method to wait within a flow.

More Actions

Click the More Actions button to access additional options for the flow.

Stages

Access the stages for a flow.

Manage flow catalog variables

Manage the catalog variables available to Service Catalog-triggered-flows.

Copy flow

Create a copy of the open flow in an application you specify.

Configurations

Enable or disable the Show draft actions, Show triggered flows, Show store spokes, and Show inline script toggle options.

Code Snippet

Generate a code snippet to call a specific flow, subflow, or action.

Manage security

Enable or disable the Callable by Client API option.

Manage natural language title

Create or edit a flow title with styled or dynamic text. For more information, see Manage natural language titles.

Flow trigger types

The trigger specifies the conditions that start the flow. When the trigger condition is true, the system starts the flow.
Record triggers

Follow these design considerations when creating record triggers.

Create unique filter conditions for record triggers on the same table

To prevent flows from overwriting each other, create unique filter conditions for each flow running on the same table. If multiple flows on the same table have the same filter, there is no way to know the order in which the flows will run.

Ignore records added or updated by import and update sets

Record triggers ignore records added or updated by applying an update set or importing an XML file. These operations apply to the entire application or table rather than an individual record.

Replace record triggers on Service Catalog tables with Service Catalog application triggers

Flow Designer no longer displays Service Catalog tables as options for record triggers. Instead, create flows that use the Service Catalog application trigger type.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Starts a flow when a record is created in a specific table.</td>
</tr>
<tr>
<td>Trigger</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>

<tr>
<td></td>
<td>· <strong>For each unique change</strong>: Triggers the flow for every unique update to a non-system field even if the flow is currently running.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: The system stores a history of every change to a record and determines whether the change is unique. For example, if an incident record’s State field changes from In Progress to On Hold, the flow will run. However, if the State field then changes back to In Progress, the flow will not run.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Flows that have a record trigger that runs <strong>For each unique change</strong> can produce recursions when run in a non-interactive session. When such flows make a change to the trigger record, the change meets the flow trigger conditions and causes a recursion.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Once</strong>: Triggers the flow once for the life of the record.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Only if not currently running</strong>: Triggers the flow for every unique change if the flow is not currently running. This behavior is the same as the <strong>Always</strong> option in previous releases.</td>
</tr>
<tr>
<td></td>
<td>· <strong>For every update</strong>: Triggers the flow every time the record is updated, regardless of whether there has already been or there currently are any running contexts for the flow.</td>
</tr>
</tbody>
</table>
### Trigger Description

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created or Updated</td>
<td>Starts a flow when a record is either created or updated in a specific table. Requires selecting when to run the flow.</td>
</tr>
<tr>
<td></td>
<td>• <strong>For each unique change</strong>: Triggers the flow for every unique update to a non-<a href="#">system field</a> even if the flow is currently running.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: The system stores a history of every change to a record and determines whether the change is unique. For example, if an incident record’s <a href="#">State</a> field changes from In Progress to On Hold, the flow will run. However, if the State field then changes back to In Progress, the flow will not run.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Flows that have a record trigger that runs <strong>For each unique change</strong> can produce recursions when run in a non-interactive session. When such flows make a change to the trigger record, the change meets the flow trigger conditions and causes a recursion.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Once</strong>: Triggers the flow once for the life of the record.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Only if not currently running</strong>: Triggers the flow for every unique change if the flow is not currently running. This behavior is the same as the <a href="#">Always</a> option in previous releases.</td>
</tr>
<tr>
<td></td>
<td>• <strong>For every update</strong>: Triggers the flow every time the record is updated, regardless of whether there has already been or there currently are any running contexts for the flow.</td>
</tr>
</tbody>
</table>

**Note**: Flows including approval actions should only run the trigger once.

### Date triggers

Use date triggers to start a flow after a specific date and time or repeatedly at scheduled intervals.

**Note**: Because flows are processed asynchronously, a flow with a date trigger may not run at the exact scheduled time its trigger conditions were met. For example, if a scheduled flow is triggered during core business hours, the system may have to process other events in the queue before it can run the scheduled flow.
<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daily</td>
<td>Starts a flow at a specific time every day.</td>
</tr>
<tr>
<td>Weekly</td>
<td>Starts a flow at a specific time every week.</td>
</tr>
<tr>
<td>Monthly</td>
<td>Starts a flow at a specific time every month.</td>
</tr>
<tr>
<td>Run Once</td>
<td>Starts a flow once at a specific time but does not repeat. If you select a past date or time, the system schedules the flow to run as soon as possible.</td>
</tr>
<tr>
<td>Repeat</td>
<td>Starts a flow at regular intervals you define.</td>
</tr>
</tbody>
</table>

**Application triggers**

Use application triggers to start a flow when application-specific conditions are met.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetricBase</td>
<td>Starts a flow when a MetricBase trigger is met. Requires the MetricBase application. For more information, see Create a flow with a MetricBase trigger.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>Starts a flow from a Service Catalog item request. For more information, see Create a flow with a Service Catalog trigger.</td>
</tr>
<tr>
<td>SLA Task</td>
<td>Starts a flow from an SLA Definition record. For more information, see Create a flow with an SLA Task trigger.</td>
</tr>
</tbody>
</table>

**Inbound email triggers**

Start a flow when your instance receives an email.

Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

With inbound email actions, you don't have full control over email attachment handling or assigning the target record of an email. When you create a flow with an inbound email trigger, you can perform these actions with the Move Email Attachments to Record action and the Associate Record to Email action. For greater control over email attachments, you can also use the Look up email attachments action to access a specific attachment as a data pill.

Although you can process an inbound email with multiple inbound email actions, you can't process an inbound email with multiple flows by default. Additional configuration is required. For information on how to stop processing in inbound email actions, see Specifying the inbound email processing order.

For more information on running multiple flows on an inbound email, see Allow multiple triggers to process an inbound email.

The following diagram shows how inbound emails are processed by inbound email triggers. After the email has been classified as a reply, forward, or new email, the system tries to match the email
to an active inbound email trigger. If the email meets the conditions of an inbound email trigger, the flow runs. If the flow issues stop processing, the email is finished being processed. If the flow does not issue stop processing, the system tries again to match the email to an active inbound email trigger. If at any point the email does not match an active inbound email trigger, the system tries to match the email with an active inbound email action instead.

**Diagram:**

1. **Start**
   - **Yes**
     - **Email matches conditions of an active inbound email trigger**
       - **Yes**
         - **Flow issues stop processing**
           - **Yes**
             - **Stop**
           - **No**
             - **Stop**
       - **No**
         - **There are more inbound email triggers to evaluate**
           - **No**
             - **Stop**
           - **Yes**
             - **Inbound Email Action Execution**

**Processing emails with inbound email triggers**

**Note:** With other types of flows, you can choose to run as a system user or the user who initiates the session. However, inbound email flows always run as the sender of the inbound email. If the system does not recognize the sender, inbound email flows will run as the...
Guest user. The actions of inbound email flows are limited by user ACL restrictions. To test access controls for an inbound email flow, impersonate a typical inbound email user and manually trigger the flow.

Advanced options

Specify the user session requirements needed to start a flow with Advanced Options.

When to run the flow

Determine the type of session that can trigger the flow, and whether to run the flow when triggered by certain users.

**Interactive session options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only Run for Non-Interactive Session</td>
<td>Flow that is only triggered in non-interactive sessions. See Non-interactive sessions.</td>
</tr>
<tr>
<td>Only Run for User Interactive Session</td>
<td>Flow that is only triggered in interactive sessions.</td>
</tr>
<tr>
<td>Run for Both Interactive and Non-Interactive Sessions</td>
<td>Flow that is triggered in all sessions.</td>
</tr>
</tbody>
</table>

**User options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not run if triggered by the following users</td>
<td>Flow that does not trigger for a selected list of users. Click the Add User icon to add users to the list.</td>
</tr>
<tr>
<td>Only run if triggered by the following users</td>
<td>Flow that triggers only for a selected list of users. Click the Add User icon to add users to the list.</td>
</tr>
<tr>
<td>Run for any user</td>
<td>Flow that runs for any user.</td>
</tr>
</tbody>
</table>

**Where to run the flow**

Determine whether to run the flow in the background or in the current session.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run flow in background (default)</td>
<td>Flow that runs asynchronously in the background. Use this option for flows that do not require immediate updates and to allow other system processes to run at the same time.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Run flow in foreground</td>
<td>Flow that runs synchronously in the current session. Use this option to provide immediate updates to an end user. For example, if a flow opens a task after the previous task closes, use this option to open the next task immediately after a user closes one.</td>
</tr>
</tbody>
</table>

**Note:** Running a flow in foreground blocks the current session thread and prevents it from running anything else until the flow finishes. To avoid making your system unresponsive while running a flow, do not use this trigger option for flows that take a long time to complete.
Data pills available by trigger type

Flow designers have access to data pills from the trigger.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Data pills available</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>(Table Label) Record</td>
</tr>
<tr>
<td></td>
<td>An object containing the triggering record.</td>

</tr>
<tr>
<td></td>
<td>Run Start Time:</td>
</tr>
<tr>
<td></td>
<td>The Date/Time value of when the flow started.</td>
</tr>
</tbody>
</table>

Note: To process the Changed Fields array data pill, you will need to use For Each flow logic. For more information on working with array data pills, see Complex data.
Create a flow

Automate a process to run one or more actions when a trigger condition occurs.

- Setting up an application in Guided Application Creator to store Flow Designer content.
- Role required: flow_designer or admin

Users with flow_designer or admin role should know the application table structure and be aware of any existing business logic associated with the target tables of a flow or subflow. Be sure to disable any conflicting business rules or workflows before creating a flow or subflow.

Creating a custom application to contain your Flow Designer content enables you to deploy the application using the application repository or the ServiceNow Store.

1. Navigate to Flow Designer > Designer.
2. Click + New > New Flow.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify your flow. The system computes the internal name of the flow from the name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of your flow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Selection to specify if the flow is read-only. You can only select a value when you create the flow in an application scope that you own.</td>
</tr>
<tr>
<td>Run As</td>
<td>Selection to specify if the flow runs as system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, when you want incident record comments to come from the current user, or approval emails to originate from the approver. Run As settings for a flow don't apply to child subflows. When flows run as the user who initiates the session, the system limits flow actions by user ACL restrictions. Ensure that security restrictions don't prevent users who trigger the flow from performing flow actions. Flows run by the initiating user also respect user-specific settings such as date/time formats.</td>
</tr>
</tbody>
</table>

Note: Inbound email flows ignore this setting and always run as the user who initiates the session. To test access controls for an inbound email flow, impersonate a typical inbound email user and manually trigger the flow.

4. Click Submit.
   The system displays the Flow Designer page.
5. Add a trigger.
   a) From the Trigger list, select the type of trigger.
      For more information on trigger types, see Flow trigger types.
      The system displays a set of fields depending on the type of trigger that you've selected.
   b) To specify the trigger, fill in the fields.
      For a record-based trigger, for example, fill in the table and conditions.
6. To add actions, flows, subflows, or flow logic, click **Select to add an Action, Flow Logic, or Subflow**.
   a) Select an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Select the desired action. Flow Designer includes a set of Actions available to flows and subflows. Alternatively, a user with the action_designer role can create additional actions to add to flows. The IntegrationHub and spoke plugins install additional actions. To add draft actions from the More Actions menu, set Show draft actions to true. To view spokes available in the ServiceNow Store, set Show store spokes to true from the More Actions menu.</td>
</tr>
<tr>
<td>Flow Logic</td>
<td>Select an option to specify conditional or repeated operations.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Select a published subflow and define input values. In addition to adding a subflow as a flow action, you can enable the Show triggered flows option from the More Actions menu to select an activated flow and define the required inputs. Running a triggered flow ignores its trigger conditions and runs all actions.</td>
</tr>
<tr>
<td>Manage natural language title</td>
<td>Create a flow, subflow, or action title with styled and dynamic text.</td>
</tr>
</tbody>
</table>

   c) Click **Done**.

   d) Repeat adding actions until complete.

7. Click **Save**.
   Flow Designer saves a draft of the flow, trigger, and actions.
   - Test your flow until it is ready to activate.
   - **Note:** The system only triggers active flows.
   - Transfer your flow to another instance.
     - **Deploy** your flow from the application repository when your application is complete and ready for release.
Create a flow with an inbound email trigger

Start a flow when your instance receives an email.

Role required: flow_designer or admin

1. Navigate to Flow Designer > Designer.
2. Click + New > Flow.
3. Define the flow properties, and then click Submit.
   For more information, see Create a flow.
4. In the Trigger section, click the plus icon
   to add a trigger.
5. Select Inbound Email.
6. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email conditions</td>
<td>Conditions to qualify which emails start your flow. The condition builder</td>
</tr>
<tr>
<td></td>
<td>uses fields from the Email (sys_email) table. For example, to trigger a flow</td>
</tr>
<tr>
<td></td>
<td>for an inbound email in which a user replies to a system notification, set</td>
</tr>
<tr>
<td></td>
<td>the condition to (Receive type) is (Reply).</td>
</tr>
<tr>
<td>Reply Record Type</td>
<td>Table that is associated with the target email. For example, to trigger a</td>
</tr>
<tr>
<td></td>
<td>flow from a reply email that a user sends from an incident record notification,</td>
</tr>
<tr>
<td></td>
<td>select Incident (incident).</td>
</tr>
</tbody>
</table>

7. Click Done.
8. Add actions, subflows, and flow logic to the flow.
9. Optional: Add stages to the flow to report progress to the requester.
   See Flow Designer stages.
10. Test the flow. If the test is successful, activate the flow.
    For more information, see Test a flow and Activate a flow.

When an inbound email meets the conditions that you set, the associated flow triggers and runs the actions. Allow multiple triggers to process an inbound email Configure Flow Designer to allow an inbound email to be processed by multiple inbound email triggers in a specific order.

Role required: admin

Although you can process an inbound email with multiple inbound email actions, you can't process an inbound email with multiple flows by default. You can add a system property to let process owners use multiple triggers to process an inbound email.

**Warning:** Allowing multiple triggers to process an inbound email may increase maintenance and decrease system performance.

1. Add a system property with the following settings:
   - Name: glide.hub.flow.inbound_email_trigger.show_advanced
After you activate the system property, the **Order** and **Stop processing** fields appear on the inbound email trigger, as shown in the following figure.

2. Create multiple flows with an inbound email trigger.
   For more information, see [Create a flow with an inbound email trigger](#).

3. Specify the processing order for each of the inbound email flows:
   a) Open each flow and enter a value in the **Order** field.
      To give the flow higher priority over other flows, enter a lower number.
   b) Enable or disable stop processing for each flow in your sequence.
      To allow an inbound email to be processed by the next flow in your sequence, clear the **Stop processing** option.
Create a flow with a MetricBase trigger

Start a flow when a MetricBase trigger is met. MetricBase triggers track time series data and can monitor when a threshold is reached, when a trend is detected, or when a system stops reporting data.

Role required: flow_designer or admin

MetricBase triggers are not available on the base system. The MetricBase application requires a separate subscription and must be activated by ServiceNow personnel.

1. Navigate to Flow Designer > Designer.
2. Click + New > New Flow.
3. Define the flow properties.
   For more information, see Create a flow.
4. In the Trigger section, add a trigger and select MetricBase.
5. Complete the trigger fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetricBase Trigger</td>
<td>Select or create a MetricBase trigger record to start the flow. For types of MetricBase triggers, see MetricBase triggers.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only table that contains the metric.</td>
</tr>
<tr>
<td>Condition</td>
<td>Click Add filters to set field-based conditions that determine when the flow runs.</td>
</tr>
<tr>
<td>Condition Script</td>
<td>Define a script in the Additional MetricBase Trigger Filtering and Moderation table to prevent duplicate metric events from re-triggering a flow. For example, if a metric hovers at a defined trigger threshold, create a script that defines whether to run the flow once when the metric is met, or every time the triggering threshold is exceeded.</td>
</tr>
</tbody>
</table>

6. Add actions, subflows, and flow logic to the flow.
7. Test the flow. Once behaving as desired, activate the flow.
   For more information, see Test a flow and Activate a flow.

The MetricBase application monitors time series data on the Now Platform. When the selected trigger is met, the flow runs.

Create a flow with a Service Catalog trigger

Start a flow when a Service Catalog item is requested to automate the fulfillment process.

Role required: flow_designer or admin

Unlike a record trigger which runs on all records in a table, the Service Catalog trigger runs on all catalog item requests for a specific item when the catalog item is configured to run a specific flow. For example, you can define a flow that runs every time there is a request for a tablet. The requested item becomes the flow trigger record.

1. If not already created, create the catalog item to associate with the flow.
   a) Navigate to Service Catalog > Catalog Definition > Maintain Items.
      The Catalog Items (sc_cat_item) table opens.
   b) Click New.
c) Complete the fields.
   For a detailed description of catalog item fields, see Create or edit a catalog item.

   Note: If you plan to add stages to your flow, verify that there is not an existing workflow associated with the item that also has stages. Clear the values of the Workflow and Execution Plan fields to prevent conflicting stages from reporting to the requested item stage field.

2. Create the flow to associate with the catalog item. When triggered, this flow processes the catalog item request.
   a) Navigate to Flow Designer > Designer.
   b) Click + New > New Flow.
   c) Define the flow properties.
      For more information, see Create a flow.
   d) In the Trigger section, add a trigger and select Service Catalog.
   e) Optional: Create flow-specific catalog variables available only to flow actions. See Create flow Service Catalog variables.
   f) Add actions, subflows, and flow logic to the flow.
      Some actions enable you to manage catalog items. For example, the Create Catalog Task action generates a task for the requested item, and the Get Catalog Variables action enables you to access catalog variables as data pills in the flow. See Create Catalog Task action and Get Catalog Variables action.
   g) Optional: Add stages to the flow to report progress to the requester.
      See Flow Designer stages.
   h) Test the flow. Once behaving as desired, activate the flow.
      For more information, see Test a flow and Activate a flow.

3. Add the flow to the Flow field of the catalog item you created.
   a) Navigate to the catalog item.
   b) In the Flow field, select the flow you created.

   Note: The Flow field only displays flows with a Service Catalog trigger.

   c) Click Update.

When the catalog item is requested, the associated flow triggers and runs the actions.

Create flow Service Catalog variables

Create Service Catalog variables that are only available to a specific Service Catalog-triggered flow. Flow-specific variables are available to catalog tasks and actions in the flow.

Role required: flow_designer or admin

Flow Service Catalog variables display in the Catalog Variables field of the Create Catalog Task and Get Catalog Variables actions. They display in the Flow:variable_name format and are only available to the flow in which they are defined.
For more information about Service Catalog actions, see Create Catalog Task action and Get Catalog Variables action.

1. Open or create a flow with a Service Catalog trigger.
2. Click and select Manage flow catalog variables. The Flow catalog variables table opens.
3. Click New to add a new variable available to the flow.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>The variable type that you want to create.</td>
</tr>
<tr>
<td>Application</td>
<td>Read-only field that indicates which applications can use this variable.</td>
</tr>
<tr>
<td>Catalog item</td>
<td>Catalog item using the variable.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to make the variable mandatory as part of the ordering process.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to make the variable available for use</td>
</tr>
<tr>
<td>Selection Required</td>
<td>Check box to require users to select the check box variable. For example, use this option to require users to select an I agree check box for an agreement form. If users try to submit the agreement form without selecting the check box, an alert message is displayed to tell users that they must select the check box.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the variable is placed on the page for the catalog item. The variables are organized from top to bottom from least to greatest order value. For example, a variable with an order value of 1 is placed above other variables with higher-order values.</td>
</tr>
<tr>
<td>Global</td>
<td>If selected, the variable is available for all catalog tasks within service catalog workflows or execution plans by default. If deselected, the variable must be associated with individual catalog tasks.</td>
</tr>
<tr>
<td>Map to field</td>
<td>Maps the variable to a specific field on the table for the record producer. This field appears if the variable belongs to a record producer.</td>
</tr>

**Question**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question</td>
<td>Question to ask users ordering the catalog item.</td>
</tr>
<tr>
<td>Name</td>
<td>A name to identify the question.</td>
</tr>
</tbody>
</table>

**Note:** If this field is empty, its value is auto-populated based on the Question field for all variable types except break, container split, and container end.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tooltip</td>
<td>Tooltip text to display when users point to the variable. Enter a brief note to describe the purpose of the 'Question'.</td>
</tr>
</tbody>
</table>

**Annotation**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show help</td>
<td>If selected, displays the help text and instructions for the variable.</td>
</tr>
</tbody>
</table>

**Note:**
- It is not available for break and check box variables.
- Help text and instructions are not available for a variable set.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always Expanded</td>
<td>If selected, the <strong>Help text</strong> and <strong>Instructions</strong> field value are expanded by default when the catalog item page loads. This check box appears only when the <strong>Show help</strong> check box is selected.</td>
</tr>
<tr>
<td>Help tag</td>
<td>If the <strong>Always Expanded</strong> check box is deselected, click the value specified in this field to display the <strong>Help text</strong> and <strong>Instructions</strong> field values.</td>
</tr>
<tr>
<td>Help text</td>
<td>Help information for a service catalog variable.</td>
</tr>
<tr>
<td>Instructions</td>
<td>Information that requires rich text formatting or adding images to support help information.</td>
</tr>
</tbody>
</table>

**Note:** For HTML tables, use sizes that are within the width of the variable.

---

**Type Specifications** *(The fields in this section vary for each variable type)*

<table>
<thead>
<tr>
<th>Variable Width</th>
<th>Width for the variable on the catalog item page, to specify what percentage of the screen size that it can span. For details, see <em>Configure a default width for service catalog variables</em>.</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Reference qual</td>
<td>Qualifiers to restrict data that is available in the field. Supports reference qualifiers and advanced reference qualifiers. Returns all matching results (no maximum).</td>
</tr>
<tr>
<td>Note:</td>
<td>For security reasons, the use of scripts in the Reference qual field is restricted to system administrators through the Allow javascript in Default Value business rule.</td>
</tr>
<tr>
<td></td>
<td>This field appears for list collector, lookup multiple choice, and lookup select box variables, reference variables. It appears for reference variables when Use reference qualifier is set to Dynamic.</td>
</tr>
<tr>
<td>Reference qualifier condition</td>
<td>Options to build conditions. This field appears for reference variables when Use reference qualifier is set to Simple.</td>
</tr>
<tr>
<td>Scale max</td>
<td>Highest value on the scale of available options for the variable. This field appears for numeric scale variables.</td>
</tr>
<tr>
<td>Scale min</td>
<td>Lowest value on the scale of available options for the variable. This field appears for numeric scale variables.</td>
</tr>
<tr>
<td>Unique values only</td>
<td>Check box to require a unique value for the field. When this check box is selected, two records cannot have the same value for that field. This field appears for lookup multiple choice, lookup select box, and select box variables.</td>
</tr>
<tr>
<td>Use confirmation</td>
<td>Check box to prompt users to reenter data to verify their entries. This field appears for masked variables.</td>
</tr>
<tr>
<td>Use encryption</td>
<td>Check box to store the answer in encrypted format in the database. If not encrypted, the answer is stored in plain text format. Encryption uses Triple DES with system encryption. This field appears for masked variables.</td>
</tr>
<tr>
<td>Use reference qualifier</td>
<td>Type of qualifier to use. This field appears for reference variables.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Validation Regex</td>
<td>Regular expression that validates the variable value. This field is displayed only for Single Line Text and Wide Single Line Text variable types. To define regular expressions, see <a href="#">Define a regular expression for a variable</a>.</td>
</tr>
<tr>
<td>Note:</td>
<td>• This field is also applicable in Service Portal.</td>
</tr>
<tr>
<td></td>
<td>• The max_length attribute value is valid even when the validation regex is set.</td>
</tr>
<tr>
<td></td>
<td>• You cannot add a catalog item with regex validation errors to the wishlist.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Default value: Default value for the variable.</td>
</tr>
<tr>
<td></td>
<td>Variable attributes: Attributes for this variable.</td>
</tr>
<tr>
<td>Permission</td>
<td>If no role is specified in this tab for the read, write, or create actions, all users who can access the catalog item can perform these actions irrespective of their role. For example, if no role is specified for the <strong>Write roles</strong> field, all users who can access the catalog item can edit the variable value in the variable editor. A user with a role that does not match any of the following roles cannot set variable values even through scripting. These roles are not available for Label, Break, Container Split, Container End, Macro, Macro with Label, and UI Page variables.</td>
</tr>
<tr>
<td>Read roles</td>
<td>Roles that can view the variable before or after requesting the catalog item or record producer. Only a user with the roles specified in this field can view the variable.</td>
</tr>
<tr>
<td>Write roles</td>
<td>Roles that can edit the variable in the variable editor after requesting the catalog item or record producer. If a user does not have the roles specified in this field, the variable is read-only in the variable editor.</td>
</tr>
<tr>
<td>Create roles</td>
<td>Roles that can create values for the variable before requesting the catalog item or record producer. If a user does not have the specified role, the variable is read-only before requesting the catalog item or record producer.</td>
</tr>
<tr>
<td>Availability</td>
<td>Visible Elsewhere: If selected, the variable is visible in the item form before ordering the item, in VEditor after ordering the item, and in the cart view of the item.</td>
</tr>
</tbody>
</table>
### Visible on Bundles
If selected, the variable is visible when the item is added to a bundle.

### Visible on Guides
If selected, the variable is visible when it is added to an order guide, or when it is added to a catalog item that is included in the order guide.

**Note:** If an order guide has too many items and variables, consider clearing this check box on as many items as possible, to improve loading performance on order guides.

### Visible on Summaries
If selected, the variable is visible on any variable summarizer of the catalog item.
In Service Portal, the variable is visible in the RITM ticket page and the Approval page.
In Now Mobile, the variable is visible in the RITM and the Approval records.

5. Click **Submit**.

Access the variable in the flow by adding a Create Catalog Task or Get Catalog Variables action.

### Create a flow with an SLA Task trigger
Configure your Service Level Agreement (SLA) definition to run a flow as the action plan.
- **Setting up an application in Guided Application Creator** to store Flow Designer content.
- **Role required:** flow_designer or admin

An SLA Task trigger only runs when a task record matches the conditions of a Service Level Agreement (SLA) definition. For example, you can run a flow whenever an incident record matches the **Priority 1 resolution (8 hour)** SLA Definition.

1. Navigate to **Flow Designer > Designer**.
2. Select **+ New > New Flow**.
3. On the form, fill in the fields.

### Flow Properties form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify your flow. The system computes the internal name of the flow from the name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of your flow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Selection to specify if the flow is read-only. You can only select a value when you create the flow in an application scope that you own.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>Run As</td>
<td>Selection to specify if the flow runs as system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, when you want incident record comments to come from the current user, or approval emails to originate from the approver. <strong>Run As</strong> settings for a flow don't apply to child subflows. The system runs flow actions as the user who initiates the flow. Verify that all users who can trigger a flow have the necessary security access to run its actions. The initiating user also determines user-specific settings such as date/time formats.</td>
</tr>
</tbody>
</table>

**Note:** Inbound email flows ignore this setting and always run as the user who initiates the session. To test access controls for an inbound email flow, impersonate a typical inbound email user and manually trigger the flow.

4. **Select Submit.**
   The system displays the Flow Designer page.
5. **Select Select to add a Trigger > Application > SLA Task.**
6. Add actions, subflows, and flow logic to the flow.
   Add **SLA Percentage Timer actions** to specify what to do when a task record attached to an SLA reaches specific percentages of completion.
7. **Test the flow.** Once behaving as desired, activate the flow.
   For more information, see **Test a flow** and **Activate a flow.**
8. **Create an SLA definition**
   a) In the **Flow** field, select the SLA Task flow you previously created.
   
   **Note:** The **Flow** field only displays flows with an SLA Task trigger.
   
   b) Click **Submit.**

When the SLA Definition conditions are true, the system runs the specified SLA task flow.

**Test a flow**
Before activating a flow so other users can access it, test to make certain it works the way you expect.

Role required: flow_designer or admin.

Testing a flow bypasses the flow trigger conditions to run it with sample data, which you provide. For example, testing a flow with a record **Created** trigger causes the system to act as if the selected record was created. For a list of data pills available by trigger type, see **Flow trigger types.**

1. If necessary, navigate to **Flow Designer > Designer**, then double click the row for the flow you want to test.
2. If necessary, save the flow.
3. **Select Test.**
   The system displays the Test flow dialog. The contents of the Test flow dialog depend on the type of trigger.
4. If the flow has a record trigger, create or select a record to use for the test.
To create a record, select the Create new record button.

5. If the flow has a record Updated or Created or Updated trigger, specify which fields and values changed in the update.

To specify a field value change, select the Create new changed field button for each field whose value you want to change. Complete the changed field details for each changed field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Name</td>
<td>The field updated by the test.</td>
</tr>
<tr>
<td>Previous Value</td>
<td>The field value prior to the update.</td>
</tr>
<tr>
<td>Current Value</td>
<td>The field value after the update.</td>
</tr>
<tr>
<td>Previous Display Value</td>
<td>The field display value prior to the update.</td>
</tr>
<tr>
<td>Current Display Value</td>
<td>The field display value after the update.</td>
</tr>
</tbody>
</table>

6. Select Run Test.
   The system tests the flow.

7. Select Flow has been executed. To view the flow, click here.
   The system displays the flow execution details for the test.

Review the Flow execution details.

**Activate a flow**

Activate a flow to make it available to other users.

Role required: flow_designer or admin

When you save a flow, you can test it, but no other users on the instance can see or run it. To make the flow available to other users, activate it.

1. Navigate to Flow Designer > Designer.
2. Locate the flow you want to activate from the list of saved flows and open it.
3. Click Activate.

**Edit a flow**

Edit an existing flow.

Role required: flow_designer or admin

1. If necessary, navigate to Flow Designer > Designer, then double click the row for the flow you want to edit.
   The system displays the flow designer page.
2. Take the appropriate actions to edit the flow.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change the flow name or description</td>
<td>Click <strong>Edit Properties</strong>, enter the values you want into the appropriate fields, then click <strong>Update</strong>.</td>
</tr>
<tr>
<td>Note:</td>
<td>You cannot change the scope of an automationHub flow after you have saved it.</td>
</tr>
<tr>
<td>To edit the trigger</td>
<td>Click the trigger description, fill in the fields as desired, then click <strong>Done</strong>.</td>
</tr>
<tr>
<td>Note:</td>
<td>Modifying triggers can result in the deletion of referenced action configurations.</td>
</tr>
<tr>
<td>To edit an existing action</td>
<td>Click the action description, fill in the fields as desired, then click <strong>Done</strong>.</td>
</tr>
<tr>
<td>To add a new action</td>
<td>Click the plus icon in the ACTION section then proceed as you would for adding an action to a new flow.</td>
</tr>
</tbody>
</table>

3. To save your changes, click **Save**.

### Delete a flow
Delete a flow that you no longer need.

**Role required:** flow_designer or admin

You can only delete records that are in the same application scope as the current session.

1. If necessary, navigate to **Flow Designer > Designer** to display the flow designer page.
2. Check the selection box for the row corresponding to the flow you want to delete.
3. Click **Actions on selected rows . . .**, then click **Delete**.

### Allow flow designers to dynamically set field values
Enable flow designers to dynamically set field values when adding the subflow or action to a flow. For example, allow flow designers to set the priority and short description of a Create Task action.

A dynamic field can only be created in a subflow action or action step that creates or updates a record, such as Create Catalog Task, Create Task, Create Record, and Update Record.

**Role required:** admin or action_designer

When creating or updating a record in a subflow action or action step, you can set static or dynamic values. A static value is the same every time a flow runs. A dynamic value allows a flow designer to change it every time a flow runs. For example, setting the Urgency to the static value 1 - High generates an urgent catalog task every time the flow runs.

1. Open an action in Action Designer or a subflow in Flow Designer that you want to create a dynamic value for.
2. Create an input.
   a) In the **Label** field, enter a label to help flow designers understand the purpose of the field. This is the label for the field when the flow designer adds the subflow or action to a flow. For example, enter **Select fields**.
b) In the **Type** field, select Template Value. Select the table containing the record you will create or update. For example, if you are adding a Create Catalog Task action in a subflow, set the Type to Template Value.Requested Item (sc_req_item).

3. Add an action step or action that will use the template value.
   The action step or action must create or update a record. For example, add a Create Task action to a subflow that will create an incident task.

4. Drag the Template Value data pill into the **Field Values** or **Fields** field.

5. Optional: Add static values in addition to the dynamic field by selecting **+ Add Field Value**.

   **Note:** Avoid setting static values that you want flow designers to set from the dynamic field. The flow always uses the static value from the subflow or action step over a value entered from a dynamic field. You can use static values to enforce business policies that you do not want flow designers to change.

When the subflow or action is added to a flow, a flow designer can set field values for the record being created or updated.

---

**View activated flows for a table**

View flows with record-based triggers that run on a specific table.
Role required: flow_designer or admin

1. Navigate to a table.
2. Right-click the form header and select Configure > Flow Designer Flows.
   The Flows table opens and displays all flows that have been activated to run on the specified table.

**Actions**

Actions can be added to any flow, enabling process analysts to automate Now Platform features without having to write code.

An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. ServiceNow core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to preset configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

In Flow Designer, a process analyst adds actions to a flow and defines the configuration options.

**ServiceNow Core actions**

A ServiceNow core action is a ServiceNow-provided action available to any flow that cannot be viewed or edited from the Action Designer design environment. For example, the Ask for Approval action is a ServiceNow core action that allows process analysts to use Now Platform approvals. Flow Designer provides a set of ServiceNow core actions to automate Now Platform processes. You can add application-specific ServiceNow core actions by activating the associated spoke.

**Custom actions**

Using a core action enables the process analyst to configure the desired behavior within the flow. To create an action with a pre-set configuration, or to define custom configuration options, a subject matter expert can create a custom action in Action Designer.

**Action limit**

By default, flows can have no more than 50 actions. To change the default behavior, increase the value of the sn_flow_designer.max_actions system property. However, consider the performance impact that a large flow may have on your instance.

**Add Worknote Link to Context action**

Add a journal field entry containing a link to the current flow context record. Use the link to view the flow execution details of the current flow. You can add a flow context link to any record that has a journal field.
Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record. For example, the Task table.</td>
</tr>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record. For example, the trigger record.</td>
</tr>
<tr>
<td>Journal Field</td>
<td>The journal field to insert the link to the flow context record. For example, the work notes field of a task record.</td>
</tr>
<tr>
<td>Additional Comments</td>
<td>The text you want to add to the journal field in addition to the link to the flow context record. For example, the name of the flow run.</td>
</tr>
</tbody>
</table>

Ask for Approval action

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

Approvals is a platform feature that enables users or groups to approve or reject a task.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>

</tr>
</tbody>
</table>
| Rules | Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:  
  - Anyone approves  
  - All users approve  
  - All responded and anyone approves  
  - % of users approve  
  - # of users approve  
  In the field beside the approval rule, add the desired approvers. To add approvers:  
    - Select individual users or groups.  
    - Drag-and-drop or select a field from a record.  
    Select to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list.  
  Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.  
  Note: If you set an approval rule with no rejection rule (or vice versa) and the expected approval state is not met, the runtime value will be canceled. |
| Due Date | Define a due date to ensure that the flow does not remain in a waiting state if the request is not approved or denied.  
  - None: The approval is not dependent on a specific date.  
  - Approve: Automatically approve the step if an action is still pending by the specified date.  
  - Reject: Automatically reject the step if an action is still pending by the specified date.  
  - Cancel: Automatically cancel the step if an action is still pending by the specified date. |
Example

TRIGGER

[Incident] Created or Updated

ACTION

1. Ask For Approval

- Action: Ask For Approval
- Record: Trigger ➔ Incident Record
- Table: Incident [incident]
- Approval Field: Approval
- Journal Field: Approval history

Rules

- Approve
  - When: Anyone approves
  - Trigger ➔ Incident Record ➔ Assigned to ➔ Manager

OR

- Reject
  - When: Anyone rejects
  - Trigger ➔ Incident Record ➔ Assigned to ➔ Manager

Due Date:

- Approve if pending by Relative date 1 Days From
- Days schedule: 8-5 weekdays
## Associate Record to Email action

Associate a record with an Email (sys_email) record so that you can track which record is affected by the email.

### Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Email (sys_email) record that the Target Record associates with.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Record to associate to the email record</td>
</tr>
</tbody>
</table>

### Output

- This action updates the **Target** field on the Email (sys_email) record.

### Example

In the following example, a process owner adds the Associate Record to Email action under an inbound email trigger. The user has also added a Create Catalog Task action in the flow. In the **Email Record** field, the user selects to associate a record to the email that triggered the flow. In the **Target Record** field, the user selects to associate the Catalog Task (sc_task) record that is created in the Create Catalog Task action.
Create Catalog Task action

Creates a record in the Catalog Task (sc_task) table associated to a requested item in the Requested Items (sc_req_item) table. Adds the catalog task record as data to be used in the flow.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
### Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>The Catalog Task (sc_task) table where the catalog task is created. This value is read only.</td>
</tr>
<tr>
<td>Requested Item (Requested Item)</td>
<td>The requested item record from the Requested Items (sc_req_item) table that this catalog task fulfills.</td>
</tr>
<tr>
<td>Short Description</td>
<td>Short description for the catalog task.</td>
</tr>
<tr>
<td>Fields (Catalog Task)</td>
<td>To add the action to a flow, set fields in the catalog task record to the desired value. For example, to set the Urgency, select Urgency and set the desired value.</td>
</tr>
<tr>
<td></td>
<td>If adding the action to a subflow, you can allow flow designers to dynamically set field values.</td>
</tr>
<tr>
<td>Wait</td>
<td>Pauses the flow until this task completes and is no longer active (active=false).</td>
</tr>
<tr>
<td></td>
<td>Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the Wait field. The flow only waits for the task to complete when this field is true.</td>
</tr>
<tr>
<td>Template Catalog Item (Catalog Item)</td>
<td>Select an item from the Catalog Items (sc_cat_item) table to populate the Catalog Variables slushbucket with the associated variables.</td>
</tr>
<tr>
<td>Catalog Variables</td>
<td>Select catalog variables to show on the catalog task form to provide more information or allow the fulfiller to modify the variables.</td>
</tr>
<tr>
<td></td>
<td>You can define flow-specific variables that are displayed in the Available list. To define flow-specific variables, see Create flow Service Catalog variables.</td>
</tr>
</tbody>
</table>
Example

TRIGGER

SERVICE CATALOG

[Service Catalog]

CREATE CATALOG TASK

Action: Create Catalog Task
Table Name: Catalog Task [sc_task]

* Requested Item (Requested Item)
  - Trigger  → Requested Item Record

Short Description: Order from vendor or move from in-stock inventory

Fields (Catalog Task)

Wait

Template Catalog Item (Catalog Item)
  - Apple iPhone 5

Catalog Variables: Available

- data_plan
- color

Selected

- storage
- carrier
- duration
Create Record action

Creates a record on any table. You can dynamically add and configure fields for the record.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the values of fields in the record to be created. For example, to set the short description to a certain value, select <strong>Short description</strong> and set the desired value. If adding the action to a subflow, you can <strong>Allow flow designers to dynamically set field values</strong>.</td>
</tr>
</tbody>
</table>

Create or Update Record action

Create or update a record in a ServiceNow table using a single action. Update a record that exists, or create a record using the values provided.

Identification of existing records

The Create or Update Record action identifies existing records by searching for matching values in the fields that you select as unique identifiers. For example, you can specify that the short description and priority fields uniquely identify an incident. When the action finds an incident with a matching short description and priority, it updates the matching record rather than creating a new record.

**Note:**

- If no field is selected as a unique identifier, the action creates a record with the field values provided.
- If more than one record matches the value of the unique identifiers, the action doesn’t update any records and displays an error message in the flow execution details.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Table in which a record is created or updated.</td>
</tr>
<tr>
<td>Fields</td>
<td>Values of fields in the record to be created or updated.</td>
</tr>
<tr>
<td></td>
<td>If adding the action to a subflow, you can allow flow designers to dynamically set field values. Dynamically set field values can trigger server-side validation rules such as data policies, business rules, and dictionary-defined mandatory fields, but cannot trigger UI policies.</td>
</tr>
<tr>
<td>Determines uniqueness</td>
<td>Option for selecting the field as a unique identifier. This field appears when the required table name and fields are selected.</td>
</tr>
</tbody>
</table>

Create Task action

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td></td>
<td>- Ticket (ticket)</td>
</tr>
</tbody>
</table>

Field Values

Set the values of fields in the task to be created. For example, to set the short description to a certain value, select **Short description** and set the desired value. To associate the task with a parent record, define the **Parent** field.

If adding the action to a subflow, you can **Allow flow designers to dynamically set field values**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait</td>
<td>Waits to complete the action until the task completes and is no longer active (active=false).</td>
</tr>
<tr>
<td></td>
<td>Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the</td>
</tr>
<tr>
<td></td>
<td>data panel into the <strong>Wait</strong> field. The flow only waits for the task to complete when the condition</td>
</tr>
<tr>
<td></td>
<td>field is true.</td>
</tr>
</tbody>
</table>

**Copy Attachment action**

Copies an attachment from the Attachments (sys_attachment) table to a target record.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Note:** Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Attachment Record (Attachment)</td>
<td>Select an attachment record from the Attachments (sys_attachment) table.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Select a record to attach the <strong>Source Attachment Record</strong> to, or drag a Record data pill from the data pane.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table from the list to select a Target Record.</td>
</tr>
</tbody>
</table>

**Delete Attachment action**

Removes one or all attachments associated with a record and deletes the attachment record from the Attachments (sys_attachment) table.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Record</td>
<td>Drag a Record data pill from the data pane to delete one or all attachment records from.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table</td>
<td>Automatically populates with the Source Record table.</td>
</tr>
<tr>
<td>Attachment File Name</td>
<td>Enter the name of the attachment file to delete a single attachment associated with the selected record.</td>
</tr>
<tr>
<td>Delete All Attachments?</td>
<td>Select to delete all attachments associated with the selected record.</td>
</tr>
</tbody>
</table>

**Delete Record action**

Deletes a record on any table.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
</tbody>
</table>

**Get Attachments on Record action**

Access the list and count of the attachments associated with the provided source record as data pills in a flow. Use flow logic or scripting to process each attachment in the list of the attachments that the action returns.

**Roles and availability**

Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Name</td>
<td>Entire file name or part of the file name.</td>
</tr>
<tr>
<td>Source Record</td>
<td>Record as a data pill from the data pane or the record that the attachment is associated with.</td>
</tr>
</tbody>
</table>
Get Catalog Variables action
Access Service Catalog variables as data pills in a flow.

Roles and availability
Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Submitted Request (Requested Item)</td>
<td>Submitted request from any ServiceNow table.</td>
</tr>
<tr>
<td>Template Catalog Item (Catalog Item)</td>
<td>Item from the Catalog Items (sc_cat_item) table to populate the Catalog Variables list with the associated variables.</td>
</tr>
<tr>
<td>Catalog Variables</td>
<td>Catalog variables to be displayed in the data panel. Select variables or single-row variable sets.</td>
</tr>
</tbody>
</table>

Note: You cannot select Masked or Multi Line Text catalog variables, or multi-row variable sets.

You can define flow-specific variables that are displayed in the Available list. To define flow-specific variables, see Create flow Service Catalog variables.

Get Email Header action
Access an email header value as a data pill in a flow.

Roles and availability
- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Record from the Email (sys_email) table.</td>
</tr>
<tr>
<td>Target Header</td>
<td>Header from the email record. Upon completion of the action, the header value is added as a data pill in the flow.</td>
</tr>
</tbody>
</table>

Note: If multiple headers have the same name, the action gets the value of the first header that appears.
Example

In the following example, a process owner adds the Get Email Header action under an inbound email trigger. In the Email Record field, the user selects to get an email header from the email that triggered the flow. In the Target Header field, the user selects to get the Subject header from the email.

Log action

Logs a message in the Flow Designer log table.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Warn</td>
</tr>
<tr>
<td></td>
<td>• Info</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

Look up email attachments action

Look up files that are attached to an email so that you can perform an action on the files.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email record (Email)</td>
<td>Record from the Email (sys_email) table. For example, select the email record from the flow trigger. After you select an email record, the related Email Attachment (sys_email_attachment) record and its fields become available as data pills.</td>
</tr>
</tbody>
</table>

Output

- This action generates a list of Email Attachment (sys_email_attachment) records, which list the attachments that are associated with a given email record. To perform an action on an attachment, add flow logic that runs for each Attachment pill under the Email Attachment Record pill. For more information, see For each flow logic.

Example

In the following example, a process owner adds the Look up email attachments action under an inbound email trigger. In the Email record (Email) field, the user selects to look up files that are attached to the email that triggered the flow.
Look Up Record action

Look up a record from any table based on defined conditions.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to be met by the returned record.</td>
</tr>
<tr>
<td></td>
<td>When building a condition that looks up the value of a reference field, use</td>
</tr>
<tr>
<td></td>
<td>a data pill that explicitly provides the Sys ID value. Ensure the condition</td>
</tr>
<tr>
<td></td>
<td>has the format (reference field)(is)(Reference type data pill-&gt;Sys ID).</td>
</tr>
<tr>
<td></td>
<td>For example, both the Change and Incident tables contain a reference field</td>
</tr>
<tr>
<td></td>
<td>to the User table. To look up change records where the requester is the</td>
</tr>
<tr>
<td></td>
<td>caller from an incident record, create the condition (Requested by)(is)</td>
</tr>
<tr>
<td></td>
<td>(Trigger-&gt;incident record-&gt;Caller-&gt;Sys ID).</td>
</tr>
<tr>
<td>Order by</td>
<td>Determines how to sort results when more than one record matches the</td>
</tr>
<tr>
<td></td>
<td>defined conditions. Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>If multiple records are found</td>
<td>Determines what is returned if more than one record matches the defined conditions.</td>
</tr>
<tr>
<td></td>
<td>· Return only the first record</td>
</tr>
<tr>
<td></td>
<td>· Fail the step</td>
</tr>
</tbody>
</table>

**Example**

**TRIGGER**

*Incident Created or Updated*

**ACTIONS**

1. *Look Up Incident Record*
   
   **Action**: Look Up Record
   
   **Table**: Incident [incident]
   
   **Conditions**: All of these conditions must be met
   
   - **Active**: is true
   - **State**: is New
   - **Short description**: contains Email
   
   **Order by**: Short description
   
   **If multiple records are found action**: Return only the first record

**Look Up Records action**

Look up multiple records on any table using defined conditions.
Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to be met by the returned records.</td>
</tr>
<tr>
<td></td>
<td>When building a condition that looks up the value of a reference field, use a</td>
</tr>
<tr>
<td></td>
<td>data pill that explicitly provides the Sys ID value. Ensure the condition has</td>
</tr>
<tr>
<td></td>
<td>the format (reference field)(is)(Reference type data pill-&gt;Sys ID). For example,</td>
</tr>
<tr>
<td></td>
<td>both the Change and Incident tables contain a reference field to the User table.</td>
</tr>
<tr>
<td></td>
<td>To look up change records where the requester is the caller from an incident</td>
</tr>
<tr>

<td>Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>Max Results</td>
<td>Maximum number of results returned.</td>
</tr>
</tbody>
</table>
Example

Look Up Incident Records

Action: Look Up Records
Table: Incident [incident]

Conditions:
- Assigned to is Bow Ruggiero
- State is New

Order by: Short description
Max Results: 1000

Lookup Attachment action

Looks up an attachment associated with a record and returns the Attachment Sys ID as a data pill.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Note: Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Name</td>
<td>Enter the name of the attachment to look up. If the record includes multiple attachments with the same file name, the system returns the first Sys ID encountered.</td>
</tr>
<tr>
<td>Source Record</td>
<td>Drag a Record data pill from the data pane, or select the record that the attachment is associated with.</td>
</tr>
</tbody>
</table>

### Move Attachment action

Associates a record from the Attachment (sys_attachment) table with a target record. Removes the attachment from any other associated records.

### Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Note:** Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Attachment Record</td>
<td>Select an attachment record from the Attachments (sys_attachment) table.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Drag a Record data pill from the data pane to attach the Source Attachment Record to.</td>
</tr>
<tr>
<td>Table</td>
<td>Automatically populates with the Source Record table.</td>
</tr>
</tbody>
</table>

### Move Email Attachments to Record action

Move attachments from an email to a record so that the files are available to your users when they view the record.

### Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Email (sys_email) record to move attachments from.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Record to move attachments to.</td>
</tr>
</tbody>
</table>

Output

- This action updates the Email Attachment (sys_email_attachment) record. The **Action** field changes to **Attached to Target Record**.

Example

In the following example, a process owner adds the Move Email Attachments to Record action under an inbound email trigger. The user has also added the Create Catalog Task action in the flow. In the **Email Record** field, the user selects to move attachments from the email that triggered the flow. In the **Target Record** field, the user selects to move email attachments to the Catalog Task (sc_task) record that is created in the Create Catalog Task action.
Send Email action

Send an email to specified users or groups as an action in a flow.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Record</td>
<td>Record that the email is associated to. When a user sends a reply to your email, the target record is updated with the reply email content.</td>
</tr>
<tr>
<td>Table</td>
<td>Table of the target record.</td>
</tr>
<tr>
<td>Include Watermark</td>
<td>Option to apply a watermark to the email that is sent. To include a watermark, you must set a target record.</td>
</tr>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field, such as a User record. For example, if your action involves an incident record and you want to send an email to the group assigned to the incident, drag the (Assignment group) data pill from the data panel.</td>
</tr>
<tr>
<td>CC</td>
<td>Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>BCC</td>
<td>Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>Subject</td>
<td>Subject of the email. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
<tr>
<td>Body</td>
<td>The content of the message body. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

Note: Flow Designer does not support the $(URI) parameter for creating a link to a record in the email message body. Instead, consider inserting the information from the record in the email body using data pills, or create a notification step.

Testing the email action

To verify that the email was generated when testing the action, review the email record in the Email (sys_email) table. The Headers field indicates whether the email was successfully generated. For example:
ACL restrictions apply to the Send Email action. If you configured your flow to run as the user who initiates the session, ensure that the user has access control to send email. To test access controls for a Send Email action, impersonate a typical email sender and manually trigger the flow.

**SLA Percentage Timer action**

Identify when a task SLA record reaches a specific percentage value and perform other actions or flow logic that is based on the SLA percentage. For example, send a notification when an SLA percentage timer completes.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for percentage</td>
<td>The positive integer percentage of the total SLA duration used to compute an end time. For example, a 50% percentage results in the system computing an end date-time value that is 50% of the total SLA duration. If an SLA requires tasks to be completed within 24-hours, then 50% of that SLA would be 12 hours.</td>
</tr>
</tbody>
</table>

**Scheduled End Date/Time**

The **Scheduled End Date/Time** data pill lists when the SLA percentage timer action is expected to end.

- If the end date is in the future, the system creates a system event to continue running the action at that future date. While the system waits for the scheduled end date, it pauses the flow and action.
- If the end date is in the past, the system immediately sets the **Status** of the SLA Percentage Timer action.
Status

The **Status** data pill contains the result of the SLA percentage timer.

**SLA Percentage Timer status descriptions**

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Completed</td>
<td>The timer action reached its scheduled end date/time. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Paused</td>
<td>The timer was paused before its scheduled end date/time. If the timer resumes running, Flow Designer generates a new scheduled end date/time value. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Repair</td>
<td>The flow is running in repair mode, and the scheduled end date/time is in the past. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The timer did not run because the scheduled end date/time is in the past. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The timer is running and has yet to reach the scheduled end date/time.</td>
</tr>
</tbody>
</table>

Flow Designer sets the action status when the SLA state matches an **SLA condition** or when certain UI actions are selected.

**Action status set for SLA state**

<table>
<thead>
<tr>
<th>SLA state</th>
<th>Action status set</th>
<th>Flow run state</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLA attaches and the scheduled end date/time is in the future.</td>
<td>Set action status to <strong>Waiting</strong>.</td>
<td>The flow waits until the SLA timer completes, is cancelled, or is paused.</td>
</tr>
</tbody>
</table>
| SLA attaches and the scheduled end date/time is in the past. | • If the flow was started in Repair mode, set action status to **Repair**.  
  • Otherwise, set action status to **Skipped**. | The flow runs the next action or flow logic in the flow sequence. |
<p>| SLA Cancels.                                        | Set action status to a null value.          | The flow stops with a state of <strong>Cancelled</strong>.                                 |
| SLA Pauses.                                         | Set action status to <strong>Paused</strong>.            | The flow waits until the SLA Task flow is cancelled or is resumed.            |
| SLA reaches Scheduled End Date/Time.                | Set action status to <strong>Completed</strong>.         | The flow runs the next action or flow logic in the flow sequence.             |</p>
<table>
<thead>
<tr>
<th>SLA state</th>
<th>Action status set</th>
<th>Flow run state</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLA Resumes.</td>
<td>Set action status to <strong>Waiting</strong>.</td>
<td>The flow waits until the SLA timer completes, is cancelled, or is paused.</td>
</tr>
<tr>
<td>SLA Stops.</td>
<td>Set action status to a null value.</td>
<td>The flow stops with a state of <strong>Cancelled</strong>.</td>
</tr>
</tbody>
</table>

**Total Duration**

The **Total Duration** data pill lists the total number of seconds that the action ran. The total duration is computed from the action start time and the time when the action reached the **Completed** status. Status values other than **Completed** produce a null value **Total Duration**.

**Design considerations**

Follow these design considerations when creating flows that contain SLA Percentage Timer actions.

**Add SLA Percentage Timer actions only to flows with an SLA Task trigger**

An SLA Percentage Timer action can only run when the flow starts from an SLA Task trigger. You cannot activate a subflow containing an SLA Percentage Timer action.

**Create conditional flow logic for expected Status values**

Use the value of the **Status** field as a condition for flow logic. Build flow logic for expected **Status** values such as **Completed**, **Repair**, and **Skipped**. For example, add an **If** flow logic block to send a notification when the SLA Percentage Timer has a status of **Completed**.

**Assign each SLA Percentage Timer action a unique cumulative Wait for percentage value**

Each SLA Percentage Timer action computes its own Scheduled End Date/Time using its Wait for percentage value. If you create multiple SLA Percentage Timer actions, give each action its own unique cumulative Wait for percentage value. For example, create three separate actions with different percentage complete values such as 25%, 50%, and 75% complete. Setting all three actions to the same percentage complete value such as 25% causes the timers to complete at the same time.

**Copy existing flows to make customizations**

Reduce development time by copying the default SLA flows and customizing the copies with your own logic. Select a customized flow to run from the SLA definition. See **Create an SLA definition**.

**Update Record action**

Update an existing record in a table. You can dynamically add and configure fields for the record.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the values of fields in the record to be updated. For example, to set the short description to a certain value, select Short description and set the desired value. If adding the action to a subflow, you can Allow flow designers to dynamically set field values.</td>
</tr>
</tbody>
</table>

Wait For Condition action
Pause the flow until the record value conditions are met.

Roles and availability
- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this record is deleted while the flow is waiting, the flow stops waiting and continues running.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record. Confirm that the system supports Wait for Condition for your selected table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Select the record values necessary to resume running the flow. For example, if the condition is (State)(is)(Closed), the flow pauses until the condition is met. Once met, the flow moves on to the next step or action. Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field.</td>
</tr>
</tbody>
</table>

Unsupported tables
The system does not support Wait for Condition for the following tables.
<table>
<thead>
<tr>
<th>Table Category</th>
<th>Table Names</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audit</td>
<td>Audit Relationship Change (sys_audit_relation), Audit Deleted Record (sys_audit_delete)</td>

</tr>
</tbody>
</table>

**Condition Evaluation**

The condition in a Wait for Condition action is evaluated only when the record in the **Record** field is updated. Conditions must be set to be met upon a change to a record rather than a relative time period. For conditions that depend on a specific duration, consider using *Wait for a duration flow logic*.

In this example, the condition is met when the record in the **Record** field is updated, and the state is **Closed**.
Condition met in a flow

In this example, the condition relies on a time relative to the **Created** date. Actions that have a condition that relies on a time interval will not be met, so the action is never performed.
### Condition not met in a flow

#### Wait for Condition
- **Action:** Wait For Condition
- **Record:** Incident [incident]
- **Conditions:**
  - Created before 6 minutes...
  - or
  - New Criteria

#### Subflow Inputs & Outputs
- **Subflow Inputs & Outputs**
- **Create Incident Record**

#### Data
- **Subflow Inputs**
  - variable: String
- 2 - Create Record
  - incident: Incident [incident]
  - incident: Record
  - incident_table: Table

Flow Designer stages

Communicate the current stage of a request or flow with an end user.

When configuring stages in Flow Designer, you can:

- Create any number of stages.
- Change stage labels and names.
- Set the estimated duration for a stage.
- Import a copy of a pre-defined stage set from the Stage Sets table. To learn more about stage sets, see Workflow stage sets. Any changes made to the copy do not affect the original stage set record.

While stages can be added to a flow with a scheduled trigger, the stages are never displayed to an end user because there is no associated record for the stage field. Only use stages in flows with record and Service Catalog triggers. Stages are not supported on subflows.

View the stages of a flow in the flow execution details.

Displaying stages in a stage field

A stage field is a field of type Workflow that displays the stages of a flow to a user. For example, the Service Catalog uses a Stage field to indicate progress of a request as it is processed by an associated flow or workflow.

Stage fields display:

- Stages from flows with record or Service Catalog triggers.
- Stages from the associated flow. If the associated flow calls another flow, stages set on the child flow do not display.
- Stages from flows that have started.

State icons in stage fields cannot be modified. Limit the number of stages and the length of each stage name to represent each stage in a stage field without causing text and icons to wrap onto multiple lines.
Note: Only add one stage field per table. If there is more than one stage field, the system only displays stages from the first stage field defined in the table dictionary entry.

Stage field and trigger types

Associating a flow to a stage field depends on the flow trigger type.

<table>
<thead>
<tr>
<th>Flow trigger type</th>
<th>Requirements</th>
</tr>
</thead>
</table>
| Record            | For a stage field to report stages on a record-based flow, a stage field must be present on the same table as the triggering record. When a flow has stages, Flow Designer communicates the status of each stage back to the triggering table and displays the current stage state as an icon. If more than one stage field exists on the table, only the first stage field defined in the table's dictionary definition is used.  
Note: Avoid creating stages for multiple flows that trigger from the same table. A stage field only displays the stages of the final flow to run. Add different conditions to each flow to ensure that the stages of one flow do not overwrite another flow. |
| Service Catalog   | If using the Service Catalog trigger, the flow must be associated with the Service Catalog item through the Flow field. Remove any workflows associated with the item by clearing the Workflow and Execution Plan fields. The Stage field displays the current stage state on any list view of the Requested Items (sc_req_item) table. |

Stage states

During flow execution, each stage can be in one of five states.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending</td>
<td>This stage has not yet started.</td>
</tr>
<tr>
<td>In progress</td>
<td>This stage is executing.</td>
</tr>
<tr>
<td>Skipped</td>
<td>This stage was skipped and did not run. Typically, this state is reached when a conditional flow logic block is not executed.</td>
</tr>
<tr>
<td>Complete</td>
<td>This stage is complete.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>Error</td>
<td>This stage has reached an error condition. When designing a flow, you can manually set the flow to report an Error state. To set an Error state:</td>
</tr>
<tr>
<td></td>
<td>- The flow must have at least one stage defined.</td>
</tr>
<tr>
<td></td>
<td>- The Error can only be set within a stage. When an Error condition is reached, the current stage is set to Error.</td>
</tr>
<tr>
<td></td>
<td>- The Error can only be set within a conditional flow logic block.</td>
</tr>
</tbody>
</table>

While setting the Error state does not affect flow execution, it communicates to the user that the state of the current stage is Error. For example, if an approval is not approved within the required limit you may want to communicate an error to the user.

Each stage can have its own custom state labels. For example, suppose that you have a flow with two stages. Stage 1 could have the Pending state with the label Waiting, and Stage 2 could have a Pending state with a label of Not yet started. Flow Designer provides options to generate either the default states or approval states.

### Configure stages and add them to a flow

Configure when stages display to a user, define stage state labels, and add stages to a flow within Flow Designer.

While stages can be added to a flow with a scheduled trigger, the stages are never displayed to an end user because there is no associated record for the stage field. Only use stages in flows with record and Service Catalog triggers.

Role required: flow_designer or admin

1. Optional: If not already present, create a stage field on the table that triggers the flow. A stage field is a field of type Workflow that displays the stages of a flow to a user. The Service Catalog Requested Items (sc_req_item) table has a stage field by default.

   For a stage field to report stages on a record-based flow, a stage field must be present on the same table as the triggering record.

   To add a field to a table, see Add and customize a field in a table.

2. Optional: If adding stages to a flow with a Service Catalog trigger, select the flow in the Flow field of the Service Catalog Item (sc_cat_item) table.

   If using the Service Catalog trigger, the flow must be associated with the Service Catalog item through the Flow field. Remove any workflows associated with the item by clearing the Workflow and Execution Plan fields. This enables a request for a catalog item to initiate a flow specific to that catalog item.

3. Open the flow in Flow Designer.

4. Optional: Create and configure stages in the More Actions menu. Alternatively, you can create stages within the flow itself.

   a) Click [ ] and select Stages.

   The Flow Stages / State menu opens.

   b) Click New Stage to add a new stage and configure the stage options.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name for the stage. Must be unique.</td>
</tr>
<tr>
<td>Value</td>
<td>Internal name for the stage. Must be unique.</td>
</tr>
<tr>
<td>Duration</td>
<td>Estimated duration displayed to the user.</td>
</tr>
<tr>
<td>Always Show</td>
<td>If selected, the stage always displays in the stage field, even if the stage is set within a flow logic block that might not execute.</td>
</tr>
</tbody>
</table>

c) Optional: Select a stage set to import from the Stage Sets table.
   To learn more about stage sets, see Workflow stage sets. Any changes made to the copy do not affect the original stage set record.

5. Point to a location in the flow and click Add a Stage. Select a stage or click + to add a new stage inline.
   Stages can be applied at the beginning of any Flow Designer action or flow logic block, or within an If block. Stages are not supported within a For Each flow logic block.

   **TRIGGER**

   ![Service Catalog]

   **ACTIONS**

   1. ![Get Catalog Variables from Apple iPhone 6s]

   **Note:** The stage field displays stages in the order they are defined in the flow.

6. Optional: Set a stage to the Error state within a conditional flow logic block.
   a) Point to a location and select Set "Error" State.
      To set a stage to the Error stage:
      - The flow must have at least one stage defined.
      - The Error can only be set within a stage. When an Error condition is reached, the current stage is set to Error.
      - The Error can only be set within a conditional flow logic block.
If ( records not found ) then

Else

Log

Log

When the flow reaches the indicated point, the currently executing stage is set to Error in the stage field.

In a flow with a record-based trigger, Flow Designer communicates the status of each stage back to the triggering table and displays the current stage state as an icon. In a flow with a Service Catalog trigger, the Stage field displays the current stage state on any list view of the Requested Items (sc_req_item) table.

**Flow execution details**

View runtime information about an action or flow directly from the design environment such as the current state, actions or steps run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

Each time a flow or action runs, the system stores information about the configuration and runtime values produced, which process analysts can view from the Flow Designer design environment Flow Executions tab. Select a flow execution to open its associated execution details page.

**Note:** To avoid performance issues, turn off reporting during production with the com.snc.process_flow.reporting.level system property. For more information, see Flow Designer system properties.
Sample execution details of the VTB Sample Flow

Each execution details page displays:
• Calling source
• Flow state
• Related record options
• Flow Statistics

Calling source

The calling source lists what started a flow or subflow.

<table>
<thead>
<tr>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow Designer Test</td>
<td>The flow started because a user selected the <strong>Test</strong> option from the Flow</td>
</tr>
<tr>
<td></td>
<td>Designer interface. The flow trigger conditions were ignored.</td>
</tr>
<tr>
<td>CRUD Trigger</td>
<td>The flow started when the record-based trigger conditions were met.</td>
</tr>
<tr>
<td>Date Trigger</td>
<td>The flow started when the schedule-based trigger conditions were met.</td>
</tr>
<tr>
<td>Metric Trigger</td>
<td>The flow started when the MetricBase trigger conditions of a <strong>MetricBase</strong></td>
</tr>
<tr>
<td></td>
<td>were met.</td>
</tr>
<tr>
<td>Service Catalog Trigger</td>
<td>The flow started when a Service Catalog item was requested.</td>
</tr>
<tr>
<td>Script</td>
<td>The flow started from an API method call in a script, such as a business</td>
</tr>
<tr>
<td></td>
<td>rule.</td>
</tr>
<tr>
<td>Background Script</td>
<td>The flow started from an API method call in the <strong>Scripts - Background</strong></td>
</tr>
<tr>
<td></td>
<td>module.</td>
</tr>
</tbody>
</table>

Flow state

All active flows are in one of these states.

**Completed**

The flow successfully ran all actions. The flow statistics display configuration and run-time details for each action.

**Waiting**

The flow paused on an action that is waiting for some condition to be met before continuing. The flow statistics display configuration and run-time details for completed actions and configuration details for any actions waiting for a condition to be met. Flows in the Waiting state display a **Cancel Flow** UI action in the header.

**Error**

The flow stopped with an error. The flow statistics display configuration and run-time details for completed actions and configuration details for the action that produced the error. Flows in the Error state display a **Go to error** UI action in the header.

Related record options

From the Execution details page, you can access records related to the current flow.

Refresh Flow Data
Use this option to update flow runtime data.

**Open Flow**

Use this option to make configuration changes and publish a new instance of the flow. Changing the flow configuration does not change any currently active flow.

**Open Context Record**

Use this option to view the flow state, run duration, and related log entries from a standard form view. This option opens the context record in a new tab.

**Open Flow Logs**

Use this link to view detailed log information about each action. This link opens the log entries list in a new tab.

**Open Current Record**

For flows that have a record-based trigger, use this link to view the triggering record in a pop-up window.

**Open Action**

Use this link to make configuration changes and publish a new instance of the action. Changing the action configuration does not change any currently active flow. This link is unavailable for ServiceNow-provided core actions.

**Flow statistics**

Use flow statistics to see configuration details and run-time values for each flow component. Clicking a trigger or action expands the row and displays configuration and run-time details about it.
The following types of execution details are available.

**Integration Metadata**

Use Integration Metadata to view transaction data such as connection and credential used, target host, and payload size. Integration Metadata only displays for integration steps and requires a separate IntegrationHub subscription. For more information, see Integration steps.

**Configuration Details**

Use the list of input variables to identify any configuration errors with the action. Each variable has its own row displaying its name, data type, configuration settings, and run-time value. The configuration settings display dynamic values as pills. The run-time values display generated records as a link.

**Output Data**

Use the list of output variables to identify any configuration errors with the action.

**Logs**

Use the log entries to identify potential processing or performance issues. Each log entry has its own row displaying the creation date, log level, and log message. If the action does not generate any logs, the statistics displays the string **No Logs**.

**Steps**

Use the list of steps to identify any configuration errors with the action. Each step has its own row displaying the variable name, data type, configuration settings, and run-time value. Core actions do not display steps because users cannot change their configuration.

Change the `com.snc.process_flow.reportingserialized.val_size_limit` system property to truncate runtime values in the flow execution details step configuration. To learn more, see Flow Designer system properties.

**Run duration**

Use the run duration to identify potential processing or performance issues. Each action and step displays the duration in milliseconds. System quota rules prevent any action from running longer than a minute.

**Embedded text viewer**

Flow Designer displays large text-based configuration and runtime output records such as email output, XML payloads, or script steps using an embedded text viewer. The embedded text viewer can format text as HTML, plain text, or color-coded JavaScript. For script steps, the text viewer highlights code lines containing errors.
Error: missing ; before statement (Process Automation.05c45050db5e8300efc57416bf961939; line 4)

```javascript
(function execute(inputs, outputs) {
  var vtblane = new GlideRecord('vtb_lane');
  vtblane.addQuery('board', inputs.vtbBoard.sys_id)
  vtblane.query();
  vtblane.next();

  var vtbCard = new GlideRecord('vtb_card');
  vtbCard.task = inputs.task.sys_id;
  vtbCard.board = inputs.vtbBoard.sys_id;
  vtbCard.lane = vtblane.sys_id;
  vtbCard.insert();

  outputs.vtbCard = vtbCard;
}) (inputs, outputs);
```
Viewing results for each item in flow logic

Flow Designer displays a selector control to view the configuration and run-time results for each item processed by flow logic. Select a record number to see its configuration and run-time details.
<table>
<thead>
<tr>
<th>Id</th>
<th>Description</th>
<th>Status</th>
<th>Start Time</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
Flow execution details retention

Due to the large amount of data used for flow designer reporting, your instance uses data retention policies to delete this data after a set time period.

Scheduled table cleanup

The time period used for scheduled table cleanup depends on the type of data stored. Once a record is older than its default retention period, it is deleted if it is in a completed state and the default skip_schedule_cleanup value is false.

Flow reporting data tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Default retention period</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_flow_action_report</td>
<td>Flow engine context action reports</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_flow_context</td>
<td>Flow context</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_flow_flow_report</td>
<td>Flow designer executions</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_flow_step_report</td>
<td>Flow engine context step reports</td>
<td>1 Week</td>
</tr>
</tbody>
</table>

Disable scheduled cleanup

The scheduled data cleanup for a flow can be disabled by setting the Skip Schedule Cleanup (skip_schedule_cleanup) field to true on the Flow engine contexts (sys_flow_context) record for the flow.

Change scheduled cleanup times

The retention periods shown in the preceding tables can be changed from their defaults by updating the Age in seconds field on the Auto Flushes (sys_auto_flush) table.

Disable reporting on a flow

Disable reporting on a flow by creating a record on the Settings (sys_flow_execution_setting) table for the flow, and setting the Reporting field to false. Navigate to Flow Designer > Settings to access this table. Create a record, and select a flow, subflow, or action. Enable or disable reporting using the Reporting field.

Note: Each record on the Settings table controls reporting for a single flow, subflow, or action. A setting record cannot have a value in both the Action and Flow fields.

Note: Setting records do not effect actions and subflows running within a parent flow. These settings are only honored when an action or subflow is run using the action API or script API. Setting records are honored for subflows executed with the Test button.

Reporting can be disabled for all flows using a system property. To disable the flow execution details, add the com.snc.process_flow.reporting.enabled system property to the System Properties
(sys_properties) table and set the value to false. If disabled, details are not saved for actions in the flow. However, the flow context record and related log messages are available. If a flow runs while the property is false, execution details are never available for the flow, even if the property value changes. If a flow runs while the property is true, execution details are always available for the flow, even if the property value changes.

Settings (sys_flow_execution_setting) records override this system property. For example, set the property to false in your production instance to disable all reporting, and use setting records to enable reporting specific flows. Limiting reporting in this way can increase performance of flow execution on your instance.

**Unavailable flow data**

A message displays at the top of the flow report to indicate that action reports are not available for a flow because of table cleanup. The **Show Action Details** link and Action states are not available in this case. A similar message is shown to indicate when reporting for a flow has been disabled. In this case, a link to the report settings also displays.
Flow logic

Enable flows and subflows to specify conditional or repeated actions. Combine the elements of flow logic to create workflows in a graphical interface with little or no scripting.
The system provides these flow logic options.

<table>
<thead>
<tr>
<th>Flow logic option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If</td>

<td>Use this flow logic to access flow contexts and derive the runtime values for dynamic flow outputs.</td>
</tr>
</tbody>
</table>

**Flow logic inputs**

Each flow logic option displays one or more fields that are used to determine its behavior. For example, the **Call Workflow** flow logic has an input where you are able to select a workflow to run. Use these inputs to define the behavior of the flow and enable optional functionality depending on your needs. See flow logic option documentation for a list of the available inputs and how they control the function of that element.
Flow logic outputs

Flow logic options may also have outputs. These represent information that is returned by the flow logic. For example, the Make a decision flow logic has an output that contains a decision answer record representing the decision reached by the flow. See the documentation for a flow logic option to see definitions for its outputs.

If flow logic

Selectively apply one or more actions only when a list of conditions is met.

Use this flow logic by specifying conditions that are based on the current record. Actions or subflows can be added to the flow within the if flow logic. The flow only applies the actions within this flow logic if the conditions evaluate to true. Conditions are based on data in records, such as a records state or urgency.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition label</td>
<td>Descriptive label for the branch.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions under which the branch runs.</td>
</tr>
</tbody>
</table>

Perform an action on if an incident has a high urgency

In this example, the action is triggered when the incident record has a high urgency value.
Execution details

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Type</th>
<th>Configuration</th>
<th>Runtime Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>condition_name</td>
<td>String</td>
<td>Urgent</td>
<td></td>
</tr>
<tr>
<td>No Logs</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Execution details for if flow logic

1. The header shows the state, start time, and runtime for the flow logic.
2. The Configuration Details section shows the details about the variables that are used by the flow, including the type, configuration, and runtime values for each variable. Use the condition variable to see if the branch conditions were met.

For Each flow logic

Apply one or more actions to each record in a list of records.

The For Each flow logic requires a list of records to act upon. The flow applies all actions within the for each flow logic to each record in that list.

Note: Iterating over a large number of records can be resource intensive, especially when the For Each logic block includes complex actions for each iteration. To avoid performance issues, turn off reporting using the com.snc.process.flow.reporting.level system property. For more information, see Flow Designer system properties.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Items</td>
<td>Data pill that contains a list of records. For example, you could use the additional Assignee list for an incident record. For information on data pills, see Flow Designer data.</td>
</tr>
</tbody>
</table>
Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Table name) Record</td>
<td>Current record in the loop.</td>
</tr>
</tbody>
</table>

**Note:**

To optimize performance, avoid iterating over lists with more than one thousand records. If you need to iterate over large lists, divide the lists into smaller sections and use multiple flows.

You can nest a **For Each** flow logic block inside of another flow logic block to repeat an action over a series of records. However, avoid nested For Each loops that process many records. Nested loops may cause the flow to run until it is stopped by the flow transaction quota rule, which prevents flows from running longer than an hour. For more information about transaction quotas, see *Transaction quotas*.

**Send an email to each person assigned to a problem**

In this example, a flow is created to send an email to each additional assignee of a problem record when a record is created. If the **For Each** flow logic is selected, and the **Additional Assignee** data pill is dragged in from the trigger record, the **For each** logic performs actions for each user in the **Additional Assignee** field of the trigger record.

When the loop is created, a new entry appears in the Data pane on the right called **1 - For Each**. In that entry, you see an **Additional assignee list Record** data pill that contains the user information for the users in that field.

**Inputs used in for each flow logic**
In this example, you configure a flow to send an email to each user in the **Additional Assignee** field on the triggering problem record. The plus icon (+) below this email action is used to add additional actions, such as logging, to the loop.

**Execution details**

1. The header shows the state, start time, and runtime for the flow logic.
2. This flow logic can run actions or subflows multiple times. Use the arrow keys to cycle through each of these instances to see their values.
3. The **Configuration Details** section shows which records the flow has evaluated.
4. After the **For Each** section are the actions taken within it. The values for these actions change as you cycle through the actions that are taken by this flow logic.

The flow execution details tab provides runtime information on the flow logic.
Do the following until flow logic

Apply one or more actions repeatedly until an end condition is met. You can use the flow data to specify the end conditions.

You can use Do the following until flow logic to create a loop that repeatedly applies actions. This flow logic requires a condition specifying when to stop the loop.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition label</td>
<td>Descriptive label for the loop.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions under which the loop terminates. You could, for example, end a loop when the state of an incident changes.</td>
</tr>
</tbody>
</table>

**Note:** Avoid using the same record you used to trigger the flow in your condition, because the flow populates its values when the flow starts and they remain static.

Send a daily email until an incident is resolved

In this example, the flow sends a daily email about the incident, until the incident is in a closed or canceled state. Inside the Do the following branch, there is a step for looking up the incident record. This is necessary because the record that triggers the flow is only loaded when it is triggered. By adding this look up step, you can get the current state of the incident each time the loop runs.
Outputs

This flow logic produces no outputs.
Execution details

1. The header shows the state, start time, and runtime for the flow logic.
2. This flow logic can run actions or subflows multiple times until its condition is met. Use the arrow icons to select an iteration and its values.
3. The Actions section shows details on the actions, flows, or subflows that are run during this loop iteration.

Do the following in parallel flow logic

Run actions and subflows in separate paths within an isolated flow logic block.

With this flow logic, you can run actions and subflows in separate paths. If any action within the Do the following in parallel flow logic block must wait, other actions run until all paths within the block finish processing.
Paths in a Do the following in parallel flow logic block

**Note:** Paths in a Do the following in parallel flow logic block do not run in multiple threads, since a flow execution context runs in a single thread. However, there may be times when you want to run flows within separate contexts even though this may consume more of your instance's resources. To run subflows in separate flow contexts within the same flow, see Dynamic flows.
Inputs

Do the following in parallel flow logic does not have field inputs. Instead, it displays a plus (+) icon that enables you to create a path with actions or subflows.

The actions and subflows in each path run until all tasks within the flow logic block have completed.

Outputs

This flow logic has no outputs, but actions and subflows in each path may have outputs. While the flow is running, outputs from a path are only accessible to other actions in the same path. After the Do the following in parallel flow logic completes, its final outputs are accessible to the rest of the flow.

Create two tasks in parallel when a change request is created

In this example, a flow triggers when a new change request is created. Using Do the following in Parallel, two tasks are created in separate paths and are assigned to different groups. The flow uses the Number field data pill from the triggering change request to display the number in the short description for the task record.
Do the following in parallel flow logic inputs
Execution details

Do the following in parallel execution details

1. The header shows the state, start time, and runtime for the flow logic.
2. The Configuration Details section shows the state, start time, and runtime for each path in the flow logic block.

Make a decision flow logic

You can use the decision table branching logic in situations where multiple conditional paths are required, as an alternative to nested If, Else If, or Else flow logic. For example, if you want to determine what kind of car insurance you need, you can add inputs such as your age, accident history, and car model to the decision table to determine a level of insurance coverage. This logic can save you time and present a more readable format than nested if conditions or switch case statements.

The Make a decision flow logic requires that you create an external decision table for its branch paths. Each answer that is defined in the decision table results in a branch path within Flow Designer. Decision tables accept any number of inputs, include any number of decisions, and result in a finite set of decision paths. You can configure a decision table to determine a single path or multiple paths. For more information on decision tables, see Decision Tables.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decision Label</td>
<td>Descriptive label for the decision that you want to make. For example, you can create the Recommended Insurance Policy label if you want to determine the level of insurance coverage that you need. This value overrides the default action label.</td>
</tr>
<tr>

<td>- <strong>Run all decisions that match</strong>: Runs all branches with a matching decision answer.</td>
</tr>
<tr>
<td>Include otherwise</td>
<td>Option to add the otherwise branch. The flow only runs this branch when no other branch runs.</td>
</tr>
<tr>
<td>Decision table inputs</td>
<td>List of Decision Input (sys_decision_input) records that are associated with your decision table. Flow Designer displays a separate input for each record. For example, if you have decision inputs for Units Ordered and Location of Sale, an input displays for each record.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decision answer record</td>
<td>Record that was created after the decision inputs were evaluated.</td>
</tr>
</tbody>
</table>

**Use make a decision flow logic to determine insurance coverage**

In this example, the flow uses a decision from the **Insurance Coverage** decision table, which an administrator had configured to determine the insurance coverage that was based on three inputs. The flow displays all the inputs that were used by the decision table in Flow Designer. These inputs can be entered manually, or by dragging data pills into the inputs from the Data pane on the right side of the screen. Below this section, the branches for each answer are shown in the decision table.

The **Flow execution details** tab provides runtime information about the flow logic.

1. The header shows the state, start time, and runtime for the flow logic.
2. The action shows details about the decision table configuration and inputs.
3. Each possible answer for the decision table is represented as a branch. The state field indicates whether the branch was evaluated and the evaluation result. This section also displays details about the actions that are taken within a branch. Branches that evaluate to true are highlighted in green.

### Wait for a duration flow logic

Use this flow logic to give your users time to act during automated processes or to wait for a specific date and time to complete actions.

### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration Type</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Explicit Duration</strong>: Wait for a specific time period, such as 5 minutes.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Relative Duration</strong>: Wait for a specific time period from a selected Duration data pill or date/time value, such as 5 minutes after the flow start.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Percentage Duration</strong>: Type to specify a certain percentage of time duration between the start of the flow logic and specified end time.</td>
</tr>
</tbody>
</table>

**Note:** The percentage value must be from 0 through 100 only.
### Input

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for</td>
<td>Set this value manually or select a Duration data pill from the data pill picker ( ).</td>
</tr>
<tr>
<td></td>
<td>· <strong>Explicit Duration</strong>: Wait duration in hours, minutes, and seconds.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Relative Duration</strong>: Wait duration in hours, minutes, and seconds before or after a specific time. Select <strong>Relative Duration</strong> to specify a wait duration from a specific date.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Past dates don’t affect the wait duration.</td>
</tr>
<tr>
<td></td>
<td>You can enter a wait value of up to 999 hours.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: The actual wait duration can vary due to the instance processing time. The flow always waits for the time that you specify for this field, but other work in the queue may add to the wait time.</td>
</tr>
<tr>
<td>Wait for Percentage</td>
<td>Wait duration as a percentage of the time period between the start of flow logic and specified end time. If you select a past date for the end time, the wait duration is set to 0. This field appears when <strong>Percentage Duration</strong> is selected from the Duration Type list.</td>
</tr>
<tr>
<td>During the following schedule</td>
<td>Select the schedule used to calculate the <strong>Scheduled End date/time</strong> value from the selected wait duration. For example, waiting for a 10-hour duration as part of an 8-5 weekdays schedule causes the flow to wait for one or more business days. If you leave this field blank, the timer runs without a schedule. For information on creating schedules, see <em>Define a schedule</em>.</td>
</tr>
</tbody>
</table>

### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration</td>
<td>Total time that the flow ran in milliseconds. You can drag this data pill into the duration fields.</td>
</tr>
<tr>
<td>Date/time</td>
<td>Date/time that the flow completed. You can drag this data pill into the date/time fields.</td>
</tr>
</tbody>
</table>

**Close an incident if it has been in the resolved state for 10 days**

In this example, a flow starts when the incident state changes to Resolved.
**Wait 10 days after the last update to a record**

In this example, the flows waits for 10 days after the incident record has been resolved.
Update a record after 10 days

In this example, the flows closes the incident record 10 days after it was resolved.
Wait for a duration of 50% of the time between the start of the flow logic and the due date

In this example, the flows send a notification email to the relevant manager when a critical problem is created and 50% of the time between the problem record creation and the problem due date has lapsed.
Relative Duration type

When the duration type is **Relative Duration**, the flow logic first evaluates the relative date and time, the schedule, and finally, the duration. Schedules, dates, and times set in the past don’t affect the wait duration. This table provides examples of how the flow processes the wait duration in these scenarios.

<table>
<thead>
<tr>
<th>Duration Setting</th>
<th>Relative Date/Time</th>
<th>Schedule</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set to 0.</td>
<td>None</td>
<td>None</td>
<td>Duration ends immediately.</td>
</tr>
<tr>
<td>Duration Setting</td>
<td>Relative Date/Time</td>
<td>Schedule</td>
<td>Effect</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------</td>
<td>----------</td>
<td>--------</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Past date</td>
<td>None</td>
<td>Duration ends immediately.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>None</td>
<td>Flow waits for the date/time, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Past date</td>
<td>Future date</td>
<td>Flow waits for schedule, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>Past date</td>
<td>Flow waits for the date/time, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>Future date</td>
<td>Flow waits for the future date, then for the schedule, and then for the duration.</td>
</tr>
</tbody>
</table>

The timer waits for the next instance of a selected schedule. For example, if you set a schedule for Monday through Friday from 8 a.m. to 5 p.m., and the timer is initiated on Saturday, the timer waits until Monday at 8 a.m. before starting.
### Execution details

<table>
<thead>
<tr>
<th>Index</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Execution details for Wait for a duration flow logic</td>
</tr>
<tr>
<td></td>
<td>1. The header shows the state, start time, and runtime for the flow logic.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Note:</strong> The runtime value in the header only includes the time that it takes to execute the flow logic and doesn’t include the wait duration that is specified in the flow.</td>
</tr>
<tr>
<td></td>
<td>2. The Configuration Details section shows details about the variables that are used by the flow, including the type, configuration, and runtime values for each variable.</td>
</tr>
</tbody>
</table>

**Call a workflow flow logic**

Run a published and active workflow from your flow. You can use the flow data as a workflow input. For example, you can specify the current record as a workflow input.
## Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select a Workflow</td>
<td>Published and active workflow that you can select to run. The workflow that you select determines the records that are associated with it. If the workflow has inputs, Flow Designer displays them as additional flow inputs.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>To prevent the workflow from running outside of Flow Designer, modify it to remove its start conditions.</td>
</tr>
<tr>
<td>Wait?</td>
<td>Workflow that you set to true so that the flow waits for workflow completion before continuing. Only workflows that wait for completion can return certain output values to the flow. Set to false to continue running the flow separately from the workflow.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If the workflow is canceled or its context record is deleted prior to the workflow finishing, the flow stops waiting and instead continues running.</td>
</tr>
<tr>
<td>Current</td>
<td>Current record that the workflow processes. Select a data pill that contains a record from the associated workflow table.</td>
</tr>
</tbody>
</table>

## Outputs

The flow execution details only display workflow output values that are generated while the flow is running. If you configure the flow to wait for the workflow to finish, the flow execution details can display all workflow output values. If the flow does not wait, the flow execution details only display the workflow output values that were generated before the Call a Workflow flow logic completes. If Call a Workflow completes before the workflow finishes, the workflow output values stop updating and only display the last known value.

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>State of the workflow. This value comes from the workflow context record. The state will be Complete if the workflow executes successfully. If the workflow is canceled, the workflow state is set to Canceled. If the context record is deleted prior to the workflow finishing, the workflow state is set to Invalid.</td>
</tr>
<tr>
<td>Context</td>
<td>Reference to the workflow context record.</td>
</tr>
</tbody>
</table>
### Output

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String that contains the result from the workflow. This value comes from the workflow context record.</td>
<td></td>
</tr>
</tbody>
</table>

| Return value    | String that contains the return_value from the workflow. This value comes from the workflow context record. |

### Calling the Routine Change workflow

In this example, the flow calls the **Routine Change** workflow. The **Wait?** option is checked, so the flow pauses until this workflow completes. The **Current** field is filled using a data pill representing the record that triggered this flow.
Execution details

1. The header displays a link so that you can view the workflow progress in the Workflow Editor, the flow logic state, the start time, and the runtime duration.

2. The Workflow Configuration section displays how the flow logic was configured for this flow and the runtime values that were generated.

3. The Workflow Output section displays the output that is generated by the workflow while the flow is running.

**Note:** If you cancel the workflow or delete the context record prior to the workflow finishing, the flow logic state is set to **Complete**.

End flow logic

Use this flow logic to stop a flow within flow designer.

End flow logic can be contained within a conditional flow logic block, such as an **If**, **Else If**, or **Else** flow logic block. Use this flow logic to stop a flow when certain conditions are met. You cannot add actions or flow logic after you use the **End** flow logic. All branches of a flow are ended when a flow reaches the **End** flow logic, including the **Wait for a duration** logic. Any branches that run in parallel also stop their progress when you use the **End** flow logic.
Inputs

This flow logic has no inputs.

Execution Details

When a flow ends, the flow state becomes **Complete**.

Dynamic flows

Identify and run a flow or subflow dynamically using runtime data. Build templates to provide expected inputs for dynamically called flows or subflows.

The Dynamic Flow flow logic calls a flow or subflow during runtime by using the data that you specify during the flow design. You can use Dynamic Flow to select which flow to run when multiple flows have similar names or purposes.

To use Dynamic Flow, the flow designer does the following:

1. Creates and publishes a flow or subflow to use as a template.
2. Adds Dynamic Flow to a parent flow.
4. Enters the flow name for Dynamic Flow.
5. Enters the required inputs specified by the flow template.

Dynamic flow templates

The template for Dynamic Flow can be a flow or a subflow. The template's inputs must match the inputs of any flow or subflow that you call dynamically. An input matches when it has the same **Label** and **Name** field values in each flow or subflow.

After you build a template, consider copying it to create similarly named and similarly performing flows or subflows. Make sure that you name each flow or subflow with a standard naming convention that can be generated by Dynamic Flow. For more information on creating a template for Dynamic Flow, see *Getting started with Dynamic Flow and Get Flow Outputs*.

Inputs

The following inputs always appear when you add the Dynamic Flow flow logic to a flow.

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Flow Template</strong></td>
<td>Template whose inputs the dynamic flow copies and displays. The inputs for</td>
</tr>
<tr>
<td></td>
<td>the template must match the inputs of the subflow that you want to run.</td>
</tr>
</tbody>
</table>
**Input** | **Description**
--- | ---
Flow | Name of the flow or subflow that you want to run. Generate a flow or subflow name dynamically by entering a string and concatenating it with data pill values.

*Note:* You can call a flow or subflow that is associated with another application scope by entering a scope-name.flow-name format. The user running the flow or subflow must have access to the application scopes that you specify. If you do not specify an application scope, the dynamic flow runs in the parent flow’s scope.

*Note:* If the system can’t find the flow or subflow, it skips the Dynamic Flow flow logic step and logs an error message.

Wait for completion | Option to force the parent flow to wait until the dynamic flow finishes running before proceeding with the next action.

---

**Get flow outputs**

Dynamic Flow outputs appear in the data pane as Record type data pills that are named as Context. You can use these flow contexts to derive the runtime values for dynamic flow outputs with the Get Flow Outputs flow logic. To use Get Flow Outputs, the flow designer does the following:

1. Adds a Dynamic Flow to a flow.
2. Adds Get Flow Outputs after the dynamic flow.
3. Specifies the value for the **Context** input by clicking the data pill picker (_av) and selecting Dynamic Flow > Context.

For more information on using Get Flow Outputs, see *Getting started with Dynamic Flow and Get Flow Outputs*.

**Design considerations**

**Consider using dynamic flows if you have multiple subflows with similar functionality**

Dynamic flows let you compartmentalize your processes by applying a template to handle the inputs of multiple similar subflows. Compartmentalization lets you distinguish between subflows that perform similar functions, such as subflows for IntegrationHub spokes.
Ensure dynamically called subflow inputs match template flow inputs
If the inputs of the dynamic flow don't match the inputs of the flow template, the system throws an error and the main flow can't run properly.

Use the correct context when getting flow outputs
If you are using Dynamic Flow more than once within a flow, make sure to drop in the correct context data pill from Get Flow Outputs.

Get started with Dynamic Flow and Get Flow Outputs
Create a sample flow that dynamically calls subflows for provisioning cloud services.

Role required: flow_designer or admin
To understand how to use the Dynamic Flow and Get Flow Outputs flow logic together, the flow that you create in this task dynamically runs subflows that are related to provisioning cloud services. This flow does the following:
1. Triggers when a Cloud Instance Provisioning Request record is created.
2. Calls the appropriate subflow to create a Cloud Instance record.
3. Gets an output from the dynamically called subflow and updates the Cloud Instance Provisioning Request record with the output's value.

1. Navigate to System Applications > Studio.
2. On the Select Application screen, click Create Application.
3. On the Guided App Creator welcome screen, click Let's get started.
4. In the Name field, enter Cloud Instance Provisioning and then click Create.
5. In the Roles field, enter flow_designer or admin and then click Continue.
6. From the list of app formats, select Classic and then click Continue.
7. Select Create new table > Create table from scratch > Continue to create two new tables for your application.
   • Add the following fields for the first table and name the table Cloud Instance.

<table>
<thead>
<tr>
<th>Field label</th>
<th>Field type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Instance Type</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Instance URL</td>
<td>URL</td>
<td>None</td>
</tr>
<tr>
<td>Build Status</td>
<td>String</td>
<td>None</td>
</tr>
</tbody>
</table>

   • Add the following fields for the second table and name the table Cloud Instance Provisioning Request.

<table>
<thead>
<tr>
<th>Field label</th>
<th>Field type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requested Instance Type</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Requested by</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Approval Status</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Approved Instance</td>
<td>URL</td>
<td>None</td>
</tr>
</tbody>
</table>

8. After creating both tables, click Done with tables.
9. Select Start > Create > Done with apps to finish creating your application.
Create a subflow template

Role required: flow_designer or admin

1. Under Business logic, process automation, and integrations, click Go to Flow Designer.
2. In the Flow Designer landing page main header, click New > New Subflow.
3. On the Subflow Properties screen, enter TEMPLATE: Create Cloud Instance Record in the Name field and then click Submit.

4. Under Inputs & Outputs, click the plus icon (+) to create two inputs for your subflow template.

<table>
<thead>
<tr>
<th>Label</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requested by</td>
<td>Reference.User</td>
</tr>
<tr>
<td>Requested Instance Type</td>
<td>String</td>
</tr>
</tbody>
</table>

5. Click the plus icon (+) to create one output for your subflow template.

<table>
<thead>
<tr>
<th>Label</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance URL</td>
<td>URL</td>
</tr>
</tbody>
</table>

6. Under your output, click Done.
7. Click the add action, flow logic, or subflow to end of flow icon (+) and then click Action.
8. From the list of ServiceNow Core actions, select Log.
9. In the Data pane, drag the data pills for the Requested by and Requested Instance Type inputs you created earlier, and drop both of the pills into the Message field.
10. In the Subflow header, click Save and then click Publish to publish your subflow template.

Create a subflow for Jira cloud instance provisioning requests

Role required: flow_designer or admin

1. In the Subflow header, click the more actions icon (···) and select Copy subflow.
2. On the Copy Subflow screen, enter Create Cloud Instance Record - Jira in the New Subflow Name field, and then click Copy.
3. Under the Log action, add a Create Record action.
4. In the Table Name field, select Cloud Instance and then fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td></td>
</tr>
</tbody>
</table>

Click the data pill picker (···) and select Subflow - Inputs > Requested by.
Create a subflow for Salesforce cloud instance provisioning requests

Role required: flow_designer or admin

1. In the Subflow header, click the more actions icon
   and select Copy subflow.
2. On the Copy Subflow screen, enter Create Cloud Instance Record - Salesforce in the New Subflow Name field, and then click Copy.
3. Expand the Create Cloud Instance Record action and replace the .atlassian.net value for the Instance URL field with .salesforce.com.
4. In the Subflow header, click Save and then Publish to publish the subflow.

Create a flow that runs your subflows dynamically

Role required: flow_designer or admin

1. Under the Flow Designer header, click the Create flow, subflow, or action icon and select Flow.
2. On the Flow Properties screen, enter Process Cloud Instance Provisioning Request in the Name field, and then click Submit.
3. Under Trigger, click the plus icon to add a trigger to your flow, and then fill out the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger</td>
<td>Select Created.</td>
</tr>
<tr>
<td>Table</td>
<td>Enter Cloud Instance Provisioning Request (x_cloud_instance_p_cloud_instance_provisioning_request)</td>
</tr>
</tbody>
</table>

4. Under Actions, click the plus icon
   then click Flow Logic > Dynamic Flow.
5. Fill in the following fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow Template</td>
<td>Enter <code>TEMPLATE: Create Cloud InstanceFlow</code></td>
</tr>
<tr>
<td>Flow</td>
<td>Enter <code>Create Cloud Instance - and then click the data pill picker ( ) and select</code> <code>Trigger - Record Created &gt; Cloud Instance Provisioning Request Record</code> <code>Requested Instance Type.</code></td>
</tr>
<tr>
<td>Wait for completion</td>
<td>Enable this option to run your subflow dynamically first before other actions in your flow occur.</td>
</tr>
<tr>
<td>Requested by</td>
<td>Click the data pill picker ( ) and select <code>Trigger - Record Created &gt; Cloud Instance Provisioning Request Record</code> <code>Requested by.</code></td>
</tr>
<tr>
<td>Requested Instance Type</td>
<td>Click the data pill picker ( ) and select <code>Trigger - Record Created &gt; Cloud Instance Provisioning Request Record</code> <code>Requested Instance Type.</code></td>
</tr>
</tbody>
</table>

6. Under your **Dynamic Flow** flow logic, add the Get Flow Outputs flow logic, and then fill in the following fields.

7. Next to the **Context** field, click the data pill picker ( ) and select `1 - Dynamic Flow` `-> Context`.

8. Under your **Get Flow Outputs** flow logic, click the plus icon ( ) and then click **Action > Update Record** to add an **Update Record action** to your flow.

9. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Click the data pill picker ( ) and select <code>Trigger - Record Created &gt; Cloud Instance Provisioning Request Record</code></td>
</tr>
<tr>
<td>Approved Instance</td>
<td>Click the data pill picker ( ) and select <code>2 - Get Flow Outputs</code> <code>-&gt; Instance URL</code></td>
</tr>
<tr>
<td></td>
<td>Enter Approved.</td>
</tr>
</tbody>
</table>

a) Click **Save**.

Test your flow
Role required: flow_designer or admin

1. In the Flow header, click Test to test your flow.

2. On the Test Flow screen, click the Create new record ( ) icon, and then click the Lookup using list icon ( ) and select any user from the list.

3. Enter either Jira or Salesforce in the Requested Instance Type field. The value you enter determines which subflow runs dynamically at runtime. Entering Jira runs the Create Cloud Instance Record - Jira subflow, and entering Salesforce runs the Create Cloud Instance Record - Salesforce.

4. Click Run Test, and when the flow finishes running, click Flow has been executed. To view the flow, click here. Your flow runs successfully if the values in the State column for each step in your flow shows Completed and each step’s runtime value populates appropriately.

5. Select the tab for your Process Cloud Provisioning Requests flow and close the Test Flow modal.

6. In the Flow header, click Activate to make your flow accessible within the Cloud Instance Provisioning application scope.

When a user in your instance creates a new record in the Cloud Provisioning Request table, your Process Cloud Provisioning Requests flow runs automatically. This flow dynamically creates the proper Cloud Instance record that is based on the requested instance type. It also generates a cloud instance URL, which populates in the Cloud Instance Provisioning Request record.

Subflows

Define a sequence of reusable actions that can be started from a flow, subflow, or script. Define inputs and outputs to pass data to and from the subflow.

Unlike flows, subflows lack a trigger. Use a subflow when:

- You only want to start a flow by calling it from another flow or script.
- You want to create a set of reusable operations for use in multiple flows.
- You want to add flow logic in addition to actions.
- You want to specify the inputs available to the subflow when it starts.
- You want to specify the outputs available to the parent flow after the subflow ends.

All subflows consist of properties, one or more inputs, one or more outputs, a sequence of actions, and the data collected or created. Unlike flows, subflows:

Subflow properties

The subflow properties specify the subflow name, application, category, description, in-flow annotation, and status. Flow designers can update the subflow name, category, description, and in-flow annotation at any time, but can only set the application during subflow creation. The subflow status is set when you save or publish a subflow.
Subflow inputs

Subflow inputs specify the data available to the subflow when it starts. Each input you define for a subflow becomes a configuration option in the Flow Designer interface. To use the subflow in a flow, flow designers must define a value for each mandatory input. The more inputs a subflow has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the subflow effectively.

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring a subflow to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

Subflow outputs

Subflow outputs specify the data available to the parent flow after the subflow completes. Subflow outputs are defined as variables with a name and data type. Subflow designers assign values to an output using the Assign Subflow Output flow logic. Output values can be based on the subflow logic conditions, action results, or a manually set value. For example, an output may have one value when a condition is met and another value when a condition is not met. During runtime, the value of the output is determined by the condition that is met.

Consider the following example of a subflow with two conditions that both result in a value for a single output variable. The value of the variable depends on which condition is met during runtime.

Outputs

(Manager ID) (String)

Actions

• 1 Look Up (User) Record where (Created on Today)
• 2 If (1->User Record->Title) contains Manager) then
  • 2.1 Assign Subflow Outputs (Manager ID) to (1->User Record->User ID)
• 3 Else
  • 3.1 Assign Subflow Outputs (Manager ID) to (1->User Record->Manager->User ID)

In this case, if the user's title contains "Manager" then the user ID is assigned as output. Otherwise, the subflow looks up the user's manager and assigns the user ID of the manager as output.

Flow Designer allows you to define a value for the same variable multiple times. However, if a variable is given two or more possible values without conditional logic, only the last value defined in the subflow is applied to the output at runtime.

Outputs

(Manager ID) (String)

Actions

• 1 Look Up (User) Record where (Created on Today)
• 2 Assign Subflow Outputs (Manager ID) to (1->User Record->User ID)
- 3 Assign Subflow Outputs (Manager ID) to (1->User Record->Manager->User ID)

In this example, action three overwrites the value of action two and (1->User Record->Manager->User ID) is applied to the (Manager ID) output at runtime because it was the last value defined. Typically, subflows should only include multiple values for one variable if conditional flow logic is used.

**Actions**

Within **Actions**, flow designers can add actions, flow logic, flows, or other subflows.

An **action** is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the **Create Record** action allows process analysts to generate records in a particular table with particular values when certain conditions occur. ServiceNow core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to preset configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

**Flow logic**

Subflows can contain **flow logic** to specify conditional or repeated actions, or to assign output variables to subflow data. The system provides these flow logic options.

**Available flow logic**

<table>
<thead>
<tr>
<th>Flow logic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>For Each</td>
<td>Applies actions to each record in a list of records. Flow designers must specify the records from the subflow data.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can nest a For Each flow logic block inside of another flow logic block to repeat an action over a series of records. However, avoid nested For Each loops that process many records. Nested loops may cause the flow to run until it is stopped by the flow transaction quota rule, which prevents flows from running longer than an hour. For more information about transaction quotas, see <a href="#">Transaction quotas</a>.</td>
</tr>
<tr>
<td>If</td>
<td>Applies actions when a list of conditions is met. Flow designers can specify the conditions with subflow data. Once an If condition is added, you can add an Else or Else If flow logic option to define behavior when conditions are not met.</td>
</tr>
<tr>
<td>Assign Subflow Outputs</td>
<td>Assigns an output variable to subflow data. Only outputs defined in <a href="#">Inputs &amp; Outputs</a> can be assigned a value. Assigning outputs enables you to assign a different output variable for each logical path in the subflow.</td>
</tr>
</tbody>
</table>
More Actions

Click the **More Actions** button to access additional options for the subflow.

**Copy action**

Create a copy of the open subflow in an application you specify.

**Configurations**

Enable or disable the *Show draft actions*, *Show triggered flows*, *Show store spokes*, and *Show inline script toggle* options.

**Code Snippet**

Generate a code snippet for the action.

**Manage security**

Enable or disable the *Callable by Client API* option.

**Manage natural language title**

Create or edit a subflow title with styled or dynamic text. For more information, see *Manage natural language titles*.

Testing subflows

You can test a subflow alone, or when added to a flow. When testing a subflow alone, you must define the inputs that the subflow uses in its actions. Because a subflow does not have a trigger, testing a subflow runs the actions using the defined input values.

*i Note:* Flow designers should always test flows and subflows on sub-production instances containing relevant demonstration data since testing a subflow creates or changes records on the instance.

Roles

To access subflows, a user must have the flow_designer or admin role.

Create a subflow

Create a reusable sequence of actions that can be added to multiple flows.

- Role required: flow_designer or admin
- *Setting up an application in Guided Application Creator* to store Flow Designer content.

Users with flow_designer or admin role should know the application table structure and be aware of any existing business logic associated with the target tables of a flow or subflow. Be sure to disable any conflicting business rules or workflows before creating a flow or subflow.

Creating a custom application to contain your Flow Designer content allows you to *deploy* it using the application repository or the ServiceNow Store.

1. Navigate to **Flow Designer > Designer**.
2. Click + New > New Subflow.
   The Subflow properties dialog displays.
3. Fill in the following properties:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the subflow.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create the subflow in.</td>
</tr>
<tr>
<td>Category</td>
<td>Logical group for subflow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the subflow is read-only. You can only select a value when</td>
</tr>
<tr>
<td></td>
<td>you create the subflow in an application scope you own. The default value</td>
</tr>
<tr>
<td></td>
<td>is None.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the subflow title in Flow Designer to help</td>
</tr>
<tr>
<td></td>
<td>flow designers understand what the subflow does when used in a flow.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the subflow.</td>
</tr>
<tr>
<td>Run As</td>
<td>Selection to specify if the flow runs as system user or the user who</td>
</tr>
<tr>
<td></td>
<td>initiates the session. Select the user who initiates the session option</td>
</tr>
<tr>
<td></td>
<td>when updates should come from the user who triggered the flow. For example,</td>
</tr>
<tr>
<td></td>
<td>when you want incident record comments to come from the current user, or</td>
</tr>
<tr>
<td></td>
<td>approval emails to originate from the approver. Run As settings for a flow</td>
</tr>
<tr>
<td></td>
<td>don’t apply to child subflows.</td>
</tr>
<tr>
<td></td>
<td>Running as the initiating user also ensures the actions taken during flow</td>
</tr>
<tr>
<td></td>
<td>execution are limited by the user’s ACL restrictions. Flows run by the</td>
</tr>
<tr>
<td></td>
<td>initiating user will also respect user-specific settings like date/time</td>
</tr>
<tr>
<td></td>
<td>format.</td>
</tr>
</tbody>
</table>

Note: When choosing the option to run as the user who initiates the session, ensure that your security restrictions do not prevent your users from making any changes the flow executes.

4. Create subflow inputs to specify the data available to the subflow when it starts.
   Each input you define for a subflow becomes a configuration option in the Flow Designer interface. To use the subflow in a flow, flow designers must define a value for each mandatory input. The more inputs a subflow has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the subflow effectively.
   a) Click + to open the Inputs & Outputs pane.
   b) Click + to add a new input.
   c) Define the name and type for the input.
   d) To make the input a mandatory configuration option, select the Mandatory flag.
   e) Click ▼ to view the advanced options and define values.

   Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring a subflow to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

5. Create subflow outputs by defining the names and data types.
Subflow outputs specify the data available to the parent flow after the subflow completes.

a) Click + to add a new output.

b) Define the name and the data type.
   Output values are assigned in later steps.

### INPUTS & OUTPUTS

#### Inputs

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incident</td>
<td>Reference.Incident</td>
<td>▼</td>
</tr>
</tbody>
</table>

#### Outputs

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Caller name</td>
<td>String</td>
</tr>
<tr>
<td>Incident short description</td>
<td>String</td>
</tr>
</tbody>
</table>

6. To add actions, flows, subflows, or flow logic, click **Select to add an Action, Flow Logic, or Subflow**.

   a) Select an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Select the desired action. Flow Designer includes a set of Actions available to flows and subflows. Alternatively, a user with the action_designer role can create additional actions to add to flows. The IntegrationHub and spoke plugins install additional actions. To add draft actions from the More Actions menu, set Show draft actions to true. To view spokes available in the ServiceNow Store, set Show store spokes to true from the More Actions menu.</td>
</tr>
</tbody>
</table>

   **Note:** Under Not Installed Spokes, the system displays spokes available in the ServiceNow Store based on compatibility with the ServiceNow version and application dependency on Flow Designer.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow Logic</td>
<td>Select an option to specify conditional or repeated operations.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Select a published subflow and define input values. In addition to adding a subflow as a flow action, you can enable the Show triggered flows option from the More Actions menu to select an activated flow and define the required inputs. Running a triggered flow ignores its trigger conditions and runs all actions.</td>
</tr>
<tr>
<td>Manage natural language title</td>
<td>Create a flow, subflow, or action title with styled and dynamic text.</td>
</tr>
</tbody>
</table>

To change the order of an action in a flow, drag the handle on the left side of the action to the desired location.

The system displays a set of fields depending on the option selected.

b) To configure the action, flow, or subflow, fill in the fields.
c) Click **Done**.
d) Repeat adding actions until complete.

7. Assign subflow outputs to a value.
You can assign a subflow output to multiple values, enabling you to create conditional outputs based on flow logic.

a) Under **Actions**, click + and select **Flow Logic**.
b) Click **Assign Subflow Outputs**.
c) In the **Name** field, select an output you created in the Inputs & Outputs section. You can only assign values to outputs that have already been given a name and data type.
d) In the **Data** field, enter a value or select a data pill from the data panel.
e) Click **Done**.

Test the subflow, and publish it when it is ready to be added to a flow or called from a script.
**Test a subflow**

You can test a subflow alone, or when added to a flow. When testing a subflow alone, you must define the inputs that the subflow uses in its actions. Because a subflow does not have a trigger, testing a subflow runs the actions using the defined input values. Unless updated, subsequent tests use the same inputs defined in the initial test run.

Role required: flow_designer or admin

*Create a subflow* that contains at least one action and save it. Flow Designer only tests saved subflows that contain at least one action.

Flow designers should always test flows and subflows on sub-production instances containing relevant demonstration data since testing a subflow creates or changes records on the instance.

1. Navigate to **Flow Designer > Designer**.
2. Click the subflows tab and open a saved subflow.
3. Click **Test**.
   - The Test Subflow dialog opens.
4. Define input values for the subflow to use in its actions. The values defined are remembered on future test runs.
5. Click **Run Test**.
6. After the flow executes, click **Subflow has been executed. To view the subflow, click here**.
   - The Execution Details open.

Once the subflow behaves as desired, you can **publish the subflow** and add it to a flow.

**Publish a subflow**

Publish a subflow to make it available to other users and to add it to activated flows.

Role required: flow_designer or admin

*Create a subflow, test the subflow*, and verify that it is working as expected.

When you make changes to a published subflow, the changes remain in the draft state until you publish the subflow again. You must publish a changed subflow to make the changes available to activated flows.

1. Navigate to **Flow Designer > Designer**.
2. Click the subflows tab and open a tested subflow.
3. Click **Publish**.

The subflow can be added to activated flows. If you update the subflow after it is published, you must click **Publish** again to see the changes when the parent flow is run. After publishing changes, all parent flows that use the subflow are automatically updated to use the current version.

**Complex data**

Use a graphical interface to work with collections of complex structured data. Help design users understand the organization of structured data, and add, remove, or configure its individual elements.

Complex data allows you to encode and store structured data in a machine-readable format such as JavaScript Object Notation (JSON) or eXtensible Markup Language (XML). You can use the Flow Designer interface to view and understand the organization of structured data as well.
as create data structures. For example, you can create a contact data structure consisting of information you look up from a user record such as first name, last name, and email address.

You can create complex data from these Flow Designer interfaces.

### Complex data usage examples

<table>
<thead>
<tr>
<th>Flow Designer interface</th>
<th>Example usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action inputs and outputs</td>
<td>Create an action that generates an object from record data. Populate the object using record data the action looks up. See <a href="#">Create a custom action to generate an object from a record</a>.</td>
</tr>
</tbody>
</table>
| Script step input and output variables               | Write a script to create an array of objects from a list of records. See [Create a custom action to generate an array of objects from a list of records](#).  
Write a script to parse a JSON document into an output of type Object. |
| Subflow inputs and outputs                          | Create a subflow that accepts an object as an input and uses it to call an external service.       |
| XML parser step Target field configurations         | Parse an XML payload into a complex data object using the XML parser step.                       |

### Benefits

Complex data offers these benefits.

- Parse and format data without having to write code. For example, create data variables to parse a response message or format a request message.
- Create arbitrary data structures. For example, create an issue data structure that combines information from existing interaction and incident records, or create a data structure to support a custom integration.
- View the organization of data structures. For example, an issue data structure might consist of a user object to describe who to contact about the issue and a history object to describe the work done to resolve it. You could configure a notification action with the path to the email address listed in the user object, and call an escalate issue subflow with the path to the status or reassign count from the history object.
- Allow access to data structure from API calls. For example, call an action or subflow from a script and use the predefined data structure as input values.
- Save and reuse data structures as templates. For example, save the user object as a template data structure for reuse in other actions and flows.

### Data structure

A data structure is a collection of related data elements organized into a hierarchy. Each element in a data structure has its own data type and its own unique position in the hierarchy.

The Editor pane displays data structure hierarchy with indentation. The indentation level identifies whether an element is a parent, child, or sibling in the hierarchy. Parent elements have children indented underneath them, and siblings have the same indentation level.
Note: The Flow Designer interface allows you to create hierarchies with an unlimited number of child levels, but you may have to scroll horizontally to see them.

For example, this data structure consists of an Employee parent element with four child elements for ID Number, Name, Start Date, and Contact Email. The Contact Email element is also a parent element with one child.

<table>
<thead>
<tr>
<th>Label</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>ID Number</td>
<td>Integer</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Start Date</td>
<td>Date/Time</td>
<td></td>
</tr>
<tr>
<td>Contact Email</td>
<td>Array[String]</td>
<td></td>
</tr>
<tr>
<td>Contact Email[x</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

Sample inputs for an Employee object

The Data pane displays data structure hierarchy as a tree of collapsible and expandable data pills just like it does with record variables. Parent elements have an arrow icon to collapse or expand the hierarchy.

For example, here is the Employee data structure as seen from the Data pane.

Sample data pill for an Employee object
You can use the Data pane or Data picker to select specific values from a data structure. Data structures are similar to data pills for records in that you can dot-walk or navigate to specific elements within the structure. When you select a data element, Flow Designer displays the path to it as a data pill just like any other data element selection. For example, if you select the Start Date data element, the path is (Input->Employee->Start Date).

You can use an element data path the same way you can an XPath or JPath. Sometimes you may even convert the data pill path into one of these path notations.

**Complex data types**

You build data structures using one or more Array or Object variables. Only these variable data types support child variables.

An Array variable contains values for one type of item. The parent variable is always of an Array data type, and there is always only one child variable, which is one instance of the data type supported by the array. Create Array variables when an input or output accepts multiple values of the same data type.

For example, you could create a Contact Email array to list all the email addresses associated with a given person.

**Sample data structure for the Contact Email array**

<table>
<thead>
<tr>
<th>Component label</th>
<th>Data Type</th>
<th>Sample Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Email</td>
<td>Array.String</td>
<td><a href="mailto:beth.anglin@example.com">beth.anglin@example.com</a> and <a href="mailto:beth@anglin.com">beth@anglin.com</a></td>
</tr>
<tr>
<td>Contact Email_child0</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

An Object variable contains any number and arrangement of child variables that each have their own data type and values. Nesting Object variables allows you to create complex data structures similar to a table schema where one table has related records in another table. Create Object variables when an input or output accepts one or more related properties.
For example, you can create an Employee object to define information about the people who work at a company.

Sample data structure for the Employee object

<table>
<thead>
<tr>
<th>Component label</th>
<th>Data Type</th>
<th>Sample Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>ID Number</td>
<td>Integer</td>
<td>20190304000101</td>
</tr>
<tr>
<td>Name</td>
<td>String</td>
<td>Beth Anglin</td>
</tr>
<tr>
<td>Start Date</td>
<td>Date/Time</td>
<td>March 4, 2019</td>
</tr>
<tr>
<td>Contact Email</td>
<td>Array.String</td>
<td><a href="mailto:beth.anglin@example.com">beth.anglin@example.com</a> and <a href="mailto:beth@anglin.com">beth@anglin.com</a></td>
</tr>
</tbody>
</table>

Only these variable data types can be parents.

Parent data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Array</td>
<td>A container for arrays. Adds a read-only child item of type Array.</td>
</tr>
<tr>
<td>Array.True/False</td>
<td>A container for true/false values. Adds a read-only child item of type True/False.</td>
</tr>
<tr>
<td>Array.Choice</td>
<td>A container for choice values. Adds a read-only child item of type Choice.</td>
</tr>
<tr>
<td>Array.Date/Time</td>
<td>A container for date/time values. Adds a read-only child item of type Date/Time.</td>
</tr>
<tr>
<td>Array.Integer</td>
<td>A container for integer values. Adds a read-only child item of type Integer.</td>
</tr>
<tr>
<td>Array.Object</td>
<td>A container for objects. Adds a read-only child item of type Object, which displays the Add Child Item option.</td>
</tr>
<tr>
<td>Array.String</td>
<td>A container for string values. Adds a read-only child item of type String.</td>
</tr>
<tr>
<td>Object</td>
<td>A container for other data elements. Displays the Add Child Item option.</td>
</tr>
</tbody>
</table>

Array and Object variables only support these child data types.

- Array
- True/False
- Choice
- Date/Time
- Integer
- Object
- String
Note: The data types in array and object variables are not Glide elements. There may not be complete compatibility between these items and Now platform types.

Advanced options

Object variables have advanced options to save and load data structures. These options allow you to reuse a data structure defined in one location in another. For details on advanced options see Advanced options for action inputs.

Data structure templates

Data structure templates allow you to reuse Object variables in multiple actions or subflows. For example, you can create a data structure to parse a response and then later reuse that same data structure to format a request. A template stores the list of child variables and their structure within an object. Each Object variable has an Advanced Option to save it as a template.

When you apply a template, you are creating a copy of the original structure. Any changes you make after applying a template do not affect the template, nor do they affect other actions that use the template.

Array data pills

Objects that contain array data may require For Each flow logic to process. For example, a user object that contains an array of email addresses would require a For Each flow logic loop to send a notification to each email address.

Object data pills

You can design actions that accept object data pills as input values. For example, you might create a notification action that accepts a user object as an input. If the user object consists of values for first name, last name, and addresses, then the notification action has access to all these values. To configure an action input with an object data pill, you must create an object earlier in the flow.
Sample action that accepts an object data pill

You can use an object data pill or any of its child elements to configure an input. When you configure an input value with an object data pill, Flow Designer makes any child elements of the object read-only, and the action uses the values provided by the object. For example, you can create a flow where one action generates a user object and another action sends a notification to the user specified in the object.
Sample action configured to use an object data pill

When you configure the child elements of an object, you must manually provide data pills for each child element of the object. For example, you can manually configure the user object with record values from an earlier action.

Script support

Create and reference complex data from a script. Use a script when your source data comes from a data stream, a REST step response, or a Look Up Records step. See Script support for complex data for more information about scripting with complex data.
Null values

When a name-value pair contains an empty or unknown value, the value is set to the null data type. For example, here is an object constructed from an approval record. In this case, the `note` has a null value.

```json
{
  "Approval Details": {
    "approvalStatus": "pending_approval",
    "approver": {
      "approver_assignee": "Approver",
      "approver_email": "approver@example.com",
      "approver_firstname": "Approval",
      "approver_lastname": "User",
    },
    "note": null,
    "reasons": [
      "The requester has no manager defined."
    ],
  }
}
```

Design considerations

Follow these design guidelines to create reusable and maintainable data structures.

**Minimize the number of child levels in the hierarchy**

The more child levels a data structure has, the more difficult it is to view and select any specific data variable from the hierarchy. While you can build data structures with any number of child levels, it becomes difficult to navigate and understand data structures with more than seven child levels. For the best user experience, avoid creating data structures that have so many child levels you must scroll horizontally to see and populate them.

**Create a separate object for each type of record data**

Most Flow Designer data is record data whether it is from an instance or an external system. This design method ensures that you know what the object contains and where the data came from.

**Recreate record data structures**

When building objects that receive or transmit record data, review the database dictionary entries for these records and create matching object data structures. For example, suppose that you want an object to contain data from incident and configuration item records. You might create a string element for the incident short description field and an array of strings element for the configuration item class field.

**Create objects to combine different types of records**

If you need information from multiple types of records, create an object that contains all the information you need. You can then use the object to format or parse data in Flow Designer.

**Create data structure**

Organize multiple data variables into a structure to process them as a unit and identify the individual items within it.

- Role required: action_designer, flow_designer, or admin
- Setting up an application in Guided Application Creator to store Flow Designer content.
- Create an action or Create a subflow

A data structure is a collection of related data elements organized into a hierarchy. Each element in a data structure has its own data type and its own unique position in the hierarchy.

1. Create a data variable.

<table>
<thead>
<tr>
<th>Action or subflow input</th>
<th>Click Create Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action or subflow output</td>
<td>Click Create Output</td>
</tr>
</tbody>
</table>

| XML parser step         | See XML parser step |

2. Set Type to Object.
   The top level of a data structure hierarchy must be an Object variable.
3. Click the Add Child Item icon.
   Flow Designer adds a child data variable to the bottom of the object list.

**Note:** You can insert a child item variable between existing variables by hovering your mouse pointer between two variables, and click the insert item icon that appears.

**Note:** When hovering your mouse pointer between a child and sibling variable, you will see a add child icon.

Click the left side of the icon to add a new sibling variable to the child’s parent, or the right side to add another child variable under the current variable.

4. Set the child variable **Label** and **Type**.
   To add another branch to the data structure hierarchy, set the Type to Object.
5. Repeat steps 3-4 for each data variable in the hierarchy.

Use the data structure to populate action, step, or subflow inputs. If you can reuse the data structure, save it as a template.

**Save data structure**

Save the data structure of child variables within an Object variable for later reuse.

- Role required: action_designer, flow_designer, or admin
- Setting up an application in Guided Application Creator to store Flow Designer content.
- Create an action or Create a subflow

1. Create data structure.
2. Expand the Advanced options for the Object variable you want to save.
3. Click Save as Template.
   Flow Designer displays a pop-up dialog.
4. Enter the template name.
5. Click Save.
   If the template name already exists, Flow Designer displays a confirmation dialog to overwrite the existing template.
Load the data structure in another action or subflow. Make updates to the data structure and save them.

**Load data structure**

Load a data structure of child variables within an Object variable.

- Role required: action_designer, flow_designer, or admin
- Setting up an application in Guided Application Creator to store Flow Designer content.
- Create an action or Create a subflow

1. Create a data variable.
2. From **Type**, select **Object**.
3. Expand the Advanced options for the Object variable whose data structure you want to replace.
4. From **Structure**, select **Start from Template**.
   Flow Designer displays the **Template** field.
5. From **Template**, select the template containing the template you want to load.
   If the Object variable has no existing data structure, Flow Designer loads the data structure into it. If the Object variable has an existing data structure, Flow Designer displays a confirmation dialog to replace the existing structure.

**Create a custom action to generate an object from a record**

Generate an object from a User record. Learn how to use an Action output to create an object from record values.

Role required: admin

Use this example to see demonstrations of these operations and steps.

- Create action inputs for the User record fields First name, Last name, and Email.
- Lookup a User record matching the action input values.
- Create an action output for a contact object.
- Save the contact object as a template.
- Map contact object values to User record field values.
- Test the action with a sample user.

1. Create an application to store your work.
   Use the **Guided Application Creator**.
   For example, create **My Application**.
2. Navigate to **Flow Designer > Designer**.
   The system displays the Flow Designer landing page.
3. Select **New > Action**
   The system displays the Action Properties dialog.
4. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contact Object From User</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Accessible From</td>
<td>All application scopes</td>
</tr>
</tbody>
</table>
5. Select **Submit**.
   The system displays the Action Designer interface.
6. From the Action Outline, select **Inputs > Create Input**
The system displays a new action input.
7. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>First name</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

8. From the Action Outline, select **Inputs > Create Input**
The system displays a new action input.
9. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Last name</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

10. From the Action Outline, select **Inputs > Create Input**
The system displays a new action input.
11. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Email address</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
</tbody>
</table>

12. From Action Outline, select **Outputs > Create Output**.
The system displays a new action output.
13. Configure the output variable with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contact</td>
<td>contact</td>
<td>Object</td>
<td>False</td>
</tr>
</tbody>
</table>

14. From the row for the contact Object, select **Add Child Item**.
15. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>first_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

16. From the row for the contact Object, select **Add Child Item**.
17. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last name</td>
<td>last_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>
20. From the row for the contact Object, select **Toggle Advanced Inputs**.
21. From the Advanced Options, select **Save As Template**.
   The system displays the Save As Template dialog.
22. For Enter a Name, enter **contact**.
23. Click Save.
24. Select **Exit Edit Mode**.
   The System displays the output fields you created.
25. Configure the outputs with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>(step-&gt;Look Up Record step-&gt;Record-&gt;First name)</td>
</tr>
<tr>
<td>Last name</td>
<td>(step-&gt;Look Up Record step-&gt;Record-&gt;Last name)</td>
</tr>
<tr>
<td>Email Address</td>
<td>(step-&gt;Look Up Record step-&gt;Record-&gt;Email)</td>
</tr>
</tbody>
</table>

**Note:** You can select data pills from the Data pane or from the Data Pill Picker button.

26. Select **Save**.
27. Select **Test**.
   The system displays the Test Action dialog.
28. Enter these test values.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>Abel</td>
</tr>
<tr>
<td>Last name</td>
<td>Tuter</td>
</tr>
</tbody>
</table>

29. Select **Run Test**.
   The system runs the action with the test values provided.
30. Select **Action has executed. To view the action, click here**.
   The system displays the action execution details.
31. Review the runtime value for the action Output data.
   The system displays output data in JSON format.
   For example, sample contact object JSON for the user Abel Tuter.

```json
{
  "contact": {
    "email_address": "abel.tuter@example.com",
    "last_name": "Tuter",
    "first_name": "Abel"
  }
}
```

You have a custom action that looks up a User record and converts it into a contact object.

Customize the action to use your own logic.
Create a custom flow to generate an object for each record in a list

Generate an object for each User record in a list. Learn how to use flow logic to iterate through a list of records.

- Role required: admin
- Create a custom action to generate an object from a record

Use this example to see demonstrations of these operations and steps.

- Create a flow that runs on a daily schedule.
- Look up User records filtered by the Department provided as an input.
- Add flow logic that runs for each User record you looked up previously.
- Create a contact object for each User record using the custom action you created previously.
- Create a log message for each User record.

1. Navigate to Flow Designer > Designer. The system displays the Flow Designer landing page.
3. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contact Objects From Users</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Run As</td>
<td>User who initiates session</td>
</tr>
</tbody>
</table>

4. Select Submit. The system displays the Flow Designer interface.
5. Select Click to add a Trigger > Date > Daily.
6. Select Done to close the trigger.
7. Select Click to add an Action, Flow Logic, or Subflow > Action > ServiceNow Core > Look Up Records.
   The system adds the action to the flow.
8. For Table, select User (sys_user).
9. For Conditions, add these values.
   - (Department)(is)(Development) (AND)
   - (Email)(is not empty)
10. Configure these field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order by</td>
<td>Name</td>
</tr>
<tr>
<td>Sort</td>
<td>a to z</td>
</tr>
<tr>
<td>Max Results</td>
<td>1000</td>
</tr>
</tbody>
</table>

11. Select Done to close the action.
12. Select Click to add an Action, Flow Logic, or Subflow > Flow Logic > For Each. The system adds the flow logic to the flow.
13. For Items, select (1->User Records).
14. Select Done to close the flow logic.
15. Select the plus icon to add a child item to the For Each flow logic.
16. Select Action > My Application > Create Contact Object.
17. For userRecord (User), select (2->User Record).

Note: You can select the Action 1 User Records data pill from the Data pane or from the Data Pill Picker button.

18. Select Done to close the flow logic action.
19. Select the plus icon to add a child item to the For Each flow logic.
20. Select Action > ServiceNow Core > Log.
21. For Message, select (2.1->contact).

Note: You can select the Action 2 User Record data pill from the Data pane or from the Data Pill Picker button.

22. Select Done to close the flow logic action.
23. Select Save.

Script support for complex data
Create and reference complex data from a script. Use a script when your source data comes from a data stream, a REST step response, or a Look Up Records step.

Use script to create complex data when data comes from these sources.

<table>
<thead>
<tr>
<th>Data source</th>
<th>Create/map complex data from</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Stream action response stream</td>
<td>Script Parser step</td>
</tr>
<tr>
<td>REST step response</td>
<td>Script step</td>
</tr>
<tr>
<td>Look Up Records step</td>
<td></td>
</tr>
</tbody>
</table>

Data Stream action response stream
Data Stream actions use a parser script to map stream item values to complex object values. When writing a parser script, use JavaScript methods appropriate to the data stream format. For example, use the JSON class to parse or encode a JSON data stream.

Parser scripts have access to the data stream input and output objects as well as a targetObject property. See Data Stream actions and pagination for more information about parsing a response stream to create complex data.

REST step response
You can convert a REST step response into one or more complex objects by parsing it with a Script step. To access a response from a Script step, you must create an input script variable and map
Write a script that maps REST response values to complex object values. When writing REST response script, use JavaScript methods appropriate to the response format such as the JSON parse() method.

**Note:** When you use complex data as the source of a string input, Flow Designer automatically converts it into a JSON string.

You do not need to use a Script step to create a REST request from complex data. You can generate complex data in a prior action or step and then map it to a string input of the REST step. At run time, the action or flow converts the complex data into a JSON representation.

**Look Up Records step**

While flows can use For each flow logic to process a list of records, actions require a Script step. The Script step replaces the For each flow logic with JavaScript such as a For or While loop.

To access record data from a Script step, you must create an input script variable and map it to the record data from the prior look up step. See Script step for more information about creating script input variables.

See Create a custom action to generate an array of objects from a list of records for an example action that converts a list of user records into an array of contact objects.

**Note:** The Look Up Records action does not require a Script step to convert record data into complex data. You can create a custom action to convert a record into an object and apply For each flow logic to the custom action. See Create a custom action to generate an object from a record and Create a custom flow to generate an object for each record in a list for an example of creating a complex object without using script.

**Dot-walking object structures**

You can reference elements from the structure of an object by dot-walking the path of the structure. All complex data paths start with the name of the data source, which is either the global object for inputs, the global object for outputs, or the name of the array or object you created in script.

Next in the path are the names of each structural element referenced separated by period characters (also known as dots). Listing the names of structural elements is identical to dot-walking a reference field where you list the table structure to a particular reference field.

**Note:** A dot-walk path always lists the name of a structural element rather than its label.

For example, suppose that you define a contact object as an Output variable. The object has the following structure.
### Output Variables

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact</td>
<td>contact</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>First name</td>
<td>first_name</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Last name</td>
<td>last_name</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Email Addresses</td>
<td>email_addresses</td>
<td>Array.Object</td>
<td></td>
</tr>
<tr>
<td>Email Address</td>
<td>email_address</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>type</td>
<td>Choice</td>
<td></td>
</tr>
<tr>
<td>Email</td>
<td>email</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Telephone Numbers</td>
<td>telephone_numbers</td>
<td>Array.Object</td>
<td></td>
</tr>
<tr>
<td>Mailing Addresses</td>
<td>mailing_addresses</td>
<td>Array.Object</td>
<td></td>
</tr>
</tbody>
</table>

**Create Variable**

---

### Sample Contact object

<table>
<thead>
<tr>
<th>Place in structure</th>
<th>Label</th>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent</td>
<td>Contact</td>
<td>contact</td>
<td>Object</td>
</tr>
<tr>
<td>Place in structure</td>
<td>Label</td>
<td>Name</td>
<td>Type</td>
</tr>
<tr>
<td>-------------------</td>
<td>----------------</td>
<td>------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>Child</td>
<td>First name</td>
<td>first_name</td>
<td>String</td>
</tr>
<tr>
<td>Child</td>
<td>Last name</td>
<td>last_name</td>
<td>String</td>
</tr>
<tr>
<td>Child</td>
<td>Email Addresses</td>
<td>email_addresses</td>
<td>Array.Object</td>
</tr>
<tr>
<td>Grandchild</td>
<td>Email Address</td>
<td>email_address</td>
<td>Object</td>
</tr>
<tr>
<td>Great grandchild</td>
<td>Type</td>
<td>type</td>
<td>Choice</td>
</tr>
<tr>
<td>Great grandchild</td>
<td>Email</td>
<td>email</td>
<td>String</td>
</tr>
<tr>
<td>Child</td>
<td>Telephone</td>
<td>telephone_number</td>
<td>Array.Object</td>
</tr>
<tr>
<td>Child</td>
<td>Mailing Addresses</td>
<td>mailing_address</td>
<td>Array.Object</td>
</tr>
</tbody>
</table>

The dot-walk path to the **First name** structural element would be `outputs.contact.first_name` while the path to the **Email** structural element would be `outputs.contact.email_addresses[0].email` since you must specify an individual element of the array by its JavaScript index value.

The dot-walk path omits the name of the repeated element within the array. For example, an array of objects does not have to specify the object element name. However, since objects are containers for other elements, you can specify a child element of the object within a dot-walk path.

### Note:
A dot-walk path omits the name of the repeated element within the array. For example, an array of objects does not have to specify the object element name. However, since objects are containers for other elements, you can specify a child element of the object within a dot-walk path.

### Design considerations

Keep these design considerations in mind when scripting with complex data.

**Use string inputs to convert complex data into a JSON string**

When you map complex data to a string input, Flow Designer automatically converts it into a JSON string. Instead of writing a script, you can add a string input to a REST step and map it to complex data from a prior action or step.

**Save your objects as templates**

Save your objects as templates so you can reuse them in other actions, flows, and Script steps.

**Create script input variables to access prior data**

Create a script input variable for any data you want to access from the action input or a prior step. Map the script input variable to the input or step data pill. For example, map the script input variable to a list of user records you looked up in a prior step.

**Create a script output variable to store complex data**

Create a script output variable to store any complex data your script creates. The script output variable data structure, data types, and names must match the values defined in the script. For example, create a contacts array of objects to store multiple contact objects. Save the contact object as a template so you can reuse it.

**Map the action output to the script output variable**

When you want a custom action to output complex data, add an action output and map it to the data pill for your Script step output variable. For example, create a contacts array and load the contact object template you saved earlier. Map the action output to the contacts array produced by your Script step.
Create a custom action to generate an array of objects from a list of records

Generate an array of objects from a list of User records. Learn how to use a Script step to iterate through a list of records.

Role required: admin

Use this example to see demonstrations of these operations and steps.

- Create an action input for a Department record.
- Look up a maximum of three User records for the Department action input.
- Configure a Script step to process a list of User records.
- Create a script input variable containing the list of User records.
- Write script that creates an empty contacts array.
- Write script that iterates through the list of User records.
- Write script that creates a contact object and maps User record field values to the contact object.
- Write script that populates the contacts array with the current contact object.
- Create script output variables for the contacts array and child contact object.
- Save the contact object as a template.
- Output the generated contacts array of objects as a data pill.

1. Create an application to store your work.
   Use the Guided Application Creator.
   For example, create My Application.

   The system displays the Flow Designer landing page.

3. Select New > Action
   The system displays the Action Properties dialog.

4. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contacts Array Of Objects</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Accessible From</td>
<td>All application scopes</td>
</tr>
</tbody>
</table>

5. Select Submit.
   The system displays the Action Designer interface.

6. From the Action Outline, select Inputs > Create Input
   The system displays a new action input.

7. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Department</td>
</tr>
<tr>
<td>Type</td>
<td>Record.Department (Reference.cmn_department)</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

8. From the Action Outline, select Add a new step.
   The system displays a list of available steps.

9. Select Look Up Records
10. Configure the step with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>User (sys_user)</td>
</tr>
<tr>
<td>Conditions</td>
<td>(Department)({\text{is}}\text{action}\rightarrow\text{Department})</td>
</tr>
<tr>
<td>Order by</td>
<td>Name</td>
</tr>
<tr>
<td>Sort Type</td>
<td>a to z</td>
</tr>
<tr>
<td>Max Results</td>
<td>3</td>
</tr>
</tbody>
</table>

**Note:** This example limits the Max Results setting to three records just for demonstration purposes.

11. From the Action Outline, select **Add a new step**. The system displays a list of available steps.

12. Select **Script**.

13. For **Required Runtime**, select **Instance**.

14. From the Input Variables section, select **Create Variable**.

15. Configure the input variable with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>userRecords</td>
</tr>
<tr>
<td>Value</td>
<td>(step\rightarrow\text{Look Up Records step}\rightarrow\text{Records})</td>
</tr>
</tbody>
</table>

**Note:** You can select the **User records** data pill from the Data pane or from the Data Pill Picker button.

16. For **Script**, enter the following text.

```javascript
(function execute(inputs, outputs) {
    //Create an empty array
    var contactsArray = [];
    var i = 0;
    //Iterate through the list of User records
    while(inputs.userRecords.next()) {
        //Create an empty object for each iteration
        var contactObject = {};
        //Query User records to assign object values
        contactObject.first_name = inputs.userRecords.getValue('first_name');
        contactObject.last_name = inputs.userRecords.getValue('last_name');
        contactObject.email_address = inputs.userRecords.getValue('email');
        //Add current object to array
        contactsArray[i] = contactObject;
        i += 1;
    }
    outputs.contacts = contactsArray;
})(inputs, outputs);
```

17. From Output Variables, select **Create Variable**.

18. Configure the output variable with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contacts</td>
<td>contacts</td>
<td>Array.Object</td>
<td>True</td>
</tr>
</tbody>
</table>
19. From the row for the contact Object, select **Add Child Item**.
20. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contact</td>
<td>contact</td>
<td>Object</td>
<td>False</td>
</tr>
</tbody>
</table>

21. From the row for the contact Object, select **Add Child Item**.
22. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>first name</td>
<td>first_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

23. From the row for the contact Object, select **Add Child Item**.
24. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>last name</td>
<td>last_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

25. From the row for the contact Object, select **Toggle Advanced Inputs**.
26. From the Advanced Options, select **Save As Template**.
   The system displays the Save As Template dialog.
27. For **Enter a Name**, enter contact.
28. Click **Save**.
29. From the Action Outline, select **Outputs > Create Output**.
30. Configure the Action Output with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contacts</td>
<td>contacts</td>
<td>Array.Object</td>
<td>True</td>
</tr>
<tr>
<td>contact</td>
<td>contact</td>
<td>Object</td>
<td>False</td>
</tr>
</tbody>
</table>

31. From the row for the contact Object, select **Toggle Advanced Inputs**.
32. From the Advanced Options, select **Structure > Start from Template**.
   The system displays **Template**.
33. For **Template**, select the template you previously saved.
   For example, select **My application: contact**.
34. Select **Exit Edit Mode**.
   The System displays the output fields you created.
35. For **contact**, select (step->Script step->contacts).

   **Note:** You can select the Script step **contacts** data pill from the Data pane or from the Data Pill Picker button.

36. Select **OK** to confirm structure change.
   The system makes all array of objects child items read-only because they will get their value from the parent object.
37. Click **Save**.
38. Select **Test**.
   The system displays the Test Action dialog.
39. Enter these test values.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department</td>
<td>Development</td>
</tr>
</tbody>
</table>

40. Select **Run Test**.
The system runs the action with the test values provided.

41. Select **Action has executed. To view the action, click here.**
The system displays the action execution details.

42. Review the runtime value for the action **Output data**.
The system displays output data in JSON format.

For example, sample contacts array of objects JSON for the Development department.

```
{
  "contacts": [
    {
      "email_address": "allyson.gillispie@example.com",
      "last_name": "Gillispie",
      "first_name": "Allyson"
    },
    {
      "email_address": "alva.pennigton@example.com",
      "last_name": "Pennigton",
      "first_name": "Alva"
    },
    {
      "email_address": "andrew.och@example.com",
      "last_name": "Och",
      "first_name": "Andrew"
    }
  ]
}
```

You have a custom action that looks up the Users for a given department and converts those users into an array of contact objects.

Customize the action to use your own logic.

**Inline scripts**

Enable users with coding experience to write inline scripts that set and modify input values during the configuration of an action or flow. Use inline scripts to modify input values that require small format conversions, data transformations, or math operations.

Flow Designer displays a Script button when you configure these components.

- Action instance inputs when you configure the action for a flow
- Action instance outputs when you configure the action for a flow
- Flow logic inputs when you configure the flow logic for a flow
- Flow logic outputs when you configure the flow logic for a flow
- Step inputs when you configure the step for an action.
- Subflow inputs when you configure the subflow for a flow.
- Subflow outputs when you configure the subflow for a flow.

Inline scripts must return values in the same data type as the input expects. For example, an inline script for a Record input must return a GlideRecord object and an inline script for a Date input
must return a date-time value. Always test actions and flows containing inline scripts, and verify that there are no runtime errors in the flow execution details.

Script writers should be familiar with Now Platform table structures and field types. In addition, they should know how to work with record and system data using the ServiceNow API.

**Benefits**

Inline scripts offer these benefits.

- Enable simple data conversion or transformation without having to create custom actions or flows.
- Identify which input data a script affects.
- Restricted access to scripting features to users or groups who are knowledgeable with the available ServiceNow APIs.

**Access to inline script**

You can grant users access to online scripting by either granting them the flow_designer_scripting role or the **Allow Scripting** delegated development permission. Both the role and the developer permission display a script button field for each Flow Designer input.

**Script button**

When you enable a user to create inline scripts, Flow Designer displays a script button next to flow and step inputs.

<table>
<thead>
<tr>
<th>1</th>
<th>now</th>
<th>Log</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Action</strong></td>
<td>Log</td>
<td></td>
</tr>
<tr>
<td><strong>Level</strong></td>
<td>Info</td>
<td></td>
</tr>
<tr>
<td><strong>Message</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Script buttons display beside inputs**

Clicking the **Script** button opens the Script editor, which replaces the standard input interface. Enter a script to compute the input value. Script writers can use the `fd_data` object to access...
data from previous actions and steps. Ensure your script includes a return statement with the results of your script. For example, `return shortDesc;` returns the value of the shortDesc variable.

```javascript
/*
**Access Flow/Action data using the fd_data object. Script must return a value.
**example: var shortDesc = fd_data.trigger.current.short_description;
**return shortDesc;
*/
return(math.sqrt(64));
```
Input containing script

**Design considerations**

Follow these design guidelines to create reusable and maintainable inline scripts.

**Write inline script for small non-reusable logic**

Use inline script to format or modify the data for specific inputs and use cases. For reusable logic, create an action or subflow instead.

**Create custom actions or subflows for reusable code rather than inline script**

Create custom actions or subflows for reusable or complex data logic such as changing the data type of source data. You may also want to provide custom actions or subflows for flow designers who are not comfortable with code.

**Avoid duplicating action and flow functionality**

Avoid writing inline script that duplicates action and flow functionality. For example, rather than write inline script to perform record operations, use the create and update record baseline actions.

**Avoid data type changes**

Avoid runtime errors by verifying that your inline script provides information in the same data type as the input or output expects.

**Create variables by declaring them with the var keyword**

Use the `var` keyword to declare variables so that they remain within the proper JavaScript scope. When you create a variable by assigning it a value, JavaScript may attach it to the global object, which can result in variable values persisting outside of the local scope and causing errors.

**Process records outputs with For Each flow logic and the flow data object**

Inline script can only access the `records` output of a Look Up Records action from For Each flow logic. Add a Look Up Records action to the flow to generate the records output. Add
a For Each flow logic to the flow to process each record in the records output. Create an inline script reference to the For Each flow logic using the fd_data and item objects. For example, this reference assumes the For Each flow logic is the second item in your flow outline fd_data._2__for_each.item.

**Use type ahead suggestions to generate references to flow and action data.**

Create references to flow and action data using the fd_data object. The script editor displays type ahead suggestions for existing flow and action data when you type `fd_data`. Select a suggestion to build references to flow and action data.

![Note: Refer to record data in a For Each flow logic using the item object.](image)

**Licensing considerations**

Inline scripts that call integration APIs are subject to IntegrationHub licensing.

**Code editor**

The code editor provides text editor support for inline scripts.

The code editor has these features for the supported language services and scripts.

- Syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes
- Auto-suggestions and auto-completions

```javascript
// Access Flow/Action data using the fd_data object. Script must return a value.
var shortDesc = fd_data.trigger.current.short_description;

return math.sqrt(64));
```
Editing tips

- To insert a fixed space anywhere in your code, press Tab.
- To indent a single line of code, click in the leading white space of the line and then press Tab.
- To indent one or more lines of code, select the code and then press Tab. To decrease the indentation, press Shift+Tab.
- To remove one tab from the start of a line of code, click in the line and press Shift+Tab.
- To declare variables, use the `var` keyword so that they remain within the proper JavaScript scope.

Action Designer

Automate a task with a sequence of related steps such as lookup a record, create a record, and log details about the record creation. Actions separate complexity from the Flow Designer environment, enabling flow designers to add actions to multiple flows with minimal configuration.

Using Action Designer, subject matter experts can:

- Create application-specific actions with pre-set configuration details, enabling process analysts to easily add actions to a flow with little configuration.
- Create scripted actions that appear code-less when added to a flow.
- Build integrations using IntegrationHub.

Custom actions

Unlike core actions where flow designers must manually configure flow logic, custom actions always use the same configuration when added to a flow. If your flow designers often use an action with the same configuration, you might create a reusable action.

A reusable action includes these components.

Inputs

Inputs are data variables used in your action. For example, if an action step creates a record in the incident table, your input might be a reference to the incident table. Once added as an input, the table and its fields are available to steps and outputs in the flow.

Each input you define for an action becomes a configuration option in the Flow Designer interface. To use the action in a flow, flow designers must define a value for each mandatory input. The more inputs an action has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the action effectively.

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring an action to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

Action steps

An action step or step is a single reusable operation within an action. For example, the Create Record step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of ServiceNow core action
steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

**Outputs**

*Outputs* are data variables that represent the results of the action. These results are available to other actions in a flow.

**Action Designer environment**

Subject matter experts build custom actions in Action Designer.

<table>
<thead>
<tr>
<th>Action Outline</th>
<th>Action Input</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Inputs" /></td>
<td><img src="image" alt="Outputs" /></td>
</tr>
</tbody>
</table>

Create and edit actions by defining inputs and adding action steps. Test actions to verify if they complete successfully and review the runtime values they generate. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

**More Actions**

Click the **More Actions** button to access additional options for the action.

- **Copy action**
  - Create a copy of the open action in an application you specify.

- **Configurations**
  - Enable or disable the *Show inline script toggle* option.

- **Code Snippet**
  - Generate a code snippet for the action.

- **Manage security**
  - Enable or disable the *Callable by Client API* option.

- **Manage natural language title**
  - Create or edit an action title with styled or dynamic text. For more information, see [Manage natural language titles](#).
Testing actions

After adding inputs and action steps, users with the flow_designer role can test an action. To test an action, users must provide the required inputs.

Note: Inputs must be provided for all the mandatory fields.

Flow designers should always test actions on non-production instances containing relevant demonstration data since testing an action creates or changes records on the instance.

Note: User must have the flow_designer or admin role to view the executions.

Roles

To create custom actions, a user must have the action_designer or admin roles.

Action input and output data types

Action inputs and outputs are data variables that store data of a particular data type. Flow Designer supports action inputs and outputs with these data types:

- Array
  - Array.Boolean
  - Array.Choice
  - Array.Datetime
  - Array.Integer
  - Array.Object
  - Array.String
- Audio
- Choice
- Color
- Condition String
- Conditions – Reference table required
- Currency
- Data Structure
- Date
- Date/Time
- Document ID – Reference table required
- Due Date
- Duration
- Dynamic Choice
- Dynamic Template
- Encrypted Text
- Field Name
- Floating Point Number
- HTML
- IP Address (Validated IPV4, IPV6)
- Icon
• Image
• Integer
• Journal
• Journal Input
• Journal List
• List
• Long
• Name-Value Pairs
• Password (1 Way Encrypted)
• Password (2 Way Encrypted)
• Percent Complete
• Phone Number (E164)
• Price
• Records – Reference table required
• Reference – Reference table required
• Script
• Script (Plain)
• String
• String (Full UTF-8)
• Table Name
• Template Value – Reference table required
• Time
• Translated HTML
• Translated Text
• True/False
• URL
• Video
• Wiki
• Workflow

Advanced options for action inputs
Use advanced options to further configure your inputs.

All

The following options are available for all advanced inputs.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the array in script calls.</td>
</tr>
<tr>
<td>Hint</td>
<td>Text to display to flow designers so they know what information the array contains.</td>
</tr>
<tr>
<td>Default Value</td>
<td>The value used when an input value is not provided. For example, the default selection of a choice field or a default string in a string field.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>The input requires a value.</td>
</tr>
</tbody>
</table>

Some action inputs have additional options. The details of these options are listed below.
## Array

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max Rows</td>
<td>The maximum number of rows you want to display in the user interface. This does not set a limit on the maximum number of rows in the array object.</td>
</tr>
</tbody>
</table>

## Array Choice

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max length</td>
<td>The maximum length the system stores for an input choice value. Use this option to restrict the length of input values stored during action design.</td>
</tr>
<tr>
<td>Choice</td>
<td>Select from:</td>
</tr>
<tr>
<td></td>
<td>- Dropdown with --None--</td>
</tr>
<tr>
<td></td>
<td>- Dropdown without --None--</td>
</tr>
<tr>
<td>Choice list</td>
<td>Select from:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Create New Choice list</strong> to manually create choices. Use the add button (&gt;Create) to create a choice with Name, Value, and Order values.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Reference existing choice list on a table</strong> to select a choice list from and field on an existing table using the Choice Table and Choice field buttons.</td>
</tr>
</tbody>
</table>

## Array Object

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Structure</td>
<td>Select from:</td>
</tr>
<tr>
<td></td>
<td>- Create Structure Manually</td>
</tr>
<tr>
<td></td>
<td>- Start from Template</td>
</tr>
<tr>
<td>Template</td>
<td>Select a template to use for this array.</td>
</tr>
<tr>
<td>Save as Template</td>
<td>Save the current array as a template.</td>
</tr>
</tbody>
</table>
Array.String

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max Length</td>
<td>The maximum length the system stores for an input string value. Use this option to restrict the length of input values stored during action design.</td>
</tr>
</tbody>
</table>

**Password (2 Way Encrypted) design considerations**

Follow these guidelines when designing flows containing Password (2 Way Encrypted) data.

- To specify the encryption algorithm and the roles allowed to access encrypted data, see *Set up encryption contexts*.
- Flow Designer prevents manual entries in Password (2 Way Encrypted) values in flow inputs.
- Fields containing Password 2 data cannot be used in conditions.
- To assign a value to a password2 field, drag an existing password2 data pill. Dragging values from other field types is not supported. Flow Designer presents a warning message when password2 data is required.

- Flow Designer prevents dragging Password2 data pills into other field types, and presents a warning message when the field is incompatible type.

- Flow Designer only allows Password2 data pills to be dragged into the following field types.
  - Email body fields
  - HTML fields
  - Password 2 Fields
  - PowerShell Input Variables
  - REST fields
    - Variables
    - REST payload body
    - Query parameters
    - Headers
    - REST multi-part form values
    - Form URL-encoded values
  - SOAP fields
Flow Designer performs a validation check when a user saves, publishes, or tests actions and flows. This check shows an alert for any data pills dropped in restricted field types and prevents the action or flow from executing. Update the action or flow to remove the invalid data pill and then retry the action.

**Retry policy**

Automatically retry failed requests when a step encounters an intermittent issue such as a network failure or request rate limit. Set a retry policy to prevent having to manually trigger the step again.

**Features**

Retry policies can be:

- Created to support connection timeouts or failed requests based on header, status, response body, error, and HTTP method.
- Applied to all actions that use a given connection alias.
- Applied directly to an action step.

Use retry policies to define:

- The conditions that must be met to retry a step.
- The time interval to wait before retrying a step.
- The maximum number of retry attempts the step makes before stopping.

Associate a default retry policy to a Connection & Credentials alias and apply the retry policy to all HTTP connections.

**Note:** You can only create retry policies for REST and SOAP steps.

**Create a retry policy**

Role required: flow_designer or admin

1. Navigate to **IntegrationHub > Retry Policy > Create New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the retry policy.</td>
</tr>
<tr>
<td>Connection Type</td>
<td>HTTP</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions that must be met to trigger the retry policy. Conditions that trigger a retry policy include the <strong>is</strong>, <strong>is not</strong>, <strong>contains</strong>, and <strong>contains not</strong> operators.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Retry Strategy</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Exponential Backoff</strong>: Option to exponentially increase the time interval for the subsequent retry attempts. The multiplier is 2.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Fixed Interval</strong>: Option to specify a fixed time interval after which a retry attempt should be made.</td>
</tr>
<tr>
<td>Interval (seconds)</td>
<td>Time interval in seconds after which a retry attempt should be made.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: If Retry Strategy is <strong>Exponential Backoff</strong>, the time interval exponentially increases after every retry attempt till the maximum numbers of attempts is reached.</td>
</tr>
<tr>
<td>Count</td>
<td>Maximum number of retry attempts. If no value is specified, the maximum number of retry attempts is based on the value provided in the <code>glide.fdih.retry.max_count</code> system property. Default value of the <code>glide.fdih.retry.max_count</code> system property is 0. For more information about system properties, see Available system properties.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
### Sample retry policy

In this example, the policy is defined to attempt retry when one of these conditions is met:

- **HTTP Method is GET and Error is Connection Timeout**
- **HTTP Method is GET and Status Code is 429**

When the condition is met, retry attempts are made for a maximum number of three times. The time interval between the retry attempts is exponentially
increased. The time intervals in this example are 10 seconds, 20 seconds, and 40 seconds.

- Create Connection & Credential alias, if you do not have the required alias.
- Assign the retry policy as Default Retry Policy to the required Connection & Credential alias.

  **Note:** A default retry policy is provided and is selected as Default Retry Policy. If you have created retry policies, you can select the required policy as Default Retry Policy.

- Create an HTTP(s) Connection in the Connections related list for the Connection & Credential alias. For more information, see credentials, connections, and aliases.
- Verify and view the details of the retry attempts by navigating to System Logs > Outbound HTTP Requests.

### Dynamic inputs

Build dynamic choice and template inputs for an action. Dynamically display and assign values to the inputs during flow design.

  **Note:** Dynamic inputs are not available in the base system. To use dynamic inputs in Flow Designer, you must request an IntegrationHub Enterprise Pack subscription.

During flow design, dynamic inputs retrieve values and display them as inputs within an action dynamically. Dynamic input types include:

- Dynamic choice
- Dynamic template

A dynamic input must point to a data gathering action that collects the displayed data. For example, a data gathering action can retrieve values from a third-party system and populate a dynamic choice for an action that runs in an IntegrationHub spoke. To use a dynamic input in Flow Designer:

1. An action designer creates a data gathering action.
2. An action designer creates a parent action with a dynamic input that points to the child data gathering action.
3. A flow designer adds the parent action to a flow.

### Data gathering actions

A data gathering action collects data, typically from a third-party system via a REST call, and dynamically builds its output based on the returned payload. A data gathering action must:

- Have a script step that contains an output variable of type JSON.
- Have an action output named output of type JSON whose value is derived from the script step’s JSON output variable.

  **Note:** The action can have multiple outputs, but there can only be one of type JSON.

- Format the payload in the script step so that output has a property named data.
- Wait for up to 300 seconds (5 minutes) to gather data before it times out.
Dynamic choice

A dynamic choice displays gathered data as a list of choice values during flow design. For more information on building a dynamic choice, see Create a data gathering action for a dynamic choice.

Dynamic template

A dynamic template displays a gathered list of fields whose associated values can be specified during flow design. Because this list populates dynamically, you don't have to change the flow if new fields are added to or removed from the table that is accessed in the data gathering action. For more information on building a dynamic template, see Create a data gathering action for a dynamic template.

Design considerations

Consider dynamic inputs for third-party integrations

Dynamic inputs let you create flows that fetch data dynamically from external sources. In third-party integrations, dynamic inputs can provide data values that pertain to a particular endpoint. For more information on setting up third-party integrations with Flow Designer, see IntegrationHub.

Be aware of the time required to retrieve large amounts of data

By default, dynamic inputs have up to 300 seconds to gather data before they time out. If your data gathering action needs more time to gather data, set the sn_flow_designer.sync_action_execution_timeout_in_seconds system property to a higher value. However, don’t use long timeout values for interactive flows where an end user must enter or select a value.

Be aware of scripting errors

Because all data gathering actions use a script step, potential errors could occur from scripting. When using scripts to output JSON variables for your dynamic inputs, you may encounter errors which prevent inputs from receiving the JSON values they need. When a dynamic input scripting error occurs, the following warning message may appear.

Message displayed for scripting error

---

Note: To change the timeout period for a data gathering action, modify the value of the sn_flow_designer.sync_action_execution_timeout_in_seconds system property.
Get started with dynamic inputs

Create a sample action that builds a dynamic choice and dynamic template for use in a flow.

Role required: action_designer or admin

In this task, you create a custom action that dynamically generates a list of tables and associated fields in your instance. To accomplish this, you create two data gathering actions: one that collects a list of tables in your instance, and another that collects a list of fields for the selected table. Each data gathering action consists of the following:

- A REST step to gather table and field data from your instance
- A script step to construct the payload from the REST step’s Response Body
- An output variable named output of type JSON

You then use these data gathering actions to build a dynamic choice and a dynamic template. Finally, you will create a custom action that calls the data gathering action during flow design.

Note: This task recreates the demo actions that are installed when you request a ServiceNow IntegrationHub Enterprise Pack subscription for your instance.

1. Navigate to Flow Designer > Designer.
2. Click New and select New Action.
   a) On the Action Properties screen, in the Name field, enter Get ServiceNow Tables (Dynamic).
   b) Click Submit.
3. In the Action Outline, click the Add a new step icon under Inputs and select the REST step. Enter the following information.
4. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave Use Connection Alias selected</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the Create new record icon to create a new HTTP(s) connection, or use an existing connection for your instance. The Credential for the HTTP(s) connection must use basic auth. Additionally, the Connection URL must be the base URL for your instance, including the forward slash at the end. For more information on connections and credentials, see Getting started with connections and Getting started with credentials.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave the Manually option selected</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/doc/table/schema</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
</tbody>
</table>
5. In the Action Outline, click the Add a new step icon under your REST step and select the **Script** step.  
   a) In the Input Variables section, click **Create Variable**.  
   b) In the **Name** field, enter `payload`.  
   c) Next to the **Value** field, click the data pill picker and select **REST Step > Response Body**.  
   d) In the **Script** field, enter the following code:

   ```javascript
   (function execute(inputs, outputs) {
     var payload = JSON.parse(inputs.payload);
     var tables = payload.result
       .filter(function(table) { return table.value.indexOf('_') < 0; }) // Filter the tables we want
       .map(function(table) {
         return { label: table.label, name: table.value }; 
       });
     outputs.tables = { data: tables }; // Final, properly formatted output
   })(inputs, outputs);
   ```

   e) In the Output Variables section, click **Create Variable**.  
   f) In the **Label** and **Name** fields, enter `tables`.  
   g) In the **Type** field, select **JSON**.

6. In the Action Outline, click **Outputs**.  
   a) Click **Create Output**.  
   b) In the **Label** and **Name** fields, enter `output`.  
   c) In the **Type** field, select **JSON**.  
   d) Click **Exit Edit Mode**.  
   e) Next to the **Value**, click the data pill picker and select **Script Step > tables**.

7. In the Action header, click **Save** and then click **Test** to **test the action**.  
   a) Click **Run Test**.  
   b) Check the action's execution details. Your data gathering action runs successfully if the runtime value for `tables` is a complex object containing an array of key-value pairs for `label` and `name` as shown in the following abbreviated example.

   ```json
   {
     "data":[
       {
         "name":"sla",
         "label":"Agreement"
       },
       {
         "name":"announcement",
         "label":"Announcement"
       }
   ```
8. In the Action header, click **Publish** to make the **Get ServiceNow Tables (Dynamic)** action available to other flows and actions within the Global scope.

**Create the Get ServiceNow Fields (Dynamic) action**

Role required: action_designer or admin

1. In the main header, click the Create flow, subflow, or action icon ( ) and select **Action**.
   a) On the Action Properties screen, in the **Name** field, enter **Get ServiceNow Fields (Dynamic)**.
   b) Click **Submit**.

2. In the Action Outline, select **Inputs**.
   a) In the Action Input header, click **Create Input**.
   b) In the **Label** and **Name** fields, enter **Table**.
   c) In the **Type** field, select **String**.
   d) To make the input required, toggle the **Mandatory** slider so that it is active.

3. In the Action Outline, click the Add a new step icon ( ) under **Inputs** and select the **REST** step. Enter the following information.

4. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave <strong>Use Connection Alias</strong> selected.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the Create new record icon ( ) to create a new HTTP(s) connection, or use an existing connection for your instance. The <strong>Credential</strong> for the HTTP(s) connection must use <strong>basic auth</strong>. Additionally, the <strong>Connection URL</strong> must be the base URL for your instance, including the forward slash at the end.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave <strong>Manually</strong> selected.</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/table/ and then click the data pill picker ( ). Select <strong>Inputs &gt; Table</strong>.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
</tbody>
</table>
5. In the Action Outline, under the REST step, click the Add a new step icon (➕) and select the **Script** step.
   a) In the Input Variables section, click **Create Variable**.
   b) In the **Name** field, enter **payload**.
   c) Next to the **Value**, click the data pill picker (🔍) and select **REST Step > Response Body**.
   d) In the **Script** field, enter the following code.

```javascript
(function execute(inputs, outputs) {
  var payload = JSON.parse(inputs.payload);
  var fields = Object.keys(payload.result[0])
    .map(function (property) {
      return {
        label: property.charAt(0).toUpperCase() + property.slice(1).replace(/_/g, ' '),
        name: property,
        value: '' // value is always empty
      };
    });
  outputs.fields = { data: fields }; // final properly formatted output
})(inputs, outputs);
```

e) In the Output Variables section, click **Create Variable**.
   f) In the **Label** and **Name** fields, enter **fields**.
   g) In the **Type** field, select **JSON**.

6. In the Action Outline, click **Outputs**.
   a) On the Action Output header, click **Create Output**.
   b) In the **Label** and **Name** fields, enter **output**.
   c) In the **Type** field, select **JSON**.
   d) Click **Exit Edit Mode**.
   e) Next to the **Value** field, click the data pill picker (🔍) and then select **Script Step > fields**.

7. In the Action header, click **Save** and then click **Test** to **test the action**.
   a) On the Test Action screen, in the **Table** field, enter **incident**.
   b) Click **Run Test**.
   c) Check the action’s execution details.

Your data gathering action runs successfully if the runtime value for **fields** is a complex object containing an array of key-value pairs for **label**, **name**, and **value** as shown in the following abbreviated example.

```
{
  "data": [
    "name":"Parent",
```
8. In the Action header, click Publish to make the Get ServiceNow Fields (Dynamic) action available to other actions within the Global scope.

Create the Create ServiceNow Record (Dynamic) action

Role required: action_designer or admin

1. Click the Create flow, subflow, or action icon (✚) and then select Action.
   a) On the Action Properties screen, in the Name field, enter Create ServiceNow Record (Dynamic).
   b) Click Submit.

2. In the Action Outline, click Inputs.
   a) Click Create Input.
   b) In the Label and Name fields, enter Table.
   c) In the Type field, select Dynamic Choice.
   d) To make the input required, toggle the Mandatory slider so that it is active.
   e) Click the Toggle advanced inputs icon (▼) to display the advanced options for the Table input.
   f) Under Dynamic Options, in the Action field, select Get ServiceNow Tables (Dynamic).
   g) Click Create Input to create another action input.
   h) In the Label and Name fields, enter Fields.
   i) In the Type field, select Dynamic Template.
   j) To make the input required, toggle the Mandatory slider so that it is active.
   k) Click the Toggle advanced inputs icon (▼) to display the advanced options for the Table input.
   l) Under Dynamic Options, in the Action field, select Get ServiceNow Fields (Dynamic).
m) Toggle the **Depends-On Another Input** slider to make it active.

n) In the **Table** field, select **Table**.

3. In the Action Outline, under Inputs, click the Add a new step icon and then select the **Script** step.

   a) In the Input Variables section, click **Create Variable**.

   b) In the **Name** field, enter **table**.

   c) Next to the **Value** field, click the data pill picker and select **Inputs > Table**.

   d) Click **Create Variable** to create another input variable.

   e) In the **Name** field, enter **fields**.

   f) In the **Type** field, select **String**.

   g) Next to the **Value** field, click the data pill picker and select **Inputs > Fields**.

   h) In the **Script** field, enter the following code:

   ```javascript
   (function execute(inputs, outputs) {
     var gr = new GlideRecord(inputs.table);
     gr.applyEncodedQuery(inputs.fields);
     gr.insert();
   })(inputs, outputs);
   ```

4. In the Action header, click **Save** and then click **Test** to test the action.

   a) On the Test Action screen, in the **Table** input, select any dynamically-generated choice value.

   b) Click **Add Field Value** and then select any field and enter any value.

   c) Click **Run Test**.

   d) Check the action’s execution details. Your action runs successfully if the runtime values for **Table** and **Field** match the values you entered for the test.

5. In the Action header, click **Publish** to make the **Create ServiceNow Record (Dynamic)** action available to flows within the Global scope.

You can now add the **Create ServiceNow Record (Dynamic)** action to a flow in Flow Designer. This sample action dynamically generates a list of tables and
associated fields in your instance whose values you can assign during flow design.

Create a data gathering action for a dynamic choice

Create an action to collect input values to pass to a parent action as a dynamic choice.

Role required: action_designer or admin

1. Navigate to Flow Designer > Designer.
2. Click the New button and select New Action.
3. Enter a Name for your action and choose the proper Application scope. Then, click Submit.
4. Under Action Outline, click the Add a new step icon under Inputs and select the REST step. Configure your REST step to get data from the proper Base URL and Resource Path with any applicable Query Parameters for the HTTP Method GET. For more information on using the REST step in IntegrationHub, see REST step and REST in IntegrationHub.
5. Under **Action Outline**, click the **Add a new step** icon under your REST step and select the **Script** step. This script step must transform the REST step’s **Response Body** into a format that can be used as a dynamic choice for a parent action. Format the JSON output variable so that it contains a property named `data` with a structure similar to the following example.

   ```json
   {
     "data": [ 
       { 
         "label": "Choice Option 1",
         "name": "choice_option_1"
       },
       { 
         "label": "Choice Option 2",
         "name": "choice_option_2"
       },
       { 
         "label": "Choice Option 3",
         "name": "choice_option_3"
       }
     ]
   }
   ```

6. Under **Action Outline**, click **Outputs**. Create an output named `output` of type JSON. Then, use the data pill picker ( )-> to assign the data pill for the JSON output variable from your script step to the action output’s **Value**.

   **Note:** The action can have multiple outputs, but there can only be one of type JSON.

7. Click **Save** and **test the action**. In the execution details, your data gathering action runs successfully if the runtime value for `output` contains the `data` property in the proper format.

8. Click **Publish** to make the action available to other flows and actions within the same application scope.
You can now use your data gathering action to populate the options that appear for a dynamic choice input in a parent action.

Create a data gathering action for a dynamic template

Create an action to collect input values to pass to a parent action as a dynamic template.

Role required: action_designer or admin

1. Navigate to Flow Designer > Designer.
2. Click the New button and select New Action.
3. Enter a Name for your action and choose the proper Application scope. Then, click Submit.
4. Under **Action Outline**, click the **Add a new step** icon under **Inputs** and select the **REST** step. Configure your REST step to get data from the proper **Base URL** and **Resource Path** with any applicable **Query Parameters** for the **HTTP Method** **GET**. For more information on using the REST step in IntegrationHub, see **REST step** and **REST in IntegrationHub**.

5. Under **Action Outline**, click the **Add a new step** icon under your REST step and select the **Script** step. This script step must transform the REST step's **Response Body** into a format that can be used as a dynamic choice for a parent action. Format the JSON output variable so that it contains a property named **data** with a structure similar to the following example.

```json
{
  data: [
    {
      label: "Template Option 1",
      name: "template_option_1",
      value: ""
    },
    {
      label: "Template Option 2",
      name: "template_option_2"
    },
    {
      label: "Template Option 3",
      name: "template_option_3",
      value: "",
      type: "choice",
      choices: [
        { label: "Choice 1", value: "choice_1" },
        { label: "Choice 2", value: "choice_2" }
      ]
    }
  ]
}
```

**Note:** The JSON output structure for a dynamic template can include the optional properties **type** and **choices**.
- **type**: Specify a valid **field type** to render the appropriate UI control for the dynamic template.
- **choices**: If specifying **choice** for the **type** property, you can then specify an array of choice options that will render in a list for the dynamic template.

6. Under **Action Outline**, click **Outputs**. Create an output named **output** of type **JSON**. Then, use the data pill picker ( ) to assign the data pill for the JSON output variable from your script step to the action output's **Value**.

**Note:** The action can have multiple outputs, but there can only be one of type **JSON**.

7. Click **Save** and **test the action**. In the execution details, your data gathering action runs successfully if the runtime value for **output** contains the **data** property in the proper format.

8. Click **Publish** to make the action available to other flows or actions within the same application scope.
You can now use your data gathering action to populate the options that appear for a dynamic template input in a parent action.

**Dynamic input configuration options**

Use these options to configure your dynamic inputs for a parent action.

**Dynamic input configuration**

**Dynamic input options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a label that will appear for the action input when the action is added to a flow.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the dynamic choice or template.</td>
</tr>
<tr>
<td>Max length</td>
<td>Enter the maximum character length for one choice or template field value.</td>
</tr>
<tr>
<td>Hint</td>
<td>Enter a hint to display for the dynamic input.</td>
</tr>
<tr>
<td>Choice</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>· Dropdown with --None--</td>
</tr>
<tr>
<td></td>
<td>· Dropdown without --None--</td>
</tr>
<tr>
<td>Default Value</td>
<td>Enter a string value to use as a default for the dynamic input.</td>
</tr>
<tr>
<td>Action</td>
<td>Select a data gathering action that generates values as JSON output.</td>
</tr>
<tr>
<td>Depends-on Another Input</td>
<td>Enable this option to require an input value from the parent action to be passed as an input to the data gathering action. If enabled, select a dependent input from the parent action.</td>
</tr>
</tbody>
</table>

**Dynamic outputs**

Access action and subflow outputs as dynamically generated data pills during flow design. You can also build data gathering actions to generate complex objects from Now Platform and IntegrationHub outputs.

**Note:** Dynamic outputs are not available in the base system. To use dynamic outputs in Flow Designer, you must request an IntegrationHub Enterprise Pack subscription.

During flow design, a dynamic output retrieves a complex object’s schema values and displays them as data pills in the data pane.

A dynamic output must point to a data gathering action that collects the data it displays. For example, a data gathering action can retrieve values from a third-party system as part of an IntegrationHub spoke. To use a dynamic output in Flow Designer:

1. An action designer creates a data gathering action.
2. An action designer creates a parent action with a dynamic output that points to the child data gathering action.
3. A flow designer adds the parent action to a flow.

**Data gathering actions**

A data gathering action collects data, typically from a third-party system via a REST call, and dynamically builds its output based on the returned payload. A data gathering action must:

- Have a `script step` that contains an output variable of type JSON.
- Have an action output named `output` of type JSON whose value is derived from the script step’s JSON output variable.
Note: The action can have multiple outputs, but there can only be one of type JSON.

- Format the payload in the script step so that `output` has a property named `data`.
- Wait for up to 300 seconds (5 minutes) to gather data before it times out.

Note: To change the timeout period for a data gathering action, modify the value of the `sn_flow_designer.sync_action_execution_timeout_in_seconds` system property.

Dynamic object

A dynamic object is either a complex object or an array of complex objects. Action designers build the object structure dynamically with a data gathering action rather than hard-coding it. For more information on building a dynamic object, see Create a data gathering action for a dynamic object.

Design considerations

Consider dynamic outputs for third-party integrations

Use dynamic outputs to introspect and fetch data from external systems during flow design. For example, specify service endpoints or call actions that interact with specific endpoint APIs. For more information on setting up third-party integrations with Flow Designer, see IntegrationHub.

Be aware of time required to retrieve large amounts of data

By default, dynamic outputs have up to 300 seconds to gather data before the system stops them. If your data gathering action needs more time to gather data, set the `sn_flow_designer.sync_action_execution_timeout_in_seconds` system property to a greater value. Avoid long timeout values for interactive flows where an end user is expecting to enter or select a value.

Be aware of scripting errors

Since all data gathering actions use a script step, be aware of any potential errors that could arise from scripting. Review any scripts used to output JSON variables as script errors may prevent the outputs from receiving the JSON values they need. When a dynamic output scripting error occurs, the following warning message may appear.

Get started with dynamic outputs

Create a sample action that builds dynamic objects for use in a flow.

Role required: action_designer or admin
In this task, you create two data gathering actions: one that collects the schema for a record on your instance, and another that collects the schema for multiple records in the same table on your instance. The goal is to create both a complex object and a complex object array to use as dynamic outputs. Each data gathering action will consist of the following:

- A REST step to gather table schema data from your instance.
- A script step to construct the payload from the REST step’s Response Body.
- An output variable named output of type JSON.

You use these data gathering actions to build two dynamic objects. Then, you create a custom action that calls the data gathering actions during the flow design.

**Note:** This task re-creates the demo actions that are installed when you request an IntegrationHub Enterprise Pack subscription for your instance.

1. Navigate to Flow Designer > Designer.
2. Click New and select New Action.
   a) On the Action Properties screen, in the Name field, enter Get ServiceNow Object Schema (Dynamic).
   b) Click Submit.
3. In the Action Outline, click Inputs.
   a) In the Action Input header, click Create Input.
   b) In the Label and Name fields, enter Table.
   c) In the Type field, select String.
   d) To make this input required, toggle the Mandatory slider so that it is active.
4. In the Action Outline, click the add a new step icon (.addButton) under Inputs and select REST Step.
5. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave the Use Connection Alias option selected.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the create new record icon (EDIT button) to create a new HTTP(s) connection, or use an existing connection for your instance. The Credential for the HTTP(s) connection must use basic auth. Additionally, the Connection URL must be the base URL for your instance, including the forward slash at the end. For more information on connections and credentials, see Getting started with connections and Getting started with credentials.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave the Manually option selected.</td>
</tr>
</tbody>
</table>
Field | Value
--- | ---
Resource Path | Enter api/now/processflow/table/ and then click the data pill picker. Select Inputs > Table. Next, enter /schema.
HTTP Method | Enter GET
Query Parameters | Click the plus icon to add a new query parameter. Then, in the Name field, enter get_choices and true in the Value field.

6. In the Action Outline, click the add a new step icon under your REST step and select the Script step.
   a) In the Input Variables section, click Create Variable.
   b) In the Name field, enter payload.
   c) Next to the Value field, click the data pill picker and select REST Step > Response Body.
   d) In the Script field, enter the following code.

```javascript
(function execute(inputs, outputs) {
    var payload = JSON.parse(inputs.payload);

    var columns = payload.result.data.columns;
    var schema = columns.map(function(column) {
        var value = {
            label: column.label,
            name: column.name,
            type: getCOType(column.definition.base_type),
        };
        if (column.definition.type === 'choice') {
            value.type = 'choice';
            value.choices = column.definition.choices;
        }
        if (column.definition.base_type === 'GUID') {
            value.children = [
                { label: 'Link', name: 'link', type: 'string' },
                { label: 'Value', name: 'value', type: 'string' },
            ];
        }
        return value;
    });

    outputs.schema = {
        data: {
            type: 'object',
            children: schema,
        },
    };

    function getCOType(type) {
        if (type === 'GUID') return 'reference';
        return type;
    }
```
e) In the Output Variables section, click Create Variable.

f) In the Label and Name fields, enter schema.

g) In the Type field, select JSON.

7. In the Action Outline, click Outputs.
   a) In the Action Output header, click Create Output.
   b) In the Label and Name fields, enter output.
   c) In the Type field, select JSON.
   d) In the Action Output header, click Exit Edit Mode.
   e) Next to the Value field, click the data pill picker ( ) and select Script Step > schema.

8. In the Action header, click Save and then click Test to test the action.
   a) On the Test Action screen, enter incident for the Table input.
   b) Click Run Test.
   c) Check the action’s execution details.

Your data gathering action runs successfully if the runtime value for fields is a complex object in a format that is similar to the following abbreviated example.

```
{
  "data": {
    "type": "object",
    "children": [
      {
        "name": "active",
        "label": "Active",
        "type": "boolean"
      },
      {
        "name": "activity_due",
        "label": "Activity due",
        "type": "datetime"
      }, ...
   }
```

9. In the Action header, click Publish to make the Get ServiceNow Object Schema (Dynamic) action available to other flows and actions within the Global scope.

Create the Get ServiceNow Array Object Schema (Dynamic) action
Role required: action_designer or admin

1. In the main header, click the create flow, subflow, or action icon ( ) and select Action.
   a) In the Action Properties modal, in the Name field, enter Get ServiceNow Array Object Schema (Dynamic).
   b) Click Submit.

2. In the Action Outline, click Inputs.
   a) In the Action Input header, click Create Input.
b) In the **Label** and **Name** fields, enter *Table*.

c) In the **Type** field, select *String*.

d) To make the input required, toggle the **Mandatory** slider so that it is active.

3. In the Action Outline, click the add a new step icon

   ( )

   under Inputs and select the **REST** step.

4. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave Use Connection Alias selected.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td></td>
</tr>
</tbody>
</table>

   Click the create new record icon ( ) to create a new HTTP(s) connection, or use an existing connection for your instance. The **Credential** for the HTTP(s) connection must use **basic auth**. Additionally, the **Connection URL** must be the base URL for your instance, including the forward slash at the end.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Request</td>
<td>Leave Manually selected</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter <code>api/now/processflow/table/</code> and then click the data pill picker ( ). Select <strong>Inputs &gt; Table</strong>. Finally, enter <code>/schema</code></td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter <em>GET</em></td>
</tr>
<tr>
<td>Query Parameters</td>
<td>Click the plus icon ( ) to add a new query parameter. Then, in the <strong>Name</strong> field, enter <em>get_choices</em> and <em>true</em> in the <strong>Value</strong> field.</td>
</tr>
</tbody>
</table>

5. In the Action Outline, click the **Add a new step** ( ) icon under your REST step and select the **Script** step.

   a) In the Input Variables section, click **Create Variable**.

   b) In the **Name** field, enter *payload*.

   c) Next to the **Value** field, click the data pill picker ( ) and select **REST Step > Response Body**.

   d) In the **Script** field, enter the following code.

   ```javascript
   (function execute(inputs, outputs) {
   var payload = JSON.parse(inputs.payload);
   var columns = payload.result.data.columns;
   });
   ```

```javascript
var schema = columns.map(function(column) {
    var value = {
        label: column.label,
        name: column.name,
        type: getCOType(column.definition.base_type),
    };
    if (column.definition.type === 'choice') {
        value.type = 'choice';
        value.choices = column.definition.choices;
    }
    return value;
});
outputs.schema = {
    data: {
        type: 'array.object',
        attributes: {
            child_type: 'object',
        },
        children: schema,
    },
}
``` 

function getCOType(type) {
    if (type === 'GUID') return 'string';
    return type;
}(inputs, outputs);

6. In the Action Outline, click Outputs.
a) On the Action Output header, click Create Output.
b) Enter output in the Label field and Name field.
c) Select JSON for the Type field.
d) Click Exit Edit Mode.
e) Next to the Value field, click the data pill picker ( ) and select Script Step > schema.

7. In the Action header, click Save and then click Test to test the action.
a) On the Test Action screen, in the Table field, enter incident.
b) Click Run Test.
c) Check the action's execution details.

Your data gathering action runs successfully if the runtime value for fields output is a complex object that contains an array of key-value pairs for label, name, and value as shown in the following abbreviated example.

```json
{
    "data": {
        "type": "array.object",
```
8. In the Action header, click **Publish** to make the **Get ServiceNow Array.Object Schema (Dynamic)** action available to other actions within the Global scope.

**Create the Get ServiceNow Records (dynamic) action**

Role required: action_designer or admin

1. In the main header, click the create flow, subflow, or action icon (++) and select **Action**.
   a) In the Action Properties modal, in the **Name** field, enter **Get ServiceNow Records (Dynamic)**.
   b) Click **Submit**.

2. In the Action Outline, click **Inputs**.
   a) In the Action Input header, click **Create Input**.
   b) In the **Label** and **Name** fields, enter Table.
   c) In the **Type** field, select **Dynamic Choice**.
   d) To make the input required, toggle the **Mandatory** slider so that it is active.
   e) Click the Toggle advanced inputs icon (▼) to display the advanced options for the Table input.
   f) In the **Default value** field, enter incident.
   g) Under Dynamic Options, in the **Action** field, select **Get ServiceNow Tables - Dynamic**.
   h) Click **Create Input** to create another action input.
   i) In the **Label** and **Name** fields, enter NumberOfRecords.
   j) In the **Type** field, select **Integer**.
   k) To make the input required, toggle the **Mandatory** slider so that it is active.
   l) Click the Toggle advanced inputs icon (▼) to display the advanced options for the Table input.
   m) In the **Default value** field, enter 3.

3. In the Action Outline, click the add a new step icon (++) under Inputs and select the **REST** step.

4. Under the REST step header, fill in the following fields.
Field | Value
--- | ---
Connection | Leave **Use Connection Alias** selected.
Connection Alias | Click the Create new record icon ( + ) to create a new HTTP(s) connection, or use an existing connection for your instance. The **Credential** for the HTTP(s) connection must use basic auth. Additionally, the Connection **URL** must be the base URL for your instance, including the forward slash at the end.
Build Request | Leave **Manually** selected
Resource Path | Enter api/now/table/ and then click the data pill picker ( ). Select Inputs > Table.
HTTP Method | Enter GET
Query Parameters | Click the plus icon ( + ) to add a new query parameter. Then, enter sysparm_limit in the Name field. Next to the Value field, click the data pill picker ( ) and then select Inputs > NumberOfRecords.

5. In the Action Outline, click the Add a new step icon ( + ) under Inputs and select the **Script** step.
   a) In the Input Variables section, click **Create Variable**.
   b) In the **Name** field, enter payload.
   c) Next to the **Value** field, click the data pill picker ( ) and select REST Step > Response Body.
   d) In the **Script** field, enter the following code.

   ```javascript
   (function execute(inputs, outputs) {
   var response = JSON.parse(inputs.payload);
   var records = response.result;
   outputs.record = records[0];
   outputs.records = JSON.stringify(records);
   })(inputs, outputs);
   ```
   e) In the Output Variables section, click **Create Variable**.
   f) In the **Label** and **Name** fields, enter record.
   g) Select **JSON** for the **Type** field.
   h) Toggle the **Mandatory** slider so that it is active.
   i) Click **Create Variable** to create another output variable for the script step.
   j) In the **Label** and **Name** fields, enter records.
In the **Type** field, select **JSON**.

To make the input required, toggle the **Mandatory** slider so that it is active.

6. In the Action Outline, click **Outputs**.
   a) In the Action Output header, click **Create Output**.
   b) In the **Label** and **Name** fields, enter Records.
   c) In the **Type** field, select **Dynamic Object**.
   d) Click the Toggle advanced inputs icon ( ) to display the advanced options for the Records output.
   e) Under Dynamic Options, select **Get ServiceNow Array.Object Schema (Dynamic)** as the **Action**.
   f) To make the Table input dependent on another input, toggle the **Depends-On Another Input** slider to make it active.
   g) In the **Table** field, select **Table**.
   h) In the Action Output header, click **Exit Edit Mode**.
   i) Next to the **Value** field, click the data pill picker ( ) and select **Script Step > records**.
   j) In the Action Output header, click **Edit Outputs > Create Output** to create another action output.
   k) In the **Label** and **Name** fields, enter Record.
   l) In the **Type** field, select **Dynamic Object**.
   m) Click the Toggle advanced inputs icon ( ) to display the advanced options for the Record output.
   n) Under Dynamic Options, in the **Action** field, select **Get ServiceNow Object Schema (Dynamic)**.
   o) To make the Table input dependent on another input, toggle the **Depends-On Another Input** slider to make it active.
   p) In the **Table** field, select **Table**.
   q) In the Action Output header, click **Exit Edit Mode**.
   r) For the **Value**, click the data pill picker ( ) and select **Script Step > record**.

7. In the Action header, click **Save** and then click **Test** to test the action.
   a) On the Test Action screen, select any dynamically generated choice value for the **Table** input.
   b) Click **Run Test**.
   c) Check the action's execution details.
      Your action runs successfully if the runtime value for **Record** is a properly formatted complex object and the runtime value for **Records** is a properly formatted complex object array.
8. In the Action header, click **Publish** to make the **Get ServiceNow Records (Dynamic)** action available to flows within the Global scope.

You can now add the **Get ServiceNow Records (Dynamic)** action to a flow in Flow Designer. This sample action dynamically generates two action outputs, Record and Records, which can be accessed as data pills in the data pane. The data pills refresh dynamically when the value for the **Table** input changes.

Create a data gathering action for a dynamic object

Create an action to collect output values. Then, pass the values to a parent action as a dynamic object.

Role required: action_designer or admin

1. Navigate to **Flow Designer > Designer**.
2. Click the **New** button and select **New Action**.
3. Enter a **Name** for your action and choose the proper **Application** scope. Then, click **Submit**.
4. Under **Action Outline**, click the **Add a new step** icon under **Inputs** and select the **REST** step. Configure your REST step to get data from the proper **Base URL** and **Resource Path** with any applicable **Query Parameters** for the **HTTP Method** **GET**. For more information on using the REST step in IntegrationHub, see **REST step** and **REST in IntegrationHub**.
5. Under **Action Outline**, click the **Add a new step** icon under your REST step and select the **Script** step. This script step must transform the response from the REST step’s **Response Body** into a format that defines the schema of a dynamic object output for a parent action. Your script step must:

- Have a single JSON output variable. The script step can have other output variables, but one and only one must be of type JSON.
- Format the JSON output variable so that it contains a property named `data`. For a complex object output, your `data` property must have a format similar to the following example:

```json
{
  "data": {
    "type": "object",
    "children": [
      {
        "name": "Name 1",
        "label": "Label 1",
        "type": "string"
      },
      {
        "name": "Name 2",
        "label": "Label 2",
        "type": "string"
      }
    ]
  }
}
```

For a complex object array output, your `data` property must have a format similar to the following example:

```json
{
  "data": {
    "type": "object",
    "attributes": { "child_type": "object" }
  }
}
```
//Required - Display name
type: "string"

//Required - Supported field type (See the Note below)
{
    name: "Name 2",
    label: "Label 2",
    type: "string"
}

Note: Supported action input data types for the type property include:
- string
- integer
- datetime
- choice
- boolean
- object
- array.string
- array.integer
- array.datetime
- array.choice
- array.boolean
- array.object

6. Under Action Outline, click Outputs. Create an output named output of type JSON. Then, use the data pill picker ( ) to assign the data pill for the JSON output variable from your script step to the action output's Value.

Note: The action can have multiple outputs, but there can only be one of type JSON.

7. Click Save and test the action. In the execution details, your data gathering action runs successfully if the runtime value for output contains the data property in the proper format.

8. Click Publish to make the action available to other flows or actions within the same application scope.
You can now use your data gathering action to populate the schema values for a dynamic object in a parent action.

**Dynamic output configuration options**

Use these options to configure your dynamic outputs for a parent action.

**Dynamic output configuration**

**Dynamic output options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a label that will appear within the output data pill for the action.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the dynamic object.</td>
</tr>
<tr>
<td>Action</td>
<td>Select a data gathering action that generates values as JSON output.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Depends-on Another Input</td>
<td>Enable this option to require an input value from the parent action to be passed as an input to the data gathering action. If enabled, select a dependent input from the parent action.</td>
</tr>
</tbody>
</table>

Create an action

Create a reusable component to automate one or more steps of a process.

- Setting up an application in Guided Application Creator to store Flow Designer content.
- Role required: flow_designer, action_designer or admin

Action designers should know the application table structure and be aware of any existing business logic associated with the target tables of an action. Be sure to disable any conflicting business rules or workflows before creating an action.

Creating a custom application to contain your Flow Designer content enables you to deploy it using the application repository or the ServiceNow Store.

1. Navigate to Flow Designer > Designer.
2. Click the Actions tab and select New Action.
3. Fill in the Action Properties and click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of action.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Accessible from all application scoped or only within the specified application scope.</td>
</tr>
<tr>
<td>Category</td>
<td>Defined category within the application scope for an action.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the action is read-only. You can only select a value when you create the action in an application scope you own. The default value is None.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the action.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the action.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the action title in Flow Designer to help flow designers understand what the action does when used in a flow.</td>
</tr>
</tbody>
</table>

An empty action opens.

4. Define action inputs to make data available to the action steps and outputs.
   a) Select + Create Input and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the input. This value is used as the name of the data pill in the right-hand pane.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type of the input. For supported data types, see Action input and output data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Reference Table  | Reference table for the data type. Only required for the following data types:  
  - Conditions  
  - Document ID  
  - Records  
  - Reference  
  - Template Value |

**Advanced options**  
Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring an action to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see [field types](#).  
Click to view the advanced options and define values.

Inputs are represented as data pills in the right-hand pane. You can add inputs to steps and outputs in the flow by dragging and dropping data pills.

5. Add an action step to perform an operation on the action inputs.  
   a) Click the + underneath Inputs in the Action Outline.  
   b) Select the step you would like to perform.  
   c) Complete the fields in the step.

6. Add action outputs to make data available to a flow.  
   a) Select + **Create Outputs** and complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the output. This value is the name of the data pill in the right-hand pane when the action is added to a flow.</td>
</tr>
<tr>
<td>Value</td>
<td>Data used previously in the action either in a step or input. Adding a variable to the output makes the value available to the flow.</td>
</tr>
</tbody>
</table>

7. Click **Save**.  
   Action Designer saves a draft of the action.

**Test the action** until it is ready to be published.

**Note:** By default, the system only runs published actions.

**Test an action**  
Test an action before publishing it for other users.
• **Create an action** and save it.
• Role required: flow_designer, flow_operator, action_designer, or admin.

A user with the flow_designer role should always test actions on non-production instances containing relevant demonstration data because testing an action creates or changes records on the instance.

1. Navigate to Flow Designer > Designer.
2. Click the Actions tab and select the action that you want to test.
3. Click Test.
   The system displays the Test Action dialog box.
4. Fill in the fields for the action.

   **Note:** Complete all mandatory fields in the Test Action dialog box.

5. Click Run Test.

Click Action has been executed. To view the action, click here to view the action execution details. See Flow execution details for information about the executions.

   **Note:** Users must have the flow_operator or admin role to view the executions.

**Ask for Approval step**

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

**Approvals** is a platform feature that enables users or groups to approve or reject a task.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panel and drag the record pill into the Record field. If selecting a table with an approval field already configured, the Approval field is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval.</td>
</tr>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>Rules</td>
<td>Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:</td>
</tr>
<tr>
<td></td>
<td>· Anyone approves</td>
</tr>
<tr>
<td></td>
<td>· All users approve</td>
</tr>
<tr>
<td></td>
<td>· All responded and anyone approves</td>
</tr>
<tr>
<td></td>
<td>· % of users approve</td>
</tr>
<tr>
<td></td>
<td>· # of users approve</td>
</tr>
<tr>
<td></td>
<td>In the field beside the approval rule, add the desired approvers. To add approvers:</td>
</tr>
<tr>
<td></td>
<td>· Select individual users or groups.</td>
</tr>
<tr>
<td></td>
<td>· Drag-and-drop or select a field from a record.</td>
</tr>
<tr>
<td></td>
<td>Select to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see <em>Generate approvals using the approvers related list</em>.</td>
</tr>
<tr>
<td></td>
<td>Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.</td>
</tr>
<tr>
<td></td>
<td>Note: If you set an approval rule with no rejection rule (or vice versa) and the expected approval state is not met, the runtime value will be canceled.</td>
</tr>
<tr>
<td>Due Date</td>
<td>Define a due date to ensure that the flow does not remain in a waiting state if the request is not approved or denied.</td>
</tr>
<tr>
<td></td>
<td>· None: The approval is not dependent on a specific date.</td>
</tr>
<tr>
<td></td>
<td>· Approve: Automatically approve the step if an action is still pending by the specified date.</td>
</tr>
<tr>
<td></td>
<td>· Reject: Automatically reject the step if an action is still pending by the specified date.</td>
</tr>
<tr>
<td></td>
<td>· Cancel: Automatically cancel the step if an action is still pending by the specified date.</td>
</tr>
</tbody>
</table>
Example

1. Ask for Approval step

**Approval Request Definition**

- **Record**: action=incident
- **Table**: Incident [incident]
- **Approval Field**: Approval
- **Journal Field**: Approval history

**Rules**

<table>
<thead>
<tr>
<th>Rule</th>
<th>When:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approve</td>
<td>action=incident-&gt;Assigned to-&gt;Manager</td>
</tr>
<tr>
<td>Anyone approves</td>
<td>action=incident-&gt;Assigned to-&gt;Manager</td>
</tr>
<tr>
<td>Reject</td>
<td>action=incident-&gt;Assigned to-&gt;Manager</td>
</tr>
<tr>
<td>Anyone rejects</td>
<td>action=incident-&gt;Assigned to-&gt;Manager</td>
</tr>
</tbody>
</table>

**Due Date**

- Approve if pending by: Relative date = 1 Days
- Days from: action=incident

**Days schedule**: 8-5 weekdays excluding holidays

Output

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval State</td>
<td>State of the approval request</td>
<td>Choice</td>
</tr>
</tbody>
</table>

Create Record step

Creates a record on any table. You can dynamically add and configure fields for the record.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select <strong>Short description</strong> and set the desired value. To add dynamic values, see <a href="#">Allow flow designers to dynamically set field values</a>.</td>
</tr>
</tbody>
</table>

Create or Update Record step

Create or update a record in a ServiceNow table by determining if it already exists. Add records that do not exist, and update existing ones. Identify existing records by selecting unique fields. Set field values dynamically and enforce server-side validation rules (data policy, business rules, dictionary-defined mandatory fields). UI policy does not apply.

Roles and availability

Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Table in which a record is created or updated.</td>
</tr>
<tr>
<td>Fields</td>
<td>Values of fields in the record to be created or updated.</td>
</tr>
<tr>
<td>determins uniqueness</td>
<td>Option for selecting the field as a unique identifier. This field appears when the required table name and fields are selected.</td>
</tr>
</tbody>
</table>

Create Task step

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.
Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a task table.</td>
</tr>
<tr>
<td></td>
<td>- Catalog Task (sc_task)</td>
</tr>
<tr>
<td></td>
<td>- Change Phase (change_phase)</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td></td>
<td>- Standard Change Proposal (std_change_proposal)</td>
</tr>
<tr>
<td></td>
<td>- Ticket (ticket)</td>
</tr>
</tbody>
</table>
## Field Values
Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select **Short description** and set the desired value. To add dynamic values, see [Allow flow designers to dynamically set field values](#).

To associate the task with a parent record, define the **Parent** field.

## Wait
Waits to complete the step until the task completes and is no longer active (active=false).

Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the **Wait** field. The flow only waits for the task to complete when the condition field is true.

### Delete Record step
Deletes a record on any table.

### Roles and availability
- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
</tbody>
</table>

### JDBC step
Create a reusable action to send SQL commands to a relational database.

#### Note:
- The JDBC step is not available in the base system and requires the subscription to IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later. For more information about the ServiceNow® IntegrationHub subscription packages, see [IntegrationHub usage and subscription](#). After the required plugin is activated, the step is visible under Integrations.
- The JDBC step runs only on a ServiceNow® MID Server with JDBC step capabilities.Activate the plugin, IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later to use the JDBC capability for the MID Server.
Roles and availability

The JDBC step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Sanitizing inputs

Escape all user inputs to eliminate the possibility of a malicious user from executing malicious SQL statements that can result in SQL injection on your target database. When you use data pills in JDBC step SQL statements, sanitize them first using Sanitize SQL transform functions. This transform function category automatically appears when a data pill is dropped into the SQL Statement input.

Whitelisting SQL operations

By default, you can run the following SQL operations.

- SELECT
- INSERT
- UPDATE
- DELETE
- SHOW
- DESCRIBE

To enable only some of these SQL operations that the JDBC step can perform, create a MID Server property, `mid.property.jdbc_operations` and enter the whitelisted SQL operations, separated by comma. To learn more about MID Server properties, see MID Server properties.

Fields

<table>

<td>Maximum allowable payload size, in KB, to be returned from the SQL statement. The default payload size is <strong>5120 KB</strong>. The maximum payload size is <strong>5 MB</strong>.</td>
</tr>
</tbody>
</table>
| Retry Policy | **Enable Retry Policy** Option to enable the retry policy. For more information, see Retry policy.  
**Override Default Policy for Alias** Option to override the default retry policy. This option is not applicable when **Define Connection Inline** is selected from the Connection list.  
**Retry Policy** Default retry policy associated with Connection Alias. If **Override Default Policy for Alias** is selected, you can override the default retry policy and select another existing retry policy based on your requirement. |

---

**Test JDBC step**

Test the JDBC step before testing or publishing an action that contains the JDBC step.

It is mandatory that you test the JDBC step before testing the action. Testing ensures that the relevant complex object output schema is created from table columns, which can be used as data pills in subsequent steps.

1. Navigate to **Flow Designer** > **Designer**.
2. **Create an action** with a **JDBC step**.
3. Click **Test JDBC Step**.  
The **Test JDBC Step** pop-up window is displayed.
4. If the JDBC step takes an action input or output of the previous step as its input, provide required input values in the **Step input pills** field to test the JDBC step.

**Note:** Input values in the **Step input pills** fields are not needed when records are updated, inserted, or deleted.

5. Click **Run Test**.  
   - When a SELECT query is executed, **Sample Result** is displayed in the **Test JDBC Step** pop-up window. **Sample Result** includes column names, columns types, and the values of the first row.  
   - When an UPDATE, INSERT, or DELETE query is executed, a message is displayed mentioning the number of rows affected.

6. To use the sample result as the JDBC step output, click **Use Result**.  
   **Note:** **Use Result** is not displayed when records are updated, inserted, or deleted.
7. To retrieve schema of a different table when a SELECT query is executed in the JDBC step, enter the required value in the Step input pills field and click Run Test.

When a SELECT query is executed in the JDBC step, ResultSet is displayed under Outputs. The relevant complex object output is populated. To learn more about complex objects, see Complex data.

Test and publish the action.

Log step
Logs a message in the Flow Designer log table.

Roles and availability
- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Warn</td>
</tr>
<tr>
<td></td>
<td>• Info</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

Look Up Record step
Look up a record from any table based on defined conditions.

Roles and availability
- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Conditions</td>
<td>Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format (reference field)(is)(Reference type data pill-&gt;Sys ID). For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition (Requested by)(is)(action-&gt;incident-&gt;Caller-&gt;Sys ID) where incident is an input variable for an incident record.</td>
</tr>
<tr>
<td>Order by</td>
<td>Determines how to sort results when more than one record matches the defined conditions. Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>If multiple records are</td>
<td>Determines what is returned if more than one record matches the defined conditions.</td>
</tr>
<tr>
<td>found</td>
<td>• Return only the first record</td>
</tr>
<tr>

</tbody>
</table>

Look Up Records step

Look up multiple records on any table using defined conditions.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Conditions  | Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field.  
When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format (reference field)(is)(Reference type data pill->Sys ID). For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition (Requested by)(is)(action->incident->Caller->Sys ID) where incident is an input variable for an incident record. |
| Order by    | Select the field you want to use to sort results.                                                                                                                                                                                                                                                                                          |
| Sort Type   | Select whether to sort alphabetically in ascending or descending order.                                                                                                                                                                                                            |
| Max Results | Maximum number of results returned.                                                                                                                                                                                                                                                                                                       |

Example

1. Look Up Records step

![Look Up Records step diagram](image-url)
Notification step

Trigger a notification as a step within an action by selecting a record (such as an incident, change request, problem, or user record) to trigger a notification and defining the associated notification.

Notifications is a platform feature. Before triggering a notification as an action step in Flow Designer, ensure that the notification is set up for use in the platform.

- When you create or update the notification, set the Send when field in the When to send tab of the Notification form to Triggered.
- Verify that your users have an active primary email channel and that all their notifications are active.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step. This is the record that will trigger a notification.</td>
</tr>
<tr>
<td>Table name</td>
<td>Read-only. Set to the table of the triggering record.</td>
</tr>
<tr>
<td>Notification</td>
<td>Select the notification to be triggered. The notifications that can be selected are associated with the table of the specified record. If no record was selected, you can select a notification that does not have an associated record or table. To create notifications, see Create an email notification.</td>
</tr>
</tbody>
</table>

Example

1. Notification step

   - Record: action⇒incident
   - Table Name: Incident [incident]
   - Notification: Incident Priority Raised
Payload Builder step

Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name Value Pairs | The name-value pairs to include in the payload. Click the plus icon to add name-value pairs. Drag data pills into either field to produce dynamic payloads. The **Name** becomes a key in JSON and an element in XML. For example, suppose you create this name-value pair.  
  - **Name**: short_description  
  - **Value**: [action]->[short_description]  
  
  When the system formats the name-value pair as JSON:  
  
  "short_description": "[action]->[short_description]"  
  
  When the system formats the name-value pair as XML:  
  
| Omit if empty    | The option to exclude a name-value pair if the value is empty or null. **Note:** This field is only visible after clicking the down arrow to display advanced options.                                           |
| Output Format    | The payload file format.  
  - **JSON**: Select to format the payload as a JSON document.  
  - **XML**: Select to format the payload as an XML document. |
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Namespace</td>
<td>The XML namespace to apply to each element. For example, when the namespace is set to incident:</td>
</tr>
<tr>
<td></td>
<td><code>&lt;incident:short_description&gt;[action]-&gt;[short_description]</code></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the <strong>Output Format</strong> is set to XML.</td>
</tr>
<tr>
<td>Include Outer Structure</td>
<td>The option to include or exclude a top level container appropriate to the output format. When the <strong>Output Format</strong> is JSON, curly braces contain the name-value pairs. When the <strong>Output Format</strong> is XML, a specified XML element contains the name-value pairs.</td>
</tr>
<tr>
<td></td>
<td>For example, when the system formats the name-value pair as JSON:</td>
</tr>
<tr>
<td></td>
<td><code>{ &quot;short_description&quot;: &quot;[action]-&gt;[short_description]&quot; }</code></td>
</tr>
<tr>
<td></td>
<td>When the system formats the name-value pair as XML:</td>
</tr>
<tr>
<td></td>
<td><code>&lt;xml&gt;</code>&lt;br&gt;  <code>&lt;short_description&gt;[action]-&gt;[short_description]</code>&lt;br&gt;  <code>short_description&gt;</code>&lt;br&gt;  <code>&lt;/short_description&gt;</code>&lt;br&gt;  <code>&lt;/xml&gt;</code></td>
</tr>
</tbody>
</table>
### Fields

<table>
<thead>
<tr>
<th>Description</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>The option to send valid JSON or XML structures when the payload is empty. Enable this option to include JSON or XML structural text in the payload. For example, when the system formats an empty structure as JSON:</td>
<td>Send Empty Structure</td>
</tr>
<tr>
<td>{}</td>
<td></td>
</tr>
<tr>
<td>When the system formats an empty structure as XML:</td>
<td></td>
</tr>
<tr>
<td>&lt;xml&gt;&lt;/xml&gt;</td>
<td></td>
</tr>
<tr>
<td>Disable this option to produce an empty payload. Empty payloads can occur when you select the Omit if empty option for every name-value pair, and all name-value pairs in the payload produce empty values.</td>
<td></td>
</tr>
<tr>
<td>The name of the XML element that contains the name-value pairs. The default parent node element is xml.</td>
<td>Parent Node</td>
</tr>
<tr>
<td>Note: This field is only visible when the Output Format is set to XML and the option to Include Outer Structure is enabled.</td>
<td></td>
</tr>
<tr>
<td>The read-only payload the step produces.</td>
<td>Preview</td>

</table>

### PowerShell step

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server. PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 3.0 to 5.1. PowerShell 3.0 does not support Windows 2003 Server.

**Note:** PowerShell step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Connection</strong></td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Define Connection Inline</strong>: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Use Connection Alias</strong>: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Connection Alias</strong></th>
<th>Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Credential Alias</strong></td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.</td>
</tr>
<tr>
<td><strong>Host</strong></td>
<td>Specify the fully-qualified domain name of the target host where the system runs the action step. For example, host.domain.com.</td>
</tr>
<tr>
<td><strong>Port</strong></td>
<td>Specify the communications port on which the target host listens for connections. For example, 5985. Leave blank to use the default port.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MID Application</td>
<td>Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td>Remoting Type</td>
<td>The location where the PowerShell script runs such as the MID or a remote server.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Explicit Remoting (Most Common)</strong>: Establish a connection with and run the script on a remote server.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Implicit Remoting (Advanced)</strong>: Run a script on a MID Server while importing necessary modules from a remote server. If selected, define the Remote name prefix and Modules to import fields. For optimal performance, only import modules necessary to the step. If blank, all available modules are imported from the server.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Run on a MID Server or have your script establish a remote session</strong>: Run a script directly on a MID Server, or define remoting specifications within the script. This value is the default.</td>
</tr>
<tr>
<td></td>
<td>Note: To invoke a function in a PowerShell script command or PowerShell script file, the command must define the function param block if the function has input parameters. This requirement applies to explicit and implicit remoting. For additional information on param block, see Microsoft's documentation on Windows Powershell parameters at <a href="https://technet.microsoft.com/">https://technet.microsoft.com/</a>.</td>
</tr>
<tr>
<td>Remote name prefix</td>
<td>The file path, excluding file names, to the modules to load from the remote server.</td>
</tr>
<tr>
<td>Modules to import</td>
<td>The comma-separated list of modules to import from the remote server at the defined file path.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Script type</td>
<td>The type of script to run on the PowerShell host.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Inline script</strong>: Enter the script to run in the Command field of the step.</td>
</tr>
<tr>
<td></td>
<td>- <strong>MID Server Script File</strong>: Select the PowerShell script to run from the MID Server Script Files (ecc_agent_script_file) table. This is the default value and separates scripting logic from the action, enabling you to update the script without having to modify and redeploy the action.</td>
</tr>
<tr>
<td>MID Server Script</td>
<td>Pre-defined PowerShell script from the MID Server Script Files table (ecc_agent_script_file).</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only available if the Script type is MID Server Script File.</td>
</tr>
<tr>
<td>Script path</td>
<td>Read-only path to the selected MID Server script.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the Script type is MID Server Script File.</td>
</tr>
<tr>
<td>Input variables</td>
<td>The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps within the PowerShell script. Define the following fields for each variable:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Name</strong>: The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable names are reserved for internal processing and should not be used as input variables. See Reserved variables in PowerShell scripting variables.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Value</strong>: The value to map to the variable. Manually enter a value, or drag a data pill into the field.</td>
</tr>
<tr>
<td>Command</td>
<td>The inline PowerShell script to run on the target host.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the Script type is Inline script.</td>
</tr>
</tbody>
</table>

**PowerShell scripting variables**

To access input variables from the Command field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the Remoting Type is Run on a MID Server or have your script establish a remote session, some reserved variables are available in addition to input variables.

**Input variable syntax**

By default, prefix variable names with a $ character. For example, if an input variable is named message, use $message to access the variable in script.
If the `mid.powershell.command.script.parameter_passing` parameter is set to false, prefix the variable name with `$env:SNC_`. For example, if an input variable is named `message`, use `$env:SNC_message` to access the variable in script. To learn more about the `mid.powershell.command.script.parameter_passing` parameter, see [MID Server parameters](#).

**Reserved variables**

When the **Remoting Type** is **Run on a MID Server or have your script establish a remote session**, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$computer</code></td>
<td>Host IP address defined in the Connection alias record.</td>
</tr>
<tr>
<td><code>$cred</code></td>
<td>Credential object that contains the credentials defined in the connection record. Use this variable with any PowerShell cmdlet that supports the credential parameter. For example, <code>New-PSSession -credential $cred</code>.</td>
</tr>
<tr>
<td><code>$log_info</code></td>
<td>If the <code>mid.property.powershell.log_info</code> property is set to true, adds logging information to a PowerShell script.</td>
</tr>
</tbody>
</table>

The following variable names are reserved for internal processing and should not be used as input variables.

- `script`
- `useCred`
- `isMid`
- `isDiscovery`
- `debug`
- `user`
- `password`
- `executingScriptDirectory`
- `midScriptDirectory`
- `hresult`

**REST step**

Send an outbound REST web service request to an external system.

**Note:** REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

Outbound REST web service is a platform feature that enables you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
# Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

<tr>
<td></td>
<td>• <strong>Value:</strong> The sys_id of the Attachment record containing the content. You can look up this record in a prior step or define it as an input variable.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> These fields are available when you select <strong>Multipart</strong> from the Request Type list.</td>
</tr>
<tr>
<td>Name, Value</td>
<td>Content of a form URL-encoded request. Specify each part of the URL-encoded request with a name-value pair.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when you select <strong>Form URL-Encoded</strong> from the Request Type list.</td>
</tr>
<tr>
<td>Enable Retry Policy</td>
<td>Option to enable the retry policy. For more information, see <strong>Retry policy</strong>.</td>
</tr>
<tr>
<td>Override Default Policy for Alias</td>
<td>Option to override the default retry policy. This check box is not applicable when <strong>Define Connection Inline</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td>Retry Policy</td>
<td>Default retry policy associated with <strong>Connection Alias</strong>. If <strong>Override Default Policy for Alias</strong> is selected, you can override the default retry policy and select another existing retry policy based on your requirement.</td>
</tr>
<tr>
<td>Save As Attachment</td>
<td>Option to specify whether to save the response as a record in the Attachment (sys_attachment) table.</td>
</tr>
<tr>
<td>Attachment File Name</td>
<td>Name of the attachment created by the REST response. For example, rest-response.txt.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when <strong>Save As Attachment</strong> is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Attachment File Record</td>
<td>Target record to which the attachment is associated. The target record must be a data pill of type <code>Record</code>. For example, a specific incident record. You can look up this record in a prior step or define it as an input variable. The flow execution details display the sys_id of the associated record.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when <code>Save As Attachment</code> is selected.</td>
</tr>
</tbody>
</table>

**REST response size limits**

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the `glide.pf.rest.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

**Script step**

Add custom JavaScript to execute within a reusable action. While most core actions and steps fit common use cases, you can build a Script step to execute behavior not satisfied by the core steps.

**Roles and availability**

- Available as an Action Designer action step. Users with the `action_designer` role can create a custom action with one or more action steps.
- The Script step is available by default to run JavaScript on a local instance.

**Note:** An IntegrationHub subscription is required to enable integration features such as running a Script step on a MID Server. See `Request IntegrationHub` for information about IntegrationHub usage and subscriptions.

**Fields**

The JavaScript step includes separate input and output variables that enable you to map JavaScript data to Flow Designer data. By defining input and output variables within the step, you can define what Flow Designer data is available within your script, and which scripting variables are available to other steps in your action.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Required Runtime**          | The runtime environment required to support the script. Choices include:  
  - **Instance**: The action step runs the script from instance. Select this option when the script needs access to the ServiceNow API or instance data. This is the default value.  
  - **MID**: The action step runs the script from the MID Server. Select this option when the script needs access to MID Server script files and APIs. Selecting this option displays the **Select MID Server Using** field.  
  - **Vanilla (Core JavaScript)**: The action step runs the script from either the instance or MID Server. Select this option when the script only needs the core JavaScript APIs and not the ServiceNow API or instance data.  
  
  The runtime you select determines the JavaScript objects and methods displayed in the **Context-sensitive help**.  
  
  **Note**: This field is only visible when IntegrationHub is activated.  
| **Select MID Server Using**   | Specify the MID Server selection process to use. Choices include:  
  - **Any MID**: The system runs the action step from any available MID Server.  
  - **Use Connection Alias**: The system runs the action using the connection alias you specify. Selecting this option displays the **Connection Alias** field.  
  - **Use Inline Selection**: The system runs the action using the connection details you specify in the action. Selecting this option displays the **Host**, **MID Application**, and **Capabilities** fields.  
  
  **Note**: This field is only visible when IntegrationHub is activated, and you select **MID** from **Required Runtime**.  
| **Connection Alias**          | Connection & Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. Only aliases of connection type Basic are supported.  
  
  **Note**: This field is only visible when IntegrationHub is activated, and you select **Use Connection Alias** from **Select MID Server Using**.  
| **Host**                      | The fully-qualified domain name of the MID Server where the system runs the action step. For example, mid-server.domain.com.  
  
  **Note**: This field is only visible when IntegrationHub is activated, and you select **Use Inline Selection** from **Select MID Server Using**. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Application</td>
<td>Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when IntegrationHub is activated, and you select <strong>Use Inline Selection</strong> from <strong>Select MID Server Using</strong>.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when IntegrationHub is activated, and you select <strong>Use Inline Selection</strong> from <strong>Select MID Server Using</strong>.</td>
</tr>
<tr>
<td>Input variables</td>
<td>Name-value pairs that represent data from the action, enabling you to use action inputs and data from other steps within a script.</td>
</tr>
<tr>
<td>Script</td>
<td>Script that executes within the action. To access input and output variables in your script, use the global objects <strong>inputs</strong> and <strong>outputs</strong>. For example, <strong>inputs.myVariable</strong>.</td>
</tr>
<tr>
<td></td>
<td>By default, Flow Designer run scripts on the instance. To run script from a MID Server requires an IntegrationHub subscription.</td>
</tr>
<tr>
<td></td>
<td>Flow Designer runs script from the domain from which it is triggered or initiated. See [Domain separation and Flow Designer](https:// preço e mais à link).</td>
</tr>
<tr>
<td></td>
<td>For available classes and methods, see the JavaScript API Context-sensitive help or the JavaScript API reference.</td>
</tr>
<tr>
<td>Output variables</td>
<td>Map JavaScript output to Flow Designer data pills. Define output variables when you want other steps in the action to use the script output.</td>
</tr>
</tbody>
</table>

**Example**

This example builds a JSON payload that can be easily updated or changed and added to a subsequent REST step.

**Note:** REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription.
1. Script step

By creating an output variable that represents the payload, you can drag the (Payload) data pill into the REST step Body field.

Send Email step

Send an email to specified users or groups as an action in a flow.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Record</td>
<td>Record that the email is associated to. When a user sends a reply to your email, the target record is updated with the reply email content.</td>
</tr>
<tr>
<td>Table</td>
<td>Table of the target record.</td>
</tr>
<tr>
<td>Include</td>
<td>Option to apply a watermark to the email that is sent. To include a watermark, you must set a target record.</td>
</tr>
<tr>
<td>Watermark</td>
<td></td>
</tr>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field, such as a User record. For example, if your action involves an incident record and you want to send an email to the group assigned to the incident, drag the <code>Assignment group</code> data pill from the data panel.</td>
</tr>
<tr>
<td>CC</td>
<td>Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>BCC</td>
<td>Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>Subject</td>
<td>Subject of the email. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
<tr>
<td>Body</td>
<td>The content of the message body. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

**Note:** Flow Designer does not support the `${URI}` parameter for creating a link to a record in the email message body. Instead, consider inserting the information from the record in the email body using data pills, or create a notification step.

### Testing the email step

To verify that the email was generated when testing the action, review the email record in the Email (sys_email) table. The **Headers** field indicates whether the email was successfully generated.

For example:

```plaintext
X-ServiceNow-Source:FlowDesigner-9ad2747b0b710300f4eb8bf637673a1e
Message-ID:<193756824.0.1508534586438@[10.0.66.70]>
X-ServiceNow-Generated:true
```

ACL restrictions apply to the Send Email action. If you configured your flow to run as the user who initiates the session, ensure that the user has access control to send email. To test access controls for a Send Email action, impersonate a typical email sender and manually trigger the flow.
SFTP step

Create a reusable action to manage files and directories on an SFTP server and to move files from one SFTP server to another.

Note:

- The SFTP step is not available in the base system and requires the subscription to IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional). For more information about the ServiceNow®IntegrationHub subscription packages, see IntegrationHub usage and subscription. After the required plugin is activated, the step is visible under Integrations.
- The SFTP step runs only on a ServiceNow® MID Server with SSH capabilities. Activate the plugin, IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) to use the JDBC capability for the MID Server.

Roles and availability

The SFTP step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Prerequisite

Activate the Managed File Transfer Extensions for the SFTP Step (com.glide.hub.action_step.sftp_mft) plugin.

SFTP commands

- Copy File
- Copy Directory
- Create Directory
- Get File List
- Remove File
- Remove Files
- Delete Directory
- Rename File or Directory
- Set File Attributes

Note: The SFTP commands can be performed on a maximum of 10,000 files at a time.

Copy File

Copies a file from the source SFTP server to target SFTP server.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

<td>Capability of the MID Server. Select SSH. This field is available when Define Connection Inline is selected from the Source Connection list.</td>
</tr>
<tr>
<td>Command Details</td>
<td></td>
</tr>
<tr>
<td>Source Path</td>
<td>Full path to the file in the source server you wish to copy. For example, /root/doc/tempwsdl.rtf.</td>
</tr>
<tr>
<td>Target Path</td>
<td>Full path to the file in the target server you wish to copy the contents. For example, /root/doc/attribute.rtf. In this case, the contents of the tempwsdl.rtf are copied to the file, attribute.rtf.</td>
</tr>
<tr>
<td>Retry Policy</td>
<td>Option to enable the retry policy. For more information, see Retry policy.</td>
</tr>
</tbody>
</table>
## Override Default Policy for Alias

Option to override the default retry policy. This option is not applicable when **Define Connection Inline** is selected from the Connection list.

## Retry Policy

Default retry policy associated with **Connection Alias**. If **Override Default Policy for Alias** is selected, you can override the default retry policy and select another existing retry policy based on your requirement.

### Copy Directory

Copies a directory from the source SFTP server to the target SFTP server.

**Note:** If you wish to use the Managed File Transfer feature while copying a directory, activate the ServiceNow IntegrationHub Action Step - MFT (com.glide.hub.action_step.mft) plugin.

### Field | Description
--- | ---
**MID Application** | Option to use a MID Server to run the SFTP step. This field is available when Define Connection Inline is selected from the Source Connection list.

**Capabilities** | Capability of the MID Server. Select SSH. This field is available when Define Connection Inline is selected from the Source Connection list.

### Command Details

**Source Path** | Path of the directory that contains the file you wish to remove.

**Retry Policy**

**Enable Retry Policy** | Option to enable the retry policy. For more information, see Retry policy.

**Override Default Policy for Alias** | Option to override the default retry policy. This option is not applicable when Define Connection Inline is selected from the Connection list.

**Retry Policy** | Default retry policy associated with Connection Alias. If Override Default Policy for Alias is selected, you can override the default retry policy and select another existing retry policy based on your requirement.

### Remove Files

Remove files on an SFTP server, including subfolders, when configured.

### Fields

**Field** | **Description**
--- | ---
**Connections**

**Source Connection** | Type of connection to use to connect to the source SFTP server.

* Define Connection Inline: Define connection information within the action step.
* Use Connection Alias: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action.

To learn more about connections and credentials, see credentials, connections, and aliases.

**Set File Attributes**

Sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

A good practice is to use the Get File List command to return a list of files and their attributes first. Then, after you have moved the files from a source host to a target host, use the Set File Attributes command to set the source file attributes on the target file.

**Fields**

</tbody>
</table>

### SSH step

The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.

**Note:**
- The SSH step is not available in the base system. The step requires the subscription to ServiceNow® IntegrationHub and activation of IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) or later. For more information about the IntegrationHub subscription packages, see IntegrationHub usage and subscription. After you activate the required plugin, the step is visible under Integrations.
- IntegrationHub supports ServiceNow SSH only.

### Roles and availability

The SSH step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Sanitizing inputs

Escape all user inputs to eliminate the possibility of a malicious user executing arbitrary commands on your target server. Escape and validate data pills before the command field uses them by sanitizing arguments using Sanitize shell arguments transform functions. This transform function category automatically appears when a data pill is dropped into the Command input.

<td>Option to elevate privileges to execute the script.</td>
</tr>
</tbody>
</table>

For more information, see [SSH credentials](https:// servicenow.com).  

**Advanced SSH script options**

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `$syncFile()` parameter. The system uses this parameter to locate the named script in the MID Server Script File (ecc_agent_script_file) table and run it on the target host. For example, a bash script can be expressed as:

```
bash ${syncFile("<MID script name>")} argument1 argument2 argument3
```

A base script (`main_script.bash`) can reference another script (`my_include.bash`) as well as a separate file (`.my_profile`) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `$syncFile()` parameter, to execute properly.

```
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```
set $LIB_DIR=/usr/bin;
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
```
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
# call a script that requires functions from the package as well as a
function from myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py

To see the list of available MID Server scripts, navigate to MID Server > Script Files.

SOAP step

Enable action designers to send outbound SOAP web service requests to external systems.

Note: SOAP step is not available in the base system and requires the ServiceNow®
IntegrationHub subscription. After the required plugin is activated, the step is visible under
Integrations.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a
custom action with one or more action steps.
- Action designers need the web_service_admin role to perform these web services tasks.
  - Select WSDL
  - Load new WSDL
  - Select a WS-Security policy
- The ServiceNow® MID Server doesn’t support WS-Security policies

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Details</td>
<td>The type of connection to use.</td>
</tr>
<tr>
<td>Connection</td>
<td>• Define Connection Inline: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>• Use Connection Alias: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don’t need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when Use Connection Alias is selected from the Connection list.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don’t need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when Define Connection Inline is selected from the Connection list.</td>
</tr>
<tr>
<td>Use MID</td>
<td>Option to use a MID Server to run the SOAP step. Select this check box to display the MID Application and Capabilities fields.</td>
</tr>
<tr>
<td>Endpoint</td>
<td>The URL endpoint for the SOAP request. If Use Connection Alias is selected, this field is read-only and displays the endpoint URL associated with alias. If Define Connection Inline is selected, enter an endpoint URL for the connection.</td>
</tr>
<tr>
<td>Request Details</td>
<td>The method to use when building the SOAP envelope.</td>
</tr>
<tr>
<td>Build Envelope</td>
<td>• From WSDL: Select this option to display the Select a WSDL and Operation fields.</td>
</tr>
<tr>
<td></td>
<td>• Manually: Select this option to manually enter or paste WSDL text.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Select a WSDL</td>
<td>The WSDL to use to build the SOAP envelope. Select an existing WSDL record or click Load New WSDL to download or manually enter a WSDL file. The selected WSDL populates the values of the Operation, SOAP action, and SOAP Envelope fields.</td>
</tr>
<tr>
<td><strong>Note:</strong> This field is available when you select From WSDL from the Build Envelope list.</td>
<td></td>
</tr>
<tr>
<td>Load New WSDL</td>
<td>Option to download or manually enter a WSDL file.</td>
</tr>
<tr>
<td>Operation</td>
<td>The operation to run from the selected WSDL. Each WSDL has its own list of available operations.</td>
</tr>
<tr>
<td>SOAP Action</td>
<td>The URL to run the SOAP action. If Build Envelope is set to From WSDL, this field is read-only and displays the URL to run SOAP action. If Build Envelope is set to Manually, enter a URL to run the SOAP action.</td>
</tr>
<tr>
<td>SOAP Envelope</td>
<td>The XML text sent to the endpoint. If Build Envelope is set to From WSDL, the system adds the necessary XML for the Operation that you select. If Build Envelope is set to Manually, enter the XML text that you want to use. Enter record values in the appropriate SOAP envelope elements. For example, enter an incident short description in the &lt;short_description&gt; element.</td>
</tr>
<tr>
<td>Reset Envelope</td>
<td>Option to discard all manual changes that you made to the SOAP envelope. Select this check box to revert the SOAP envelope to its original state.</td>
</tr>
<tr>
<td><strong>Note:</strong> This field is available when you select From WSDL from the Build Envelope list.</td>
<td></td>
</tr>
<tr>
<td>New WSDL</td>
<td>The name of the WSDL record you want to create.</td>
</tr>
<tr>
<td>Name</td>
<td>The method to enter WSDL.</td>
</tr>
<tr>
<td><strong>Download from URL:</strong> Select to display the WSDL URL, User name, and Password fields to retrieve the WSDL from an external source, typically the web service provider.</td>
<td></td>
</tr>
<tr>
<td><strong>Manually Populate WSDL Content:</strong> Select to display the WSDL Content field to manually enter or paste WSDL text.</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>WSDL URL</td>
<td>The URL to the SOAP web service.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when you select <strong>Download from URL</strong> from the Import Method list.</td>
</tr>
<tr>
<td>User name</td>
<td>The user name to authenticate with the SOAP web service.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when you select <strong>Download from URL</strong> from the Import Method list.</td>
</tr>
<tr>
<td>Password</td>
<td>The password to authenticate with the SOAP web service.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when you select <strong>Download from URL</strong> from the Import Method list.</td>
</tr>
<tr>
<td>WSDL Content</td>
<td>The XML document describing the SOAP web service and its operations.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when you select <strong>Manually Populate WSDL Content</strong> from the Import Method list.</td>
</tr>
<tr>
<td>Import</td>
<td>Option to add the SOAP web service WSDL to the instance.</td>
</tr>
<tr>
<td>WS-Security</td>
<td></td>
</tr>
<tr>
<td>Enable WS-Security Policy</td>
<td>Option to restrict the SOAP web service to a security policy. Select this check box to display the <strong>Policy</strong> field.</td>
</tr>
<tr>
<td>Policy</td>
<td>The policy record that you want to use to restrict web service connections. Select an existing policy record.</td>
</tr>
<tr>
<td>Retry Policy</td>
<td></td>
</tr>
<tr>
<td>Enable Retry Policy</td>
<td>Option to enable the retry policy. For more information, see <strong>Retry policy</strong>.</td>
</tr>
<tr>
<td>Override Default Policy for Alias</td>
<td>Option to override the default retry policy. This check box is not applicable when <strong>Define Connection Inline</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Retry Policy</td>
<td>Default retry policy associated with Connection Alias. If Override Default Policy for Alias is selected, you can override the default retry policy and select another existing retry policy based on your requirement.</td>
</tr>
<tr>
<td>Advanced Options</td>
<td></td>
</tr>
<tr>
<td>Headers</td>
<td>The name-value pairs to include in the SOAP message as HTTP headers. Click the plus icon to add headers. Add a Name and Value for each HTTP header.</td>
</tr>
<tr>
<td>Omit if empty</td>
<td>Option to exclude a name-value pair if the value is empty or null.</td>
</tr>
</tbody>
</table>

**SOAP response size limit**

The system limits the size of SOAP responses to 5 MB. Direct SOAP responses that exceed this limit generate an error. To support larger response sizes, increase the response size limit with the `glide.pf.soap.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

**Update Record step**

Update an existing record in a table. You can dynamically add and configure fields for the record, or use a template to set field values.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
</tbody>
</table>
### Field Values

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Values</td>
<td>Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select <strong>Short description</strong> and set the desired value. To add dynamic values, see <em>Allow flow designers to dynamically set field values</em>.</td>
</tr>
</tbody>
</table>

### Wait For Condition step

Pause the flow until the record value conditions are met.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step.</td>
</tr>
<tr>
<td>Note: If this record is deleted while the flow is waiting, the flow stops waiting and continues running.</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record. Confirm that the system supports <strong>Wait for Condition</strong> for your selected table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Select the record values necessary to resume running the flow. For example, if the condition is <strong>(State)(is)(Closed)</strong>, the flow pauses until the condition is met. Once met, the flow moves on to the next step or action. Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type <strong>Conditions</strong> and drag-and-drop the input data pill into the <strong>Conditions</strong> field.</td>
</tr>
</tbody>
</table>

### Unsupported tables

The system does not support **Wait for Condition** for the following tables.

<table>
<thead>
<tr>
<th>Table Category</th>
<th>Table Names</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audit</td>
<td>Audit Relationship Change (sys_audit_relation), Audit Deleted Record (sys_audit_delete)</td>
</tr>
<tr>
<td>Email</td>
<td>Email (sys_email), Email Account (sys_email_account), Email Log (sys_email_log)</td>
</tr>
<tr>
<td>Table Category</td>
<td>Table Names</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Import Sets</td>
<td>Import Set (sys_import_set), Import Set Row (sys_import_set_row), Import Set Row Error (sys_import_set_row_error), Transform History (sys_import_set_run)</td>
</tr>
<tr>
<td>Logs</td>
<td>Log Entry (syslog), Service Portal Log Entry (sp_log)</td>
</tr>
<tr>
<td>MID Server</td>
<td>MID Server Property (ecc_agent_property)</td>

<tr>
<td>Upgrade History</td>
<td>System Upgrades (sys_upgrade_history), Upgrade Details (sys_upgrade_history_log)</td>
</tr>
<tr>
<td>Usage Analytics</td>
<td>Usage Data for Applications (ua_app_usage), UsageAnalytics Count Configurations (usageanalytics_count_cfg), Application Metadata (ua_app_metadata), UsageAnalytics Count for Tables (usageanalytics_count), Subscription (license_details), Role for Subscription (role_has_license)</td>
</tr>
</tbody>
</table>
### Table Category

<table>
<thead>
<tr>
<th>Users</th>
<th>User Session (sys_user_session), User Token (sys_user_token), User Preference (sys_user_preference), Navigator History (sys_ui_navigator_history)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflow</td>
<td>Workflow Execution (wf_workflow_execution), Workflow History (wf_history), Workflow Executing Activity (wf_executing), Workflow Queued Command (wf_command), Workflow Context (wf_context), Workflow Transition History (wf_transition_history)</td>
</tr>
</tbody>
</table>

### Example

**Transform functions**

Transform data pill values without the need to write a script. Use transform functions to reformat text, perform mathematical calculations, sanitize potentially unsafe SQL statements, and serialize complex objects to raw XML.

Available transform function categories include **date and time**, **string**, **utilities**, **simple math**, **sanitize shell arguments**, **sanitize SQL**, and **complex data**. Some examples of transform function uses include:

- Trimming white space from a string before integrating it into the CMDB.
- Adding days, hours, minutes, and seconds to a date or time to localize for a specific time zone.
- Sanitizing SQL values to prevent injection as part of a JDBC step for an IntegrationHub spoke.
- Retrieving an appropriate value from a map of priorities that have equivalent values in a third-party database.
- Transforming a complex object into raw XML as part of a REST step Request Body field.

**Note:** Custom transform functions are not currently supported. For information on creating custom functions to transform Flow Designer data, see *Inline scripts*.

### Applying a transform function

You can apply a transform function to a data pill when you are designing or creating a flow. To apply a transform function, point or tab to a data pill and select the $f(x)$ icon that appears. Selecting the icon displays the Available Transforms list. Select the transform function that you want to apply to your data pill, enter information into any required fields, and select **Apply**. Your selected transform function appears in the Applied Transforms list.
Applying multiple transform functions

You can apply multiple transform functions to the same data pill. The system applies transform functions sequentially from top to bottom as listed in the Applied Transforms list. For example, you can apply a String to Date transform function followed by the Add Time transform function.

Viewing applied transform functions

You can find out which transform functions are applied to a data pill by looking at the Applied Transforms list. When you are designing or creating a flow or action, point to or tab into the data
pill and select the $f(x)$ icon. You can also view applied transform functions in the flow execution details.

Note: The output values for applied transform functions are field values, not display values.

When a data pill is dropped into certain types of inputs, the system automatically suggests a transform function category that is related to the input. For example, the system suggests transform functions to escape special characters in SQL statements, prevent script injection in shell scripts, and validate API or operation requests. Currently, the system suggests transform function categories for these inputs:

- For data pills dropped in the JDBC step’s SQL Statement input, the sanitize SQL transform function category is displayed automatically.
- For data pills dropped in the SSH step’s Command input, the sanitize shell arguments transform function category is displayed automatically.

Design considerations

Apply transform functions to valid input data pill types

Be sure to check the input data pill type before applying a transform function. Applying a transform function to an invalid data pill type results in the system skipping the transform. An error also occurs if transform functions produce results that the system cannot parse. For example, when transforming a string into a date, the system throws an error if the transform does not produce a valid date.

Confirm applied transform functions for multiple inputs with the same data pill

Transform functions only affect the runtime value of a data pill for one specific input. The actual field value that is associated with a data pill remains unchanged. To apply a transform function to the same data pill across multiple actions or steps, you must apply the transform function to the data pill in each input separately.

View final transformed values in the flow execution details

Only the final transformed value, and not the value for each applied transform, appears in the flow execution details.

Test transform functions to verify they produce expected results

Verify that your transform functions produce the expected data pill runtime values. For more information on confirming the runtime values for data pills with applied transform functions, see Test a flow and Test an action.

Date and time transform functions

Use date and time transform functions to recalculate or reformat data pills for Date/Time values.

Date and time transform functions require a Date/Time or String input data pill. Make sure to use the correct input data pill type when applying date and time transform functions. If a date and time transform function is applied to an improper data pill type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.
Note: Runtime Date/Time values are not localized and appear in the UTC (Coordinated Universal Time) time zone. For more information, see time zones and time zone representation.

Add Time

Adds days, hours, minutes, or seconds to the input Date/Time, Date, or Due Date.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date/Time, Date, or Due Date</td>
<td>Duration - Amount of time to add in days, hours, minutes, and seconds</td>
<td>Date/Time - Transformed Date/Time value after adding the specified Duration</td>
</tr>
</tbody>
</table>

- Input: 2019-09-12 11:00:00
- Duration: 3 hours
- Output: 2019-09-12 13:00:00

In this example, the flow retrieving a CMDB Configuration Item record from a remote instance. The Subtract Time transform function then localizes the value of the Created field by subtracting three hours from the input Date/Time.
Subtract Time

Subtracts days, hours, minutes, and/or seconds from the input Date/Time, Date, or Due Date. Enter a Duration of time to subtract from the input Date/Time.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date/Time, Date, or Due Date</td>
<td>Duration - Enter an amount of time to subtract in days, hours, minutes, and seconds</td>
<td>Date/Time - Transformed Date/Time value after subtracting the specified Duration</td>
</tr>
</tbody>
</table>

**Note:** If the input is a Date or Due Date, the transform creates a full Date/Time value using time values of hour 0, minute 0, and second 0.

- **Input:** 2019-09-12 11:00:00
- **Duration:** 2 days, 1 hours, 5 minutes, 10 seconds
- **Output:** 2019-09-10 09:54:50

Example

String to Date

Converts the input String to a Date/Time.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
</table>
| String formatted as specified in the Input Date Format | - **Input Date Format** - Date/Time or date format of the input String  
- **Custom Format** - Valid Date/Time or date format represented as a String. Required only if Custom Format is selected as the Input Date Format. | Date/Time        |

**Note:**

- If the Date/Time value for the Custom Format input is incomplete, the transform creates a full Date/Time value using default dates and times. In such a case, the transform defaults to the current year, the current month, day 1 of a month, hour 0, minute 0, and second 0. For example, an input data pill value of Oct 2019 and a custom date format of MMM yyyy produces an output of 2019-10-01 00:00:00.
- If you use an incorrect data pill type or invalid Custom Format, the flow cancels during runtime.
Example

Date to String
Converts the input Date/Time, Date, or Due Date to a String. Select a Date Format for the input Date/Time. Alternatively, enter a Custom Format for the input Date/Time.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
</table>
| Date/Time, Date, or Due Date | · Output Date Format - Date/Time or date format of the output String  
· Custom Format - Valid Date/Time or date format represented as a String. Required only if selecting Custom Format as the Date Format. | String formatted as specified in the Output Date Format |

Note: If you use an incorrect input data pill type or invalid Custom Format, the flow cancels during runtime.

- Input: '1995-11-20'
- Input Date Format: ISO Date (2004-06-28)
- Output: 1995-11-20 00:00:00

- Input: 1969-12-31 14:23:57
- Output Date Format: Custom (enter below)
- Custom Format: 'On' MMM dd, yyyy 'at' hh:mm a

In this example, the flow retrieves a User (sys_user) record from a third-party database. The Date to String transform function converts the format of the Created field and then logs the date, time, and name that is associated with the record.
Custom date formats

You can specify a custom date format with a sequence of specific date and time pattern strings. A pattern string consists of one or more uppercase and lowercase letters from A to Z. Any text within quotation marks is ignored and is instead copied into the date output.

<table>
<thead>
<tr>
<th>String</th>
<th>Description</th>
<th>Output Format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>

<td>-08: -0800; -08:00</td>
</tr>
</tbody>
</table>
String transform functions

Use string transform functions to reformat or perform calculations on String data pills.

String transform functions require a String input data pill. Make sure to use the correct input data pill type when applying string transform functions. If a string transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

First Character

Returns the first character of the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - Transformed String as first character of the input String</td>
</tr>
</tbody>
</table>

- Input: Madrid
- Output: M

In this example, the flow triggers when a User (sys_user) record is created. The flow then updates the City field for the User (sys_user) record with a code that is represented as the first character of the city's name.
**Last Character**

Returns the last character of the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - Transformed String as last character of the input String</td>
</tr>
</tbody>
</table>

- **Input:** Madrid
- **Output:** d

**Example**

**Size**

Returns the total number of characters in the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Integer</td>
</tr>
</tbody>
</table>

- **Input:** Example input string.
- **Output:** 21

**Example**

**Split**

Returns an Array.String based on a provided **Separator** that splits the input String. If the **Separator** field is left blank, the transformation is ignored and the system returns the input String. If entering any data type other than a String as the **Separator**, the system converts the provided value to a String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td><strong>Separator</strong> - Enter a delimiter that specifies where the input String should be split. If left blank, the input String is not transformed at runtime.</td>
<td>Array.String - An array of substrings from the input String</td>
</tr>
</tbody>
</table>

- **Input:** Example, input, string.
- **Separator:** ,
• Output: ["Example", "input", "string."

Example

SubString

Returns a substring from the input String that is based on the provided **Start Index** and **End Index**. Input String index starts at 0.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
</table>
| String          | Start Index - Index of the first character to include in the returned substring  
                  End Index - Index of the last character to include in the returned substring | String - Transformed String as a substring of the input String |

• Input: Example input string  
  • Start Index: 3  
  • End Index: 6  
  • Output: mple

Example

To Lowercase

Converts the input String to all lowercase characters.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String in all lowercase characters</td>
</tr>
</tbody>
</table>

• Input: Example input string  
  • Output: example input string

Example

To Uppercase

Converts the input String to all uppercase characters.
### Trim

Removes white space from the beginning and end of the input String. Does not remove white space within the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - Transformed String with trimmed white space</td>
</tr>
</tbody>
</table>

- **Input:** SQL Server APAC 1
- **Output:** SQL Server APAC 1

In this example, the action makes a REST call to a third-party system and GETs a response body containing data about a server. Then, the Trim transform function removes any unwanted white space before adding the server's name to a new record in the Server (cmdb_ci_server) table.
Example

Utilities transform functions

Use utilities transform functions to return specified values from Array or Name-Value Pairs data pills.
Utilities transform functions require an Array or Name-Value Pairs input data pill. Make sure to use the correct input data pill type when applying utilities transform functions. If a utilities transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

Get Item from Array

Returns a Complex Object from the input Array. Enter a value for the Nth Item in the input Array that you want to return. The Nth Item represents the Array index, starting at 0.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td>Nth Item - Enter the index of the target object in the input Array. Array index starts at 0.</td>
<td>Complex Object</td>
</tr>
</tbody>
</table>

Get Item from Name/Values

Returns a value that is associated with a matching key from a map of Name-Value Pairs.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
</table>
| Name-Value Pairs         | • Key - Name of the key that is used to look up its corresponding value  
                          | • Default - The default value that is returned if the provided key is not found in the map of Names and Values | String as the value that is associated with the matching key |

Note: When applying the Get Item from Name/Values transform function, consider that the runtime value might be the system value, not the display value. For example, if mapping the Priority field in the Incident table to a similar field in a remote table, the returned runtime value might be 2, not 2 - High.

- Input: "username":"abel.tuter"
- Key: username
- Default: example.username
- Output: abel.tuter

In this example, an action makes a REST call to a third-party system and GETs ticket data as a map of Name-Value Pairs. A Ticket ID is provided as an output for this action. The Get Item from Name/Values transform function returns either the value that is associated with the ticket_id key or Ticket ID not found.
Example

Simple math transform functions

Use simple math transform functions to perform basic mathematical calculations on Array.Number data pills.

Simple math transform functions require an Array.Number, Array.Integer, or Array.Decimal input data pill. Make sure to use the correct input data pill type when applying simple math transform functions. If a simple math transform function is applied to an improper data type, the data
is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

### Max

Returns the highest value found in the input Array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, or Array.Decimal</td>
<td>Number as highest value in the input Array</td>
</tr>
</tbody>
</table>

- Input: [1, -5, 20, 6]
- Output: 20

**Example**

### Min

Returns the lowest value found in the input Array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, or Array.Decimal</td>
<td>Number as lowest value in the input Array</td>
</tr>
</tbody>
</table>

- Input: [1, -5, 20, 6]
- Output: -5

**Example**

### Sum

Returns the sum of all values in the input Array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, or Array.Decimal</td>
<td>Number as sum of all values in the input Array</td>
</tr>
</tbody>
</table>

- Input: [1, -5, 20, 6]
- Output: 22

**Example**
Sanitize shell arguments transform functions

Use sanitize shell arguments transform functions to remove any potentially unsafe command injections in String data pills to be used for Bash shell scripting.

Sanitize shell arguments transform functions require a String input data pill. Make sure to use the correct input data pill type when applying sanitize shell arguments transform functions. If a sanitize shell arguments transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

Note: When a data pill is dropped into the Command input for an SSH step, the sanitize shell arguments transform function category automatically appears.

Sanitize Bash shell arguments

Returns a String free of any unsafe command injections in your Bash shell script. Wraps the input String with single quotes and escapes any existing single quotes so that you can pass the String directly to a shell function as a safe argument.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - String with Bash shell arguments properly escaped</td>
</tr>
</tbody>
</table>

Sanitize SQL transform functions

Use sanitize SQL transform functions to escape special characters and prevent injection in String data pills to be used for SQL statements.

Sanitize SQL transform functions require a String input data pill. Make sure to use the correct input data pill type when applying sanitize SQL transform functions. If a sanitize SQL transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

Note: When a data pill is dropped into the SQL Statement input for a JDBC step, the sanitize SQL transform function category automatically appears.

Sanitize SQL Identifier

Returns a String with escaped special characters/injected values for SQL identifiers (such as table, view, and column names). Wraps the input String in database-specific quotes.
### Sanitize SQL Identifier

Returns a String with SQL identifiers that are properly escaped based on the selected database.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td><strong>Database</strong> - The database-specific context in which characters are escaped. Choices include MySQL, Oracle, PostgreSQL, and Microsoft SQL Server.</td>
<td>String - String with SQL identifiers that are properly escaped based on the selected database</td>
</tr>
</tbody>
</table>

- **Input:** `simple_column`
- **Database:** MySQL
- **Output:** `'simple_column'`

#### Example

#### Note:
- If your input String contains a period character, **Sanitize SQL Identifier** returns an error. To join SQL identifiers using a period, use two data pills concatenated with a period and apply **Sanitize SQL Identifier** to both pills.
- Don’t enclose the input data pill in quotes. The system automatically wraps the input value with the type of quotes or backticks that apply to your database type.

### Sanitize SQL Value

Returns a String with escaped special characters or injected values for SQL values. Wraps the input String in database-specific quotes.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td><strong>Database</strong> - The database-specific context in which characters are escaped. Choices include MySQL, Oracle, PostgreSQL, and Microsoft SQL Server.</td>
<td>String - String with SQL values that are properly escaped based on the selected database</td>
</tr>
</tbody>
</table>

- **Input:** `'1'='1`
- **Database:** SQLServer
- **Output:** `'1'='1'`

#### Example

#### Note:
Complex data transform functions

Use complex data transform functions to serialize Complex Object data pills into an XML format.

Complex data functions require a Complex Object input data pill. Make sure to use the correct input data pill type when applying complex data transform functions. If a complex data transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

To XML

Serializes the input Complex Object to XML.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complex Object</td>
<td>XML - XML document formatted as a String</td>
</tr>
</tbody>
</table>

- Input: `{ "article_id": KB3843202, "article_description": "How do I reset my Active Directory password?" }`  
- Output: `<article_id>KB3843202</article_id> <article_description>How do I reset my Active Directory password?</article_description>`

In this example, an action makes a REST call to a third-party knowledge base and retrieves KB article IDs and descriptions. The To XML transform function changes the response body’s JSON text into XML format before it is integrated into the system’s knowledge base.
Example

Domain separation and Flow Designer

Flow Designer supports domain separation of business logic, which lets each tenant domain have its own flows, actions, and subflows. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Support level: Standard*

- Includes Basic level
- Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another. Business logic:

How domain separation works in Flow Designer

The system domain separates Flow Designer content according to these rules.

**Flow Designer content inherits the domain of the user who creates them**

Flows, actions, and subflows belong to the domain of the user who creates them. For example, when a Service Provider (SP) administrator in the TOP domain creates a flow, it belongs to the TOP domain.

**Note:** The domain selected from the domain picker overrides the domain the user belongs to. For example, when an SP administrator in the TOP domain selects the ACME domain from the domain picker, any content created belongs to the ACME domain.

**Flow Designer content runs from the domain from which it is triggered or initiated**

Flows, actions, and subflows run from the domain of the record or user who initiates them. For example, when a user from the child domain ACME triggers a flow belonging to the parent domain TOP, the flow runs in the context of the child domain ACME.

**Domain assignment by trigger type**

<table>
<thead>
<tr>
<th>Trigger type</th>
<th>Domain assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>API call</td>
<td>Domain of the user making API call</td>
</tr>
<tr>
<td>Email trigger</td>
<td>Domain of the email sender</td>
</tr>
<tr>
<td>Record trigger</td>
<td>Domain of the triggering record</td>
</tr>
<tr>
<td>Scheduled trigger</td>
<td>Domain of the flow</td>
</tr>
<tr>
<td>Service Catalog trigger</td>
<td>Domain of the requested item record</td>
</tr>
</tbody>
</table>

Flow Designer only runs content accessible from the current domain context

The system can only run content to which the current domain context allows access. See Understanding domain separation to understand data separation and the domain hierarchy. For example, a user in the child domain ACME can trigger flows belonging to the parent domain TOP, but cannot trigger flows belonging to a sibling domain such as INITECH.

Flow Designer runs record operations from the current user domain context. A read operation such as the Lookup Records action returns records based on the currently selected domain and its children. For example, if the currently selected domain is the TOP domain, you will see...
records from the TOP domain and all its children such as the ACME and INITECH domains. If the currently selected domain is the ACME domain, you will see records from the ACME domain and its children, but you will not see records from the parent TOP domain.

**Note:** Record operations use the data or process separation rules applied to the table the record belongs to. For example, suppose you have process-separated the Business Rule table. If you add a business rule to the TOP domain, the business rule will be accessible to record operations in child domains such as the ACME domain because process separation allows access to records from parent domains.

Flows that call another application such as a decision table or workflow also run from the current user domain context.

**Flow Designer runs all flows whose trigger conditions are met**

A flow in one domain cannot override or prevent a flow from another domain from running. Flow Designer runs any flow that is visible to the current user and whose trigger conditions have been met. For example, a flow belonging to the TOP domain that is triggered by the creation of an incident record runs anytime an incident is created, regardless of whether the incident is created in the ACME or INITECH child domains.

**Design considerations**

Follow these design considerations when using domain separation with Flow Designer.

**Have a Service Provider (SP) administrator in the TOP domain author and manage tenant flows, actions, and subflows**

Since tenants cannot override Flow Designer content, an SP administrator from the TOP domain must author and manage them to ensure they run properly for all domains. While you can create domain-specific flows, be aware that users working from domains higher in the hierarchy may trigger multiple child domain flows. For example, a user working in the TOP domain can trigger flows in child domains such as ACME and INITECH.

**Note:** Flow authors can see only Flow Designer content available from their current domain and any parent domains in the hierarchy. Flow Designer does not display content visible from Contains domains.

**Provide a unique name for each flow, action, and subflow**

Since all domains share the same Flow Designer content, have an SP administrator in the TOP domain uniquely name each flow, action, and subflow to ensure that a flow intended for one domain does not duplicate the name of a flow in another domain. For example, add the domain to the flow name such as Validate incidents - TOP, Validate incidents - ACME, and Validate incidents - INITECH.

**Ensure flows and actions only contain artifacts available from the current or parent domains**

Flow Designer prevents the activation of any flow containing artifacts unavailable to the current or parent domains. For example, if you create a domain-specific flow that belongs to the ACME domain, it cannot contain actions or subflows belonging to the sibling domain INITECH.

**Edit Flow Designer content in the domain to which it belongs**

While users in a parent domain can see flows, actions, and subflows in a child domain, they must edit them in the domain they belong to. For example, an administrator in the TOP domain can see flows from the ACME domain but must switch to the ACME domain to edit it.
User access to Flow Designer

Administrators can grant users access to Flow Designer by assigning delegated development permissions or directly assigning a user role.

Access by delegated development permissions

Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer delegated development permission. Delegated development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. See Developer and deployment permissions.

Access by user roles

Administrators can also grant access to Flow Designer by directly assigning users the flow_designer user role, which includes the role to view flow execution details.

Warning: Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer can run flows as the System user, which has access to all tables and all database operations.

Flow Designer roles

Grant users one or more Flow Designer roles to enable them to create flows and subflows, to see flow execution details, and to create actions.

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>flow_designer</td>
<td>Enables a user to launch the Flow Designer design environment to create and edit flows and subflows.</td>
<td>flow_operator</td>
</tr>
<tr>
<td>flow_operator</td>
<td>Enables a user to view flow execution details, dashboards, and logs. Administrators can grant this role to users they want to be able to view flow results but not create, change, or test them.</td>
<td>none</td>
</tr>
<tr>
<td>action_designer</td>
<td>Enables a user to launch the Action Designer design environment to create and edit actions.</td>
<td>none</td>
</tr>
</tbody>
</table>

API access to Flow Designer

Application developers can access Flow Designer functionality through APIs for flows, subflows, and actions. Flow designers can enable individual flows, subflows, and actions to be client callable during design.
Available Flow Designer APIs

Trigger flows, subflows, and actions using these APIs from server or client scripts.

Server side

**FlowAPI**: Trigger a flow, subflow, or action using synchronous or asynchronous methods, with or without execution details.

Client side

**GlideFlow**: Perform client-side interactions with actions, flows, and subflows. Flow designers must enable a flow, subflow, and action to be called from the client.

FlowAPI quick methods

Use quick methods in the *FlowAPI* class to run an action, flow, or subflow from a server-side script without creating execution details or other related records. Use these methods to increase the speed of high-volume processing in a production environment, and to improve performance by eliminating record-keeping overhead. Methods include:

- `executeActionQuick()`, `executeFlowQuick()`, `executeSubflowQuick()`: Run an action, flow, or subflow from a server-side script synchronously from the current user session.
- `startActionQuick()`, `startFlowQuick()`, `startSubflowQuick()`: Run an action, flow, or subflow from a server-side script asynchronously.

Client callable APIs

By default, the flows, subflows, and actions can only be called by the FlowAPI within a server script. Flow and action designers can make individual flows, subflows, or actions available to client calls by enabling the **Client callable** option during design.

Code snippets

Application developers can generate a JavaScript function that calls a specific flow, subflow, or action with the **Code Snippet** option. Use the code snippet in scripts such as business rules or the **Scripts - Background** module to call specific Flow Designer elements. The system only generates code snippets for published flows, subflows, and actions. Flow Designer elements in the draft or modified status do not generate code snippets.

Create code snippets for flows, sub-flows, and actions

Generate a code snippet to call a specific flow, subflow or action.

- Role required: flow_designer or admin
- Activate the flow or subflow you want to call.
- Publish the action you want to call.

1. Navigate to **Flow Designer > Designer**.
2. Open a flow, subflow, or action.
3. Click the **More Actions** icon in the upper right corner of the flow designer.
4. Select **Code Snippet**.
Create a client callable flow, subflow, or action

Enable a client script to trigger a flow, subflow, or action.

- Role required: security_admin
- Consider the implications of making a flow, subflow, or action client callable, such as whether it exposes protected data or bypasses validation logic.

By default, the flows, subflows, and actions can only be called by the FlowAPI within a server script. Flow and action designers can make individual flows, subflows, or actions available to client calls by enabling the Client callable option during design.

1. Elevate privileges to security_admin.
3. Click New.
4. Create an access control.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>client_callable_flow_object</td>
</tr>
<tr>
<td>Operation</td>
<td>create</td>
</tr>
<tr>
<td>Admin overrides</td>
<td>Selected</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a name for the ACL</td>
</tr>
<tr>
<td>Requires role</td>
<td>Create a role to provide access to the APIs. For example, create a flow_api_access role.</td>
</tr>
</tbody>
</table>

5. Assign the role to the user you would like to grant access to.
6. Enable a client script to trigger the flow, subflow, or action.
   a) Open the flow, subflow, or action you want to make client callable.
   b) In the More Actions menu, select Manage security.
   c) Select Callable by Client API.
   d) Add the access control record created earlier to the ACLs field.
   e) Click Update.

The user with the designated permissions can trigger a client callable flow, subflow, or action from a client script using the GlideFlow API.

Spokes

Add application-specific content to Flow Designer by installing spokes.

A spoke is a scoped application containing Flow Designer content dedicated to a particular application or record type. For example, the ITSM Spoke contains actions for managing Task records such as the Create Task action. Spokes are activated when their parent application is activated. For example, the ITSM Spoke is activated when the Incident, Problem, and Change applications are activated. Creating a spoke requires familiarity with application development as developers must add Flow Designer content to a scoped application.
<table>
<thead>
<tr>
<th>Spoke</th>
<th>Description</th>
<th>Plugin</th>
<th>Included with</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Benchmarks Spoke</strong></td>
<td>Provides read-only actions for the read-only Benchmark Recommendation Evaluator flow.</td>
<td>(com.sn_bm_client.spoke)</td>
<td>Benchmarks application.</td>
</tr>
<tr>
<td><strong>Connect speak</strong></td>
<td>Provides actions to automate the creation of conversations, to add users to a conversation, and to send messages to a conversation. These actions work with Connect API version 3 and later.</td>
<td>(com.glide.connect_v3plus.core.ah)</td>
<td>Now Platform</td>
</tr>
<tr>
<td><strong>Customer Service Spoke</strong></td>
<td>Provides actions for flow designers to use when creating Customer Service Management business processes.</td>
<td>(com.snc.customer_service.spoke)</td>
<td>Customer Service Management application</td>
</tr>
<tr>
<td><strong>External Related Files spoke</strong></td>
<td>The External Related Files spoke stores information about files in third-party systems and helps you manage the information.</td>
<td>(com.sn.external.files)</td>
<td>Now Platform</td>
</tr>
<tr>
<td><strong>Field Service Spoke</strong></td>
<td>Provides actions for flow designers to use when creating Field Service Management business processes.</td>
<td>(com.snc.field_service.spoke)</td>
<td>Field Service Management application</td>
</tr>
<tr>
<td><strong>ITSM spoke</strong></td>
<td>Provides flow and actions associated with ITSM. Requires the ITSM application suite.</td>
<td>(com.snc.itsm.spoke)</td>
<td>IT Service Management application</td>
</tr>
<tr>
<td><strong>Visual Task Board (VTB) Spoke</strong></td>
<td>Provides VTB actions for flow designers to manage the boards, lanes, cards, board members, and assignees.</td>
<td>(com.glide.ui.vtb.ah)</td>
<td>Now Platform</td>
</tr>
</tbody>
</table>

Additional spokes are available with an IntegrationHub subscription. To see a list of IntegrationHub spokes, see IntegrationHub available spokes. For more information about requesting an IntegrationHub subscription, see Request IntegrationHub.
### Benchmarks Spoke

Provides read-only actions for the read-only Benchmark Recommendation Evaluator flow. The Benchmarks Spoke is designed for the Recommendations feature of the *Benchmarks* application.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Recommendation Activity Records</td>
<td>Create or update recommendation activity records.</td>
<td>• Recommendation</td>
<td>N/A</td>
</tr>
<tr>
<td>Delete Recommendation Evaluations</td>
<td>Delete recommendation evaluations for the specified month.</td>
<td>• Activity record</td>
<td>N/A</td>
</tr>
<tr>
<td>Evaluate Recommendation Condition</td>
<td>Evaluate the conditions and script specified for the recommendation.</td>
<td>• Record count • Threshold • Direction • Recommendation • Activity record</td>
<td>• Result • Score</td>
</tr>
</tbody>
</table>

### Connect Spoke

Provides actions to automate the creation of conversations, to add users to a conversation, and to send messages to a conversation. These actions work with Connect API version 3 and later.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Group Users to Task Conversation</td>
<td>Create a task conversation, and add all users of a group to it.</td>
</tr>
<tr>
<td>Add User to Task Conversation</td>
<td>Create a task conversation, and add a user to it.</td>
</tr>
<tr>
<td>Send Message to Task Conversation</td>
<td>Send a message to all users of a task conversation.</td>
</tr>
</tbody>
</table>

### Customer Service Spoke

Provides actions for flow designers to use when creating Customer Service Management business processes. Requires the Customer Service Management (com.sn_customerservice) plugin.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Case</td>
<td>Retrieve a case record using the case number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Case</td>
<td>Create a case using one or more attributes. This action mimics the structure of the Case table (sn_customerservice_case) and exposes the fields present on the Case table.</td>
</tr>
<tr>
<td>Create Quick Case</td>
<td>Create a case using the customer, description, channel, priority, and category attributes.</td>
</tr>
<tr>
<td>Create Task on Case</td>
<td>Create a case task and optionally associate it with a case.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Update Case</td>
<td>Update a case by providing the case reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Assign Case</td>
<td>Assign a case using matching rules. To use this action, you must first define the matching rules that match cases with resources (assignment groups, agents).</td>
</tr>
<tr>
<td>Escalate Case</td>
<td>Request case escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Escalate Account</td>
<td>Request account escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a case or case task).</td>
</tr>
<tr>
<td>Add Comment to Task</td>
<td>Add a comment to a task or to task extended objects (for example, a case or case task).</td>
</tr>
</tbody>
</table>

**External Related Files spoke**

The External Related Files spoke stores information about files in third-party systems and helps you manage the information.

**External Related Files spoke tables**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>External Provider (sn_ext_files_spoke_provider)</td>
<td>Stores information about the external provider. For example, Box or DocuSign services.</td>
</tr>
<tr>
<td>External Related Files (sn_external_related_files)</td>
<td>Stores metadata information about the files in third-party systems. This table is extensible.</td>
</tr>
</tbody>
</table>

**Note:** If you extend the table, ensure that you perform the data separation for the scoped applications

- To store metadata information of files in a specific third-party system, create a table with a column that contains a reference field to the External Related Files table. For more information about reference fields, see reference field type.
- To establish a relationship between a specific ServiceNow table and External Related Files table, create defined related lists.
### External Related Files spoke actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create External File Record</td>
<td>Creates a record in the External Related Files table.</td>
</tr>
<tr>
<td>Update External File Record</td>
<td>Updates a record in the External Related Files table.</td>
</tr>
<tr>
<td>Delete External File Record</td>
<td>Deletes a record in the External Related Files table.</td>
</tr>
</tbody>
</table>

### External Related Files spoke user roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_ext_files_spoke.doc_reader</td>
<td>Read records in the External Related Files and External Provider tables.</td>
</tr>
<tr>
<td>sn_ext_files_spoke.file_admin</td>
<td>• Read, update, and delete records in the External Related Files table.</td>
</tr>
<tr>
<td></td>
<td>• Read records in the External Provider table.</td>
</tr>
<tr>
<td>sn_ext_files_spoke.provider_admin</td>
<td>Read, update, and delete records in the External Provider table.</td>
</tr>
</tbody>
</table>

### Field Service Spoke

Provides actions for flow designers to use when creating Field Service Management business processes.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Work Order</td>
<td>Retrieve a work order record using the work order number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order</td>
<td>Create a work order and optionally associate it with a case.</td>
</tr>
<tr>
<td>Update Work Order</td>
<td>Update a work order by providing the work order reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Get Work Order Task</td>
<td>Retrieve a work order task record using the work order task number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order Task</td>
<td>Create a work order task and optionally associate it with a work order.</td>
</tr>
<tr>
<td>Update Work Order Task</td>
<td>Update a work order task by providing the work order task reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a work order or work order task).</td>
</tr>
</tbody>
</table>
## ITSM spoke

Provides flow and actions associated with ITSM. Requires the ITSM application suite.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Comment</td>
<td>Adds a comment to a task record.</td>
</tr>
<tr>
<td>Add Worknote</td>
<td>Adds a work note to a task record.</td>
</tr>
<tr>
<td>Assign Incident to CI Support Group</td>
<td>Updates an incident record to assign it to the CI Support Group.</td>
</tr>
<tr>
<td>Create Catalog Task on Request</td>
<td>Creates a Catalog Task record from a Request record.</td>
</tr>
<tr>
<td>Create Catalog Task on Request Item</td>
<td>Creates a Catalog Task record from a Request Item record.</td>
</tr>
<tr>
<td>Create Change Task on Change Request</td>
<td>Creates a Change Task record from a Change Request record.</td>
</tr>
<tr>
<td>Create Emergency Change Request</td>
<td>Creates a Change Request record of type Emergency.</td>
</tr>
<tr>
<td>Create Emergency Request from Incident</td>
<td>Creates a Change Request record of type Emergency from an Incident record.</td>
</tr>
<tr>
<td>Create Incident</td>
<td>Creates an Incident record.</td>
</tr>
<tr>
<td>Create Incident Task on Incident</td>
<td>Creates an Incident Task record from an Incident record.</td>
</tr>
<tr>
<td>Create Normal Change Request from Incident</td>
<td>Creates a Change Request record of type Normal from an Incident record.</td>
</tr>
<tr>
<td>Create Outage</td>
<td>Creates a cmdb_ci outage record for a configuration item. The Task field is populated only if the source is a task record. If the source is non-task record such as an alert record, the Task field is empty.</td>
</tr>
<tr>
<td>Create Problem from Incident</td>
<td>Creates a Problem record from an Incident record.</td>
</tr>
<tr>
<td>Create Request</td>
<td>Creates a Request record.</td>
</tr>
<tr>
<td>Create Standard Change Request</td>
<td>Creates a Change Request record of type Standard.</td>
</tr>
<tr>
<td>Create Task</td>
<td>Creates a child task record for a Task table record. For example, creates an Incident Task record for an Incident record.</td>
</tr>
<tr>
<td>Create Task Outage Relationship</td>
<td>Creates a Task Outage Relationship record where cmdb_ci outage record and task record are inputs to the action.</td>
</tr>
<tr>
<td>Create Standard Change Request from Incident</td>
<td>Creates a Change Request record of type Standard from an Incident record.</td>
</tr>
<tr>
<td>Update Assignee</td>
<td>Updates the Assigned to field of a Task table record.</td>
</tr>
<tr>
<td>Update Assignment Group</td>
<td>Updates the Assignment Group field of a Task table record.</td>
</tr>
</tbody>
</table>
**Security Operations spoke**

**Security Incident Response flow templates**

The Security Incident Response flow templates are created using the Flow Designer.

![Note: Each of the flows is triggered when the Category in a security incident is set or changed.](image)

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Incident Confidential Data Exposure flow template</td>
<td>Perform a series of tasks designed to handle the exposure of sensitive data.</td>
</tr>
<tr>
<td>Security Incident Denial of Service flow template</td>
<td>Perform a series of tasks designed to handle Denial of Service (DOS) attacks.</td>
</tr>
<tr>
<td>Security Incident Lost Equipment flow template</td>
<td>Perform a series of tasks designed to handle lost equipment.</td>
</tr>
<tr>
<td>Security Incident Malicious Software flow template</td>
<td>Perform a series of tasks designed to handle malicious software on your network.</td>
</tr>
<tr>
<td>Security Incident Phishing flow template</td>
<td>Perform a series of tasks designed to handle spear phishing emails on your network.</td>
</tr>
<tr>
<td>Security Incident Policy Violation flow template</td>
<td>Perform a series of tasks designed to handle security policy violations.</td>
</tr>
<tr>
<td>Security Incident Reconnaissance flow template</td>
<td>Perform a series of tasks designed to handle reconnaissance on your network.</td>
</tr>
<tr>
<td>Security Incident Rogue Server or Service flow template</td>
<td>Perform a series of tasks designed to handle activity from rogue servers or services affecting your network.</td>
</tr>
<tr>
<td>Security Incident Spam flow template</td>
<td>Perform a series of tasks designed to handle email spam on your network.</td>
</tr>
<tr>
<td>Security Incident Unauthorized Access flow template</td>
<td>Perform a series of tasks designed to handle unauthorized access to your network.</td>
</tr>
<tr>
<td>Security Incident Web/BBS Defacement flow template</td>
<td>Perform a series of tasks designed to handle vandalism directed against one of your BBS or web sites.</td>
</tr>
</tbody>
</table>

**Visual Task Board (VTB) Spoke**

Provides VTB actions for flow designers to manage the boards, lanes, cards, board members, and assignees.
## Board Management Actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Freeform VTB</td>
<td>Creates a Freeform VTB for any task type. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane</td>
<td>• Name&lt;br&gt;• Board Owner&lt;br&gt;• Default view&lt;br&gt;• Label visibility&lt;br&gt;• Picker visibility&lt;br&gt;• Background color</td>
<td>• Board record</td>
</tr>
<tr>
<td>Action</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create Flexible VTB</td>
<td>Creates a Flexible VTB bound to a single Task table. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane</td>
<td>• Name&lt;br&gt;• Task table&lt;br&gt;• Filter&lt;br&gt;• Board Owner&lt;br&gt;• Default view&lt;br&gt;• Label visibility&lt;br&gt;• Picker visibility&lt;br&gt;• Background color</td>
<td>• Board record</td>
</tr>
<tr>
<td>Action</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Create Guided VTB</td>
<td>Creates a data-driven VTB bound to a single Task table along with the fields the lanes are derived.</td>
<td>• Name&lt;br&gt;• Task table&lt;br&gt;• Land field&lt;br&gt;• Filter&lt;br&gt;• Board Owner&lt;br&gt;• Default view&lt;br&gt;• Label visibility&lt;br&gt;• Picker visibility&lt;br&gt;• Background color</td>
<td>• Board record</td>
</tr>
<tr>
<td>Action</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Add VTB Member</td>
<td>Add a user to a VTB. Only members of the VTB can access the board. Any VTB member can add other members.</td>
<td>• Board record&lt;br&gt;• User record</td>
<td>N/A</td>
</tr>
<tr>
<td>Action</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Remove VTB Member</td>
<td>Remove a user from a VTB. Only members of a VTB can access the board. Any VTB member can remove other members.</td>
<td>• Board record&lt;br&gt;• User record</td>
<td>N/A</td>
</tr>
</tbody>
</table>

## Lane Management Actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add VTB lane</td>
<td>Add a lane to a Freeform or Flexible VTB. This action does not apply to Guided boards, which are constrained to fixed lanes based on fields configured.</td>
<td>• Board record&lt;br&gt;• Lane name</td>
<td>VTB lane record</td>
</tr>
<tr>
<td>Rename VTB Lane</td>
<td>Rename an existing lane on a Freeform or Flexible VTB.</td>
<td>• Lane record&lt;br&gt;• New lane name</td>
<td>N/A</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reorder VTB Lane</td>
<td>Reorder lanes on any VTB.</td>
<td>• Lane record</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• New lane name</td>
<td></td>
</tr>
<tr>
<td>Delete VTB Lane</td>
<td>Delete an existing lane from a Freeform or Flexible VTB.</td>
<td>• Lane record</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Card Management Actions**

<table>
<thead>
<tr>
<th>Flow/Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create VTB Card</td>
<td>Create a VTB card on a Freeform board for a task.</td>
<td>• Lane record</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Task record</td>
<td></td>
</tr>
<tr>
<td>Assign VTB Card</td>
<td>Assign a user to a VTB card.</td>
<td>• Card record</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• User record</td>
<td></td>
</tr>
<tr>
<td>Move VTB Card</td>
<td>Move a VTB card from one lane to another lane.</td>
<td>• Card record</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Lane record</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** For Flexible boards, use the Update Record action to change the state of the underlying task. For Guided boards, this action changes the field on the task associated with that card.

| Remove Assignee from VTB Card | Remove an assignee from a card.                                    | • Card record                         | N/A   |

### Create a natural language title

Create a flow, subflow, or action title with styled and dynamic text.

Role required: admin, flow_designer, or action_designer

1. Navigate to **Flow Designer > Designer**.
2. On the Flow Designer landing page, click **New** and then select **New Flow, New Subflow**, or **New Action** from the list.
3. In the Flow Designer main header, click the more actions icon (…).
4. Click **Manage natural language title**.
5. On the Natural Language Title screen, enter a title.
   a) Use any combination of the following options to create a styled title:
<table>
<thead>
<tr>
<th>Text style</th>
<th>Example input for natural language title</th>
<th>Example output in Flow Designer environment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bold</td>
<td>A &quot;bold&quot; title</td>
<td>![Image of &quot;now&quot; logo]</td>
</tr>
<tr>
<td>Italic</td>
<td>An <em>italic</em> title</td>
<td>![Image of &quot;now&quot; logo]</td>
</tr>
<tr>
<td>Underline</td>
<td>An <del>underlined</del> title</td>
<td>![Image of &quot;now&quot; logo]</td>
</tr>
<tr>
<td>Strikethrough</td>
<td>A <del>strikethrough</del> title</td>
<td>![Image of &quot;now&quot; logo]</td>
</tr>
<tr>
<td>Title (bold and colored)</td>
<td>A #titled# title</td>
<td>![Image of &quot;now&quot; logo]</td>
</tr>
</tbody>
</table>

b) Add dynamically generated text for your title from an input, output, action, or action step by clicking the data pill picker (±) and selecting the input, output, action, or action step that you want to include in your title.
6. Click Submit.

When you add your action or subflow with a natural language title to a flow, the title appears in the Flow Designer environment.

**Instance Data Replication (IDR)**

Instance Data Replication (IDR) copies data updates from one instance to one or more other instances. IDR enables you to maintain consistent data across different organizations in your company.

IDR provides a one-to-many replication, which enables one instance to propagate data across different departments and business units to keep data in sync. With IDR, you can also modify data during replication. For example, you could localize the data during replication.
Benefits

- Data is automatically replicated to one or more other instances.
- Data can be *modified and mapped to any table and table column* on other instances. For example, you can modify and map table columns to localize data for different locales.
- Data that is updated on consumer instances can be *replicated to the producer instance.*
Data, such as problem requests, can be given on consumer instances to third parties. The third parties can update the problem issue and return it to the consumer instance. The data can then be updated on the producer instance.

- Business rules can trigger post-replication workflows, such as generating notifications or validating the replication.
- Data that is in transit during a crash is recoverable.

How Instance Data Replication works

You use the Instance Data Replication plugin to replicate data updates on one instance, called the **producer instance**, to one or more other instances, called **consumer instances**.

By configuring a **producer replication set**, you can specify the tables and table columns on the producer instance to replicate. When you configure a **consumer data set**, you can specify the tables and table columns on the consumer instances that receive the producer replication set data.

Next, you **activate** both producer and consumer replication sets to turn on the IDR functionality. The data that is updated in a producer replication set automatically updates the corresponding data in the consumer replication sets.

**Syncing** the producer and consumer replication sets requires that you do a one-time download called **seeding** of all the producer replication set data to the consumer instances. You can initiate seeding requests on a consumer instance while you are activating a consumer replication set. After seeding, your future replications involve data updates only. An audit trails contain a history of those record updates.

By default, the table data on a producer instance goes into the tables of the same name on consumer instances. **Transformation** is the process of replicating producer data in differently named tables or table columns on consumer instances.

**IDR adapters** modify data before storing it on consumer instances. Adapters perform string and mathematical operations, such as converting one currency to another, or converting one time zone to another.
Warning: IDR overwrites data on instances and can replicate sensitive data. Given the potential for data loss and data exposure, test your IDR implementation in a pre-production environment.

Producer and Consumer instance data replication delays

After IDR has been set up on the producer instance, a job (IDRProducerJob) runs on producer instances to detect data updates. When there are updates to replicate, the producer instance sends the updates to consumer instances.

The IDRConsumerJob runs on the consumer instances to detect the data updates from a producer. When IDRConsumerJob finds updates, it updates the data in consumer tables.
It takes some time for the data updates in a producer replication set to appear in consumer replication sets. You can look on the monitoring dashboard to see how long data updates move from a producer replication set to consumer replication sets.

If you have significant data delays, contact ServiceNow Technical Support.

**Domain separation**

IDR runs in ServiceNow datacenters only. It functions at the data level so IDR does not explicitly support domain separation. Data moves from a producer instance to a consumer instance without regard to which domain the instance is in. However, you can use business rules to convert from one domain to another. For more information, see *About Before Query business rules*.

**When not to use IDR**

- Do not use IDR to clone instances.
  - IDR does not replicate metadata tables, child metadata tables, and most user and system tables. IDR is designed to replicate data, not clone instances.
- Do not use IDR if your use case breaks any of the following IDR limitations:
  - Replication must not take longer than seven days to complete.
  - Initial seeding of the tables must be less than 3 million records per replication set.
  - Producer and consumer instances must be in the same geographic region.

**What to do next**

Get an overview of *setting up IDR*.

**Request an Instance Data Replication (IDR) subscription**

The Instance Data Replication (IDR) plugin requires a separate subscription and must be activated by ServiceNow personnel.

Role required: admin

London is the earliest version that supports IDR. The IDR plugin ID is com.glide.idr. When purchasing an IDR subscription, ServiceNow personnel also activate the following plugins that IDR depends upon:

- com.snc.db.data_replicate
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

1. From your instance, navigate to **System Definition > Plugins**.
2. On the All Applications page, click **Request Plugin** to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>would like this plugin to be</td>
<td></td>
</tr>
<tr>
<td>enabled</td>
<td></td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are</td>
</tr>
<tr>
<td></td>
<td>activating the plugin. For example, if you need the plugin activated at</td>
</tr>
<tr>
<td></td>
<td>a specific time instead of during one of the default activation windows,</td>
</tr>
<tr>
<td></td>
<td>specify it in the comments.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

5. Click Submit.

Create and activate a producer replication set.

Set up Instance Data Replication (IDR)

IDR requires a separate subscription and only ServiceNow can install the plugin. After the plugin activates, you can configure the producer and consumer instances.

Role required: admin

1. *Request that ServiceNow install* the IDR plugin.
2. *Create and activate a producer replication set.*
   - The producer replication set specifies the tables and table columns that you want to replicate to one or more consumer instances.
3. *Create and activate one or more consumer replication sets and request data from the producer.*

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The consumer replication set specifies the tables and table columns on consumer instances that receive producer data updates. The replicated data overwrites the corresponding consumer instance data. Consumers must apply to producers to receive the replication data.

4. **Approve or deny consumer requests** to access replication data on your producer instance to access the replication data.

   ![Note: You must have the producer replication admin role to approve or deny consumer requests.]

5. Optional: **Map replicated data into different tables or table columns** on consumer instances.

6. Optional: **Modify records** during replication.
   As an example, you might change time zone or currency records to make them appropriate for a different geographic region.

7. Optional: Set up **bi-directional replication**.

---

**Create a producer replication set in Instance Data Replication (IDR)**

You can use a producer replication set to specify the tables and table columns to replicate on consumer instances.

- **Purchase an IDR subscription** and have ServiceNow personnel install the IDR plugin.
- Verify that the producer and consumer instances are in the same geographic region and belong to the same customer.
- Role required: idr_admin or admin

Seeding is the initial download of all the records in the producer replication set to the tables in the consumer replication set. After seeding, IDR only replicates data updates. The seeding limitations are:

- The maximum record size is 32 MB.
- The maximum seeding size is 3 million records.

   ![Note: If your replication set contains more than 3 million records, seeding cannot start. To fix this situation, break the replication set into multiple replication sets with fewer records in each.]

- The maximum seeding time is 7 days.
1. On the producer instance, navigate to **Instance Data Replication > Producer Replication Sets** and click **New**.
2. Fill in the following fields and click **Submit**.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Names can only contain alphanumeric characters and hyphens.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The consumer replication set must have the same name as the producer replication set, so the name should not be producer-specific.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of the replication set.</td>
</tr>
<tr>
<td>Entry Set</td>
<td>A set of replication entries. You can choose an existing entry set if you imported as an update set from another instance or you created earlier on your instance.</td>
</tr>
</tbody>
</table>

In the Producer Replication Set form, the system auto-generates the producer ID, which you can’t edit. The **Producer ID** field identifies the producer instance in the system.
3. Optional: Select the **Require Consumer Sync** option to enable bidirectional replication on consumer instances.
Bidirectional replication replicates changes that are made directly on consumer instances back to the producer instance. For bidirectional replication to happen, the consumer replication set must synchronize the configuration changes. Bidirectional replication only works for records that originated on the producer. For more information, see Bidirectional replication.

4. Identify the table and the table columns to include in the replication set:
   a) On the Replication Entries tab, click New.
b) In the **Source Table name** field, select one of the tables on the producer instance to replicate.
   For example, select **Incident**.

c) Optional: Select the **Include Attachments** option to replicate files that are associated with the records that are being replicated.
d) Optional: Click Add Filter Condition and select filter criteria in the Filter section to prevent a group of records in a selected table from being replicated. For example, you might want to replicate only active records. In that case, select Active in the – choose field – list, Is in the – oper – list, and True in the – value – list. If you do not use a filter, all the fields in the producer replication set table appear in the Available column.

Note: The Available column contains the fields in the Source Table that you specified. That table may not contain the Active field.

e) In the Included Fields columns, use the arrows to move table fields into the Selected column to replicate them or into the Available column to prevent replicating them, and then click Submit.
5. Repeat step 4 for each table that you want to include in the replication set.

Note: Some fields, such as SYS ID (Mandatory), must be replicated. Other fields, such as Edge Encrypted and Password1, can't be replicated and do not appear in either column.
6. Click **Activate**.

   Replication can’t happen until you link the producer replication set to one or more consumer replication sets. Activation just makes the producer data available for replication.

7. Click the **Replication Setup Instructions** related link to view the information and close the modal.

   The Replication Setup Instructions modal shows important configuration information that you use to associate this producer instance with its consumer instances.

8. Click the **Notification Configuration** related link and configure who receives replication notifications.

   a) On the **When to send** tab, specify the conditions for sending a notification.

   b) On the **Who will receive** tab, specify who receives the notifications.

      The fields that appear on the tab vary with the **Send when** value:

      - **Record inserted of updated**—The Updated and Inserted options, when selected, send notifications when records are updated or inserted.

      - **Event is fired**—The Event Name specifies the event type that sends the notification.

      - **Triggered**—A notification is sent when triggered by a Flow Designer flow. For more information, see [Flow Designer](#).

      The Updated and Inserted options, when selected, send notifications when records are updated or inserted.

   c) On the **What it will contain** tab, specify the notification content.

   d) Click **Update**.

   The producer is ready to send the data that is specified in the replication set to one or more consumer instances.

   **Note:** If you believe that a consumer set should no longer receive replication data, you can revoke the consumer set’s access.

   - Create and activate a consumer replication set.

   - Grant access to replication data.

   After creating a consumer replication set, you must ask for permission to receive the producer’s replication data. See [Grant access to replication data](#) to see how to grant or deny access.

---

**Create a consumer replication set for Instance Data Replication (IDR)**

You can use a consumer replication set to specify the tables and columns on a consumer instance that receives the producer data.

- **Create and activate a producer replication set.**

- Make sure that the producer and consumer instances are in the same geographic region and belong to the same customer.

- Role required: idr_admin or admin

Create a consumer replication set and link it to a producer replication set. The data from the producer replicates into the tables and table columns of the same name on the consumer
instance. The administrator of the producer replication set must grant the consumer instance access to the replication data.

If the producer replication set administrator generates a new encryption key, the encryption key value that is stored in the consumer replication set may not automatically update. If not, replication stops. To restore access, see *Restore access to replication data.*

1. On a consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets.**
2. Click **New** and fill out the Consumer Replication Set form:

   **Required Consumer Replication Set fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Producer Instance URL</td>
<td>Name of the consumer replication set.</td>
</tr>
<tr>
<td>Producer Replication Set Name</td>
<td>Unique ID for the created producer replication set. Access from the producer administrator.</td>
</tr>
<tr>
<td>Description</td>
<td>Unique ID for the created producer replication set. Access from the producer administrator.</td>
</tr>
</tbody>
</table>

3. Click **Submit.**
   The list of all consumer replication sets appears. A request is sent to the producer replication set administrator to approve or deny your request for a shared encryption key.

   **Warning:** Do not change any of the values.

4. In the list of all consumer replications sets, click the replication set.
   The Consumer Replication Set displays the replication set information.
The Consumer Approval Status shows as Approval Pending. The producer administrator must approve your request to be a consumer.

Note: If you receive an error that your encryption key does not work, call ServiceNow Technical Support.

5. Wait until the producer administrator approves the request. The Consumer Approval Status changes to Approved. For more information, see Grant access to replication data.

6. After you receive confirmation, click the Synchronize Replication Configuration related link. If you do not see this option, refresh the page. A modal confirms the synchronization. The tables that are selected for replication in the producer replication set are replicated in the consumer replication set and appear on the Consumer Replication Entries tab. The initial seeding of all the table data may take some time. In the future, only data updates are replicated to consumer replication sets. For more information about seeding, see Seed a consumer instance.

7. Click the Notification Configuration related link and configure who receives replication notifications.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When to send</td>
<td>Specify the trigger for sending a notification.</td>
</tr>
<tr>
<td>Who will receive</td>
<td>Specify who receives the notifications.</td>
</tr>
<tr>
<td>What it will contain</td>
<td>Specify the notification content.</td>
</tr>
</tbody>
</table>

8. Click Update.

9. Activate the consumer replication set by selecting the option next to the replication set that you want to activate. Then, on the Consumer Replication Entries tab, click one of the following buttons:

- **Activate with Seeding** — Makes the replication set ready to take producer updates and replicates the current records (only) specified in the producer replication set.
- **Activate with Seeding (Include History)** — Same as Activate with Seeding but also replicates the entire history of record updates.

With both seeding options, IDR generates audit trails of all record updates. If you encounter an error during seeding, see Fix seeding errors. For more information about seeding, see Seed a consumer instance.

Note: Activate without Seeding under Related Links makes the replication set ready to take producer updates but does not download any data from the producer. Do not use this option when setting up replication. Always start with seeding the consumer instance. Use this option, for example, after updating the producer’s ID, producer set ID, or encryption key.

10. Optional: Cancel a seeding request:
    a) On the Seeding Requests tab, click a seeding request.
    b) On the Seeding Request form, click Cancel.

11. Optional: On the Consumer Replication Entries tab, click a source table name to modify the behavior of the consumer.
    a) On the Consumer Replication Entry form, select the Preserve Modified By option to add the name of a user to an Activities entry.
Preserve Modified By preserves the name of the person who updated a field of type Activity in a record. For example, the Work Notes field is of type Activity in change request records. When someone updates a change request, the work note moves into the Activities stream. If the option is unselected, the Activities entry attributes the update to Instance Data Replication in consumer records. With the option selected, the person who updated the change request is identified in the entry and IDR is prepended to their name. The following image shows two Activities entries. A name is attached to one entry to demonstrate that the Preserve Modified By option was selected.

b) Select the Run Business Rule option to run business workflows after a replication.

A business rule is a server-side script that is associated with a table. Use business rules to trigger workflows that are associated with replications, such as sending a notification or validating the replicated data. For more information, see Trigger workflows after replication.

c) Click Enable Transform to replicate the data from the producer tables into tables of different names on the consumer instance.

For more information, see Transform replication data.

d) Click Update.

The consumer instances contain, at a minimum, the current data in producer replication set tables. The consumer instances are now ready to accept replicated data updates. By default,
the data in producer tables is replicated into tables and table columns of the same name on
the consumer instances. Transform replicated data describes how to map the data into different
tables and table columns, and how to modify the data as it is replicated.

- Map the replication data to different tables on the consumer instance.
- Modify the values during replication.
- Set up business rules to trigger post-replication workflows.

Reconfigure a replication set in Instance Data Replication (IDR)

Reconfigure replication sets on the producer instance if you need to change or update your
original replication set.

Role required: idr_admin or admin

After activating a revised producer replication set, update the producer replication set's name,
shared key, producer ID, and producer set ID on each consumer instance.

Note: Make sure that a seeding request is not in progress before you reconfigure a
producer instance. Check the consumer replication sets seeding requests status.

1. Reconfigure a producer instance:
   a) On the producer instance, navigate to Instance Data Replication > Producer Replication
      Sets.
   b) Select a producer replication set and make one or more of the following changes to the
      set:
      - On the Replication Entries tab, click New to add a table to the set.
      - On the Replication Entries tab, click a replication set. In the Replication Entry form,
        modify the columns that are included in the replication set, and click Update.
      - On the Replication Entries tab, click a replication set and click Delete to remove the
        table from the replication set.
      - Click Generate New Shared Key to change the shared encryption key.

      You only generate new shared keys when you discover that they have been
      compromised or if you want to stop sending data to a consumer. After changing
      the encryption key on the producer instance, consumers that have the Consumer
      Approved Status of Denied must reapply for access to the producer replication set. For
      more information, see Grant access to replication data.

      These changes stop replication and produce this status message on the consumer
      instance: ‘Producer Replication Set configuration has been modified.’ On the consumer
      instance, click Synchronize Replication Configuration and then click Activate with
      Seeding.

2. To update consumers with the changes that were made on the producer, on each consumer
   instance, navigate to Instance Data Replication > Consumer Replication Sets and click
   the consumer replication set that you want to update. The status of the replication set is
   Replication Error. See the following table to learn what action to take according to the status
   message.
Status Message | What to do
--- | ---
Approval was denied by producer instance. | The producer changed the shared key and this consumer's access to the replication data was revoked. Replication stops. Click the Request shared key related link. The producer must approve your request. For more information, see Grant access to replication data. If the consumer's access was not revoked, replication continues. Nothing needs to be done on the consumer instance.
Producer Replication Set configuration has been modified. | The producer added or subtracted tables or table columns in the producer replication set. Replication stops. Click Synchronize Replication Configuration and then click Activate with Seeding. If the producer set contains fewer tables, you can click Activate Without Seeding instead. The tables on the consumer instance that the producer no longer replicates are not deleted.

3. Optional: Delete a replication set.
   - To delete a producer replication set from the producer instance, navigate to Instance Data Replication > Producer Replication Sets. Click the producer replication set that you want to delete, and then click Delete.
   - To delete a consumer replication set on a consumer instance, navigate to Instance Data Replication > Consumer Replication Sets. Click the consumer replication set that you want to delete, and then click Delete.

Deploy a producer or consumer replication configuration by update set

Package a replication set configuration from a producer or consumer instance to another instance and then deploy through an update set. For example, you copy a configuration from a test to production environment.

Role required: admin

Note: To learn about access to update sets, see update set administration.

Once you deploy the update set, you must still activate the producer replication set. You must also update the consumer replication set with the producer instance URL on each consumer instance.

1. Export the update set from the instance where you created the replication set.
   To learn about update sets, see ..Get started with update sets
2. Import the update set to the instance where you must set up the replication set.
   To learn about update sets, see ..Get started with update sets
3. On the producer instance, navigate to Instance Data Replication > Producer Replication Sets and select the producer replication set that you imported.
4. Click Activate.
   Replication can't happen until you link the producer replication set to one or more consumer replication sets. Activation just makes the producer data available for replication.
5. On the consumer instance, navigate to Instance Data Replication > Consumer Replication Sets and select the consumer replication set that you imported.
   Update the consumer replication set with the producer instance URL on each consumer instance.
Grant access to the replicated data for Instance Data Replication (IDR)

Approve or deny a request to grant access to the replication data.

Role required: admin

You can review consumer access requests for all of your producer replication sets or for a specific producer replication set. The administrators of consumer sets must apply for access before they can receive the replication data.

1. On the producer instance, navigate to Instance Data Replication > Consumers Pending Approval.
2. Select the option for each consumer replication set that you want to approve.
3. On the Actions on selected rows... list, select Approve.
   The approved consumer sets start receiving the replicated data.

   Note: You can change the Consumer Approval Status to Denied to prevent the consumer from receiving the replicated data.

4. To approve a consumer access request for a specific producer replication set:
   a) On the producer instance, navigate to Instance Data Replication > Producer Replication Sets.
   b) Select the producer replication set where you want to approve consumer access.
   c) Under Related Links, on the Consumer Subscriptions tab, select the option for the consumer replication set that you want to approve.
   d) On the Actions on selected rows... list, select Approve.
   The approved consumer set starts receiving replicated data.

   Note: You can change the Consumer Approval Status to Denied to prevent the consumer from receiving the replicated data.

Revoke access to replicated data for Instance Data Replication (IDR)

Revoke a consumer’s access to replicated data if you believe that consumer instance should no longer receive that data.

Role required: admin

When you generate a new, shared encryption key, approved consumer sets automatically receive the new key and data replication is not interrupted. Any consumer set with a status of Denied or Pending Approval does not receive the new encryption key, and replication ceases.

1. On the producer instance, navigate to Instance Data Replication > Producer Replication Sets.
2. Select the producer replication set that has consumers whose access needs to be revoked.
   The instance identifies the consumers under the Consumer Subscriptions tab.
3. On the **Consumer Subscriptions** tab, select the option for the consumer instance whose permissions you want to revoke.

4. In the Actions on selected rows... list, select **Revoke**.
   
   Instance Data Replication generates a new encryption key and shares it with all approved consumer sets. All other consumer sets stop receiving replication data. Admins of those consumer replication sets must **reapply to restore access to the replication data**.

### Restore access to replication data for Instance Data Replication (IDR)

Restore access to replicated data by sending a request to the producer replication set admin.

**Role required:** admin

When the producer replication set administrator generates a new encryption key, approved consumer sets automatically receive the new key and data replication is uninterrupted. Consumer sets with a status of Denied or Pending Approval do not receive the new encryption key and replication ceases.

1. On the consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets**.

2. Select the consumer replication set to restore access to,
3. Click the Request Shared Key related link.  
   A request is sent to the producer replication set administrator. If you are granted access, the 
   consumer's Approval Status changes to Approved.

4. Optional: If the producer's replication set has changed, click the Synchronize Replication 
   Configuration related link.

5. On the Consumer Replication Entries tab, select all of the tables and click Activate with 
   Seeding to get the latest data in the producer's replication set.

Transform replication data for Instance Data Replication (IDR)

Transform the producer instance data to tables or table columns that are named differently on 
consumer instances.

- Create and activate a producer replication set.
- Create, activate, and seed one or more consumer replication sets.
- Role required: idr_admin or admin

By default, the replicated data from producer tables and table columns goes into tables and 
table columns of the same name on consumer instances. You can map the producer data 
into any table or table column on consumer instances. If existing tables or table columns have 
different names, you can replicate the data to a different table or table column. Adapters modify 
the data before storing it on consumer instances. You can use adapters to localize the data and 
transforms to create the producer for business systems (consumer instances) that refer to the same 
entity by different names.

You can also use adapters to modify the producer data during replication. For example, you can 
localize the data or populate the data that has been labeled differently in consumer tables.

Transformations have the following limitations:

- sys_created, sys_created_by, sys_domain, sys_updated_by, sys_id, and sys_mod_count are 
  automatically mapped to the consumer and can't be remapped.

  No other sys_ fields can be replicated.

- Adapters can't operate on the sys_journal field type such as Comments or Worknotes columns 
in a Task table.

- Calculated fields can't be transformed.

  For example, sys_user is a combination of first and last name fields. If the source and target 
fields have the same names, the calculated fields replicate. Attempting to remap calculated 
fields breaks the calculation.

1. On the consumer instance, navigate to Instance Data Replication > Consumer Replication 
Sets and click a consumer replication set.

2. On the Consumer Replication Entries tab, click a consumer replication entry. 
   A consumer replication entry appears.
3. Select the **Enable Transform** option.
4. In the **Target Table Name** list, select the table into which you want to replicate the source table data and click **Update**.
5. On the **Consumer Replication Entries** tab, click the same consumer replication entry.
6. Click the lock icon next to **Transform Map** to unlock it.

The image shows a Transform Map, with the field names from the source table appearing in the left column. The middle column shows matching field names in the target table. All fields...
that do not have the same names in both tables appear in the – choose source field – or – choose target field – lists.

7. Map a producer column to a consumer column that has a different name:
   a) Click – choose source field – and select the source field that you want to map.
   b) Click – choose target field –, select the target field into which you want to map the data, and then click Add.
   c) If you want to remove a field from replicating the producer instance to the consumer instance, click the X at the end of the row to delete the field.

8. To modify the producer data before replicating it in the consumer instance, click Add Adapter.
   The image shows the type of Adapter rules that you can create.
What kind of Adapter Rule do you want to create?

- Concatenate String Adapter Rule
- Replace Adapter Rule
- Split Adapter Rule
- Fixed-Width Format Adapter Rule
- Pattern Adapter Rule
- Task Number Adapter Rule
- Calculation Adapter Rule
- Map Adapter Rule
- Time Zone Conversion Adapter Rule

9. Click the adapter that you want to use and then configure it.
For more information about configuring adapters, see Adapter descriptions.

Note: Adapters do not modify the data on the producer instance.

Bidirectional replication for Instance Data Replication (IDR)

Bidirectional replication enables data to not only flow from a producer instance to a consumer instance, but also to accept data from a consumer instance and flow back to the producer instance.

By default, replicated data flows from a producer instance to a consumer instance. Bidirectional replication reverses that flow. For example, a company might outsource its networking issues. The third party receives the networking incident records from the consumer instance, fixes the networking issues, updates the records, and returns them to the consumer instance. Bidirectional replication then updates the incident records on the producer instance. Bidirectional replication only works for records that originated on the producer instance.

To make data flow bidirectionally on the consumer instance, the system creates a producer instance on the consumer instance and a consumer instance on the producer instance.
Choosing bidirectional replication creates producer and consumer instances

If you look at the replication sets on the original producer instance, you see the replication set name and the automatically generated consumer instance. It has the same name appended with the suffix, `-<long-number>-reverse`, where `<long-number>` is a randomly generated number. For example, if Test is the replication set name on the producer instance, Test-2034802-reverse might be the name of the consumer replication set that is automatically generated on the same instance. On the original consumer instance, you see the same names. Replication sets with the reverse suffix are read-only.

You can see the automatic creation of a consumer on a producer instance and a producer on a consumer instance by running `https://<producer-instance-name>/xmlstats.do?include-idr` and `https://<consumer-instance-name>/xmlstats.do?include=dir` on the producer and consumer instances. In the following image, the original producer instance is on the left and the original consumer instance is on the right.
Bidirectional replication has the following limitations:

- Auto-conflict resolution is unsupported.
- Merge conflicts happen if producer and consumer instances modify the same record at the same time.
  The most recent update wins, which means that the data on the consumer and producer tables might be different.
- Deleting data on a consumer instance does not delete the same data on the producer instance.
- Bidirectional replication supports the Number adapter but none of the other adapters.

Create a bidirectional replication for Instance Data Replication (IDR)

Replicate updated data on a consumer instance to the producer instance.

Role required: idr_admin or admin

1. On a producer instance, navigate to Instance Data Replication > Producer Replication Sets and click a producer replication set.
2. On the Producer Replication Set pane, select the Require Consumer Sync option to enable bidirectional replication.
3. On a consumer instance, navigate to Instance Data Replication > Consumer Replication Sets and click a consumer replication set that is connected to the producer replication set.
4. On the Consumer Replication Set pane, click the Synchronize Replication Configuration related link.

Data that is updated on this consumer instance automatically replicates on the producer instance, which then replicates the updates to its other consumer instances.

Seed a consumer instance for Instance Data Replication (IDR)

Seed all or some of the tables in your replication sets depending on the needs of your consumer instance.
Role required: idr_admin or admin

You can initiate seeding requests on a consumer instance while you are activating a consumer replication set.

Note: Seeding continues even if errors occur on some consumer tables. You can restart seeding specifically on the tables that have errors or on all tables in a replication set.

1. On the consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets** and click a consumer replication set.
2. On the **Consumer Replication Entries** tab, select the option next to the tables to seed.
3. Click either **Activate with Seeding** to download only the current field values from the producer or **Activate with Seeding (Include History)** to download the current field values and the history of all field updates.

   Once seeded, the consumer instance maintains a history of all field updates.

4. To cancel a seeding request:
   a) On the **Seeding Requests** tab, click a seeding request.
   b) On the Seeding Request form, click **Cancel**.

Note: If you encounter an error during seeding, see **Fix seeding errors**.

In a successful seeding, all selected data on a producer instance is replicated on a consumer instance.

- Records that exist on the producer instance and not on the consumer instance are copied to the consumer instance.
- If the identical record exists on a consumer instance, the record on the consumer instance is not modified.
- The sys_ID of the record identifies the record on both instances.
- If a replication set changes and no longer includes a table, the records in the corresponding table on the consumer instances are not altered.
- The producer instance handles one seeding request at a time. When the producer instance is busy with a seeding request, subsequent seeding requests are queued and initiated in the order that they are received.

Note: In bidirectional replication, the same rules apply.

**Trigger workflows after replications for Instance Data Replication (IDR)**

Use platform business rules to trigger workflows after replications.

Role required: idr_admin or admin

A business rule is a server-side script that is associated with a table. Use business rules to trigger workflows that are associated with replications, such as sending a notification or validating the replicated data.

Business rules are part of the Now Platform. For more information, see **Business rules**.

1. On a consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets** and click a consumer replication set.
2. On the **Consumer Replication Entries** tab, click a replication set table.
3. Select the **Run Business Rule** option.
4. Repeat this procedure for the other tables in the replication set.
5. Click **Update**.
   IDR invokes the business rules that are associated with the specified table after replicating the data to the table.

**Instance Data Replication (IDR) dashboard**

The IDR dashboard enables you to monitor the status of active producer and consumer replication sets, scheduled jobs, and producer or consumer seeding requests.

**Accessing the IDR dashboard**

Users with the admin or idr_admin role can access the dashboard.

Navigate to the IDR dashboard in the following way:

- **Instance Data Replication > Monitoring Dashboard**

The IDR dashboard monitors the following:

- Active Producer Replication Sets
- Active Consumer Replications Sets
- IDR Scheduled Jobs
- Producer Seeding Requests Within Last 7 Days
- Consumer Seeding Requests Within Last 7 Days
### Active Producer Replication Sets

<table>
<thead>
<tr>
<th>Name</th>
<th>Replication Queue Reading Lag</th>
<th>Status</th>
<th>Status Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmdb-ci-san-disk</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>cmdb-ci-storage-device</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>idr:incident-sync-up-0f861766bc54410b10</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>idr:problem-sync-up</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
</tbody>
</table>

### Active Consumer Replication Sets

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Lag</th>
<th>Network Lag</th>
<th>Status</th>
<th>Status Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>idr:incident-sync-up</td>
<td>00:00:43</td>
<td>00:00:04</td>

<tr>
<td>label</td>
<td>00:00:43</td>
<td>00:00:04</td>
<td>active</td>
<td>Active Replication</td>
</tr>
</tbody>
</table>
Active Producer Replication Sets

The Active Producer Replication Sets monitors your producer replication set status and reports data lag time between your instance and the replication queue.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the producer replication set.</td>
</tr>
<tr>
<td>Replication Queue Reading Lag</td>
<td>Time between a record change on the producer instance and the moment it is sent over the outbound replication queue.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

Active Consumer Replication Sets

The Active Consumer Replication Sets monitors your consumer replication set status, reports network lag time, and reports data lag time between the producer and consumer instance.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the consumer replication set.</td>
</tr>
<tr>
<td>Data Lag</td>
<td>Time between a record change on the producer instance and the moment it is recorded in the consumer instance.</td>
</tr>
<tr>
<td>Network Lag</td>
<td>Time between a record change logs in the outbound replication queue and the moment it is recorded in the consumer instance.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

IDR Scheduled Jobs

The suite of IDR scheduled jobs poll for data changes, requests, and check the health of your producer and consumer instances. You can monitor the following jobs:

**IDRConsumerJob**
Polls for record changes and seeding requests on the consumer instance in 15-second intervals.

**IDRHeartBeatJob**
Updates information about the health of every active producer or consumer set.

**IDRMetadataConsumerJob**
Polls for metadata record changes on the consumer instance in 15-second intervals.

**IDRProducerJob**
Polls for new, updated, or deleted records in the data replication queue for a producer instance in 15-second intervals.

**IDRSeedingProducerJob**

Checks for new seeding requests coming from consumer instances.

You can set when your IDR scheduled jobs run and configure a periodic trigger specifying how often the job runs.

**IDR Scheduled Jobs fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Scheduled job name.</td>
</tr>
<tr>
<td>Next Action</td>
<td>Date and time when the job next runs.</td>
</tr>
<tr>
<td>Trigger type</td>
<td>Job that you can configure to run daily, weekly, monthly, periodically, once, on-demand, or business calendar start or end date. The trigger can repeat daily, hourly, by minute, or by second.</td>
</tr>
<tr>
<td>Job ID</td>
<td>ID of the scheduled job.</td>
</tr>
<tr>
<td>State</td>
<td>State of the job, for example, ready.</td>
</tr>
</tbody>
</table>

**Producer Seeding Request Within Last 7 Days**

You can monitor the status of a producer seeding request within the last seven days.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Set</td>
<td>Producer set and the consumer set.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of the seeding request. The status can be completed, in progress, or failed.</td>
</tr>
<tr>
<td>Start Time</td>
<td>Time that the seeding begins.</td>
</tr>
<tr>
<td>End Time</td>
<td>Time that the seeding ends.</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>Percentage of the seeding request job that is complete.</td>
</tr>
</tbody>
</table>

**Consumer Seeding Request Within Last 7 Days**

You can monitor the status of a consumer seeding request within the last seven days.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Set</td>
<td>Corresponding consumer set.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of the seeding request. The status can be completed, in progress, or failed.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Start Time</td>
<td>Time that the seeding begins.</td>
</tr>
<tr>
<td>End Time</td>
<td>Time that the seeding ends.</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>Percentage of the seeding request job that is complete.</td>
</tr>
</tbody>
</table>

**IDR Dashboard Properties**

You can navigate to the IDR dashboard properties in the following way:

- **Instance Data Replication > Properties**

You can change the following properties on your dashboard:

<table>
<thead>
<tr>
<th>Property field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minutes of lag before the Data Lag field is highlighted in red on the IDR Monitoring Dashboard</td>
<td><strong>Data Lag</strong> field that is part of the Active Consumer Replication set. The field highlights if the actual lag time is greater than the time threshold that you set. The default is 15 minutes.</td>
</tr>
<tr>
<td>Minutes of lag before the Network Lag field is highlighted in red on the IDR Monitoring Dashboard</td>
<td><strong>Network Lag</strong> field that is part of the Active Consumer Replication set. The field highlights if the actual lag time is greater than the time threshold that you set. The default is 15 minutes.</td>
</tr>
<tr>
<td>Minutes of lag before the Replication Queue Reading Lag field is highlighted in red on the IDR Monitoring Dashboard</td>
<td><strong>Replication Queue Reading Lag</strong> field that is part of the Active Consumer Replication set. The field highlights if the actual lag time is greater than the time threshold that you set. The default is 15 minutes.</td>
</tr>
</tbody>
</table>

**Note:** You can set colors on fields through personalize list columns (v_idr_dashboard_list.do).

**Resolve errors for Instance Data Replication (IDR)**

Resolve common errors and issues when completing an IDR.

Role required: idr_admin or admin

**Resolving common issues in (IDR)**

Before calling ServiceNow customer support, review the checklist for commonly found issues and solutions.

Role required: idr_admin or admin

1. Make sure that the Name, Shared Key, Producer ID, and Producer Set ID are exactly the same on the producer and consumer instances. The names must match.
2. On the producer instance, navigate to **Instance Data Replication > Producer Replication Sets**.
3. Select a producer replication set and make sure that the producer replication set status is Active Replication.
   If you see the status as In Draft, click Activate. Only active producer and consumer replication sets replicate.

4. Optional: On the Consumer Replication Set page, if there are no tables on the Consumer Replication Entries tab, click Synchronize Replication Configuration.

5. Confirm that the producer and consumer instances are connected:
   a) On the producer instance, navigate to Instance Data Replication > Producer replication set
   b) Select a producer replication set.
   c) Click the Open Metadata Logs related link.
   d) See if the Payload Type INIT_TOPIC shows Sent as the status.
      If the status is not Sent, the producer instance is not connected to the consumer instances. To learn how to connect the producer and consumer instances, see create a consumer replication step.
   e) Repeat the procedure on the consumer instance and see if there are any records where the status of the INIT_TOPIC is Sent.
      If the status is not Sent, the consumer instance is not connected to the producer instance. To learn how to connect the consumer instance to the producer instance, see create a consumer replication step.

6. To see if the producer-side and consumer-side replication jobs are running, navigate to Instance Data Replication > Replication Log and check the entries in the Source column.
   The entries should have IDRProducerJob and IDRConsumerJob. The Created column specifies when the jobs ran. Make sure that the jobs ran recently.

7. To check for payload errors, on either producer or consumer instance navigate to Instance Data Replication > Replication Payload Error and review the error messages.

Test Instance Data Replication (IDR) connectivity
You can test your IDR instance connectivity, to determine the connectivity of your instance to the message queue.
Role required: admin

1. Navigate to Instance Data Replication > Test Connectivity.
2. Click Test Connectivity.
   If you have connectivity, the message or relay test shows how long the successful test took. If you do not have connectivity, the message or relay shows the test results as unsuccessful.

Find Instance Data Replication (IDR) errors
Identify IDR errors by viewing the metadata for messages between producer and consumer instances, payload error logs, and message logs.
Role required: idr_admin or admin

1. View the producer or consumer metadata logs:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Producer</td>
<td>Navigate to Instance Data Replication &gt; Producer Replication Sets, select a producer replication set and click the Open Metadata Logs related link.</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
Consumer | Navigate to Instance Data Replication > Consumer Replication Sets, select a consumer replication set and click the Open Metadata Logs link.

2. On either the producer instance or the consumer instance, to view transformation errors and replications that failed to load:
   a) Navigate to Instance Data Replication > Replication Payload Error. In this view, if the Source value is Seeding, the error happened during seeding. If the source value is different, the error occurred during a replication set update. If any column breaks during transformation, transformation for the entire table breaks and data is not replicated in the table.
   b) Select an error in the Created column. The Error Message field on the Payload Error pane describes the payload error.

3. View the replication log on either the producer instance or the consumer instance:
   a) Navigate to Instance Data Replication > Replication Log.
   b) Select an entry. The Instance Data Replication Log form shows the message and message level.

---

Review synchronization errors in Instance Data Replication (IDR)

Review the status field to check that synchronizations are done correctly on the consumer instance.

Role required: idr_admin or admin

Complete the tasks in check for common issues before identifying synchronization errors.

Synchronization errors occur when a producer instance does not send data or a consumer instance does not receive data. Synchronization errors appear in the Status field on the consumer instance as Replication Error.

1. Determine if the consumer successfully sent the synchronize request to the producer:
   a) On the consumer instance, navigate to Instance Data Replication > Consumer Replication Sets.
   b) Select a consumer replication set.
   c) Click the Open Metadata Logs related link.
   d) Sort the logs in a descending order that is based on the sequence that is in the Log Sequence column.
   e) Find the most recent payload with the REPL_SET_DETAIL_REQUEST type. If you do not see this payload type, refresh the log until you see REPL_SET_DETAIL_REQUEST.
   f) Verify that you see the correct producer instance ID in the To column. If the producer instance ID is incorrect, update the ID and click the Activate Without Seeding Related Link.
   g) Verify that you see “Sent” in the Status column. If you do not see this status, the producer did not send any updates.

2. Determine if the producer received the synchronize request from the consumer:
a) On the producer instance, click **Instance Data Replication > Producer Replication Sets**.
b) Select a producer replication set.
c) Click the **Open Metadata Logs** related link.
d) Sort the logs in a descending order that is based on the sequence that is in the Log Sequence column.
e) Find the most recent payload with the REPL_SET_DETAIL_REQUEST type. If you do not see this payload type, refresh the log until you see REPL_SET_DETAIL_REQUEST.
f) Verify that you see the correct consumer instance ID in the From column. If the consumer instance ID is incorrect, update the ID.
g) Verify that you see “Received” in the Status column.

**Fix seeding errors in Instance Data Replication (IDR)**

You can retry seeding on tables with seeding errors, which occur from errors such as network problems and failed inserts. This alleviates the need to do a full seeding.

Role required: idr_admin or admin

The maximum for a partial reseeding request is 10,000 errors. If you have more errors, perform a **full seeding**.

Do not retry seeding if the errors include any of the following problems:

- Record size exceeds 32 MB.
- Seeding request exceeds 3 million records.
- Replication takes longer than seven days to complete.

**Note:** To fix these problems, reduce the number of tables in the seeding request or reduce the size of the records.

1. On the consumer instance, navigate to **Instance Data Replication > Consumer Replication sets**
2. Select a consumer replication set.
3. On the Seeding Requests tab of the Consumer Replication Set pane, click a seeding request that failed.

4. On the Seeding Request pane, click the Payload Errors tab and examine the values in the Message column.

5. Click Retry All Errors or select specific errors, and then click Retry Selected Errors.

The image shows areas where you can retry errors.
Discover replication delays in Instance Data Replication (IDR)

Monitor possible data replication issues using the IDR Monitoring Dashboard.

Role required: admin

1. To view the time lag on a producer instance, go to Instance Data Replication > Monitoring Dashboard. Check the Active Producer Replication Sets for the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the producer replication set.</td>
</tr>
<tr>
<td>Replication Queue Reading Lag</td>
<td>Time between a record change on the producer instance and the moment it is sent over the outbound replication queue.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

To get additional information, you can also view the producer instance xmlstats: https://<producer-instance-name>/xmlstats.do?include=idr.

xmlstats shows:
- The `producer_last_run` indicates the last time that the replication job ran on the producer instance.
- The `last_message_sent_on` indicates the last time that the producer sent updated data to consumers.

**Note:** The timestamps are GMT.

2. To view the time lag on a consumer instance, go to Instance Data Replication > Monitoring Dashboard. Check the Active Consumer Replication Sets for the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the consumer replication set.</td>
</tr>
<tr>
<td>Data Lag</td>
<td>Time between a record change on the producer instance and the moment it is recorded in the consumer instance.</td>
</tr>
<tr>
<td>Network Lag</td>
<td>Time between a record change logs in the outbound replication queue and the moment it is recorded in the consumer instance.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

To get additional information, you can also view the consumer instance xmlstats [https://<consumer-instance-name>/xmlstats.do?include=idr](https://<consumer-instance-name>/xmlstats.do?include=idr).

The xmlstats shows:

- The `consumer_last_run` indicates the last time that the consumer job ran and received changes from the producer.
- The `last_heartbeat_received_on` shows the timestamp of when the consumer last received a heartbeat from the producer instance.

**Note:** The timestamps are GMT.

**Verify producer instance is reading from the replication queue in Instance Data Replication (IDR)**

You can check that the producer instance is reading from the replication queue in IDR, to determine if there is a problem with your instance replication.

Role required: idr_admin or admin

Perform the steps in Check for common issues.

1. Get the producer instance's `queue_reading_lag` from the monitoring dashboard.
2. If `queue_reading_lag` is greater than 0 and the Producer cursor last updated time is less than 60 minutes, the producer instance encountered an error.
   If there is an error, look in the syslog, replication log, and localhost log for errors that occurred after the most recent Producer cursor last updated time.

**Status messages for Instance Data Replication (IDR)**

Review these status messages with recovery information so that you can troubleshoot or fix IDR issues.

- All Producer Replication Sets have been deactivated due to fatal replication error

   All consumer replication sets are moved to the error state. Contact ServiceNow Technical Support.
• Error while seeding data. Please refer to the Replication Payload Error table for details
  On the consumer instance, more than one record failed to seed. To recover, go to the Replication Payload Error table to find and fix the error, and then activate the replication set.
• Error while seeding data. Please retry seeding this table
  To recover, reseed the table.
• Producer has encountered an error while seeding
  To recover, contact the administrator of the producer instance to determine the cause of the problem.
• Producer Replication Set configuration has been modified
  To recover, activate the replication set on the consumer instance, either with seeding or without seeding.
• Producer Replication Set has been deactivated due to replication error
  Contact ServiceNow Technical Support.
• Producer Replication Set has been deactivated
  To recover, activate the producer replication set, and then activate the consumer replication.
• Producer Replication Set has been deleted
  To recover, delete the consumer replication set.
• Producer Replication Set is inactive
  To recover, activate the producer replication set, and then synchronize and activate the consumer replication set.
• Producer Replication Set not found
  To recover, delete the consumer replication set.
• Replication Set Paused
  To recover, click Resume or Activate with Seeding.
• Replication set was in pause/error/seeding pause state for more than 7 days
  The consumer replication set has been in the pause state, error state, or seeding pause state for more than the timeout period. The replication set is put into the disabled state. To recover, check for seeding errors and activate the replication with seeding.
• Seeding has been terminated due to timeout
  To recover, retry the seeding request or contact ServiceNow Technical Support.
• Seeding request for a Producer Replication Set containing more than X number of records is not supported
  To recover, change the filter criteria to reduce the number of records to be seeded. The default limit is 10 million records. Contact ServiceNow Technical Support to change the default limit.
• Seeding was cancelled by a consumer admin
  To recover, activate the replication set with or without seeding.
• Seeding was cancelled by a producer admin
  To recover, activate the consumer replication set with or without seeding. Only seeding requests in the queued, paused, or started states can be canceled. In this case, the consumer replication state is Replication Error.
• Shared key not matching
  The producer and consumer replication sets have different shared keys. To recover, copy the shared encryption key on the producer replication set, paste it into the consumer replication set, and activate the replication set.
Adapter descriptions for Instance Data Replication (IDR)

During replication, adapters modify the producer data before inserting the data on consumer instances.

**Adapter fields**

Each adapter has **Name** and **Description** fields. The name appears in the Adapter column. Use the **Description** field to explain the purpose of the data conversion.

**Calculation adapter**

Use the calculation adapter on the producer data to specify the operation and the value that is used in the operation.

<table>
<thead>
<tr>
<th>Parameter example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter and value</td>
</tr>
<tr>
<td>Operation: Multiply</td>
</tr>
<tr>
<td>Constant Value: 1.08</td>
</tr>
<tr>
<td>Operation: Max</td>
</tr>
<tr>
<td>Constant Value: 1000</td>
</tr>
<tr>
<td>Operation: Floor</td>
</tr>
<tr>
<td>Constant Value: 0</td>
</tr>
</tbody>
</table>

**Max** specifies the highest and **Min** specifies the lowest possible values. Values above or below those limits are set to those limits. Value types such as **int** and **long** have maximum and minimum values. Values above or below those limits cause precision errors.

**Concatenate String adapter**

Use the concatenate string adapter to append a specified string to the source data.

<table>
<thead>
<tr>
<th>Parameter example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter and value</td>
</tr>
<tr>
<td>String: _v2</td>
</tr>
</tbody>
</table>

**Fixed-width format adapter**

Use the fixed-width format adapter to reformat fixed-width input data. Use # to represent any positive integer, @ to represent any character, and \ as the literal escape character.
### Map adapter

Use the map adapter for comma-separated pairs of literals to map source-to-target conversions. Matches must be exact. For example, PRB=TASK would not convert PRB1000 to TASK1000.

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Map: PRB=TASK, done=complete</td>
<td>PRB</td>
<td>TASK</td>
</tr>
<tr>
<td>Map: PRB=TASK, done=complete</td>
<td>done</td>
<td>complete</td>
</tr>
<tr>
<td>Map: PRB=TASK, done=complete</td>
<td>PRB1000</td>
<td>(no mapping)</td>
</tr>
</tbody>
</table>

### Pattern adapter

Use the pattern adapter for regular expressions to identify input patterns. Use parentheses in the Regex to identify groups. In Output Pattern, use $ to specify groups. $0 represents the entire input, $1 represents the first group, $2 represents the second group, and so on. You can also insert, prefix, and append literal characters, including spaces so they appear in the adapter output.

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regex: (<em>.),(</em>)</td>
<td>Smith, John</td>
<td>John Smith</td>
</tr>
<tr>
<td>Output pattern: $2 $1</td>
<td>ABCDEABCFG</td>
<td>ABCDE ABCDEABCFG</td>
</tr>
<tr>
<td>Regex: (ABC[a-zA-z][a-zA-z]),(ABC[a-zA-z][a-zA-z])</td>
<td>ABCDEABCFG</td>
<td>ABCDE ABCDEABCFG</td>
</tr>
<tr>
<td>Parameter and value</td>
<td>Source data</td>
<td>Adapter output</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------</td>
<td>----------------</td>
</tr>
<tr>
<td><strong>Regex</strong>: (ABC((a-zA-z))(a-zA-z))) (ABC((a-zA-z)(a-zA-z)))</td>
<td>ABCDEABCFG</td>
<td>ABCDE release ABCDEABCFG</td>
</tr>
<tr>
<td><strong>Output pattern</strong>: $1 release $0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In the second example, the match is ABC followed by two letters, followed by ABC and two letters. $1$ of this input is ABCDE. $2$ of this input is ABCFG. $0$ is the entire input string. So $1$ $0$ is ABCDE ABCDEABCFG.

**Replace adapter**

Use the replace adapter to replace a specified input string or substring with a specified string. Use $1$ to replace only some of the occurrences of the string. $1$ replaces only the first occurrence; $2$ replaces only the second. Use curly braces to replace the first N occurrences. For example, $\{3\}$ replaces the first three occurrences.

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Find</strong>: London</td>
<td>The product is London. The product is London.</td>
<td>The product is Madrid. The product is Madrid.</td>
</tr>
<tr>
<td><strong>Replace</strong>: Madrid</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| **Find**: $2$ London | The product is London. The product is London. | The product is London. The product is London. |
| **Replace**: Madrid | | |

| **Find**: $(2)$ London | The product is London. The product is London. | The product is Madrid. The product is London. |
| **Replace**: Madrid | | |

**Split adapter**

Use the split adapter for a specified delimiter, such as a space, to break a string into two or more strings. In **Output Pattern**, use $1$ to specify groups. $0$ represents the entire input, $1$ represents the first group, $2$ represents the second group, and so on. You can repeat a group in an output pattern, for example, $2$, $1$, $1$. Multiple instances of a delimiter in source data create three or more groups.

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Delimiter</strong>: &quot; &quot;</td>
<td>John Smith</td>
<td>Smith, John</td>
</tr>
<tr>
<td><strong>Output Pattern</strong>: $2$, $1$</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| **Delimiter**: " " | John Harry Smith | Harry, John, John |
| **Output Pattern**: $2$, $1$, $1$ | | |
### Task number adapter

Use the task number adapter to add a prefix or suffix to a task number or replace the task number's prefix.

**Parameter examples**

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Modification</strong>: Replace</td>
<td>PRB80899</td>
<td>STRY80899</td>
</tr>
<tr>
<td><strong>Number Prefix</strong>: PRB</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>New Number Prefix</strong>: STRY</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| Modification: Add Prefix | | |
| **Prefix**: STRY | 08099 | STRY80899 |

### Time zone conversion adapter

Use the time zone conversion adapter to convert one time zone to another.

**Parameter example**

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output time zone</strong>: PDT</td>
<td>07:00:00 am GMT</td>
<td>00:00:00 am PDT</td>
</tr>
</tbody>
</table>

### Instance Data Replication (IDR) and blacklisted tables

Some tables can't be included in IDR replication sets. Child tables of blacklisted tables are also blacklisted.

#### Blacklisted tables

These tables get blacklisted from IDR:

- Tables with the prefixes V_PREFIX, SYSX_, sys, ts_, ua_, usageanalytics_, wf_, ecc_, clone_, jrobin_, rrd_, imp_, pf_, pfld_, idr_, sys_domain is an exception.
- Rotated tables, including syslog, sys_querystat, ecc_queue, ecc_event, cmdb_metric, sysevent
- Tables without a sys_id
- sso_federation
- saml2_update1_properties
IntegrationHub

Automate integration tasks using ServiceNow-built components for Flow Designer, or develop custom integrations. Requires a separate subscription.

Capabilities

IntegrationHub enables execution of third-party APIs as a part of a flow when a specific event occurs in ServiceNow. These integrations, referred to as spokes, are easy to configure and enable you to quickly add powerful actions without the need to write a script. For example, you can post a message and incident details in a Slack channel when a high priority incident is created.

IntegrationHub provides the following functionality:

Spokes for base system integrations

Using IntegrationHub actions in Flow Designer, you can:

- Post messages and ServiceNow incident, problem, and change record details to HipChat, Slack spoke, or Microsoft Teams spoke communications channels.
- Synchronize data across multiple production instances using the eBonding spoke as an example.

Create custom integrations

Build custom integrations with Action Designer using a REST step or a Script step.

Automate the administration of servers and applications in your network

Use custom actions to delegate Flow Designer processes to a MID Server in your network. For example, actions that use the PowerShell step or REST step.

Connection and Credentials

IntegrationHub takes advantage of aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. IntegrationHub only requires an alias, which then resolves to use the correct credentials and connection information during runtime. Learn more about Introduction to credentials, connections, and aliases.

Benefits

IntegrationHub provides process owners and developers these benefits.

- Consolidates multiple Now Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes and integrations from a single interface.
- Extends Flow Designer content to integrate business processes with external systems.
- Promotes business process automation by enabling subject matter experts to develop and share spokes with flow designers.
- Provides natural-language-descriptions of integration logic to help non-technical users understand triggers, actions, inputs, and outputs.

Development process

When developing a custom integration, develop all actions for the integration within a scoped application. When deployed to a target instance, these actions are grouped as a spoke in Flow Designer. Brand the spoke by adding a custom icon to the application record. To learn more about application development, see Applications.

When developing spokes, flow and action designers typically perform these application development tasks.

1. Create a scoped application on a development instance to build spokes.
2. Publish a test version of the scoped application to the application repository.
3. Deploy the scoped application to a test instance from the application repository.
4. Test the scoped application on the test instance.
5. When working as expected, publish the scoped application in one of the following ways.
   - Publish to the application repository for deployment on production instances.
   - Publish to the ServiceNow Store as an application that customers can request for their environments.
   - Publish to ServiceNow Share to provide content to other customers in the ServiceNow community.

Review Flow Designer design considerations in the Architecture Overview.

Request IntegrationHub

IntegrationHub lets you build reusable integrations with third-party systems and call them from anywhere in the Now Platform®. For example, you can request IntegrationHub to call external systems using integration APIs from the Action Designer Script step, run the Script step on the MID Server, and activate protocol steps like REST, SOAP, and PowerShell.

Flow Designer is a Now Platform feature that enables you to automate processes within a single instance. Without an IntegrationHub subscription, you can use base system actions or steps, including the Script step, to manipulate records, send emails, trigger notifications, and perform operations within the instance. Request IntegrationHub to automate and create integrations with external systems from the Flow Designer interface.

IntegrationHub usage and subscription

Choose an IntegrationHub subscription package to build reusable integrations with third-party systems. Review the usage dashboard to determine the number of transactions used within your current subscription, and to view transaction details.
IntegrationHub subscription packages

<table>
<thead>
<tr>

</table>

**IntegrationHub usage overview**

Navigate to IntegrationHub > IntegrationHub Usage to view the current transaction count for your instance and feature usage.

**Request an IntegrationHub plugin**

IntegrationHub plugins require a separate subscription and must be activated by ServiceNow personnel.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

1. From your instance, navigate to System Definition > Plugins.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Date and time</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>Note:</td>
<td>Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**IntegrationHub plugins**

Request IntegrationHub plugins included in your subscription.

**Note:** The ServiceNow eBonding spoke is included by default in your instance and doesn’t require an IntegrationHub or Orchestration subscription.

### Adobe Experience Platform spoke

Automate the process of managing datasets and entities in Adobe Experience Platform from your ServiceNow instance.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Adobe Experience Platform released on September 10, 2019, but may be compatible with later versions.

Spoke requirements

- Registered Adobe ID account
- User with developer access
- Details such as API key and client secret

See the Adobe Experience Platform documentation for instructions on creating Adobe ID and adding developer.

Spoke actions

The Adobe Experience Platform spoke provides actions manage datasets and entities when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dataset Management</td>
<td>Get All Data Inlets</td>
<td>Retrieves the details of all data inlets.</td>
</tr>
<tr>
<td></td>
<td>Get All Datasets</td>
<td>Retrieves the details of all datasets.</td>
</tr>
<tr>
<td></td>
<td>Get All Union Schemas</td>
<td>Retrieves the list of all schemas that are part of unions.</td>
</tr>
<tr>
<td>Entity Management</td>
<td>Get Entity Information</td>
<td>Retrieves the information of an entity.</td>
</tr>
<tr>
<td></td>
<td>Load Entity Data</td>
<td>Ingest the information of an entity to Adobe Experience Platform.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Metadata For All Attributes In A Schema</td>
<td>Retrieves all attributes for the selected union schema.</td>
</tr>
</tbody>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Note: Two connection and credential alias records are needed for the Adobe Experience Platform spoke; one for data inlet management and batch ingestion, and other for data collection. Each alias should be associated with the respective Adobe Experience Platform API.

Set up Adobe Experience Platform spoke

Integrate your Adobe Experience Platform account with your ServiceNow instance. Create a custom OAuth application in Adobe Experience Platform and authenticate requests from ServiceNow.

- Request IntegrationHub subscription
- Activate Adobe Experience Platform spoke
- Role required: admin

Attach a Java Key Store certificate to the Adobe Experience Platform spoke

Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the Adobe Experience Platform spoke.

- Valid Java KeyStore certificate
- Role required: admin

1. Navigate to System Definition > Certificates.
2. Click New.
3. On the form, fill in the fields.
### X.509 Certificate form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, AEP Certificate.</td>
</tr>
<tr>
<td>Expiration notification</td>
<td>Option to send a notification when the certificate is about to expire.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the certificate.</td>
</tr>
<tr>
<td>Format</td>
<td>Certificate format. The instance supports the PEM and DER formats.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of certificate. Select Java Key Store.</td>
</tr>
<tr>
<td>Valid from</td>
<td>Date from which the certificate is valid.</td>
</tr>
<tr>
<td>Expires</td>
<td>Date on which the certificate expires.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Password associated with the certificate.</td>
</tr>
<tr>
<td>Short description</td>
<td>Summary about the certificate.</td>
</tr>
<tr>
<td>PEM Certificate</td>
<td>Contents of the X509 certificate.</td>
</tr>
</tbody>
</table>

4. Click the attachments icon (_attach) and attach a JKS certificate.

5. Click **Validate Stores/Certificates**.

The JKS certificate is created and attached to the Adobe Experience Platform spoke.

**Create a JWT signing key for the Adobe Experience Platform spoke**

Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

Role required: admin

1. Navigate to **System OAuth > JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

### JWT Keys form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the JWT signing key. For example, AEP JWT Keys.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Valid JKS certificate attached in the previous task. For example, AEP Certificate.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Key ID to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Adobe Experience Platform spoke.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Algorithm to sign with the JWT key.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Password associated with the signing key.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the certificate.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

The JWT key is created and assigned to the JKS certificate.

**Create a JWT provider for the Adobe Experience Platform spoke**

Add a JSON Web Token (JWT) provider to your ServiceNow instance.

Role required: admin

1. Navigate to **System OAuth > JWT Providers**.
2. Click **New**.
3. On the form, fill in the fields.

   **JWT Provider form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the JWT provider. For example, AEP JWT Provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Number in seconds to set the lifespan of JWT provider tokens.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>JWT signing key from the previous step. For example, AEP JWT Keys.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.
   The Standard Claims and Custom Claims related lists are displayed.
5. Enter values for **iss**, **sub**, and **aud** in the Standard Claims related list. See the Adobe Experience Platform documentation documentation for instructions.
6. Enter these values in the Custom Claims related list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim Name</td>
<td><a href="https://ims-na1.adobelogin.com/s/entdinfervices_sdk">https://ims-na1.adobelogin.com/s/entdinfervices_sdk</a></td>
</tr>
<tr>
<td>Claim Value Type</td>
<td>true</td>
</tr>
<tr>
<td>Claim Value</td>
<td>true</td>
</tr>
</tbody>
</table>

7. Click **Update**.

The JWT provider is added to your ServiceNow instance.

**Register Adobe Experience Platform as OAuth Provider**

Use the information generated during Adobe ID account creation and configuration to register Adobe Experience Platform as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
The system displays a blank Application Registries form.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter AEP OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Consumer key you generated during the Adobe ID account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Consumer secret you generated during the Adobe ID account configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthUtilAEP.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select JWT Bearer.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

**Note:** You can use only Authorization Code as the Default Grant type when PKCE is enabled.

<table>
<thead>
<tr>
<th>Application</th>
<th>Application scope that contains this record. Select Adobe Experience Platform.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   - The system validates the OAuth credentials and populates the Redirect URL.
   - The system populates OAuth Entity Profile with Grant Type as JWT Bearer. For example, OAuth Entity Profile is created with default Name: AEP default_profile

6. Open the record of OAuth Entity Profile.
7. Select the JWT Provider record for JWT Provider. For example, AEP JWT Provider.
8. Click Update.
The instance can request OAuth 2.0 tokens for the spoke.

Note: When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

Create Credential records for the Adobe Experience Platform
Create Credential records to the Adobe ID account you created. The Adobe Experience Platform spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin

You must create two credential records; one for data inlet management and batch ingestion, and other for data collection.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter AEP for data inlet management and batch ingestion, and AEP_Ingestion for data collection.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile you created when you registered the Salesforce connected app as an OAuth provider. For example, select AEP OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>This field isn’t applicable.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. Click the Get OAuth Token related link to generate the OAuth token.

The credential records for the Adobe Experience Platform spoke is created.

Create Connection records for the Adobe Experience Platform spoke
Create Connection records to your Adobe ID account. The Adobe Experience Platform spoke connection and credential alias uses these connections to perform actions in Adobe Experience Platform.

Role required: admin

Two connection and credential alias records are available by default; one for data inlet management and batch ingestion, and other for data collection. Perform these steps to associate each alias with the respective Adobe Experience Platform API.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the required Adobe Experience Platform spoke record.
Note: There are two connection and credential records; **AEP** and **AEP_Ingestion**. The **AEP** record is for data inlet management and batch ingestion, and **AEP_Ingestion** is for data collection.

3. From the **Connections** tab, click **New**. The system displays a blank HTTP(s) Connection form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>AEP Platform</strong> for data inlet management and batch ingestion, and <strong>AEP dcs</strong> for data collection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Adobe Experience Platform. For example, select <strong>AEP</strong> and <strong>AEP_Ingestion</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><img src="image" alt="Note: Do not select the check box." /></td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Adobe Experience Platform.</td>
</tr>
<tr>
<td></td>
<td>- If the connection record is for data inlet management and batch ingestion, enter <strong><a href="https://platform.adobe.io/">https://platform.adobe.io/</a></strong>.</td>
</tr>
<tr>
<td></td>
<td>- If the connection record is for data collection, enter <strong><a href="https://dcs.adobedc.net">https://dcs.adobedc.net</a></strong>.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>This field isn’t applicable.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. In the Attributes related list, enter these values.
   - If the connection record is for data inlet management and batch ingestion, enter **API Key** and **Organization ID**.
   - If the connection record is for data collection, enter **Organization ID**.

6. Right-click the form header and click **Save**.

The Adobe Experience Platform spoke is set up and integrated with the ServiceNow instance.

**Adobe Sign spoke v1.0.2**

Automate the process of sending a legal document to an individual or list of recipients for digital signature using Adobe Sign. For example, automate employee onboarding and offboarding, or sending non-disclosure agreements, legal agreements, and statements of work for digital signature. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Compatible versions

This spoke was built for Adobe Sign API version v6, but may be compatible with later versions.

Key features

Adobe Sign spoke enables a flow designer to:

- Automate the process of sending a legal document to an individual or list of recipients for digital signature.
- Copy and customize sample flows for sending transient documents or Adobe Sign library documents for digital signature.
- Discover and synchronize the Adobe Sign documents.
- Pause a flow until an agreement or document is signed. A scripted REST API webhook waits for the recipient to sign the document.
- Use values from a signed document in a flow.
- Manage the life cycle of documents in Adobe Sign from the ServiceNow instance.

Spoke requirements

- Adobe Sign account
- Adobe Sign account admin credentials to perform the required account specific tasks in Adobe Sign
- Adobe Sign group admin credentials to perform the required group specific tasks in Adobe Sign
Note: Account admin or group admin can add users to the groups. These users can access information specific to their group only.

- Adobe Sign application configured to integrate with ServiceNow
- Adobe Sign application details such as application ID and client secret.
- ServiceNow admin credentials to create and synchronize the required Adobe Sign groups with ServiceNow

Note:
- This is the default admin role that is created when the Adobe Sign spoke is activated.
- ServiceNow admin has access to information about all Adobe Sign groups synchronized with ServiceNow and all tables part of the Adobe Sign spoke.
- User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. Group users have access to information specific to their Adobe Sign groups only and can view only the group-specific data from the tables that are part of the Adobe Sign spoke.

- IntegrationHub subscription

See the Adobe Sign development documentation for instructions on creating and configuring custom applications.

Spoke flows

The Adobe Sign spoke provides sample flows to demonstrate automating the Adobe Sign tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adobe Sign - Send NDA Demo</td>
<td>Sends a statement of work for digital signature using an Adobe Sign library document when a Service Catalog request is created by the Adobe Sign - Statement of Work Demo item. Before using this flow, activate the Adobe Sign - Statement of Work Demo catalog item.</td>
</tr>
<tr>
<td>Adobe Sign - Statement of Work Demo</td>
<td>Sends a non-disclosure agreement for digital signature using an Adobe Sign library document when a Service Catalog request is created by the Adobe Sign - Statement of Work Demo item. Before using this flow, activate the Adobe Sign - Statement of Work Demo catalog item.</td>
</tr>
</tbody>
</table>

The Adobe Sign spoke adds catalog items for use with the Adobe Sign spoke sample flows. Before triggering an Adobe Sign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog Item</th>
<th>Description</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adobe Sign - Send NDA Demo</td>
<td>Sends a non-disclosure agreement for digital signature using a Adobe Sign library document.</td>
</tr>
</tbody>
</table>

**Spoke subflows**

The Adobe Sign spoke provides a sample subflow to demonstrate automating Adobe Sign tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Get Documents Per Group. The subflow retrieves documents relevant to an Adobe Sign group and stores them in the AdobeSign Documents table.

**Spoke actions**

The Adobe Sign spoke provides actions to automate Adobe Sign tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Management</td>
<td>Attach Adobe Sign Document To Agreement Record</td>
<td>Downloads an Adobe Sign document and attaches it to the relevant ServiceNow agreement record.</td>
</tr>
<tr>
<td></td>
<td>Convert Transient to Library Document</td>
<td>Converts a transient document to a library document. Ensures that the document is available in the library for more than the stipulated transient 7-day purging period.</td>
</tr>
<tr>
<td></td>
<td>Get Library Documents</td>
<td>Discovers the documents and document templates from Adobe Sign. Populates ServiceNow tables with the document names and descriptions.</td>
</tr>
<tr>
<td></td>
<td>Lookup Agreement ID</td>
<td>Retrieves the agreement ID from the ServiceNow Agreement table.</td>
</tr>
<tr>
<td></td>
<td>Look Up Library Document ID</td>
<td>Retrieves the library document ID from the ServiceNow Documents table.</td>
</tr>
<tr>
<td></td>
<td>Set Agreement Field</td>
<td>Creates a list of fields for a draft agreement.</td>
</tr>
</tbody>
</table>

*Note: Access to the documents is based on the group user roles.*
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signature Management</td>
<td>Download Attachment As Transient Document</td>
<td>Uploads an attachment to Adobe Sign as a transient document. The transient document is available for a period of 7 days.</td>
</tr>
<tr>
<td></td>
<td>Add Participant to Agreement</td>
<td>Builds a participant list iteratively over time and adds a participant to the local ServiceNow agreement record.</td>
</tr>
<tr>
<td></td>
<td>Check Agreement Status</td>
<td>Retrieves the status of an agreement.</td>
</tr>
<tr>
<td></td>
<td>Create Draft Agreement</td>
<td>Creates an agreement in the draft state in Adobe Sign and draft record in the ServiceNow Agreement table.</td>
</tr>
<tr>
<td></td>
<td>Finalize Draft and Send Agreement</td>
<td>Sends a draft agreement to the participant list for signature.</td>
</tr>
<tr>
<td></td>
<td>Get Form Field Value From An Agreement</td>
<td>Retrieves value of the required field from an existing agreement in Adobe Sign.</td>
</tr>
<tr>
<td></td>
<td>Get Signing URL</td>
<td>Creates an embedded signing URL for in-person signing.</td>
</tr>
<tr>
<td></td>
<td>Cancel Agreement</td>
<td>Cancels an agreement that has been sent for signature.</td>
</tr>
<tr>
<td></td>
<td>Wait For Signature From Adobe Sign</td>
<td>Waits for the Adobe Sign webhook until the participant has either signed or rejected the document. Updates the status in the ServiceNow Agreement table.</td>
</tr>
<tr>
<td></td>
<td>Send Agreement</td>
<td>Sends document for signature to one or more participants.</td>
</tr>
<tr>
<td>User Management</td>
<td>Activate A User</td>
<td>Activates an existing user in Adobe Sign.</td>
</tr>
<tr>
<td></td>
<td>Deactivate A User</td>
<td>Deactivates an existing user in Adobe Sign.</td>
</tr>
<tr>
<td></td>
<td>Lookup User ID by Email</td>
<td>Retrieves the user ID of an existing user in Adobe Sign.</td>
</tr>
<tr>
<td>Webhook Management</td>
<td>Create Webhook</td>
<td>Creates a webhook to notify the signing events in Adobe Sign.</td>
</tr>
<tr>
<td></td>
<td>Remove Webhook</td>
<td>Removes a webhook from Adobe Sign.</td>
</tr>
</tbody>
</table>
Spoke module

The Adobe Sign spoke adds a Adobe Sign module to your ServiceNow instance. The Adobe Sign spoke synchronizes and stores information about groups, documents, and agreements in ServiceNow. The Adobe Sign spoke includes the these tables:

- Agreements (sn_adobesign_spoke_agreement)
- Documents (sn_adobesign_spoke_adobe_sign_documents)
- Groups (sn_adobesign_spoke_adobesign_group_details)
- Client Details (sn_adobesign_spoke_client_details)

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agreements</td>
<td>Adobe Sign agreements from the synchronized Adobe Sign groups and accounts. Records in the Agreements table are updated with the signing status only when webhook is configured for the Adobe Sign account.</td>
<td>Name, Agreement ID, Declined Reason, Status, Participants Info, Next Signer, Group Name</td>
</tr>
<tr>
<td>Documents</td>
<td>Adobe Sign documents from the synchronized Adobe Sign groups and accounts. To synchronize accounts, see Synchronize Adobe Sign with ServiceNow. The Get Documents Per Group subflow retrieves a list of documents in each Adobe Sign group.</td>
<td>Document ID, Document Owner, Document Last Modified, Group, Document Name, Document Type</td>
</tr>
</tbody>
</table>

Note: Access to the documents is based on the group user roles.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
### Groups and user roles

Create a group in your ServiceNow instance to synchronize the group with the corresponding group in Adobe Sign.

User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. For example, a HR group user role, sn_adobesign_spoke.HR, is created when the HR group is created in ServiceNow. ServiceNow admin can assign these group user roles to users and control access to the group-specific information such as:

- Documents and agreements
- Connection and credential aliases
- Credential records
- Application registries
- Data in tables of the Adobe Sign spoke

To run flows and subflows, group users must also have these roles:

- connection_admin
- credential_admin
- flow_designer
- oauth_admin
- script_debugger
- view_changer

Only ServiceNow admin has access to information about all Adobe Sign groups that are synchronised with the ServiceNow instance.

---

<table>

<td>• Authentication Key</td>
</tr>
</tbody>
</table>
Adobe Sign account requirements

The Adobe Sign spoke requires creating a custom app on your Adobe Sign account to generate OAuth 2.0 tokens.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Note: A connection and credential alias is specific to a group in Adobe Sign.

A sample connection and credential alias is provided for demonstration purpose. ServiceNow admin must create an alias for each Adobe Sign group to synchronize that group with the ServiceNow instance. For example, you can have different connection and credential alias records one for each BU in your organization such as HR, Legal, Finance and so on.

Synchronize Adobe Sign group with ServiceNow

Synchronize ServiceNow with the required group in Adobe Sign to access the group specific documents, and agreements from the Adobe Sign spoke.

- Request IntegrationHub subscription
- Activate the Adobe Sign spoke
- Role required: admin

These steps are performed to synchronize only one Adobe Sign group. To synchronize another Adobe Sign group, repeat this process.

Create custom OAuth application in Adobe Sign account

Create a custom OAuth application from your Adobe Sign account to enable OAuth 2.0 authentication with the Adobe Sign spoke.

- Adobe Sign account
- Adobe Sign admin credentials

Complete these steps from your Adobe Sign account. See the Adobe Sign development documentation for instructions on creating and configuring custom applications.

1. From your Adobe Sign account, create an application.
2. Copy and record the Application ID and Application Secret for later use. These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

The custom OAuth application from your Adobe Sign account is created and can be integrated with the ServiceNow instance.

Configure webhook in Adobe Sign application

Configure the webhook in your Adobe Sign application to enable Adobe Sign to send data to ServiceNow when a participant signs an agreement or document.

Role required: admin
If the scope of the Adobe Sign application is Account, use the same webhook for all the groups defined within the account scope. If the scope of the Adobe Sign application is Group, you must configure for each group.

1. Navigate to **System Web Services > Scripted REST APIs**.
2. Open the Adobe Sign record.
3. Copy and record the **Base API path**.
4. From your Adobe Sign account, create a webhook with these configurations.
   a) Enter the target URL in **URL** in this format: https://<instance-name>.service-now.com/<Base-API-path>.
   b) Select **Agreement all events** in **Events**.
   c) Select all the required agreement events in **Notification Parameters**.

   See the Adobe Sign development documentation for more information about creating webhooks in your Adobe Sign account.

Webhook is created in your Adobe Sign account and signing events in Adobe Sign are updated in the tables of the Adobe Sign spoke.

**Register Adobe Sign as OAuth provider**

Use the information generated during Adobe Sign account configuration to register Adobe Sign as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   The system displays the message What kind of OAuth application?
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Adobe Sign OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during the Adobe Sign account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Application Secret created during the Adobe Sign account configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization. Note: You can use only Authorization Code as the Default Grant type when PKCE is enabled.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Adobe Sign Spoke.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from. Note: You must ensure that the application scope is Adobe Sign Spoke.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. System generates the URL upon saving the application registry.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

5. Insert records for group scope modifiers in the OAuth Entity Scopes related list in this format, `<scope>;<modifier>`. For example, if the user_read scope for the Group modifier is enabled in the Adobe Sign application, insert the following record in the OAuth Entity Scopes related list.
6. Right-click the form header, and click **Save**. The system validates the OAuth credentials and populates the **Redirect URL**.

7. Copy and record the **Redirect URL**.

8. Login to your Adobe Sign account and edit the configuration of your custom Adobe Sign application. See the Adobe Sign development documentation for instructions.

The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

**Create Credential records for the Adobe Sign spoke**

Authorize the Adobe Sign spoke actions by creating credential records for the application registered in Adobe Sign. The Adobe Sign spoke connection and credential alias uses these credentials to authorize actions.

**Role required**: admin

1. Navigate to **Connections & Credentials > Credentials**.

2. Click **New**. The system displays the message **What type of Credentials would you like to create?**.

3. Select **OAuth 2.0 Credentials**.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Adobe Sign Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Adobe Sign spoke as an OAuth provider. For example, select Adobe Sign OAuth profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Save**.

6. To generate the OAuth token, click the **Get OAuth Token** related link.

The credential record for the Adobe Sign spoke is created.

**Create Connection and Credential Alias for Adobe Sign group**

Manage connection and credential information of an Adobe Sign group to authorize the group-specific actions by creating connection and credential alias for the Adobe Sign group.

**Role required**: admin

A sample connection and credential alias is provided for demonstration purpose. If you are using the sample alias, it is not necessary to create a connection and credential alias. However,
admin must create an alias for every other Adobe Sign group to synchronize that group with the ServiceNow instance.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Click **New**.
3. On the form, fill in the fields.

**Connection & Credential Aliases form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the alias. For example, AdobeSign_Legal.</td>
</tr>
<tr>
<td>ID</td>
<td>System generated unique ID.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Adobe Sign Spoke.</td>
</tr>
<tr>
<td>Type</td>
<td>Alias type. Select Connection and Credential.</td>
</tr>
<tr>
<td>Connection type</td>
<td>Connection type. Select HTTP.</td>
</tr>
<tr>
<td>Support Multiple Active Connections</td>
<td>Option to specify if the alias supports multiple active connections.</td>
</tr>
</tbody>
</table>

4. Click **Save**.

The connection and credential alias is created for the Adobe Sign group and the group can be synchronised with the ServiceNow instance.

**Create Connection record and Connection Attributes for the Adobe Sign spoke**

Perform actions in Adobe Sign by creating connection records and connection attributes for your Adobe Sign group. The Adobe Sign spoke connection and credential alias uses these connections to perform actions on Adobe Sign.

Role required: **admin**

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for Adobe Sign.
3. In the Connections related list, click **New**.
4. On the form, fill in the fields.

**HTTP(s) Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Adobe Sign Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Adobe Sign spoke. For example, Adobe Sign Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><img src="https://api.eul.echosign.com/" alt="Note: Do not select the check box." /></td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL. For example, <a href="https://api.eul.echosign.com/">https://api.eul.echosign.com/</a>.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
6. In the Connections Attributes related list, click **New**.
7. On the form, fill in the fields.

**Connection Attributes form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Connection attribute type. Select <strong>String</strong>.</td>
</tr>
<tr>
<td>Label</td>
<td>Name to identify the connection attribute. Enter <strong>Version</strong>.</td>
</tr>
<tr>
<td>Column name</td>
<td>System generated value that is based on the value entered in <strong>Label</strong>.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection attribute.</td>
</tr>
<tr>
<td>Read only</td>
<td>Option to disable modifications to the connection attribute. Enter <strong>false</strong>.</td>
</tr>
<tr>
<td>Default value</td>
<td>Default value of the connection attribute. Enter v6.</td>
</tr>
</tbody>
</table>

8. Click **Submit**.

The connection record and connection attribute is created for the connection and credential alias.

**Configure Application Access to ServiceNow tables**

Allow Adobe Sign spoke to create group admin user role when an Adobe Sign group is synchronized with ServiceNow tables by configuring the application access of the required ServiceNow tables.

Role required: **admin**

1. Navigate to **System Definition > Tables**.
2. For each of the following tables, ensure that the **Can read**, **Can create**, and **Can update** options are selected in the Application Access related list.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Role</td>
<td>sys_user_role</td>
</tr>
<tr>
<td>Access Control</td>
<td>sys_security_acl</td>
</tr>
</tbody>
</table>
3. Click Update.

Application access of the required ServiceNow tables is configured.

Create Adobe Sign group in ServiceNow

Synchronize ServiceNow with the required group in Adobe Sign by creating a record in the AdobeSign Group Details (sn_adobesign_spoke_adobesign_group_details) table.

Role required: admin

1. Navigate to Adobe Sign Spoke > Groups.
2. Click New.
3. On the form, fill in the fields.

AdobeSign Group Details form

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Roles</td>
<td>sys_security_acl_role</td>
</tr>
<tr>
<td>Application Menu</td>
<td>sys_app_application</td>
</tr>
<tr>
<td>Module</td>
<td>sys_app_module</td>
</tr>
</tbody>
</table>

The required Adobe Sign group is created in ServiceNow and can be managed from the Adobe Sign spoke.

User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. For example, a HR group user role, sn_adobesign_spoke.HR, is created when the HR group is created in ServiceNow. ServiceNow admin can assign these group user roles to users and control access to the group-specific information such as:

- Documents and agreements
- Connection and credential aliases
- Credential records
- Application registries
- Data in tables of the Adobe Sign spoke

To run flows and subflows, group users must also have these roles:

- connection_admin
- credential_admin
- flow_designer
- oauth_admin
- script_debugger
- view_changer

Only ServiceNow admin has access to information about all Adobe Sign groups that are synchronised with the ServiceNow instance.
Synchronize documents in Adobe Sign group with ServiceNow

Synchronize ServiceNow with the required group in Adobe Sign to access the documents and agreements that are specific to the group, from the Adobe Sign spoke.

Role required: admin

Ensure that the groups are setup and configured with their respective connection and credential aliases before synchronizing the group documents.

1. Navigate to Adobe Sign Spoke > Documents.
   The AdobeSign Documents (sn_adobesign_spoke_adobe_sign_documents) table opens.
2. Click the Get Documents related list.

   Note:
   - If you have logged in as an admin, you can synchronize the documents of all Adobe Sign groups.
   - If you have logged in as a group admin, you can synchronize only those documents that are specific to your Adobe Sign groups.

Details of all documents specific to the required Adobe Sign groups are synchronized with ServiceNow.

Activate Adobe Sign spoke catalog items

Trigger events in Adobe Sign when an item is requested in Service Catalog. For example, the Adobe Sign - Statement of Work Demo catalog item triggers a sample flow that sends a Adobe Sign document to a designated recipient.

- Synchronize Adobe Sign group with ServiceNow
- Role required: admin

The Adobe Sign spoke adds catalog items for use with the Adobe Sign spoke sample flows. Before triggering a sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adobe Sign - Send NDA Demo</td>
<td>Sends a non-disclosure agreement for digital signature using a Adobe Sign library document.</td>
</tr>
</tbody>
</table>

1. Navigate to Self-Service > Service Catalog.
2. Click the add content icon
4. Click Add here.
5. Search for and select Adobe Sign - Send NDA Demo.
6. Click Add here.

When one of these items is requested in the Service Catalog, the associated Adobe Sign spoke sample flow is triggered and necessary actions are performed in Adobe Sign.
Ansible spoke

Integrate your ServiceNow instance with Ansible Tower. Automate Ansible Tower tasks when events occur in ServiceNow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Supported version

This spoke was built for Ansible Tower v2, but may be compatible with later versions.

Spoke requirements

- Ansible Tower
- Ansible Tower administrator credentials to create a custom application
- Application information such as Client ID and Client Secret

Spoke actions

The Ansible spoke provides actions to automate Ansible Tower tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ansible Tower</td>
<td>Cancel Job</td>
<td>Cancels the required job in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Create Job Template</td>
<td>Creates a job template in Ansible Tower.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a user in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the required user in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Get Job</td>
<td>Retrieves details of the required job in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Get Status From Ad-Hoc Command</td>
<td>Retrieves the run status of an ad-hoc command.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get User</td>
<td>Retrieves details of the required user in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Launch Job Template</td>
<td>Launches a job template in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>List Hosts From Inventory</td>
<td>Retrieves list of hosts from an inventory in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>List Instance Groups From</td>
<td>Retrieves list of instance groups from an inventory in the Ansible Tower</td>
</tr>
<tr>
<td></td>
<td>Inventory</td>
<td>environment.</td>
</tr>
<tr>
<td></td>
<td>List Job Templates</td>
<td>Retrieves the list of job templates.</td>
</tr>
<tr>
<td></td>
<td>List Jobs</td>
<td>Retrieves the list of jobs.</td>
</tr>
<tr>
<td></td>
<td>List Users</td>
<td>Retrieves the list of users.</td>
</tr>
<tr>
<td></td>
<td>Relaunch Job</td>
<td>Relaunches job in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Run An Ad-Hoc Command</td>
<td>Runs an ad hoc command on one or more target devices.</td>
</tr>
<tr>
<td></td>
<td>Schedule Job</td>
<td>Schedules a job in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates details of the required user in the Ansible Tower environment.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Credentials</td>
<td>Retrieves credentials in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Get Inventories</td>
<td>Retrieves inventories in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Get Projects</td>
<td>Retrieves projects in the Ansible Tower environment.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up the Ansible spoke**

Integrate the instance and Ansible Tower by creating a custom OAuth application to authenticate ServiceNow requests.

- Request an IntegrationHub subscription
- Activate the Ansible spoke
Create a custom application in Ansible Tower
Obtain OAuth 2 token by creating a custom application in Ansible Tower.

Role required: admin

1. Create an application in Ansible Tower. See Ansible documentation for information on creating and configuring an application.
   a) Select Authorization code for Authorization Grant Type.
   b) Specify the ServiceNow instance URL in Redirect URI in this format, https://<instance-name>.service-now.com/api/sn_ansible_spoke/ansible_oauth_redirect. For more information on obtaining the Redirect URI, see Register Ansible Tower as OAuth provider.

2. Upon creating the application, access the application information.
3. Copy and record the Client ID and Client Secret for later use. These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

The custom OAuth application from your Ansible Tower is created and can be integrated with the ServiceNow instance.

Register Ansible Tower as OAuth provider
Use the information generated during Ansible Tower application configuration to register Ansible Tower as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to System OAuth > Application Registry.
2. Open for the record for Ansible.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Ansible Tower OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the application in Ansible Tower.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret of the application in Ansible Tower.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

Note: You can use only Authorization Code as the Default Grant type when PKCE is enabled.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select <strong>Ansible Tower Spoke</strong>.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the registry record.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. For example, https://&lt;Ansible-Tower-Instance&gt;.com/api/o/token/.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.
5. Paste the Redirect URL value into the **Redirect URI** for your custom Ansible Tower application. For example, paste https://<instance-name>.service-now.com/api/sn_ansible_spoke/ansible_oauth_redirect.

The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

---

**Create Credential record for the Ansible spoke**

Create Credential records for your application in Ansible Tower. The Ansible spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Ansible**.
3. From the **Credentials** tab, click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>Ansible Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Ansible spoke as an OAuth provider. For example, select <strong>Ansible OAuth profile</strong>.</td>
</tr>
</tbody>
</table>
6. Right-click the form header and click Save.
7. To generate the OAuth token, click the Get OAuth Token related link.

**Note:** If you are setting up the spoke for the first time, you will be prompted to provide the ServiceNow instance credentials. Provide the credentials.

The credential record the Ansible spoke spoke is created.

**Create Connection record for the Ansible spoke**
Create Connection record for your application in Ansible Tower. The Ansible spoke connection and credential alias uses these connections to perform actions in Ansible Tower.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Ansible.
3. From the Connections tab, click New.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Ansible Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Ansible Tower. For example, select Ansible Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the Ansible Tower instance.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**Amazon EBS spoke**
Manage block level storage volumes and snapshots in Amazon EBS from your ServiceNow instance.

**Request apps on the Store**
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

**Note:** If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

- User with full access to Amazon EC2.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke actions

The Amazon EBS spoke provides actions to automate Amazon EBS tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic Block Store Management</td>
<td>Attach Volume</td>
<td>Attaches an EBS volume to a running or stopped instance.</td>
</tr>
<tr>
<td></td>
<td>Create Snapshot</td>
<td>Creates a snapshot of an EBS volume.</td>
</tr>
<tr>
<td></td>
<td>Create Volume</td>
<td>Creates an EBS volume that can be attached to an instance in the same Availability Zone.</td>
</tr>
<tr>
<td></td>
<td>Delete Snapshot</td>
<td>Deletes the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Delete Volume</td>
<td>Deletes the specified EBS volume.</td>

<tr>
<td></td>
<td>Detach Volume</td>
<td>Detaches an EBS volume from an instance.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

### Set up the Amazon EBS spoke

Integrate the ServiceNow instance and Amazon EBS using AWS credential to authenticate ServiceNow requests.

- Request an IntegrationHub subscription
- Activate the Amazon EBS spoke
- Role required: admin

Create Credential record for the Amazon EBS spoke

Create Credential record for your Amazon EBS account. The Amazon EBS spoke connection and credential alias uses this credential to perform actions on Amazon EBS.

1. Navigate to [Connections & Credentials > Connection & Credential Aliases](#).
2. Open for the record for [Amazon EBS](#).
3. From the [Credentials](#) tab, click New.
   The system displays the message *What type of Credentials would you like to create?*.  
4. Select [AWS Credentials](#).
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter EBS Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon EC2.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon EC2.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AmazonEBSAuthAlgo.</td>
</tr>
</tbody>
</table>

**Note:** Users are cautioned against directly modifying the default authentication algorithm.
6. Click Submit.

The credential record the Amazon EBS spoke is created.

**Amazon EC2 spoke**

Integrate ServiceNow instance with Amazon Elastic Compute Cloud (EC2). Manage Amazon instances, Amazon Machine Images (AMIs), Key Pairs, and Tags from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Supported Versions**

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

**Spoke requirements**

- User with full access to Amazon EC2.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

**Spoke flows and subflows**

This spoke has no flows and subflows.
### Spoke actions

The Amazon EC2 spoke provides actions to automate Amazon EC2 tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon Machine Image Management</td>
<td>Copy Image</td>
<td>Copies an Amazon Machine Image (AMI) from the specified source region to the current region.</td>
</tr>
<tr>
<td></td>
<td>Create Image</td>
<td>Creates an Amazon EBS supported AMI from an Amazon EBS supported instance that is either running or stopped.</td>
</tr>
<tr>
<td></td>
<td>Deregister Image</td>
<td>Deregisters the specified AMI.</td>
</tr>
<tr>
<td></td>
<td>List Image Attribute</td>
<td>Retrieves the specified AMI attribute.</td>
</tr>
<tr>
<td></td>
<td>List Images</td>
<td>Retrieves the specified AMIs.</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Get Instance Attribute</td>
<td>Retrieves the specified attribute of the specified instance.</td>
</tr>
<tr>
<td></td>
<td>Get Instances Status</td>
<td>Retrieves the status of the specified instance.</td>
</tr>
<tr>
<td></td>
<td>Get Password Data</td>
<td>Retrieves the encrypted administrator password for an active Windows instance.</td>
</tr>
<tr>
<td></td>
<td>List Instance Types</td>
<td>Retrieves the list of all instance types in an AWS region.</td>
</tr>
<tr>
<td></td>
<td>List Instances</td>
<td>Retrieves a list of all instances.</td>
</tr>
<tr>
<td></td>
<td>Monitor Instances</td>
<td>Enables monitoring for all active instances.</td>
</tr>
<tr>
<td></td>
<td>Reboot Instances</td>
<td>Reboots the specified instances.</td>
</tr>
<tr>
<td></td>
<td>Run Instances</td>
<td>Launches the specified number of instances using an AMI.</td>
</tr>
<tr>
<td></td>
<td>Stops Instances</td>
<td>Stops the specified instances.</td>
</tr>
<tr>
<td></td>
<td>Terminate Instances</td>
<td>Shutdowns or terminates the specified instances.</td>
</tr>
<tr>
<td></td>
<td>Unmonitor Instances</td>
<td>Disables monitoring for the specified running instances.</td>
</tr>
</tbody>
</table>
### Category | Action | Description
---|---|---
Update Instance Attribute | Updates the specified attribute for the specified instance. 
   | **Note:** You can specify only one attribute at a time. Before you update an attribute, ensure that the instance is stopped.
Key Pair Management | Create Key Pair | Creates a 2048-bit SSH-2 RSA key pair.
Delete Key Pair | Deletes the specified key pair.
List Key Pair | Retrieves the specified key pair or a list of all key pairs.
Region and Availability Zone Management | Get Availability Zones | Retrieves the list of availability zones in the specified AWS region.
List Regions | Retrieves the list of all AWS regions.
Tag Management | Create Tags | Adds or overwrites the specified set of tags from the specified set of resources.
Delete Tags | Deletes the specified set of tags from the specified set of resources.
List Tags | Retrieves the list of tags for the specified region.

### Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

### Setup the Amazon EC2 spoke
Integrate the ServiceNow instance and Amazon EC2 using AWS credentials to authenticate ServiceNow requests.
- Request an IntegrationHub Enterprise subscription
- Activate the Amazon EC2 spoke
- Role required: admin

_Create Credentials record for the Amazon EC2 spoke_
Create Credential records for the Amazon EC2 instance. The Amazon EC2 spoke connection and credential alias uses these credentials to authorize actions._
Role required: admin

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record for AWS EC2.
3. From the **Credentials** tab, click **New**.
   The system displays the message *What type of Credentials would you like to create?*.
4. Select **AWS Credentials**.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>AWS Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to EC2.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to EC2.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>AmazonEC2AuthAlgo</strong>.</td>
</tr>
</tbody>
</table>

**Note:** Do not directly modify the default authentication algorithm.

6. Click **Submit**.

**AWS IAM spoke**

Integrate ServiceNow instance with AWS IAM to manage access to AWS services and resources securely. Manage groups, policies, and roles in AWS IAM from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported version**

This spoke was built for API version 2010-05-08, but may be compatible with later versions.

**Note:** If you use different API version, ensure that you change the API version in all spoke actions.
Spoke requirements

- User with full access to IAM.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see AWS Identity and Access Management Documentation site.

Spoke subflows

The Jenkins spoke provides sample subflows to demonstrate automating AWS IAM tasks. Available subflows are:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete Group</td>
<td>Deletes the specified AWS IAM group.</td>
</tr>
<tr>
<td>Delete User</td>
<td>Deletes the specified AWS IAM user.</td>
</tr>
<tr>
<td>Delete Policy</td>
<td>Deletes the specified policy from the AWS IAM account.</td>
</tr>
</tbody>
</table>

Spoke actions

The AWS IAM spoke provides actions to automate AWS IAM tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds user to a group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Get Group</td>
<td>Searches for the required group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Get Group Users</td>
<td>Lists all the users in the required group.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes a user from a group in AWS IAM.</td>
</tr>
<tr>
<td>Group Policy Management</td>
<td>Attach Inline Policy In Group</td>
<td>Adds or updates an inline policy document embedded in the specified IAM group.</td>
</tr>
<tr>
<td></td>
<td>Attach Policy To Group</td>
<td>Attaches the specified managed policy to the required IAM group.</td>
</tr>
<tr>
<td></td>
<td>Detach Inline Policy From Group</td>
<td>Deletes the specified inline policy from the specified AWS IAM group.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Detach Policy From Group</td>
<td>Detaches the specified managed policy from the required IAM group.</td>
</tr>
<tr>
<td></td>
<td>List Attached Group Policies</td>
<td>Retrieves the list of all policies attached to the IAM group.</td>
</tr>
<tr>
<td></td>
<td>List Group Policies</td>
<td>Retrieves all the inline policies of the specified group. If none exists, the operation returns an empty list.</td>
</tr>
<tr>
<td>Policy Management</td>
<td>Create Policy</td>
<td>Creates managed policy in the specified IAM group.</td>
</tr>
<tr>
<td></td>
<td>Delete Policy</td>
<td>Deletes specified Policy from AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Detach Policy From Roles</td>
<td>Detaches the specified managed policy from the specified IAM Role.</td>
</tr>
<tr>
<td></td>
<td>List Entities For Policy</td>
<td>Lists all entities (Users, Group, and Roles) attached to this policy.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Deactivate MFA Device</td>
<td>Deactivates the required MFA device attached to a user.</td>
</tr>
<tr>
<td></td>
<td>Delete Access Key For User</td>
<td>Deletes the access key of the AWS IAM user.</td>
</tr>
<tr>
<td></td>
<td>Delete Login Profile</td>
<td>Deletes the password for the specified IAM user, which terminates the user's ability to access AWS services through the AWS Management Console.</td>
</tr>
<tr>
<td></td>
<td>Delete Service Specific</td>
<td>Deletes the required service-specific credential.</td>
</tr>
<tr>
<td></td>
<td>Credential</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Delete Signing Certificate</td>
<td>Deletes a signing certificate associated with the specified IAM user.</td>
</tr>
<tr>
<td></td>
<td>Delete SSH Public Key</td>
<td>Deletes the specified SSH public key.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the required IAM User.</td>
</tr>
<tr>
<td></td>
<td>Delete Virtual MFA Device By</td>
<td>Deletes the specified Virtual MFA device.</td>
</tr>
<tr>
<td></td>
<td>User</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Detach Policy From User</td>
<td>Detaches the specified managed policy from the specified IAM role.</td>
</tr>
<tr>
<td></td>
<td>Get User</td>
<td>Searches for the required user in the AWS IAM.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>List Access Keys By User</td>
<td>Lists the access key of the AWS IAM user.</td>
</tr>
<tr>
<td></td>
<td>List Groups For User</td>
<td>Retrieves the list of all the groups, a particular user belongs to.</td>
</tr>
<tr>
<td></td>
<td>List Inline User Policies</td>
<td>Retrieves all the inline policies of the specified IAM user. If none exists, the operation returns an empty list.</td>
</tr>
<tr>
<td></td>
<td>List MFA Devices By User</td>
<td>Retrieves information about the MFA services associated with the specified IAM user. If none exists, the operation returns an empty list.</td>
</tr>
<tr>
<td></td>
<td>List Service Specific Credentials</td>
<td>Retrieves information about the service-specific credentials associated with the specified IAM user.</td>
</tr>
<tr>
<td></td>
<td>List Signing Certificates By User</td>
<td>Retrieves information about the signing certificates associated with the specified IAM user. If none exists, the operation returns an empty list.</td>
</tr>
<tr>
<td></td>
<td>List SSH Public Keys By User</td>
<td>Retrieves information about the SSH public keys associated with the specified IAM user. If none exists, the operation returns an empty list.</td>
</tr>
<tr>
<td>User Policy Management</td>
<td>Attach Policy To User</td>
<td>Attaches the specified managed policy to the specified user.</td>
</tr>
<tr>
<td></td>
<td>Delete Inline User Policy</td>
<td>Deletes an inline policy attached to the user.</td>
</tr>
<tr>
<td></td>
<td>List Attached User Policies</td>
<td>Retrieves all the attached policies of the user.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).
**MID Server requirements**

These actions use REST calls, which can run on a MID Server. Use the connection record associated with the AWS IAM alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

**Set up the AWS IAM spoke**

Integrate the ServiceNow instance and AWS IAM using AWS credential to authenticate ServiceNow requests.

- Request an IntegrationHub subscription
- Activate the AWS IAM spoke
- Role required: admin

*Create Credential record for the AWS IAM spoke*

Create Credential record for your AWS IAM account. The AWS IAM spoke connection and credential alias uses this credential to perform actions on AWS IAM.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **AWS IAM**.
3. From the **Credentials** tab, click **New**.
   - The system displays the message **What type of Credentials would you like to create?**.
4. Select **AWS Credentials**.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>AWS Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to IAM.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to IAM.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>AWS IAM Auth Algo</strong>.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

The credential record the AWS IAM spoke is created.
Amazon RDS spoke
Integrate ServiceNow instance with Amazon Relational Database Service (RDS). Manage the process of performing various operations like set up, operate, and scale on Amazon RDS using this spoke.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported Versions
This spoke was built for API version 2014-09-01 and 2014-10-31, but may be compatible with later versions.

Spoke Requirements
- User with full access to Amazon RDS.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

Spoke flows and subflows
This spoke has no flows and subflows.
Spoke actions

The Amazon RDS spoke provides actions to automate Amazon RDS tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>List Account Attributes</td>
<td>Retrieves the list of attributes of an account.</td>
</tr>
<tr>
<td></td>
<td>List Certificates</td>
<td>Retrieves the list of certificates of an account.</td>
</tr>
<tr>
<td>DB Engines Management</td>
<td>List DB Engines</td>
<td>Retrieves the list of available database (DB) engines.</td>
</tr>
<tr>
<td>DB Instance Management</td>
<td>Create DB Instance</td>
<td>Creates an instance of DB.</td>
</tr>
<tr>
<td></td>
<td>Create DB Instance Read Replica</td>
<td>Creates a read replica of a DB instance.</td>
</tr>
<tr>
<td></td>
<td>Delete DB Instance</td>
<td>Deletes an existing provisioned DB instance.</td>
</tr>
<tr>
<td></td>
<td>List DB Instances</td>
<td>Retrieves the list of provisioned DB instances.</td>
</tr>
<tr>
<td></td>
<td>List Reserved DB Instances</td>
<td>Retrieves the list of reserved DB instances.</td>
</tr>
<tr>
<td></td>
<td>Promote DB Instance Read Replica</td>
<td>Promotes a read replica of a DB instance to standalone DB instance.</td>
</tr>
<tr>
<td></td>
<td>Reboot DB Instance</td>
<td>Reboots a DB instance.</td>
</tr>
<tr>
<td></td>
<td>Restore DB Instance From DB Snapshot</td>
<td>Creates a DB instance from a DB snapshot.</td>
</tr>
<tr>
<td></td>
<td>Start DB Instance</td>
<td>Starts a DB instance.</td>
</tr>
<tr>
<td></td>
<td>Stop DB Instance</td>
<td>Stops a DB instance.</td>
</tr>
<tr>
<td>DB Snapshots Management</td>
<td>Create DB Snapshot</td>
<td>Creates a snapshot of a DB instance.</td>
</tr>
<tr>
<td></td>
<td>Delete DB Snapshot</td>
<td>Deletes a snapshot of a DB instance.</td>
</tr>
<tr>
<td></td>
<td>List DB Snapshots</td>
<td>Retrieves the list of snapshots of a DB instance.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>

</tbody>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Amazon RDS spoke

Integrate the ServiceNow instance and Amazon RDS using AWS credentials to authenticate ServiceNow requests.

- Request an IntegrationHub Enterprise subscription
- Activate the Amazon RDS spoke
- Role required: admin

Create Credentials records for the Amazon RDS spoke

Create Credential records for the Amazon RDS instance. The Amazon RDS spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin

1. Navigate to Connections & Credentials > Connection & Credentials Aliases.
2. Open for the record for Amazon RDS.
3. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?
4. Select AWS Credentials.
5. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter AWS Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon RDS.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon RDS.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select Amazon RDS Auth Algorithm.</td>
</tr>
</tbody>
</table>

6. Click Submit.

Amazon SNS spoke

Integrate ServiceNow with Amazon SNS. Manage topics and subscriptions, and delegate roles in Amazon SNS from your ServiceNow instance.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported version

This spoke was built for API version 2010-03-31, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon SNS.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For information about creating and accessing keys, see the AWS Security Credentials documentation.

Spoke subflows

The Amazon SNS spoke provides a sample subflow to demonstrate automating Amazon SNS tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Amazon SNS Subscription. The subflow receives three types of messages; Notification, Subscription Confirmation, and Unsubscribe Confirmation. This subflow is triggered when you configure your ServiceNow instance to receive events from Amazon SNS. For more information about the required configurations, see Receive events at your ServiceNow instance from Amazon SNS.

Note: Spoke subflow can be used independently to subscribe for notifications from Amazon SNS. For more information about the configurations, see Receive events at your ServiceNow instance from Amazon SNS.

Spoke actions

The Amazon SNS spoke provides actions to automate Amazon SNS tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permission Management</td>
<td>Add Permission</td>
<td>Adds a statement to a topic’s access control policy and grants access for the specified AWS accounts for the specified actions.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Remove Permission</td>
<td>Removes a statement from a topic’s access control policy and revokes access for the specified AWS accounts for the specified actions.</td>
</tr>
<tr>
<td>Subscription Management</td>
<td>Confirm Subscription</td>
<td>Verifies intent of endpoint owner to receive messages by validating the token sent to the endpoint through an earlier Subscribe action.</td>
</tr>
<tr>
<td></td>
<td>Create Subscription</td>
<td>Creates a subscription on a topic.</td>
</tr>
<tr>
<td></td>
<td>Delete Subscription</td>
<td>Deletes a subscription on a topic.</td>
</tr>
<tr>
<td></td>
<td>Get Subscription Attributes</td>
<td>Retrieves all properties of a subscription.</td>
</tr>
<tr>
<td></td>
<td>List Subscriptions</td>
<td>Retrieves a list of all subscriptions to a specific region.</td>
</tr>
<tr>
<td></td>
<td>List Subscriptions By Topic</td>
<td>Retrieves a list of the subscriptions to a specific topic.</td>
</tr>
<tr>
<td>Topics Management</td>
<td>Set Subscription Attributes</td>
<td>Enables a subscription owner to set an attribute of the subscription to a new value.</td>
</tr>
<tr>
<td></td>
<td>Create Topic</td>
<td>Creates a topic for which notifications can be published.</td>
</tr>
<tr>
<td></td>
<td>Delete Topic</td>
<td>Deletes a topic and all its subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Get Topic Attributes</td>
<td>Retrieves all properties of a topic. Topic properties retrieved may differ based on the authorization of the user.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>List Topics</td>
<td>Retrieves a list of the requester's topics.</td>
</tr>
<tr>
<td></td>
<td>Set Topic Delivery Policy</td>
<td>Enables a topic owner to set a delivery policy of the topic to a new value.</td>
</tr>
<tr>
<td></td>
<td>Set Topic Display Name</td>
<td>Enables a topic owner to set a display name of the topic to a new value.</td>
</tr>
</tbody>
</table>

**Note:** Spoke actions can be used independently without subscribing to notifications from Amazon SNS.

**Spoke module**

The Amazon SNS spoke adds an AWS Configurations module to your ServiceNow instance. If you want receive events at your ServiceNow instance from Amazon SNS, you must specify the subflow internal name here. For more information about the required configurations, see *Receive events at your ServiceNow instance from Amazon SNS.*

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials.*

**Set up the Amazon SNS spoke**

Integrate the ServiceNow instance and Amazon SNS using AWS credential to authenticate ServiceNow requests.

- Request an IntegrationHub subscription
- Activate the Amazon SNS spoke
- Role required: admin

To receive events at your ServiceNow instance from Amazon SNS, see *Receive events at your ServiceNow instance from Amazon SNS.* Spoke set up described here enables you to use spoke subflow and actions.
Create Credential record for the Amazon SNS spoke
Create Credential record for your AWS account. The Amazon SNS spoke uses this credential to perform actions on Amazon SNS.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for Amazon SNS.
3. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter SNS Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of your AWS account.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of your AWS account.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select SNS Algorithm.</td>
</tr>
</tbody>
</table>

6. Click Submit.

The credential record for the Amazon SNS spoke is created.

Receive events at your ServiceNow instance from Amazon SNS
Receive events (Notification, Subscription Confirmation, and Unsubscribe Confirmation) from Amazon SNS at your ServiceNow instance.

- Request an IntegrationHub subscription
- Activate the Amazon SNS spoke
- Role required: admin

You can receive events at your ServiceNow instance from Amazon SNS even without setting up the Amazon SNS spoke. To set up the Amazon SNS spoke and use the spoke actions, see Set up the Amazon SNS spoke.

Create secret for the Amazon SNS spoke
Create a client secret to authorise requests from Amazon SNS.

1. Navigate to System Definition > Scripts - Background.
2. Enter this command in the Run script (JavaScript executed on server) text field:
   ```javascript
   gs.info(GlideSecureRandomUtil.getSecureRandomString(32));
   ```
3. Click Run Script.
4. Copy and record the generated value for later use.
Create a record in AWS Configurations
Create a record in AWS Configurations to authorise requests from Amazon SNS spoke.

1. Navigate to AWS Configuration > All Configurations.
2. Click New.
3. On the form, fill these values:

<table>
<thead>
<tr>
<th>AWS Configurations form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Property Value</td>
<td>Internal name of the Amazon SNS Subscription subflow. For example, amazon_sns_subscription.</td>
</tr>
<tr>
<td>Property Name</td>
<td>Name to identify the record.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret generated by the script. For information about generating Client Secret see, Create secret for the Amazon SNS spoke.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click Save.
5. Right-click the form header and click Copy sys_id. Record this value for later use.

Record the Base API path of the Amazon SNS spoke
Record the Base API path of the Amazon SNS spoke to authorise requests from Amazon SNS.

1. Navigate to System Web Services > Scripted Web Services > Scripted REST APIs.
2. Open the record for Amazon SNS.
3. Copy and record the value of Base API path for later use.

Create topic
Use the Create Topic spoke action to create a topic in Amazon SNS for your ServiceNow instance.

1. In Flow Designer, create a flow and include the Create Topic spoke action. For information about creating flows in Flow Designer, see Flows.
2. Customize flow to provide these values as inputs to the Create Topic spoke action:
### Create subscription

Use the Create Subscription spoke action to create subscription in Amazon SNS for your ServiceNow instance.

1. In Flow Designer, create a flow and include the Create Subscription spoke action. For information about creating flows in Flow Designer, see Flows.

2. Customize flow to provide these values as inputs to the Create Subscription spoke action:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Region</td>
<td>AWS geographic area where the infrastructure is housed.</td>
</tr>
<tr>
<td>Topic ARN</td>
<td>ARN to uniquely identify the required topic. Subscriptions are created for this topic.</td>
</tr>
<tr>
<td>Protocol</td>
<td>HTTPS</td>
</tr>
</tbody>
</table>

**Note:** For information about obtaining the required values, see Record the Base API path of the Amazon SNS spoke, Create a record in AWS Configurations, and Create secret for the Amazon SNS spoke.

3. Test the flow.

   The flow internally triggers the default Amazon SNS Subscription subflow.

4. In the Executions tab, open the record associated with the subflow execution.

   **Note:** Ensure that you check the execution details of the default Amazon SNS Subscription subflow, not the flow you had created.

5. In the Execution Details page, click RUNTIME VALUE.

6. Copy and record the value of Token for later use. This confirmation token is needed to Confirm subscription.
Subscription for the required topic in Amazon SNS for your ServiceNow instance is created. 

**Confirm subscription**

Use the Confirm Subscription spoke action to confirm subscription in Amazon SNS for your ServiceNow instance.

1. In Flow Designer, create a copy of the default Amazon SNS Subscription subflow. For information about using subflows in Flow Designer, see [Subflows](#).
2. In Flow Designer, create a flow that includes the copy of the default subflow. For information about creating flows in Flow Designer, see Flows.
3. Customize the subflow to include the Confirm Subscription spoke action.
4. Customize subflow to provide these values as inputs to the Confirm Subscription spoke action:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Region</td>
<td>AWS geographic area where the infrastructure is housed.</td>
</tr>
<tr>
<td>Topic ARN</td>
<td>ARN to uniquely identify the required topic. Subscriptions are created for this topic.</td>
</tr>
<tr>
<td>Token</td>
<td>Confirmation token generated after creating subscription. See Create subscription, for more information.</td>
</tr>
</tbody>
</table>

**Note:** Ensure that you use the confirmation token to confirm subscription within its validity period.

5. Test the flow and check the Executions tab to ensure that flow is executed as expected.

The Amazon SNS subscription for your ServiceNow instance is confirmed.

### Customize event management

Customize the management of events (Notification, Subscription Confirmation, and Unsubscribe Confirmation) you receive for your ServiceNow instance from Amazon SNS.

1. In Flow Designer, create a copy of the default subflow, Amazon SNS Subscription and customize the subflow as per your requirement. For more information about creating subflows, see Subflows.
2. Copy and record the internal name of the customized subflow.
3. Navigate to AWS Configuration > All Configurations.
4. Open the record you had created to receive events. In this record, the internal name of the default Amazon SNS Subscription subflow is specified in Property Value.
5. Update this record by replacing the internal name of default subflow with the internal name of the customized subflow in Property Value.

**Note:** Use the same Client Secret.

The event management is customized as per your requirement.

### Amazon VPC spoke

Provision a logically isolated section of the AWS cloud using Amazon VPC and launch the required AWS resources in a virtual network, from your ServiceNow instance.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

Note: If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

- User with full access to Amazon VPC.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke subflows

The Amazon VPC spoke provides sample subflows to demonstrate automating Amazon VPC tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete Subnet</td>
<td>Deletes the specified subnet. Before you delete the subnet, you must terminate all the running instances in the subnet.</td>
</tr>
</tbody>
</table>
Spoke actions

The Amazon VPC spoke provides actions to automate Amazon VPC tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network &amp; Security Group</td>
<td>Add Egress Rules To A Security Group</td>
<td>Adds the specified egress rules to a security group.</td>
</tr>
<tr>
<td>Management</td>
<td>Add Ingress Rules To A Security Group</td>
<td>Adds the specified ingress rules to a security group.</td>
</tr>
<tr>
<td></td>
<td>Create Security Group</td>
<td>Creates a security group.</td>
</tr>
<tr>
<td></td>
<td>Delete Egress Rules From Security Group</td>
<td>Removes the specified egress rules from security group. Values must match the existing rule’s values exactly.</td>
</tr>
<tr>
<td></td>
<td>Delete Ingress Rules From Security Group</td>
<td>Adds the specified ingress rules to a security group.</td>
</tr>
<tr>
<td></td>
<td>Delete Security Group</td>
<td>Deletes a security group.</td>
</tr>
<tr>
<td></td>
<td>List Security Groups</td>
<td>Lists the specified security groups or all of your security groups.</td>
</tr>
<tr>
<td></td>
<td>Lookup Security Group</td>
<td>Retrieves the specified security group.</td>
</tr>
<tr>
<td>Virtual Private Cloud</td>
<td>Create Subnet</td>
<td>Creates a subnet in an existing VPC.</td>
</tr>
<tr>
<td>Management</td>
<td>Create VPC</td>
<td>Creates a VPC with the specified IPv4 CIDR block and can optionally request an IPv6 CIDR block for the VPC.</td>
</tr>
<tr>
<td></td>
<td>Delete NAT Gateway</td>
<td>Deletes the specified NAT gateway. Deleting a NAT gateway disassociates its Elastic IP address, but does not release it.</td>
</tr>
<tr>
<td></td>
<td>Delete Route Table</td>
<td>Deletes the specified route table. You must disassociate the route table from any subnets before you can delete it.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Delete Subnet</td>
<td>Deletes the specified subnet. You must terminate all running instances in the subnet before you can delete the subnet.</td>
</tr>
<tr>
<td></td>
<td>Delete VPC</td>
<td>Deletes the specified VPC. You must detach or delete all gateways and resources that are associated with the VPC before you can delete it or use Delete VPC subflow.</td>
</tr>
<tr>
<td></td>
<td>Delete VPC Peering Connection</td>
<td>Deletes a VPC peering connection. Either the owner of the requester VPC or the owner of the accepter VPC can delete the VPC peering connection if it's in the active state.</td>
</tr>
<tr>
<td></td>
<td>Detach Internet Gateway</td>
<td>Detaches an internet gateway from a VPC, disabling connectivity between the internet and the VPC.</td>
</tr>
<tr>
<td></td>
<td>Detach Route Table</td>
<td>Disassociates a subnet from a route table.</td>
</tr>
<tr>
<td></td>
<td>List Internet Gateways</td>
<td>Retrieves the details of the required internet gateways.</td>
</tr>
<tr>
<td></td>
<td>List NAT Gateways</td>
<td>Retrieves the details of the required NAT gateways.</td>
</tr>
<tr>
<td></td>
<td>List Route Tables</td>
<td>Retrieves the details of the required route tables.</td>
</tr>
<tr>
<td></td>
<td>List Subnets</td>
<td>Retrieves the details of the required subnets in an existing VPC.</td>
</tr>
<tr>
<td></td>
<td>List VPC Peering Connections</td>
<td>Retrieves the details of the required VPC peering connections.</td>
</tr>
<tr>
<td></td>
<td>Detach VPN Gateway</td>
<td>Detaches a virtual private gateway from a VPC.</td>
</tr>
<tr>
<td></td>
<td>List VPN Gateways</td>
<td>Retrieves the details of the required virtual private gateways.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need
to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the Amazon VPC spoke**

Integrate the ServiceNow instance and Amazon VPC using AWS credential to authenticate ServiceNow requests.

- Request an IntegrationHub subscription
- Activate the Amazon VPC spoke
- Role required: admin

*Create Credential record for the Amazon VPC spoke*

Create Credential record for your Amazon VPC account. The Amazon VPC spoke connection and credential alias uses this credential to perform actions on Amazon VPC.

1. Navigate to *Connections & Credentials > Connection & Credential Aliases*.
2. Open for the record for *Amazon VPC*.
3. From the *Credentials* tab, click *New*.
   - The system displays the message *What type of Credentials would you like to create?*
4. Select *AWS Credentials*.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <em>VPC Credentials</em>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon VPC.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon VPC.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <em>AmazonVPCAuthAlgo</em>.</td>
</tr>
</tbody>
</table>

6. Click *Submit*.

The credential record the Amazon VPC spoke is created.

**Azure DevOps Boards spoke v1.5.5**

Automate the process of managing work items in Azure DevOps Boards from your ServiceNow instance.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Azure DevOps Boards REST API version 4.1 and TFS 2018 Update 3, but may be compatible with later versions.

Spoke requirements

- Azure DevOps instance
- Personal access tokens (PATs) to authenticate Azure DevOps

See Azure DevOps documentation for information about creating token.

Spoke actions

The Azure DevOps Boards spoke provides actions manage work items when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Core Process Management</td>
<td>Create Iteration</td>
<td>Creates an Azure DevOps iteration.</td>
</tr>
<tr>
<td></td>
<td>Delete Iteration</td>
<td>Deletes an Azure DevOps iteration by path.</td>
</tr>
<tr>
<td></td>
<td>Post Iteration to Team</td>
<td>Adds an Azure DevOps iteration to an Azure DevOps team.</td>
</tr>
<tr>
<td></td>
<td>Reporting Work Items Revisions</td>
<td>Adds reporting work-item revisions for batch processing.</td>
</tr>
<tr>
<td></td>
<td>Reporting Work Items Links</td>
<td>Adds reporting work-item links for batch processing.</td>
</tr>
<tr>
<td></td>
<td>Update Iteration</td>
<td>Updates the name, start date, and end date for an Azure DevOps iteration.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Delink Iterations From A Team</td>
<td>Delinks Azure DevOps iterations from a team.</td>
</tr>
</tbody>
</table>

<tbody>
<tr>
<td></td>
<td>Add Attachment</td>
<td>Adds an attachment associated with a ServiceNow record to the required work item on the Azure DevOps instance.</td>
</tr>
<tr>
<td></td>
<td>Move To Project</td>
<td>Moves between projects in the same organization.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

### Set up Azure DevOps Boards spoke

Integrate the ServiceNow instance and Azure DevOps Boards using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Azure DevOps Boards spoke
- Role required: admin

Create Credential records for the Azure DevOps Boards spoke

Create Credential records for the Azure DevOps instance. The Azure DevOps Boards spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to [Connections & Credentials > Credentials](#).
2. Click **New**.
   - The system displays the message *What type of Credentials would you like to create?*
3. Select **Basic Auth Credentials**.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Azure DevOps Boards Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your Azure DevOps instance.</td>
</tr>
<tr>
<td>Password</td>
<td>Personal access token to authenticate Azure DevOps.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
Create Connection records for the Azure DevOps Boards spoke
Create Connection records to your Azure DevOps instance. The Azure DevOps Boards spoke connection and credential alias uses these connections to perform actions in the Azure DevOps instance.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for Azure DevOps Boards.
3. From the Connections tab, click New.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Azure DevOps Boards Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Azure DevOps Boards. For example, select Azure DevOps Boards Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the Azure DevOps instance. For example, <a href="https://dev.azure.com/">https://dev.azure.com/</a> &lt;instance-name&gt;.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Box spoke v2.0.2
Move attachments to Box where they can be managed as shared documents.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions
API version v2.

Spoke flows
The Box spoke provides sample flows in the draft state to demonstrate automating Box tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:
<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move Attachment when created to Box</td>
<td>Moves attachment files from ServiceNow to Box when a new attachment record is added. Updates the trigger record with a shared link to the moved attachment file on Box.</td>
</tr>
<tr>
<td>On-boarding user</td>
<td>Creates a user in Box when you create a ServiceNow user in the Box User group.</td>
</tr>
</tbody>
</table>

### Spoke actions

The Box spoke provides actions to automate Box tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Management</td>
<td>Add Metadata to File</td>
<td>Specifies custom data for a particular file or folder.</td>
</tr>
<tr>
<td></td>
<td>Copy File to ServiceNow Attachment</td>
<td>Copies a file from Box and attaches it to the specified ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Lookup File ID</td>
<td>Retrieves the ID of the specified file in Box.</td>
</tr>
<tr>
<td></td>
<td>Move Owned Item</td>
<td>Moves all items owned by the specified user in Box to the specified folder.</td>
</tr>
<tr>
<td></td>
<td>Remove File</td>
<td>Removes the specified file from Box.</td>
</tr>
<tr>
<td></td>
<td>Upload File</td>
<td>Uploads the specified file to Box.</td>
</tr>
<tr>
<td>Document Sharing</td>
<td>Add Collaborator</td>
<td>Grants a user or group a specified level of access to a particular file or folder. Collaborators have one of these access levels.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Co-Owner</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Editor</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Previewer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Preview Uploader</td>
</tr>
<tr>

<td></td>
<td>- Viewer</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Viewer Uploader</td>
</tr>
<tr>
<td></td>
<td>Create Shared Link</td>
<td>Create a direct and read-only link to a file or folder in Box.</td>
</tr>
<tr>
<td></td>
<td>Get Folder Collaborators</td>
<td>Retrieves the collaborators associated with the specified folder in Box.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Create Folder</td>
<td>Creates a folder in Box on behalf of the specified Box user account.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes the specified folder in Box.</td>
</tr>
<tr>
<td></td>
<td>Lookup Folder ID</td>
<td>Retrieves the ID of the specified folder in Box.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Items added to Box require ten minutes to become accessible. For example, if one action creates a folder, a Lookup Folder ID action will not return results until after ten minutes have passed.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Create Group</td>
<td>Creates a group in Box with the specified invitation preferences.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes the specified group in Box.</td>
</tr>
<tr>
<td></td>
<td>Update Group</td>
<td>Updates the specified group in Box with the specified preferences.</td>
</tr>
<tr>
<td>User Management</td>
<td>Add User to Group</td>
<td>Adds the specified user to the specified group in Box.</td>
</tr>
<tr>
<td></td>
<td>Create App User</td>
<td>Creates an Enterprise App User in Box, which the spoke uses to act on behalf of other Box users. An Enterprise App User account cannot login directly to Box.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a new user account in Box.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified user in Box.</td>
</tr>
<tr>
<td></td>
<td>Disable User</td>
<td>Sets the status of the specified user in Box to inactive.</td>
</tr>
<tr>
<td></td>
<td>Enable User</td>
<td>sets the status of the specified user in Box to active.</td>
</tr>
<tr>
<td></td>
<td>Lookup User ID</td>
<td>Retrieves the ID of the specified user in Box.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates the specified user in Box with the specified role changes.</td>
</tr>
</tbody>
</table>

**Box account requirements**

The Box spoke requires creating a custom app on your Box account to generate OAuth 2.0 tokens. See [Configure Box account](#).

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

This spoke uses these alias records to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Box</td>
<td>Connection to the Box Collaboration and File Management APIs.</td>
<td>• Connection type: HTTP</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Connection URL: <a href="https://api.box.com">https://api.box.com</a></td>
</tr>
<tr>
<td>Box Upload</td>
<td>Connection to the Box upload service.</td>
<td>• Connection type: HTTP</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Connection URL: <a href="https://upload.box.com">https://upload.box.com</a></td>
</tr>
</tbody>
</table>

To use the spoke connection aliases, create an associated Connection record and an associated Credential record for each alias.

**Set up Box spoke**

Integrate the ServiceNow instance and Box by creating a custom OAuth application in Box to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Box spoke
- Role required: admin

**Configure Box account**

Create a custom OAuth application from your Box account to enable OAuth 2.0 authentication with the Box spoke.

Box requirements:

- Box account
- Box administrator credentials
Complete these steps from your Box account. See the Box Developer Portal documentation for instructions on creating and configuring custom applications.

1. From your Box account, create a custom OAuth application.
2. Select standard OAuth 2.0 user authentication as the application authentication method.
3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Enable the matching Box application scope permissions you want the app to support.

<table>
<thead>
<tr>
<th>Box application scope permission</th>
<th>Required for</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write all files and folders stored in Box</td>
<td>Document management, document sharing, and folder management actions</td>
</tr>
<tr>
<td>Manage users</td>
<td>User management actions</td>
</tr>
<tr>
<td>Manage groups</td>
<td>Group management actions</td>
</tr>
<tr>
<td>Manage enterprise properties</td>
<td>Document sharing, group management, and user management actions</td>
</tr>
</tbody>
</table>

Register Box as OAuth provider
Use the information generated during Box account configuration to register Box as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Box OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Box account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the Box account configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   The system validates the OAuth credentials and populates the Redirect URL and the OAuth Entity Profiles related list.
6. Copy the value from Redirect URL.
7. Login to your Box account to edit the configuration of your custom Box application.
   See the Box Developer Documentation for instructions.
8. Paste the Redirect URL value into the OAuth 2.0 Redirect URI for your custom Box application. For example, paste https://instance.service-now.com/oauth_redirect.do.
The instance can request OAuth 2.0 tokens for the spoke.

Note: The spoke generates OAuth tokens that expire after 30 days. An administrator can regenerate the spoke OAuth token every 30 days.

Create Credential records for the Box spoke
Create Credential records to the Box custom OAuth application you created during Box account configuration. The Box spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Box API Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Box application as an OAuth provider. For example, select Box OAuth default profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.
6. Click New.
   The system displays the message What type of Credentials would you like to create?.
7. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
8. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Box Upload Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Box application as an OAuth provider. For example, select Box OAuth default profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
</tbody>
</table>
9. Click **Submit**.

**Create Connection records for the Box spoke**
Create Connection records to your Box account and the Box APIs. The Box spoke connection and credential aliases use these connections to perform actions on Box.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Box**.
3. From the **Connections** tab, click **New**.
The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Box API Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for the Box API. For example, select Box API Credentials.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
6. Open for the record for **Box Upload**.
7. From the **Connections** tab, click **New**.
The system displays a blank HTTP(s) Connection form.
8. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Box Upload Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Box upload. For example, select Box Upload Credentials.</td>
</tr>
</tbody>
</table>

9. Click **Submit**.

**Regenerate Box OAuth token**
Regenerate the Box OAuth token when it expires. The Box spoke OAuth token expires every thirty days.

1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Box spoke OAuth Credential record.
   For example, select **Box API Credentials**.
3. From Related Links, click **Get OAuth Token**.

The Box spoke receives a new OAuth access token good for 30 days.
Cisco Webex Meetings spoke
Manage users of the Cisco Webex Meetings application. Get a list of all users, view user activity, and deactivate user accounts.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions
Webex Meetings XML API

Spoke actions
The Cisco Webex Meetings spoke provides actions to automate Webex tasks when events occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Get Users</td>
<td>Gets a list of all Webex user subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Get User Activity</td>
<td>Gets the date of the most recent meeting hosted by each Webex user.</td>
</tr>
<tr>
<td></td>
<td>Remove User</td>
<td>Deactivates a Webex user account.</td>
</tr>
</tbody>
</table>

Webex Meetings account requirements
The Cisco Webex Meetings spoke requires creating a custom app in Cisco DevNet to generate OAuth 2.0 tokens. See Create Webex OAuth app.

Connection and credential alias requirements
IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.
This spoke uses the Webex alias record to authorize actions.

**Set up Cisco Webex Meetings spoke**

Integrate your ServiceNow instance and the Cisco Webex Meetings application by creating a custom OAuth application in Cisco DevNet to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Cisco Webex Meetings spoke
- Role required: admin

**Create Webex OAuth app**

Create a custom OAuth application in Cisco DevNet to enable OAuth 2.0 authentication with the Cisco Webex Meetings spoke.

Webex Meetings requirements:

- Webex Meetings account
- Webex Meetings administrator credentials

1. Navigate to *Cisco DevNet WebEx Integration*. Log in using the *Login with Webex Meetings* option.
2. On the My App Information page, click *Add App Information*.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integration name</td>
<td>Name of your choice. For example, ServiceNow integration.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td><a href="https://instance.service-now.com/oauth_redirect.do">https://instance.service-now.com/oauth_redirect.do</a>, where instance is the name of your ServiceNow instance</td>
</tr>
<tr>
<td>Scope</td>
<td>Webex Meetings application scope permissions you want the app to support.</td>
</tr>
</tbody>
</table>

> **Note:** The *read_all* and *modify_users* scopes are required to use the actions provided with the spoke. The Get Users and Get User Activity actions require the *read_all* scope. The Remove User action requires the *modify_users* scope.

4. Record the client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.

**Register Webex Meetings as OAuth provider**

Use the information generated during OAuth app creation to register the Webex Meetings application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to *System OAuth > Application Registry*.
2. Click *New*.
3. Select *Connect to a third party OAuth Provider*.
4. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Webex Meetings OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID you created during the Webex app configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you created during the Webex app configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Authorization Code.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
The system validates the OAuth credentials and populates the **Redirect URL** field and the OAuth Entity Profiles related list.

Create Credential record for the Webex Meetings spoke
Create a Credential record for the Webex custom OAuth application you created in Cisco DevNet. The Cisco Webex Meetings spoke connection and credential alias uses the credential to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Webex Meetings Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Selected.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile you created when you registered the custom Webex application as an OAuth provider. For example, Webex Meetings OAuth default profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Create Connection record for the Webex Meetings spoke
Create a Connection record for your Webex account. The Cisco Webex Meetings spoke connection and credential alias uses the connection to perform actions in Webex.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for Webex.
3. From the Connections tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, Webex Meetings Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Webex Meetings. For example, Webex Meetings Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td><a href="https://site.webex.com/WBXService/XMLService">https://site.webex.com/WBXService/XMLService</a>, where site is the name of your Webex site.</td>
</tr>
</tbody>
</table>

Click Submit.

Continuous Integration and Continuous Delivery (CICD) Spoke

Build a Continuous Integration and Continuation Delivery (CICD) pipeline for your ServiceNow instances. You can automate publishing and installing applications from an application repository, activating plugins, running ATF test suites, and running an instance HealthScan.

CICD spoke application

The CICD spoke application is installed by default with the Orlando upgrade.

Supported versions

Continuous Integration and Continuous Delivery (CICD) REST API version 1.0.0, which is a Now Platform feature active by default.

Spoke flows

This spoke has no sample flows.

Spoke subflows

The Continuous Integration and Continuous Delivery (CICD) Spoke provides sample subflows in the draft state to demonstrate automating CICD tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activate Plugin</td>
<td>Activate a plugin by ID on the specified instance URL.</td>
</tr>
<tr>
<td>Apply Changes From Source Control With ID</td>
<td>Apply remote changes from source control to an application by its Sys ID.</td>
</tr>
<tr>
<td>Apply Changes From Source Control With Scope</td>
<td>Apply remote changes from source control to an application by its scope name.</td>
</tr>
</tbody>
</table>
### Spoke actions

The Continuous Integration and Continuous Delivery (CICD) Spoke provides actions to automate CICD tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Application Repo</strong></td>
<td>Install Application With ID</td>
<td>Install an application by its Sys ID from the application repository.</td>
</tr>
<tr>
<td></td>
<td>Install Application With Scope</td>
<td>Install an application by its scope name from the application repository.</td>
</tr>
<tr>
<td></td>
<td>Publish Application With ID</td>
<td>Publish an application by its Sys ID to the application repository.</td>
</tr>
<tr>
<td></td>
<td>Publish Application With Scope</td>
<td>Publish an application by its scope name to the application repository.</td>
</tr>
<tr>
<td></td>
<td>Rollback Application With ID</td>
<td>Rollback an application by its Sys ID. Confirm the rollback version number matches the specified version number or produce an error.</td>
</tr>
<tr>
<td></td>
<td>Rollback Application With Scope</td>
<td>Rollback an application by its scope name. Confirm the rollback version number matches the specified version number or produce an error.</td>
</tr>
<tr>
<td></td>
<td>Rollback Plugin</td>
<td>Rollback a plugin by ID on the specified instance URL to the last installed version.</td>
</tr>
<tr>
<td></td>
<td>Wait Until Tracker Completes</td>
<td>Wait for a tracker to complete its progress on the specified instance URL and return the results.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Publish Application With Scope</td>
<td>Publish an application by its scope name to the application repository.</td>
</tr>
<tr>
<td></td>
<td>Rollback Application With ID</td>
<td>Rollback an application by its Sys ID. Confirm the rollback version number matches the specified version number or produce an error.</td>
</tr>
<tr>
<td></td>
<td>Rollback Application With Scope</td>
<td>Rollback an application by its scope name. Confirm the rollback version number matches the specified version number or produce an error.</td>
</tr>
<tr>
<td></td>
<td>ATF</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ATF Get Suite Results</td>
<td>Return the test suite execution results by Sys ID.</td>
</tr>
<tr>
<td></td>
<td>Get Execution Tracker Progress</td>
<td>Return tracker progress information by Sys ID.</td>
</tr>
<tr>
<td></td>
<td>Start ATF Suite With ID</td>
<td>Start a test suite by its Sys ID on the specified instance URL.</td>
</tr>
<tr>
<td></td>
<td>Start ATF Suite With Name</td>
<td>Start a test suite by its name on the specified instance URL.</td>
</tr>
<tr>
<td></td>
<td>HealthScan</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Get HealthScan Results</td>
<td>Return HealthScan execution results by progress ID.</td>
</tr>
<tr>
<td></td>
<td>HealthScan Execute Full Scan</td>
<td>Start a full HealthScan on the specified instance URL.</td>
</tr>
<tr>
<td></td>
<td>HealthScan Execute Point Scan</td>
<td>Start a HealthScan on the specified instance starting from a particular table and record.</td>
</tr>
<tr>
<td></td>
<td>Plugin</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Activate Plugin</td>
<td>Activate a plugin by ID on the specified instance URL.</td>
</tr>
<tr>
<td></td>
<td>Rollback Plugin</td>
<td>Rollback a plugin by ID on the specified instance URL to the last installed version.</td>
</tr>
<tr>
<td></td>
<td>Source Control</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Apply Changes From Source Control With ID</td>
<td>Apply remote changes from source control to an application by its Sys ID.</td>
</tr>
<tr>
<td></td>
<td>Apply Changes From Source Control With Scope</td>
<td>Apply remote changes from source control to an application by its scope name.</td>
</tr>
</tbody>
</table>
CICD account requirements

The Continuous Integration and Continuous Delivery (CICD) Spoke requires creating basic authorization credentials. The user credentials must have either the admin or sn_cicd.sys_ci_automation roles to authorize CICD actions and flows.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the CICD alias record to authorize actions on local and remote instances.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the CICD alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Continuous Integration and Continuous Delivery (CICD) Spoke

Use basic authentication to authenticate CICD REST API calls on a ServiceNow instance.

- Request IntegrationHub subscription
- Activate Continuous Integration and Continuous Delivery (CICD) Spoke
- Role required: admin or sn_cicd.sys_ci_automation

Create Credential records for the Continuous Integration and Continuous Delivery (CICD) Spoke

Create Credential records to the ServiceNow instance. The Continuous Integration and Continuous Delivery (CICD) Spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter CICD Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>The ServiceNow instance user name that authorizes and runs spoke actions and flows. This user must have either the admin or sn_cicd.sys_ci_automation roles.</td>
</tr>
<tr>
<td>Password</td>
<td>The password for the ServiceNow instance user.</td>
</tr>
</tbody>
</table>
Create Connection records for the Continuous Integration and Continuous Delivery (CICD) Spoke

Create Connection records to your ServiceNow instance. The Continuous Integration and
Continuous Delivery (CICD) spoke connection and credential alias uses these connections to
perform actions on your ServiceNow instance.

1.  Navigate to Connections & Credentials > Connection & Credential Aliases.
2.  Open for the record for CICD.
3.  From the Connections tab, click New.
   The system displays a blank HTTP or HTTPS Connection form.
4.  Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter CICD Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for CICD. For example, select CICD Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL of the ServiceNow instance on which the spoke runs actions and flows.</td>
</tr>
</tbody>
</table>

5.  Click Submit.

**Coupa spoke v2**

Manage business spend and automate approval, contract, inventory, purchase order, requisition, supplier, and user management in Coupa from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for Coupa version stable_025.6.0, but may be compatible with later versions.
Spoke requirements

Create an API key in your Coupa instance and record the API key for later use. See Coupa documentation for information about creating API key.

Spoke actions

The Coupa spoke provides actions to automate approval, contract, inventory, invoice, catalog item, purchase order, requisition, supplier, and user management when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Management</td>
<td>Approve Approval Request</td>
<td>Approves an approval request in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Get Approval Details</td>
<td>Retrieves the details of the required approval in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Look Up Approval</td>
<td>Looks up an approval record in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Look Up Approval By Requisition ID</td>
<td>Looks up the required approval record in Coupa using its Requisition ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Approvals</td>
<td>Looks up the required approval records in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Reject Approval Request</td>
<td>Rejects a request for approval in Coupa.</td>
</tr>
<tr>
<td>Contract Management</td>
<td>Look Up Contracts</td>
<td>Looks up the required contract records in Coupa using the Coupa query.</td>
</tr>
<tr>
<td>Inventory Management</td>
<td>Create Receipt</td>
<td>Creates a receipt in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Get Receipt Details</td>
<td>Retrieves the details of the required receipt in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Get Receipt Fields</td>
<td>Retrieves the list of fields in the Coupa Receipts table.</td>
</tr>
<tr>
<td></td>
<td>Get Advance Shipment Notices After Updated Date</td>
<td>Retrieves the details of the advance shipment notices after the updated date in Coupa.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>

</tbody>
</table>

**Note:** Remote tables are created when the Coupa spoke is activated. Users are cautioned against directly modifying schema or inserting data in these tables.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

### Set up Coupa spoke

Integrate the ServiceNow instance and your Coupa account using an API key to authenticate ServiceNow requests.
- Request IntegrationHub subscription
- Activate the Coupa spoke
- Role required: admin

Create Credential records for the Coupa spoke
Create Credential records to the Coupa application you created. The Coupa spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Coupa Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>API Key</td>
<td>API key generated in your Coupa instance.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Coupa spoke
Create a Connection record to the Coupa API. The Coupa spoke connection and credential alias uses these connections to perform actions in Coupa.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Coupa.
3. From the Connections tab, click New.
The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Coupa Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Coupa. For example, select Coupa Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Coupa organization URL. For example, https://&lt;instance-name&gt;.coupacloud.com.</td>
</tr>
</tbody>
</table>

5. Click Submit.
Docker spoke v1.0.3

Lookup Docker data from your ServiceNow instance. Automate changes in the Docker engine when an event occurs in ServiceNow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

Community Edition version 18.09.0.

Spoke actions

The Docker spoke provides actions to automate Docker tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Images Management</td>
<td>Create An Image</td>
<td>Creates an image in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Images</td>
<td>Lists images from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Remove An Image</td>
<td>Removes an image from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Search Images</td>
<td>Searches for images on Docker Hub.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Services Management</td>
<td>Create A Service</td>
<td>Creates a service in the Docker instance. Services are tasks run on a swarm.</td>
</tr>
<tr>
<td></td>
<td>Delete A Service</td>
<td>Deletes a service from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect A Service</td>
<td>Returns detailed information about a service in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Update A Service</td>
<td>Updates a service to the swarm on the docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Services</td>
<td>Returns a list of services from the Docker instance.</td>
</tr>
<tr>
<td>Containers Management</td>
<td>Create A Container</td>
<td>Creates a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect A Container</td>
<td>Inspects a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Kill A Container</td>
<td>Kills a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Containers</td>
<td>Lists containers in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Pause A Container</td>
<td>Suspends all processes in a container on the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Remove A Container</td>
<td>Removes a container from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Rename A Container</td>
<td>Renames a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Restart A Container</td>
<td>Restarts a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Start A Container</td>
<td>Starts a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Stop A Container</td>
<td>Stop a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Unpause A Container</td>
<td>Unpauses a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Update A Container</td>
<td>Updates a container in the Docker instance with the provided values.</td>
</tr>
<tr>
<td></td>
<td>Wait for A Container</td>
<td>Blocks all processes until a container stops, then returns the exit code for the container on the Docker instance.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Executions Management</td>
<td>Create An Exec Instance</td>
<td>Creates an exec instance in Docker, through which you can run a new command in a running container. To execute a command in a container, create and start an exec instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect An Exec Instance</td>
<td>Inspects an exec instance in Docker.</td>
</tr>
<tr>
<td></td>
<td>Start An Exec Instance</td>
<td>Starts an exec instance in Docker, through which you can run a new command in a running container.</td>
</tr>
<tr>
<td>Networks Management</td>
<td>Create A Network</td>
<td>Creates a network on the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect A Network</td>
<td>Returns detailed information about a network in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Networks</td>
<td>Returns a list of networks from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Remove A Network</td>
<td>Removes a network from the Docker instance.</td>
</tr>
<tr>
<td>Volumes Management</td>
<td>Create A Volume</td>
<td>Creates a volume in Docker.</td>
</tr>
<tr>
<td></td>
<td>Inspect A Volume</td>
<td>Returns detailed information about a volume in Docker.</td>
</tr>
<tr>
<td></td>
<td>List Volumes</td>
<td>Returns a list of volumes from Docker.</td>
</tr>
<tr>
<td></td>
<td>Remove A Volume</td>
<td>Removes a volume from the Docker instance.</td>
</tr>
<tr>
<td>Swarm Management</td>
<td>Delete A Node</td>
<td>Deletes a node from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Initialize A New Swarm</td>
<td>Initializes a new Docker swarm. A swarm is a group of machines running Docker joined into a cluster.</td>
</tr>
<tr>
<td></td>
<td>Inspect Swarm</td>
<td>Returns detailed information about a Docker swarm.</td>
</tr>
<tr>
<td></td>
<td>Join An Existing Swarm</td>
<td>Joins a node to a swarm as a manager or worker node based on the Docker token.</td>
</tr>
<tr>
<td></td>
<td>Leave A Swarm</td>
<td>Removes a Docker instance from a swarm.</td>
</tr>
</tbody>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Docker alias record to authorize actions. To use the spoke connection alias, create an associated Connection record. This spoke does not require a credential record.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Docker alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Create Connection records for the Docker spoke

Create Connection records to the Docker engine. The Docker spoke connection and credential alias uses these connections to perform actions on Docker.

- Request IntegrationHub subscription
- Activate Docker spoke
- Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Docker.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Docker Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The IP address and port of the host machine where Docker is installed.</td>
</tr>
</tbody>
</table>

5. Click Submit.

DocuSign spoke v1.2.1

Automate the process of sending a document to an individual or list of recipients for digital signature using DocuSign. For example, automate employee onboarding and offboarding, or send non-disclosure agreements, legal agreements, and statements of work. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Compatible versions

This spoke was built for DocuSign API version v2 or v2.1, but may be compatible with later versions.

Key features

DocuSign spoke enables a flow designer to:

- Automate the process of sending a document from a ServiceNow attachment or DocuSign template to an individual or recipient list for digital signature.
- Discover and synchronize DocuSign accounts and templates in ServiceNow.
  - Retrieve a list of accounts and associated templates from DocuSign and then insert or update them as records in the Accounts (sn_docusign_spoke_accounts) and Templates (sn_docusign_spoke_docusign_templates) tables using the Get Accounts subflow.
  - Retrieve templates associated with a specified DocuSign account and then insert or update them as records in the Templates (sn_docusign_spoke_docusign_templates) table using the Get Templates Per Account subflow.
- Copy and customize sample flows for sending templates and on-demand document requests.
- Pause a flow until a document is signed. A scripted REST API webhook waits for the recipient to sign the document.
- Use values from a signed document in a flow.
- Attach a completed DocuSign document to a ServiceNow record for auditing purposes.
- Manage envelopes and users.
Spoke requirements

- DocuSign account
- DocuSign administrator credentials
- DocuSign application configured to integrate with ServiceNow
- DocuSign application details such as client ID, integrator key, secret keys, and RSA keypairs
- ServiceNow IntegrationHub subscription

Note: Ensure that you have activated the Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer) plugin.

See the DocuSign Developer Center documentation for instructions on creating and configuring custom applications.

Spoke flows

The DocuSign spoke provides sample flows to demonstrate automating DocuSign tasks. Use DocuSign spoke actions to automate any tasks desired by your organization. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document to DocuSign for a digital signature when a Service Catalog request is created by the Send a Document for Digital Signature item. Before using this flow, activate the Send a Document for Digital Signature catalog item.</td>
</tr>
<tr>
<td>Send employment offer to candidate using DocuSign template</td>
<td>Sends a DocuSign envelope to a user using a template. For example, use this flow to send a job offer to a candidate. Before using this flow, activate the Demonstrate Template - Send Job Offer to Candidate catalog item.</td>
</tr>
</tbody>
</table>

The DocuSign spoke adds catalog items for use with the DocuSign spoke sample flows. Before triggering a DocuSign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document for digital signature in DocuSign.</td>
</tr>
<tr>
<td>Demonstrate Template - Send Job Offer to Candidate</td>
<td>Sends a job offer using a DocuSign template.</td>
</tr>
</tbody>
</table>

Spoke subflows

The DocuSign spoke provides sample subflows to demonstrate automating DocuSign tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:
<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attach DocuSign Envelope To ServiceNow Record</td>
<td>Attaches all the documents in an envelope to a ServiceNow record.</td>
</tr>
<tr>
<td>Get &amp; Set DocuSign Field Data</td>
<td>Processes a list of catalog item variables and updates a draft envelope with each variable value.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The DocuSign spoke provides actions to automate DocuSign tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Get Accounts</td>
<td>Retrieves accounts associated with the spoke Connection and Credential alias record.</td>
</tr>
<tr>
<td>Document Signature</td>
<td>Get Embedded Signing URL</td>
<td>Creates a signing URL that is embedded into an application. User can sign the document without leaving the application.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Signing URL is active for 300 seconds and can be sent to one recipient at a time.</td>
<td></td>
</tr>
<tr>
<td>Document Management</td>
<td>Attach DocuSign Document to Record</td>
<td>Retrieves a signed DocuSign document and attaches it to a ServiceNow record.</td>
</tr>
<tr>
<td>Document Management</td>
<td>Get Document ID by Name</td>
<td>Retrieves the document ID from an envelope using the specified document name.</td>
</tr>
<tr>
<td>Document Management</td>
<td>Get Documents In An Envelope</td>
<td>Returns a list of documents with an ID and name in the given DocuSign envelope.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Envelope Management</td>
<td>Add Recipient to Envelope</td>
<td>Adds the specified recipient to the specified envelope.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Recipient ID used in this action is associated with the envelope and is different from the Recipient ID used in the Get All Template Fields action.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Administrator enters a numeric value for this Recipient ID.</td>
</tr>
<tr>
<td></td>
<td>Create Draft Envelope from Template</td>
<td>Creates a draft envelope from an existing DocuSign template.</td>
</tr>
<tr>
<td></td>
<td>Get Field ID</td>
<td>Retrieves the ID of the specified field from the specified draft envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Field Value</td>
<td>Retrieves the value of the specified field from the specified envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Recipient ID by Role Name</td>
<td>Retrieves the recipient ID of the specified role name from the specified envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Recipients In An Envelope</td>
<td>Returns a list of recipients with a Recipient ID and Role Name in the given DocuSign envelope.</td>
</tr>
<tr>
<td></td>
<td>Send Adhoc Signature Request to User</td>
<td>Sends a DocuSign document associated with the specified ServiceNow record to the specified recipient for signature.</td>
</tr>
<tr>
<td></td>
<td>Send Adhoc Signature Request to Users</td>
<td>Sends a DocuSign document associated with the specified ServiceNow record to the specified multiple recipients for signatures at a time.</td>
</tr>
<tr>
<td></td>
<td>Send Envelope</td>
<td>Sends an envelope to the specified recipients.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> All recipient details must be provided before sending an envelope.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Set Field Value</td>
<td>Sets the value of the specified field in the specified draft envelope.</td>
</tr>
<tr>
<td></td>
<td>Wait for Signature from DocuSign</td>
<td>Pauses a flow until the specified document has been signed or rejected.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Returns the status of the document to the flow for further processing.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get List Of Documents</td>
<td>Gets the list of all DocuSign documents in an envelope.</td>
</tr>
<tr>
<td>Template Management</td>
<td>Get Templates Per Account</td>
<td>Retrieves the templates associated with the specified DocuSign account.</td>
</tr>
<tr>
<td></td>
<td>Get Template Fields</td>
<td>Retrieves all fields in a template that is defined for a recipient.</td>
</tr>
<tr>
<td></td>
<td>Get Template Recipients</td>
<td>Retrieves all recipients defined for a template.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Recipient ID used in this action is associated with the template and is different from the Recipient ID used in the Add Recipient to Envelope action.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Value of the Recipient ID is a unique system-generated number.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a DocuSign user with the specified user details.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified DocuSign user.</td>
</tr>
</tbody>
</table>

### Spoke module

The DocuSign spoke adds a DocuSign module to your ServiceNow instance. The DocuSign spoke synchronizes and stores templates and envelopes in ServiceNow. The DocuSign spoke includes these tables and records.

<table>
<thead>
<tr>
<th>Table/Record</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Aliases</td>
<td>The DocuSign connection alias.</td>
</tr>
<tr>
<td>Table/Record</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Scheduled Job</td>
<td>The Get Accounts &amp; Templates scheduled job that synchronizes templates and envelopes with your DocuSign account.</td>
</tr>
<tr>
<td>Accounts</td>
<td>DocuSign accounts synchronized with your ServiceNow instance. To synchronize accounts, see <a href="#">Synchronize DocuSign with ServiceNow</a>. The Get Accounts subflow retrieves a list of accounts and associated templates from DocuSign and then inserts or updates them as records in the Accounts (sn_docusign_spoke_accounts) and Templates (sn_docusign_spoke_docusign_templates) tables.</td>
</tr>
<tr>
<td>Templates</td>
<td>DocuSign templates from synchronized DocuSign accounts. The Get Templates Per Account subflow retrieves templates associated with a specified DocuSign account and then inserts or updates them as records in the Templates (sn_docusign_spoke_docusign_templates) table.</td>
</tr>
<tr>
<td>Envelopes</td>
<td>DocuSign envelopes from synchronized DocuSign accounts. Records in the Envelopes table are updated only when webhook is configured for the DocuSign account.</td>
</tr>
</tbody>
</table>

The DocuSign spoke tables include these fields.

<table>
<thead>
<tr>
<th>Table</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounts (sn_docusign_spoke_accounts)</td>
<td>- Account ID</td>
</tr>
<tr>
<td></td>
<td>- Account Name</td>
</tr>
<tr>
<td></td>
<td>- Description</td>
</tr>
<tr>
<td></td>
<td>- Email</td>
</tr>
<tr>
<td></td>
<td>- Alias</td>
</tr>
<tr>
<td></td>
<td>- Display Name</td>
</tr>
<tr>
<td>Templates (sn_docusign_spoke_docusign_templates)</td>
<td>- Account</td>
</tr>
<tr>
<td></td>
<td>- Template ID</td>
</tr>
<tr>
<td></td>
<td>- Name</td>
</tr>
<tr>
<td></td>
<td>- Description</td>
</tr>
<tr>
<td></td>
<td>- Last Modified</td>
</tr>
<tr>
<td></td>
<td>- Display Name</td>
</tr>
<tr>
<td>Envelopes (sn_docusign_spoke_envelopes)</td>
<td>- Account</td>
</tr>
<tr>
<td></td>
<td>- ID</td>
</tr>
<tr>
<td></td>
<td>- Status</td>
</tr>
<tr>
<td></td>
<td>- Signed Date</td>
</tr>
<tr>
<td></td>
<td>- Declined Reason</td>
</tr>
<tr>
<td></td>
<td>- Display name</td>
</tr>
<tr>
<td></td>
<td>- Embedded Signing</td>
</tr>
<tr>
<td></td>
<td>- Signed Date Time Zone</td>
</tr>
<tr>
<td></td>
<td>- Template</td>
</tr>
</tbody>
</table>
DocuSign account requirements

The DocuSign spoke requires configuring your DocuSign account to generate an OAuth 2.0 JWT Bearer Grant token.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the DocuSign Connection & Credential Alias record to authorize actions.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the DocuSign alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Create connection aliases for additional DocuSign accounts

If your DocuSign implementation includes multiple DocuSign accounts, create a connection alias for each account.

Role required: admin

Your company may have a DocuSign account for each department that uses DocuSign. To use multiple accounts with this spoke, create an alias for each account. At runtime, the system identifies the alias associated with the account and sends the correct connection and credential information in the request.

If your company only has one account, you can use the default DocuSign alias provided with the spoke and proceed to Set up DocuSign spoke.

1. Navigate to DocuSign > Connection Aliases.
2. Select New.
3. In the Name field, add a descriptive name for the account. For example, DocuSign HR account.
4. Save the record.

Set up DocuSign spoke for each connection alias in your DocuSign implementation.

Set up DocuSign spoke

Integrate your DocuSign account with your ServiceNow instance. Create a custom OAuth application in DocuSign and authenticate requests from ServiceNow.

Role required: admin

- Request IntegrationHub subscription
- Activate DocuSign spoke

Configure DocuSign account

Create a custom OAuth application from your DocuSign account to enable OAuth 2.0 authentication with the DocuSign spoke.
DocuSign requirements:
- DocuSign account
- DocuSign administrator credentials
- DocuSign app configured to integrate with x

Complete these steps from your DocuSign account. See the DocuSign Developer Center documentation for instructions on creating and configuring custom applications. DocuSign uses a scripted webhook to send signed document data to x. This enables flow designers to pause a flow until a document is signed, and use document data in the flow.

1. From your DocuSign account, register your application.

   Note: Ensure that you select the Authorization Code Grant option for User Application.

2. Generate an integrator key.
3. Generate a secret key.
4. Record the integrator key and secret key to register the app as a third-party OAuth provider on your x instance.
5. Click ADD RSA KEYPAIR and record the Keypair ID, Public Key, and Private Key.
6. In Redirect URIs, add your x instance URL in this format: https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook.

Generate the JKS certificate
Generate a JKS certificate for the JWT authentication of the DocuSign spoke.

Role required: admin

1. Open the text editor for code such as, Sublime Text.
2. Create a new file.
3. Paste the Private Key you had earlier generated from your DocuSign integrator app. For more information, see Configure DocuSign account.

   Note: Ensure that you include both beginning and ending of the private key.

4. Save the file with the .key extension. For example, privatekey.key.
5. Open terminal and navigate to the directory where you saved the file with the .key extension.
6. Create a CA signed certificate using your private key by executing the command:

   openssl req -new -x509 -key <file-name>.key -out <certificate-name>.pem -days 1095

   System prompts you to provide required details such as Country Name, Province Name and so on.
7. Enter the required details.
8. Create PKCS 12 file using your private key and CA signed certificate by executing the command:

   openssl pkcs12 -export -in <certificate-name>.pem -inkey <file-name>.key -certfile <certificate-name>.pem -out <PKCS-12-file-name>.p12

   System prompts you to provide a password.
9. Provide the export password.
10. Create the JKS file by executing this command:

    keytool -importkeystore -srckeystore <PKCS-12-file-name>.p12 -srcstoretype pkcs12 -destkeystore <JKS-certificate-filename>.jks -deststoretype JKS

   System prompts you to provide a password.

11. Provide the destination and source keystore passwords.

Attach a Java Key Store certificate to the DocuSign spoke
Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the DocuSign spoke.

- Ensure the availability of a valid Java KeyStore certificate
- Role required: admin

1. Navigate to System Definition > Certificates.
2. Click New.
3. Complete the form.

X.509 Certificate form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the record. For example, DocuSign Certificate.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Define users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Enter the number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Type</td>
<td>Select Java Key Store.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Enter the number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Enter a password associated with the certificate.</td>
</tr>
<tr>
<td>Short description</td>
<td>Enter a summary about the certificate.</td>
</tr>
</tbody>
</table>

4. Click the attachments icon (_attach_icon) and attach a JKS certificate.
5. Click Validate Stores/Certificates.

Create a JWT signing key for the DocuSign spoke
Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

1. Navigate to System OAuth > JWT Keys.
2. Click New.
3. Complete the form.
JWT Keys form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the JWT signing key. For example, DocuSign JWT Keys.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Select the valid JKS certificate attached in the previous task. For example, DocuSign Certificate.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Enter a key Id to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Select an algorithm to sign with the JWT key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Enter a password associated with the signing key.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Create a JWT provider for the DocuSign spoke
Add a JSON Web Token (JWT) provider to your ServiceNow instance.

1. Navigate to System OAuth > JWT Providers.
2. Click New.
3. On the JWT Provider form, fill the values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the JWT provider. For example, DocuSign JWT Provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Enter a number in seconds to set the lifespan of JWT provider tokens.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>Select a JWT signing key. For example, DocuSign JWT Keys.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
The Standard Claims and Custom Claims related lists display.
5. Select the JWT provider created for the DocuSign spoke.
6. Enter values for iss, sub, and aud in the Standard Claims related list. See the DocuSign Developer Center for instructions.
7. Insert a record in the Custom Claims related list and complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim Name</td>
<td>scope</td>
</tr>
<tr>
<td>Claim Value Type</td>
<td>string</td>
</tr>
<tr>
<td>Claim Value</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
8. Click **Update**.

Register DocuSign as OAuth Provider
Use the information generated during DocuSign account configuration to register DocuSign as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   The system displays the message *What kind of OAuth application?*
3. Select **Connect to a third party OAuth Provider**.
   The system displays a blank Application Registries form.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter DocuSign OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the integrator key you generated during the DocuSign account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the client secret you generated during the DocuSign account configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select JWT Bearer.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Enter <a href="https://account-d.docusign.com/oauth/token">https://account-d.docusign.com/oauth/token</a>.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.
   - The system validates the OAuth credentials and populates the **Redirect URL**.
   - The system populates **OAuth Entity Profile** with **Grant Type** as JWT Bearer. For example, **OAuth Entity Profile** is created with default **Name**, DocuSign OAuth default_profile

6. Insert a record in the **OAuth Entity Scopes** related list and fill the values.

   **OAuth Entity Scopes related list fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>scope</td>
</tr>
<tr>
<td>OAuth Scope</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

7. Copy the value from **Redirect URL**.
8. Click **Update**.
9. Login to your DocuSign account to edit the configuration of your custom DocuSign application. See the [DocuSign Developer Center](https://www.docusign.com/developer) for instructions.

The instance can request OAuth 2.0 tokens for the spoke.
Obtain consent
Obtain explicit consent for the ServiceNow application from DocuSign.
Role required: admin

Obtain consent for individuals

1. Navigate to System OAuth > Application Registry.
2. Open the record you had created for the DocuSign spoke.
3. Insert a record in the OAuth Entity Profiles related list and fill the values.

<table>
<thead>
<tr>
<th>OAuth Entity Profiles related list fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Is default</td>
</tr>
<tr>
<td>Grant type</td>
</tr>
</tbody>
</table>

4. Click the created OAuth Entity Profile.
5. Insert a record in the OAuth Entity Scopes related list and fill the values.

<table>
<thead>
<tr>
<th>OAuth Entity Scopes related list fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>OAuth Scope</td>
</tr>
</tbody>
</table>

6. Create credential record associated with the OAuth Entity profile whose Grant type is Authorization Code.
   a. Navigate to Connections & Credentials > Credentials.
   b. Click New. The system displays the message What type of Credentials would you like to create?
   c. Select OAuth 2.0 Credentials.
   d. Fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter DocuSign Credentials Auth Code.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
</tbody>
</table>
### Obtain consent for an organization administrator

See [DocuSign Developer documentation (Admin consent for internal applications)](https://www.docusign.com) for instructions to obtain consent for an organization administrator.

**Create Credential records for the DocuSign spoke**

Create Credential records to the DocuSign custom OAuth application you created during DocuSign account configuration. The DocuSign spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter <strong>DocuSign Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom DocuSign application as an OAuth provider. For example, select <strong>DocuSign OAuth default_profile</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. Click the Get OAuth Token related link to generate the OAuth token.

Create Connection records for the DocuSign spoke
Create Connection records to your DocuSign account. The DocuSign spoke connection and credential alias uses these connections to perform actions in DocuSign.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for DocuSign.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter DocuSign Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for DocuSign. For example, select DocuSign Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://demo.docusign.net">https://demo.docusign.net</a>.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke. See Synchronize DocuSign with ServiceNow.

Configure DocuSign webhook
Configure the webhook in your DocuSign account to enable DocuSign to send data to ServiceNow when a recipient signs a document.

Role required: admin
1. Connect a custom configuration to enable your DocuSign application to share events and data with your ServiceNow instance.
2. Add your ServiceNow instance URL in this format: https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook.
3. Include basic authorization in the header and add your x credentials.
4. Enable DocuSign to share envelope events with ServiceNow.
   - Envelope Sent
   - Envelope Delivered
   - Envelope Signed/Completed
   - Envelope Declined
   - Envelope Voided
**Synchronize DocuSign with ServiceNow**

Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke.

Role required: admin
- Request IntegrationHub subscription
- Activate DocuSign spoke
- **Set up DocuSign spoke**

Schedule a job to synchronize DocuSign with your ServiceNow instance daily, or synchronize data as needed.

1. **Required: Schedule a job to synchronize DocuSign data with your ServiceNow instance.**
   a) Navigate to **DocuSign > Scheduled Job.**
      The Get Accounts & Templates scheduled job opens.
   b) Select **Active.**

   The DocuSign spoke synchronizes accounts, templates, and envelopes daily.

2. **Required: Synchronize DocuSign data as needed with a UI action.**
   a) Navigate to **DocuSign > Accounts.**
      The Accounts (sn_docusign_spoke_accounts) table opens.
   b) Click the **Get Accounts** related link.

   The system synchronizes all accounts linked through an OAuth Credential record and populates the Templates and Envelopes tables with DocuSign data. Use template and envelope records when constructing flows.

**Activate DocuSign spoke catalog items**

Trigger events in DocuSign when an item is requested in the Service Catalog. For example, The Send a Document for Digital Signature catalog item triggers a sample flow that sends a DocuSign document to a designated recipient.

Role required: admin
- Request IntegrationHub subscription
- Activate DocuSign spoke
- Activate the Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer) plugin

The DocuSign spoke adds catalog items for use with the DocuSign spoke sample flows. Before triggering a DocuSign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document for digital signature in DocuSign.</td>
</tr>
<tr>
<td>Demonstrate Template - Send Job Offer to Candidate</td>
<td>Sends a job offer using a DocuSign template.</td>
</tr>
</tbody>
</table>

1. Navigate to **Service Catalog > Maintain Items.**
2. Search for and select **Send a Document for Digital Signature.**
3. Click Activate.
4. Open the record, Send a Document for Digital Signature.
5. In the Process Engine tab, select Send a Document for Digital Signature for Flow.
6. Search for and select Demostrate Template - Send Job Offer to Candidate.
7. Click Activate.
8. Open the record, Demostrate Template - Send Job Offer to Candidate.

When one of these items is requested in the Service Catalog, the associated DocuSign spoke sample flow triggers and performs actions in DocuSign.

**Change the DocuSign API version**

By default, the DocuSign spoke sends REST API requests to DocuSign API v2. For forward compatibility and to take advantage of DocuSign’s newer API, you can update a connection attribute to send API requests to DocuSign API v2.1.

Role required: admin

To understand the difference between the two APIs, see the DocuSign Developer site.

1. Navigate to DocuSign > Connection Aliases.
2. Open the connection alias that you want to update the version for.
   - Only requests sent using this alias use the new API version. For example, if you want to update the API version for all requests and your implementation uses multiple connection aliases, you must update each connection alias.
3. In the Connection Attributes related list, add or edit the API Version record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Label</td>
<td>API Version</td>
</tr>
<tr>
<td>Column name</td>
<td>api_version</td>
</tr>
<tr>
<td>Default value</td>
<td>v2.1</td>
</tr>
</tbody>
</table>

4. Save or submit the record.

When the DocuSign spoke makes an API request, it uses the API version designated in the connection attribute Default value field.

**How to automate on-demand signing requests**

Send DocuSign on-demand signing requests using information in your ServiceNow instance by creating flows in Flow Designer.

Role required: admin

- Request IntegrationHub subscription
- Activate DocuSign spoke
- Set up DocuSign spoke

**Note:** Customize flows in Flow Designer based on your requirements.

1. In Flow Designer, create a flow.
2. Specify TRIGGER to initiate the flow.
3. Specify the **ACTIONS** to be performed during the flow. The actions include one of the following:
   - Send Adhoc Signature Request To User
   - Send Adhoc Signature Request To Users

4. Optional: To pause the flow until the specified document is signed or rejected, select the **Wait for Signature from DocuSign** action.

5. Perform one of the following set of actions:
   - To send an embedded signing URL, select **Use Embedded Signing**, and **Embedded Signing Recipient (User)**.
   - To send a document for signing, provide details regarding DocuSign account, PDF document, recipient, email, and envelope expiry.
     - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
     - An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

**How to automate signing requests using templates**

Send DocuSign signing requests using DocuSign templates and information in your ServiceNow instance by creating flows in Flow Designer. For example, *Send employee offer*.

Role required: admin
- Request IntegrationHub subscription
- Activate DocuSign spoke
- **Set up DocuSign spoke**

**Note:** Customize flows based on your requirements.

1. In DocuSign, create document templates and specify recipient roles. For example, *Candidate* and *Manager*. The system retrieves other recipient details such as name and email, when the flow is triggered.
2. In Flow Designer, create a new flow.
3. Specify **TRIGGER** to initiate the flow.
4. Specify the **ACTIONS** to be performed during the flow and provide recipient details. The actions include:
   - **Create Draft Envelope from Template**
   - **Get Recipient ID by Role Name**
   - **Add Recipient to Envelope**
   - **Get Recipient ID by Role Name**
   - **Add Recipient to Envelope**
   - **Get Field ID**
   - **Set Field Value**
   - **Send Envelope**
   - **Get Field Value**

5. Optional: To pause the flow until the specified document is signed or rejected, select the **Wait for Signature from DocuSign** action.
   - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
• An envelope record is created in the Envelopes table. The Envelope status and other details are updated.

How to separate DocuSign account data

Restrict access to DocuSign data based on a user’s role. For example, your company may have one DocuSign account used by the HR team and another used by the Legal team. To keep the data separate between these two accounts, you can create a role for each account and add it to the accounts record.

- Request IntegrationHub subscription
- Activate DocuSign spoke
- Create connection aliases for additional DocuSign accounts
- Set up DocuSign spoke

1. Create a role for each DocuSign account that you want to restrict access to.
   a) Navigate to System Security > Users and Groups > Roles.
   b) In the Roles (sys_user_role) table, select New.
   c) Check that the value of the Application field is DocuSign Spoke. If a different scope is listed, change the scope to DocuSign Spoke.
   d) In the Suffix field, add a name to indicate the account that the role is for. For example, Legal.
   e) Save the record.
   f) Note the name of the role you just created. For example, sn_docusign_spoke.legal.

2. Add the role to the associated account in the accounts table.
   a) Navigate to DocuSign > Accounts.
   b) Open the account record that you want to restrict access to.
   c) In the Role field, add the associated role.
   d) Click Update.

3. Grant the role to the desired users.
   a) Navigate to System Security > Users and Groups > Users.
   b) Open the record for the user you want to provide access.
   c) Add the role you created to the Roles related list.

Only users with the designated role have access to DocuSign data associated with the account.

F5 BIG-IP spoke

Manage servers and pools in the F5 BIG-IP system.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version

BIG-IP 13.1.0.

Spoke flows

The F5 BIG-IP spoke provides sample flows in the draft state to demonstrate automating F5 tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Traffic Management Using F5 Big-IP</td>
<td>Creates a virtual server, associates it to a pool, and adds pool member in the BIG-IP system from a ServiceNow Service Catalog request.</td>
</tr>
</tbody>
</table>

Spoke subflows

The F5 BIG-IP spoke provides sample subflows to demonstrate automating F5 tasks. Available sample subflows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>F5 Server - Pool Management</td>
<td>Creates a pool in the BIG-IP system and manages it.</td>
</tr>
</tbody>
</table>

Spoke actions

The F5 BIG-IP spoke provides actions to automate F5 tasks when events occur in ServiceNow. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pool Management</td>
<td>Create Pool</td>
<td>Creates a pool in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Add Pool Member</td>
<td>Creates a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Check Pool</td>
<td>Checks pool health in BIG-IP system. Returns whether the pool is available, unavailable, offline, or if the status is unknown.</td>
</tr>
<tr>
<td></td>
<td>Delete Pool</td>
<td>Deletes a pool from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Disable Pool Member</td>
<td>Disables a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Enable Pool Member</td>
<td>Enables a pool member of a specified pool in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Get Pool Members</td>
<td>Retrieves the list of members of a specified pool from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Remove Pool Member</td>
<td>Deletes a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td>Server Management</td>
<td>Add Profile to Virtual Server</td>
<td>Adds a profile to a virtual server in the BIG-IP system. Profiles enable you to control network traffic. For example, you can enable HTTP connections to the virtual server.</td>
</tr>
<tr>
<td></td>
<td>Create Virtual Server</td>
<td>Creates a virtual server in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Delete Virtual Server</td>
<td>Deletes a virtual server from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Update Virtual Server</td>
<td>Updates virtual server attributes in the BIG-IP system.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

This spoke uses this alias record to authorize actions.
## Connection & Credential alias

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
</table>
| F5_BIG_IP                    | Connection to the F5 BIG-IP system. | • Connection type: HTTP  
• Connection URL: URL of the host machine where the F5 server is installed. |

To use the spoke connection alias, create an associated Connection record and an associated Credential record.

### MID Server requirements

These actions use REST calls, which can run on a MID Server. Use the connection record associated with the F5 BIG-IP alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

### Set up F5 BIG-IP spoke

Integrate the ServiceNow instance and F5 using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate F5 BIG-IP spoke
- Role required: admin

**Create Credential records for the F5 BIG-IP spoke**

Create Credential records to the F5 BIG-IP server. The F5 BIG-IP spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter F5 Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Your F5 BIG-IP user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Your F5 BIG-IP password.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
Create Connection records for the F5 BIG-IP spoke

Create Connection records to your F5 BIG-IP account. The F5 BIG-IP spoke connection and credential alias uses these connections to perform actions on the F5 BIG-IP server.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for F5_BIG_IP.
3. From the Connections tab, click New. The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter F5 Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for F5. For example, select F5 Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL of the host machine where the F5 BIG-IP server is installed.</td>
</tr>
</tbody>
</table>

5. Click Submit.

First Advantage spoke v1.0.1

Manage and track the background verifications of candidates using First Advantage from your ServiceNow instance. Manage users, accounts, candidates, invites, and orders in First Advantage from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for First Advantage API version v1.1, but may be compatible with later versions.

Spoke requirements

- First Advantage account
- API key
- Account ID

Note: Contact the First Advantage team to obtain the API key.
Spoke flows

The First Advantage spoke provides sample flows to demonstrate automating the First Advantage tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Advantage - Candidate Background Verification using Invite</td>
<td>Initiates background check of the candidate using invite. Sends a request to the candidate to complete an application. For information about creating a case, see Create a case in First Advantage from ServiceNow.</td>
</tr>
<tr>
<td>First Advantage - Candidate Background Verification using Order</td>
<td>Initiates background check of the candidate using order. An order record is created and request to provide essential details is sent to the candidate. For information about creating a case, see Create a case in First Advantage from ServiceNow.</td>
</tr>
</tbody>
</table>

Spoke subflows

The First Advantage spoke provides a sample subflow to demonstrate automating First Advantage tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Get Packages. The subflow retrieves packages in First Advantage and stores the details in the Packages table.

Spoke actions

The First Advantage spoke provides actions manage accounts, candidates, invites, orders, and users when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Get Account Details</td>
<td>Retrieves details of the First Advantage account.</td>
</tr>
<tr>
<td></td>
<td>Get Account Packages</td>
<td>Retrieves the details of all the packages in an account.</td>
</tr>
<tr>
<td></td>
<td>Get Account Profiles</td>
<td>Retrieves the details of all profiles in an account.</td>
</tr>
<tr>
<td></td>
<td>Get Account Users</td>
<td>Retrieves the details of all users in an account.</td>
</tr>
<tr>
<td>Candidate Management</td>
<td>Create New Candidate</td>
<td>Creates a candidate profile for background verification.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Candidate By Candidate ID</td>
<td>Retrieves the details of the required candidate.</td>
</tr>
<tr>
<td></td>
<td>Get Documents For A Specific Candidate</td>
<td>Retrieves the documents associated with the required candidate.</td>
</tr>
<tr>
<td></td>
<td>Get Monitoring Product Details For A Specific Candidate</td>
<td>Retrieves the details of the monitoring product for the required candidate.</td>
</tr>
<tr>
<td></td>
<td>Update Candidate Details</td>
<td>Updates the details of a candidate profile.</td>
</tr>
<tr>
<td>Invite Management</td>
<td>Create Invite</td>
<td>Create an invite for the candidate to fill the application.</td>
</tr>
<tr>
<td></td>
<td>Get Invite Status By Applicant ID</td>
<td>Retrieves the latest status of the invite for the required applicant.</td>
</tr>
<tr>
<td></td>
<td>Get Invite View Link By Application ID</td>
<td>Retrieves a secure link to access the profile that the candidate must complete.</td>
</tr>
<tr>
<td>Order Management</td>
<td>Create Order</td>
<td>Creates a First Advantage screening order.</td>
</tr>
<tr>
<td></td>
<td>Get Order Report By Order ID</td>
<td>Retrieves the completed order report for the required order.</td>
</tr>
<tr>
<td></td>
<td>Get Order Status By Order ID</td>
<td>Retrieves the latest order status for the required order.</td>
</tr>
<tr>
<td>User Management</td>
<td>Activate User</td>
<td>Activates the required user.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a user profile.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the required user.</td>
</tr>
<tr>
<td></td>
<td>Update User Password</td>
<td>Updates the password of the required user.</td>
</tr>
<tr>
<td></td>
<td>Update User Profile</td>
<td>Updates information in the profile of the required user.</td>
</tr>
</tbody>
</table>

**Spoke module**

The First Advantage spoke adds a First Advantage spoke module to your ServiceNow instance. The First Advantage spoke synchronizes and stores information about First Advantage cases, tasks, employee tasks, order tasks, and packages.

The First Advantage spoke includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FADV Webhook Client Details</td>
<td>Enables you to set up First Advantage webhook by providing key for the First Advantage webhook client.</td>
</tr>
<tr>
<td>Module</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create New First Advantage Case</td>
<td>Enables you to initiate the background check of the required candidate using invite or order from ServiceNow.</td>
</tr>
<tr>
<td>First Advantage Cases</td>
<td>Enables you to view list of all First Advantage cases created using invite and order.</td>
</tr>
<tr>
<td>Packages</td>
<td>Enables you to view the details of all packages available in First Advantage. To view the package details, you must set up the spoke and synchronise the packages.</td>
</tr>
<tr>
<td>Order Tasks</td>
<td>Enables you to view list of all First Advantage order records.</td>
</tr>
<tr>
<td>Employee Tasks</td>
<td>Enables you to view list of all First Advantage cases created using invite.</td>
</tr>
</tbody>
</table>

The First Advantage spoke includes the these tables:
- First Advantage Task (sn_fadv_spoke_first_advantage_task)
- First Advantage Employee Task (sn_fadv_spoke_first_advantage_employee_task_table)
- Packages (sn_fadv_spoke_packages)
- FADV Webhook Client Details (sn_fadv_spoke_webhook_client_details)

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Advantage Task</td>
<td>Details of all the First Advantage order records.</td>
</tr>
<tr>
<td>First Advantage Employee Task</td>
<td>Details of all the First Advantage invite records.</td>
</tr>
<tr>
<td>Packages</td>
<td>First Advantage packages that are synchronized with ServiceNow®.</td>
</tr>
<tr>
<td>FADV Webhook Client Details</td>
<td>Client details to set up the First Advantage webhook.</td>
</tr>
</tbody>
</table>

**Spoke user roles**
- First Advantage admin
- First Advantage user

Only users with the First Advantage admin role can view the FADV Webhook Client Details module.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).
Set up the First Advantage spoke

Integrate the ServiceNow instance with your First Advantage account using an API key to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the First Advantage spoke
- Role required: admin

Create Credential record for the First Advantage spoke
Create Credential records to the First Advantage spoke. The First Advantage spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter FADV Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>API Key</td>
<td>API key generated for your First Advantage instance.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection record for the First Advantage spoke
Create a Connection record to the First Advantage API. The First Advantage spoke connection and credential alias uses these connections to perform actions in First Advantage.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for First Advantage.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter FADV Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for First Advantage. For example, select FADV Credentials.</td>
</tr>
</tbody>
</table>
5. In the Attributes tab, enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution Email</td>
<td>Distribution email of your organization.</td>
</tr>
<tr>
<td>Account ID</td>
<td>Account ID of your First Advantage account.</td>
</tr>
</tbody>
</table>

Note: Contact the First Advantage team to obtain the Account ID.

Note: If you are using any other version of First Advantage, specify the version number.

6. Click Submit.

8. Open the record for First Advantage.

9. Click the Connection Attributes tab.

10. Modify the default values of the connection attributes records as per your requirement.

<table>
<thead>
<tr>
<th>Connection Attributes record</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution Email</td>
<td>Distribution email of your organization.</td>
</tr>
<tr>
<td>Account ID</td>
<td>Account ID of your First Advantage account.</td>
</tr>
</tbody>
</table>

Note: Contact the First Advantage team to obtain the Account ID.

Version v1.1

Note: If you are using any other version of First Advantage, specify the version number.

Create First Advantage states in your ServiceNow instance

Create First Advantage states to be displayed in the State list in your ServiceNow instance.

Role required: admin

Create the Draft, Ready, and In Progress states

Create the Draft, Ready, and In Progress states in the Task (task) table.

1. In the Filter navigator, enter sys_choice.list.
   The records in the Choice (sys_choice) table are displayed.

2. Click New.

3. On the form, fill these values and create three records for the Draft state.
Record 1 - Draft state

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Task (task)</td>
</tr>
<tr>
<td>Label</td>
<td>Draft</td>
</tr>
<tr>
<td>Value</td>
<td>137</td>
</tr>
</tbody>
</table>

Note:
- Ensure that you provide the exact numbers in the Value field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.
- Ensure that the record is created in the Global application.

4. Click Submit.
5. Similarly, create records for the Ready and In Progress states.

Record 2 - Ready state

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Task (task)</td>
</tr>
<tr>
<td>Label</td>
<td>Ready</td>
</tr>
<tr>
<td>Value</td>
<td>173</td>
</tr>
</tbody>
</table>

Record 3 - In Progress state

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Task (task)</td>
</tr>
<tr>
<td>Label</td>
<td>In Progress</td>
</tr>
<tr>
<td>Value</td>
<td>181</td>
</tr>
</tbody>
</table>

Note:
- Ensure that you provide the exact numbers in the Value field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.
- Ensure that the record is created in the Global application.

The Draft, Ready, and In Progress states are created in the Task (task) table.

Create the Complete and Cancelled states
Create the Complete and Cancelled states in the First Advantage Task (sn_fadv_spoke_first_advantage_task) table.

1. Navigate to First Advantage Spoke > Order Tasks.
2. Click New.

Note: Ensure that the record is created in the First Advantage application.
3. Right-click State and click Configure Choices.
4. Perform these steps to create the Cancelled state:
   a) Enter Cancelled in New item text.
   b) Enter 149 in Numeric value.

   Note: Ensure that you provide the exact numbers in the Numeric value field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c) Click Add.
   d) Click Save.

5. Perform these steps to create the Complete state:
   a) Enter Complete in New item text.
   b) Enter 127 in Numeric value.

   Note: Ensure that you provide the exact numbers in the Numeric value field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c) Click Add.
   d) Click Save.

The Complete and Cancelled states are created in the First Advantage Task (sn_fadv_spoke_first_advantage_task) table.

Create the Complete - Success and Complete - Deal Broken states

Create the Complete - Success and Complete - Deal Broken states in the First Advantage Employee Task (sn_fadv_spoke_first_advantage_employee_task_table) table.

1. Navigate to First Advantage Spoke > Employee Task.
2. Click New.

   Note: Ensure that the record is created in the First Advantage application.

3. Right-click State and click Configure Choices.
4. Perform these steps to create the Cancelled state:
   a) Enter Complete - Success in New item text.
   b) Enter 161 in Numeric value.

   Note: Ensure that you provide the exact numbers in the Numeric value field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c) Click Add.
   d) Click Save.

5. Perform these steps to create the Complete state:
   a) Enter Complete - Deal Broken in New item text.
   b) Enter 117 in Numeric value.
c) Click **Add**.
d) Click **Save**.

The Complete - Success and Complete - Deal Broken states are created in the First Advantage Employee Task (sn_fadv_spoke_first_advantage_employee_task_table) table.

**Set up First Advantage webhooks**

Receive invite and order event updates at your ServiceNow instance by setting up the webhooks.

**Role required: admin**

**Provide key in your ServiceNow instance**

Set up the First Advantage webhook by providing key for the First Advantage webhook client.

- Generate a secure key as per your requirement and record the value. For example, a base64 encoded key.
- Role required: admin

1. Navigate to **First Advantage Spoke > FADV Webhook Client Details**.
2. Click **New**.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record.</td>
</tr>
<tr>
<td>Authorization Key</td>
<td>Key you had generated as per your requirement.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Access API endpoints**

Access the API endpoint for the invite and order events and share the required details with First Advantage to set up the webhooks.

**Role required: admin**

1. Navigate to **System Web Services > Scripted REST APIs**.
2. Open the record for the First Advantage spoke. For example, **First Advantage Webhook**.
3. In the **Resources** tab:
   a) Open the record for the invite event. For example, **Invite Status**.
   b) Copy and record the path provided in **Resource path**. For example, `/api/sn_fadv_spoke/fadv/invite_status`.
   c) Open the record for the order event. For example, **Order Status**.
   d) Copy and record the path provided in **Resource path**. For example, `/api/sn_fadv_spoke/fadv/order_status`.

Contact First Advantage to setup webhooks for your ServiceNow instance. For this, share these details with First Advantage:
• Custom header in this format: fadvKey <authorization-key>.

Note:
• Ensure that the custom header is in this format only. The spoke flows will not be triggered if there is any change.
• Provide the same key you had earlier provided in First Advantage Spoke > FADV Webhook Client Details.
• Use the same case as mentioned here: fadvKey.

• API endpoint for the invite events in this format: <ServiceNow-instance-URL>/api/sn_fadv_spoke/fadv/invite_status
• API endpoint for the order events in this format: <ServiceNow-instance-URL>/api/sn_fadv_spoke/fadv/order_status

Synchronise First Advantage packages with ServiceNow
Store the details of the First Advantage packages by synchronizing First Advantage packages with ServiceNow.

Role required: First Advantage admin
1. Navigate to First Advantage Spoke > Packages.
2. Click the Get Packages related link.

The First Advantage package details are retrieved and saved in the Packages table.

Note: Only users with the FADV admin role can synchronize the package details. Users with FADV user role can only view the retrieved details.

Create a case in First Advantage from ServiceNow
Initiate the background check of the required candidate using invite or order from ServiceNow.
• Set up the First Advantage spoke
• Synchronise First Advantage packages with ServiceNow
• Create users in the User (sys_user) table. Background check can be performed only for these users.
• Role required: First Advantage admin or First Advantage user

1. Navigate to First Advantage Spoke > Create New First Advantage Case.
   Form to provide the First Advantage case details is displayed.
2. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Distribution Email for getting invite email from First Advantage</td>
<td>Option to send invitation email to all users in the distribution email.</td>
</tr>
<tr>
<td>Select User</td>
<td>User in the User (sys_user) table.</td>
</tr>
<tr>
<td>First Name</td>
<td>First name of the selected user. The value is auto-populated based on the user selected in Select User.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the selected user. The value is auto-populated based on the user selected in Select User.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Email</td>
<td>Email address of the selected user. The value is auto-populated based on the user selected in Select User.</td>
</tr>
<tr>
<td>Select A Package</td>
<td>First Advantage package to perform the background check.</td>
</tr>
<tr>
<td>Short Description</td>
<td>Brief description about the background check.</td>
</tr>
<tr>
<td>Agent Name</td>
<td>Agent to perform the background check.</td>
</tr>
<tr>
<td>Send Invite link</td>
<td>Option to send an invite email. When selected, a request to complete an application is sent to the candidate through an invite email. If this option isn't selected, an order email is sent to the user. An order record is created and request to provide essential details is sent to the candidate.</td>
</tr>
</tbody>
</table>

**Note:**
- When the Send Invite link option is selected, an order is created only after the candidate has filled the application form.
- When the Send Invite link option isn't selected, an order is immediately created.

Events updates can be accessed in your ServiceNow instance.

3. Click **Submit**. A First Advantage task is created in your ServiceNow instance with **State** as **Draft**. The case can be accessed by navigating to **First Advantage Spoke > First Advantage Cases**.

Initiate background verification in First Advantage from ServiceNow using invite

Initiate background verification of the required candidate by sending a request to complete an application through an invite email.

- **Create a case in First Advantage from ServiceNow**

  **Note:** Ensure that the Send Invite link option is selected.

- Role required: First Advantage admin or First Advantage user

1. Navigate to **First Advantage Spoke > First Advantage Cases**.
2. Search for the required task.
3. Ensure that the Send Invite link option is selected. Else, select the Send Invite link option if you want to initiate background verification using invite.
4. Change the State of the task from **Draft** to **Ready**.
   - The First Advantage - Candidate Background Verification using Invite flow is triggered.
   - State is changed to **In Progress**.
• In the **Employee Tasks** tab, a record is created and its details such as **Number**, **Invite ID** and so on, are populated. Open the record to access details such as **Invite URL**, **Candidate ID**, and so on. Also, real-time updates are displayed here.

| Note: The Employee Tasks tab displays all the invite records created for the user. |

| Note: The Order History tab displays all the order records created for the user. |

• In the **Order History** tab, a record is created and its details such as **Number**, **Short Description** and so on, are populated.

| Note: Order ID is populated only after the invite is executed successfully. For example, Order ID isn’t populated if the candidate has declined to complete the application form. |

• Real-time updates and System Administrator events are displayed in the **Order Details** tab.

| Note: | You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks. |
| Note: | If the candidate has declined the request for background verification, the Order record isn’t created for the task. |

• An invite email is sent to the candidate.

After accessing the invite email, candidate can either complete the application form or decline. If candidate fills and submits the application form, First Advantage approves, cancels, or rejects the task after performing the background verification.

• The status and all other details can be accessed in real-time by navigating to **First Advantage Spoke > Employee Tasks**.

• Guest events are displayed in the respective First Advantage Employee Task record.

| Note: | Ensure that the Send Invite link option isn’t selected. |

Initiate background verification in First Advantage from ServiceNow using order

Initiate background verification of the required candidate by sending an email requesting for the essential information.

• **Create a case in First Advantage from ServiceNow**

| Note: | Ensure that the Send Invite link option isn’t selected. |

• Role required: First Advantage admin or First Advantage user

An order is initiated when First Advantage has all basic information about the candidate and requires only some essential sensitive information.

1. Navigate to **First Advantage Spoke > First Advantage Cases**.
2. Search for the required task.
3. Ensure that the Send Invite link option isn’t selected. Else, clear the Send Invite link option if you want to initiate background verification using order.
4. Change the **State** of the task from **Draft** to **Ready**.

| Note: | The First Advantage - Candidate Background Verification using Order flow is triggered. |
• **State** is changed to **In Progress**.
• In the **Order History** tab, a record is created and its details such as **Order ID**, **Number**, **Short Description** and so on, are populated.
• Real-time updates and System Administrator events are displayed in the **Order Details** tab.

**Note:** The **Order History** tab displays all the order records created for the user.

• An order email is sent to the candidate.

A mail is sent to candidate requesting only the sensitive information. Real-time updates and guest events are displayed in the **Order Details** tab. First Advantage approves, cancels, or rejects the task after performing the background verification.

**Note:** You must set up the webhooks to receive the guest event updates. See **Set up First Advantage webhooks** for information on setting up the webhooks.

**GitHub spoke v1.0.2**

Manage distributed version control and source code in GitHub from your ServiceNow instance. Create flows in ServiceNow to manage collaborative features such as tracking bugs, feature requests, tasks and so on, for projects in GitHub.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see **Request IntegrationHub**.

**Supported versions**

This spoke was built for GitHub API version v3, but may be compatible with later versions.

**Spoke requirements**

• GitHub account
• User with admin credentials
• Token to authenticate the ServiceNow instance

See the **GitHub documentation** for instructions on creating GitHub account and generating token.
GitHub Webhooks module

Bi-directional webhooks can be setup to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in GitHub for which you wish to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the GitHub tasks.

The bi-directional webhooks requires separate setup and can be used independently without using the spoke actions. By default, the GitHub Webhooks application is available in the GitHub spoke and has the following modules:

- GitHub Webhook Registries
- GitHub WebHook Routing Policies

Use the GitHub Webhook Registries module to assign a token and provide the API path. You must generate Callback URL here and provide this URL in GitHub. A default routing policy is provided in the GitHub WebHook Routing Policies module. The default routing policy supports these GitHub fields:

<table>
<thead>
<tr>

To use other conditions in the routing policy, create routing policy in the GitHub WebHook Routing Policies module and specify conditions as per your requirement. See *Set up bi-directional webhook for the GitHub spoke* for information regarding setting up and configuring the webhooks.
Spoke subflow

The GitHub spoke provides a sample subflow to handle various GitHub webhook events. Available sample subflows are:

### Spoke subflows

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
<th>Supported GitHub Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process GitHub Branch and Tag Webhook Events</td>
<td>Handles branch and tag webhook events.</td>
<td>Branch and Tag</td>
</tr>
<tr>
<td>Process GitHub Commit Webhook Events</td>
<td>Handles commit webhook events.</td>
<td>Commit</td>
</tr>
<tr>
<td>Process GitHub Issue Webhook Events</td>
<td>Handles issue webhook events.</td>
<td>Issue</td>
</tr>
<tr>
<td>Process GitHub Milestone Webhook Events</td>
<td>Handles milestone webhook events.</td>
<td>Milestone</td>
</tr>
<tr>
<td>Process GitHub Project Webhook Events</td>
<td>Handles project webhook events.</td>
<td>Project</td>
</tr>
<tr>
<td>Process GitHub Pull Request Webhook Events</td>
<td>Handles pull request webhook events.</td>
<td>Pull Request</td>
</tr>
<tr>
<td>Process GitHub Push Webhook Events</td>
<td>Handles push request webhook events.</td>
<td>Push Request</td>
</tr>
<tr>
<td>Process GitHub Release Webhook Events</td>
<td>Handles release webhook events.</td>
<td>Release</td>
</tr>
<tr>
<td>Process GitHub Repository Webhook Events</td>
<td>Handles repository webhook events.</td>
<td>Repository</td>
</tr>
<tr>
<td>Process GitHub Security Webhook Events</td>
<td>Handles security webhook events.</td>
<td>Security</td>
</tr>
<tr>
<td>Process GitHub Webhook Events</td>
<td>Handles all GitHub webhook events.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** This subflow handles all GitHub events. You can customize this subflow to handle other GitHub webhook events that are not supported by default.

To create subflows to handle other GitHub webhook events or handle the supported GitHub webhook events differently, customize the Process GitHub Webhook Events subflow. For this, you must create a copy of the subflow, parse the payload, and customize the subflow as per your requirement. Payload is one of the inputs to the subflow.

While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

**Note:**

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
- You must configure webhooks to use the spoke subflow. See *Set up bi-directional webhook for the GitHub spoke* for information regarding setting up and configuring the webhook.
- The sample subflows run as a user by default. It can be configured to run as system.
- GitHub spoke supports application/json payload. Configure the GitHub webhook accordingly. See the *GitHub Developer* documentation for instructions on creating and configuring a webhook.

**Spoke actions**

The GitHub spoke provides actions manage branches, issues, repositories, and source code when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch Management</td>
<td>Create Branch</td>
<td>Creates a branch in GitHub based on a specific commit SHA.</td>
</tr>
<tr>
<td></td>
<td>Delete Branch</td>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up GitHub spoke**

- Request IntegrationHub subscription
- Activate GitHub spoke
- Generate token and record the value
- Role required: admin

Create Credential record for the GitHub spoke

Create Credential records for the GitHub spoke. The GitHub spoke connection and credential aliases use these credentials to authorize actions.

Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.  
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **API Key Credentials**.  
   A blank API Key Credentials form displays.
4. Enter these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter GitHub Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>API Key</td>
<td>Token generated in GitHub. See the GitHub documentation for instructions on creating GitHub account and generating token.</td>
</tr>
<tr>
<td>Applies to</td>
<td><img src="image" alt="Note: This option is not applicable to this spoke." /></td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the GitHub spoke
Create Connection records for your GitHub account. The GitHub spoke connection and credential aliases use these connections to perform actions in GitHub.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for GitHub.
3. From the Connections tab, click New.
The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter GitHub Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for GitHub. For example, select GitHub Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL. Enter <a href="https://api.github.com/">https://api.github.com/</a>.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Set up bi-directional webhook for the GitHub spoke
Configure webhook to subscribe to GitHub with a ServiceNow callback URL.

- Request IntegrationHub subscription
- Activate the GitHub spoke
- Role required: admin

Create secret for the GitHub spoke
Create secret to embedded in the GitHub webhook URL.

Role required: admin
1. Navigate to System Definition > Scripts - Background.
2. Enter this command in the Run script (JavaScript executed on server) text field:
   ```javascript
gs.info(GlideSecureRandomUtil.getSecureRandomString(16));
```
3. Click Run Script.
4. Copy and record the generated secret for later use.

Register GitHub webhook in ServiceNow

Role required: admin

1. Navigate to GitHub Webhooks > GitHub Webhook Registries.
2. Click New.
3. On the form, fill in the fields.

   **GitHub Webhook Registry form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, GitHub webhook.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the record.</td>
</tr>
<tr>
<td>Secret</td>
<td>Secret you had generated using the Scripts - Background module.</td>
</tr>
<tr>
<td>Path</td>
<td>GitHub webhook path. By default, this is set to api/sn_github_spoke/gh_webhook_callbacks/wh_entry.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click Save.
5. Click Callback URL.
   The system displays the Webhook Callback URL.
6. Copy and record the Webhook Callback URL.

The GitHub webhook is registered in your ServiceNow instance.

Add Callback URL in GitHub

Provide Webhook Callback URL in GitHub account to create webhook.

Role required: admin

1. Log in to your GitHub account.
2. Create a webhook in your Atlassian account.
3. Enter Webhook Callback URL in Payload URL and Secret in Secret. See the GitHub Developer documentation for instructions on creating and configuring a webhook.

   **Note:** GitHub spoke supports application/json payload. Configure the GitHub webhook accordingly. See the GitHub Developer documentation for instructions on creating and configuring a webhook.

   The Callback URL is added in the GitHub account. You can create routing policies and subflows as per your requirement. See Customize a bi-directional webhook for information regarding creating new routing policies and subflows.

   **Customize bi-directional webhook in the GitHub spoke**

   Create webhook routing policy and subflow as per your requirement in the GitHub spoke.

Role required: admin
The default routing policy in the GitHub WebHook Routing Policies modules triggers the relevant GitHub subflow and notifies the ServiceNow app when certain events occur in GitHub. See GitHub spoke v1.0.2 for information about the GitHub fields that the default routing policy supports and the GitHub events that the subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

1. Navigate to Flow Designer > Designer.
2. Click Subflows.
3. Create a copy of the required subflow.
4. Customize the required subflow as per your requirement and publish it. See Subflows for more information about creating and using subflows and GitHub spoke v1.0.2 for information about the GitHub fields that the default routing policy supports and the GitHub events that the subflows support.
6. Click New.
7. On the form, fill in the fields.

### Decision form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
</tbody>
</table>
| Default answer   | Option to specify if this is the default answer. Default answer is applicable when the conditions are not met.  
1. Click the Lookup icon.  
2. Select the required subflow from the Document: list. |
| Condition        | Conditions to be met when the required events occur in GitHub. See GitHub spoke v1.0.2 for information about the supported fields. |
| Answer           | Subflow that has to be triggered when the specified conditions are met. |

8. Click Submit.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Routing policy and subflow are created.

**GitLab spoke v1.0.1**

Manage the DevOps lifecycle in GitLab from your ServiceNow instance. Create flows in ServiceNow to manage branches, groups, issues, merge requests, projects, and source code in GitLab.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Compatible versions

This spoke was built for GitLab API version v4, but may be compatible with later versions.

Spoke requirements

- GitLab account
- An application in GitLab configured to integrate with ServiceNow
- Application ID and Secret of the GitLab application

See the GitLab documentation for instructions on creating and configuring applications.

Spoke actions

The GitLab spoke provides actions to automate GitLab tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch Management</td>
<td>Create Branch</td>
<td>Creates a branch in the required project.</td>
</tr>
<tr>
<td></td>
<td>Delete Branch</td>
<td>Deletes the required branch from a project.</td>
</tr>
<tr>
<td></td>
<td>Delete Merged Branches</td>
<td>Deletes the required merged branch from a project.</td>
</tr>
<tr>
<td></td>
<td>Get Branch</td>
<td>Retrieves the details of the required branch.</td>
</tr>
<tr>
<td></td>
<td>List Branches</td>
<td>Retrieves the list of branches in a required project.</td>
</tr>
<tr>
<td></td>
<td>Protect Branch</td>
<td>Protects a branch in a project with access levels.</td>
</tr>
<tr>
<td></td>
<td>Unprotect Branch</td>
<td>Unprotects a branch in a project with access levels.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To A Group</td>
<td>Adds user to a GitLab group.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Remove User From A Group</td>
<td>Removes user from a GitLab group.</td>
</tr>
<tr>
<td>Issue Management</td>
<td>Create Issue</td>
<td>Creates an issue in the required project.</td>
</tr>
<tr>
<td></td>
<td>Create Issue Note</td>
<td>Creates an issue note for the required issue.</td>
</tr>
<tr>
<td></td>
<td>Delete Issue Note</td>
<td>Deletes an issue note for the required issue.</td>
</tr>
<tr>
<td></td>
<td>List Issue Notes</td>
<td>Retrieves the list of all issue notes for the required issue.</td>
</tr>
<tr>
<td></td>
<td>List Issues</td>
<td>Retrieves the list of the issues based on the input criteria.</td>
</tr>
<tr>
<td></td>
<td>Update Issue</td>
<td>Updates details of the required issue.</td>
</tr>
<tr>
<td></td>
<td>Update Issue Note</td>
<td>Updates an issue note in a project.</td>
</tr>
<tr>
<td>Merge Request Management</td>
<td>Accept Merge Request</td>
<td>Approves a merge request in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Create Merge Request</td>
<td>Creates a merge request in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Create Merge Request Note</td>
<td>Creates a note for the required merge request.</td>
</tr>
<tr>
<td></td>
<td>Delete Merge Request Note</td>
<td>Deletes a note for the required merge request.</td>
</tr>
<tr>
<td></td>
<td>List All Merge Requests</td>
<td>Retrieves the list of merge requests in a project.</td>
</tr>
<tr>
<td></td>
<td>List Merge Request Notes</td>
<td>Retrieves the list of merge request notes in a project.</td>
</tr>
<tr>
<td></td>
<td>Update Merge Request</td>
<td>Updates details of the required merge request.</td>
</tr>
<tr>
<td></td>
<td>Update Merge Request Note</td>
<td>Updates details of the required merge request note.</td>
</tr>
<tr>
<td>Project Management</td>
<td>Add User To A Project</td>
<td>Adds user to a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Archive Project</td>
<td>Archives a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Create Milestone</td>
<td>Creates milestone in a GitLab project.</td>
</tr>
<tr>
<td></td>
<td>Create Project</td>
<td>Creates a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Delete Milestone</td>
<td>Deletes milestone in a GitLab project.</td>
</tr>
<tr>
<td></td>
<td>Delete Project</td>
<td>Deletes a project in GitLab.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Project</td>
<td>Retrieves the details of the required project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>List Milestones</td>
<td>Retrieves a list of milestones, along with their details.</td>
</tr>
<tr>
<td></td>
<td>Look Up Projects</td>
<td>Retrieves a list of projects, along with their details.</td>
</tr>
<tr>
<td></td>
<td>Remove User From A Project</td>
<td>Removes user from a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Share Project With Group</td>
<td>Shares a project with a group in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Unarchive Project</td>
<td>Unarchives a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Unshare Project With Group</td>
<td>Unshares a project with a group in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Update Milestone</td>
<td>Updates details of a milestone in a project.</td>
</tr>
<tr>
<td></td>
<td>Update Project</td>
<td>Updates details of a project.</td>
</tr>
<tr>
<td>Source Code Management</td>
<td>Add New File To Repository</td>
<td>Adds a file to a repository in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Get Commit</td>
<td>Retrieves a details of a commit in GitLab.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**MID Server requirements**

These actions use REST calls, which can run on a MID Server. Use the connection record associated with the GitLab alias to configure where actions run as well as set MID Server selection attributes. For more information, see *MID server*.

**Set up GitLab spoke**

Integrate the ServiceNow instance and GitLab by creating a custom OAuth application in GitLab to authenticate ServiceNow requests.
- Request IntegrationHub subscription
- Activate the GitLab spoke
- Role required: admin
Create OAuth application in GitLab account
Create a custom OAuth application from your GitLab account to enable OAuth 2.0 authentication with the GitLab spoke.

- GitLab account
- GitLab admin credentials

Complete these steps from your GitLab account. See the GitLab documentation for instructions on creating and configuring applications.

1. From your GitLab account, create an application.
2. Enter ServiceNow instance URL in Redirect URI.
3. Copy and record the Application Id and Secret for later use. These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

The custom OAuth application from your GitLab account is created and can be integrated with the ServiceNow instance.

Register GitLab as OAuth provider
Use the information generated during GitLab application configuration to register GitLab as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to System OAuth > Application Registry.
2. Open for the record for GitLab.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter GitLab OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during the GitLab application configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Secret created during the GitLab application configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

Note: You can use only Authorization Code as the Default Grant type when PKCE is enabled.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select <strong>GitLab Spoke.</strong></td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you have installed GitLab on an on-premise server, enter the URL in this format: https://&lt;gitlab-hosted-instance&gt;.com/oauth/authorize.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. For example, <a href="https://gitlab.com/oauth/token">https://gitlab.com/oauth/token</a>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you have installed GitLab on an on-premise server, enter the URL in this format: https://&lt;gitlab-hosted-instance&gt;.com/oauth/token.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. System generates the URL upon saving the application registry. This is the URL of the ServiceNow instance.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**. The system validates the OAuth credentials and populates the **Redirect URL**.

5. Copy and record the **Redirect URL**.

6. Login to your GitLab application and edit the configuration of your GitLab application. See the **GitLab** documentation for instructions on creating and configuring applications.

7. Paste the **Redirect URL** value into the **Redirect URI** for your GitLab application.

The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

*Create Credential records for the GitLab spoke*

Authorize the GitLab spoke actions by creating credential records for the application registered in GitLab. The GitLab spoke connection and credential alias uses these credentials to authorize actions.
Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, GitLab Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of GitLab spoke as an OAuth provider. For example, select GitLab OAuth profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.
6. To generate the OAuth token, click the Get OAuth Token related link.

The credential record for the GitLab spoke is created. Create Connection record for the GitLab spoke
Create Connection records to your GitLab account. The GitLab spoke connection and credential alias uses these connections to perform actions in GitLab.

Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for GitLab.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter GitLab Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for GitLab. For example, select GitLab Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://gitlab.com/api">https://gitlab.com/api</a>. Note: If you have installed GitLab on an on-premise server, enter the URL in this format: https://&lt;gitlab-hosted-instance&gt;.com/api</td>
</tr>
</tbody>
</table>

5. Click Submit.
The connection record is created for GitLab spoke.

**Google Cloud Translator Service spoke**

Provides subflows and actions to dynamically translate the user-entered text, and to detect the language of the text using the Google translation service.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**Subscription**

This spoke requires one of the following subscriptions:

- Any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.
- IntegrationHub Professional subscription package. For more information see, Request IntegrationHub.

**Supported versions**

Google Translate API version v3beta1

**Scope of the spoke in the Dynamic Translation framework**

To use Google Cloud Translator Service spoke in the Dynamic Translation framework, ensure that the spoke is installed in ServiceNow Store and the Dynamic Translation plugin is active. For more information, see Dynamic Translation.

**Spoke flows**

This spoke has no sample flows.

**Spoke subflows**

The Google Cloud Translator Service spoke provides subflows in the Published state to integrate with the Google translation service. These subflows can be used as part of other subflows and flows.

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language</td>
<td>Contains a set of inputs, actions, and outputs to detect the language of the input text.</td>
</tr>
<tr>
<td>Translate Text To Multiple Languages</td>
<td>Contains a set of inputs, actions, and outputs to translate the input text to multiple languages.</td>
</tr>
</tbody>
</table>
Spoke actions

The Google Cloud Translator Service spoke provides actions to integrate with the Google translation service. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language</td>
<td>Detects the language of the input text.</td>
</tr>
<tr>
<td>Translate Text To Single Language</td>
<td>Translates the input text to a single language.</td>
</tr>
<tr>
<td>Translate Text To Multiple Languages</td>
<td>Translates the input text to multiple languages.</td>
</tr>
</tbody>
</table>

Google account requirements

The Google Cloud Translator Service spoke requires configuring your Google Cloud account to generate an OAuth 2.0 JWT Bearer Grant token.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the GoogleTranslation alias record (sn_google_trans_google_translation) to authorize actions.

Set up Google Cloud Translator Service spoke

Integrate your Google account with your ServiceNow instance.

- Role required: admin
- Create a service account on Google Cloud and generate a service account key of JSON type. For information on creating the service account key, see the Google documentation.
- Enable the Cloud Translation API service. For information on enabling a service, see the Google documentation.

Create a Java KeyStore certificate

Encrypt the security certificates obtained from Google by creating a Java KeyStore (JKS) file.

- Role required: admin
- Create a JSON file containing security account key from Google. For information on creating the JSON file, see the Google documentation.

1. Use the openssl command to create a PKCS 12 file using the private key and certificate available in the JSON file obtained from Google.

```bash
```
For example, if certificate.pem is the certificate and privatekey.pem is the private key:

```bash
openssl pkcs12 -export -in certificate.pem -inkey privatekey.pem -certfile certificate.pem -out testkeystore.p12
```

A PKCS 12 file, testkeystore.p12, is created.

2. Specify an export password or source keystore password.

   **Note:** You should specify this password when creating a JWT key for Google Cloud Translator Service spoke.

3. Use the keytool command to create a JKS file from the PKCS 12 file.

```bash
keytool -importkeystore -srckeystore testkeystore.p12 -srcstoretype pkcs12 -destkeystore wso2carbon.jks -deststoretype JKS
```

   **Note:** testKeyStore.p12 is the PKCS 12 file and wso2carbon.jks is the JKS file.

4. Specify a destination keystore password.

   **Note:** You should specify this password when attaching a JKS certificate to Google Cloud Translator Service spoke.

---

**Attach a Java KeyStore certificate to Google Cloud Translator Service spoke**

Enable the JWT client authentication by attaching a valid Java KeyStore (JKS) certificate to Google Cloud Translator Service spoke.

- Role required: admin
- Valid Java KeyStore certificate

1. Navigate to **System Definition > Certificates**.
2. Click **New**.
3. On the form, fill in the fields.

**X.509 Certificate form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the certificate.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the certificate.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the certificate. Select <a href="#">Java Key Store</a>.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Password to access the certificate. Use the destination keystore password specified when creating the JKS certificate. For more information on this password, see <a href="#">Create a Java KeyStore certificate</a>.</td>
</tr>
</tbody>
</table>
4. Click the manage attachments icon ( ) and attach a JKS certificate.
5. To validate the JKS certificate, click Validate Stores/Certificates.
6. Click Submit.

Create a JWT signing key for Google Cloud Translator Service spoke
Assign a JSON Web Token (JWT) signing key to your Java KeyStore certificate.
Role required: admin
1. Navigate to System OAuth > JWT Keys.
2. Click New.
3. On the form, fill in the fields.
   **JWT Keys form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the JWT signing key.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Valid JKS certificate for which you want to assign the key.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Key ID to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Algorithm to sign with the key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Password associated with the key. Use the export password or the source keystore password specified when creating the JKS certificate. For more information on this password, see Create a Java KeyStore certificate.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the key.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Create a JWT provider for Google Cloud Translator Service spoke
Add a JSON Web Token (JWT) provider to Google Cloud Translator Service spoke.
Role required: admin
1. Navigate to System OAuth > JWT Providers.
2. Click New.
3. On the form, fill in the fields.
   **JWT Provider form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the JWT provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Number of seconds that indicate the lifespan of the JWT provider token. Specify 3600.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>JWT signing key.</td>
</tr>
</tbody>
</table>
4. Right-click the form header, and click Save.
5. In the Standard Claims related list, enter the values for these claims.

<table>
<thead>
<tr>
<th>Claim name</th>
<th>Claim value</th>
</tr>
</thead>
<tbody>
<tr>
<td>aud</td>
<td><a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a></td>
</tr>
<tr>
<td>iss</td>
<td>client_email value from the JSON file.</td>
</tr>
</tbody>
</table>

6. In the Custom Claims related list, create the scope claim and enter its value as https://www.googleapis.com/auth/cloud-translation.
7. Click Update.

Configure the credential for the GoogleTranslation alias
Authorize actions of Google Cloud Translator Service spoke by configuring the Google OAuth 2.0 credential.

Role required: admin
1. Navigate to Connections & Credentials > Credentials.
2. Select the Google OAuth 2.0 credential.
3. Open the record specified in the OAuth Entity Profile field.
4. In the JWT Provider field, specify the JWT provider that you want to use.
5. Click Update.
6. To verify if an OAuth Access token is generated to connect to Google’s translation services, click the Get OAuth Token related link of the Google OAuth 2.0 credential.

Configure the connection attributes for the GoogleTranslation alias
Connect to the Google’s translation service by configuring the Google connection. Provide information that is used by HTTP(s) actions or activities to connect to that service.

Role required: connection_admin
1. Navigate to Connections & Credentials > Connections.
2. Open for the record for Google.
3. In the Attributes related list of the HTTP(S) Connection form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Location of the customer. If the value is not specified when creating an account on Google Cloud, then specify global.</td>
</tr>
<tr>
<td>project_id</td>
<td>Identifier of a project. Specify the project_id value from the JSON file.</td>
</tr>
<tr>
<td>version</td>
<td>API version that the related spokes are built for. The default value is v3beta1. Do not edit this value.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click Save.
Gmail spoke
Manage Gmail actions.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions
API version v1.

Spoke subflows
The Gmail spoke provides sample subflows in the draft state to demonstrate automating Gmail tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to Gmail</td>
<td>Copies an attachment from ServiceNow to Gmail.</td>
</tr>
</tbody>
</table>

Spoke actions
The Gmail spoke provides actions to automate Gmail tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label Management</td>
<td>Add Label to Email</td>
<td>Add a label to an email.</td>
</tr>
<tr>
<td></td>
<td>Create New Label</td>
<td>Create a label in your Gmail account.</td>
</tr>
<tr>
<td></td>
<td>Lookup Label ID By Name</td>
<td>Retrieve details of a specified Label ID.</td>
</tr>
<tr>
<td></td>
<td>Remove Label From Email</td>
<td>Remove the specified label from an email.</td>
</tr>
<tr>
<td>Email Management</td>
<td>Add Attachment To ServiceNow Record</td>
<td>Add an attachment from an email in your Gmail account to a ServiceNow record.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Get Email Details</td>
<td></td>
<td>Retrieve details of a specified email.</td>
</tr>
<tr>
<td>Look Up Emails</td>
<td></td>
<td>Retrieve details of specified emails.</td>
</tr>
<tr>
<td>Reply To Email</td>
<td></td>
<td>Send a reply to an email.</td>
</tr>
<tr>
<td>Send Email</td>
<td></td>
<td>Send email from your Gmail account to specified recipients.</td>
</tr>
<tr>
<td>Delete Email</td>
<td></td>
<td>Delete the specified email.</td>
</tr>
<tr>
<td>Undelete Email</td>
<td></td>
<td>Retrieve the specified email from the Bin.</td>
</tr>
</tbody>
</table>

**Gmail spoke account requirements**

The Gmail spoke requires a custom app that you create in the Google Developers Console.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Gmail alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

**Set up Gmail spoke**

Integrate the ServiceNow instance and Gmail spoke by using Google credentials to authenticate ServiceNow requests.

- Install the Gmail spoke.
- Request IntegrationHub subscription.
- Activate the Gmail spoke.
- Role required: admin.

**Configure Gmail application**

Create a custom OAuth application from your Gmail account to enable OAuth 2.0 authentication with the Gmail spoke.

Google Tasks integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or Gmail login created with the domain.

Complete these steps from the Google Developers Console. See the G Suite product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type Web application.
5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.

   This redirect URI must match the Redirect URL you provide when you Register Gmail as an OAuth provider.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Gmail as an OAuth provider.

   The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Gmail as an OAuth provider

Use the information generated during Gmail application configuration to register the Gmail application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Open the GMail spoke.
3. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Gmail application you created.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret of the Gmail application you created.</td>
</tr>
</tbody>
</table>
   | Redirect URL  | Click the lock icon
     enter https://<instance>.service-now.com/oauth_redirect.do, and then click the lock icon again. |

4. In the OAuth Entity Scopes related list, add the scopes required by your application. The Gmail spoke supports these scopes:

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>labels</td>
<td><a href="https://www.googleapis.com/auth/gmail.labels">https://www.googleapis.com/auth/gmail.labels</a></td>
</tr>
<tr>
<td>send</td>
<td><a href="https://www.googleapis.com/auth/gmail.send">https://www.googleapis.com/auth/gmail.send</a></td>
</tr>
<tr>
<td>readonly</td>
<td><a href="https://www.googleapis.com/auth/gmail.readonly">https://www.googleapis.com/auth/gmail.readonly</a></td>
</tr>
<tr>
<td>Name</td>
<td>OAuth scope</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>compose</td>
<td><a href="https://www.googleapis.com/auth/gmail.compose">https://www.googleapis.com/auth/gmail.compose</a></td>
</tr>
<tr>
<td>insert</td>
<td><a href="https://www.googleapis.com/auth/gmail.insert">https://www.googleapis.com/auth/gmail.insert</a></td>
</tr>
<tr>
<td>modify</td>
<td><a href="https://www.googleapis.com/auth/gmail.modify">https://www.googleapis.com/auth/gmail.modify</a></td>
</tr>
<tr>
<td>metadata</td>
<td><a href="https://www.googleapis.com/auth/gmail.metadata">https://www.googleapis.com/auth/gmail.metadata</a></td>
</tr>
<tr>
<td>basic settings</td>
<td><a href="https://www.googleapis.com/auth/gmail.settings.basic">https://www.googleapis.com/auth/gmail.settings.basic</a></td>
</tr>
<tr>
<td>sharing settings</td>
<td><a href="https://www.googleapis.com/auth/gmail.settings.sharing">https://www.googleapis.com/auth/gmail.settings.sharing</a></td>
</tr>
<tr>
<td>mail</td>
<td><a href="https://mail.google.com">https://mail.google.com</a></td>
</tr>
</tbody>
</table>

**Note:** The mail scope provides full access to the account including permanent deletion of threads and messages.
Click **Insert a new row** and enter the name and the OAuth scope

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>labels</td>
<td><a href="https://www.googleapis.com/auth/gmail.labels">https://www.googleapis.com/auth/gmail.labels</a>...</td>
</tr>
<tr>
<td>readonly</td>
<td><a href="https://www.googleapis.com/auth/gmail.readonly">https://www.googleapis.com/auth/gmail.readonly</a>...</td>
</tr>
<tr>
<td>send</td>
<td><a href="https://www.googleapis.com/auth/gmail.send">https://www.googleapis.com/auth/gmail.send</a></td>
</tr>
</tbody>
</table>

5. On the **OAuth Entity Profiles** tab, add at least one profile, set its **Is default** value to true, and select the **Grant type** Authorization Code. Click **Update**.

6. Open the form for this default profile, add the entity scopes to the profile, and click **Update**.

7. On the **Application registries** form, click **Update** again.

The system validates the OAuth credentials.

Create Credential record for the Gmail spoke.
Create Credential record for the Gmail spoke
Create Credential records to Gmail. The Gmail spoke connection and credential alias uses these credentials to authorize actions.
• Role required: admin.

1. Navigate to IntegrationHub > Connections & Credentials > Credentials and click New.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, Gmail Spoke Credential.
4. Click the OAuth Entity Profile search icon and select the default Gmail profile.
5. Click Submit and reopen the credential.
7. Choose the Google account that the application is associated with and allow Google to access the spoke actions you specified.

Create Connection record for the Gmail spoke.

Create Connection record for the Gmail spoke
Create Connection records to your Gmail account. The Gmail spoke connection and credential alias uses these connections to perform actions on Gmail.

Role required: admin

1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases and select Gmail.
2. On the Connections related list, click New.
3. Select HTTP(s) Connection.
4. Provide this connection information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name gmail.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the name of the credential you created in Create Credential record for the Gmail spoke.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL <a href="https://www.googleapis.com">https://www.googleapis.com</a>. Note: Make sure that you don't include spaces before or after this URL. If there are spaces, the connection fails.</td>
</tr>
</tbody>
</table>

5. Click Submit.

The Gmail spoke is set up and integrated with the ServiceNow instance.

**Google Calendar spoke**

Use ServiceNow to create and update events and attendees in Google Calendar.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v1.

Spoke actions

The Google Calendar spoke provides actions to perform Google Calendar tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attendees</td>
<td>Add Attendees To Event</td>
<td>Updates an event by adding to the list of attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td></td>
<td>Remove Attendees From Event</td>
<td>Updates an event by removing specified attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td>Event Management</td>
<td>Create Event</td>
<td>Creates an event on the specified calendar.</td>
</tr>
<tr>
<td></td>
<td>Update Event</td>
<td>Edit event information. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td></td>
<td>Get Event By ID</td>
<td>Returns the specified event.</td>
</tr>
<tr>
<td></td>
<td>Delete Event</td>
<td>Removes a specified event from a calendar.</td>
</tr>
</tbody>
</table>
|                        | Look Up Events       | Returns events on a specified calendar based on start time, end time, or search terms.                                                           
Google Calendar Online account requirements

The Google Calendar spoke requires a custom app that you create in Google G Suite.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Calendar alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Google Calendar spoke

Integrate a ServiceNow instance and Google Calendar by using G Suite credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Google Calendar spoke.
- Role required: admin

Configure Google Calendar application

Create a custom OAuth application from your G Suite account to enable OAuth 2.0 authentication with the Google Calendar spoke.

Google Calendar integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or login created with the domain.

Complete these steps from your Google G Suite account. See the G Suite product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. Search for the Google Calendar API and enable it.
4. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
5. Select the application type Web application.
6. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.

This redirect URI must match the Redirect URL you provide when you Register Google Calendar as an OAuth provider.
7. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Tasks as an OAuth provider. The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Google Calendar as an OAuth provider
Use the information generated during Google Calendar account configuration to register the Google Calendar application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Click New.
3. On the screen titled What kind of OAuth application, select Connect to a third-party OAuth Provider.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example Google Calendar.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Calendar application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Click the search icon and select OAuthGoogleRefreshTokenUtil</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon enter <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon enter <a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. Optional: In the OAuth Entity Scopes related list, add any scopes required by your application. The Google Calendar spoke includes these scopes by default:

- Calendar
• Events

6. Right-click the form header, and click Save.
The system validates the OAuth credentials.

Create Credential record for the Google Calendar spoke
Create Credential records to connect the Google Calendar custom OAuth application you
created during account configuration. The Google Calendar spoke connection and credential
aliases use these credentials to authorize actions.

1. Navigate to IntegrationHub > Connections & Credentials > Credentials and click New.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, gCal Cred.
4. Click the OAuth Entity Profile search icon
   and select the profile with the name of the OAuth application registry you created when you
registered the Google Calendar service as an OAuth provider.
5. Click Get OAuth Token.

Create Connection record for the Google Calendar spoke
Create connection records to a Google Calendar account. A connection alias resolves your
Google Calendar connection and credential at runtime. Only one connection is active per
Connection Alias at a time.

You should provide a single Credential and Connection Alias for all G Suite service spokes.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Select the Google Calendar connection.
3. On the Connection Attributes related list, set the default value of the API version to v3.
   If there are no connection attributes, click New and create a connection attribute with this
   information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>API version</td>
</tr>
<tr>
<td>Column name</td>
<td>u_api_version</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
<tr>
<td>Read only</td>
<td>False</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Reference</td>
<td>(empty)</td>
</tr>
<tr>
<td>Default value</td>
<td>v3</td>
</tr>
</tbody>
</table>

4. In the Connections related list, select the Google Calendar Connection.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name Google Calendar Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential name you specified when you created the Credential record. The value used in the preceding steps is gCal Cred.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the value sn_gcalendar_scope.Google_Calendar.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL <a href="https://www.googleapis.com/">https://www.googleapis.com/</a></td>
</tr>
</tbody>
</table>

5. Return to IntegrationHub > Connections & Credentials > Credentials and select googlecalendar_cred.

6. From Related Links, click Get OAuth Token. A confirmation message indicates that the OAuth token flow has completed successfully. Review the details if the flow is not successful.

*Note: Ensure that you allow pop-up windows in your browser.*

The Google Calendar spoke is set up and integrated with the ServiceNow instance.

**Google Directory spoke**

Manage groups, members, and users in Google Directory from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

*Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.*
Google Directory account requirements

The Google Directory spoke requires a custom app that you create in the Google Developers Console.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke actions

The Google Directory spoke provides actions to automate Google Directory when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Create Group</td>
<td>Creates a group.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group.</td>
</tr>
<tr>
<td></td>
<td>Get Group Details</td>
<td>Retrieves the details of the specified groups.</td>
</tr>
<tr>
<td></td>
<td>List All Groups</td>
<td>Retrieves the details of all groups.</td>
</tr>
<tr>
<td></td>
<td>Look Up Groups</td>
<td>Searches for the required groups.</td>
</tr>
<tr>
<td></td>
<td>Update Group Details</td>
<td>Updates details of the specified group.</td>
</tr>
<tr>
<td>Member Management</td>
<td>Add Member To A Group</td>
<td>Adds member to the specified group.</td>
</tr>
<tr>
<td></td>
<td>Delete Member From A Group</td>
<td>Deletes a member from the group.</td>
</tr>
<tr>
<td></td>
<td>Get Member Details From A Group</td>
<td>Retrieves details of a member from the specified group.</td>
</tr>
<tr>
<td></td>
<td>List Members Of A Group</td>
<td>Retrieves list of members in a group.</td>
</tr>
<tr>
<td></td>
<td>Member Of A Group</td>
<td>Checks if a member is part of the specified group.</td>
</tr>
<tr>
<td></td>
<td>Update Member</td>
<td>Updates details of the specified member.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified user.</td>
</tr>
<tr>
<td></td>
<td>Get User Details</td>
<td>Retrieves the details of the specified user.</td>
</tr>
<tr>
<td></td>
<td>Grant Admin To User</td>
<td>Grants admin privileges to the specified user.</td>
</tr>
</tbody>
</table>
### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

#### Set up the Google Directory spoke

Integrate the ServiceNow instance and Google Directory spoke by using G Suite credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Google Directory spoke.
- Role required: admin.

**Configure the Google Directory application**

Create a custom OAuth application from your Google G Suit account to enable OAuth 2.0 authentication with the Google Directory spoke.

**Google Directory integration requirements:**

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or login created with the domain.

Complete these steps from the [Google Developers Console](#). See the G Suite product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to [https://console.developers.google.com](https://console.developers.google.com), create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain `service-now.com`. Click **Save**.
3. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
4. Select the application type **Web application**.
5. Enter the following Authorized redirect URL: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you [Register Google Directory as an OAuth provider](#). The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

Register Google Directory as an OAuth provider
Use the information generated during Google Directory account configuration to register the
Google Directory application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Open the record for Google Directory.
3. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Calendar.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Directory application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGoogleDirectoryUtils</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the ServiceNow instance in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
The system validates the OAuth credentials.

Create Credential record for the Google Directory spoke
Create Credential records to connect the Google Directory custom OAuth application you
created during account configuration. The Google Directory spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to IntegrationHub > Connections & Credentials > Credentials and click New.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, GDirectory Cred.
4. Click the OAuth Entity Profile search icon
   and select the profile with the name of the OAuth application registry you created when you
   registered the Google Calendar service as an OAuth provider.
5. Click Get Oauth Token.
Google Drive spoke

Use Google Drive as file storage in place of attachments in ServiceNow. Adds Google Drive storage to your ServiceNow instance and enables users to reference Google Drive files in ServiceNow records.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v1.

Spoke subflows

The Google Drive spoke provides sample subflows in the draft state to demonstrate automating Google Drive tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to Google Drive</td>
<td>Copies an attachment from ServiceNow to Google Drive, records the new location of the attachment, and deletes the attachment from the ServiceNow attachment table.</td>
</tr>
</tbody>
</table>

Spoke actions

The Google Drive spoke provides actions to perform Google Drive tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File and Folder Management</td>
<td>Copy Attachment to Drive</td>
<td>Copies a ServiceNow attachment to a Google Drive folder. It either copies to the root drive of the current account or to the specified folder. To change the file name during the copy, use the optional file name.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Copy Drive File</td>
<td>Creates a copy of a Google Drive File and applies any metadata updates like a change in file name, file description, parent folder location, if file is starred, or shared by users with writer permissions.</td>
</tr>
<tr>
<td></td>
<td>Copy Drive File To Attachment</td>
<td>Copies a drive file to a ServiceNow attachment. If a ServiceNow record is supplied as input, the record should be attached to it.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a Google Drive folder that can be nested within other folders.</td>
</tr>
<tr>
<td></td>
<td>Delete Drive File Or Folder</td>
<td>Permanently deletes a drive file or folder owned by the Google Drive account user without moving it to the trash. To delete folders the user must be the owner of folder and its contents</td>
</tr>
<tr>
<td></td>
<td>Look Up Folders</td>
<td>Returns a list of Google Drive folder IDs based on given search parameters.</td>
</tr>
<tr>
<td></td>
<td>Update Attachment To Drive</td>
<td>Updates the contents of a file, but maintains the previous versions and metadata. This action only updates the content of the Google Drive file. It does not update metadata.</td>
</tr>
<tr>
<td></td>
<td>Update File Or Folder Metadata</td>
<td>Updates the metadata on a file or folder. This can be a file name change, change to the file description, a move to a new parent folder, a change in starred status, or a change to sharing permissions.</td>
</tr>
<tr>
<td>Permission Management</td>
<td>Create File or Folder Permission</td>
<td>Adds a permission to a given user, group, domain, or anyone for a file or folder. If User or Group is selected, the email address is required for those users and groups. If Domain is selected, the domain name is required. If Anyone is selected, then anyone has permissions to the file or folder.</td>
</tr>
</tbody>
</table>
# ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td></td>
<td>Delete File Or Folder Permission</td>
<td>Removes a permission to a given user, group, domain, or anyone for a file or folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up File Or Folder Permissions By ID</td>
<td>Returns the list of permissions associated with a particular file or folder.</td>
</tr>
<tr>
<td></td>
<td>Transfer Ownership Of All User Data</td>
<td>Transfers the ownership of data from one user to another within a domain. All previous permissions of old owner are removed and new owner permissions are created for new user.</td>
</tr>
<tr>
<td></td>
<td>Update File Or Folder Permission</td>
<td>Updates a given permission by updating the role.</td>
</tr>
</tbody>
</table>

**Google Drive Online account requirements**

The Google Drive spoke requires a custom app that you create in Google Drive Enterprise or Google G Suite.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Drive alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

**Set up Google Drive spoke**

Integrate a ServiceNow instance and Google Drive spoke by using Google Drive credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Google Drive spoke.
- Role required: admin

**Configure Google Drive application**

Create a custom OAuth application from your Google Drive account to enable OAuth 2.0 authentication with the Google Drive spoke.

Google Drive integration requirements:
- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in GSuite or Google Drive.
- A Google G Suite or Google Drive login created with the domain.
- A Google Drive account.

Complete these steps from your Google G Suite or Google Drive account. See the G Suite product documentation for instructions on creating and configuring custom applications.

2. Enter your business name, the number of employees, and your country, and click Next.
3. Enter the administrator contact name, email address and business phone number, and click Next.
4. Enter the domain associated with this spoke.
5. Provide the user name and password for your domain.
6. Add users to the G Suite account.
7. Verify your domain and email address.
   Users must create their own logins by navigating to the Google documentation.
9. Search for the Google Drive API and enable it.
10. Create a Credentials application and save the Client ID and Client secret.
   The Client Secret is only displayed in plain text for a short time. Copy the Client ID and the Client Secret to a text file so that you can use them when you Register Google Drive as an OAuth provider.

Register Google Drive as an OAuth provider
Use the information generated during Google Drive account configuration to register the Google Drive application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Click New.
3. On the screen titled What kind of OAuth application, select Connect to a third-party OAuth Provider.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example GoogleDrive.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Drive application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Click the search icon (🔍) and select OAuthUtilGoogleDrive.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon, enter <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon, enter <a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon, enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. Optional: In the OAuth Entity Scopes related list, add any scopes required by your application. The Google Drive spoke includes these scopes by default:

- appdata
- drive
- drivereadonly
- file
- filetransfer
- metadata
- metadatereadonly
- photosreadonly
- scripts
- user

Click **Insert a new row** and enter the name and the OAuth scope of the permission. The name and the OAuth scope are often the same.

<table>
<thead>
<tr>
<th>OAuth Entity Profiles</th>
<th>OAuth Entity Scopes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Define all available OAuth scopes for this OAuth provider. The scopes defined here can be selected when you create/update a profile. Name: A unique name. OAuth Scope: Scopes you must get from the provider’s specification, such as a read scope and a write scope. Define each scope separately.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendars.ReadWrite</td>
<td>Calendars.ReadWrite</td>
</tr>
<tr>
<td>Calendars.ReadWrite.Shared</td>
<td>Calendars.ReadWrite.Shared</td>
</tr>
<tr>
<td>email</td>
<td>email</td>
</tr>
<tr>
<td>Files.Read</td>
<td>Files.Read</td>
</tr>
<tr>
<td>Files.Read.All</td>
<td>Files.Read.All</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

Create Credential record for the Google Drive spoke

Create Credential records to connect the Google Drive custom OAuth application you created during Google Drive account configuration. The Google Drive spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, **gDrive Cred.**
4. Click the **OAuth Entity Profile** search icon

and select the profile with the name of the OAuth application registry you created when you registered the Google Drive service as an OAuth provider.

5. Click **Get Oauth Token**.

---

Create Connection record for the Google Drive spoke

Create connection records to a Google Drive account. A connection alias resolves your Google Drive connection and credential at runtime. Only one connection is active per Connection Alias at a time.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Select the Google Drive connection.
3. On the Connection Attributes related list, set the default value of the API version to **v3**.

   If there are no connection attributes, click **New** and create a connection attribute with this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>API version</td>
</tr>
<tr>
<td>Column name</td>
<td>u_api_version</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
<tr>
<td>Read only</td>
<td>False</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Reference</td>
<td>(empty)</td>
</tr>
<tr>
<td>Default value</td>
<td>v3</td>
</tr>
</tbody>
</table>

4. In the Connections related list, select **gDrive Connection**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name gDrive Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential name you specified when you created the Credential record. The value used in the steps above is gDrive Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the value sn_googledrive_spoke.Google_Drive</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL <a href="https://www.googleapis.com/">https://www.googleapis.com/</a></td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Client Credentials</strong>.</td>
</tr>
</tbody>
</table>

5. Return to **IntegrationHub > Connections & Credentials > Credentials** and select **googledrive_cred**.

6. From Related Links, click **Get OAuth Token**.

   A confirmation message indicates that the OAuth token flow has completed successfully. Review the details if the flow is not successful.
The Google Drive spoke is set up and integrated with the ServiceNow instance.

**Google Hangouts spoke**

Use ServiceNow to create and update events and attendees in Google Hangouts.

**Request apps on the Store**

Visit the [ServiceNow Store](https://servicenow.com/store) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](https://servicenow.com/store/release-notes).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see [Request IntegrationHub](https://servicenow.com/store/subscription).

**Supported versions**

API version v1.

**Spoke actions**

The Google Hangouts spoke provides actions to perform Google Hangouts tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attendees</td>
<td>Add Attendees To Hangout</td>
<td>Updates a hangout by adding to the list of attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td></td>
<td>Remove Attendees From Hangout</td>
<td>Updates a hangout by removing specified attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td>Event Management</td>
<td>Create Hangout</td>
<td>Creates a hangout on the specified calendar.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Update Hangout</td>
<td>Edit hangout information. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td></td>
<td>Get Hangout By ID</td>
<td>Returns the specified hangout.</td>
</tr>
<tr>
<td></td>
<td>Delete Hangout</td>
<td>Removes a specified hangout from a calendar.</td>
</tr>
</tbody>
</table>

### Google Hangouts Online account requirements

The Google Hangouts spoke requires a custom app that you create in Google G Suite.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

### MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Hangouts alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

### Set up Google Hangouts spoke

Integrate a ServiceNow instance and Google Hangouts by using G Suite credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Google Hangouts spoke.
- Role required: admin

**Configure Google Hangouts application**

Create a custom OAuth application from your G Suite account to enable OAuth 2.0 authentication with the Google Hangouts spoke.

Google Hangouts integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or login created with the domain.
Complete these steps from your Google G Suite account. See the G Suite product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. Search for the Google Hangouts API and enable it.
4. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
5. Select the application type Web application.
6. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.
   This redirect URI must match the Redirect URL you provide when you Register Google Hangouts as an OAuth provider.
7. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Hangouts as an OAuth provider. The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Google Hangouts as an OAuth provider
Use the information generated during Google Hangouts account configuration to register the Google Hangouts application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Click New.
3. On the screen titled What kind of OAuth application, select Connect to a third-party OAuth Provider.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example Google Hangouts.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Hangouts application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Click the search icon and select OAuthHangoutsRefreshTokenUtil.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon, enter <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a>, and then click the lock icon again.</td>
</tr>
</tbody>
</table>
5. Optional: In the **OAuth Entity Scopes** related list, add any scopes required by your application. The Google Hangouts spoke includes these scopes by default:

<table>
<thead>
<tr>
<th>Google Hangouts OAuth entity scopes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>------</td>
</tr>
<tr>
<td>Calendar</td>
</tr>
<tr>
<td>Events</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

Create Credential record for the Google Hangouts spoke
Create Credential records to connect the Google Hangouts custom OAuth application you created during account configuration. The Google Hangouts spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, **Hangout Cred**.
4. Click the **OAuth Entity Profile** search icon and select the profile with the name of the OAuth application registry you created when you registered the Google Hangouts service as an OAuth provider.
5. Click **Get OAuth Token**.

Create Connection record for the Google Hangouts spoke
Create connection records to a Google Hangouts account. A connection alias resolves your Google Hangouts connection and credential at runtime. Only one connection is active per Connection Alias at a time.

You should provide a single Credential and Connection Alias for all G Suite service spokes.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Select the Google Hangouts connection.
3. On the Connection Attributes related list, set the default value of the API version to v3.
If there are no connection attributes, click New and create a connection attribute with this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Field: API version</td>
</tr>
<tr>
<td>Column name</td>
<td>Field: u_api_version</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
<tr>
<td>Read only</td>
<td>False</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Reference</td>
<td>(empty)</td>
</tr>
<tr>
<td>Default value</td>
<td>v3</td>
</tr>
</tbody>
</table>

4. In the Connections related list, select the Google Hangouts Connection.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name Google Hangouts Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential name you specified when you created the Credential record. The value used in the preceding steps is Hangouts Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the value sn_ghangouts_scope.Google_Hangouts.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL <a href="https://www.googleapis.com/">https://www.googleapis.com/</a></td>
</tr>
</tbody>
</table>

5. Return to IntegrationHub > Connections & Credentials > Credentials and select googlehangouts_cred.

6. From Related Links, click Get OAuth Token.
   A confirmation message indicates that the OAuth token flow has completed successfully. Review the details if the flow is not successful.

   **Note:** Ensure that you allow pop-up windows in your browser.

The Google Hangouts spoke is set up and integrated with the ServiceNow instance.

**Google Tasks spoke**

Manage Google Task actions.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v1.

Spoke subflows

The Google Tasks spoke provides sample subflows in the draft state to demonstrate automating Google Tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to Google Tasks</td>
<td>Copies an attachment from ServiceNow to Google Tasks.</td>
</tr>
</tbody>
</table>

Spoke actions

The Google Tasks spoke provides actions to automate Google Tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task Management</td>
<td>Complete Task</td>
<td>Mark a task complete in a task list.</td>
</tr>
<tr>
<td></td>
<td>Create Task</td>
<td>Create a task in a task list.</td>

<td>Delete Task List</td>
<td>Delete the specified task list.</td>
</tr>
<tr>
<td></td>
<td>Get All Task Lists</td>
<td>Retrieve the details of all task lists in your Google Tasks account.</td>
</tr>
<tr>
<td></td>
<td>Get Task List</td>
<td>Retrieve details of a specified task list.</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Update Task List</td>
<td>Update details of a specified task list.</td>
</tr>
</tbody>
</table>

Google Tasks account requirements

The Google Tasks spoke requires a custom app that you create in the Google Developers Console.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Tasks alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Google Tasks spoke

Integrate the ServiceNow instance and Google Tasks spoke by using G Suite credentials to authenticate ServiceNow requests.

- Install the Google Tasks spoke.
- Request IntegrationHub subscription.
- Activate the Google Tasks spoke.
- Role required: admin.

Configure Google Tasks application

Create a custom OAuth application from your Gmail account to enable OAuth 2.0 authentication with the Google Tasks spoke.

Google Tasks integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or Gmail login created with the domain.

Complete these steps from the Google Developers Console. See the G Suite product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type **Web application**.
5. Enter the following Authorized redirect URL: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you **Register Google Tasks as an OAuth provider**.

   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

**Register Google Tasks as an OAuth provider**

Use the information generated during Google Tasks application configuration to register the Google Tasks application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to **System OAuth > Application Registry**.
2. Open the **Google Tasks** spoke.
3. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Tasks application you created.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret of the Google Tasks application you created.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon, enter <code>https://&lt;instance&gt;.service-now.com/oauth_redirect.do</code>, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

4. In the **OAuth Entity Scopes** related list, add the scopes required by your application. The Google Tasks spoke supports two scopes:

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>tasks</td>
<td><code>https://www.googleapis.com/auth/tasks</code></td>
</tr>
<tr>
<td>readonly</td>
<td><code>https://www.googleapis.com/auth/tasks.readonly</code></td>
</tr>
</tbody>
</table>
Click **Insert a new row** and enter a name for the scope and the OAuth scope URL.

5. On the **OAuth Entity Profiles** tab, add at least one profile, set its **Is default** value to true, and select the **Grant type** Authorization Code. Click **Update**.

6. Open the form for this default profile, add the entity scopes to the profile, and click **Update** again.

7. On the Application registries form, click **Update** again.

The system validates the OAuth credentials.

---

**Create Credential record for the Google Tasks spoke.**

Create Credential record for the Google Tasks spoke

Create Credential records to Google. The Google Tasks spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin.

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select **OAuth 2.0 Credentials**.
3. Enter a unique name for the credential, for example, **Google Tasks Spoke Credential**.
4. Click the **OAuth Entity Profile** search icon and select the default Google Task profile.
5. Click **Submit** and reopen the credential.

6. In Related Links, click **Get OAuth Token**.
   
   Choose the Google account that the application is associated with and allow Google to access the spoke actions you specified.

**Create Connection record for the Google Tasks spoke.**

Create Connection records to your Google account. The Google Tasks spoke connection and credential alias uses these connections to perform actions in Google tasks.

Role required: admin

1. Navigate to **IntegrationHub > Connections & Credentials > Connection & Credential Aliases** and select **Google Tasks**.

2. On the **Connections** related list, click **New**.

3. Select **HTTP(s) Connection**.

4. Provide this connection information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name GTask.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the name of the credential you created in <strong>Create Credential record for the Google Tasks spoke.</strong></td>
</tr>
</tbody>
</table>

   **Note:** Make sure that you don't include spaces before or after this URL. If there are spaces, the connection fails.

5. Click **Submit**.

The Google Tasks spoke is set up and integrated with the ServiceNow instance.

**HipChat spoke**

The HipChat spoke provides actions which post messages and ServiceNow incident, problem, and change record details to a HipChat conversation.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see **Request IntegrationHub**.

**HipChat actions**

The HipChat spoke is an available integration through IntegrationHub. You can specify the following HipChat actions within a flow:
## HipChat Inputs

The following inputs are common to the HipChat actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Required) Room Notification URL</td>
<td>The HipChat notification REST API URL. Example: <a href="https://api.hipchat.com/v2/%7Broom">https://api.hipchat.com/v2/{room</a> name}/ah-test/notification</td>
</tr>
<tr>
<td>(Required) Auth Token</td>
<td>You need an access token to send notifications. Refer to the HipChat API access token guide for details.</td>
</tr>
<tr>
<td>(Optional) Additional Message</td>
<td>Add a message to the record details.</td>
</tr>
<tr>
<td>(Optional) Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
</tbody>
</table>

## Example

You can add a HipChat Post Incident Details action to a flow which identifies high priority incidents and who they are assigned to.
Infoblox spoke
Automate network management tasks in Infoblox from your ServiceNow instance. For example, register or delete IP addresses on an Infoblox server.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Supported version
Infoblox versions 2.7 and 2.9.

Spoke flows
The Infoblox spoke provides sample flows in the draft state to automate allocating IP addresses in the Infoblox grid server. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Register or Reserve IP in IPAM</td>
<td>Registers or reserves an IP address in Infoblox based on a Service Catalog item request.</td>
</tr>
</tbody>
</table>
Spoke subflows

The Infoblox spoke provides sample subflows to register and reserve IP addresses.

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Register AName Record and Get Network Details</td>
<td>Registers an AName record type in the DNS server and retrieves network details such as network options and ID.</td>
</tr>
</tbody>
</table>

Spoke actions

The Infoblox spoke provides actions to manage IP addresses and networks in Infoblox from your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCP</td>
<td>Delete IP Reservation</td>
<td>Deletes IP address range from an Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>List IP Address Reservation</td>
<td>Lists IP address reservation in the DHCP server for a given Infoblox network view.</td>
</tr>
<tr>
<td></td>
<td>Reserve IP Address Range</td>
<td>Reserves an IP address range in the Infoblox server.</td>
</tr>
<tr>
<td>DNS</td>
<td>List CName Records</td>
<td>Lists CName records present in the Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>List DNS Records</td>
<td>Lists DNS records present in the Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>Register AName Record</td>
<td>Registers an AName record type in DNS server. An AName record stores mapping between the fully qualified domain name and the IP address.</td>
</tr>
<tr>
<td></td>
<td>Register CName Record</td>
<td>Registers a CName record in the Infoblox DNS Server. A CName record is an alias to the fully qualified domain name.</td>
</tr>
<tr>
<td></td>
<td>Delete DNS Record</td>
<td>Deletes a DNS record in the Grid Server.</td>
</tr>
<tr>
<td></td>
<td>Reserve IPAM IP Address</td>
<td>Reserves the next available IP address within a network provided in a given Infoblox server if no IP address is provided in a catalog item request.</td>
</tr>
<tr>
<td>IPAM</td>
<td>Delete IPAM IP Address</td>
<td>Deletes an IPAM IP address Reservation in Infoblox.</td>
</tr>
<tr>
<td></td>
<td>List all the IPAM Reservations</td>
<td>Lists the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Register IPAM IP Address</td>
<td>Registers the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Reserve IPAM IP Addresses</td>
<td>Reserves the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td>Network</td>
<td>Create Network</td>
<td>Creates a network within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Delete Network</td>
<td>Deletes a network within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Get Network Details</td>
<td>Gets the network details within a given Infoblox Server.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Infoblox alias record to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
</table>
| Infoblox                      | Connection to Infoblox server | • Connection type: HTTP  
• Connection URL: URL of the host machine where the Infoblox server is installed. |

To use the spoke connection alias, create an associated Connection record and an associated Credential record.

### MID Server requirements

These actions use REST calls, which must run on a MID Server. Use the connection record associated with the Infoblox alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

### Set up Infoblox spoke

Integrate the ServiceNow instance and Infoblox using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Infoblox spoke.
- Role required: admin
Create Credential records for the Infoblox spoke
Create Credential records to the Infoblox server. The Infoblox spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

   **Note:** The user name and password must be for a user with permissions to perform the actions associated with the spoke, usually an administrator.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Infoblox Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Your Infoblox user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Your Infoblox password.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Infoblox spoke
Create Connection records to your Infoblox account. The Infoblox spoke connection and credential alias uses these connections to perform actions on the Infoblox server.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Infoblox.
3. Optional: Select the Connection Attributes tab. If necessary, edit the Default value of the API. The default value of the API is associated with your Infoblox application version. For example, application version 13 uses v2.9 of the API.
   The system displays a blank HTTP(s) Connection form.
5. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Infoblox Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Infoblox. For example, select Infoblox Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL of the host machine where the Infoblox server is installed.</td>
</tr>
</tbody>
</table>

6. Click Submit.
Jenkins spoke v2

Manage builds, users, settings, and jobs on the Jenkins server. Retrieve Jenkins data to use in a flow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Spoke requirements

The Jenkins spoke v2 requires generating an API token. See Security Hardening: New API token system in Jenkins 2.129+ for more information about the API tokens.

Supported versions

All versions between 2.176.2 to 2.222.1.

Spoke modules

You can configure the Jenkins spoke v2 to receive updates from Jenkins at your ServiceNow instance. In the routing policies, conditions that must be met to receive updates at your ServiceNow instance are defined. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Jenkins tasks. This requires separate setup and can be used independently without using the spoke actions. See Set up a webhook for information regarding setting up and configuring the webhooks. To use other conditions in the routing policy or customize the default subflows, see Customize a webhook.

Routing policies and subflows support these fields:

- Keywords
- Build Number
• Job Name  
• Job Path  
• Show Related Fields

By default, the Jenkins v2 application is available in the Jenkins spoke and has these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Webhook Answer Subflows</td>
<td>Details of the webhook authorization key to authorise requests from Jenkins.</td>
</tr>
<tr>
<td>Webhook Client Detail</td>
<td>Details about the subflows in Jenkins spoke.</td>
</tr>
</tbody>
</table>

The Jenkins spoke v2 includes these tables:

• Jenkins v2 Webhook Answer Subflow (sn_jenkinsv2_spoke_webhook_answer_subflow)  
• Jenkins Webhook Client Details (sn_jenkinsv2_spoke_webhook_client_details)

### Spoke subflows

The Jenkins spoke provides sample subflows to demonstrate automating Jenkins tasks. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Jenkins Job</td>
<td>Receives updates from Jenkins at the ServiceNow instance.</td>
</tr>
<tr>
<td>Jenkins Webhook Answer Subflow</td>
<td>Builds Jenkins Job and retrieves the information.</td>
</tr>
<tr>
<td>Jenkins Webhook Answer Subflow:</td>
<td>To customize this subflow, create a copy of the subflow and change it as per your requirement.</td>
</tr>
<tr>
<td>Process build information</td>
<td></td>
</tr>
</tbody>
</table>

### Spoke actions

The Jenkins spoke provides actions to automate Jenkins tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Management</td>
<td>Delete Build</td>
<td>Deletes a build from a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Get Build ID</td>
<td>Retrieves the Build ID of an executed job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Timestamp</td>
<td>Retrieves build timestamp of a given job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Console Output</td>
<td>Retrieves build console output for a given job from Jenkins Server.</td>
</tr>
<tr>
<td></td>
<td>List Builds</td>
<td>Retrieves all the builds for a given job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Perform Build with Parameters</td>
<td>Executes a job with parameters on the Jenkins server.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Build History</td>
<td>Retrieves a range of build history for a given job from Jenkins Server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Information</td>
<td>Retrieves the build timestamp, build status, and complete build information of a given job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Number</td>
<td>Retrieves the build number for a Jenkins server job based on a pre-defined build filter, such as last successful build.</td>
</tr>
<tr>
<td></td>
<td>Perform Build</td>
<td>Executes a job on the Jenkins server.</td>
</tr>
<tr>
<td>Configuration Management</td>
<td>Create Node</td>
<td>Creates a node that you can launch with Java Web Start software. A node is a machine that is part of the Jenkins environment and capable of executing jobs.</td>
</tr>
<tr>
<td></td>
<td>Delete Node</td>
<td>Deletes a node from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Version</td>
<td>Retrieves the Jenkins server version.</td>
</tr>
<tr>
<td></td>
<td>Restart Jenkins</td>
<td>Restarts the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Test Connection</td>
<td>Tests the connection to the Jenkins server.</td>
</tr>
<tr>
<td>Job Management</td>
<td>Copy Job</td>
<td>Creates a job by copying an existing Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a Jenkins server folder to organize jobs.</td>
</tr>
<tr>
<td></td>
<td>Create Job</td>
<td>Creates a Jenkins server job from an XML file.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes an existing Jenkins server folder.</td>
</tr>
<tr>
<td></td>
<td>Delete Job</td>
<td>Deletes a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>List Jobs By Folder</td>
<td>Retrieves all the jobs for a given folder from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Job Configuration</td>
<td>Retrieves the XML configuration for a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Reload Job</td>
<td>Reloads a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Rename Job</td>
<td>Renames a Jenkins server job.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a Jenkins server user.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes an existing Jenkins server user.</td>
</tr>
<tr>
<td>View Management</td>
<td>Add Job To View</td>
<td>Adds a job to the Jenkins server view. Views are containers to organize jobs. As a Jenkins instance grows, you can create views for appropriate groups and categories. For example, you may want to create a Build view, which only displays build-specific jobs.</td>
</tr>
<tr>
<td></td>
<td>Create View</td>
<td>Creates a Jenkins server view.</td>
</tr>
<tr>
<td></td>
<td>Delete View</td>
<td>Deletes a Jenkins server view.</td>
</tr>
</tbody>
</table>
Connection and credential requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Jenkins v2 Connection & Credential Alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record.

MID Server requirements

These actions use REST calls, which run on a MID Server. Use the connection record associated with the Jenkins alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up the Jenkins spoke

Integrate the ServiceNow instance and Jenkins using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Jenkins spoke
- Role required: admin

Create Credential records for the Jenkins spoke

Create Credential records to the Jenkins server. The Jenkins spoke connection and credential alias use these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select Basic Auth Credentials.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Jenkins Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Jenkins user name.</td>
</tr>
<tr>
<td>Password</td>
<td>API token.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
</tbody>
</table>
Create Connection records for the Jenkins spoke

Create Connection records to your Jenkins account. The Jenkins spoke connection and credential alias uses these connections to perform actions on Jenkins.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases.**
2. Open for the record for **Jenkins v2.**
3. From the **Connections** tab, click **New.**
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit.**

**Set up a webhook**

Set up webhook application to receive the required updates from Jenkins at your ServiceNow instance.

Role required: admin

Create authorization key for the Jenkins spoke

Create a authorization key to authorise requests from Jenkins.

1. Navigate to **System Definition > Scripts - Background.**
2. Enter this command in the **Run script (JavaScript executed on server)** text field:
   ```javascript
   gs.info(GlideSecureRandomUtil.getSecureRandomString(32));
   ```
3. Click **Run Script.**
4. Copy and record the generated value for later use.

```plaintext
[0:00:00.241] Script completed in scope x_snc_sap_ecc_rfc: script
```

Script execution history and recovery [available here](#)

```
x_snc_sap_ecc_rfc: r29B3icyMMZAz06vEZvyxBF48K06s14
```
Provide authorization key for webhook
Authorize requests from Jenkins by providing authorization key for webhook in your ServiceNow instance.

1. Navigate to **Jenkins v2 > Webhook Client Details**.
2. Click **New**.
3. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authorization Key</td>
<td>Authorization key you had generated. See <a href="#">Create authorization key for the Jenkins spoke</a> for more information.</td>
</tr>
<tr>
<td>Name</td>
<td>Name to identify the webhook client record.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

Provide authorization key in Jenkins
Receive updates from Jenkins by providing the authorization key in Jenkins.

1. Log in to your Jenkins account.
2. Click and open the job for which you want to configure your webhook.
3. Click **Configure**.
4. In the **Bindings** tab, click **Add** and select **Jenkins**. For more information about the using the plugin, see [Credentials Binding](#).
5. On the Jenkins Credential Provider form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kind</td>
<td>Select <strong>Secret text</strong>.</td>
</tr>
<tr>
<td>Secret</td>
<td>Enter authorization key. See Create authorization key for the Jenkins spoke for more information.</td>
</tr>
<tr>
<td>ID</td>
<td>Provide unique identifier to identify the record.</td>
</tr>
</tbody>
</table>

6. Click **Add**.

7. In the **Post-build Actions** tab, configure task and specify script to receive updates at your ServiceNow instance.

   - **Sample Windows Script:**
     ```
     curl "https://<instance-name>.service-now.com/api/sn_jenkinsv2_spoke/jenkins_v2_webhook/build_status" -X POST -H "content-type:application/json" -H "jenkinsKey: %<ID>%' -d "{"Job_Name": "%JOB_NAME%", "Job_Path": "%JOB_URL%", "Build_Number": "%BUILD_NUMBER%"}"
     ```
• **Sample Shell Script**: curl "https://<instance-name>.service-now.com/api/sn_jenkinsv2_spoke/jenkins_v2_webhook/build_status" -X POST -H "content-type:application/json" -H "jenkinsKey: ${<ID>}" -d "\"Job_Name\": "$\{JOB_NAME\}\", \"Job_Path\": "$\{JOB_URL\}\", \"Build_Number\": "$\{BUILD_NUMBER\}\""

**Note**: ID in the script is the ID you had provided in the Jenkins Credential Provider form.

For more information about the using the plugin, see *Post build task*.

8. Click **Apply**.

**Provide description to subflow**

Provide user friendly descriptions to the subflows in the Jenkins spoke.

1. Navigate to **Jenkins v2 > Webhook Answer Subflows**.
2. Click **New**.
3. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description about the subflow.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Required subflow in the Jenkins spoke.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Provide answers to the decision table**

Provide subflows as answers to the conditions mentioned in the decision table. When the specified conditions are met, the associated subflow is triggered.

1. Navigate to **System Definition > Decision Tables**.
2. Open the record for the **Jenkins v2 spoke**.
3. In the **Decisions** tab, click **New**.
4. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Jenkins. See <em>Jenkins spoke v2</em> for information about the supported fields.</td>
</tr>
</tbody>
</table>
Customize a webhook
Create a webhook routing policy and customize subflow as per your requirement.
1. Navigate to Flow Designer > Designer.
2. Click Subflows.
3. Create a copy of the required default subflow.
4. Customize the Jenkins Webhook Answer Subflow: Process build information subflow as per your requirement and publish it. See Subflows for more information about creating and using subflows and Jenkins spoke v2 for information about the fields that the routing policies and subflows support.
5. Navigate to Jenkins v2 > WebHook Answer Subflows.
6. Click New.
7. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description about the subflow.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Required subflow in the Jenkins spoke.</td>
</tr>
</tbody>
</table>

8. Click Submit.

Note: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

10. Open the record for the Jenkins v2 spoke.
11. In the Decisions tab, click New.
12. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Jenkins. See <em>Jenkins spoke v2</em> for information about the supported fields.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that must be triggered when the specified conditions are met.</td>
</tr>
</tbody>
</table>

1. Click the Lookup icon ( ).
2. Select the required subflow from the Document list.

**Note:** Ensure that the Table name is `Jenkins v2 Webhook Answer Subflow [sn_jenkinsv2_spoke_webhook_answer_subflow]`.

13. Click **Submit**.

### Jira spoke v2.6.5

Manage issues, users, stories, and groups in Jira. Retrieve Jira data to use in a flow. Use bidirectional webhooks and subscribe to Jira with a ServiceNow callback URL.

### Request apps on the Store

Visit the *ServiceNow Store* website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the *ServiceNow Store version history release notes*.

### IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see *Request IntegrationHub*.

### Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Integrations - External Authentication Framework (com.glide.external.app)
Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

This spoke was built for API version v2, but may be compatible with later versions.

Note: If your Jira instance supports another API version, specify the API version in API Version under the Attributes related list. By default, the API Version is 2. See Create Connection records for the Jira spoke for information about creating a Connection record.

Spoke requirements

Activate the Integrations - External Authentication Framework (com.glide.external.app) plugin.

Jira Webhooks module

Bi-directional webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in Jira that you want to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Jira tasks.

The bi-directional webhooks require separate setup and can be used independently without using the spoke actions. By default, the Jira Webhooks application is available in the Jira spoke and has the following modules:

- Jira Webhook Registries
- Jira WebHook Routing Policies

Use the Jira Webhook Registries module to assign a token and provide the API path. You must generate a Callback URL here and provide this URL in Jira. A default routing policy is provided in the Jira WebHook Routing Policies module. The default routing policy supports these fields:
<table>
<thead>
<tr>
<th>Category</th>
<th>Field</th>
</tr>
</thead>
</table>
| Issue    | - Jira Instance URL  
|          | - Webhook Event  
|          | - Issue Description  
|          | - Created  
|          | - Updated  
|          | - Issue Resolution  
|          | - Previous Issue Resolution  
|          | - Issue Summary

| Project  | - Jira Instance URL  
|          | - Webhook Event  
|          | - Project  |
To use other conditions in the routing policy, create routing policy in the Jira WebHook Routing Policies module and specify conditions as per your requirement. See Set up a bi-directional webhook for information regarding setting up and configuring the webhooks.

Spoke subflow

The Jira spoke provides a sample subflow to handle various Jira webhook events. The available sample subflow is Process Jira Webhooks. The Process Jira Webhooks subflow supports these fields:

<table>
<thead>
<tr>
<th>Category</th>
<th>Field</th>
</tr>
</thead>
</table>
| Issue    | • User  
           • Issue  
           • Attachments  
           • Issue Change Log  
           • Project       |
| Comment  | • Issue  
           • Project  
           • Comment  |
| Worklog  | Worklog                                      |
| Attachments | Attachment                    |
| Project  | Project                                      |
| Version  | Version                                      |
| Webhook Event |                                |
| Timestamp |                                |
| Payload  |                                |

<i>Note: This is the entire Jira payload.</i>

To customize the default subflow, you must create a copy of the sample subflow, parse the payload, and customize the subflow as per your requirement. Payload is one of the inputs to the subflow.

While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.
**Spoke actions**

Use actions in the Jira spoke in Flow Designer to automate Jira tasks when an event occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issue Management</td>
<td>Copy Attachment</td>
<td>Copies the required attachment associated with the ServiceNow record to the required issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Delete Attachment</td>
<td>Deletes the required attachment in Jira.</td>
</tr>
<tr>
<td></td>
<td>Add Comment</td>
<td>Adds a comment to the specified issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Assign Issue</td>
<td>Assigns the issue in Jira to the user.</td>
</tr>
<tr>
<td></td>
<td>Create Issue</td>
<td>Creates an issue in Jira. Depending on how your organization is using Jira, an issue could represent a software bug, a project task, a help desk ticket, or more. An issue in Jira represents a task in the Now Platform.</td>
</tr>
<tr>
<td></td>
<td>Delete Issue</td>
<td>Deletes an issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Do Transition</td>
<td>Transitions an issue in Jira from one state to another.</td>
</tr>
<tr>
<td></td>
<td>Get Issue By ID</td>
<td>Retrieves the JSON object of the required issue.</td>
</tr>
<tr>
<td></td>
<td>Look Up Records By JQL</td>
<td>Retrieves the list of the required records by providing a JQL query.</td>
</tr>
<tr>
<td></td>
<td>Look Up Transitions</td>
<td>Retrieves information about all Transitions in JSON format for a given Issue ID.</td>
</tr>
<tr>
<td></td>
<td>Update Issue</td>
<td>Updates a set number of fields of an issue in Jira with values passed as input.</td>
</tr>
<tr>
<td></td>
<td>Get Issues</td>
<td>Gets a list of Jira issues.</td>
</tr>
<tr>
<td></td>
<td>Get Issues for Sprint</td>
<td>Retrieves the details of all issues for the given sprint.</td>
</tr>
<tr>
<td>Project Management</td>
<td>Get All Projects</td>
<td>Retrieves information in JSON format for all projects visible to the currently logged in user. A project in Jira is a collection of issues, and is defined according to your organization's requirements.</td>
</tr>
<tr>
<td>SDLC Management</td>
<td>Create Story</td>
<td>Creates a story in Jira, similar to a story in Now Platform Agile Development.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User Management</td>
<td>Look Up Users</td>
<td>Fetches a list in JSON format of all active Jira users.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a new user in Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove User</td>
<td>Removes a user from Jira.</td>
</tr>
<tr>
<td></td>
<td>Get Jira Users</td>
<td>Gets all Jira user subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Get Jira User Activity</td>
<td>Retrieves the details of user activity in Jira.</td>
</tr>
<tr>
<td></td>
<td>Get Audit Log</td>
<td>Gets audit log activity for Jira user subscriptions.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User to Group</td>
<td>Adds given user to a group in Jira.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Jira.</td>
</tr>
<tr>
<td></td>
<td>Look Up Users By Group</td>
<td>Retrieves a list of users who are members of the specified group and its subgroups in Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove Group</td>
<td>Removes the given group from Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove User from Group</td>
<td>Removes the given user from a group in Jira.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Creatable Fields</td>
<td>Retrieves the list of all fields in a required Jira project.</td>
</tr>
<tr>
<td></td>
<td>Get Editable Fields</td>
<td>Retrieves the list of all editable fields in a required Jira issue.</td>
</tr>
<tr>
<td></td>
<td>Get Issue Types</td>
<td>Retrieves the list of all issue types in a required Jira project.</td>
</tr>
<tr>
<td></td>
<td>Get Projects</td>
<td>Retrieves the list of all Jira projects.</td>
</tr>
<tr>
<td></td>
<td>Get All Boards</td>
<td>Retrieves the details of all boards in Jira.</td>
</tr>
<tr>
<td>Sprint Management</td>
<td>Create Sprint</td>
<td>Creates a sprint in Jira.</td>
</tr>
<tr>
<td></td>
<td>Delete Sprint</td>
<td>Deletes a sprint in Jira.</td>
</tr>
<tr>
<td></td>
<td>Get All Sprints By Board</td>
<td>Retrieves the details of all sprints in the required board.</td>
</tr>
<tr>
<td></td>
<td>Get Sprint By ID</td>
<td>Retrieves the details of the required sprint as a JSON object.</td>
</tr>
<tr>
<td></td>
<td>Update Sprint</td>
<td>Updates the details of a sprint in Jira.</td>
</tr>
</tbody>
</table>

**Jira account requirements**

The Jira spoke requires generating an API token for Jira using your Atlassian account.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Jira alias record. To use these actions, you must create a connection record and a credential record and associate them with the Jira alias record.

These actions use REST calls, which can run on an instance. Use the connection record associated with the Jira alias to configure the endpoint against which the actions run.

Set up the Jira spoke v2.6.5

Integrate the ServiceNow instance and Jira using an API key to authenticate ServiceNow requests.

- Request an IntegrationHub Standard subscription
- Activate the Jira spoke v2.6.5
- Role required: admin

You can integrate a ServiceNow instance with multiple Jira instances. For this integration, create a connection and credential alias record and a connection record for each Jira instance.

Generate a Jira account API token

Jira requirements:
- Atlassian account
- Atlassian administrator credentials

Complete these steps from your Atlassian account. See the Atlassian Developer portal documentation for instructions on generating your API token.

1. From your Atlassian account, generate an access token to interact with Jira APIs.
2. Copy and record the access token to create credential records on your ServiceNow instance.

Create credential records for the Jira spoke

Create a credential record for the Jira account. The Jira spoke connection and credential alias uses this credential to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select Basic Auth Credentials.
   The pop-up window displays a blank Basic Auth Credentials form.
4. Enter these values, then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Jira Credentials.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the email address of the user.</td>
</tr>
</tbody>
</table>
Create Connection records for the Jira spoke

Create a connection record for the Jira account. The Jira spoke connection and credential alias uses this connection to perform actions in Jira.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the alias record for Jira that shipped with the spoke.
3. On the Connections tab, click New. The system displays a blank HTTP(s) Connection form.
4. Enter these values and click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Jira Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record created for Jira. For example, select Jira Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Search for and select the Jira alias.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL of your Jira instance.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
</tbody>
</table>

5. Optional: If you create a credential record to integrate your ServiceNow instance with another Jira instance, ensure that api_version in the Attributes related list in the associated connection record is set to 2.

Note: If your Jira instance supports another API version, specify the API version in API Version in the Attributes related list. By default, API Version is 2.

The Jira spoke is set up and integrated with the ServiceNow® instance.

Set up a bi-directional webhook

Configure a webhook to subscribe to Jira with a ServiceNow callback URL.

- Request an IntegrationHub Standard subscription
- Activate the Jira spoke v2.6.5
- Role required: admin

Create a token
Create a token to embed in the Jira webhook URL.

Role required: admin

1. In the navigation filter, enter token_verification.list. The system displays records in the Token Verifications table.
2. Click New.
3. On the form, fill the fields.

**Token Verification form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the token. For example, Jira token.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the token.</td>
</tr>
<tr>
<td>Token</td>
<td>Authentication token. This token is encrypted and embedded in the URL.</td>
</tr>
</tbody>
</table>

The token is created to be embedded in the Jira webhook URL.

**Register a Jira webhook in ServiceNow**

Register a Jira webhook in ServiceNow to notify the ServiceNow app when certain events occur in Jira.

Role required: admin

1. Navigate to Jira Webhooks > Jira Webhook Registries.
2. Click New.
3. On the form, fill in the fields.

**Jira Webhook Registry form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, Jira webhook.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the record.</td>
</tr>
<tr>
<td>Token</td>
<td>Authentication token. This token is encrypted and embedded in the URL. For example, Jira token.</td>
</tr>
<tr>
<td>Path</td>
<td>Jira webhook path. By default, this path is set to api/sn_jira_spoke/jira_webhook_callbacks/wh_entry.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click Save.
5. Click Callback URL.
   The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.

The Jira webhook is registered in your ServiceNow instance.

**Add a callback URL in Jira**

Provide a webhook callback URL in your Jira Atlassian account to create a webhook.

Role required: admin

1. Log in to your Jira Atlassian account.
2. Create a webhook in your Atlassian account.
3. Enter the webhook callback URL in the URL field. See the Atlassian Developer portal documentation for instructions on creating a webhook.
The callback URL is added in your Jira Atlassian account. You can create routing policies and subflows as per your requirement. See *Customize a bi-directional webhook* for information regarding the creation of new routing policies and subflows. *Customize a bi-directional webhook*

Create a webhook routing policy and subflow as per your requirement.

Role required: admin

The default routing policy in the Jira WebHook Routing Policies module triggers the Process Jira Webhooks subflow and notifies the ServiceNow app when certain events occur in Jira. See *Jira spoke v2.6.5* for information about the fields that the default routing policy and subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

1. Navigate to Flow Designer > Designer.
2. Click Subflows.
3. Create a copy of the default subflow, Process Jira Webhooks.
4. Customize the subflow as per your requirement and publish it. See *Subflows* for more information about creating and using subflows and *Jira spoke v2.6.5* for information about the fields that the default routing policy and subflows support.
6. Click New.
7. On the form, fill in the fields.

### Decision form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
</tbody>
</table>
| Default answer  | Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.  
1. Click the Lookup icon.  
2. Select the required subflow from the Document list. |
| Condition       | Conditions to be met when the required events occur in Jira. See *Jira webhooks* for information about the supported fields. |
| Answer          | Subflow that must be triggered when the specified conditions are met.       |

8. Click Submit.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

The routing policy and subflow are created.
Kubernetes spoke

Automate changes in Kubernetes when an event occurs in ServiceNow.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

API version v1.

Spoke actions

The Kubernetes spoke provides actions to automate Kubernetes tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint Management</td>
<td>Create Endpoints</td>
<td>Creates an endpoint in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Endpoints</td>
<td>Deletes an endpoint from the Kubernetes instance.</td>
</tr>
<tr>
<td>Namespace Management</td>
<td>Create Namespace</td>
<td>Creates a namespace in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Namespace</td>
<td>Deletes a namespace from the Kubernetes instance.</td>
</tr>
<tr>
<td>Node Management</td>
<td>Create Node</td>
<td>Creates a node in the Kubernetes instance.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Node</td>
<td>Deletes a node in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Node</td>
<td>Inspects a specified node in the Kubernetes instance and returns node information and status.</td>
</tr>
<tr>
<td>Pod Management</td>
<td>Create Pod</td>
<td>Creates a Pod in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Pod</td>
<td>Deletes a pod from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Pod</td>
<td>Inspects the specified pod in the Kubernetes instance and returns pod information and status.</td>
</tr>
<tr>
<td>Secret Management</td>
<td>Create Docker Hub Secret</td>
<td>Creates a secret in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Docker Hub Secret</td>
<td>Deletes a Secret from the Kubernetes instance.</td>
</tr>
<tr>
<td>Service Management</td>
<td>Create Service</td>
<td>Creates a service on a Kubernetes server.</td>
</tr>
<tr>
<td></td>
<td>Delete Service</td>
<td>Deletes a service from the Kubernetes server.</td>
</tr>
<tr>
<td>Volume Management</td>
<td>Create Persistent Volume</td>
<td>Creates a persistent volume in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Create Persistent Volume Claim</td>
<td>Creates a Persistent Volume Claim in a Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Persistent Volume</td>
<td>Deletes a persistent volume from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Persistent Volume Claim</td>
<td>Deletes a persistent volume claim from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Persistent Volume Claim</td>
<td>Inspects a persistent volume claim in a Kubernetes instance and returns claim information and status.</td>
</tr>
</tbody>
</table>

**Kubernetes account requirements**

The Kubernetes spoke requires generating and configuring your Kubernetes account to use a web API key.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when
using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Kubernetes alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Kubernetes alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Kubernetes spoke**

Integrate the ServiceNow instance and Kubernetes using an API key and certificate to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Kubernetes spoke
- Role required: admin

*Generate Kubernetes API token and certificate*

Generate an access token and a certificate from your Kubernetes account for API key authentication.

Kubernetes requirements:

- Kubernetes account
- Administrator credentials on the host machine where Kubernetes is installed

Complete these steps from your Kubernetes host machine. See Kubernetes documentation for instructions on generating your API token and client certificate.

1. From your Kubernetes host machine, generate an access token to interact with Kubernetes APIs. This token does not expire.
2. Copy and record the access token to create Credential records on your ServiceNow instance.
3. Generate a client certificate to upload to your ServiceNow instance.

*Upload Kubernetes client certificate*

Upload the Kubernetes client certificate to your ServiceNow instance to authenticate API requests to the Kubernetes host machine.

1. Navigate to System LDAP > Certificates.
2. Click New.
3. Complete the form and enter the certificate in the PEM Certificate field.
   For more information about uploading certificates, see Upload a certificate to an instance.
4. Click Submit.

*Create Credential records for the Kubernetes spoke*

Create Credential records to your Kubernetes account. The Kubernetes spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select **API Key Credentials**.  
   A blank API Key Credentials form displays.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Kubernetes Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter Bearer followed by the access token you obtained from Kubernetes. For example, Bearer {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Create Connection records for the Kubernetes spoke**

Create Connection records to the Kubernetes engine. The Kubernetes spoke connection and credential alias uses these connections to perform actions in Kubernetes.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Kubernetes**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Kubernetes Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Kubernetes. For example, select Kubernetes Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The IP address and port of the host machine where Kubernetes is installed.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Turn off remote SSL host verification**

A system property prevents the Kubernetes spoke from processing Kubernetes responses. Set the `com.glide.communications.httpclient.verify_hostname` system property to false to enable the integration.

1. Enter `sys_properties.list` in the application navigator.
   The System Properties (sys_properties) table opens.
2. Search for the `com.glide.communications.httpclient.verify_hostname` system property.
3. Set the value to false.
Microsoft AD spoke
Create, delete, and manage objects in Microsoft Active Directory, such as users, groups, and computers.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke requirements
Ensure that Active Directory Web Services (ADWS) is deployed in the same server where Microsoft AD is installed. See Microsoft documentation for information about deploying ADWS.

Spoke flows
The Microsoft AD spoke provides sample flows in the draft state to demonstrate automating Active Directory tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Offboarding</td>
<td>Disables an AD user account and removes the user from any AD groups when a ServiceNow user record is deactivated.</td>
</tr>
<tr>
<td>User Onboarding</td>
<td>Creates and enables an AD user account when a ServiceNow user record is activated.</td>
</tr>
</tbody>
</table>

Spoke subflows
This spoke has no sample subflows.

Spoke actions
The Microsoft AD spoke provides actions to automate Microsoft Active Directory tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Delete Computer</td>
<td>Deletes a computer from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Disable Computer</td>
<td>Disables a computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Enable Computer</td>
<td>Enables a computer account in Active Directory.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Computer OU</td>
<td>Gets the Organizational Unit (OU) of a Computer Account.</td>
</tr>
<tr>
<td></td>
<td>Is Computer Enabled</td>
<td>Checks the status of the specified computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Move Computer to OU</td>
<td>Changes the Organizational Unit (OU) of a Computer Account in Active Directory.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds an existing Active Directory user to an Active Directory group.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Checks if an existing Active Directory user is a member of an Active Directory group.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group</td>
<td>Gets the details of a given group in Active Directory, including the group category, scope, and distinguished name.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes an existing user from a group in Active Directory.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Change User Password</td>
<td>Changes the user password in AD. The password input must comply with Active Directory password requirements.</td>
</tr>
<tr>
<td></td>
<td>Is User Account Locked</td>
<td>Checks the locked status of the specified user account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Reset AD User Password</td>
<td>Resets a user's password in Active Directory.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user with no password in Active Directory. To enable a user to set a password, log in to AD, create a default password for the user, and enable password reset.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes a user from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Disable User</td>
<td>Disables a user account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Enable User</td>
<td>Enables a user account in Active Directory.</td>
</tr>
</tbody>
</table>

<tr>
<td></td>
<td>Query AD</td>
<td>Queries AD for objects specified by a search filter.</td>
</tr>
<tr>
<td></td>
<td>Update AD Object OU</td>
<td>Changes the Organizational Unit (OU) of an object in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Update AD Object Expiration</td>
<td>Update the account expiration date of an object in Active Directory.</td>
</tr>
</tbody>
</table>

**MID server requirements**

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see *Integration steps*. For information, see *MID Server*.

**Note:** MID and Microsoft AD must be installed on different servers.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the AD alias record to authorize actions in Microsoft Active Directory.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>AD</td>
<td>Connection to Microsoft Active Directory.</td>
<td>The URL of the host machine where Microsoft Active Directory is installed.</td>
</tr>
</tbody>
</table>
Set up Microsoft AD spoke

Integrate the ServiceNow instance and your Microsoft AD account using Windows credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin

Create Credential record for the Microsoft AD spoke

Create a Credential record for the Microsoft Active Directory host. The Microsoft AD spoke connection and credential alias uses this credential to authorize actions.

- Request IntegrationHub subscription
- Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Windows Credentials**.
   A blank Windows Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter AD Credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>User name</td>
<td>Enter a user name with access to the target Windows host. For more information about Windows permissions, see Windows credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MiD Servers that can use this credential. For example, select All MiD servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Create Connection record for the Microsoft AD spoke

Create a Connection record to your Microsoft Active Directory host machine. The Microsoft AD spoke connection and credential alias uses this connection to perform actions in Microsoft Active Directory.

- Request IntegrationHub subscription
- **Create Credential record for the Microsoft AD spoke**
- Role required: admin

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for AD.
3. From the **Connections** tab, click **New**.
   The system displays a blank Basic Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter AD Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Windows Active Directory. For example, select AD Credential.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the fully qualified domain name of the target host where Microsoft Active Directory is installed. For example, &lt;host&gt;.&lt;domain&gt;.com.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Enable</td>
</tr>
<tr>
<td>Override default port</td>
<td>Enter the target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Microsoft Azure AD spoke

Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke flows

The Microsoft Azure AD spoke provides sample flows in the draft state to demonstrate automating Azure Active Directory tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Offboarding</td>
<td>Disables an Azure AD user account and removes the user from any Azure AD groups when a ServiceNow user record is deactivated.</td>
</tr>
<tr>
<td>User Onboarding</td>
<td>Creates and enables an Azure AD user account when a ServiceNow user record is activated.</td>
</tr>
</tbody>
</table>

Spoke subflows

The Microsoft Azure AD spoke provides sample subflows in the draft state to demonstrate automating Azure Active Directory tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:
### Spoke actions

The Microsoft Azure AD spoke provides actions to automate Azure Active Directory tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add Owner To Group</td>
<td>Adds an owner to an existing group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Add User to Group</td>
<td>Adds an existing user to a group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Create Office 365 Group</td>
<td>Creates an Office 365 Group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Create Security Group</td>
<td>Create a Security Group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Look Up Group ID</td>
<td>Returns the first Group ID found based on provided search criteria.</td>
</tr>
<tr>
<td></td>
<td>Look Up Group Membership</td>
<td>Retrieves a list of groups for the given user as a JSON string.</td>
</tr>
<tr>
<td></td>
<td>Remove Owner From Group</td>
<td>Removes the owner from a group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes an existing user from a group in Azure AD.</td>
</tr>
<tr>
<td>License Management</td>
<td>Assign User License</td>
<td>Assigns a license to an existing user in Azure AD and defines access to Office 365 services. For example, if the license includes access to Microsoft Exchange, the user is provisioned a mailbox and login rights.</td>
</tr>
<tr>
<td></td>
<td>Remove User License</td>
<td>Removes a license from a user in Azure AD.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Reset User Password</td>
<td>Resets the password of the specified Azure AD user account.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates an Azure AD user account using the specified account details.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes a user from Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Disable User</td>
<td>Disables a user in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Enable User</td>
<td>Enables a user in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Is User Enabled</td>
<td>Checks whether the specified user account is enabled in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Checks whether the specified user account is a member of the specified group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Look Up User ID</td>
<td>Returns the first User ID found based on the provided search criteria.</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates user properties in Azure AD with the provided details.</td>
</tr>
</tbody>
</table>

**Note:** Azure AD does not allow updating values to null. Null or empty values are discarded in Azure AD when passed as input.

**Microsoft Azure AD account requirements**

The Microsoft Azure AD spoke requires creating a custom app on your Azure AD account to generate OAuth 2.0 tokens. See: *Create an Azure AD application.*

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the AzureAD alias record to authorize actions on Microsoft Azure AD.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>AzureAD</td>
<td>Connection to Microsoft Azure AD.</td>
<td><a href="https://graph.microsoft.com">https://graph.microsoft.com</a></td>
</tr>
</tbody>
</table>

**Set up Microsoft Azure AD spoke**

Integrate the ServiceNow instance and your Microsoft Azure AD account by creating a custom OAuth application in Microsoft Azure AD to authenticate ServiceNow requests.

- Request IntegrationHub subscription
Role required: admin

Create an Azure AD application
Create a custom app using your Azure portal to enable OAuth 2.0 authentication with the Azure AD spoke.

- Request IntegrationHub subscription.
- Activate Azure AD spoke.
- Azure AD requirements:
  - Azure AD account
  - Azure AD administrator credentials

Role required: admin

Complete these steps from your Azure portal. See the Azure Active Directory for developers documentation for instructions on creating and configuring custom applications.

1. From your Azure portal, access Azure Active Directory.
2. Create an Azure AD application.
   a) In Redirect URI, enter your ServiceNow instance URL in this format: https://<Instance-Name>.servicenow.com/oauth_redirect.do. See Create an Azure Active Directory application for instructions on registering and configuring an application.
   b) Record the Directory ID to register the app as a third-party OAuth provider on your ServiceNow instance.
   c) Create a Client Secret and record the value to register the app as a third-party OAuth provider on your ServiceNow instance.
   d) Add permissions to access the APIs. Ensure that you provide these permissions:

<table>
<thead>
<tr>
<th>Permission</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directory.AccessAsUser.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.Read.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.ReadWrite.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>User.Read</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.Read.All</td>
<td>Application</td>
</tr>
<tr>
<td>Directory.ReadWrite.All</td>
<td>Application</td>
</tr>
</tbody>
</table>

See Add permissions to access web APIs for more information.

   e) Grant admin consent to your application. See Understanding API permissions and admin consent UI for more information.

Register Azure AD as OAuth provider

Use the information generated during Azure Active Directory account configuration to register Azure AD as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
The system displays a blank Application Registries form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure AD OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Azure AD application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Key value you created during the Azure AD application registration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
</tbody>
</table>

5. In the OAuth Entity Scopes related list, create these entries

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter a unique name for the record, such as auth code.</td>
<td>Enter offline_access.</td>
</tr>
<tr>
<td>Enter a unique name for the record, such as openid.</td>
<td>Enter openid.</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click Save.
   The system validates the OAuth credentials and populates the Redirect URL and the OAuth Entity Profiles related list.

7. In the OAuth Entity Profiles related list, open the default profile record.
8. Verify that the openid entity scope record created in previous steps appears in the OAuth Entity Profile Scopes related list. If it does not appear, add the record.

Create Credential records for the Azure AD spoke
Create Credential records to the Azure AD custom app registration you created. The Azure AD spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure AD Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Azure AD application as an OAuth provider. For example, select Azure OAuth default profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Create Connection records for the Azure AD spoke
Create Connection records to your Azure AD account. The Azure AD spoke connection and credential aliases use these connections to perform actions in Azure AD.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the AzureAD record.
3. Click the **New** button in the **Connections** related list.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Azure AD Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Azure AD. For example, select Azure AD Credentials.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Regenerate Azure AD OAuth token
Regenerate the Azure AD OAuth token when it expires.

1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Azure AD spoke OAuth Credential record. For example, select Azure AD Credentials.
3. From Related Links, click **Get OAuth Token**.

Microsoft Azure AD spoke action reference

Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.

The Azure AD spoke is an available integration through IntegrationHub.

This spoke uses the Azure AD Connection & Credential Alias record. To use these actions, you must create a Connection record and a Credential record and associate them with the Azure
AD Connection & Credential Alias record. To learn more about connections and credentials, see *Introduction to credentials, connections, and aliases*.

These actions use REST calls, which can run on an instance or MID Server. To determine when to run REST from the instance or a MID Server, see the design considerations in *Integration steps*. To learn more about the MID Server, see *MID Server*.

### Add Owner To Group

Adds an owner to an existing group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to add an owner to. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to make owner of the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Add User To Group

Adds an existing user to a group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to add a user to. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to add to the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
Create Office 365 Group

Creates an Office 365 Group in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Email Enable Distribution List</td>
<td>Group email address or distribution list associated with the group. By default set to true.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the group in Azure AD.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>ID of group created in Azure AD. Only populated if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Create Security Group

Create a Security Group in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the group in Azure AD.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>ID of group created in Azure AD. Only populated if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
Is User In Group

Check if an existing user is a member of a group in Azure Active Directory (Azure AD).

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>Group ID in which you wish to check the membership of the user.</td>
</tr>
<tr>
<td>User ID</td>
<td>User ID or User Principal Name of the Azure AD user.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Will be set to Success if the request succeeds or Error if a failure in Azure AD occurs</td>
</tr>
<tr>
<td>Answer</td>
<td>True if the user is a member of the group. False if the user is not a member of the group. Populated only if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Look Up Group ID

Returns the first Group ID found based on provided search criteria.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Mail ID</td>
<td>Group email address or distribution list associated with the group.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>First group found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Look Up Group Membership

Retrieves a list of groups for the given user as a JSON string.
Remove Owner From Group

Removes the owner from a group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the owner from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to remove as owner of the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Remove User From Group

Removes an existing user from a group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the user from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
### Assign User License

Assigns a license to an existing user in Azure AD and defines access to Office 365 services. For example, if the license includes access to Microsoft Exchange, the user is provisioned a mailbox and login rights.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to assign a license to. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt;CompanyName&gt;:&lt;LicensingPlan&gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

#### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Remove User License

Removes a license from a user in Azure AD.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to remove the license from. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt;CompanyName&gt;:&lt;LicensingPlan&gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>
Delete User

Deletes a user from Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to delete. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Disable User

Disables a user in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to disable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Enable User

Enables a user in Azure AD.
### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to enable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Look Up User ID

Returns the first User ID found based on the provided search criteria.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name displayed in the address book for the user.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>.</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>

#### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>User ID</td>
<td>First user found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Update User

Updates user properties in Azure AD with the provided details.

**Note:** Azure AD does not allow updating values to null. Null or empty values are discarded in Azure AD when passed as input.
### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the user.</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>. This field is mandatory</td>
</tr>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>City</td>
<td>City of the user.</td>
</tr>
<tr>
<td>Country</td>
<td>Country of the user.</td>
</tr>
<tr>
<td>Department</td>
<td>Name of the department the user belongs to.</td>
</tr>
<tr>
<td>Mobile</td>
<td>Mobile phone number for the user.</td>
</tr>
<tr>
<td>Job Title</td>
<td>User job title.</td>
</tr>
<tr>
<td>Physical Delivery</td>
<td>Office location of the user.</td>
</tr>
<tr>
<td>Office Name</td>
<td>Postal code for the user.</td>
</tr>
<tr>
<td>Preferred Language</td>
<td>Preferred language for the user.</td>
</tr>
<tr>
<td>State</td>
<td>State for the user.</td>
</tr>
<tr>
<td>Street Address</td>
<td>Street address for the user.</td>
</tr>
<tr>
<td>Telephone Number</td>
<td>Telephone number for the user.</td>
</tr>
<tr>
<td>Usage Location</td>
<td>Some Microsoft services are not available in all locations. This property must be defined for the user in Azure AD before a license can be assigned to them.</td>
</tr>
</tbody>
</table>

### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Microsoft Azure Resource Management spoke**

Azure Resource Management enables you to create, update, and delete resources in your Azure subscription from within ServiceNow. This spoke is installed automatically when you install the MicrosoftAzure SQL spoke.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke information

To use the Azure Resource Management spoke, you must first install and set up the Microsoft Azure SQL spoke. Because the Azure Resource Management spoke uses the same connection and credential alias record as Azure SQL spoke, it doesn't require any other set up.

Spoke actions

The Azure Resource Management spoke provides actions to automate resource management tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resource Management</td>
<td>Get Databases</td>
<td>Retrieves a list of databases in a server.</td>
</tr>
<tr>
<td></td>
<td>Get Elasticpools</td>
<td>Retrieves a list of elastic pools in Azure.</td>
</tr>
<tr>
<td></td>
<td>Get Resources</td>
<td>Retrieves a list of resource groups.</td>
</tr>
<tr>
<td></td>
<td>Get SQL Servers</td>
<td>Retrieves a list of servers in a resource group.</td>
</tr>
</tbody>
</table>

MicrosoftAzure SQL spoke

Configure and manage Microsoft Azure SQL databases from within ServiceNow. When you install the Azure SQL spoke, you also get the Microsoft Azure Resource Management spoke. Azure Resource Manager provides a management layer that enables you to create, update, and delete resources in your Azure subscription.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported version

This spoke is built for Azure SQL v12, but may be compatible with later versions.

Spoke requirements

- User with full access to Microsoft Azure Cloud Computing.

Spoke actions

The Azure SQL spoke provides actions to automate Microsoft Azure SQL tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Database</td>

Set up Microsoft Azure SQL spoke

Integrate the ServiceNow instance and your Microsoft Azure SQL databases by creating a custom OAuth application in Azure to authenticate ServiceNow requests.

- Role required: admin
- Request IntegrationHub subscription.
Activate Azure SQL spoke.

Configure an app registration for Azure SQL
Create a custom app from your Azure account to enable OAuth 2.0 authentication with the Azure SQL spoke.

Azure SQL requirements:
- Azure SQL account
- Azure SQL administrator credentials

Complete these steps from your Azure account. See the Azure SQL Database documentation for instructions on creating and configuring custom applications.

1. From your Azure account, navigate to Home > App registrations > Register an application.
2. Create an app registration in your Azure Active Directory.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Web app/API.</td>
</tr>
<tr>
<td>Supported account types</td>
<td>Specify who can use the application.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td>The format of the Redirect URI is <code>https://&lt;instance&gt;.service-now.com/\oauth_redirect.do</code>. Replace <code>&lt;instance&gt;</code> with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

3. Click Register.
4. Copy the Application (client) ID.
   You use this ID when you Register Azure SQL as OAuth provider.
5. Select Manage > Certificates & secrets and click New client secret.
6. Give the client secret a description, select when it expires, and click Add.
   Copy the client secret value for use when you Register Azure SQL as OAuth provider. It will not be available after you leave the Certificates & secrets page.

Register Azure SQL as OAuth provider.
Register Azure SQL as OAuth provider
Use the information generated during Azure account configuration to register Azure SQL as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third-party OAuth Provider.
   The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure SQL OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Azure SQL application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Key value you created during the Azure SQL application registration.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>OAuth API Script</td>
<td></td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Enter <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a>&lt;Directory ID&gt;/oauth2/v2.0/token. Replace &lt;Directory ID&gt; with the directory ID in your Azure SQL configuration properties. On the Azure page for the app registration, click Endpoints. The Authorization URL is labeled <strong>OAuth 2.0 token endpoint (v2)</strong>. You can copy the URL there.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The format of the Redirect URI is https://&lt;instance&gt;.service-now.com/oauth_redirect.do. Replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

5. **Right-click the form header, and click Save.**
   The system validates the OAuth credentials and populates the **Redirect URL** and the **OAuth Entity Profiles** related list.

6. **In the OAuth Entity Profiles related list, open the default profile record.**
7. **Verify that the openid entity scope record created in previous steps appears in the OAuth Entity Profile Scopes related list. If it does not appear, add the record.**

---

### Create Credential records for the spoke

Create Credential records to the Azure SQL custom app registration you created. The Microsoft Azure SQL spoke connection and credential aliases use these credentials to authorize actions.

1. **Navigate to Connections & Credentials > Credentials.**
2. **Click New.**
   The system displays the message **What type of Credentials would you like to create?**
3. **Select **OAuth 2.0 Credentials**.**
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. **Enter these values.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure SQL Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
</tbody>
</table>
Create Connection records for the Microsoft Azure SQL spoke
Create Connection records to your Azure account. The Azure SQL spoke connection and credential aliases use these connections to perform actions in Azure SQL.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the Azure_database record.
3. Select the Type Connection and Credential
4. In the Connections related list, click New.
5. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Azure SQL Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Azure SQL. For example, select Azure SQL Credentials.</td>
</tr>
</tbody>
</table>

6. Click Submit.

Regenerate Azure SQL OAuth token
Regenerate the Azure SQL OAuth token when it expires.

1. Navigate to Connections & Credentials > Credentials.
2. Select the Azure SQL spoke OAuth Credential record. For example, select Azure SQL Credentials.
3. From Related Links, click Get OAuth Token.

Microsoft Dynamics CRM spoke v1.0.1
Provide the baseline actions to interact with Microsoft Dynamic Entities through introspection.
**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see [Request IntegrationHub](#).

**Spoke flows & subflows**

This spoke ships with one subflow, Process Dynamics CRM Webhook. See [Configure Microsoft Dynamics CRM webhook details](#).

**Spoke actions**

The Microsoft Dynamics CRM spoke provides the baseline actions to interact with Microsoft Dynamic Entities through introspection.

**Available Microsoft Dynamics CRM spoke actions**

<td>Retrieve records based on the search query and specific entity.</td>
</tr>
<tr>
<td></td>
<td>Update Record</td>
<td>Update a record in Microsoft Dynamics CRM.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Microsoft_Dynamics_CRM alias record to authorize actions.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft_Dynamics_CRM</td>
<td>Connection to Microsoft Dynamics CRM</td>
<td>URL configured when you create your application in Azure. This URL ends with dynamics.com.</td>
</tr>
</tbody>
</table>
Set up Microsoft Dynamics CRM spoke

Integrate the ServiceNow instance and Microsoft Dynamics CRM by using the Windows credentials to authenticate ServiceNow requests.

- Install Microsoft AD
- Request IntegrationHub subscription.
- Activate the Microsoft Dynamics CRM spoke.
- Role required: admin.

- Perform these steps to use all Microsoft Dynamics CRM spoke actions.

Configure Microsoft Dynamics CRM application

Create a custom OAuth application from your Microsoft Dynamics CRM account to enable OAuth 2.0 authentication with the Microsoft Dynamics CRM.

Microsoft Dynamics CRM requirements:

- Microsoft Dynamics CRM account
- [Microsoft Azure](#) account
- Microsoft Dynamics CRM credentials

Complete these steps from your Azure Developer account. See the Azure product documentation for instructions on creating and configuring custom applications.

1. Log in to the [Microsoft Azure App registration portal](#) with your organization credentials.
2. Register a new custom application. Fill in the application name, the supported account type, and the redirect URI, and then click Register. An overview of the application's basic information is shown.
3. Copy the application ID to a text file. You will use this ID and the client secret generated in the next step to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to ServiceNow.
4. Add a client secret.
   a) In Microsoft Azure, navigate to Manage > Certificates & secrets.
   b) Provide a description and an expiration date and click Add.

   **Note:** The client secret is only displayed in plain text for a short time. You use the client secret when you connect the application to ServiceNow.

5. Enable the permissions you want the application to support. For more information, see the Microsoft Graph permissions reference.
   a) In Microsoft Azure, navigate to Manage > API permissions.
   b) Click the Microsoft Graph tile.
   c) Select the Delegated or Application permissions that the application supports. Delegated permissions enable the application to access the API as a signed-in user. Application permissions enable the application to run as a background service or daemon without a signed-in user.
   d) Click Add permissions.

Register Microsoft Dynamics CRM as OAuth provider.
Register Microsoft Dynamics CRM as OAuth provider

Use the information generated during Microsoft Dynamics CRM account configuration to register Microsoft Dynamics CRM as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

- Request IntegrationHub subscription.
- Activate Microsoft Dynamics CRM.
- Create a Microsoft Dynamics CRM application.

Role required: admin.

1. In ServiceNow, navigate to **System OAuth > Application Registry**.
2. Click **New**.
3. On the screen titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example Dynamics CRM OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Application ID of the Microsoft Dynamics CRM application you created in Azure.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in Azure.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon (🔒), enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/authorize">https://login.microsoftonline.com/common/oauth2/v2.0/authorize</a> followed by a question mark and the resource attribute of your instance, and then click the lock icon again. The resource attribute of the URL. For example, ?resource=<a href="https://mycompany.crm.dynamics.com">https://mycompany.crm.dynamics.com</a>. This attribute is the URL of your Microsoft application.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon (🔒), enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/token">https://login.microsoftonline.com/common/oauth2/v2.0/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon (🔒), enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. In the **OAuth Entity Scopes** related list, edit the provided entity scope to include the URL of your Microsoft Dynamics CRM application. The name and the OAuth scope are often the same string.

   ![OAuth Entity Scopes](image)

6. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

Create credential record for Microsoft Dynamics CRM.

Create Credential records for the Microsoft Dynamics CRM spoke
Create Credential records for the Microsoft Dynamics CRM custom OAuth application you created during Microsoft Dynamics CRM account configuration. The Microsoft Dynamics CRM spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.
Create Connection records for the Microsoft Dynamics CRM spoke
Create Connection records to your Microsoft Azure account. The Microsoft Dynamics CRM spoke connection and credential alias uses these connections to perform actions on Microsoft Dynamics CRM.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the connection and credential alias for the Microsoft Dynamics CRM application.
3. On the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter MS Dynamics CRM Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Microsoft Dynamics CRM. For example, select MS Dynamics Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the Connection alias record you created for Microsoft Dynamics CRM.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the root Dynamics URL. For example, https://&lt;SiteName&gt;.dynamics.com.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Configure Microsoft Dynamics CRM webhook details
Register Microsoft Dynamics CRM webhook in ServiceNow to notify the ServiceNow application when certain events occur in Microsoft Dynamics CRM.

Role required: admin

5. Save the record.
6. From Related Links, click Get OAuth Token.
   The system displays a confirmation message that the OAuth token flow is completed successfully. Review the details if the flow is not completed successfully.

Note: Ensure that you allow pop-up windows in your browser.
Microsoft Dynamics CRM requires registration through the Windows Plugin Registration Tool. To install the Windows Plugin Registration Tool, see the Microsoft document Download tools from NuGet.

The Endpoint URL is the ServiceNow instance URL to which event information is posted. For example, https://<instance-name>.service-now.com/api/sn_ms_crm_spoke/dynamics_webhook_callbacks.

The key-value pair you use to register the webhook in the Plugin Registration Tool is the same as the Name and Authorization Key in Dynamics CRM Webhook Details.

1. Navigate to Dynamics CRM Webhook Details > Client Details.
2. Click New.
3. In the Name field, enter the webhook's plugin key. In the Authorization Key field, enter the value from the webhook's key-value pair.

Configure Microsoft Dynamics CRM webhook decision policy

Create webhook routing policy and subflow according to your requirements.

1. Navigate to Flow Designer > Designer
2. Click Subflows.
3. Create a copy of the default subflow, Process Dynamics CRM Webhook.
4. Customize the subflow according to your requirement and publish it. See Subflows for more information about creating and using subflows.
5. Navigate to Dynamics CRM Webhook Details > Decision Policy.
7. On the form, fill in the fields.

**Decision form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Answer</td>
<td>Option to specify if this answer is the default answer. Default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td></td>
<td>1. Click the Lookup icon.</td>
</tr>
<tr>
<td></td>
<td>2. Select the required subflow from the Document list.</td>
</tr>
</tbody>
</table>

**Note:** Ensure that the Table name is Dynamics CRM Webhook Answer Subflow [sn_ms_crm_spoke_dynamic_crm_webhook_answer_subflow].

| Condition | Conditions to be met when the required events occur in Microsoft Dynamics CRM. |

8. Click Submit.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Decision policy and subflow are created.
Microsoft Exchange Online spoke

The Microsoft Exchange Online spoke creates and manages calendar and mail in Microsoft Exchange Online. To create, manage, or delete users and groups, use the Microsoft Azure AD spoke.

**Note:** User and group management can be done using Microsoft Azure AD only and not Microsoft Exchange Online spoke.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version

Microsoft Graph REST API v1.0

Spoke actions

The Microsoft Exchange Online spoke provides actions to automate calendar and mail tasks when an incident is created in the ServiceNow instance.

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendar Management</td>
<td>Copy Attachment To Calendar Event</td>
<td>Copies a ServiceNow attachment to an Exchange calendar event.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create Calendar Event</td>
<td>Creates an event in the user's default calendar and specifies the time zone for the start and end times of the event.</td>
</tr>
<tr>
<td></td>
<td>Create Recurring Calendar Events</td>
<td>Creates a recurring event in the user's default calendar and specifies the time zone for the start and end times of the event.</td>
</tr>
<tr>
<td></td>
<td>Delete Calendar Event</td>
<td>Deletes a calendar event.</td>
</tr>
<tr>
<td></td>
<td>Get Events by User ID</td>
<td>Retrieves the list of event objects in the user's mailbox.</td>
</tr>
<tr>
<td></td>
<td>Update Calendar Event</td>
<td>Updates the properties of an event object.</td>
</tr>
<tr>
<td>Mail Management</td>
<td>Delete Message</td>
<td>Deletes the message in user's inbox or from a custom folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up Mail Folders By User ID</td>
<td>Retrieves all the mail folders for a specified User ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Messages By Mail Folder ID</td>
<td>Retrieves all the messages in a mail folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up Messages By User ID</td>
<td>Retrieves all the messages in the inbox folder of the user.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Time Zones</td>
<td>Retrieves the list of all available time zones.</td>
</tr>
</tbody>
</table>

**Microsoft account requirements**

The Microsoft Exchange Online spoke requires registering an application using the Microsoft Azure portal to generate OAuth 2.0 tokens.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up Microsoft Exchange Online spoke**

Integrate the ServiceNow instance and Microsoft Exchange Online account by creating a custom OAuth application in Microsoft Exchange Online to authenticate ServiceNow requests.

- Request IntegrationHub Professional subscription
- Activate the Microsoft Exchange Online spoke
- Role required: admin
Register an application using the Microsoft Azure portal
Provide authorization to the ServiceNow instance by registering an application with Azure AD.

Role required: Azure Active Directory admin

Complete these steps from the Microsoft Azure portal. For instructions on registering an application, see the Microsoft Azure documentation.

1. In the Microsoft Azure portal, add the Redirect URIs in this format: https://<instance-name>.service-now.com/oauth_redirect.do
2. For the Required Permissions, select Microsoft Graph.
3. Record the Client Secret for use in later configurations.

The ServiceNow application is created with Microsoft Azure AD.

Register Microsoft Exchange Online as the OAuth provider
Register Microsoft Exchange Online as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Use the information generated during the registration of the application in the Microsoft Azure portal.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message, What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Microsoft Exchange Online.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

Note: You can use only Authorization Code as the Default Grant type when PKCE is enabled.

Application
Application scope that contains this record.

Accessible from
Application scope that this registry is accessible from.
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter <code>https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</code></td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**. A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, Microsoft Exchange Online default_profile.

**Create Credential records for the Microsoft Exchange Online spoke**

Authorize the Microsoft Exchange Online spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Exchange Online connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**. The system displays the message, *What type of Credentials would you like to create?*
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

**OAuth 2.0 Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <code>Exchange_Online_Credentials</code></td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Microsoft Exchange Online spoke as an OAuth provider. For example, <code>Microsoft Exchange Online</code>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select <code>All MID Servers</code>.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

**Field** | **Description**
--- | ---
Order | Order that the credentials are used. For example, enter 100.

5. Right-click the form header and click **Save**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

The credential record for the Microsoft Exchange Online spoke is created. **Create Connection records for the Microsoft Exchange Online spoke**

Perform actions in Microsoft Exchange Online by creating connection records for your Microsoft Exchange Online account. The Microsoft Exchange Online spoke connection and credential alias uses these connections to perform actions.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the Microsoft Exchange Online spoke record.
3. In the Connections related list, click **New**.
4. On the form, fill in the fields.

#### HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <code>Exchange_Online_Connection</code>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Exchange Online. For example, <code>Exchange_Online_Credentials</code>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note:</strong> Do not select the check box.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click **Update**.

The Microsoft Exchange Online spoke is set up and integrated with the ServiceNow instance.

**Regenerate the Microsoft Exchange Online OAuth token**

Authorize the Microsoft Exchange Online spoke by regenerating the Microsoft Exchange Online OAuth token after it expires.

Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Microsoft Exchange Online spoke OAuth Credential record.
3. To regenerate the OAuth token, click the **Get OAuth Token** related link.
The Microsoft Exchange Online spoke receives a new OAuth access token.

**Microsoft Exchange Server spoke**

The Microsoft Exchange Server spoke creates and manages address list, mailbox, and calendar events in Microsoft Exchange mail system.

**Request apps on the Store**

Visit the [ServiceNow Store](https://store.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

The Microsoft Exchange Server spoke requires an IntegrationHub subscription.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see [Request IntegrationHub](https://store.servicenow.com).

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - PowerShell (com.glide.hub.action_step.powershell)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Supported versions**

- Exchange Server 2016 installed on Windows Server 2016

  **Note:** The Create Calendar Event For User action is supported only on Exchange Server 2013.

- Exchange Server 2013 installed on Windows Server 2012 R2

This spoke may be compatible with the earlier versions of Microsoft Exchange Server.

**Spoke requirements**

Powershell remoting must be enabled on the target Exchange Server.

**Spoke actions**

The Microsoft Exchange Server spoke provides actions to automate address list, mailbox, and calendar event tasks.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address List Management</td>
<td>Create Address List Using Included Recipients</td>
<td>Creates a new address list in Exchange Server using the Included Recipients field.</td>
</tr>
<tr>
<td></td>
<td>Create Address List Using Recipient Filter</td>
<td>Creates a new address list in Exchange Server using the Recipient field.</td>
</tr>
<tr>
<td></td>
<td>Delete Address List</td>
<td>Deletes the required address list on a required Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Get Address List Details</td>
<td>Retrieves the details of a required address list on a required Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Look Up Address List</td>
<td>Retrieves the address list details on a required Exchange Server using a search query.</td>
</tr>
<tr>
<td></td>
<td>Move Address List</td>
<td>Moves an address list to another location in the address hierarchy.</td>
</tr>
<tr>
<td></td>
<td>Synchronize Address List</td>
<td>Refreshes email clients with the latest details, for a required address list in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Update Address List Using Included Recipients</td>
<td>Updates details and recipients of a required address list using a the Included Recipients field.</td>
</tr>
<tr>
<td></td>
<td>Update Address List Using Recipient Filter</td>
<td>Updates details and recipients of a required address list details using the Recipient Filter field.</td>
</tr>
<tr>
<td>Mailbox Management</td>
<td>Create Calendar Event For User</td>
<td>Creates a calendar event in Exchange Server. Calendar event can be either a meeting or appointment.</td>
</tr>
<tr>
<td></td>
<td>Create Mailbox</td>
<td>Creates mailboxes and user accounts simultaneously.</td>
</tr>
</tbody>
</table>

**Note:**
- This action is supported only on Exchange Server 2013.
- This action uses the Exchange_https connection and credential alias.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Delete Mailbox</td>
<td>Deletes a mailbox in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Disable Mailbox</td>
<td>Disables a mailbox in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Enable Mailbox</td>
<td>Enables a mailbox in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Get Mailbox</td>
<td>Retrieves the properties of a mailbox in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Set Mailbox</td>
<td>Modifies the properties of a mailbox in Exchange Server.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Two connection and credential aliases are created when the Microsoft Exchange Server spoke is activated, Exchange and Exchange_https.

**Note:**
- The Exchange_https alias is supported only on Exchange Server 2013.
- The Exchange_https alias is required to use the Create Calendar Event For User action.

**MID Server requirements**

Your instance must have a MID Server set up and configured to run PowerShell 2.0. Use the connection record associated with the Microsoft Exchange alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Microsoft Exchange Server spoke**

Integrate the ServiceNow instance and Exchange Server by using the Windows credentials to authenticate ServiceNow requests.

- Install Microsoft AD
- Request IntegrationHub subscription
- Activate the Microsoft Exchange Server spoke
- Role required: admin

- Perform these steps to use all Microsoft Exchange Server spoke actions except the Create Calendar Event For User action.
- To use the Create Calendar Event For User action, perform the same steps again for the Exchange_https connection and credential alias. MID Server is not necessary to perform this action.
Note: The Create Calendar Event For User action is supported only on Exchange Server 2013.

Create Credential record for Microsoft Exchange Server spoke
Authorize the Microsoft Exchange Server spoke actions by creating Windows credential record for the Exchange Server host. The Microsoft Exchange Server spoke connection and credential alias uses these credentials to authorize actions.

Create two credential records, one for each connection and credential alias.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message, What type of Credentials would you like to create?
4. On the form, fill in the fields.

Windows Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSExchangeCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>User name</td>
<td>User name with access to the target Windows host. For more information about Windows permissions, see Windows credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Advanced selection criteria for the credential.</td>
</tr>
</tbody>
</table>

5. Click Submit.

The Windows credential record for the Microsoft Exchange Server spoke is created.

Create Connection record for Microsoft Exchange Server spoke
Perform actions in Microsoft Exchange Server spoke by creating connection records. The Microsoft Exchange Server spoke connection and credential alias uses these connections to perform actions.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the Microsoft Exchange Server spoke record.
3. In the Connections related list, click New.
4. On the form, fill in the fields.
### Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Exchange Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for the Microsoft Exchange Server spoke. For example, MSExchangeCredentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name or IP address of the target host where Exchange Server is installed.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port that the connection uses.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
</tbody>
</table>

**Note:** MID Server is necessary for all the Microsoft Exchange Server spoke actions except the Create Calendar Event For User action.

5. Click **Submit**.

The Microsoft Exchange Server spoke is set up and integrated with the ServiceNow instance.

**Microsoft OneDrive spoke**

Automate file and folder management and collaboration in Microsoft OneDrive. Adds Microsoft OneDrive data to your ServiceNow instance.

**Request apps on the Store**

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](#).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see [Request IntegrationHub](#).
Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

API version v1.

Spoke subflows

The Microsoft OneDrive spoke provides sample subflows in the draft state to demonstrate automating Microsoft OneDrive tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to OneDrive</td>
<td>Copies an attachment from ServiceNow to OneDrive, records the new location of the attachment, and deletes the attachment from the ServiceNow attachment table.</td>
</tr>
</tbody>
</table>

Spoke actions

The Microsoft OneDrive spoke provides actions to automate Microsoft OneDrive tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drive Management</td>
<td>Get Drive Info</td>
<td>Gets the metadata of a specific Microsoft OneDrive drive</td>
</tr>
<tr>
<td></td>
<td>List Drives</td>
<td>Retrieves all the available drives associated with a target User, Group, or Site. If you don’t provide a User, Group, or Site, then a list of root drives associated with the authenticated user is returned.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Move File Or Folder Item</td>
<td>Moves a file or folder in Microsoft OneDrive to the target location.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a folder in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Update File Or Folder Name</td>
<td>Updates the name for a file or folder item by ID.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>File Management</td>
<td>Delete File Or Folder Item</td>
<td>Deletes a file or folder from Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Copy OneDrive File to Attachment</td>
<td>Copies a file in Microsoft OneDrive to an attachment in a record in a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment to OneDrive</td>
<td>Copies an attachment record in ServiceNow to Microsoft OneDrive</td>
</tr>
<tr>
<td></td>
<td>Copy File Or Folder Item</td>
<td>Asynchronously creates a copy of a Microsoft OneDrive item (including children), under a new parent item or with a new name.</td>
</tr>
<tr>
<td></td>
<td>List Items</td>
<td>Retrieves a list of drive items from either a path or the source and source ID of a drive item.</td>
</tr>
<tr>
<td></td>
<td>Get File Or Folder Item Info By ID</td>
<td>Gets file metadata information from the file or folder ID in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Get File Or Folder Item Info By Path</td>
<td>Gets file metadata information from the file path in Microsoft OneDrive.</td>
</tr>
<tr>
<td>File and Folder Search</td>
<td>Search Files or Folder Items</td>
<td>Searches the drive items (files or folders) based on metadata attributes such as the item name.</td>
</tr>
<tr>
<td>Collaboration</td>
<td>Add Collaborator</td>
<td>Adds a collaborator and their permissions to a file or a folder. You can identify the collaborator by their Azure AD Alias or an Object ID.</td>
</tr>
<tr>
<td></td>
<td>Get Collaborators</td>
<td>Lists all the collaborator details associated with a file or folder in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Remove Collaborator</td>
<td>Removes a collaborator from a file or folder in Microsoft OneDrive.</td>
</tr>
</tbody>
</table>

**OneDrive Online account requirements**

The Microsoft OneDrive spoke requires a custom app that you create in Microsoft Azure.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Single tenant

The OneDrive spoke includes the OneDrive alias record to authorize actions on Microsoft OneDrive. Select this alias in the Tenant record to authorize changes in Microsoft OneDrive for a single tenant.

Multiple tenants

The OneDrive spoke includes the OneDrive alias record to authorize actions on Microsoft OneDrive. Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online. See Create aliases for multiple tenants.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the MicrosoftSharepointOnline alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Microsoft OneDrive spoke

Integrate the ServiceNow instance and Microsoft OneDrive spoke by using Windows credentials to authenticate ServiceNow requests.

- Install Microsoft AD.
- Install the Microsoft OneDrive spoke.
- Request IntegrationHub subscription.
- Activate the Microsoft OneDrive spoke.
- Role required: admin

Configure Microsoft OneDrive application

Create a custom OAuth application from your Microsoft OneDrive account to enable OAuth 2.0 authentication with the Microsoft OneDrive spoke.

Microsoft OneDrive requirements:

- Microsoft OneDrive account
- Microsoft Azure account
- Microsoft OneDrive tenant administrator credentials

Complete these steps from your Azure Developer account. See the Azure product documentation for instructions on creating and configuring custom applications.

1. Log in to the Microsoft Azure App registration portal with your organization credentials.
2. Register a new custom application. Fill in the application name, the supported account type, and the redirect URI, and then click Register.
   An overview of the application's basic information is shown.
3. Copy the application ID to a text file.
You will use this ID and the client secret generated in the next step to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to ServiceNow.

4. Add a client secret.
   a) In Microsoft Azure, navigate to **Manage > Certificates & secrets**.
   b) Provide a description and an expiration date and click **Add**.

   **Note:** The client secret is only displayed in plain text for a short time. You use the client secret when you connect the application to ServiceNow.

5. Enable the permissions you want the application to support. For more information, see the Microsoft Graph permissions reference.
   a) In Microsoft Azure, navigate to **Manage > API permissions**.
   b) Click the Microsoft Graph tile.
   c) Select the Delegated or Application permissions that the application supports.
      Delegated permissions enable the application to access the API as a signed-in user. Application permissions enable the application to run as a background service or daemon without a signed-in user.
   d) Click **Add permissions**.

Register Microsoft OneDrive as OAuth provider.

**Register Microsoft OneDrive as OAuth provider**

Use the information generated during Microsoft OneDrive account configuration to register Microsoft OneDrive as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

- Request IntegrationHub subscription.
- Activate Microsoft OneDrive spoke.
- Create Microsoft OneDrive application.

Role required: admin

1. In ServiceNow, navigate to **System OAuth > Application Registry**.
2. Click **New**.
3. On the screen titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example OneDrive OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Application ID of the OneDrive application you created in Azure.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in Azure.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon, enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/authorize">https://login.microsoftonline.com/common/oauth2/v2.0/authorize</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon, enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/token">https://login.microsoftonline.com/common/oauth2/v2.0/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon, enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. In the **OAuth Entity Scopes** related list, add scopes to match the permissions you defined when you configured the Microsoft OneDrive application.
Click **Insert a new row** and enter the name and the OAuth scope of the permission. The name and the OAuth scope are often the same.

<table>
<thead>
<tr>
<th>OAuth Entity Profiles</th>
<th>OAuth Entity Scopes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Define all available OAuth scopes for this OAuth provider. The scopes defined here can be selected when you create/update a profile. Name: A unique name. OAuth Scope: Scopes you must get from the provider’s specification, such as a read scope and a write scope. Define each scope separately.

<table>
<thead>
<tr>
<th></th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendars.ReadWrite</td>
<td></td>
</tr>
<tr>
<td>Calendars.ReadWrite.Shared</td>
<td></td>
</tr>
<tr>
<td>email</td>
<td></td>
</tr>
<tr>
<td>Files.Read</td>
<td></td>
</tr>
<tr>
<td>Files.Read.All</td>
<td></td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

**Create Credential record for the Microsoft OneDrive spoke.**

Create Credential records to the Microsoft OneDrive custom OAuth application you created during Microsoft OneDrive account configuration. The Microsoft OneDrive spoke connection and credential aliases use these credentials to authorize actions.

- Microsoft role required: User management administrator, Global administrator
- ServiceNow role required: admin

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, OneDrive Spoke OAuth Cred.
4. Click the OAuth Entity Profile search icon
   and select the default OneDrive OAuth profile.
5. Click Submit.

Create Connection record for the Microsoft OneDrive spoke.

A connection alias resolves your connection and credential at runtime. Only one connection is active per Connection Alias at a time.

Role required: admin

1. Navigate to IntegrationHub > Connections & Credentials > Connections and click New.
2. Select HTTP(s) Connection.
3. Provide this connection information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>onedrive_con</td>
</tr>
<tr>
<td>Credential</td>
<td>OneDrive Spoke OAuth Cred</td>
</tr>
<tr>
<td>Connection alias</td>
<td>sn_onedrive_spoke.OneDrive</td>
</tr>
<tr>
<td>Connection URL</td>
<td><a href="https://graph.microsoft.com">https://graph.microsoft.com</a></td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Client Credentials</td>
</tr>
<tr>
<td>Authorization URL</td>
<td><a href="https://accounts.accesscontrol.windows.net/">https://accounts.accesscontrol.windows.net/</a>&lt;TenantID&gt;/tokens/OAuth/2. Replace &lt;TenantID&gt; with your Tenant ID.</td>
</tr>
</tbody>
</table>

4. Return to IntegrationHub > Connections & Credentials > Credentials and select onedrive_cred.
5. From Related Links, click Get OAuth Token.
   A confirmation message indicates that the OAuth token flow has completed successfully.
   Review the details if the flow is not successful.

   Note: Ensure that you allow pop-up windows in your browser.

The Microsoft OneDrive spoke is set up and integrated with the ServiceNow instance.

Microsoft SCCM spoke

Automate management of user collections, device collections, and application deployments on a Microsoft System Center Configuration Management (SCCM) server.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke flows & subflows

This spoke has no sample flows or subflows.

Spoke actions

The Microsoft System Center Configuration Management (SCCM) spoke provides actions to automate SCCM tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Management</td>
<td>Get Applications</td>
<td>Retrieves the application data from the SCCM server.</td>
</tr>
<tr>
<td>Deployment Management</td>
<td>Get Deployments</td>
<td>Retrieves deployment data from the SCCM server.</td>
</tr>
<tr>
<td>Device Management</td>
<td>Add to Device Collection</td>
<td>Adds a device to a collection in SCCM.</td>
</tr>
<tr>
<td></td>
<td>Get Device Collections</td>
<td>Retrieves device collection data from the SCCM server.</td>
</tr>
<tr>
<td></td>
<td>Is Device In Collection</td>
<td>Checks if a specified device exists in a device collection.</td>
</tr>
<tr>
<td></td>
<td>Remove From Device Collection</td>
<td>Removes a device from an existing device collection.</td>
</tr>
<tr>
<td>User Management</td>
<td>Add to User Collection</td>
<td>Adds a user to a collection in SCCM.</td>
</tr>
<tr>
<td></td>
<td>Get User Collections</td>
<td>Retrieves user collection data from the SCCM server.</td>
</tr>
<tr>
<td></td>
<td>Is User In Collection</td>
<td>Checks if a specified user exists in a user collection.</td>
</tr>
<tr>
<td></td>
<td>Remove From User Collection</td>
<td>Removes a user from a user collection.</td>
</tr>
</tbody>
</table>

To see inputs and outputs for these activities, see SCCM activity pack.

MID server requirements

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For information, see MID Server.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the SCCM alias record to authorize actions on a Microsoft System Center Configuration Management (SCCM) server.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM</td>
<td>Connection to the SCCM server.</td>
<td>The URL of the host machine where the SCCM server is installed.</td>
</tr>
</tbody>
</table>

Set up SCCM spoke

Integrate the ServiceNow instance and SCCM using Windows credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin
- Configure the MID Server for SCCM activities

Create Credential record for the SCCM spoke

Create a Credential record to the SCCM server. The SCCM spoke connection and credential alias uses this credential to authorize actions.

- Request IntegrationHub subscription
- Role required: admin
- Configure the MID Server for SCCM activities

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
   A blank Windows Credentials form displays.
4. Enter these values, then click Submit.
Create Connection record for the SCCM spoke
Create a Connection record to your SCCM host machine. The SCCM spoke connection and credential alias uses this connection to perform actions in SCCM.

- Request IntegrationHub subscription
- Create Credential record for the SCCM spoke
- Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for SCCM.
3. From the Connections tab, click New.
   The system displays a blank Basic Connection form.
4. Enter these values, then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter SCCM Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Windows. For example, select SCCM Credential.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the fully qualified domain name of the target host where the SCCM server is installed. For example, &lt;host&gt;,&lt;domain&gt;.com.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Enable</td>
</tr>
<tr>
<td>Override default port</td>
<td>Enter the target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

Configure MID Server as WinRM trusted host

Microsoft SCCM Usage Metering spoke
Manage the process of fetching software usage data from a Microsoft System Center Configuration Management (SCCM) Usage Metering server. Get data about software usage metering and when the software was last used using this spoke.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported Versions

This spoke was built for Microsoft SCCM version 1602, but may be compatible with later versions.

Spoke Requirements

- Microsoft System Center Configuration Management Usage Metering Server version 2012 R2 with software metering enabled. For more information about software metering, see Software metering in Configuration Manager.

  Note: Ensure that metering rules are configured in SCCM for the required software.

- Microsoft SQL Server 2014

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Microsoft SCCM Usage Metering spoke provides actions to retrieve software usage data from a Microsoft System Center Configuration Management Usage Metering server. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Software Last Used Data</td>
<td>Retrieves the last usage data of the required software from the Microsoft SCCM server.</td>
</tr>
<tr>
<td>Get Software Usage Data</td>
<td>Retrieves usage metering of the required software from the Microsoft SCCM server.</td>
</tr>
</tbody>
</table>

Note: The spoke actions support a maximum payload of 10 MB from the SCCM server for the JDBC step.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when
using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record that is associated with the Microsoft SCCM Usage Metering alias to configure where actions run as well as to set MID Server selection attributes. For more information, see MID server.

Set up the Microsoft SCCM Usage Metering spoke

Integrate the ServiceNow instance and SCCM using Java Database Connectivity (JDBC) credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Microsoft SCCM Usage Metering spoke
- Role required: admin

Create Connection records for the Microsoft SCCM Usage Metering spoke
Create Connection records to the SCCM server. The SCCM Usage Metering spoke connection and credential aliases use these connections to perform actions in SCCM.

1. Navigate to Credentials & Connections > Connections.
2. Click New and select JDBC Connection.
3. On the form, fill in the fields.

The database selection in the Format field determines which fields are available.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the JDBC connection. For example, JDBC MySQLProd.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential for the JDBC provider. Enter the user name and password of the database.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with the connection.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>Maximum elapsed time the JDBC query allowed to run without a response.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make the connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain for the table. By default, the JDBC Connection (jdbc_connection) table runs in the global domain.</td>
</tr>
<tr>
<td>Format</td>
<td>Database type for the connection. The choices are:</td>
</tr>
<tr>
<td></td>
<td>• MySQL</td>
</tr>
<tr>
<td></td>
<td>• Oracle</td>
</tr>
<tr>
<td></td>
<td>• SQLServer</td>
</tr>
<tr>
<td></td>
<td>• None</td>
</tr>
<tr>
<td>Host</td>
<td>Host name or IP address of the database server.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Oracle port</td>
<td>Port that the Oracle database is using. The default value is 1521.</td>
</tr>
<tr>
<td>Oracle sid</td>
<td>Oracle database site identifier. The default value is <code>orcl</code>.</td>
</tr>
<tr>
<td>Database name</td>
<td>Name of the database.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Port that the selected database is using.</td>
</tr>
<tr>
<td>Instance name</td>
<td>Instance name for the selected SQLServer.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL that MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases. For example, jdbc:&lt;database&gt;://&lt;hostname&gt;;selectMethods=cursor;databaseName=&lt;database_name&gt;.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server for the action. If selected, define fields in the Advanced MID Server Configuration section.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capabilities that the MID Server must support to be eligible for selection. Only displays if Use MID server is selected. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Application that the MID Server must support to be eligible for selection. Only displays if Use MID server is selected. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
</tbody>
</table>
Create Credential records for the Microsoft SCCM Usage Metering spoke
Create Credential records to the SCCM server. The Microsoft SCCM Usage Metering spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
3. Select JDBC Credentials.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to use the credentials.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to verify if the credentials apply to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to access the database.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to access the database.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Microsoft SharePoint Online spoke
Manages sites, folders, files, groups, lists, and users in Microsoft SharePoint Online. Adds Microsoft SharePoint Online data to your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

API version v1.

Spoke flows

The Microsoft SharePoint Online spoke provides sample flows in the draft state to demonstrate automating Microsoft SharePoint Online tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Attachment on Record creates folder, and copies attachment</td>
<td>Creates a Microsoft SharePoint Online folder with an attachment when the attachment is added to a Knowledge article in ServiceNow.</td>
</tr>
<tr>
<td>Create Site For Knowledge Base</td>
<td>Creates a Microsoft SharePoint Online site when a Knowledge Base is created in ServiceNow.</td>
</tr>
</tbody>
</table>

Spoke subflows

The Microsoft SharePoint Online spoke provides sample subflows in the draft state to demonstrate automating Microsoft SharePoint Online tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remove Then Add A User To A Group</td>
<td>Removes a previous owner from a Microsoft SharePoint Online group and adds the new owner.</td>
</tr>
</tbody>
</table>

Spoke actions

The Microsoft SharePoint Online spoke provides actions to automate Microsoft SharePoint Online tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Site Management</td>
<td>Create Site</td>
<td>Creates a site or subsite in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Delete Site</td>
<td>Removes a site or subsite from Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Look Up Site Collection ID</td>
<td>Looks up a specific site ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Sites</td>
<td>Looks up the sites in a given Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look Up Subsite Details</td>
<td>Looks up information about a subsite.</td>
</tr>
<tr>
<td></td>
<td>Update Site Information</td>
<td>Updates a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Create Folder</td>
<td>Creates a folder in a document library on a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes a folder in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>List Files In A Folder</td>
<td>Gets a list of files in a folder.</td>
</tr>
<tr>
<td></td>
<td>List Folders In A Folder</td>
<td>Gets a list of folders in a folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up Folder</td>
<td>Looks up a folder in Microsoft SharePoint Online and returns folder properties. For example, use this action to return the relative URL to enter as input in the Rename A Folder action.</td>
</tr>
<tr>
<td></td>
<td>Rename A Folder</td>
<td>Renames a folder in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Share Folder With Group</td>
<td>Shares a folder with a group in Microsoft SharePoint Online. The group must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Share Folder With User</td>
<td>Shares a folder with a user in Microsoft SharePoint Online. The user must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare Folder With Group</td>
<td>Unshares a folder with a group. The group must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare Folder With User</td>
<td>Unshares a folder with a user. The user must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td>File Management</td>
<td>Attach Sharepoint File To A Record</td>
<td>Attaches a Microsoft SharePoint Online file to a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Check-in File</td>
<td>Checks in a file to Microsoft SharePoint Online using the Application Service user.</td>
</tr>
<tr>
<td></td>
<td>Check-out File</td>
<td>Checks a file out of Microsoft SharePoint Online using the Application Service user.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Copy Attachment To Folder</td>
<td>Copies a ServiceNow attachment to a Microsoft SharePoint Online folder.</td>
</tr>
<tr>
<td></td>
<td>Copy File</td>
<td>Copies a file with a new name.</td>
</tr>
<tr>
<td></td>
<td>Create A Text File</td>
<td>Uploads a text file to Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Delete File</td>
<td>Deletes a file in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Look Up File Details</td>
<td>Looks up file details in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Move File</td>
<td>Moves a file to another location in Microsoft SharePoint Online.</td>
</tr>
<tr>
<td></td>
<td>Share File With Group</td>
<td>Shares a file with a group in Microsoft SharePoint Online. The group must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Share File With User</td>
<td>Shares a file with a Microsoft SharePoint Online user. The user must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare File With Group</td>
<td>Unshares a file with a Microsoft SharePoint Online group. The group must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare File With User</td>
<td>Unshares a file with a Microsoft SharePoint Online user. The user must belong to the Microsoft SharePoint Online tenant account.</td>
</tr>
<tr>
<td>User Management</td>
<td>Look Up User Information By Login Name</td>
<td>Searches the Microsoft SharePoint Online site for a given user and returns information about the user account.</td>
</tr>
<tr>
<td></td>
<td>Look Up User's SharePoint Groups</td>
<td>Searches the Microsoft SharePoint Online site for a given user and returns the user's Microsoft SharePoint Online groups regardless of which site or subsite the group is a part of.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add Role To Site</td>
<td>Adds a role to a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Add User To Group</td>
<td>Adds a User to a Microsoft SharePoint Online site group.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group on a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Look Up Group By Name</td>
<td>Looks up a group by name in the specified site location. If no site location is specified, the spoke searches the tenant root site.</td>
</tr>
<tr>
<td></td>
<td>Remove Role From Site</td>
<td>Removes permissions from a group or user.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes a user from a Microsoft SharePoint Online site group.</td>
</tr>
<tr>
<td></td>
<td>Update Group Owner (User)</td>
<td>Updates a group owner.</td>
</tr>
<tr>
<td>List Management</td>
<td>Create List</td>
<td>Creates a list in a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Delete List By ID</td>
<td>Deletes a list in a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td></td>
<td>Look Up List Details By ID</td>
<td>Looks up a list in a Microsoft SharePoint Online site by ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up List ID By Title</td>
<td>Looks up a list in a Microsoft SharePoint Online site by title.</td>
</tr>
<tr>
<td></td>
<td>Update List Details</td>
<td>Updates a list in a Microsoft SharePoint Online site.</td>
</tr>
<tr>
<td>List Item Management</td>
<td>Create List Item</td>
<td>Creates a list item inside a list.</td>
</tr>
<tr>
<td></td>
<td>Delete List Item By ID</td>
<td>Deletes a list item.</td>
</tr>
<tr>
<td></td>
<td>Look Up List Item By ID</td>
<td>Looks up a list item.</td>
</tr>
<tr>
<td></td>
<td>Look Up List Items In A List</td>
<td>Looks up items in a specified list in various useful formats.</td>
</tr>
<tr>
<td></td>
<td>Update List Item By ID</td>
<td>Updates a list item title with the ID.</td>
</tr>
</tbody>
</table>

**Sharepoint Online account requirements**

The Microsoft SharePoint Online spoke requires creating a custom app on your SharePoint Online account to generate OAuth 2.0 tokens. See [Configure Microsoft SharePoint Online account](#).

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need
to update any actions that use the connection. For more information, see Connections and Credentials.

**Single tenant**
This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft Sharepoint Online. Select this alias in the Tenant record to authorize changes in Microsoft SharePoint Online for a single tenant.

**Multiple tenants**
This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft Sharepoint Online. Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online. See Create aliases for multiple tenants.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the MicrosoftSharepointOnline alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Microsoft SharePoint Online spoke**

Integrate the ServiceNow instance and Microsoft SharePoint Online by creating a custom OAuth application in Microsoft SharePoint Online to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Microsoft SharePoint Online spoke
- Role required: admin

**Configure Microsoft SharePoint Online account**
Create a custom OAuth application from your Microsoft SharePoint Online account to enable OAuth 2.0 authentication with the Microsoft SharePoint Online spoke.

Microsoft SharePoint Online requirements:
- Microsoft SharePoint Online account
- Microsoft SharePoint Online tenant administrator credentials

Complete these steps from your Microsoft SharePoint Online account. See the SharePoint development documentation for instructions on creating and configuring custom applications.

1. Work with your Azure AD administrator to retrieve the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint Online tenant you want to connect to. Record the Directory ID to use as the Tenant ID when creating a Tenant record in your ServiceNow instance.
2. In your SharePoint site, create a custom application.
3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Enable the matching SharePoint application scope permissions you want the app to support.

For example, to provide full control, enter the following XML:

```xml
<AppPermissionRequests AllowAppOnlyPolicy="true">
  <AppPermissionRequest
    Scope="http://sharepoint/content/tenant"
    Right="FullControl" />
</AppPermissionRequests>
```
Create aliases for multiple tenants
Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint Online. If configuring an integration for a single tenant, use the existing MicrosoftSharepointOnline alias record.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. **Click New.**
   A blank Connection & Credential Alias record opens
3. On the **Connection & Credential Aliases** form, fill the following values.

   **Connection & Credential Aliases form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>&lt;unique-name&gt;</td>
</tr>
<tr>
<td>Type</td>
<td>Connection and Credential</td>
</tr>
<tr>
<td>Connection type</td>
<td>HTTP</td>
</tr>
</tbody>
</table>

4. **Click Submit.**

Associate a Credential record and a Connection record with the alias to authorize actions on the SharePoint tenant site. Create an alias record and associated connection and credential records for each tenant you want to support.

**Define Microsoft SharePoint Online tenants**
Define a profile for your Microsoft SharePoint Online tenant site. The Microsoft SharePoint Online spoke uses the tenant record and associated Connection and Credential alias to perform actions on Microsoft SharePoint Online.

1. Navigate to **Sharepoint Online > Tenants.**
2. **Click New.**
3. Complete the form.

   **Field** | **Description**
   --------- | ------------------------
   Name      | Enter a name for the tenant.
   Alias     | Select a connection and credential alias. If configuring the integration for a single tenant, select the MicrosoftSharepointOnline alias. If configuring the integration for multiple tenants, select the desired alias.
   Sharepoint Root URL | Enter the root SharePoint URL without the https:// prefix. For example, &lt;SiteName&gt;.sharepoint.com
   Tenant Id | Enter the Tenant ID. This is the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint Online tenant you want to connect to. See Configure Microsoft SharePoint Online account.
   Resource Id | Auto-populated with 000000003-0000-0ff1-0e00-000000000000.
4. Click **Submit**.

If configuring an integration with multiple Microsoft SharePoint Online tenants, create additional tenant profiles as needed.

**Register Microsoft SharePoint Online as OAuth provider**

Use the information generated during Microsoft SharePoint Online account configuration to register Microsoft SharePoint Online as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**. The system displays the message *What kind of OAuth application?*
3. Select **Connect to a third party OAuth Provider**. The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SharePoint OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the value, <code>&lt;ClientID&gt;@&lt;TenantID&gt;</code></td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the Microsoft SharePoint Online account configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Select <code>OAuthUtilSPOnline</code>.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <code>Client Credentials</code>.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Enter <code>https://accounts.accesscontrol.windows.net/&lt;TenantID&gt;/tokens/OAuth/2</code>. Replace <code>&lt;TenantID&gt;</code> with your Tenant ID.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**. The system validates the OAuth credentials and populates the **Redirect URL** and the **OAuth Entity Profiles** related list.

6. Copy the value from **Redirect URL**.

7. Login to your Microsoft SharePoint Online account to edit the configuration of your custom SharePoint application. See the **SharePoint development** site for instructions.

8. Paste the **Redirect URL** value into the OAuth 2.0 Redirect URI for your custom Microsoft SharePoint Online application. For example, paste `https://instance.service-now.com/oauth_redirect.do`.

The instance can request OAuth 2.0 tokens for the spoke.

**Create Credential records for the Microsoft SharePoint Online spoke**

Create Credential records to the Microsoft SharePoint Online custom OAuth application you created during Microsoft SharePoint Online account configuration. The Microsoft SharePoint Online spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**. The system displays the message *What type of Credentials would you like to create?*.
3. Select **OAuth 2.0 Credentials**.
The pop-up window displays a blank OAuth 2.0 Credentials form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SharePoint Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Microsoft SharePoint Online application as an OAuth provider. For example, select SharePoint OAuth profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.

6. From Related Links, click Get OAuth Token.

The system displays a confirmation message that the OAuth token flow is completed successfully. Review the details if the flow is not completed successfully.

Note: Ensure that you allow pop-up windows in your browser.

Create Connection records for the Microsoft SharePoint Online spoke
Create Connection records to your Microsoft SharePoint Online account. The Microsoft SharePoint Online spoke connection and credential alias uses these connections to perform actions on Microsoft SharePoint Online.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the connection and credential alias used in the Tenant record. See Define Microsoft SharePoint Online tenants and Create aliases for multiple tenants.
3. From the Connections tab, click New.

The system displays a blank HTTP(s) Connection form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter SharePoint Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Microsoft SharePoint Online. For example, select SharePoint Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the Connection alias record you created for Microsoft SharePoint Online.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the root SharePoint URL. For example, https://&lt;SiteName&gt;.sharepoint.com.</td>
</tr>
</tbody>
</table>
5. Click Submit.

Microsoft Teams spoke

The Microsoft Teams spoke provides actions which post messages and ServiceNow incident, problem, and change record details to Microsoft Teams channels.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Microsoft Teams actions

The Microsoft Teams spoke is an available integration through IntegrationHub. You can specify the following Microsoft Teams actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL, Title, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>

Microsoft Teams Inputs

The following inputs are common to the Microsoft Teams actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Required) Webhook URL</td>
<td>The Microsoft Teams webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Microsoft Teams documentation.</td>
</tr>
<tr>
<td>(Optional) Title</td>
<td>Title of the message.</td>
</tr>
<tr>
<td>(Optional) Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>(Optional) Override Default Fields</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
<tr>
<td>(Optional) Theme Color (Hex)</td>
<td>Hex code value of color to highlight the message.</td>
</tr>
</tbody>
</table>

**Example**

You can add a Microsoft Teams Post Incident Details action to a flow which identifies newly created high priority incidents and a specified theme color.

![Example Diagram]

**Microsoft Teams Graph spoke v2**

The Microsoft Teams Graph spoke creates and manages teams and channels in Microsoft Teams. To create, manage, or delete users and groups, use the Microsoft Azure AD spoke.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**Note:**

- Teams in the Microsoft Teams Graph spoke are created from the groups in Microsoft Azure AD. To create a team using the Microsoft Teams Graph spoke, the associated group must be present in Microsoft Azure AD.
- User and group management can be done using Microsoft Azure AD only and not Microsoft Teams Graph spoke.
- Teams can be created from the Microsoft Office 365 group only.
The team ID in Microsoft Teams is the same as the group ID of the associated group in Microsoft Azure AD.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

**Supported version**

Microsoft Graph REST API v1.0 and Beta API

*Note: The Notification Management actions use Beta API.*

**Spoke actions**

The Microsoft Teams Graph spoke provides actions to automate team and channel tasks when an incident is created in the ServiceNow instance.

**Microsoft Teams Graph spoke actions**

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Team Management</td>
<td>Create Team</td>
<td>Creates a team from an existing Microsoft Office 365 group.</td>
</tr>
<tr>
<td></td>
<td>Update Team</td>
<td>Updates the properties of a team.</td>
</tr>
<tr>
<td></td>
<td>Get Team</td>
<td>Retrieves the properties and relationships of a team.</td>
</tr>
<tr>
<td></td>
<td>Archive Team</td>
<td>Archives a team. Members cannot send messages on the channels of the team. However, members can be added to the group and can search the team content.</td>
</tr>
<tr>
<td></td>
<td>List Teams</td>
<td>Lists teams the specified user is part of.</td>
</tr>
<tr>
<td></td>
<td>Unarchive Team</td>
<td>Restores an archived team. Members can send messages on the channels of the team.</td>
</tr>
<tr>
<td>Channel Management</td>
<td>Create Channel in a Team</td>
<td>Creates a channel in a team.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Channel Metadata</td>
<td>Get Channel Metadata</td>
<td>Retrieves the properties and relationships of a channel.</td>
</tr>
<tr>
<td></td>
<td>Get Channel ID by Name</td>
<td>Retrieves the channel ID and properties.</td>
</tr>
<tr>
<td></td>
<td>Delete Channel</td>
<td>Removes the channel from a team and deletes all conversations.</td>
</tr>
<tr>
<td></td>
<td>Post Change Details</td>
<td>Posts details of the required change to a channel.</td>
</tr>
<tr>
<td></td>
<td>Post Incident Details</td>
<td>Posts details of the required incident to a channel.</td>
</tr>
<tr>
<td></td>
<td>Post Message</td>
<td>Posts message to a channel.</td>
</tr>
<tr>
<td></td>
<td>Post Problem Details</td>
<td>Posts details of the required problem to a channel.</td>
</tr>
</tbody>
</table>

**Note:** Currently, these actions use Beta API. Hence, when you create the connection record, api_version in the Attributes tab is set to beta by default.

When Microsoft Teams supports these actions in another API version, you must update api_version in the Attributes tab and specify the new API version to use these actions.

**Note:** Some of the spoke actions require the channel ID, group ID, or team ID as one of the inputs. To learn these details, log in to Microsoft Teams, navigate to Teams, and click Get link to channel for the required channel. The channel link contains the required details. For example, if the channel link is https://teams.microsoft.com/l/channel/19%3a1aa3730712e245a0af31e4095d66d613@thread.skype/New%2520channel%2520in%2520team?groupId=7fb91938-5e8c-4968-bf7d-3987df7716f3&tenantId=a46df9b7-2c9b-49d5-8c9f-d1b3de4ba59f, the group ID and team ID are 7fb91938-5e8c-4968-bf7d-3987df7716f3, and the channel ID is 1aa3730712e245a0af31e4095d66d613@thread.skype or 1aa3730712e245a0af31e4095d66d613.

For more information about accessing the channel ID and group ID through Microsoft Teams, see Microsoft Teams documentation.

**Microsoft Teams Graph spoke action permissions**

The Microsoft Teams Graph spoke should have the following permissions to perform the relevant actions.
<table>
<thead>
<tr>
<th>Action</th>
<th>Permission type</th>
<th>Permissions (from least to most privileged)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Update Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>

<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
</tbody>
</table>

For more information about the required permissions, see Microsoft Teams documentation.

**Microsoft account requirements**

The Microsoft Teams Graph spoke requires registering an application using the Microsoft Azure portal to generate OAuth 2.0 tokens.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

**MID Server requirements**

The Microsoft Teams Graph spoke actions use REST calls, which can run on an instance or a MID Server. Use the connection record associated with the Microsoft alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Microsoft Teams Graph spoke**

Integrate the ServiceNow instance and Microsoft Teams account by creating a custom OAuth application in Microsoft Teams to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Microsoft Teams Graph spoke
- Role required: admin

*Register an application using the Microsoft Azure portal*

Provide authorization to the ServiceNow instance by registering an application with Azure AD.

Role required: Azure Active Directory admin

Complete these steps from the Microsoft Azure portal. For instructions on registering an application, see the Microsoft Azure documentation.

1. In the Microsoft Azure portal, copy and record the Directory ID for later use.
2. Register your application by providing the ServiceNow instance URL for the **Home page**.
3. Copy and record the **Application ID** for later use.
4. Add the **Reply URLs** in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`
5. For the **Required Permissions**, select **Microsoft Graph**.
6. Record the **Client Secret** for use in later configurations.

The ServiceNow application is created with Microsoft Azure AD.

Register Microsoft Teams as the OAuth provider

Register Microsoft Teams as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Use the information generated during the registration of the application in the Microsoft Azure portal.

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   The system displays the message, **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill in the fields.

### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>MS Teams</strong>.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

**Note:** You can use only **Authorization Code** as the Default Grant type when **PKCE** is enabled.

<table>
<thead>
<tr>
<th>Application</th>
<th>Application scope that contains this record.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

5. Insert the following records in the OAuth Entity Scopes related list.

**Record 1 in the OAuth Entity Scopes related list**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>auth_code</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>offline_access</td>
</tr>
</tbody>
</table>

**Record 2 in the OAuth Entity Scopes related list**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>openid</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>openid</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**.

A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, MS Teams default_profile.

Create Credential records for the Microsoft Teams Graph spoke

Authorize the Microsoft Teams Graph spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Teams Graph spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message, What type of Credentials would you like to create?
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.
### OAuth 2.0 Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSTeamsCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Microsoft Teams Graph spoke as an OAuth provider. For example, MS Teams default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Save**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

The credential record for the Microsoft Teams Graph spoke is created.

Create Connection records for the Microsoft Teams Graph spoke
Perform actions in Microsoft Teams by creating connection records for your Microsoft Teams account. The Microsoft Teams Graph spoke connection and credential alias uses these connections to perform actions.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the Microsoft Teams Graph spoke record.
3. In the Connections related list, click **New**.
4. On the form, fill in the fields.

### HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSTeamsConnection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Teams. For example, MSTeamsCredentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note: Do not select the check box.</strong></td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>
Note:
Currently, the Notification Management actions use Beta API. Hence, `api_version` in the Attributes tab is set to `beta` by default.

When Microsoft Teams supports the Notification Management actions in another API version, you must update `api_version` in the Attributes tab and specify the new API version.

5. Click Update.

The Microsoft Teams Graph spoke is set up and integrated with the ServiceNow instance.

**Regenerate the Microsoft Teams OAuth token**

Authorize the Microsoft Teams Graph spoke by regenerating the Microsoft Teams OAuth token after it expires.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Select the Microsoft Teams Graph spoke OAuth Credential record.
3. To regenerate the OAuth token, click the Get OAuth Token related link.

The Microsoft Teams Graph spoke receives a new OAuth access token.

**Okta spoke v1.1.1**

Use Okta to manage users, passwords, and groups.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
Supported versions

API version v1.

Spoke flows

The Okta spoke provides sample flows in the draft state to demonstrate automating user and group management tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Okta Group</td>
<td>When a user is created, adds the user to the specified group.</td>
</tr>
<tr>
<td>Onboard User in Okta</td>
<td>When a user is created in ServiceNow, creates and activates the user in Okta.</td>
</tr>
<tr>
<td>Remove Okta Group Membership on Deactivation</td>
<td>When a user is deactivated, removes the user from all Okta groups.</td>
</tr>
</tbody>
</table>

**Note:** Okta has the ServiceNow_UD application to provision users in ServiceNow. ServiceNow can also be configured to provision users in Okta. Hence, ServiceNow administrators must ensure that circular user creation does not occur.

Spoke actions

The Okta spoke provides actions to authenticate and manage users and groups. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Activate User</td>
<td>Starts the process of activating a user in Okta by enabling new or returning users to configure their Okta account from an activation URL. This action can either have Okta send the activation URL to the user as an email, or it can return the activation URL as a data pill for use in a later action to send an email or notification.</td>
</tr>
<tr>
<td></td>
<td>Clear User Session</td>
<td>Clears all active sessions the specified user has with Okta, which forces the user to log back in the next time they use Okta.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates the specified user in Okta with the specified standard, optional, and mandatory field values.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note: Okta has the ServiceNow_UD application to provision users in ServiceNow. ServiceNow can also be configured to provision users in Okta. Hence, ServiceNow administrators must ensure that circular user creation does not occur.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the specified user in Okta, which removes the user's groups and application assignments, and changes the user status to DEACTIVATED. This action is commonly used when a user departs the company indefinitely.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note: Do not perform this action on users with a DEPROVISIONED status.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified user within Okta, which completely removes the user. This action is commonly used to clean up your user base after compliance regulations have been met.</td>
</tr>
<tr>
<td></td>
<td>Is Account Locked</td>
<td>Determines if a user account is locked.</td>
</tr>
<tr>
<td></td>
<td>Lookup Okta User ID</td>
<td>Retrieves the Okta user ID for the specified Okta login ID or login short name.</td>
</tr>
<tr>
<td></td>
<td>Lookup User Account Details</td>
<td>Retrieves user details for the specified Okta user ID.</td>
</tr>
<tr>
<td></td>
<td>Lookup User Profile Information</td>
<td>Retrieves user profile details for the specified Okta user ID.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Restart User Activation</td>
<td>Restarts the specified user’s activation within Okta. Use this action if the user did not complete their activation with the activation code or link provided by the <strong>Activate User</strong> Action.</td>
</tr>
<tr>
<td></td>
<td>Suspend User</td>
<td>Suspends the specified user within Okta by changing the user status from ACTIVE to SUSPENDED. For example, use this action to suspend access for users who are on temporary leave. To reactivate a suspended user, use the <strong>Unsuspend</strong> action.</td>
</tr>
<tr>
<td></td>
<td>Unsuspend User</td>
<td>Unsuspends the specified user in Okta.</td>
</tr>
<tr>
<td></td>
<td>Update User Profile</td>
<td>Updates the user profile details for the specified user in Okta.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Change User’s Password</td>
<td>Changes the specified user’s password after validating the user’s current password.</td>
</tr>
<tr>
<td></td>
<td>Expire User Password</td>
<td>Expires the specified user’s password within Okta. This action is commonly used as a reaction to stop breaching attempts.</td>
</tr>
<tr>
<td></td>
<td>Reset to Temporary Password</td>
<td>Resets the specified user’s password within Okta to a temporary password. This action is commonly used to get a user logged in who has forgotten their password.</td>
</tr>
<tr>
<td></td>
<td>Reset User Factors</td>
<td>Resets all of the multi-factor access devices for the specified user within Okta. This action is commonly used when a user loses their multi-factor authentication device or method.</td>
</tr>
<tr>
<td></td>
<td>Set User Password</td>
<td>Sets the specified user’s password in Okta.</td>
</tr>
<tr>
<td></td>
<td>Unlock User</td>
<td>Unlocks the specified user in Okta.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds the specified user to the specified group in Okta.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Get Groups</td>
<td>Retrieves all new and updated groups in Okta.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Determines if the specified user is a member of the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group Details</td>
<td>Retrieves group details for the specified Okta group ID.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group ID By Name</td>
<td>Retrieves group details and group ID for the specified Okta group name.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes the specified user from the specified Okta group ID.</td>
</tr>
<tr>
<td></td>
<td>Update Group</td>
<td>Updates the group details for the specified Okta group ID.</td>
</tr>
</tbody>
</table>

**Okta account requirements**

The Okta spoke requires generating and configuring your Okta account to use a web API key.

**Credential and connection alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Okta Connection & Credential Alias record to authorize actions.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Okta alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

**Set up Okta spoke v1.1.1**

Integrate the ServiceNow instance and your Okta account using an API key to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Okta spoke
- Role required: admin

**Generate Okta account API token**

Configure your Okta account to generate an access token for API key authentication.
Okta requirements:
- Okta organization or developer account
- Okta administrator credentials

Complete these steps from your Okta organization or developer account. See the Okta for developers documentation for instructions on creating and configuring your account.

1. Generate an access token to interact with Okta APIs.
2. Record the access token to create Credential records on your ServiceNow instance.

Create Credential records for the Okta spoke v1.1.1
Create Credential records to the Okta application you created. The Okta spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Okta Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter SSWS followed by the access token you obtained from Okta. For example, SSWS {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Okta spoke v1.1.1
Create a Connection record to the Okta API. The Okta spoke connection and credential alias uses these connections to perform actions in Okta.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Okta.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Okta Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Okta. For example, select Okta Credentials.</td>
</tr>
</tbody>
</table>
5. Click Submit.

**Fetch Okta groups**

Fetch Okta groups into your instance so that you can assign them to different users. You can fetch the groups on an as-needed or scheduled basis.

**Role required:** okta.admin

1. To fetch Okta groups on an as-needed basis.
   a) Navigate to Okta spoke > Okta groups.
   b) Click Fetch Okta groups.
   c) From the Okta groups list, you can review the following:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the Okta group.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the Okta group.</td>
</tr>
<tr>
<td>Group ID</td>
<td>Group ID of the Okta group.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the Okta group.</td>
</tr>
<tr>
<td>Group creation date</td>
<td>Date when Okta group was created.</td>
</tr>
<tr>
<td>Group last updated date</td>
<td>Date when Okta group was last updated.</td>
</tr>
<tr>
<td>Created</td>
<td>Date when Okta group was first synchronized with your ServiceNow instance.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date when Okta group was last synchronized with your ServiceNow instance.</td>
</tr>
</tbody>
</table>

2. To fetch Okta groups on a scheduled basis.
   a) Navigate to System Definition > Scheduled Jobs.
   b) Open the Fetch Okta Groups record.
   c) Update the fields, as needed.

   **Note:** Make sure that the Active option is selected so that the scheduled job is activated for use.

   d) Click Update.
**ServiceNow eBonding spoke**

The ServiceNow eBonding spoke demonstrates some common integration design patterns through a common use case of synchronizing incidents across ServiceNow instances.

*Note:* The ServiceNow eBonding spoke is included by default in your instance and doesn’t require an IntegrationHub or Orchestration subscription.

**Base system eBonding actions**

If you have multiple production instances in your environment, you might have a need to synchronize data across these instances. For example, one instance might manage internal applications (your source system) and another manages external customer facing applications (your target system). A common use case is an incident which initially opens on the source system, but it requires a correlated incident to be created and tracked on the target instance. The ServiceNow eBonding integration contains the following OOB actions to assist in creating the synchronization:

**Create Remote Incident action**

This action uses the source system incident details to create a new incident on the target instance. It passes the source incident number as the Correlation ID on the target system. It takes the target system incident number and updates the Correlation ID of the source system.

**Lookup Remote Incident action**

This action takes the remote incident number as input and retrieves more details about that incident, such as: short description, description, priority, etc.

**Update Remote Incident action**

This action uses the source incident details to update the remote incident with details from source instance. Look up of remote incident is performed using Correlation ID in source instance’s incident.

**Credential and Connection information for eBonding**

When building actions, you must decouple the connection and credential information from the action so there is a seamless transition from distinct production environments. This also makes it easier to share content and create content through the ServiceNow store.

As part of eBonding example, you can associate an OOB connection alias (sn_ebonding_ah.ServiceNow). Create an HTTP connection record and associate it with this alias. For credentials, ServiceNow web services supports a multitude of authentication mechanisms. Create a BasicAuth credential to start with, however, that login ID must have permissions to create, read, and update an incident on your remote system. An example HTTP connection:
Additional eBonding Script

The Payloadbuilder script is included with this example. It builds a payload by reading a set of fields from an incident table used in the REST steps for these actions.

Slack spoke

Use Slack to post messages and manage access to channels.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Spoke flows

This spoke has no sample flows.

Spoke subflows

This spoke has no sample subflows.

Spoke actions

The Slack spoke provides actions to automate Slack workspace tasks when events occurs in ServiceNow. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel Management</td>
<td>Add User to Channel</td>
<td>Adds an existing user to the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Archive Channel</td>
<td>Archives the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Create Channel</td>
<td>Creates the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Remove User from Channel</td>
<td>Removes a user from the specified channel in the Slack workspace.</td>
</tr>
<tr>
<td>Note:</td>
<td></td>
<td>To perform the channel management actions, enable these Slack application</td>
</tr>
<tr>
<td></td>
<td></td>
<td>scope permissions:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· channels:write</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· groups:write</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· im:write</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· mpim:write</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For more information, see Configure Slack workspace.</td>
</tr>
<tr>
<td>Notification Management</td>
<td>Post a Message</td>
<td>Posts a message in the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Post Change Details</td>
<td>Posts Change record details to the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Post Incident Details</td>
<td>Posts Incident record details to the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Post Problem Details</td>
<td>Posts Problem record details to the specified channel.</td>
</tr>
<tr>
<td>Note:</td>
<td></td>
<td>To perform the notification management actions, enable these Slack</td>
</tr>
<tr>
<td></td>
<td></td>
<td>application scope permissions:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· chat:write</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· chat:write:bot</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· chat:write:user</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For more information, see Configure Slack workspace.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user in the specified Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the specified user from a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Lookup User</td>
<td>Returns information about the specified user such as name, time zone,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>workspace admin rights, and team ownership.</td>
</tr>
<tr>
<td>Note:</td>
<td></td>
<td>To perform the user management actions, enable these Slack</td>
</tr>
<tr>
<td></td>
<td></td>
<td>application scope permissions:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· users:read.email</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· users:read</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For more information, see Configure Slack workspace.</td>
</tr>
</tbody>
</table>
Slack account requirements

The Slack spoke requires creating a custom app on your Slack account to generate OAuth 2.0 tokens for the Slack spoke. See Configure Slack workspace.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the Slack alias record to authorize actions on Slack.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slack</td>
<td>Connection to Slack.</td>
<td><a href="https://slack.com">https://slack.com</a></td>
</tr>
</tbody>
</table>

Set up Slack spoke

Integrate the ServiceNow instance and your Slack account by creating a custom OAuth application in Slack to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin

Configure Slack workspace

Create a custom OAuth application on your Slack workspace to enable OAuth 2.0 authentication with the Slack spoke.

Slack requirements:
- Slack account
- Slack workspace owner credentials for admin scope permissions

Complete these steps from your Slack account. See the Slack API documentation for instructions on creating and configuring custom applications.

1. From your Slack account, create a custom OAuth application.
2. Select standard OAuth 2.0 user authentication as the application authentication method.
3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Enable the matching Slack application scope permissions you want the app to support.

<table>
<thead>
<tr>
<th>Slack application scope permission</th>
<th>Required for</th>
</tr>
</thead>
<tbody>
<tr>
<td>chat:write</td>
<td>Post Message, Post Incident Details, Post Change Details, Post Problem Details actions, and Send messages as your Slack app</td>
</tr>
<tr>
<td>chat:write:bot</td>
<td></td>
</tr>
<tr>
<td>chat:write:user</td>
<td></td>
</tr>
<tr>
<td>channels:write</td>
<td>Create Channel, Achieve Channel, Add User to Channel, and Remove User from Channel actions</td>
</tr>
<tr>
<td>groups:write</td>
<td></td>
</tr>
<tr>
<td>im:write</td>
<td></td>
</tr>
<tr>
<td>mpim:write</td>
<td></td>
</tr>
</tbody>
</table>
### Slack application scope permission

<table>
<thead>
<tr>
<th>Permission</th>
<th>Required for</th>
</tr>
</thead>
<tbody>
<tr>
<td>users:read.email</td>
<td>Lookup User action</td>
</tr>
<tr>
<td>users:read</td>
<td></td>
</tr>
<tr>
<td>admin (Only available to Slack workspace owners)</td>
<td>Create User and Deactivate User actions.</td>
</tr>
</tbody>
</table>

### Register Slack as OAuth provider

Use the information generated during Slack workspace configuration to register Slack as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

- Request IntegrationHub subscription
- **Configure Slack workspace**
- Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**. The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**. The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Slack OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Slack workspace configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the Slack workspace configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Enter <a href="https://slack.com/api/oauth.access">https://slack.com/api/oauth.access</a>.</td>
</tr>
<tr>
<td>Access Token Lifespan</td>
<td>Enter a value in seconds for the access token expiration. After expiration, you must generate a new token. The maximum value is 2,144,448,000.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**. The system validates the OAuth credentials and populates the OAuth Entity Profiles related list and Redirect URL.
6. In the OAuth Entity Scopes related list, create entries for the same scopes you had configured in your Slack workspace in this format.

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>chat:write</td>
<td>chat:write</td>
</tr>
<tr>
<td>chat:write:bot</td>
<td>chat:write:bot</td>
</tr>
<tr>
<td>chat:write:user</td>
<td>chat:write:user</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>channels:write</td>
<td>channels:write</td>
</tr>
<tr>
<td>groups:write</td>
<td>groups:write</td>
</tr>
<tr>
<td>im:write</td>
<td>im:write</td>
</tr>
<tr>
<td>mpim:write</td>
<td>mpim:write</td>
</tr>
<tr>
<td>users:read.email</td>
<td>users:read.email</td>
</tr>
<tr>
<td>users:read</td>
<td>users:read</td>
</tr>
<tr>
<td>admin</td>
<td>admin</td>
</tr>
</tbody>
</table>

**Note:** This scope is available to Slack workspace owners only.

7. Open the default record in the **OAuth Entity Profiles** related list. In the **OAuth Entity Profile Scopes** related list, specify the same scopes you had earlier specified in the **OAuth Entity Scopes** related list.

8. Copy the value from **Redirect URL**.

9. Login to your Slack workspace to edit the configuration of your custom Slack application. See the **Slack API** for instructions.

10. Paste the **Redirect URL** value into the OAuth 2.0 Redirect URI for your custom Slack application. For example, paste https://instance.service-now.com/oauth_redirect.do.

The instance can request OAuth 2.0 tokens for the spoke.

**Note:** The spoke generates OAuth tokens that expire after 24 days. An administrator can regenerate the spoke OAuth token every 24 days.

---

Create Credential record for the Slack spoke

Create a Credential record for the Slack custom OAuth application you created during Slack workspace configuration. The Slack spoke connection and credential alias uses this credential to authorize actions.

- Request IntegrationHub subscription
- **Configure Slack workspace**
- Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**. The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**. The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Slack Credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>--------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Slack application as an OAuth provider. For example, select <strong>Slack OAuth default profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select <strong>All MID Servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter <strong>100</strong>.</td>
</tr>
</tbody>
</table>

5. **Click Submit.**

**Create Connection record for the Slack spoke**
Create a Connection record to your Slack workspace. The Slack spoke connection and credential alias uses this connection to perform actions on your Slack workspace.

- Request IntegrationHub subscription
- **Configure Slack workspace**
- **Create Credential record for the Slack spoke**
- Role required: **admin**

1. **Navigate to Connections & Credentials > Connection & Credential Aliases.**
2. **Open for the record for Slack.**
3. **From the Connections tab, click New.**
   The system displays a blank HTTP(s) Connection form.
4. **Enter these values.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter <strong>Slack Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for the Slack workspace. For example, select <strong>Slack Credential</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <strong><a href="https://api.slack.com">https://api.slack.com</a></strong>.</td>
</tr>
</tbody>
</table>

5. **Click Submit.**

**Regenerate Slack OAuth token**
Regenerate the Slack OAuth token when it expires. The Box spoke OAuth token expires every twenty four days.

- Request IntegrationHub subscription
- **Create Credential record for the Slack spoke**
- Role required: **admin**

1. **Navigate to Connections & Credentials > Credentials.**
2. **Select the Slack spoke OAuth Credential record.**
   For example, select **Slack Credential**.
3. **From Related Links, click Get OAuth Token.**

The Slack spoke receives a new OAuth access token good for 24 days.
Slack webhooks spoke

Use Slack webhooks to post messages and record details for ServiceNow incidents, problems, and changes to Slack channels.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Spoke actions

The Slack webhooks spoke is an available integration through IntegrationHub. You can specify the following Slack actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Slack channel using an Incoming Webhook. Specify the Webhook URL and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>

Slack Inputs

The following inputs are common to Slack webhooks spoke actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Required) Webhook URL</td>
<td>The Slack webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Slack documentation.</td>
</tr>
<tr>
<td>(Optional) Message</td>
<td>Title of the message.</td>
</tr>
<tr>
<td>(Optional) Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td>(Optional) Channel</td>
<td>Specify the Slack channel to post information.</td>
</tr>
<tr>
<td>Input</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Username</td>
<td>Specify a username to include in your post.</td>
</tr>
<tr>
<td>(Optional) Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
<tr>
<td>(Optional) Icon</td>
<td>Add an icon to the communication.</td>
</tr>
</tbody>
</table>

Note: If you do not specify a Username, Channel, or Icon, it will post the message using the defaults as configured in your webhook. If you specify them here, they will override those defaults.

Example

You can add a Slack Post Incident Details action to a flow which identifies newly created high priority incidents, a username, and a specific slack channel.
Twilio spoke

Use the Twilio spoke to send SMS, make voice calls, create conference calls, manage calls, manage short codes, notify services, and messaging services.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Twilio Base version 2010-04-01, Twilio Messaging version v1, and Twilio Notify version v1, but may be compatible with later versions.

Spoke requirements

- Twilio account
- AccountSid and AuthToken of the account
- Activate these plugins:
  - ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
  - ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
  - ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

See Twilio documentation for instructions on creating an account.

Spoke actions

The Twilio spoke provides actions to automate sending SMS, making voice calls, and creating conference calls when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Create Application</td>
<td>Creates an application resource in a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Delete Application</td>
<td>Deletes an application resource from a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Get Application</td>
<td>Retrieves the required application resource.</td>
</tr>
<tr>
<td></td>
<td>Look Up Accounts</td>
<td>Retrieves the account resources in a Twilio account. The list includes the account and its sub-account resources.</td>
</tr>
<tr>
<td></td>
<td>Look Up Applications</td>
<td>Retrieves the application resources in a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Update Application</td>
<td>Updates properties of an application resource in a Twilio account.</td>
</tr>
<tr>
<td>Call Management</td>
<td>Dequeue Call</td>
<td>Removes a call from a queue.</td>
</tr>
<tr>
<td></td>
<td>Get Call</td>
<td>Retrieves the required call resource.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Get Incoming Phone Number</td>
<td>Retrieve the incoming phone number</td>
<td></td>
</tr>
<tr>
<td>Hang Up Call</td>
<td>End a call in progress.</td>
<td></td>
</tr>
<tr>
<td>Look Up Incoming Phone Numbers</td>
<td>Retrieve the incoming phone number</td>
<td></td>
</tr>
<tr>
<td>Make a Call With Recording</td>
<td>Places a call to a phone number</td>
<td></td>
</tr>
<tr>
<td>Make a Call Without Recording</td>
<td>Places a call to a phone number and</td>
<td></td>
</tr>
<tr>
<td>Modify Call</td>
<td>Modifies a call in progress.</td>
<td></td>
</tr>
<tr>
<td>Mute Or Unmute Participant</td>
<td>Mutes or unmutes a participant</td>
<td></td>
</tr>
<tr>
<td>Remove Participant From</td>
<td>Removes a participant resource</td>
<td></td>
</tr>
<tr>
<td>Update Incoming Phone Number</td>
<td>Updates properties of an incoming</td>
<td></td>
</tr>
<tr>
<td>Add Phone Number To Messaging Service</td>
<td>Adds a phone number resource to the messaging service.</td>
<td></td>
</tr>
<tr>
<td>Add Short Code To Messaging Service</td>
<td>Adds a short code resource to the messaging service.</td>
<td></td>
</tr>
<tr>
<td>Create Messaging Service</td>
<td>Creates a new messaging service</td>
<td></td>
</tr>
<tr>
<td>Delete Messaging Service</td>
<td>Deletes a messaging service resource from a Twilio account.</td>
<td></td>
</tr>
<tr>
<td>Look Up Messaging Service Phone Numbers</td>
<td>Retrieves the phone number resources in a messaging service.</td>
<td></td>
</tr>
<tr>
<td>Look Up Messaging Service Short Codes</td>
<td>Retrieves the short code resources associated with a messaging service.</td>
<td></td>
</tr>
<tr>
<td>Look Up Messaging Services</td>
<td>Retrieves the messaging service</td>
<td></td>
</tr>
<tr>
<td>Remove Phone Number From</td>
<td>Removes a phone number resource</td>
<td></td>
</tr>
<tr>
<td>Remove Short Code From</td>
<td>Removes a short code resource</td>
<td></td>
</tr>
<tr>
<td>Create Notify Service</td>
<td>Creates a new notify service</td>
<td></td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------</td>
<td>-------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Notify Service</td>
<td>Deletes a notify service resource from Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Look Up Notify Services</td>
<td>Retrieves the notify service resources in a Twilio account.</td>
</tr>
<tr>
<td>Short Code Management</td>
<td>Get Short Code</td>
<td>Retrieves a short code resource.</td>
</tr>
<tr>
<td></td>
<td>Look Up Short Codes</td>
<td>Retrieves the short code resources of a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Reset Short Code</td>
<td>Resets the short code resource.</td>
</tr>
<tr>
<td></td>
<td>Update Short Code</td>
<td>Updates properties of a short code resource in a Twilio account.</td>
</tr>
<tr>
<td>Text Messaging</td>
<td>Send Bulk SMS</td>
<td>Sends an SMS to multiple phone numbers.</td>
</tr>
<tr>
<td></td>
<td>Send SMS</td>
<td>Sends an SMS to a phone number.</td>
</tr>
</tbody>
</table>

**Note:** To receive information about Status Callbacks, you must configure webhooks in Twilio. See Twilio documentation for instructions on creating and configuring webhooks.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**Note:** Three connection and credential alias records are needed for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each alias should be associated with the respective Twilio API.

**Set up Twilio spoke**

Integrate the ServiceNow instance and Twilio using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Twilio spoke
- Role required: admin

**Create Credential records for the Twilio spoke**

Create Credential records to the Twilio server. The Twilio spoke connection and credential alias uses these credentials to authorize actions.

Create three credential records for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each credential should be associated with the respective Twilio API.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Twilio Base, Twilio Notify, or Twilio Messaging.</td>
</tr>
<tr>
<td>User name</td>
<td>Twilio Account SID.</td>
</tr>
<tr>
<td>Password</td>
<td>Twilio AuthToken.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

The three required credential records are created for Twilio Base, Twilio Notify, and Twilio Messaging.

Create Connection records for the Twilio spoke
Create Connection records to your Twilio account. The Twilio spoke connection and credential alias uses these connections to perform actions on Twilio.

Create three connection records for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each connection record should be associated with the respective Twilio API.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open record of the Twilio spoke.
3. From the Connections tab, click New.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Twilio Base Connection, Twilio Notify Connection, or Twilio Messaging Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Twilio. For example, select Twilio Base for Twilio Base Connection.</td>
</tr>
</tbody>
</table>
| Connection URL | Connection URL.  
   • If the connection record is for Twilio Base, enter https://api.twilio.com/.  
   • If the connection record is for Twilio Notify, enter https://notify.twilio.com/.  
   • If the connection record is for Twilio Messaging, enter https://messaging.twilio.com/. |

5. In the Attributes related list:
   • For the connection record of Twilio Base, enter Account SID.
- Enter **Page size**.
- Don’t modify the default value of the **Version**.

6. Click **Submit**.

The three connection records are created. The ServiceNow instance and Twilio are integrated.

**Twitter spoke**

Use the Twitter spoke to automatically tweet messages or media in your Twitter account from your ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see **Request IntegrationHub**.

**Supported versions**

API version v1.1.

**Spoke requirements**

- Twitter developer account
- Twitter developer app to access the Twitter APIs
- Access token and secret of your Twitter developer app
- Consumer key and secret from your Twitter developer app

See the **Twitter Developers** documentation for instructions on creating the developer application and gathering the required details.

**Spoke actions**

The Twitter spoke provides actions to automate tweeting when events occur in ServiceNow. Available actions include:
## Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Note:** Two connection and credential alias records are needed for the Twitter spoke; one for tweeting messages and other for tweeting media. Each alias should be associated with the respective Twitter API.

## Create Credential records for the Twitter spoke

Authorize the Twitter spoke actions by creating credential records for the application registered in the Twitter developer account. The Twitter spoke connection and credential alias uses these credentials to authorize actions.

You must create two credential records; one for tweeting messages and other for tweeting media.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   - The system displays the message “What type of Credentials would you like to create?”
3. Select **Twitter Credentials**.
4. On the form, fill in the fields.

### Twitter Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, TwitterCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Consumer Key</td>
<td>Consumer key of your Twitter developer app.</td>
</tr>
<tr>
<td>Consumer Secret</td>
<td>Consumer secret of your Twitter developer app.</td>
</tr>
<tr>
<td>Access Token</td>
<td>Access token of your Twitter developer app.</td>
</tr>
<tr>
<td>Access Token Secret</td>
<td>Access token secret of your Twitter developer app.</td>
</tr>
</tbody>
</table>
Create Connection records for the Twitter spoke

Perform actions in Twitter by creating connection records for your Twitter account. The Twitter spoke connection and credential alias uses these connections to perform actions.

Two connection and credential alias records are available by default: one for tweeting messages and other for tweeting media. Perform these steps to associate each alias with the respective Twitter API.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the required Twitter spoke record.

   **Note:** There are two connection and credential records: **Twitter** and **Twitter_Media**. The **Twitter** record is for tweeting messages and **Twitter_Media** is for tweeting media.

3. In the Connections related list of the required record, click **New**.
4. On the form, fill in the fields.

HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>Twitter Base</strong> or <strong>Twitter_Media</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Twitter spoke. For example, <strong>Twitter</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><img src="image" alt="Note: Do not select the check box." /></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL.</td>
</tr>
<tr>
<td></td>
<td>· If the connection record is for tweeting messages, enter <a href="https://api.twitter.com">https://api.twitter.com</a>.</td>
</tr>
<tr>
<td></td>
<td>· If the connection record is for tweeting media, enter <a href="https://upload.twitter.com">https://upload.twitter.com</a>.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click **Update**.

The Twitter spoke is set up and integrated with the ServiceNow instance.

**Unified Compliance Framework (UCF) spoke**

Manage processes to collect and coordinate the compliance requirements applicable to your organization from your ServiceNow instance.

**Request apps on the Store**

Visit the *ServiceNow Store* website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the *ServiceNow Store version history release notes*.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see *Request IntegrationHub*.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
Supported version

This spoke was built for UCF v2.0, but may be compatible with later versions.

Spoke requirements

- Common Control Hub (CCH) account
- CCH administrator credentials

Spoke actions

The UCF spoke provides actions to automate UCF tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Record Management</td>
<td>Get Authority Documents</td>
<td>Retrieves authority documents that are downloaded from the UCF Common Controls Hub.</td>
</tr>
<tr>
<td></td>
<td>Get Citation Control Objective Mapping</td>
<td>Retrieves the Citation and Control objective mapping information.</td>
</tr>
<tr>
<td></td>
<td>Get Citation Documents</td>
<td>Retrieves the citations that are downloaded from the UCF Common Controls Hub.</td>
</tr>
<tr>
<td></td>
<td>Get Control Objective Documents</td>
<td>Retrieves the citation to controls that are downloaded from the UCF Common Controls Hub.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Authority Document List</td>
<td>Retrieves the current user’s authority document lists.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the UCF spoke

Integrate the ServiceNow instance and UCF by creating a custom OAuth application in UCF to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the UCF spoke
- Role required: admin
Create application in UCF
Create application in Common Controls Hub (CCH) to enable OAuth 2.0 authentication with the UCF spoke.

Role required: CCH administrator

1. Create application in UCF. For information about creating an application using your CCH account, see the CCH Support documentation.
2. While creating the application, ensure that you provide this information:
   - **Redirect URL**: ServiceNow instance URL in the format, https://<Instance-Name>.service-now.com/oauth_redirect.do
   - **Authorization URL**: Location on your website to which CCH redirects the interested users.
3. Copy and record the **Client ID** and **Client Secret** for later use.

The application is created in CCH to enable OAuth 2.0 authentication with the UCF spoke.

Register UCF as OAuth provider
Use the information generated during the application configuration in CCH, to register UCF as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Open for the record for UCF.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter <strong>UCF OAuth profile</strong>.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the application configuration in CCH.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the application configuration in CCH.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

**Note**: You can use only **Authorization Code** as the Default Grant type when PKCE is enabled.

| Application          | Application scope that contains this record. Select **UCF Spoke**.               |

**Note**: You must ensure that the application scope is **UCF Spoke**.
### Field | Value required
--- | ---
Accessible from | Application scope that this registry is accessible from.
Active | Option to actively use the application registry.
Authorization URL | OAuth authorization code endpoint. For example, https://auth.unifiedcompliance.com/authorize.
Token URL | OAuth server token endpoint. For example, https://auth.unifiedcompliance.com/token.
Token Revocation URL | OAuth server token revocation endpoint.
Redirect URL | OAuth callback endpoint. System generates the URL upon saving the application registry. This is the URL of the ServiceNow instance in this format: https://<Instance-Name>/service-now.com/oauth_redirect.do
Use mutual authentication | Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.

4. Right-click the form header, and click **Save**. The system validates the OAuth credentials and populates the **Redirect URL**.

5. Insert a row in the **OAuth Entity Profiles** tab and provide these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>UCF OAuth</td>
</tr>
<tr>
<td>Is default</td>
<td>true</td>
</tr>
<tr>
<td>Grant type</td>
<td>Authorization Code</td>
</tr>
</tbody>
</table>

**Note:** This is name to identify the record. You can provide any other name as per your requirement.

6. Insert a row in the **OAuth Entity Scopes** tab and provide these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>read</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>read</td>
</tr>
<tr>
<td>Application</td>
<td>UCF Spoke</td>
</tr>
<tr>
<td>In default profile</td>
<td>true</td>
</tr>
</tbody>
</table>

7. Right-click the form header, and click **Save**.
8. Open the record in the **OAuth Entity Scopes** tab. For example, open the **UCF OAuth** record. Details of the OAuth Entity Profile record is displayed.
9. In the **OAuth Entity Scopes** tab, select the OAuth Entity Scope you had earlier created. For example, select **read**.

10. Right-click the form header, and click **Save**.

The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

---

**Create Credential records for the UCF spoke**

Authorize the UCF spoke actions by creating credential records for the application registered in UCF. The UCF spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.

2. Click **New**.
   - The system displays the message **What type of Credentials would you like to create?**.

3. Select **OAuth 2.0 Credentials**.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>UCF Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of UCF spoke as an OAuth provider. For example, select <strong>UCF OAuth profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select <strong>All MID Servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Save**.

6. To generate the OAuth token, click the **Get OAuth Token** related link.

The credential record for the UCF spoke is created.

---

**Create Connection record for the UCF spoke**

Create Connection records to your UCF account. The UCF spoke connection and credential alias uses these connections to perform actions in UCF.

Role required: admin

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.

2. Open for the record for **UCF**.

3. From the **Connections** tab, click **New**.
   - The system displays a blank HTTP(s) Connection form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter <strong>UCF Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for UCF. For example, select <strong>UCF Credentials</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://api.unifiedcompliance.com/">https://api.unifiedcompliance.com/</a>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

The connection record is created for UCF spoke.

**UiPath spoke**

Automate business processes in UiPath from your ServiceNow® instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported version**

This spoke was built for these UiPath versions, but may be compatible with later versions.

- Platform version 2019.4.3
- Cloud Platform version 2020.1.219

**Note:** This version of the UiPath spoke doesn’t support the on-premise UiPath solution.

**Spoke requirements**

Ensure that you have UiPath account information before you Set up the UiPath spoke.

- If you are using the UiPath Cloud Platform:
  - Token URL
  - Client Id
  - Account Logical Name
  - Tenant Logical Name
  - User Key
- If you are using the UiPath Platform installed on private or public cloud:
  - Tenant Name
  - Credentials to authenticate the UiPath Orchestrator API

See the UiPath documentation for more information about obtaining the required details.
Spoke actions

The UiPath spoke provides actions to manage environments, jobs, machines, processes, robots, and so on, when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environment Management</td>
<td>Get Environment By ID</td>
<td>Retrieves the details of the required environment.</td>
</tr>
<tr>
<td></td>
<td>Lookup Environments</td>
<td>Retrieves the details of the required environments. The environments are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Job Management</td>
<td>Get Job By ID</td>
<td>Retrieves the details of the required job.</td>
</tr>
<tr>
<td></td>
<td>Lookup Jobs</td>
<td>Retrieves the details of the required jobs. The jobs are retrieved based on the filter query.</td>
</tr>
<tr>
<td></td>
<td>Start Jobs</td>
<td>Starts the jobs to execute the required process.</td>
</tr>
<tr>
<td>Machine Management</td>
<td>Get Machine By ID</td>
<td>Retrieves the details of the required machine.</td>
</tr>
<tr>
<td></td>
<td>Lookup Machines</td>
<td>Retrieves the details of the required machines. The machines are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Process Management</td>
<td>Lookup Processes</td>
<td>Retrieves the details of the required processes. The processes are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Queue Management</td>
<td>Lookup Queues</td>
<td>Retrieves the details of the required queue definition records. The queues are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Release Management</td>
<td>Get Release By ID</td>
<td>Retrieves the details of the required release.</td>
</tr>
<tr>
<td></td>
<td>Lookup Releases</td>
<td>Retrieves the details of the required releases. The releases are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Robot Management</td>
<td>Create Robot</td>
<td>Creates a robot in UiPath.</td>
</tr>
<tr>
<td></td>
<td>Delete Robot</td>
<td>Deletes a robot in UiPath.</td>
</tr>
<tr>
<td></td>
<td>Get Robot By ID</td>
<td>Retrieves the details of the required robot.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Lookup Robots</td>
<td>Retrieves the details of the required robots. The robots are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Session Management</td>
<td>Lookup Sessions</td>
<td>Retrieves the details of the required sessions. The sessions are retrieved based on the filter query.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

### Set up the UiPath spoke

Integrate the ServiceNow instance with your UiPath account using to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the UiPath spoke
- Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for UiPath.
3. Select Configuration Template as per your requirement.
4. Click the Create New Connection & Credential related link.
5. On the form, fill these fields.
   - If you have selected UiPath Configuration Template - UiPath Cloud for Configuration Template, fill these fields.

### Create Connection and Credential form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name to identify the connection record. For example, UiPath Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL in this format: <a href="https://platform.uipath.com/">https://platform.uipath.com/</a>&lt;account-logical-name&gt;/&lt;instance-logical-name&gt;</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name to identify the credential record. For example, UiPath Credential.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Location of the token endpoint that the instance uses to retrieve and refresh tokens. For example, <a href="https://account.uipath.com/oauth/token">https://account.uipath.com/oauth/token</a>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client Id</td>
<td>Client ID specific to the UiPath Orchestrator application.</td>
</tr>
<tr>
<td>Account Logical Name</td>
<td>Unique URL of the UiPath site.</td>
</tr>
<tr>
<td>Tenant Logical Name</td>
<td>Logical name of the service.</td>
</tr>
<tr>
<td>User Key</td>
<td>Unique login key you had generated.</td>
</tr>
</tbody>
</table>

- If you have selected **UiPath Configuration Template - Private/Public Cloud** for **Configuration Template**, fill these fields.

### Create Connection and Credential form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name to identify the connection record. For example, <em>UiPath Connection</em>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>UiPath instance URL.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name to identify the credential record. For example, <em>UiPath Credential</em>.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Location of the token endpoint that the instance uses to retrieve and refresh tokens in this format: http://&lt;instance-URL&gt;/api/account/authenticate</td>
</tr>
<tr>
<td>Tenant Name</td>
<td>Tenant logical name.</td>
</tr>
<tr>
<td>Username or email</td>
<td>Username or email address to authenticate the UiPath Orchestrator API.</td>
</tr>
<tr>
<td>Password</td>
<td>Associated password.</td>
</tr>
</tbody>
</table>

6.  Click **Create**.
7.  Click **Submit**.

The Connection and Credential alias is configured and the UiPath spoke is set up.

### Workplace by Facebook spoke

Manage users, groups, and notifications in Facebook Workplace.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

### IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.
Spoke flows

The Workplace by Facebook spoke provides sample flows in the draft state to demonstrate automating user and group management tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P1 Incident</td>
<td>When a P1 incident is created in ServiceNow, creates a Facebook Workplace group that includes the ServiceNow assignment group members.</td>
</tr>
</tbody>
</table>

Spoke actions

The Workplace by Facebook spoke provides actions to manage users, groups, and notifications. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds a user to a group in Facebook Workplace.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Facebook Workplace.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group ID</td>
<td>Retrieves the group ID for a given group name in Facebook Workplace.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes a user from a group in Facebook Workplace.</td>
</tr>
<tr>
<td>Notification Management</td>
<td>Post a Message</td>
<td>Posts a message to a Facebook Workplace group.</td>
</tr>
<tr>
<td></td>
<td>Post Change Details</td>
<td>Posts change request details in a Facebook Workplace group.</td>
</tr>
<tr>
<td></td>
<td>Post Incident Details</td>
<td>Posts incident details in a Facebook Workplace group.</td>
</tr>
<tr>
<td></td>
<td>Post Problem Details</td>
<td>Posts problem details in a Facebook Workplace group.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user in Facebook Workplace.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates a user in Facebook workplace.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes a user in Facebook Workplace.</td>
</tr>
<tr>
<td></td>
<td>Lookup User ID</td>
<td>Retrieves the user ID from a registered email in Facebook Workplace.</td>
</tr>
</tbody>
</table>
Workplace by Facebook spoke requirements

The Workplace by Facebook spoke requires creating a Facebook Workplace application and generating an access token for API key authentication.

Credential and connection alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses these Connection & Credential Alias records to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Facebook_Workplace</td>
<td>Connection to Facebook Workplace.</td>
<td>• Connection type: HTTP</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Connection URL: <a href="https://work.facebook.com">https://work.facebook.com</a></td>
</tr>
<tr>
<td>Facebook_Workplace_Account</td>
<td>Connection to Facebook Workplace user management.</td>
<td>• Connection type: HTTP</td>
</tr>
<tr>
<td></td>
<td></td>

</tr>
</tbody>
</table>

Set up Workplace by Facebook spoke

Integrate the ServiceNow instance and your Workplace by Facebook using an API key to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Workplace by Facebook spoke
- Role required: admin

Configure Facebook Workplace

Create a custom application from your Facebook account to generate an access token for API key authentication.

Facebook requirements:

- Facebook Workplace account
- Facebook Workplace administrator credentials

Complete these steps from your Facebook account. See the Facebook for developers documentation for instructions on creating and configuring custom applications.

1. From your Facebook account, create a custom third-party application.
2. Generate an access token to interact with Facebook APIs.
3. Record the access token to create Credential records on your ServiceNow instance.
Create Credential records for the Workplace by Facebook spoke
Create Credential records to the Facebook Workplace application you created. The Facebook Workplace spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
The system displays the message **What type of Credentials would you like to create?**.
3. Select **API Key Credentials**.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Facebook Workplace Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter Bearer followed by the access token you obtained from Facebook Workplace. For example, Bearer {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
6. Click **New**.
The system displays the message **What type of Credentials would you like to create?**.
7. Select **API Key Credentials**.
   A blank API Key Credentials form displays.
8. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Facebook Workplace Account Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter Bearer followed by the access token you obtained from Facebook Workplace. For example, Bearer {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

Create Connection records for the Workplace by Facebook spoke
Create Connection records to your Facebook Workplace account. The Facebook Workplace spoke connection and credential aliases use these connections to perform actions in Facebook Workplace.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for Facebook_Workplace.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Facebook Workplace Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Facebook Workplace. For example, select Facebook Workplace Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://work.facebook.com/">https://work.facebook.com/</a>.</td>
</tr>
</tbody>
</table>

5. Click Submit.
6. Open for the record for Facebook_Workplace.Account.
7. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
8. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Facebook Workplace Account Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Facebook Workplace user management. For example, select Facebook Workplace Account Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://work.facebook.com/">https://work.facebook.com/</a>.</td>
</tr>
</tbody>
</table>

9. Click Submit.

**Zoom spoke**

The Zoom spoke helps you create and manage meetings. Add participants, retrieve details, end or delete a meeting. Use the spoke to fetch the participant details of a conference.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.
Supported versions

Zoom API version v2.0.

Spoke flows

This spoke has no sample flows.

Spoke subflows

This spoke has no sample subflows.

Spoke actions

The Zoom spoke provides actions to automate Zoom tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Meeting Management</td>
<td>Create Meeting</td>
<td>Create a meeting for a user using their Zoom user ID or the email address.</td>
</tr>
<tr>
<td></td>
<td>Delete Meeting</td>
<td>Delete a specific meeting by using its meeting ID.</td>
</tr>
<tr>
<td></td>
<td>Get Meeting Details</td>
<td>Get details of a specific meeting by its meeting ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Live Meetings by User</td>
<td>Lists all the live or ongoing meetings for a specific user.</td>
</tr>
<tr>
<td></td>
<td>(Data Stream)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Add Meeting Registrant</td>
<td>Register a participant for a specific meeting.</td>
</tr>
<tr>
<td></td>
<td>End Meeting</td>
<td>Ends an ongoing meeting.</td>
</tr>
<tr>
<td>User Management</td>
<td>Look Up Users (Data Stream)</td>
<td>Lists all the users on your Zoom account.</td>
</tr>
<tr>
<td></td>
<td>Get User Details</td>
<td>Get details of a specific user on your account with their user ID.</td>
</tr>
</tbody>
</table>

Zoom account requirements

The Zoom spoke requires configuring your Zoom account to generate an OAuth 2.0 token.

Zoom spoke requirements

These actions use REST calls, which can run on an instance or Zoom spoke. Use the connection record associated with the Zoom alias to configure where actions run as well as set Zoom spoke selection attributes.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Zoom Connection & Credential Alias record to authorize actions.

Setup Zoom spoke

Integrate your Zoom account with your ServiceNow instance. Create a custom OAuth application in Zoom and authenticate requests from ServiceNow.

Role required: admin

- Request IntegrationHub subscription
- Activate Zoom spoke

Create a connected app in Zoom

Create a connected app in your Zoom account to enable OAuth 2.0 authentication with the Zoom spoke

1. Zoom account
2. Role required: Zoom admin

Complete the following steps from your Zoom account to enable OAuth 2.0 authentication with the Zoom spoke.

1. Login to Zoom marketplace
2. Navigate to Develop > Build App
3. Choose OAuth card from the available cards.
4. Use the toggle button to disable the option: Would you like to publish this app on Zoom App Marketplace?
5. Click Create.
6. Name the app and choose the app type as Account-level app. Account level apps must be installed by admin and can manage all users in the account.
7. Optionally, in the subsequent screens, enter the details as appropriate. For example, basic information, description and so on.
8. In the Add Scopes screen, add the actions in the scope as in the screenshot.
Add scopes

- **Meeting**
  - Webinar
  - Recording
  - User
  - Account
  - Billing
  - Contacts
  - Dashboard
  - Group
  - Devices (H323)

- View and manage sub account's user meetings
  - meeting:master

- View all user meetings
  - meeting:read.admin

- View and manage all user meetings
  - meeting:write.admin
Note: The next step is to register Zoom as an OAuth provider. However, ServiceNow ships Zoom as a registered OAuth provider in the Application Registry.

Record the **Client ID** and the **Client Secret** from the App credentials screen to use them for the application registry.

*Register Zoom as OAuth provider*

Use the information generated during Zoom account configuration to register Zoom spoke as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Click **Zoom**.
3. On the form, fill in the fields.

**Application Registries form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. This is set to 473,040,000 seconds.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. Specify the profile for the mutual authentication.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

The instance can request OAuth 2.0 tokens for the spoke.  
*Create credential records for the Zoom spoke*

Create Credential records for the Zoom connected app you created. The Zoom spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin, Zoom admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.  
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.  
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. Enter Zoom Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile you created when you registered the Zoom connected app as an OAuth provider. Select <strong>Zoom default_profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. Select <strong>All MID Servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. Enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. Click the **Get OAuth Token** related link to generate the OAuth token.

*Create connection records for the Zoom spoke*  
Create Connection records to your Zoom account. The Zoom spoke connection and credential alias uses these connections to perform actions in Zoom.
Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Zoom.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. Enter Zoom Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Zoom. Select Zoom Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to your Zoom instance. Enter <a href="https://api.zoom.us">https://api.zoom.us</a></td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Option to use a MID Server. Define the fields in the Advanced MID Server Configuration related list if you select this option.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.

Data Stream actions and pagination

Send REST or SOAP requests from Flow Designer to APIs that return a stream of response data larger than 10 MB, or that return paginated results. Parse stream data into a series of complex object outputs and use the data pills in other actions in a flow.

For example, create a Data Stream action to import a large quantity of employee data from a third-party HR site. The Data Stream action sends a REST request to the third-party site and processes the response to populate records in the User [sys_user] table.

Benefits

Data Stream actions offer these benefits.
- Parse and format a stream of response data larger than 10 MB.
- Automatically send multiple requests to APIs that paginate results.
- Enable flow designers to process large requests without complex coding or configuration.
- Enable flow designers to process each object within a data stream using For each flow logic. For example, you might create a Data Stream action that imports document data from a third-party site. When you add the action to a flow, Flow Designer automatically adds the action to a For each flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream. See Use a Data Stream action in a flow.
- Enable flow designers to reuse Data Stream actions in multiple flows, using the same source of data in multiple ways.
Running a Data Stream action

There are two ways to run a Data Stream action.

From a flow
You can process each object within a data stream using For each flow logic. For example, you might create a Data Stream action that imports document data from a third-party site. When you add the action to a flow, Flow Designer automatically adds the action to a For each flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream. See Use a Data Stream action in a flow.

From a script
You can start a Data Stream using the executeDataStreamAction() method in the FlowAPI class. For more information, see FlowAPI.

Action outline
Data Stream actions follow a set structure. Follow prompts to add and remove steps from the action outline. You cannot manually add steps to a Data Stream action.
ServiceNow Orlando Now Platform capabilities

Action Preprocessing

Use the Action Preprocessing category to run a preprocessing script before the action sends the initial API request. For example, validate action inputs or set default values. Preprocessing executes once per action, before the first API request.

Selecting this option adds a script step to the Data Stream action. For more information, see Script step.

This is an optional Data Stream action component that runs on either the instance or a MID Server.

Request

Use the Request category to configure how the action sends API requests. The Request section executes once per page of results. Request components provide these configuration options.

Pagination Setup step

Request results in batches. Once one page of data is processed, the Data Stream action runs the request section again to return the next set of results. Use the pagination setup step to set up pagination options required by the API. Configure the Pagination Setup step manually, or select a pre-built template to apply common configurations. For example, apply the Limit / Offset template to specify the number of items you want returned per page (limit), and the starting number for the first item (offset). After applying a template, update the values to ensure that the configuration complies with the API's requirements.

Note: For licensing purposes, each request counts as one transaction, including each request for the next page of results.

The value of the reserved, read-only getNextPage variable determines whether to request another page of results. As long as the getNextPage variable is true and the previous page contains data, the action continues to send requests for the next page.

Note: You must explicitly set the value to true in the script or it will default to false.

This is an optional Request component that only runs on the instance.

Script step

Run a script before every request for the next page of results. Use this script for data validation and transformation when calling a paginated API. For example, generate a JSON payload for the next page request. Selecting this option adds a script step to the Data Stream action. For more information, see Script step.

This is an optional Request component that runs on either the instance or a MID Server.

REST or SOAP step

Send a REST or SOAP request to a third-party API. Select a data format to add an associated step to the Data Stream action. For more information, see REST step and SOAP step.

This is a mandatory Request component that runs on either the instance or a MID Server.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Parsing

Use the Parsing category to configure how the action separates data stream elements into complex data objects. Use the Splitter step to identify and separate items from an XML or JSON stream, and use the Script Parser step to transform each item into a complex object. The Parsing section executes once per item in the stream.
For more information about complex data, see Complex data. Parsing components provide these configuration options.

### Splitter step

Identify the parent node in the response stream to map to a complex object. For example, identify a user element in an XML payload to create a complex object for each user in the response stream.

Select a splitter type to identify and separate repeated items in an XML or JSON data stream.

- **JSON**: Identifies objects in a stream of JSON data.
- **XML**: Identifies objects in an XML document.

This is a mandatory Parsing component that only runs on the instance.

### Script Parser step

Use JavaScript and ServiceNow APIs to map items in the response stream to a complex object output represented by the `targetObject` global object. For example, map incident record elements identified in the splitter step to a complex object containing incident fields. If the data stream includes siblings to the item identified in the splitter step that you do not want mapped to a complex object, include conditions to exclude those items.

This is a mandatory Parsing component that only runs on the instance.

### Data Stream outputs

When designing a Data Stream action, you must create a single output of type Object. The Script Parser step maps items in the stream to this object using the `targetObject` global object.

At runtime, the system splits and parses the stream of response data according to the Data Stream configuration. Each item in the stream maps to the complex object structure defined by the Script Parser step and the object output, resulting in a large series of complex objects. For more information about complex data, see Complex data.

### Execution details

View the configuration and runtime results for each item processed by a Data Stream action. Select a record number to see its configuration and runtime details. By default, the execution details include requests for the last 1000 items. To change the number of items in the execution details, update the `com.snc.process_flow.reporting.datastream.item.lastn` system property.
View an overview of the execution that includes this information.

- **Page count**: Number of pages returned by a paginated API.
- **Total item count**: Number of items in the response stream mapped to complex object outputs.
- **Error count**: Number of errors encountered.

**Page details**

View runtime data for each step within the Data Stream action. Select a page to view runtime details for each request to a paginated API. By default, the execution details include requests for the last five pages. To change the number of requests in the execution details, update the `com.snc.process_flow.page.reporting.lastn` system property. Set the value to 0 to remove pages from the execution details and -1 to include all pages.

|i| Noteworthy: Including all pages can affect performance and is not recommended. |
### Page Details

**Step 1 - Pagination Setup**

**TYPE** | **CONFIGURATION** | **RUNTIME VALUE**
--- | --- | ---
Pagination Config | String | (["name":"getPageIndex","initial_value":false,"value_from":script,"extract_using":extract_exp...](function | pageitone) | variables | pageResponse) | var limit = parseInt(variables.limit); | ...

Data Stream action design considerations

Follow these considerations when creating a Data Stream action and when adding a Data Stream action to a flow to prevent errors and performance issues.

Considerations when creating a Data Stream action

Create Data Stream actions with these considerations in mind.

Write pagination logic according to third-party requirements

Evaluate and understand the format required by your third-party endpoint. For example, you may need to write a script that sets the built-in `getNextPage` variable to true as long as there is a `nextPage` token in the response. If the response does not contain the token, then set the variable to false. Access variables in script using bracket or dot notation. For example, `variables['getNextPage']`. This variable only accepts the Boolean data type. The default value is false.

Convert pagination variable data types to perform math operations

Pagination variables only support the string data type. To perform math operations, you must convert the value to an integer, perform any required operations, then convert it back to a string.

```javascript
variables['offset'] = (parseInt(variables['offset']) + parseInt(variables['limit'])).toString();
```

Ensure that the pagination script has an end condition

Avoid infinite loops in pagination requests by creating a condition that sets the `getNextPage` variable to false. Cancel any long-running flows. Always test Data Stream actions before using them in production.

Clear configuration page options carefully

Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

Consider the size of each page returned

When configuring pagination options, try to ensure that the size of each page returned is under one GB. This ensures that flow designers who use the action won't encounter size limit issues when retrieving data from a MID Server. If the action returns more than one GB of data per page, the flow designer may need to increase the attachment size limit. For more information, see MID Server support for Data Stream actions.

Note: Nesting Data Stream actions is not supported.

Considerations when adding a Data Stream action to a flow

Add a Data Stream action to a flow with these considerations in mind.

Do not add actions with wait conditions to a Data Stream For Each logic block

You cannot add an action that pauses the flow to a Data Stream For Each flow logic block. Data Stream actions require a constant connection to the response stream. For example, you
cannot use the Ask for Approval or Wait for Condition actions within Data Stream For Each flow logic.

Some actions and steps always pause a flow and cannot be added to Data Stream For Each flow logic blocks. However, some actions and steps may pause the flow depending on how they are configured. Check the action configuration to ensure it does not pause the flow at runtime.

<table>
<thead>
<tr>
<th>Always pauses the flow (unsupported with Data Stream actions)</th>
<th>Ask for Approval action</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Ask for Approval step</td>
</tr>
<tr>
<td></td>
<td>Wait for Condition action</td>
</tr>
<tr>
<td></td>
<td>Wait for Condition step</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>May pause the flow depending on configuration</th>
<th>Create Catalog Task action</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Create Task action</td>
</tr>
<tr>
<td></td>
<td>Create Task step</td>
</tr>
</tbody>
</table>

---

**Do not add actions that run on the MID Server to a Data Stream For Each logic block**

Some actions and steps always run on a MID Server and cannot be added to Data Stream For Each flow logic blocks. However, some actions and steps may run on a MID Server depending on how they are configured. Check the action configuration to ensure it does not run on the MID Server at runtime.

<table>
<thead>
<tr>
<th>Always runs on a MID Server (unsupported with Data Stream actions)</th>
<th>JDBC step</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PowerShell step</td>
</tr>
<tr>
<td></td>
<td>SSH step</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>May run on a MID Server depending on configuration</th>
<th>REST step</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Script step</td>
</tr>
<tr>
<td></td>
<td>SOAP step</td>
</tr>
</tbody>
</table>

---

**Turn off reporting when consuming a large number of records in the For Each logic block**

Iterating over a large number of records can be resource intensive, especially when the For Each logic block includes complex actions for each iteration. To avoid performance issues, turn off reporting using the `com.snc.process_flow.reporting.level` system property. For more information, see Flow Designer system properties.

---

**MID Server support for Data Stream actions**

Get data through a ServiceNow® MID Server when running a Data Stream action.

When selected, the MID Server retrieves the data and sends each page to the instance as an attachment to process.

> **Important:** When running the Data Stream action within flow, the actions in the For Each block always run on the instance.

These steps can run on either the MID Server or the instance:

- Action Preprocessing Script
- Request Script step
- REST or SOAP step

**Note:** Avoid shifting the execution environment between the instance and the MID Server multiple times. For example, you might configure the Request Script step to run on the MID Server, but the REST step to run on the instance. In this case, the system shifts environments between the instance and MID Server for every page of data, which may degrade performance.

To learn more about running a step on a MID Server, see *Integration steps*.

**Size limits**

If your system encounters a timeout or size limit issue, try making one of these adjustments:

**Increase the REST transaction quota rule**

If the connection between the instance and the MID Server slows down, you may encounter a timeout while waiting for a response from the REST step. Increase the default timeout by updating the REST Attachment API request timeout transaction quota rule.

- Default: 60 seconds
- Maximum: 300 seconds

**Increase the instance timeout**

By default, the instance waits for 600 seconds to retrieve a single page of data from a MID Server. If you encounter a timeout when running a Data Stream action through a MID Server, change this default by increasing the datastream_alternative_env_fetch_page_timeout system property.

- Default: 600 seconds
- Maximum: 7200 seconds

**Increase attachment size**

The MID Server sends each page of data to the instance as an attachment. If a page of data is large, it may exceed the allowed attachment size. Increase the allowed size by updating the com.glide.attachment.max_size system property.

- Default: 1024 MB
- Maximum: None

**Create a Data Stream action**

Create a reusable action to process a stream of response data within a flow.

- Setting up an application in Guided Application Creator to store Flow Designer content.
- Disable any conflicting business rules or workflows before creating an action.
- Role required: action_designer or admin

Creating a custom application to contain your Flow Designer content enables you to deploy it using the application repository or the ServiceNow Store.
Note: Clearing an option in a configuration page removes the step from the Data Stream outline and deletes all data associated with the step.

1. Navigate to Flow Designer > Designer.
2. Click the Actions tab and select Data Stream.
3. Fill in the Action Properties and click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of action.</td>
</tr>
<tr>
<td>Accessible From</td>
<td>Accessible from all application scoped or only within the specified application scope.</td>
</tr>
<tr>
<td>Category</td>
<td>Defined category within the application scope for an action.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the action.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the action is read-only. You can only select a value when you create the action in an application scope you own. The default value is None.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the action.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the action title in Flow Designer to help flow designers understand what the action does when used in a flow.</td>
</tr>
</tbody>
</table>

An empty Data Stream action opens.

4. Define action inputs to make data available to the action steps.
   a) Select + Create Input and complete the fields. For more information about action inputs, see Action Designer.
      Inputs are represented as data pills in the right-hand pane. You can add inputs to steps and outputs in the flow by dragging and dropping data pills.

5. Click Action Preprocessing in the Data Stream outline and configure the desired options.
   a) Select Enable preprocessing script to run a preprocessing script before the action sends the initial API request. For example, validate action inputs or set default values. Preprocessing executes once per action, before the first API request.
      Selecting this option adds a script step to the Data Stream action. For more information, see Script step.
      This section can run on either the MID Server or the instance. The environment is determined by the script step’s Required Runtime field.

6. Click Request in the Data Stream outline and configure the desired options.
   a) In the How will you get data field, select REST Step or SOAP step. Selecting an option adds the associated step to the Data Stream action. For more information, see REST step and SOAP step.
      This section can run on either the MID Server or the instance. The environment is determined by the Use MID server field in the associated Connection (sys_connection) record.
   b) Select Enable pagination to request results in batches. Once one page of data is processed, the Data Stream action runs the request section again to return the next set of results. This option adds a Pagination Setup step to the Data Stream outline.
   c) Select Run a script before each request to run a script before every request for the next page when calling a paginated API. For example, write a script to transform variable
data types from the initial response before sending a request for the next page. Selecting this option adds a script step to the Data Stream action. For more information, see Script step.

This section can run on either the MID Server or the instance. The environment is determined by the script step’s Required Runtime field.

**Caution:** Avoid shifting the execution environment between the instance and the MID Server multiple times. For example, you might configure the Request Script step to run on the MID Server, but the REST step to run on the instance. In this case, the system shifts environments between the instance and MID Server for every page of data, which may degrade performance.

7. Optional: If pagination is enabled, configure the Pagination Setup step.
   Configure the Pagination Setup step manually, or select a pre-built template to apply common configurations. For example, apply the Limit / Offset template to specify the number of items you want returned per page (limit), and the starting number for the first item (offset). After applying a template, update the values to ensure that the configuration complies with the API’s requirements.
   a) Create pagination variables. For example, if the third-party API takes a limit parameter in the request, create the limit variable and set the initial value to limit the number of results per page. The initial value is only used in the first request. getNextPage is a reserved, read-only variable. As long as the getNextPage variable is true and the previous page contains data, the action continues to send requests for the next page.
   b) In the Next Value From field, define how pagination variables receive a value for subsequent requests.
   Choose from:
   - **Script:** Write a Pagination Variables Script to define how variables are populated. Pagination variables only support the string data type. To perform math operations, you must convert the value to an integer, perform any required operations, then convert it back to a string.
   - **Response Body:** Use a value in the response from the previous request to populate the variable. If the response is JSON format, set Extract value using to JSONPath Expression and provide the path to the value in the Expression field. If the response is XML format, set Extract value using to XPath Expression and provide the path to the value.

In this example, the getNextPage variable is true until the nextOffset variable reaches the total count value returned in the API response header. As long as the getNextPage variable is true and the previous page contains data, the action continues to send requests for the next page. This example includes a common limit/offset pagination configuration. The third-party APIs that your Data Stream action interacts with may use a page token or other method.
### 1. Pagination Setup step

#### Pagination Variables

<table>
<thead>
<tr>
<th>Name</th>
<th>Initial Value</th>
<th>Next Value From</th>
</tr>
</thead>
<tbody>
<tr>
<td>getNextPage</td>
<td>false</td>
<td>Script</td>
</tr>
<tr>
<td>limit</td>
<td>100</td>
<td>Script</td>
</tr>
<tr>
<td>offset</td>
<td>0</td>
<td>Script</td>
</tr>
</tbody>
</table>

#### Pagination Variables Script

```javascript
function paginate(variables, pageResponse) {
  var limit = parseInt(variables.limit);
  var totalCount = parseInt(pageResponse.response_headers['X-Total-Count']);
  var currentOffset = parseInt(variables.offset);
  var nextOffset = currentOffset + limit;
  if (nextOffset < totalCount) {
    variables.getNextPage = true;
    variables.offset = nextOffset.toString();
  } else {
    variables.getNextPage = false;
  }
}
```
Important: Avoid infinite loops in pagination requests by creating a condition that sets the `getNextPage` variable to false. Cancel any long-running flows. Always test Data Stream actions before using them in production.

8. Click Parsing in the Data Stream outline and configure the desired options.
   a) In the How will you identify each record field, select JSON/XML Splitter. This adds a Splitter step to the Data Stream outline.
   b) In the How will you parse each item into an object field, select Script Parser. This adds a Script Parser step to the Data Stream outline.

9. Configure the Splitter step. This step identifies the parent node in the response stream to map to a complex object. For example, identify a user element in an XML payload to create a complex object for each user in the response stream.
   a) In the Source Format field, select the format returned by the Request section.
      - JSON: Identifies objects in a stream of JSON data.
   b) In the Item Path field, define the absolute path to the object. For example, use `$.result` in JSON or `/result` in XML to separate a result object.

   Note: The system ignores XML namespaces.

If the REST step returns the following JSON content, you would enter `$.response.result.companies` as the item path to process each company object.

```json
{
  "response": {
    "result": {
      "companies": [
        {
          "name": "company1"
        },
        {
          "name": "company2"
        },
        {
          "name": "company3"
        }
      ],
      "metadata": {
        "token": 1558666526
      }
    }
  }
}
```

If the REST step returns the following XML document, you would enter `/response/result/companies/company` as the item path to process each company object.

```xml
<response>
  <result>
    <companies>
      <company>
        <!-- company 1 info -->
      </company>
      <company>
```

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
10. In the Script Parser step, use JavaScript and ServiceNow APIs to map items in the response stream to a complex object output represented by the `targetObject` global object. For example, map incident record elements identified in the splitter step to a complex object containing incident fields. If the data stream includes siblings to the item identified in the splitter step that you do not want mapped to a complex object, include conditions to exclude those items.

An example script that parses a JSON response.

```javascript
(function parse(inputs, outputs) {
    var record = JSON.parse(inputs.sourceItem);
    outputs.targetObject.id = record.number;
    outputs.targetObject.name = record.short_description;
})(inputs, outputs)
```

An example script that parses an XML response.

```javascript
(function parse(inputs, outputs) {
    var xmlDoc = new XMLDocument(inputs.sourceItem, false);
    outputs.targetObject.id = xmlDoc.getNodeText("/result/number");
    outputs.targetObject.name = xmlDoc.getNodeText("/result/short_description");
})(inputs, outputs)
```

11. Create a complex object output.
   a) Select Outputs in the Action Outline and click + to create an output.
   b) Update the Label field to represent the object. For example, if the action parses a stream of company records, add the Company label.
   c) Update the Type field to Object. This is the complex object output represented by the `targetObject` global object in the Script Parser step.
   d) Add child fields to the complex object using the + icon.
   e) Make the name of each child field more user-friendly so that you can meaningfully refer to it in script. The value in the Name field is the internal name used in the Script Parser step. For example, to refer to the City output in the Script Parser step, you would use `outputs.targetObject.city`. 
Warning: After saving the Data Stream action, you cannot change values in the Name field.

12. Click **Save**.
   Action Designer saves a draft of the action.

**Test a Data Stream action**

Test your Data Stream action to ensure that it works the way you expect before you add it to a flow.

- **Create a Data Stream action**
- Role required: action_designer or admin

Testing a Data Stream action returns the first 20 items by default. To change this value, add the `com.glide.hub.action_type.datastream.test_max_iterations` system property with a value between one and 50.

1. Open the Data Stream action you want to test.
   a) Navigate to **Flow Designer > Designer**.
   b) Select the Actions tab.
   c) Select the row for the Data Stream action you want to test.

2. Select **Test**.
   The system displays the Test Action dialog. The contents of the Test Action dialog depend on the Data Stream action inputs.

3. In the Test Action dialog, provide values for any action inputs and select **Run Test**.

4. Open the Execution Details to ensure that the action executed as expected.
   The Execution Details **Runtime Value** returns the first 20 items returned by the Data Stream action.
Use a Data Stream action in a flow.

Use a Data Stream action in a flow

Data Stream actions use the For each flow logic option to process stream data in a flow. For example, suppose that you want to use a Data Stream action that imports document data from a third-party site. When added to a flow, the action appears as a For each flow logic block, enabling flow designers to easily create a record in ServiceNow for each object in the data stream.

Role required: flow_designer or admin

1. Open the flow you want to add the Data Stream action to.
2. Add the Data Stream action to the flow. The action appears as a For Each flow logic block.

3. Add a child action within the For Each flow logic block. This action runs on each object within the data stream.

**Note:** You cannot add an action that pauses the flow to a Data Stream For Each flow logic block. Data Stream actions require a constant connection to the response stream. For example, you cannot use the Ask for Approval or Wait for Condition actions within Data Stream For Each flow logic. For more information, see Data Stream action design considerations.

4. Click Save. Flow Designer saves a draft of the flow, trigger, and actions.

Test the flow until it is ready to be activated.
**Integration steps**

Enable custom actions to integrate with external systems by activating IntegrationHub, which adds integration steps to the Action Designer interface.

Integration steps can run on the instance or a MID Server. A MID Server is required to communicate with or move data between a ServiceNow instance and external applications, data sources, and services in your network.

**Note:** Only Flow Designer admin and Connection admin can execute flows using .

Steps that perform operations on record data run on the instance, while steps that integrate with systems in your network run on a MID Server. If a step requires a MID Server to run, the instance delegates flow processing to the appropriate MID Server by sending the process plan in a REST call. The MID Server executes the action or step in the process plan and returns results. View log messages and execution status from the instance or the MID Server.

**Available integration steps**

These integration steps are available from Action Designer.

<table>
<thead>
<tr>

Training

Complete a step-by-step training on using the REST step in the REST in IntegrationHub developer training.

Connection attributes

Define connection-specific variables that you can use in IntegrationHub integration steps. When using an integration step, you must establish a connection with an external system. Use a Connection & Credential alias instead of defining the connection inline. An alias enables you to update the connection details once without having to reconfigure every action. Any action step that uses an alias inherits the attributes associated with it. Flow Designer displays attributes as data pills that you can drag into your action step. For example, you can create a page size attribute that becomes a REST step query parameter. For more information about connection attributes, see Create connection attributes for IntegrationHub.

MID Server connection aliases

Action designers can set MID Server selection attributes using a connection record associated with an alias and associate the alias with an integration step. When the flow runs, the system uses the attributes to determine which MID Server runs the step. Learn more about connection and credential aliases.

MID Server selection

Flow designers should avoid shifting the execution environment between MID Servers when a flow runs. Either configure your MID Servers to perform operations on multiple endpoints, or provide multiple capabilities to the MID Servers in your network. You may need a user with the connection_admin role to update the connection records associated with an action, or a network administrator to update the MID Server network configuration. To learn more about how a MID Server is selected during runtime, see MID Server selection.

Design considerations

Design integration steps using the following guidelines.
- Avoid shifting the execution environment between the instance and the MID Server multiple times. Where possible, group similar action steps. For example, group core steps that perform record operations and integration steps that run on the MID Server.
- When creating a spoke that uses an integration step, include a Connection and Credential alias record with the appropriate connection type. Before anyone can use the spoke, a user with the connection_admin role must associate the alias record to a connection record that supports the connection type. If defining the connection inline, use inputs to enable the process analyst to define the connection information when adding the action to a flow.
- The MID Server does not have access to all the values in a GlideRecord object, it only has access to the sys_id reference. Inputs of type Reference do not work on a MID Server. Instead, create action inputs that contain the necessary GlideRecord values.

Roles

To create integration steps, a user must have the action_designer or admin roles. If running steps on a MID Server, the MID Server user must have the connection_admin and credential_admin roles to access the connection and credential information associated with the step.

JDBC step

Create a reusable action to send SQL commands to a relational database.

**Note:**

- The JDBC step is not available in the base system and requires the subscription to IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later. For more information about the ServiceNow® IntegrationHub subscription packages, see IntegrationHub usage and subscription. After the required plugin is activated, the step is visible under Integrations.
- The JDBC step runs only on a ServiceNow® MID Server with JDBC step capabilities. Activate the plugin, IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later to use the JDBC capability for the MID Server.

Roles and availability

The JDBC step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Sanitizing inputs

Escape all user inputs to eliminate the possibility of a malicious user from executing malicious SQL statements that can result in SQL injection on your target database. When you use data pills in JDBC step SQL statements, sanitize them first using Sanitize SQL transform functions. This transform function category automatically appears when a data pill is dropped into the SQL Statement input.
**Whitelisting SQL operations**

By default, you can run the following SQL operations.

- SELECT
- INSERT
- UPDATE
- DELETE
- SHOW
- DESCRIBE

To enable only some of these SQL operations that the JDBC step can perform, create a MID Server property, `mid.property.jdbc_operations` and enter the whitelisted SQL operations, separated by comma. To learn more about MID Server properties, see [MID Server properties](#).

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Details</td>
<td>Type of connection to use.</td>
</tr>
</tbody>
</table>
| Connection        | - **Define Connection Inline**: Define connection information within the action step.  
                     - **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. |

To learn more about connections and credentials, see [credentials, connections, and aliases](#).

<p>| Connection Alias  | Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see <a href="#">credentials, connections, and aliases</a>. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane. This field is available when <strong>Use Connection Alias</strong> is selected from the Connection list. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credential Alias</td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don’t need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane. This field is available when Define Connection Inline is selected from the Connection list.</td>
</tr>
</tbody>
</table>
| Database Type         | Database type for this connection. The choices are:  
  + MySQL  
  + Oracle  
  + SQLServer  
  + Custom  

The default choice is Custom. This field is available when Define Connection Inline is selected from the Connection list. |
| JDBC Driver           | Driver to use for this connection when it’s not a default database type such as DB2 Universal and Sybase. The database Type is Custom. This field is available when Define Connection Inline is selected from the Connection list and Custom is selected from the Database Type list. |
| Connection URL        | URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases. This field is available when Define Connection Inline is selected from the Connection list and Custom is selected from the Database Type list. |
| MID Application       | Application that the MID Server must support to be eligible for selection. This field is available when Define Connection Inline is selected from the Connection list. |
| Capabilities          | Capability of the MID Server. Select JDBC. This field is available when Define Connection Inline is selected from the Connection list. |
| Connection Timeout    | Maximum elapsed time, in seconds, for the activity to wait while attempting to connect to the target database. This field is available when Define Connection Inline is selected from the Connection list. |
| Query Timeout         | Maximum elapsed time, in seconds, that the query is allowed to run without a response. This field is available when Define Connection Inline is selected from the Connection list. |
| JDBC Configuration    |                                                                                                                                             |
| SQL Statement         | SQL statement that the step executes.                                                                                                                                                                     |
|                       |  
  **Note:** When you use data pills in step SQL statements, sanitize them first using a preprocessing Script step. For more information, see Sanitizing inputs using the escape functions. |
<p>| Maximum Rows          | Maximum number of rows to be returned from the SQL statement. The default value is 1000.                                                                                                                     |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum Payload Size (KB)</td>
<td>Maximum allowable payload size, in KB, to be returned from the SQL statement. The default payload size is <strong>5120 KB</strong>. The maximum payload size is <strong>5 MB</strong>.</td>
</tr>
<tr>
<td>Retry Policy</td>
<td></td>
</tr>
<tr>
<td>Enable Retry Policy</td>
<td>Option to enable the retry policy. For more information, see <em>Retry policy</em>.</td>

### Test JDBC step

Test the JDBC step before testing or publishing an action that contains the JDBC step.

It is mandatory that you test the JDBC step before testing the action. Testing ensures that the relevant complex object output schema is created from table columns, which can be used as data pills in subsequent steps.

1. Navigate to **Flow Designer > Designer**.
2. Create an action with a **JDBC step**.
3. Click **Test JDBC Step**.
   
The **Test JDBC Step** pop-up window is displayed.
4. If the JDBC step takes an action input or output of the previous step as its input, provide required input values in the **Step input pills** field to test the JDBC step.

   **Note:** Input values in the **Step input pills** fields are not needed when records are updated, inserted, or deleted.

5. Click **Run Test**.
   
   - When a SELECT query is executed, **Sample Result** is displayed in the **Test JDBC Step** pop-up window. **Sample Result** includes column names, columns types, and the values of the first row.
   - When an UPDATE, INSERT, or DELETE query is executed, a message is displayed mentioning the number of rows affected.

6. To use the sample result as the JDBC step output, click **Use Result**.

   **Note:** **Use Result** is not displayed when records are updated, inserted, or deleted.

7. To retrieve schema of a different table when a SELECT query is executed in the JDBC step, enter the required value in the **Step input pills** field and click **Run Test**.

When a SELECT query is executed in the JDBC step, **ResultSet** is displayed under **Outputs**. The relevant complex object output is populated. To learn more about complex objects, see *Complex data*.

Test and publish the action.
# Payload Builder step

Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

## Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

## Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name Value Pairs            | The name-value pairs to include in the payload. Click the plus icon to add name-value pairs. Drag data pills into either field to produce dynamic payloads. The **Name** becomes a key in JSON and an element in XML. For example, suppose you create this name-value pair: **Name**: short_description  
  **Value**: [action]->short_description  
  When the system formats the name-value pair as JSON:  
  "short_description": "[action]>
  >[short_description]"  
  When the system formats the name-value pair as XML:  
  <short_description>[action]->
  >[short_description]"                                                                                                                                                                                                                                                                                                                              |
| Omit if empty               | The option to exclude a name-value pair if the value is empty or null.                                                                                                                                                                                                                                                                                                                                          |
| Output Format               | The payload file format.  
  - **JSON**: Select to format the payload as a JSON document.  
  - **XML**: Select to format the payload as an XML document.                                                                                                                                                                                                                                                                                   |
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
</table>
| Namespace           | The XML namespace to apply to each element. For example, when the namespace is set to incident:  
|                     | `<incident:short_description>[action]->[short_description]/>`             |
|                     | **Note:** This field is only visible when the Output Format is set to XML. |
| Include Outer Structure | The option to include or exclude a top level container appropriate to the output format. When the Output Format is JSON, curly braces contain the name-value pairs. When the Output Format is XML, a specified XML element contains the name-value pairs.  
|                     | For example, when the system formats the name-value pair as JSON:  
|                     | `{  
|                     |   "short_description": "[action]->[short_description]"  
|                     | }  
|                     | When the system formats the name-value pair as XML:  
|                     | `<xml>  
|                     |   <short_description>[action]->[short_description]/>  
|                     | `short_description`  
<p>|                     | <code>&lt;/xml&gt;</code> |</p>
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Empty Structure</td>
<td>The option to send valid JSON or XML structures when the payload is empty. Enable this option to include JSON or XML structural text in the payload. For example, when the system formats an empty structure as JSON: <code>{}</code> When the system formats an empty structure as XML: <code>&lt;xml&gt;&lt;/xml&gt;</code> Disable this option to produce an empty payload. Empty payloads can occur when you select the Omit if empty option for every name-value pair, and all name-value pairs in the payload produce empty values.</td>
</tr>
<tr>
<td>Parent Node</td>
<td>The name of the XML element that contains the name-value pairs. The default parent node element is <code>xml</code>. <strong>Note:</strong> This field is only visible when the Output Format is set to XML and the option to Include Outer Structure is enabled.</td>
</tr>
<tr>
<td>Preview</td>
<td>The read-only payload the step produces.</td>
</tr>
</tbody>
</table>

### PowerShell step

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server. PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 3.0 to 5.1. PowerShell 3.0 does not support Windows 2003 Server.

**Note:** PowerShell step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Connection** | Type of connection to use.  
  - **Define Connection Inline**: Define connection information within the action step.  
  - **Use Connection Alias**: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.  
  
  To learn more about connections and credentials, see credentials, connections, and aliases. |

| **Connection Alias** | Connection & Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.  
  
  **Note:** This field is available when Use Connection Alias is selected from the Connection list. |

| **Credential Alias** | Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.  
  
  **Note:** This field is available when Define Connection Inline is selected from the Connection list. |

| **Host** | Specify the fully-qualified domain name of the target host where the system runs the action step. For example, host.domain.com.  
  
  **Note:** This field is only visible when the Connection is Define Connection Inline. |

| **Port** | Specify the communications port on which the target host listens for connections. For example, 5985. Leave blank to use the default port.  
  
  **Note:** This field is only visible when the Connection is Define Connection Inline. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Application</td>
<td>Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the <strong>Connection</strong> is <strong>Define Connection Inline</strong>.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td>Remoting Type</td>
<td>The location where the PowerShell script runs such as the MID or a remote server.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Explicit Remoting (Most Common):</strong> Establish a connection with and run the script on a remote server.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Implicit Remoting (Advanced):</strong> Run a script on a MID Server while importing necessary modules from a remote server. If selected, define the <strong>Remote name prefix</strong> and <strong>Modules to import</strong> fields. For optimal performance, only import modules necessary to the step. If blank, all available modules are imported from the server.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Run on a MID Server or have your script establish a remote session:</strong> Run a script directly on a MID Server, or define remoting specifications within the script. This value is the default.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To invoke a function in a PowerShell script command or PowerShell script file, the command must define the function param block if the function has input parameters. This requirement applies to explicit and implicit remoting. For additional information on param block, see Microsoft’s documentation on Windows Powershell parameters at <a href="https://technet.microsoft.com/">https://technet.microsoft.com/</a>.</td>
</tr>
<tr>
<td>Remote name prefix</td>
<td>The file path, excluding file names, to the modules to load from the remote server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when the <strong>Remoting Type</strong> is <strong>Implicit Remoting (Advanced)</strong>.</td>
</tr>
<tr>

<td>Read-only path to the selected MID Server script.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Script type</strong> is <strong>MID Server Script File</strong>.</td>
</tr>
<tr>
<td>Input variables</td>
<td>The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps within the PowerShell script. Define the following fields for each variable:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Name</strong>: The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable names are reserved for internal processing and should not be used as input variables. See <strong>Reserved variables</strong> in <strong>PowerShell scripting variables</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Type</strong>: The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Value</strong>: The value to map to the variable. Manually enter a value, or drag a data pill into the field.</td>
</tr>
<tr>
<td>Command</td>
<td>The inline PowerShell script to run on the target host.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Script type</strong> is <strong>Inline script</strong>.</td>
</tr>
</tbody>
</table>

**PowerShell scripting variables**

To access input variables from the **Command** field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the **Remoting Type** is **Run on a MID Server** or have your script establish a remote session, some reserved variables are available in addition to input variables.

**Input variable syntax**

By default, prefix variable names with a `$` character. For example, if an input variable is named `message`, use `$message` to access the variable in script.
If the `mid.powershell.command.script.parameter_passing` parameter is set to false, prefix the variable name with `$env:SNC_`. For example, if an input variable is named `message`, use `$env:SNC_message` to access the variable in script. To learn more about the `mid.powershell.command.script.parameter_passing` parameter, see MID Server parameters.

**Reserved variables**

When the **Remoting Type** is **Run on a MID Server or have your script establish a remote session**, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>$computer</code></td>
<td>Host IP address defined in the Connection alias record.</td>
</tr>
<tr>
<td><code>$cred</code></td>
<td>Credential object that contains the credentials defined in the connection record. Use this variable with any PowerShell cmdlet that supports the credential parameter. For example, <code>New-PSSession -credential $cred</code>.</td>
</tr>
<tr>
<td><code>$log_info</code></td>
<td>If the <code>mid.property.powershell.log_info</code> property is set to true, adds logging information to a PowerShell script.</td>
</tr>
</tbody>
</table>

The following variable names are reserved for internal processing and should not be used as input variables.

- `script`
- `useCred`
- `isMid`
- `isDiscovery`
- `debug`
- `user`
- `password`
- `executingScriptDirectory`
- `midScriptDirectory`
- `hresult`

**REST step**

Send an outbound REST web service request to an external system.

**Note**: REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

**Outbound REST web service** is a platform feature that enables you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

**Roles and availability**

- Available as an Action Designer action step. Users with the `action_designer` role can create a custom action with one or more action steps.
<table>

<tr>
<td></td>
<td><strong>Note:</strong> This field is available when you select <strong>Binary</strong> from the Request Type list.</td>
</tr>
<tr>
<td>Name, Type, Value</td>
<td>Content of a multiple part request. For each request part, specify its name, content type, and value. The name can be any valid string and the type can be any valid type. The value must match the content type. For attachments, specify:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> attachment.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Value:</strong> The sys_id of the Attachment record containing the content. You can look up this record in a prior step or define it as an input variable.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> These fields are available when you select <strong>Multipart</strong> from the Request Type list.</td>
</tr>
<tr>
<td>Name, Value</td>
<td>Content of a form URL-encoded request. Specify each part of the URL-encoded request with a name-value pair.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when you select <strong>Form URL-Encoded</strong> from the Request Type list.</td>
</tr>
<tr>
<td>Enable Retry Policy</td>
<td>Option to enable the retry policy. For more information, see <a href="#">Retry policy</a>.</td>
</tr>
<tr>
<td>Override Default Policy</td>
<td>Option to override the default retry policy. This check box is not applicable when <strong>Define Connection Inline</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td>For Alias</td>
<td></td>
</tr>
<tr>
<td>Retry Policy</td>
<td>Default retry policy associated with <strong>Connection Alias</strong>. If <strong>Override Default Policy for Alias</strong> is selected, you can override the default retry policy and select another existing retry policy based on your requirement.</td>
</tr>
<tr>
<td>Save As Attachment</td>
<td>Option to specify whether to save the response as a record in the Attachment (sys_attachment) table.</td>
</tr>
<tr>
<td>Attachment File Name</td>
<td>Name of the attachment created by the REST response. For example, <code>rest-response.txt</code>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when <strong>Save As Attachment</strong> is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Attachment File Record</td>
<td>Target record to which the attachment is associated. The target record must be a data pill of type Record. For example, a specific incident record. You can look up this record in a prior step or define it as an input variable. The flow execution details display the sys_id of the associated record.</td>
</tr>
</tbody>
</table>

**Note:** This field is available when Save As Attachment is selected.

**REST response size limits**

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the `glide.pf.rest.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

**OpenAPI support in the REST step**

Populate REST step fields and action inputs with information imported from an OpenAPI Specification. Import specifications by providing a URL to the YAML or JSON, or copying and pasting content.

**Benefits**

OpenAPI support in the REST step offers these benefits.

- Use information imported from an OpenAPI Specification to configure REST step operations, HTTP methods, parameters, request body, path, and headers.
- Review available API operations without leaving the Flow Designer interface.
- Generate inputs required for the REST step to send valid requests to an OpenAPI service and add them to the REST step in the correct location.

**Note:** Always review REST step values imported from an OpenAPI Specification before sending a request. Remove parameters, headers, and inputs that the API does not require.

**Generated inputs**

When you import an OpenAPI Specification, the system creates any required inputs and adds them to the REST step form where appropriate. At runtime, the system sends a REST request that contains input values provided to the action. For example, if an API requires a name parameter passed in the request, the system creates a name input and adds it to the REST step. When you add the action to the flow, name becomes an input to the action.

The system maps OpenAPI data types to Flow Designer data types. For example, if the OpenAPI Specification requires a user object, then the system creates a complex data object as input. For more information, see Complex data.
Specification size limit

By default, the system can import OpenAPI Specifications up to 10 MB. To increase the import size, update the `glide.rest.openapi.max_request_size` system property. The maximum value is 100 MB.

Specification management

Import an OpenAPI Specification by selecting options in the REST step. For more information, see REST step. Importing an OpenAPI Specification creates a record in the OpenAPIs (sys_openapi) table. You can view or delete specification records directly from this table. To update a specification, delete it and import it again.

Design considerations

Create a REST step from an OpenAPI Specification with these considerations in mind.

Remove unnecessary REST step parameters

When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.

Make input labels user-friendly

Ensure that input labels required for the REST step are clear and understandable. Clear labels enable flow designers to easily understand the required inputs when using the action in a flow.

Remove inputs that do not require flow designer configuration

When importing an OpenAPI Specification, the system adds all inputs present in the specification to the action input section. Remove any inputs that do not require a flow designer to configure. For example, if a REST step variable receives a value from another step in the action, an action input is not required.

Avoid changing the API operation

Changing the value of the API Operation field removes all values dependent on that operation. If you configure the OpenAPI Specification values in the REST step form, then change the operation, the system does not save your configuration. Values that are entered manually by a user are not affected.

Limitations

Create a REST step from an OpenAPI Specification with these limitations.

Request body media types

The request body only supports JSON and XML-based media types. If the selected operation from the imported OpenAPI Specification contains a request body with a different media type, the system adds a data pill of type String to the Request body field.

OpenAPI 3.0 components
OpenAPI 3.0 adds new components to Swagger 2.0 to describe an API in further detail. OpenAPI support in the REST step supports some, but not all of these components. The REST step does not currently support these components.

- Schema Object: oneOf, anyOf properties
- Discriminator Object
- Info object: termsOfService, contact, license fields
- Example Object
- Link Object
- Callback Object
- Security Scheme Object
- Security Requirements Object
- Tag Object
- External Documentation Object
- Server Object
- Specification extensions
- Recursive references

More information on these components is available in the OpenAPI documentation. See OpenAPI Specification.

**SOAP step**

Enable action designers to send outbound SOAP web service requests to external systems.

**Note:** SOAP step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
- Action designers need the web_service_admin role to perform these web services tasks.
  - Select WSDL
  - Load new WSDL
  - Select a WS-Security policy
- The ServiceNow® MID Server doesn’t support WS-Security policies

**Fields**

<td><strong>Note:</strong> This check box is available after clicking the down arrow to display the advanced options.</td>
</tr>
</tbody>
</table>
SOAP response size limit

The system limits the size of SOAP responses to 5 MB. Direct SOAP responses that exceed this limit generate an error. To support larger response sizes, increase the response size limit with the `glide.pf.soap.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

SSH step

The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.

Note:
- The SSH step is not available in the base system. The step requires the subscription to ServiceNow® IntegrationHub and activation of IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) or later. For more information about the IntegrationHub subscription packages, see IntegrationHub usage and subscription. After you activate the required plugin, the step is visible under Integrations.
- IntegrationHub supports ServiceNow SSH only.

Roles and availability

The SSH step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Sanitizing inputs

Escape all user inputs to eliminate the possibility of a malicious user executing arbitrary commands on your target server. Escape and validate data pills before the command field uses them by sanitizing arguments using Sanitize shell arguments transform functions. This transform function category automatically appears when a data pill is dropped into the Command input.

<td>Option to disable the SSH connection timeout for commands that might take longer than the default time of 120 seconds to run. When selected, the engine detaches from the execution thread until completion.</td>
</tr>
<tr>
<td>Sudo Mode</td>
<td>Option to elevate privileges to execute the script.</td>
</tr>
</tbody>
</table>

For more information, see SSH credentials.

### Advanced SSH script options

To run a MID Server script on the target host, specify the script type and pass the name of the script into the `${syncFile()} parameter. The system uses this parameter to locate the named script in the MID Server Script File (ecc_agent_script_file) table and run it on the target host. For example, a bash script can be expressed as:

```bash
bash ${syncFile("<MID script name>"')} argument1 argument2 argument3
```

A base script (main_script.bash) can reference another script (my_include.bash) as well as a separate file (.my_profile) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the `${syncFile()} parameter, to execute properly.

```bash
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rmi /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```python
set $LIB_DIR=/usr/bin;
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
```
To see the list of available MID Server scripts, navigate to MID Server > Script Files.

**XML parser step**

Identify structured data from an XML payload without having to write script. Map incoming XML elements to a complex object output that you can use in other steps or actions. At runtime, values from an XML payload populate the complex object output.

To learn more about complex objects, see Complex data.

**Note:** XML parser step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Payload size limit**

At runtime, XML parser step supports payloads up to 10 MB. For larger payloads, create a Data Stream action. For more information, see Data Stream actions and pagination.

At design time, XML parser step supports sample payloads up to 64,000 characters.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source data</td>
<td>Select or drag a data pill that contains the source XML data. For example, a REST step Response Body data pill. At runtime, values from the data source populate the complex object output.</td>
</tr>
<tr>
<td>Payload view</td>
<td>Select a view for the example payload.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Raw (edit mode):</strong> Displays editable XML.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Structured:</strong> Displays XML in a tree view. Click an element in the tree to copy the element XPath. If creating complex data in the Target field manually, you can paste the XPath into the target XPath field.</td>
</tr>
</tbody>
</table>

**Password reset using IntegrationHub**

Create subflows in IntegrationHub to automate and customize the password reset process for users managed by third-party applications such as Okta or Microsoft Azure AD.

Create subflows in IntegrationHub to automate password reset processes. Use the **Password Reset application** to enable an end user to use a self-service process to reset or change the password. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users. See **Customize password reset processes and integrate third-party credential services** for more information.
Password reset IntegrationHub usage overview

Navigate to **Password Reset > Usage Overview** view the count of password reset transactions performed using IntegrationHub for your instance.

**Note:** Admin must activate the Password Reset - Orchestration Add-on (com.glideapp.password_reset.addon.orchestration) plugin to view the dashboard.

Client Software Distribution using IntegrationHub

Use Client Software Distribution (CSD) to distribute software from the Service Catalog using third-party management systems.

Create all the records necessary to deploy software from Service Catalog requests, including software models and catalog items. You can use the CSD application to automate the deployment and **revocation** of software from an SCCM host using the **Microsoft SCCM spoke**. You can define lease periods for software distributed from the Service Catalog and allow lease extensions in some cases, pending approvals. Deployment is accomplished using IntegrationHub flows, subflows, and actions.

Integrates with **Software Asset Management** to manage license counts for deployed software.
Request client software distribution

Client software distribution requires the Orchestration - Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution), which is available by request with a subscription to IntegrationHub.

Role required: admin
The Client Software Distribution plugin activates the System Center Configuration Manager plugin that contains the Microsoft SCCM spoke actions to deploy or revoke software using an SCCM server. For additional plugin dependencies, see Plugins installed with client software distribution.

**Note:** The Client Software Distribution plugin runs in its own application scope.

1. Navigate to System Definition > Plugins.
2. Click Request Plugin.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time that must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

4. Click Submit.

**Components installed with client software distribution**

Several types of components are installed with client software distribution (CSD).

**Tables installed**

These tables are installed with the Client Software Distribution plugin (com.snc.orchestration.client_sf_distribution).

**Client software distribution tables**

### Properties installed

Properties for client software distribution (CSD) manage the installation status of requested software deployments and configure scheduled Discoveries.

To access CSD properties, navigate to **Client Software Distribution > Properties**. The following properties are available:

#### Client software distribution properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Status check expiration interval (days)       | sn_client_sf_dist.softwareInstallExpDays      | Days controls how many days the system waits before ignoring the software installation status. The default time limit for installing software is 30 days before the system stops checking the installation status of a deployment. Installation statuses are:  
- **Not installed**: User has not installed requested software prior to the expiration of the configured time limit.  
- **Installed**: Software was installed within the configured time limit.  
- **Status check expired**: Time limit has expired for the user to install the requested software. The system no longer checks the status of this deployment.  
- **Revoked**: Software was revoked by the administrator.  
- **Type**: integer  
- **Default value**: 30 |

</tbody>
</table>
|                                              |                                           | Type: integer  
|                                              |                                           | Default value: 24                                                                                                                        |
| Set scheduled application Discovery interval (days) | sn_client_sf_dist.discoveryExeDay         | Sets the repeat interval for the scheduled job that runs application Discovery. By default, Discovery runs at midnight on the day set with this value. |
|                                              |                                           | Type: integer  
|                                              |                                           | Default value: 5                                                                                                                         |
| Set lease execution schedule job interval (minutes) | sn_client sf_dist.lease_execution_interval | Interval in which the CSD Lease Schedule scheduled job checks for requested software leases to start, stop, or extend.                        |
|                                              |                                           | Type: integer  
|                                              |                                           | Default value: 1                                                                                                                         |
| Set time prior to lease end to notify requester (days) | sn_client sf_dist.lease_end_notification  | Determines how many days prior to the end of a software lease to notify the requester. If lease extensions are allowed, ensure that this period provides enough time for the approval process to complete before the lease expires. |
|                                              |                                           | Type: integer  
|                                              |                                           | Default value: 5                                                                                                                         |

### Flows and subflows installed

These flows and subflows are installed with the Client Software Distribution plugin.

**Flows installed with client software distribution**

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order Client Software</td>
<td>Schedules the installation of an ordered application on the selected device. The request requires approvals based on the user input in the catalog item configuration.</td>
</tr>
</tbody>
</table>
### Flow

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deploy Client Software</td>
<td>Deploys a software by executing provider-specific subflow. Creates catalog tasks if there is a failure in the execution of the provider subflow.</td>
</tr>
</tbody>
</table>

### Subflows installed with client software distribution

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discover And Store SCCM Data</td>
<td>Retrieves lists of applications, collections, and deployments from SCCM servers using Microsoft SCCM spoke actions. An administrator runs this subflow from a UI action in a SCCM Server Instance record.</td>
</tr>
<tr>
<td>Deploy SCCM Application</td>
<td>Triggered by the Order Client Software flow to deploy software through SCCM server. This subflow adds either the user or the device into the SCCM collection.</td>
</tr>
<tr>
<td>Revoke Client Software</td>
<td>Begins the software revocation process for software deployed by an external provider. Administrators run this subflow from a UI action on the Requested Software record and the Installed Software Not Entitled record. This subflow triggers the appropriate provider subflow that performs the actual revocation. For example, this subflow triggers the Revoke SCCM Application subflow for applications in SCCM uninstall collections.</td>
</tr>
<tr>
<td>Revoke SCCM Application</td>
<td>Revokes SCCM applications that are members of an uninstall collection. The Revoke Client Software subflow triggers this subflow to revoke software deployed by an SCCM server. This subflow moves either the user or the device from the SCCM collection into the appropriate uninstall collection.</td>
</tr>
<tr>
<td>CSD Lease End Notification</td>
<td>Notifies user about the software lease end date and sends a link to extend the lease end date.</td>
</tr>
<tr>
<td>CSD Deploy Software Post Processing</td>
<td>Performs post processing after the software deployment is successful. The Deploy Client Software flow triggers this subflow.</td>
</tr>
<tr>
<td>CSD Lease End Notification</td>
<td>Notifies user about the software lease end date and sends a link to extend the lease end date.</td>
</tr>
<tr>
<td>Prepare Revocation Data</td>
<td>Prepare data required for the revocation flow.</td>
</tr>
</tbody>
</table>

### Create licenses and counters for distributed software

Licenses and software counters are associated with the software model and must be created if you want to track the license for software deployed by client software distribution (CSD).

Role required: sam or admin
You can create software licenses and counters in Software Asset Management for software items deployed from the service catalog by CSD. CSD depends on the software counter result to determine if the license is available for the requested software. If the license Valuation is greater than 0, and the license type is Not allocated, CSD assumes that the license is available for the software.

1. Navigate to Software Asset > Software Licenses.
2. Add a new software license for the software model you used in CSD.
3. Navigate to Software Asset > Reconciliation > Software Counters.
4. Create a software counter for the software model you created.
5. Run the counter to retrieve the software license information.

Client software distribution ordering process

Software deployed by Client Software Distribution (CSD) can be ordered from the service catalog by individual users or by approved users on behalf of others.

Client Software Distribution catalog items have different options, depending on how ordering is configured.

Lease start and end dates

All software deployed by CSD requires users to specify the beginning date for the lease. This is enforced by the Asset Lease Management plugin that is activated automatically with CSD. The system pre-populates the Lease start field with the current date and time.

If the catalog item is configured for revocation (uninstall), the form displays the Lease end field, which allows the requester to define an end date and time for the lease. The system validates user input in these fields to ensure that the dates selected define a future window. The Lease end field is not mandatory and can be left blank to order software with no end date.

**Note:** For systems deploying software from Microsoft System Center Configuration Management (SCCM), the Lease end field is only available if the SCCM configuration specifies an uninstall collection.

Software offered only to the logged in user

If the software catalog item is configured with the Order on behalf of check box cleared, the User field does not appear on the order form. The logged in user selects the device on which to deploy the software from the Device to install this software on field. Only those devices assigned to the logged in user appear in the list.

In this example, a user has logged into the service catalog to order Firefox for a computer that is assigned to her. She selects the machine from a list of devices she owns and selects the date and time the lease should begin. This software is deployed through Microsoft System Center Configuration Management (SCCM), but does not have an uninstall collection configured and cannot be revoked automatically by the system. As a result, the Lease end field is not available.
Software ordered on behalf of another user

If the software catalog item is configured with the **Order on behalf of** check box selected, the **User** field appears on the form. The logged in user can select any user from this field. The **Device to install this software on** field only lists the devices assigned to the user selected in the **User** field. If an approval is required for software ordered on behalf of another user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requester is the named user's manager.

In this example, a manager is ordering Google Chrome for a contractor. The manager selects the contractor from the **User** field and then chooses a computer from the list of devices assigned to the contractor. This software has an SCCM uninstall collection configured, which allows the manager to select an end date for the lease that coincides with the end of the user's contract. When the lease expires, SCCM automatically uninstalls the software from the device.
Extend a software lease

Users of software deployed by Client Software Distribution (CSD) can request the extension of a lease window, if the software is revocable by a software distribution system.

Role required: Any system user

If your software has a lease end date defined, and the software status is **Installed**, you can request an extension of the lease, pending any approvals your organization requires.

1. Navigate to **Service Catalog > My Requested Software**. The list shows only the software you have requested from the service catalog.
2. Select the record for the installed software whose lease you want to extend.
3. Under **Related Links** click **Extend Lease**.
4. In the dialog box that appears, select a new lease end date in the calendar and click **OK**. You must select a date later than the current date.

If the lease extension is subject to manager approval, you are notified of the decision. If the request is approved, a notification shows the new lease end date. If the new end date is within 5 days (the default notification period) of the date when you made the request, CSD sends an immediate end-of-lease notification.

**Important:** If lease extensions in your organization require approval, make sure the approver is available and has enough time to process your extension request. If the extension cannot be approved before the original end date expires, the software is revoked.
Client software distribution from SCCM

Use Client Software Distribution (CSD) to deploy and revoke software deployments from Microsoft System Center Configuration Management (SCCM) and manage distributions on SCCM hosts.

The Microsoft SCCM spoke contains actions that CSD uses to deploy software from a service catalog request and manage user and device collections on SCCM servers. In addition, CSD can manage license counts for deployed software using ServiceNow Software Asset Management, revoke software deployed by SCCM without user interaction, and manage lease periods.

Configuring SCCM

Follow the SCCM configuration procedures in the order shown.

Configure the Application Administrator role on the SCCM server

To deploy software using ServiceNow® Client Software Distribution (CSD), ensure that an SCCM administrative user has the correct permissions to deploy software and that PowerShell is properly configured.

SCCM role required: Application Administrator

These instructions are for Microsoft 2012 R2 Server.

1. In the System Center Configuration Manager console, navigate to Administration > Security > Administrative Users.
2. Right-click the user to whom you want to grant the Application Administrator role.
3. Select Properties from the drop-down menu.
4. In the Properties dialog box, select the Security Roles tab.
5. Ensure that the user has the Application Administrator role.
6. If the user does not already have this role, click Add, select this role from the list, and click OK.
Granting the Application Administrator role on the SCCM server
7. Log into SCCM as the user with the Application Administrator role.
8. Open the menu from the upper left corner of the console and select **Connect via Windows PowerShell**.

9. Ensure that the user can access the CM console. This action establishes the environment path to PowerShell for the logged in Application Administrator user.

**Update the SCCM cmdlet libraries**

Ensure that the System Center Configuration Manager SCCM Cmdlet Library is up-to-date.

SCCM role required: Either current user or system administrator, depending on settings.

The System Center Configuration Manager SCCM Cmdlet Library installs and updates the Windows PowerShell module for SCCM. SCCM checks for library updates on a daily basis. Out-of-date libraries can cause Discovery of the SCCM server to fail, because the system cannot parse the SCCM activity output. This warning message appears in the ECC queue input records for the SCCM GET activities:

```
WARNING: An update to the System Center 2012 Configuration Manager Cmdlet Library is available. Please go to 'http://go.microsoft.com/fwlink/?LinkId=528947' to download the latest version.
```
Running cmdlet version: 5.0.8231.1004 Latest cmdlet version: 5.0.8328.1155

If you elect to use an earlier version library, use this procedure to disable the CM update check, which allows Discovery to proceed without issues.

1. Log into the SCCM console as an administrator.
2. Open the menu from the upper left corner of the console.
4. Run one of these commands to disable the update check:
   - Per-user: Set-CMCmdletUpdateCheck -CurrentUser -IsUpdateCheckEnabled 0
   - Per-system: Set-CMCmdletUpdateCheck -System -IsUpdateCheckEnabled 0

   **Important:** The per-system cmdlet must run in an elevated Windows PowerShell session.

5. Run the Get-CMCmdletUpdateCheck command to refresh the console and check the settings.
6. Ensure that the value of the IsEnabled configuration variable has changed to False. This indicates that the warning for an out of date cmdlet library is disabled for the users specified.
7. To re-enable the update check, run the -IsUpdateCheckEnabled 1 command for either the current user or for the system.

### Configure the MID Server for SCCM activities
To use a MID Server with Microsoft System Center Configuration Management (SCCM) activities, configure it to communicate with the SCCM server.

**Role required:** admin

1. In the navigation filter, enter **cmdb_ci_dns_name.list**.
2. Click New.
3. Enter the fully-qualified domain name (FQDN) of the SCCM server in the **Name** field.
4. Right-click in the form header and select Save.
5. In the **IP Address** related list, click New.
6. In the **IP Address** field, enter the IP address of the SCCM server.
7. In the **Nic** field, select eth0 or your preferred network interface controller.
8. Leave the **Netmask** field blank.
9. Click Submit.

### Create Connection and Credential alias for SCCM deployments
Microsoft System Center Configuration Manager (SCCM) requires the appropriate credentials to deploy applications using the Client Software Distribution application.

**Role required:** sn_client_sf_dist.csd_admin or admin

Client software distribution requires Windows credentials that have administrative rights on the SCCM server.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Click New.
3. On the form, fill in the fields.
### Connection & Credential Aliases form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the alias. For example, CSD Alias.</td>
</tr>
<tr>
<td>ID</td>
<td>System generated unique ID.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Type</td>
<td>Alias type. Select Connection and Credential.</td>
</tr>
<tr>
<td>Connection type</td>
<td>Connection type. Select Basic.</td>
</tr>
<tr>
<td>Support Multiple Active Connections</td>
<td>Option to specify if the alias supports multiple active connections.</td>
</tr>
<tr>
<td>Default Retry Policy</td>
<td>Default retry policy associated with Connection Alias.</td>
</tr>
<tr>
<td>Configuration Template</td>
<td>Template that defines the inputs required to set up the spoke.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.
5. Click the **Create New Connection & Credential** related link.
6. On the form, fill in the fields.

### Create Connection and Credential form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM Server Instance Name</td>
<td>Name to uniquely identify the SCCM server.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name of the target host where the SCCM server is installed.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Credential record associated with the connection and credential alias.</td>
</tr>
<tr>
<td>User Name</td>
<td>User name with access to the target Windows host.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the account.</td>
</tr>
</tbody>
</table>

7. Click **Create**.

Connection record and SCCM Server Instance are created and associated with the connection and credential alias.

*Retrieve SCCM data for client software distribution*

Retrieve the collections and the list of applications available for deployment from your SCCM servers.

**Role required:** sn_client_sf_dist.csd_admin or admin

Before starting this procedure:

- Set up your Microsoft System Center Configuration Manager (SCCM) server, create the applications and collections, and configure the deployments you need. For information, see your SCCM documentation.
- **Configure a user** with the Application Deployment Manager role on the SCCM server.
- Set up the MID Server to communicate with the SCCM server.
• Add Powershell credentials to the ServiceNow Credentials (discovery_credentials) table for the SCCM user who has the Application Deployment Manager role.

To populate the Client Software Distribution application with SCCM data:

1. Navigate to **Client Software Distribution > SCCM > SCCM Server Instance**.
2. Click **New**.
3. In the SCCM Server Instance form, identify the server by name and select the connection and credential alias.
   
   **Note:** Leave the **Fully qualified domain name** field empty.

4. Click **Submit**.

   The new SCCM server appears in the list.
5. Open the new SCCM record and click **Discover now** under **Related links**.

   The system runs the Discover SCCM flow that retrieves the application, collection, and deployment data from the SCCM server.

---

**SCCM server Discovery for client software distribution**

Discovery flow populates ServiceNow tables with collection, application, and deployment data retrieved from SCCM servers.

Users run the **Discover SCCM** flow from an **SCCM Server Instance** record to populate the following ServiceNow tables:
### SCCM data populated in ServiceNow tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM Application</td>
<td>• name</td>
</tr>
<tr>

</tbody>
</table>

**Note:** For details about the actions used in this flow to extract data from an SCCM server, see *Microsoft SCCM spoke*.

---

**Set up a software model for an SCCM application**

Using the applications discovered on the SCCM server, set up a software model used by the Software Asset Management application to manage licenses.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating software models, you must discover the applications available for deployment on the SCCM server. See *Retrieve SCCM data for client software distribution* for details.

You can link an SCCM application to an existing software model or create a new model.

1. Navigate to **Client Software Distribution** > **SCCM** > **SCCM Applications**.
   
   A list of applications discovered on the SCCM server appears.

2. Open an SCCM application record.

3. To link to an existing model, click the magnifying glass icon in the **Model** field and select a model from the list.
To create a model, click **Create Software Model** under **Related Links**.

a) Complete the software model fields.

   See for details.

b) Click **Submit**.

   The view returns to the SCCM Applications form.

---

**Define an SCCM configuration**

To create catalog items for SCCM software deployment or to configure your instance to revoke software through SCCM, you must first associate that software with a collection through an SCCM configuration.

Before you create an SCCM configuration record, make sure you have discovered the SCCM applications, collections, and deployments and set up the necessary software models.

**Role required:** sn_client_sf_dist.csd_admin or admin

The SCCM configuration process associates software with SCCM collections. To deploy software from an SCCM server, the user or device must be a member of an SCCM collection associated with an **install** deployment. Client Software Distribution (CSD) allows you to **revoke unentitled software** using an SCCM server when that software can be removed using an **uninstall** collection. Users requesting revokable software from the Service Catalog also have the ability to define lease start and stop dates and request lease extensions.
SCCM table references

1. Navigate to **Client Software Distribution > SCCM > SCCM Applications**.
2. Open an application that has a configured software model.
3. Under **Related Links**, click **Create Software Configuration**.
4. Complete the form, using the fields in the table.
### SCCM Configuration Form

#### SCCM Configuration Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Recognizable name for this SCCM software configuration.</td>
</tr>
<tr>
<td>SCCM application</td>
<td>Name of an application hosted on the SCCM server.</td>
</tr>
<tr>
<td>SCCM collection</td>
<td>Name of the collection associated with the <strong>install</strong> deployment for the selected application on the SCCM server. Only those collections associated with the application are available for selection.</td>
</tr>
</tbody>
</table>
| SCCM uninstall collection    | Name of the collection associated with the **uninstall** deployment for the selected application on the SCCM server. You must specify an uninstall collection to:  
- Define a lease end date for deployed software.  
- Allow lease extensions.  
- Revoke software from a user's machine. |
Create a catalog item for an SCCM application

Create a catalog item for an application you want to offer for distribution from the service catalog using the applications discovered on the SCCM server.

Role required: sn_client_sf_dist.csd_admin or admin

Before creating a catalog item, you must link the application to a software model and create at least one software configuration.

1. Navigate to Client Software Distribution > SCCM > SCCM Applications.
   A list of applications discovered on the SCCM server appears.

2. Open a record for an SCCM application.

3. Under Related Links, click Create Catalog Item.
   A new SCCM Application Catalog Item record appears with preconfigured information.
Catalog items are available to order software applications from the service catalog. Update name and short description to display for the item. Configure approval process, license check, order on behalf of, software configuration and other information as needed.

**Name:** Dropbox - SD

**Application:** Client Software Distribution

**Price:** $0.00

**Recurrence:** Monthly

**Order on behalf of:**

**Software configuration:** Dropbox

**Description:**

Dropbox is a service that keeps your files safe, spread, and easy to share. Bring your photos, docs, and videos anywhere and never lose a file again.
4. Add price information and complete the following fields added to the Client Software Distribution Catalog Item (sn_client_sf_dist_cat_item) table by the Client Software Distribution plugin:

**SCCM fields in the catalog item form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip approval (skip_approval)</td>
<td>Check box that allows skipping approval for this item by the requester's manager when a user orders it from the service catalog. Use this field in conjunction with the <em>Order on behalf of</em> field to ensure that software ordered by a logged in user on behalf of another user is subject to approval. By default, this check box is cleared, requiring manager approval for all new catalog items.</td>
</tr>
</tbody>
</table>

**Note:** There are two levels of approval possible. By default, all category items require group approval for items in excess of $1000. If that approval is given or skipped, the system evaluates the *Skip approval* check box to determine if the software item requires approval by the requester's manager.

<p>| Check license compliance (check_license_compliance) | Check box that forces the system to determine if deploying this item is allowed under the current license.                                                                                                  |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Order on behalf of           | Check box that allows the logged-in user to order this software from the service catalog for another user. This permits service desk personnel to order SCCM deployments for other users in the system. By default, this feature is enabled. To prevent unauthorized users from ordering software, ensure that approvals are required for this type of deployment by clearing the **Skip approval** check box. If an approval is required for software ordered on behalf of a user, the system automatically sends an approval request to the manager of the user receiving the software. The approval is skipped if the requestor is the named user's manager. Software items requested from the service catalog on behalf of a different user require the following information:  
  - **User**: User selected for deployment. This field is automatically populated with the name of the logged in user. You can select another user from the list.  
  - **Device to install this software on**: Device belonging to the selected user on which to deploy the software. Only devices belonging to that user appear in the choice list.  
  - **Lease start**: Date and time to deploy the software. This is the start time for the lease. A lease can be open-ended or have a lease end time. |
| SCCM configuration           | Name of the *SCCM configuration record* for this application. This record defines the collection and uninstall collection for this application. This configuration is required for all deployments, revocations, and leases performed by the SCCM server. |

5. If the catalog item requires approval because of cost, be sure to configure an approval group in the **Approved By Group** related list. By default, the Service Catalog Request flow runs when an item costing more than $1000 is ordered and looks for an appropriate approval group. If no approval group is configured for the item, this flow skips approval altogether and ends. The system then runs the Order Client Software flow, which evaluates the **Skip approval** check box to determine if approval by the requester's manager is required.

6. **Click Update**.
   
The view returns to the SCCM Applications list.

7. To see all client software distribution (CSD) catalog items, navigate to **Client Software Distribution > Maintain Items > Software Items**.
SCCM deployment process

Order an SCCM application from a client software distribution (CSD) catalog item in the service catalog triggers the Order Client Software flow.

This process deploys an SCCM application to a user or device through a service catalog order:

1. If the Skip approval check box is cleared in the software catalog item, the Order Client Software flow sends the catalog request to the requesting user’s manager for approval.

2. If the Check license compliance check box is selected in the software catalog item, the flow performs a software license check. If there is no license available, the flow creates a catalog task to procure more licenses and assigns the task to the CSD Administrators group.

3. The Order Client Software flow triggers the Deploy SCCM Application flow as a subflow. This subflow adds either the user or the device to the SCCM collection using the Add to User Collection or Add to Device Collection actions in the Microsoft SCCM spoke.

4. If the software configuration specifies SCCM uninstall collection in the software catalog item, the Deploy SCCM Application subflow checks if the user or device exists in the uninstall collection. The flow uses the Is Device in Collection or Is User in Collection in the Microsoft SCCM spoke. If the user or device exists in the uninstall collection, the flow removes the device or user. The subflow uses the Remove from Device Collection or Remove from User Collection action in the Microsoft SCCM spoke before adding it to the SCCM install collection.

Client software distribution validation process

After SCCM deploys software to a target computer, client software distribution (CSD) detects the installation and validates its status.

Client software distribution uses the following methods for detecting software installed on the target machine:

- **Discovery**: CSD is configured to leverage Discovery to detect software installations. You can run Discovery manually at any time, or by a scheduled job.

- **Microsoft SCCM Integration**: You can import SCCM data into the CMDB using the features in the Integration - Microsoft SCCM plugin if Discovery is not active on the instance.

The instance uses the data gathered by Discovery or the SCCM integration plugin to populate the Software Installation (cmdb_sam_sw_install) table. To validate installations using this data, CSD runs a scheduled job called Reconcile Requested Software that uses CSD property settings. This process reconciles the software installation data accumulated in the CMDB and makes these status updates:

- **Not installed** to **Installed**: The user has installed the requested software within the time limit configured in the sn_client_sf_dist.softwareInstallExpDays property.

- **Not installed** to **Status check expired**: The time limit has expired for the user to install the requested software. The system stops checking for installation when the time limit expires.

SCCM software revocation

Revoke software without any user interaction using Microsoft System Center Configuration Manager (SCCM) if the software configuration specifies an SCCM uninstall collection, even if the software was installed by some other process or user.

*Revoke software deployed through the service catalog*

Software deployed by SCCM can be revoked, but only when the status of software is **Installed** and the application associated with the software configuration has an uninstall collection configured.
- Create an SCCM configuration record for the application that names an appropriate uninstall collection.
- Associate the CSD catalog item for the application with the SCCM configuration that specifies the uninstall collection.

Role required: sn_client_sf_dist.csd_admin or admin

A subflow called Revoke SCCM Application moves either the user or the device from its respective collection and adds it to the appropriate uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

1. Navigate to Client Software Distribution > Reports > Requested Software.
2. Open the record for the SCCM software package you want to revoke. The package must have a Status of Installed to be revocable.
3. Under Related Links, click Revoke software.

   This action runs the Revoke Client Software flow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.

Revoke unentitled software

Revoke software using Microsoft System Center Configuration Manager (SCCM) that a user is not entitled to use even if the software was installed by some other process or user.

To revoke software using SCCM, you must create an SCCM configuration record for the application, in which the appropriate software Discovery model is defined. See Software discovery models.

Role required: sn_client_sf_dist.csd_admin or admin

Client Software Distribution (CSD) uses Software Asset Management to identify unentitled software installations. Discovery detects the software on the user's machine, and SAM determines if the user or device is entitled to use that software. This might include software that was not installed through a catalog request or software that the user installed without approval. If the software installation's Discovery model is associated with an SCCM software configuration that has an uninstall collection defined, then an administrator can use CSD to revoke that software from the user's machine without involving the user.

1. Navigate to Client Software Distribution > Reports > Installed Software Not Entitled.
2. Select the record for the installation that has unentitled users.
3. Under Related Links, click Revoke software.

   This action runs the Revoke Client Software flow, which triggers the Revoke SCCM Application subflow that moves the user or device from the install collection to the uninstall collection. When SCCM performs an internal policy check and finds the user or device in the uninstall collection, SCCM removes the related software package from the client computer.
SCCM software revocation flow

The Revoke SCCM Application flow moves a user or device from an install collection to an uninstall collection to revoke software installed from Microsoft System Center Configuration Manager (SCCM).

For the revocation subflow to run, the software package must have a status of Installed and must be pre-configured for an appropriate uninstall collection. See Revoke software deployed through the service catalog for configuration instructions. When an administrator initiates the
revocation process, the system launches the Revoke SCCM Application subflow to move the user or device collection associated with installation to the appropriate SCCM uninstall collection. When the SCCM server performs a policy check, it finds the additions to the user or device uninstall collection and revokes the software package associated with that collection.

The subflow employs two custom actions in the Microsoft SCCM spoke, Remove from User Collection and Remove from Device Collection, to remove either the user or the device from its original collection. The subflow then adds the user or device to the appropriate uninstall collection on the SCCM server with the Add to User Collection or Add to Device Collection activity.

**Note:** This subflow is triggered by the Revoke Client Software subflow.

---

**Client software distribution dashboard**

The CSD dashboard provides a collection of visual reports for the Client Software Distribution application.

**CSD dashboard**

To access the CSD dashboard, navigate to **Client Software Distribution > Requested Software > Dashboard.**

---

**Sample report from CSD dashboard**

**Client software distribution reports**

Usage Overview dashboard

Navigate to Client Software Distribution > Usage Overview to view the current transaction count for your instance.

Client software distribution extension framework

Client software distribution (CSD) provides built-in extension points for integrating a ServiceNow instance with client software distribution providers, such as Casper, Altiris, or LANDesk.

Caution: The use of CSD extension points is an advanced procedure intended for use by experienced Now Platform developers only. Instructions for customizing your instance to deploy and revoke software from a software distribution provider can be found in the CSD Extension Implementation Guide.

Configure client software distribution providers

Identify the provider and specify the flows, subflows, and extension points for a customized software distribution process.

Perform the development tasks described in the CSD Extension Implementation Guide before attempting this procedure.

Role required: sn_client_sf_dist.csd_admin, admin

1. Navigate to Client Software Distribution > Extensions > Providers.
2. Click New.
3. Complete the form using the fields in the table.

**Note:** Ensure that you select the Use Flow option to use the IntegrationHub flows.
### Client software distribution provider fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name of the provider.</td>
</tr>
<tr>
<td>Provider server table</td>
<td>Table name of the provider server. You must create this table as an extension of the Configuration Item (cmdb_ci) table. For example, you might call your table Casper Server Instance (cmdb_ci_casper_server_instance).</td>
</tr>
<tr>
<td>Discovery flow</td>
<td>Flow that discovers the provider server and returns the data from that server back to the instance. This is the subflow you create with custom activities that query the provider server.</td>
</tr>
<tr>
<td>Software configuration table</td>
<td>Table name of the software configuration for this provider. You create this table as an extension of the Client Software Distribution Software Configuration (sn_client_sf_dist_software_config) table. For example, you might create a table called Casper Software Configuration (sn_client_sf_dist_casper_sf_config).</td>
</tr>
<tr>
<td>Deployment extension key</td>
<td>The SetDeploymentData key provided with CSD. This key sets up the data for the software ordering and deployment flow.</td>
</tr>
<tr>
<td>Deployment flow</td>
<td>Flow that deploys software from the provider server. This is the flow you created with custom activities that tells the provider where to deploy an application requested from the service catalog.</td>
</tr>
<tr>
<td>Revocation extension key</td>
<td>The SetRevocationData key provided with CSD. This key sets up the data for installation revocation.</td>
</tr>
<tr>
<td>Revocation Flow</td>
<td>Flow that revokes an installation from a provider server. This is the subflow you created with custom activities that tells the provider which application to remove from a device.</td>
</tr>
<tr>
<td>Use Flow</td>
<td>Option to use the IntegrationHub flows.</td>
</tr>
</tbody>
</table>

**Note:** Flows or workflows associated with the provider catalog items are affected based on this option.

4. Click **Submit**.

### Client software distribution extension keys

Client software distribution (CSD) extension keys allow you to customize the deployment and revocation of software from distribution providers.
These pre-defined keys allow you to generate input variables for flows that deploy and revoke software from external distribution providers:

- **SetDeploymentData**: Sets the software order information and generates the input variables for the deployment flow.
- **SetRevocationData**: Generates the input variables for the revocation flow.
- **CheckRevocable**: Specifies the conditions that determine if an installation can be revoked. If the software configuration associated with the installed software allows uninstallation, the installed software can be revoked.

### Client software distribution extension points

The client software distribution (CSD) extension points create the customization code for the specific provider and the extension keys.

The purpose of the extension points is to associate extension keys with a specific provider, and then create a script that sets input variables for your custom deployment and revocation flows. Another extension point script tells CSD if the provider has the capability to revoke software. If this is the case, CSD enables the UI action that triggers revocation from the provider.

### SetDeploymentData

The script associated with this extension key must set the `csdExtensionResult` object with these attributes:

- **deploymentFlowInputs**: Object that specifies the deployment flow input variables.
- **deploymentWorkflowInputs**: Object that specifies the deployment workflow input variables.
- **softwareModel**: Software model sys_id.
- **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.
- **softwareApplication**: Software application sys_id.

### CheckRevocable

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration (sn_client_sf_dist_software_config) table. All providers’ software configurations are extended from this table, but may have different attributes.

This script must set the `csdExtensionResult` object to `true` or `false`, depending on whether the software configuration specifies uninstallation.

### SetRevocationData

The script associated with this extension key gets the input parameter `csdExtensionInputs.softwareConfiguration`, which is a Client Software Distribution record in the Software Configuration (sn_client_sf_dist_software_config) table. All providers’ software configurations are extended from this table, but may have different attributes.

The script must set the `csdExtensionResult` object with these attributes:

- **revocationFlowInput**: Object that specifies the revocation flow input variables.
- **revocationWorkflowInput**: Object that specifies the revocation workflow input variables.
- **softwareModel**: Software model sys_id.
- **deploymentType**: An integer. Use 1 for deployment to a user and 2 for deployment to a device.
Interaction Management

Interactions are a centralized location for all communication channels in the platform. Each interaction represents a request for assistance through a given channel, for example, a call or a chat.

The Now Platform offers several forms of queueing and communication management, but each system is tightly coupled to the specific area. Interactions offer an alternative, flexible, and more extensible option so that each product area can use the same framework.

Activate the interaction management system

An administrator can activate the Interaction Logging, Routing, and Queueing plugin (com.glide.interaction) to access the functionality.

Role required: admin

1. Navigate to System Definition > Plugins.

   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   ![Note: To redirect to the legacy list view for plugins, click the link.](image)

   You have been redirected to All Applications. To see the Plugins list click here

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you’re certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.
To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the Activate/Update related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click Load demo data.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
5. Click Activate.

Components installed with Interaction Management
Several types of components are installed with activation of the Interaction Logging, Routing, and Queueing plugin, including tables and user roles.

Note: The Application Files table lists the components installed with this application. For instructions on how to access this table, see Find components installed with an application.

## Interaction configuration overview

Configure the behavior of an interaction by determining the routine behavior for each state that the interaction goes through during the life cycle.

### Interaction framework

Configure each of the following interaction components to determine the behavior and life cycle.

- Lists: Configure the interaction list view. You can also extend the interaction table.
- Forms: Configure the form view to tailor interactions for each application.

## Interaction states

States determine the behavior for interactions. For each state of the interaction life cycle, you determine which routine actions to perform. For example, the **On Created** state would have a script that creates an interaction and then adds the end user as the 'opened for'. The script then sends a message to the end user to let them know that the interaction has been opened.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New</td>
<td>An interaction is inserted into the interaction table</td>
</tr>
<tr>
<td>On Hold</td>
<td>The interaction is waiting for assignment</td>
</tr>
<tr>
<td>Work In Progress</td>
<td>An agent accepts an unassigned interaction</td>
</tr>
<tr>
<td>Closed Complete</td>
<td>The agent or consumer intentionally closes the interaction</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Closed Abandoned</td>
<td>The interaction is closed because the consumer disconnects or is unresponsive</td>
</tr>
</tbody>
</table>

### Interaction context and channel metadata

Context and channel metadata are document ID fields included as part of interactions. Both types of records store information about the interaction.

**Context**

Context for an interaction tracks the information for an interaction, such as the initial question, asset tagging, or device location. Context records are stored on the interaction_json_blob table by default; however, you can use any table to store a context record.

**Channel metadata**

Channel metadata contains the information needed to interact with the channel on which communication is happening on, for example, the chat or phone channels. Channel metadata can be free-form JSON or a reference to another record.

### Create an interaction

Most interaction creation takes place in other applications, interactions are merely a method of controlling channels. However, if needed you can create an interaction from the Interaction application.

Role required: interaction_agent

1. Navigate to Interaction > All.
2. Click New.
3. In the Type field, enter the way the interaction began. For example, chat, phone, or walk-up.
4. In the Opened for field, type the name of the user starting the interaction.
5. Include any additional information in the short description and the work notes fields.

View any incidents opened by the same user by clicking the Use the Incidents by Same Caller related list.

### Associate a record with an interaction

As an agent, you might need to create a record on another table to work on an interaction. You can associate the record with the interaction.

Role required: interaction_agent

1. Navigate to Interaction > Assigned to me.
2. Open the interaction you want to associate with another record.
3. In the form header, click Associate Record.
4. In the ID of related record field, click the search icon.
5. From the Document Table list, select the table you want to associate a record from.
6. From the Document field, click the search icon.
7. Select an existing record from the list, or click **New** to create a record.
8. Click **OK**.
9. Click **Submit**.

The associated record appears in the Related Tasks related list for the interaction.

**Knowledge Management**

The ServiceNow® Knowledge Management (KM) application enables the sharing of information in knowledge bases. These knowledge bases contain articles that provide users with information such as self-help, troubleshooting, and task resolution.

Knowledge Management has significantly changed with Knowledge v3, which is enabled by default for all instances starting with the Fuji release.

The Knowledge Management Service Portal enables users to access a portal view of knowledge bases and articles. It is available by default for new customers on the Madrid and later releases. If required, existing and upgrade customers can activate the Knowledge Management Service Portal plugin.

Knowledge Management supports processes for creating, categorizing, reviewing, and approving articles. Users can search and browse articles as well as provide feedback.

To support multiple groups, knowledge bases can be assigned to individual managers. Separate workflows can be used for publishing and retiring articles, and separate access controls can be used to control reading and contributing.
### Additional plugins for Knowledge Management

After Knowledge Management is activated, you can activate additional plugins that provide access to various additional Knowledge Management features.

You must have the admin role to activate these additional plugins. For details, see [Activate a plugin](#).

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
</table>
| Knowledge Management Core  
com.glideapp.knowledge | Installs the core Knowledge Management items used to allow other Knowledge-related plugins to work, such as Knowledge V3, Knowledge Advanced, and Knowledge Service Portal. This plugin is activated by default. |
| Knowledge Management Advanced Installer  
com.snc.knowledge_advanced.installer | Installs the Knowledge Management Advanced plugin. Activating/upgrading to this plugin validates the knowledge articles and knowledge bases to make sure that the Knowledge Advanced plugin can be successfully installed. If validation fails, check the Plugin Activation logs and follow instructions given to fix any errors. Once you fix all the issues, re-run this plugin. |
| Knowledge Management Advanced  
com.snc.knowledge_advanced | Adds advanced features to Knowledge Management such as version control and subscriptions. This plugin requires that all knowledge bases are version Knowledge V3. Use the Knowledge Management Advanced Installer plugin to activate this plugin. |
| Predictive Intelligence for Knowledge Management  
(com.snc.knowledge_ml) | Provides various Knowledge Management capabilities driven by machine-learning solutions. For example, capabilities such as similar articles and knowledge demand insights. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details. **Note:** When you install and activate the Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml), the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) is also activated. |
| Performance Analytics - Content Pack - Knowledge Management  
com.snc.pa.knowledge_v2 | Enables the Performance Analytics content pack for the Analytics and Reporting Knowledge Management Solution. Activation of this plugin on production instances might require a separate Performance Analytics license. Contact ServiceNow for details. |
| Knowledge Management V3  
com.snc.knowledge3 | Enables support for Knowledge Management V3. Activate this plugin when you upgrade from Eureka or earlier versions. |
| I18N: Knowledge Management Internationalization Plugin v2  
com.glideapp.knowledge.i18n2 | Helps create and maintain translations of an article in various languages in a way that is easy to manage translations while authoring as well as viewing articles. Activating internationalization plugins for any of the available languages automatically activates this plugin. |

**Knowledge Management roles**

Certain roles are required to use Knowledge Management functionality.

**Knowledge Management roles**

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>knowledge</td>
<td>Users with the knowledge role can contribute to the default knowledge base and access the Knowledge application menu.</td>
</tr>
<tr>
<td>knowledge_manager</td>
<td>Knowledge managers perform administrative functions for knowledge bases they manage such as defining categories, pinning important articles, and approving changes to articles. Users selected as managers of a knowledge base receive this role automatically.</td>
</tr>
<tr>
<td>knowledge_admin</td>
<td>Knowledge administrators can create new knowledge bases and manage all knowledge bases.</td>
</tr>
<tr>
<td>knowledge_coach</td>
<td>Knowledge coaches perform AQI surveys on articles and can write, edit and review knowledge management articles. A knowledge coach does AQI on articles and coaches the team on best practices.</td>
</tr>
<tr>
<td>knowledge_domain_expert</td>
<td>Knowledge domain experts perform AQI surveys on articles and can write, edit and review knowledge management articles. A knowledge domain expert keeps track on the health of knowledge base.</td>
</tr>
<tr>
<td>admin</td>
<td>Administrators can configure knowledge workflows, set knowledge properties, and manage knowledge forms and homepages.</td>
</tr>
<tr>
<td>Role</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>knowledge_group_manager</td>
<td>Knowledge group managers can add or remove members in ownership groups managed by them. They cannot change the manager assigned in their groups. The manager can only be reassigned by the knowledge administrator. Knowledge group managers are assigned feedback tasks by default. They can reassign tasks to another group member, or group members can assign a feedback task to themselves.</td>
</tr>
<tr>
<td>knowledge_group_member</td>
<td>Knowledge group members are part of an ownership group that can be associated to knowledge articles. They can approve knowledge articles, assign feedback tasks to themselves and work on them as well as edit any knowledge articles that their ownership group is assigned to.</td>
</tr>
</tbody>
</table>

### Knowledge properties

As an administrator, you can configure the look and functionality of many knowledge base features with knowledge properties.

You can access knowledge properties by navigating to Knowledge > Administration > Properties.

### Knowledge portal properties

Knowledge portal properties control the look and functionality of the legacy portal page. This portal page lists recent knowledge articles and their publishing dates, organized by topic.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of columns on Knowledge portal pages</td>
<td>Set the number of columns for arranging topics on the knowledge portal. [\text{glide.knownman.columns}]</td>
</tr>
<tr>
<td>Maximum number of articles per content block on the home page</td>
<td>Enter the maximum number of articles to display in the Most Useful and Most Viewed sections of the knowledge homepage. [\text{glide.knownman.content_block_limit}]</td>
</tr>
</tbody>
</table>

**Note:** This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Omit empty Knowledge topics and categories. (glide.knowman.show_only_populated)</td>
<td>Select the <strong>Yes</strong> check box to display topic sections only if there are articles for the topic. Clear the check box to show all topic sections, even those with no assigned articles. <strong>Note:</strong> This property does not apply to the <strong>News</strong> category. <strong>Note:</strong> This property applies only to the default knowledge base and the legacy knowledge portal. Knowledge Management v3 articles do not specify a topic. Therefore, this property applies only to Knowledge v2 pages. This property is not supported on Knowledge Management v3 pages.</td>
</tr>
<tr>
<td>Show Knowledge section descriptions. (glide.knowman.show_descriptions)</td>
<td>Select the <strong>Yes</strong> check box to display topic descriptions in the knowledge portal. To enter these descriptions: 1. Edit an existing knowledge article. 2. Right-click the <strong>Topic</strong> field label and choose <strong>Show Choice List</strong>. 3. Open the record for the topic name and enter the description into the <strong>Hint</strong> field. Clear the check box to omit section descriptions from the knowledge portal. <strong>Note:</strong> This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages.</td>
</tr>
<tr>
<td>Number of Knowledge Base items to preview in a section. (glide.knowman.section_limit)</td>
<td>Set the maximum number of articles per topic for the knowledge portal. The specific articles shown depends on the <strong>Knowledge section sort field</strong> property setting. <strong>Note:</strong> This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

<tr>
<td>Automatically place cursor in Knowledge portal search box. (glide.knowman.portal_search_focus)</td>
<td>Select the Yes check box to have ServiceNow place the cursor in the search field when a user opens the knowledge portal. Clear the check box to have users click in the search field before entering a search term.</td>
</tr>
</tbody>
</table>

**Note:** This property applies only to Knowledge Management v2 pages. This property is not supported on Knowledge Management v3 pages.

## Knowledge search properties

Knowledge search properties give you control over the search options available to users and the presentation of search results.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Knowledge search result order. (glide.knowman.order.search) | Select the order for displaying search results:  
- **Number of Views**: orders search results based on the Number of days used when summing article views property.  
- **Relevancy**: orders search results based on content that is similar to the search term.  
- **Last Modified**: orders search results based on modification date.  
This property is applicable for search within the Knowledge Management application and not the Now Platform global search. |

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Search method used when searching Knowledge from a task or directly in the Knowledge Base. (glide.knowman.search.operator) | Select the search approach to use when the search term includes multiple words.  
- **OR query**: returns articles that contain at least one word from the search term.  
- **AND then OR query**: first searches for articles that include all words in the search term (an AND query). If no matches are found, an OR query is performed. |

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Show author in knowledge search results. (glide.knowman.search.show_author) | Select this check box to include the author of each article in knowledge search results.  
If the article versioning feature is enabled, articles with a version number less than or equal to 1.0 display Authored by <name> and articles with a version number greater than 1.0 display Revised by <name>. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show last modified date and time in knowledge search results.</td>
<td>Select this check box to include the date and time each article was last edited in knowledge search results.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_last_modified)</td>
<td></td>
</tr>
<tr>
<td>Show publish date in knowledge search results.</td>
<td>Select this check box to include the date each article was published in knowledge search results.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_published)</td>
<td></td>
</tr>
<tr>
<td>Show category in knowledge search results.</td>
<td>Select this check box to include the category breadcrumbs of each article in knowledge search results.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_category)</td>
<td></td>
</tr>
<tr>
<td>Show number of views in knowledge search results.</td>
<td>Select this check box to include the number of times each article was viewed in knowledge search results.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_view_count)</td>
<td></td>
</tr>
<tr>
<td>How to display attachments in Knowledge Search Results.</td>
<td>Select the behavior of how the attachments are shown in the search results:</td>
</tr>
<tr>
<td>(glide.knowman.search.attachment)</td>
<td>- Do not show attachment</td>
</tr>
<tr>
<td></td>
<td>- Show only link for attachment</td>
</tr>
<tr>
<td></td>
<td>- Show attachment with text snippet (default)</td>
</tr>
<tr>
<td></td>
<td>For best performance, select Do not show attachment, or Show only link for attachment.</td>
</tr>
<tr>
<td>Show relevancy in knowledge search results.</td>
<td>Select this check box to show how relevant each search result is based on the search string.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_relevancy)</td>
<td>Relevancy value is only shown when knowledge search result order property is set to Relevancy.</td>
</tr>
<tr>
<td>Show number of knowledge blocks in the knowledge block search results when creating or updating a knowledge article. Maximum results displayed will be 25. (glide.knowman.add_blocks.search_results)</td>
<td>Define how many search results can be displayed when a knowledge block is searched for. By default, the minimum value is 6 and the maximum is 25.</td>
</tr>
<tr>
<td>Enable instant search results for knowledge.</td>
<td>Select this check box to enable instant search for search results. The default is No.</td>
</tr>
<tr>
<td>(glide.knowman.search.instant_results)</td>
<td></td>
</tr>
<tr>
<td>Show Knowledge Base name in Knowledge search results.</td>
<td>Select this check box to display the knowledge base to which the knowledge base article belongs. For example, IT.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_knowledgebase)</td>
<td></td>
</tr>
<tr>
<td>Show average rating from knowledge search results.</td>
<td>Select this check box to display the average star ratings for knowledge base articles.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_rating)</td>
<td></td>
</tr>
<tr>
<td>Show article number in knowledge search results.</td>
<td>Select this check box to display the article number for each article in the search result.</td>
</tr>
<tr>
<td>(glide.knowman.search.show_article_number)</td>
<td>If the article versioning feature is enabled, the article number and the version number are displayed for each article in the search result.</td>
</tr>
</tbody>
</table>
### Knowledge article view properties

Article view properties give you control over the meta data and rating options that appear with articles. They also enable you to grant access to individual feedback options based on user role.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Specify default language for searching articles. 
(glide.knowman.search.default_language) | Set the property to the desired default language for searching articles.  
- **String**  
- **Default value**: user-specified  
- **Location**: System Properties  

**Note:** If the glide.knowman.enable_multi_language_search property is set to True, then the multi-language search capability overrides the default language search capability. |
| Enable multi-language search. 
(glide.knowman.enable_multi_language_search) | Set the property to True to enable search for multiple languages simultaneously.  
- **Type**: true | false  
- **Default value**: false  
- **Location**: System Properties  

**Note:** If this property is set to True, it overrides the setting for the glide.knowman.search.default_language property. |
| Maximum character limit for meta description used for SEO. 
(glide.knowman.seo.pages.meta_description.length) | Set the maximum number of characters used as meta description for SEO.  
- **Type**: integer  
- **Default value**: 100  
- **Location**: System Properties  

When you change the character limit, the meta description with the updated limit is only applied to articles published after the change was made. To apply the change to all existing published articles, run the Populate Meta Description on KB Articles fix script. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show tasks to which an article has been recently attached.</td>
<td>Select the <strong>Yes</strong> check box to have article view include a list of tasks associated with the article. The list of associated tasks appears on the Most Recent Tasks widget on the article view page. The widget appears only when a task is attached to the article and this property is set to <strong>Yes</strong>. Knowledge articles can be attached to a task by clicking the Attach to Task button after searching from a form.</td>
</tr>
<tr>
<td>Number of attached tasks to display when viewing an article.</td>
<td>Specify the maximum number of tasks to list in article view.</td>
</tr>
<tr>
<td>Show article rating section, which may optionally include yes/no rating, star rating, and flagging options.</td>
<td>Select the <strong>Yes</strong> check box to display the rating options for users with specific roles. Clear this check box to omit the rating section for all users, regardless of role. The <strong>Feedback</strong> field is always displayed for all users.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can see an article's rating section, which may optionally include yes/no rating, star rating, and flagging option.</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If <strong>Show article rating section...</strong> is selected, users with the roles listed here see the yes/no rating, star rating, and flagging options, according to related property settings. Be sure to include all roles that should be permitted to see any of these rating options. Separate properties enable you to identify specific roles for each option separately. All roles in those properties must also be listed here.</td>
</tr>
<tr>
<td>Show the &quot;Was this article helpful?&quot; yes/no rating option.</td>
<td>Select the <strong>Yes</strong> check box to display the &quot;Was this article helpful?&quot; rating to users with roles set in the associated property. This appears only if the <strong>Show article rating section...</strong> property is selected.</td>
</tr>
<tr>
<td>List of roles (comma separated) that can see yes/no &quot;Was this article helpful?&quot; rating option.</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If both <strong>Show article rating section...</strong> and <strong>Show the &quot;Was this article helpful?&quot;</strong> properties are selected, users with the roles listed here see the &quot;Was this article helpful?&quot; rating in article view. All roles listed here must also be listed in the <strong>List of roles that can see an article's rating section...</strong> property.</td>
</tr>
<tr>
<td>Show &quot;Create Incident&quot; link.</td>
<td>Select the <strong>Yes</strong> check box to display the Create Incident link.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>URL used for the &quot;Create Incident&quot; link.</td>
<td>Enter the URL for the page where users can create an incident only if the Show &quot;Create Incident&quot; link...&quot; property is selected.</td>
</tr>
<tr>
<td>(glide.knowman.create_incident_link)</td>
<td>To find the URL, open the appropriate page, then right-click the header bar and choose Copy URL. Highlight the URL that appears and use the browser's copy and paste feature to place it into this property field.</td>
</tr>
<tr>
<td>Show five-star rating option.</td>
<td>Select the Yes check box to display the five-star rating to users with roles set in the associated property. This appears only if the Show article rating section... property is selected.</td>
</tr>
<tr>
<td>(glide.knowman.show_star_rating)</td>
<td></td>
</tr>
<tr>
<td>List of roles (comma separated) that can see five-star rating option.</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If both Show article rating section... and Show five-star rating option properties are selected, users with the roles listed here see the five-star rating option in article view.</td>
</tr>
<tr>
<td>(glide.knowman.show_star_rating.roles)</td>
<td>All roles listed here must also be listed in the List of roles that can see an article's rating section...&quot; property.</td>
</tr>
<tr>
<td>Show 'Flag Article' option to identify incomplete/inaccurate articles.</td>
<td>Select the Yes check box to display the flag article option to users with roles set in the associated property. This appears only if the Show article rating section... property is selected.</td>
</tr>
<tr>
<td>(glide.knowman.show_flag)</td>
<td></td>
</tr>
<tr>
<td>List of roles (comma separated) that can flag incomplete/inaccurate articles.</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If both Show article rating section... and Show 'Flag Article' option properties are selected, users with the roles listed here see the flag article option in article view.</td>
</tr>
<tr>
<td>(glide.knowman.show_flag.roles)</td>
<td>All roles listed here must also be listed in the List of roles that can see an article's rating section...&quot; property.</td>
</tr>
<tr>
<td>Show user comments on knowledge articles.</td>
<td>Select an option for showing user comments When article loads, When user clicks link to show comments, or Never for users with roles set in the associated property:</td>
</tr>
<tr>
<td>(glide.knowman.show_user_feedback)</td>
<td></td>
</tr>
<tr>
<td>List of roles (comma separated) that can see user comments on an article.</td>
<td>Enter role names exactly as they appear in User Administration &gt; Roles. If the Show user comments on knowledge articles property is selected, users with the roles listed here see user comments in article view.</td>
</tr>
<tr>
<td>(glide.knowman.show_user_feedback.roles)</td>
<td></td>
</tr>
<tr>
<td>Maximum number of user comments displayed on a knowledge article.</td>
<td>Set the maximum number of user comments to display. If no value is set, all comments are displayed. This property does not apply to live feed comments on the article view page.</td>
</tr>
<tr>
<td>(glide.knowman.feedback.display_threshold)</td>
<td></td>
</tr>
</tbody>
</table>
### Property Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Use Live Feed for Knowledge feedback. ([glide.knowman.use_live_feed](#)) | Set the property to **True** to use live feed to manage and display feedback on knowledge articles.  
  - **Type:** true | false  
  - **Default value:** false  
  - **Location:** System Properties |

### Knowledge homepage properties

Knowledge homepage properties control the featured content on the knowledge homepage.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display or hide the count of articles and questions in the Knowledge Homepage. (<a href="#">glide.knowman.show_number_on_homepage</a>)</td>
<td>Select to display or hide the count of knowledge articles and questions on the Knowledge homepage.</td>
</tr>
<tr>
<td>Default keyword for getting pinned articles (<a href="#">glide.knowman.default_keyword</a>)</td>
<td>Enter a default keyword for pinned articles. Articles pinned with the specified keyword appear in the Featured Content section of the knowledge homepage.</td>
</tr>
<tr>
<td>Display or hide the count of articles and questions in the category and child categories (<a href="#">glide.knowman.show_number_on_categories</a>)</td>
<td>Select to display the count of articles and questions within each category, including subcategories, when browsing or searching knowledge bases.</td>
</tr>
<tr>
<td>Show Knowledge Home page when user has access to only one Knowledge Base (<a href="#">glide.knowman.show_home_if_one_kb</a>)</td>
<td>Select to display the Knowledge homepage when the current user has access to only one knowledge base.</td>
</tr>
<tr>
<td>Default header title for the pinned articles section on knowledge home pages. (<a href="#">glide.knowman.default_pinned_section_header_title</a>)</td>
<td>Enter a title for the Featured Content section of the knowledge homepage.</td>
</tr>
</tbody>
</table>

### Other knowledge properties

Other knowledge properties let you control general knowledge management features.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>When attaching an article to an incident, copy the content into this field. (glide.knowman.attach.fields)</td>
<td>When a user searches knowledge from a task form (such as an incident, problem, or change) and clicks the Attach to Task button for an article, the system copies the article number and content into the field specified in the Value column here. This field is generally a journal field such as Comments or Work Notes. Use dot walking to copy the article content into related records. If a specified field does not exist, that field is ignored.</td>
</tr>
<tr>
<td>Displays a read-only article view page when articles are viewed from contextual search (glide.knowman.contextual_search.show_read_only_article)</td>
<td>Displays a read-only article view page when knowledge articles are viewed from contextual search.</td>
</tr>
<tr>
<td></td>
<td>- Type: true</td>
</tr>
<tr>
<td></td>
<td>Note: The glide.knowman.contextual_search.show_read_only_article property is activated by default. If the property isn’t available, add it manually and set its value to true to display read-only knowledge articles accessed from the contextual search. For more information, see Add a system property.</td>
</tr>
<tr>
<td>Knowledge Management logo to display if running out of the ServiceNow frames. (glide.knowman.frameless_logo)</td>
<td>Click the reference lookup tool and choose an image file to be displayed on knowledge pages that are used outside of the ServiceNow application frames. For example, the logo image selected here appears if you create a Content Management System site that includes knowledge pages. You can also enter the Name of an image stored in the database to use that image.</td>
</tr>
<tr>
<td></td>
<td>Note: This property applies only to Knowledge v2 pages. This property is not supported on Knowledge v3 pages.</td>
</tr>
<tr>
<td>Hide the 'Import' functionality (button and drag-n-drop) for all users. (glide.knowman.import.hide_import_functionality)</td>
<td>Select Yes to hide the Import Articles button. If you have not yet migrated to Knowledge v3 and are using legacy Knowledge v2, you can configure the visibility of the Import Articles button to prevent users from importing articles to knowledge bases.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Show publish check box on the knowledge import pop-up.</td>
<td>Select No to remove the Publish check box on the knowledge import form so that an article cannot be published as part of the import process. Default is yes.</td>
</tr>
<tr>
<td>(glide.knowman.import.show_publish_checkbox)</td>
<td></td>
</tr>
<tr>
<td>Use submission workflow.</td>
<td>Select the Yes check box to use the knowledge submission workflow instead of the standard knowledge workflow. If this option is selected, each time a user creates knowledge from an incident or problem, the content is placed into a submission record instead of a draft article. Transforming knowledge submissions into articles follows a specific workflow.</td>
</tr>
<tr>
<td>(glide.knowman.submission.workflow)</td>
<td></td>
</tr>
</tbody>
</table>
| Disable creating or updating articles larger than server size limit.   | Select Yes to disable creating or updating knowledge articles with content more than server limit of the Now Platform. By default, the server limit is 1 MB. Therefore, you can't create or edit knowledge articles with content more than 1 MB. The limit doesn't apply to the attachments of a knowledge article.  
By default, this property is enabled. If you disable this property, and try to create or update a knowledge article with content more than the server limit, some actions on the knowledge article might fail. | (glide.knowman.check_article_size)                                                                                                                                                                            |
| The sys_id of the knowledge base when creating knowledge from task records. | Enter the sys_id of the knowledge base to put new knowledge articles created from tasks in.                                                                                                               |
| (glide.knowman.task_kb)                                                |                                                                                                                                                                                                              |
| Before displaying the text of the article in search results or the article view, check field-level ACLs on appropriate field: kb_knowledge.text (HTML article) or kb_knowledge.wiki (wiki text article). | Select this check box if users must have ACL-based permission to view text fields on the Knowledge (kb_knowledge) table to read article previews in knowledge search results. |
| (glide.knowman.text.check_can_read)                                    |                                                                                                                                                                                                              |
| Send notification to approvers and authors in article approval workflow | Select this check box to send approval email notifications. By default, the property is enabled.                                                                                                               |
| (glide.knowman.enable_approval_notification)                           |                                                                                                                                                                                                              |
| glide.knowman.allow_edit_global_articles                               | Enter the value as true to enable checking out and editing global articles for users from a domain other than the global domain. Type: true | false  
Default value: true  
Location: System Properties |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| When showing a list of articles through the Knowledge portal (using the kb_list UI Page), remove articles the user cannot see before building the list. (glide.knowman.list.filter) | Enter the value as true to enable removal of articles that user cannot see before building the articles list in the knowledge portal.  
- Type: true | false  
- Default value: false  
- Location: System Properties  
If you have large number of articles in your knowledge base, setting this property to true will negatively impact performance. |
| Create translation task when an article is published (glide.knowman.translation.enable_translation_task) | Enter the value as true to enable creation of translation tasks.  
- Type: true | false  
- Default value: false  
- Location: System Properties |
| Deny access to a knowledge base when either Can Read or Can Contribute user criteria list for the knowledge base isn’t specified (glide.knowman.block_access_with_no_user_criteria) | Enter the value as true to deny contribute access to a knowledge base when Can Contribute isn’t set and read access when Can Read isn't set.  
- Type: true | false  
- Default value: true  
- Location: System Properties |

**Knowledge Social Q&A properties**

You can set the limit for the number of times users can ask, answer, or subscribe to Social Q&A questions, or comment on the questions and answers using the Social Q&A system properties.

**Note:** To open the System Properties (sys_properties) table, enter sys_properties.list in the navigation filter.

**Note:** If the Value field for any of the Social Q&A properties is left blank, then a rate limit does not apply for that particular property.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of Social Q&A questions that can be posted per user per day. (sn_kb_social_qa.max_questions_per_user) | Enter the maximum number of times a user can post Social Q&A questions per day.  
- Type: Integer  
- Default value: 500  
- Location: System Properties |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of Social Q&A answers that can be posted per user per day | Enter the maximum number of times a user can post answers to the Social Q&A questions per day.  
  `sn_kb_social_qa.max_answers_per_user_daily`  
  - Type: Integer  
  - Default value: 500  
  - Location: System Properties |
| Maximum number of Social Q&A comments that can be posted per user per day | Enter the maximum number of times a user can post comments to the Social Q&A questions or answers per day.  
  `sn_kb_social_qa.max_comments_per_user_daily`  
  - Type: Integer  
  - Default value: 500  
  - Location: System Properties |
| Maximum number of times a user can subscribe to Social Q&A questions per day | Enter the maximum number of times a user can subscribe to Social Q&A questions per day.  
  `sn_kb_social_qa.max_subscriptions_per_user_daily`  
  - Type: Integer  
  - Default value: 500  
  - Location: System Properties |

**Article versioning properties**

The knowledge administrator can set configuration properties that enable users to edit specific fields on published articles without creating new versions.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable article versioning feature.  
  `(glide.knowman.versioning.enabled)`                                   | Select the Yes check box to enable the article versioning feature.  
  - Type: true | false  
  - Default value: true  
  - Location: Knowledge > Administration > Properties                 |
## Now Platform capabilities

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable minor edits to a published article without creating a new version. (glide.knowman.versioning.enable_minor_edits) | Select the Yes check box to enable minor edits to published articles and associated attachments without creating a new version. When you enable this property, you can also add or remove any attachments associated with knowledge articles.  
- Type: true | false  
- Default value: false  
- Location: Knowledge > Administration > Properties |
| A comma-separated list of fields that can be edited on published articles without creating a new version. (glide.knowman.versioning.minor_edit_fields) | Enter the fields in a comma-separated list that can be edited on published articles without creating a new version.  
- Type: string  
- Default value: valid_to  
- Location: Knowledge > Administration > Properties |

### Knowledge subscription properties

The knowledge administrator can set configuration properties that enable users to subscribe to knowledge bases and knowledge articles.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable subscribe feature for KM (glide.knowman.enable_km_subscription) | Select the Yes check box to enable the Knowledge subscription feature.  
- Type: true | false  
- Default value: true  
- Location: Knowledge > Administration > Properties |
| List of roles (comma-separated) who can have subscription feature (glide.knowman.enable_km_subscription.roles) | Enter the roles in a comma-separated list that can use the Knowledge subscription feature.  
- Type: string  
- Default value: knowledge  
- Location: Knowledge > Administration > Properties |
## Article quality index properties

The knowledge administrator can set the pass score for AQI reviews using the knowledge properties page.

**Properties for Article Quality Index**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pass score for AQI reviews.</td>
<td>Set the pass score for AQI reviews.</td>
</tr>
</tbody>
</table>
| glide.knowman.aqi_pass_score | - Type: integer  
- Default value: 70  
- Range of values possible: 1-100 |
| List of article workflow states to perform AQI reviews. | Enter the article workflow states, in a comma-separated list, where users can perform AQI reviews. |
| glide.knowman.aqi.article_workflow_states | - Type: string  
- Default value: draft, review, published |

## External Content Integration Properties

Administrators can configure the properties to add allowed content types and change the UI label for the external content integration feature.

**Properties for External Content Integration**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum limit for total size of external content in Knowledge Management (in GB). | - Type: integer  
- Default value: 2 |
<p>| sn_km_intg.glide.knowman.external.max_content_size | Note: This is a read-only field. |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size of an external article including its attachments (in MB)</td>
<td><strong>Note:</strong> This is a read-only field.</td>

<td><strong>Default value:</strong> External Content</td>
</tr>
<tr>
<td></td>
<td>sn_km_intg.glide.knowman.external.ui_label_for_external_content</td>
</tr>
</tbody>
</table>

**Actionable Knowledge Feedback Properties**

The Knowledge administrator can set configuration properties that would create actionable feedback tasks.

**Properties for Actionable Knowledge Feedback**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create actionable feedback task when an article is flagged.</td>
<td>Select the <strong>Yes</strong> check box to enable actionable feedback task generation when an article is flagged for incorrect or inappropriate content.</td>
</tr>
<tr>
<td>(glide.knowman.feedback.enable_actionable_feedback_for_flag)</td>
<td><strong>Type:</strong> true</td>
</tr>
<tr>
<td></td>
<td><strong>Default value:</strong> true</td>
</tr>
<tr>
<td></td>
<td><strong>Location:</strong> Knowledge &gt; Administration &gt; Properties</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Create actionable feedback task when an article is marked as not helpful. | Select the **Yes** check box to enable actionable feedback task generation when an article is marked as not helpful.  
*(glide.knowman.feedback.enable_actionable_feedback_for_helpful)*  
- **Type:** true | false  
- **Default value:** false  
- **Location:** **Knowledge > Administration > Properties** |
| Create actionable feedback task when an article is rated at or lower than this value. 0 or no value indicates that actionable feedback tasks are not enabled for Rating type feedback. | An actionable feedback task is created when an article is rated at or lower than this value. The article is rated on a scale of 1-5.  
*(glide.knowman.feedback.enable_actionable_feedback_for_rating)*  
- **Type:** integer  
- **Default value:** none  
- **Location:** **Knowledge > Administration > Properties** |

**Scoped knowledge bases**

To protect knowledge bases containing sensitive articles, use a scoped knowledge base. Even system administrators and knowledge administrators can’t administer scoped knowledge bases unless explicitly authorized through user criteria.

For example, say you have a knowledge article with sensitive payroll information that should be seen only by the Payroll department and not by a system administrator or knowledge administrator. You could create a knowledge article with the sensitive information in a scoped knowledge base within the Human Resources: Core application.

Only users with the admin role of an application and the knowledge_admin role can administer a scoped knowledge base. You control access to knowledge bases of an application with application administration enabled, such as HR, through the ACLs of the knowledge tables in the application instead of global ACLs. To define access to a scoped knowledge base, specify appropriate user criteria for users, including system administrators and knowledge administrators.

To create a scoped knowledge base for an application, in addition to the knowledge_admin or admin role, you must have access to view and select that application in the application picker (see [Application picker](#)). For example, before you create a knowledge base in the Human Resources: Core application, you must select the Human Resources: Core application in the application picker, and then create the knowledge base. Then, when you create a knowledge base, on the Knowledge base form, the application scope of the knowledge base is set in the **Application** field.

**Knowledge Management setup guide for admins**

Before users in your organization can start creating knowledge bases and knowledge articles, you must set up Knowledge Management. Work with stakeholders to define requirements for setting up Knowledge Management effectively to meet the needs of users.

**Requirements**

Role required: admin
Before you begin

Meet with the stakeholders

<table>
<thead>
<tr>
<th>Stakeholder</th>
<th>Responsibilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge manager</td>
<td>Defines and oversees the knowledge management processes for day-to-day operations related to content publishing and usage.</td>
</tr>
<tr>
<td>Knowledge admin</td>
<td>Configures advanced settings for specific Knowledge Management features</td>
</tr>
<tr>
<td>Knowledge coach</td>
<td>Enables users to adhere to content standards.</td>
</tr>
<tr>
<td>Knowledge domain expert</td>
<td>Provides domain knowledge expertise.</td>
</tr>
<tr>
<td>Version author</td>
<td>Contributor to a particular version of an article.</td>
</tr>
<tr>
<td>Content creators and reviewers</td>
<td>Create, review, and update articles in the knowledge bases.</td>
</tr>
<tr>
<td>Community managers</td>
<td>Focus on the creation and curating of social content.</td>
</tr>
<tr>
<td>Line managers</td>
<td>Manage teams that create and use knowledge articles</td>
</tr>
</tbody>
</table>

With stakeholders, determine the following requirements

- Who are the consumers of the content in the knowledge bases?
- Who are the writers, editors, and managers for the knowledge base articles?
- What are the required workflows to publish and retire articles?
- What are the unique behaviors required for your knowledge management implementation? For example, should attachments appear in search results?
- Do you want to translate knowledge articles into other languages?

What to do

Assign knowledge roles to users and groups

Determine which Knowledge Management roles are appropriate for each user, and then assign those roles.

Create custom Knowledge workflows

If the default knowledge workflows for publishing and retiring knowledge articles are not appropriate for your knowledge bases, create custom workflows for those knowledge bases.

Configure Knowledge properties

If the default knowledge properties do not fulfill the requirements of users, reconfigure the properties as necessary.

Activate support for other languages besides English

If languages other than English must be supported, activate the Knowledge Management Internationalization plugins.
Coordinate with knowledge managers for knowledge base setup

Let knowledge managers and administrators know that they can start configuring their knowledge bases. For details, refer them to the *Knowledge base setup guide for knowledge admins and managers.*

Next steps

Depending on any other requirements for the knowledge bases, you may be asked to help with additional tasks, such as configuring knowledge homepages.

Using guided setup to implement Knowledge Management

Knowledge Management guided setup provides a sequence of tasks that help you configure Knowledge Management on your instance. To open Knowledge Management guided setup, navigate to *Knowledge Management > Administration > Guided Setup.*

For more information about using the guided setup interface, see *Using guided setup.*

Domain separation and Knowledge Management

This is an overview of domain separation and Knowledge Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes *Basic* level
- Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another. Business logic:

Overview

Domain separation works differently at different access levels of an application. In Knowledge Management, data, requester, and fulfiller access to knowledge bases are domain separated.

How domain separation works in Knowledge Management

In Knowledge Management, the following rules apply:

Data: At the data level of domain separation, data visibility is separated from one domain to another. Knowledge bases, user criteria, articles, categories, article feedback, article versions, article templates, and external sources are domain separated in the base system.
**Note:** The data in one domain cannot be seen in any other domain. For example, if you create a Knowledge Management article in a domain A using an article template which is not in domain A, the article will not be visible in domain A. Similarly, if you create a Knowledge Management article in the global domain using a template that is not in global, the article might not be visible in all the domains.

Requester: Requester activities are supported within tenant domains. Users can search; view; comment; and rate articles of their domain, any child domain, and global domains, if feedback is enabled and the knowledge base settings grant them read access to articles.

- Users in the global domain can access articles in all the domains if read access is granted at knowledge base and/or article level.
- Users in the parent domain can access articles in that domain, global, and all its child domains if read access is granted at knowledge base and/or article level.
- Users in the child domain can access articles in that domain and the global domain if read access is granted at knowledge base and/or article level.

Fulfiller: The application can be used by the Fulfiller within the tenant domains as a tenant domain-owned application. Users are allowed to author articles in knowledge bases of their domain, any child domain, and the global domain if the knowledge base has user criteria set up to grant contribute access.

- Articles are automatically saved to the user’s current domain when the article is created.
- If the `glide.knowman.allow_edit_global_articles` system property is enabled, users from a domain other than the global domain can check out and edit global articles. Otherwise, system administrators and users from a domain other than the global domain cannot check out global articles and are shown a warning message to that effect. Depending on their access, users can change their domain to the global domain to check out and edit the global articles.
- Domains of versioned articles will be maintained as per the latest article version's domain. This includes updating the domain for `kb_version`, `kb_knowledge`, `kb_feedback`, and `sys_attachment` tables.

See *Managing access to knowledge bases and knowledge articles* to learn how to control contribute and read access to knowledge bases and knowledge articles.

**Use cases**

This image demonstrates a basic domain hierarchy that is available in the base system.

| MSP domain (TOP/MSP)  |                       |                                 |                |                              |

### Known Issues

- The following AQI tables are not domain separated:
  - AQI Checklist (kb_quality_checklist)
  - Checklist Question (kb_checklist_question)
  - Article Checklist Answer (kb_article_checklist_answer)

  **Note:** The Article Checklist Answer table does not contain the Order field. The application shows the list in a random order.

- Comment provided by a user on an article is stored in article's domain instead of user domain.
Knowledge base setup guide for knowledge admins and managers

After basic Knowledge Management setup is completed, you can set up a knowledge base for users to create and publish knowledge articles.

Create multiple knowledge bases for different groups within your organization to share information within and between those groups. Create scoped knowledge bases to enable only application administrators to administer the knowledge bases and restrict unauthorized access to application-specific data.

Administrators create knowledge bases, and assign them to individual managers responsible for controlling the behavior and organization scheme of each knowledge base.

Each knowledge base contains knowledge articles that provide information for users, such as policy, release notes, or instructions for a task. Each knowledge base can also use a separate workflow for publishing and retiring articles.

Requirements

Role required: knowledge_administrator, knowledge_manager, or admin

Before you begin

Determine the following requirements for each knowledge base that you want to set up:

- Whether to create a scoped knowledge base? For more information, see Scoped knowledge bases.
- Who are the knowledge base managers that are responsible for approving articles?
- Who are the users and contributors for that knowledge base? Access for these users is defined through user criteria.
- What are the categories to be used to classify articles? Will users be able to create categories?
- Will users of the knowledge base be able to create new content?
- Will Social Q&A be leveraged for this knowledge base?

What to do

Set up the knowledge base

1. Create the knowledge base.
2. Set up which users can read, create, or edit knowledge articles by selecting user criteria for the knowledge base.
3. Define the approval process for articles using workflows.
4. Define the knowledge categories that are needed for organizing articles in the knowledge base.
5. If you want to enable users to ask and answer questions in the knowledge base, activate Social Q&A.
6. If you want a custom knowledge homepage, ask your ServiceNow administrator to create it.
Next steps

Let users in your organization know that they can start creating and searching articles in the knowledge base. For details, refer users to the Knowledge Management guide for users.

If you have the knowledge_manager role, there are many other tasks that you can perform to maintain the knowledge base. You can pin articles so they are featured prominently in the search results and on homepages. You can also assign other users as managers of a knowledge base. For details, see Knowledge manager.

Quick start tests for Knowledge Management

Validate that Knowledge Management still works after you make any configuration change, such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Knowledge Management quick start tests require activating the Knowledge Management Core plugin (com.glideapp.knowledge), the Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer), the Knowledge Blocks plugin (com.snc.knowledge_blocks), and the Customer Service Management Demo Data plugin (com.snc.customerservice.demo).

## Configure Knowledge Management

Configure various aspects of Knowledge Management based on the specific requirements of your organization.

The following podcast offers additional information on using Knowledge Management.

### Create a knowledge base

Create a knowledge base to provide a self-service platform for users to store, share, and manage content. Configure knowledge bases into product or service categories and manage user access based on permissions. Customize workflows for publishing and retiring articles in the knowledge base.

Understand the requirements for setting up a knowledge base.

Role required: knowledge_admin or admin

1. Navigate to **Knowledge Administration > Knowledge bases**.
2. In the Knowledge Bases list, click **New**.
3. On the Knowledge base form, fill in the following fields as appropriate:

#### Knowledge base form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Unique name for the knowledge base.</td>
</tr>
<tr>
<td>Article Validity</td>
<td>Number of default days articles will be valid for after their created date.</td>
</tr>
</tbody>
</table>

**Note:** The Article Validity field is configured to set the Valid to date for an article. The Valid to date is the date this knowledge article expires. When you create an article within a knowledge base, the date value in the Valid to field of the article is calculated as follows: Created (sys_created_on) + Article Validity (in days). An article author or editor can select whether to keep or change the Valid to date (see Create a knowledge article). If the Article Validity field is blank, the date in the Valid to field date is set to January 1, 2100.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Icon</td>
<td>An image that provides a visual reference to describe the knowledge base. This image is displayed next to all articles from this knowledge base in the article search results page.</td>
</tr>
<tr>
<td>Disable commenting</td>
<td>Option to disable commenting. If selected, users cannot comment on articles in the knowledge base.</td>
</tr>
<tr>
<td>Disable suggesting</td>
<td>Option to disable edit suggestions. If selected, users cannot suggest edits to articles in the knowledge base.</td>
</tr>
<tr>
<td>Disable category editing</td>
<td>Option to disable editing of knowledge categories. If selected, only knowledge managers can add or edit knowledge categories for the knowledge base.</td>
</tr>
<tr>
<td>Enable blocks</td>
<td>Option to enable the knowledge blocks feature. If selected, you can create knowledge blocks to add to knowledge articles within a knowledge base.</td>
</tr>
<tr>
<td>Checklist</td>
<td>Checklist to evaluate the quality of articles in the knowledge base.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the knowledge base.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is automatically set to the application selected in the application picker. For information about a scoped knowledge base, see Scoped knowledge bases.</td>
</tr>
<tr>
<td>Owner</td>
<td>The user responsible for the knowledge base. A knowledge base owner can assign other roles to the knowledge base.</td>
</tr>
<tr>
<td>Managers</td>
<td>Users who perform administrative functions on the knowledge base.</td>
</tr>
<tr>
<td>Publish workflow</td>
<td>The workflow for publishing the articles in the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Knowledge - Instant Publish:</strong> publishes articles in the knowledge base without requiring an approval.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Knowledge - Approval Publish:</strong> requests approval from the manager of the knowledge base before moving the articles to the published state.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Retire workflow               | The workflow for retiring the articles in the knowledge base.  
  * Knowledge - Instant Retire: retires articles in the knowledge base without requiring an approval.  
  * Knowledge - Approval Retire: requests approval from the manager of the knowledge base before moving the articles to the retired state. |
| Active                        | Option to indicate that the knowledge base is active. If not selected, only users with the admin role can create or view its articles.          |
| Enable social questions and answers | Option to enable social Q&A for articles in the knowledge base.                                                                          |
| Description                   | A short description to describe the knowledge base.                                                                                       |
| Set default knowledge field values | Default configuration settings for the knowledge base.                                                                                     |
| Related products              | List of products related to the knowledge base content.                                                                                   |
| Auto-create translation tasks | Option to enable creating translation tasks automatically after an article is published.  
  If selected, when a knowledge article is published in this knowledge base, translation tasks are automatically created for the configured languages.  
  This field appears only when the translation management feature and glide.knowman.translation.enable_translation_task property are enabled. For more information, see Translation management and Knowledge properties. |
| Languages                     | Languages enabled for the knowledge articles in this knowledge base.  
  If your system has more languages, use this option to select only those languages in which you want to translate knowledge articles in this knowledge base.  
  You can add more languages later. However, you can remove languages only when no knowledge articles exist in that language.  
  This field appears only when the translation management feature and glide.knowman.translation.enable_translation_task property are enabled. For more information, see Translation management and Knowledge properties. |

4. Right-click the form header and click **Save**.

5. In the related list section, view or configure the following items related to the knowledge base:
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge</td>
<td>List of knowledge articles stored in this knowledge base.</td>
</tr>
<tr>
<td>Questions</td>
<td>List of Social Q&amp;A questions stored in this knowledge base.</td>
</tr>
<tr>
<td>Can Read</td>
<td>List of user criteria that grants read access and enables user matching the criteria to read articles in a knowledge base.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> It is recommended to assign appropriate user criteria to secure read access. See, Select user criteria for a knowledge base.</td>
</tr>
<tr>
<td>Can Contribute</td>
<td>List of user criteria that grants contribute access and enables user matching the criteria to create and modify articles in a knowledge base.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> It is recommended to assign appropriate user criteria to secure contribute access. See, Select user criteria for a knowledge base.</td>
</tr>
<tr>
<td>Article Templates</td>
<td>If you have activated the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin, the Article Templates related list is displayed.</td>
</tr>
<tr>
<td></td>
<td>If there are article templates in the related list, articles in that knowledge base can only be created using one of the article templates listed.</td>
</tr>
<tr>
<td></td>
<td>If the Article Templates related list is empty, articles can be created using any article template.</td>
</tr>
<tr>
<td></td>
<td>Click Edit to map article templates to the knowledge base.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Admins, knowledge admins, and knowledge managers can edit the article templates for the knowledge base.</td>
</tr>
<tr>
<td>Featured Content</td>
<td>List of knowledge articles that appear in the homepage Featured Content section based on the corresponding keyword search set for each article.</td>
</tr>
<tr>
<td>Knowledge Categories</td>
<td>List of knowledge categories associated with this knowledge base.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
Create a custom knowledge homepage

As a system administrator, you can create a module allowing users to open a knowledge homepage for a specific knowledge base or category.

Role required: admin

1. Right-click the application label in the application navigator and select Edit Application.
2. In the Modules related list click New.
3. Enter a Title for the module.
4. In the Link type field, select URL (from Arguments).
5. In the Arguments field, append one or more of the following values to $knowledge.do#/search?.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_kb=&lt;knowledge base sys_id&gt;</td>
<td>Enter the sys_id of a knowledge base to show knowledge articles from that knowledge base by default.</td>
</tr>
<tr>
<td></td>
<td>If the specified knowledge base does not exist, the default knowledge homepage appears when accessing the custom homepage module.</td>
</tr>
<tr>
<td>sysparm_category=&lt;knowledge category sys_id&gt;</td>
<td>Enter the sys_id of a knowledge category to show knowledge articles from that category by default.</td>
</tr>
<tr>
<td></td>
<td>If the specified category does not exist, the default category for the selected knowledge base appears when accessing the custom homepage module.</td>
</tr>
</tbody>
</table>

**Note:** The category passed in this parameter must belong to the knowledge base passed in the sysparm_kb parameter.

| sysparm_order=<view_count, last_modified, or relevancy> | Enter the default sort order for articles to appear in.                                                                                      |

To create a homepage for a Facilities knowledge base with a sys_id of d582764047022100158b949b6c9a7145 and sorting by last modified date, enter $knowledge.do#/search?
sysparm_kb=d582764047022100158b949b6c9a7145&sysparm_order=last_modified in the Arguments field on the Module form.

Knowledge workflows

The publishing and retirement processes for a knowledge article are controlled by workflows defined for the knowledge base that the article belongs to.

You can assign different workflows to each knowledge base.

You can use one of the default workflows, or create your own workflows to define custom publishing and retirement processes for different types of knowledge.

For the workflows that require approval, you can configure which users can approve or reject by editing the getApprovers() function in the KBWorkflow script include.
### Default knowledge workflows

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge - Approval Publish</td>
<td>Requests approval from a manager of the knowledge base. Articles in approval are <strong>In Review</strong> state before moving to <strong>Published</strong> state once approved or to <strong>Scheduled for publish</strong> if set to publish later. If the manager rejects the request, the workflow is canceled and the article remains in <strong>Draft</strong> state. If ownership groups is enabled, email notifications with a link to the article are sent to the ownership group members for approval. If ownership groups is not enabled, email notifications with a link to the article are sent to knowledge base managers for approval. A notification is also sent to authors or revisers of articles to inform them that their article has been approved or rejected. To turn on approval email notifications, set the <code>glide.knowman.enable_approval_notification</code> property to <code>true</code>.</td>
</tr>
<tr>
<td>Knowledge - Approval Retire</td>
<td>Requests approval from a manager of the knowledge base before moving the article to the retired state. The workflow is canceled and the article remains in the published state if any manager rejects the request.</td>
</tr>
<tr>
<td>Knowledge - Instant Publish</td>
<td>Immediately publishes a draft article without requiring an approval, or publishes on the scheduled publish date if set to publish later.</td>
</tr>
<tr>
<td>Knowledge - Instant Retire</td>
<td>Immediately retires a published article without requiring an approval.</td>
</tr>
<tr>
<td>Knowledge - Publish Knowledge</td>
<td>A subflow that moves the knowledge article to the published state. You can use this subflow when defining your own workflow.</td>
</tr>
<tr>
<td>Knowledge - Retire Knowledge</td>
<td>A subflow that moves the knowledge article to the retired state. You can use this subflow when defining your own workflow.</td>
</tr>
</tbody>
</table>

**Note:** Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.

### Email notifications for approval workflows

You can send email notifications for approval workflows.

- Notify approvers about knowledge articles submitted for their approvals.
• Notify authors about the approval status of their knowledge articles.

To send email notifications for approval workflows, enable the **Send notification to approvers and authors in article approval workflow** property (**glide.knowman.enable_approval_notification**). Beginning with New York, the property is enabled by default. Existing customers on release versions prior to New York can enable this property to send email notifications. Disable any custom notifications for article approvals before enabling this property. If the **glide.knowman.enable_approval_notification** property is not available, an administrator can create the property and set its value to **true**. For more information, see **Knowledge properties**.

**Activate the Knowledge Management Advanced plugin**

Activate the Knowledge Management Advanced plugin (**com.snc.knowledge_advanced**) to enable advanced features for Knowledge Management.

Role required: admin

The Knowledge Management Advanced plugin includes feature code and demo data.

The Knowledge Management Advanced Installer plugin (**com.snc.knowledge_advanced.installer**) is used to activate the Knowledge Management Advanced plugin.

**Note:** The Knowledge Management Advanced plugin is not automatically activated with the Knowledge Management v3 application.

The Knowledge Management Advanced Installer plugin performs two validation steps prior to activation.

- Determines if there are any active Knowledge Management v2 knowledge bases.
- Determines if there is a unique database index on the **Number** field. If a unique constraint has been added to the **Number** field, the plugin activation fails. Follow the instructions listed in **KB0634959** to perform corrective steps to resolve the issue.

You need access to **HI** to be able to view KB articles.

The Knowledge Management Advanced plugin activates the following features:

- Article versioning: Enables maintaining multiple versions of a knowledge article. For more information, see **Article versioning**.

  **Note:** Migrate to Knowledge Management v3 completely to use article versioning.

- Article subscriptions: Enables managing knowledge base and knowledge article subscriptions. For more information, see **Knowledge subscriptions**.

  **Note:** The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (**com.snc.activity_subscriptions**).

- Article quality index: Enables maintaining consistent quality of knowledge articles within a knowledge base where articles are written by various authors. For more information, see **Article quality index for knowledge management**.

- Article templates: Enables creating article templates for consistent structure of knowledge articles. For more information, see **Knowledge article templates**.

- Ownership group: Enables creating ownership groups for knowledge articles. For more information, see **Enable ownership groups**.

- In-context article creation: Enables creating a knowledge article from a customer service case. For more information, see **Enable creating an article from a customer service case**.
• Translation management: Enables managing translation tasks created for published knowledge articles. For more information, see Translation management.

Demo data is included as part of the Knowledge Management Advanced plugin. If the validation step performed by the Knowledge Management Advanced Installer plugin completes successfully, the Knowledge Management Advanced plugin is activated automatically. However, the demo data is not included in this activation. To load the demo data, go to the Knowledge Management Advanced plugin page, click the Load Demo Data Only related link, and then click OK.

1. Navigate to System Definition > Plugins.

   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

   ![Legacy list view link](image)

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you’re certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.

   ![Activate plugin dialog box](image)

   • To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.
If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.

4. If demo data is available and you want to install it, click **Load demo data**.

Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

**Knowledge article templates**

Article templates have pre-defined fields structured in a specific order. These templates help create a consistent structure for knowledge articles.

Using the Knowledge Article Templates feature, as a knowledge administrator (a user with knowledge_admin role), you can create article templates, add or customize fields in a template, and activate or deactivate a template.

As a security administrator (a user with security_admin role), you can configure field-level security in any template to make it visible to specific users.

As an author, you can create articles using pre-defined article templates or any newly created article templates.

**Pre-defined knowledge article templates**

Use either the standard template or one of the pre-defined How To, What Is, FAQ or KCS article templates.

**Note:**

When you upgrade Knowledge Management to Kingston or later releases, all the existing articles from the earlier version automatically use the standard template of the upgraded version. For example, if you upgrade Knowledge Management from Jakarta to Kingston, all existing articles use the standard template available in the Kingston version.

All pre-defined templates are inactive by default. If you do not activate a template, the articles automatically use the standard template. As a knowledge admin, you can activate a template by navigating to **Knowledge > Administration > Article Templates**. Then in the article template list, set the **Active** field to true for one or more templates you would like to activate.

The table below lists the fields available in each template and the name of the template table.

<table>
<thead>
<tr>
<th>Pre-defined knowledge article templates</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Template name</strong></td>
</tr>
<tr>
<td>FAQ</td>
</tr>
</tbody>
</table>
### Activating knowledge article templates

The Knowledge Article Templates feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details, see [Activate the Knowledge Management Advanced plugin](#).

### Deactivating knowledge article templates

You cannot delete an article template because article templates have an associated child table. Deleting a template would also require deleting the child table. Due to the limitations on dropping tables, article templates and template columns are explicitly made non-deletable. Instead, you can disable the Knowledge Article Templates feature by clearing the **Active** check box on the Article Template form.

**Note:** The Standard template is available by default and can’t be made inactive.

### Create an article template

Create new article templates in addition to the pre-defined templates. Add new fields based on how you want to customize and display your content.

**Role required:** knowledge_admin or admin

For each new article template, a child table of the Knowledge (kb_knowledge) table is created. When you add a new field to the template, a new column is added to that table created for the template.

1. Navigate to **Knowledge > Administration > Article Templates**, and click **New**.
2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the article template.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the article template.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SEO Description Tag</td>
<td>Article template field name. The content in this field is used as meta description tags to search for articles created using this article template.</td>
</tr>
</tbody>
</table>

The **Active** check box is selected by default making the template available for use.

3. Right-click the form header and click **Save**.
4. In the **Article Templates Field** related list, add fields to the template.

To add a field:

a) Click **New**.

b) Fill in the following fields as required:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Name</td>
<td>Title to display on the template form.</td>
</tr>
<tr>
<td>Field Type</td>
<td>Available field types:</td>
</tr>
<tr>
<td></td>
<td>- HTML</td>
</tr>
<tr>
<td></td>
<td>- String</td>
</tr>
<tr>
<td></td>
<td>- Integer</td>
</tr>
<tr>
<td></td>
<td>- Date</td>
</tr>
<tr>
<td></td>
<td>- Date and time</td>
</tr>
<tr>
<td>Order</td>
<td>Position of the field in the article page view and the article edit view.</td>
</tr>
<tr>
<td>Article Template</td>
<td>(Read-only) Name of the article template associated with this field.</td>
</tr>
<tr>
<td>Template Table</td>
<td>(Read-only) Name of the table for this template.</td>
</tr>
<tr>
<td>Template Field</td>
<td>(Read-only) Name of the template column associated with this field.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>If checked, this field is mandatory.</td>
</tr>
<tr>
<td>Expand/Collapse</td>
<td>Defines whether the template field displays as collapsed or expanded by default.</td>
</tr>
<tr>
<td>Active</td>
<td>If checked, this field displays in the template.</td>
</tr>
<tr>
<td>Heading style</td>
<td>CSS formats applied to the template header. For example, to display the background of the template header in red, with a 24-px font size, Arial font family, and white text color, enter the following code: background-color:red; font-size:24px; font-family:Arial; color:white;</td>
</tr>
</tbody>
</table>
**ServiceNow Orlando Now Platform capabilities**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field style</td>
<td>CSS formats applied to the template fields. Any CSS format applied at the field level is automatically applied to the header if not already specified in the <strong>Heading style</strong> field. For example, to display the 300px page width, 25px solid green border, 25px padding, and 25px page margin, enter the following code: <code>width:300px; border:25px solid green; padding:25px; margin:25px;</code></td>
</tr>
</tbody>
</table>

**c)** Click **Submit**.

The field is added to the template.

5. Configure the article template form to display the fields that you added to the template.

   **Note**: You must have the admin role to configure the form layout. If the field is not available in the form layout, use the **form designer** to configure the fields.

   a) Navigate to **Knowledge > Articles > Create New**.
   b) Select the template in which you want to display the fields.
   c) Right-click the header and select **Configure > Form Layout**
   d) Select and move the required fields from the **Available** to the **Selected** list.
   e) Click **Save**.

   **Note**: Authors who started a session before a template was created or activated will see the newly added template upon their next login.

If you want to search for duplicate articles when creating an article from a new template, you must configure the article template table for contextual search. On the Table Configuration form, the **Search context** field must be set to **Knowledge ML Search**. For more information, see **Configure table for a contextual search**.

**Restrict access to fields in an article template**

Use encryption context to set field-level security in article templates and display the fields based on role permissions.

Activate the **Encryption Support plugin** to enable field-level security using an encryption context. Role required: security_admin

1. Create an encryption context for the article template field to be encrypted.
   a) Navigate to **System Security > Field Encryption > Encryption Contexts** and click **New**.
   b) On the Encryption Context form, fill in the fields.

   **Encryption Context form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the encryption context.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Encryption key</td>
<td>Key used to encrypt the data. Leave blank to generate a key randomly. Based on the desired type of encryption, enter the exact number of characters:</td>
</tr>
</tbody>
</table>
|               | • 16 characters for AES 128-bit  
|               | • 32 characters for AES 256-bit                                                                                                               |

**Warning:** You cannot retrieve this key from the instance. If you need access to the key, save it elsewhere before clicking **Submit**.

<table>
<thead>
<tr>
<th>Application</th>
<th>Defaults to <strong>Global</strong> and cannot be changed.</th>
</tr>
</thead>
</table>
| Type         | Type of encryption used to encrypt your data:  
|              | • **AES 128-bit:** Advanced Encryption Standard  
|              | • **AES 256-bit:** Advanced Encryption Standard using 256-bit encryption                                                                         |

c) Click **Submit**.

2. Associate the article template field with the encryption context.
   a) Navigate to **System Security > Field Encryption > Encryption Field Configurations** and click **New**.
   b) On the Encrypted Field Configuration form, fill in the fields.

   **Encrypted Field Configuration form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table associated with the article template fields. For example, for the How to article template fields, select <strong>How To (kb_template_how_to)</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Column</td>
<td>Article template field to be encrypted. Only String, Date, Date/Time, and URL fields are supported.</td>
</tr>
<tr>
<td></td>
<td><strong>String and URL fields</strong>: You can add a new encryption configuration to either a parent table or a child table.</td>
</tr>
<tr>
<td></td>
<td><strong>Date and Date/Time fields</strong>: You can create encrypted field configurations to encrypt existing Date and Date/Time fields. You can add a new encryption configuration to a parent table only. You cannot add a new encryption configuration to a child table.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Depending on the number of records affected by the Date and Date/Time fields you are encrypting, it may take up to a few minutes to create the encryption configuration. Make sure that you create the encryption configuration for Date and Date/Time fields when transaction volume on the instance is low.</td>
</tr>
<tr>
<td>Encryption context</td>
<td>Encryption context you created for the article template field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Method     | • **Single Encryption Context**: Enables data to be encrypted with a single encryption context only. The field is encrypted with the encryption context defined in the *Encryption context* field. Users that do not have the encryption context cannot view or update field values.  
  • **Multiple Encryption Contexts**: Enables data to be encrypted with more than one encryption context. The field is encrypted by the encryption context of the first user to enter data. If the user has multiple encryption contexts, the context defined in the encryption context selector is used. Because the encryption context is set on a per record basis, fields in a list can have different encryption contexts. However, within a single record, the field can be encrypted by only one context.  
  **Note:** Mass encryption is not available when using the Multiple Encryption Contexts method.  
  After a configuration is created using the single encryption context method, you can update the record to use multiple encryption contexts. However, you cannot change a field using multiple encryption contexts to use a single encryption context. |
Generate SEO information for articles using article templates

Improve the searchability of knowledge articles by using the content in an article template field to generate SEO tags for articles created using that template.

Role required: knowledge_admin or admin

Note: If you are using the Standard article template, the content of the Text field is used to generate the tags.

You can define the number of characters to be used as tags in the glide.knowman.seo.pages.meta_description.length system property.

1. Navigate to Knowledge > Article Templates.
2. Select an article template.
3. In the SEO Description Tag field, select an article template field.
4. Click Update.

Note: You can change which article template field is used for generating SEO. Changes are applied only to knowledge articles created or updated after the change was made. To apply the update to all existing published articles created using this template, run the Populate Meta Description on KB Articles fix script.

Article versioning

Use the Knowledge Management article versioning feature to create and maintain multiple versions of a knowledge article.

Knowledge contributors can create a new version of a knowledge article from an existing published version. This existing version can be either the latest published version or an older outdated version. All changes are stored in the new version of the article and the information in the existing article remains the same.

Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) to use the knowledge subscription feature.

If you import published knowledge articles from a ServiceNow instance that does not support article versioning, you must run the Initialize Versions on Articles fix script to enable article checkout and editing.

With the article versioning feature, a knowledge user can:

- Check out a published article and create another version.

Note: Only the author, knowledge base owner, and users with the knowledge_admin role can edit an article in the Draft state.

- Select a previously published (outdated) version of an article and make it current.

- Recall an article that is being reviewed or scheduled for publication.

- Retire the latest published version of an article.

Note: Only the author, knowledge base owner, and users with the knowledge_admin role can edit an article in the draft state.

There are two types of article revisions: major and minor. Minor revisions include updates to an article that has not yet been published. Major revisions include updates to an article that has
been published and is available to customers. To track the different revisions, the article versioning feature introduces version numbering.

With the article versioning feature, the knowledge article number also includes the version number. All references to knowledge articles use this number format. For example, KB0010003 v2.0.

**Manually update customized files**

If you have customized any of the files that are updated as part of the Knowledge Management Advanced Installer plugin, these files are skipped during plugin activation and must be updated manually.

Manually update your customization to include the article versioning-related changes.

- Add the **Version** field to the Knowledge form layout and the Knowledge list view, if it is not already present.
- Add the **outdated** choice to the **Workflow** choice list field on the Knowledge form, if it is not already present. Keep the value as **outdated** because of dependencies that article versioning functionalities have on this choice.
- Update the **Knowledge** > **My Flagged** and **Self-Service** > **My Knowledge Articles** modules to include the following condition in the **Filter** field, if these modules do not already reflect this change: **Revised by is (dynamic) me**.

If you have customized any of the Knowledge Management Overview dashboard reports, these files are also skipped during plugin activation and must be updated manually.

**Article versioning changes**

Article versioning introduces new actions that allow knowledge users to create and revise versions of existing articles. It also introduces new fields and related lists to the Knowledge form, new columns to the Knowledge list, and updates to Knowledge dashboard reports.

**New user actions**

As part of creating article versions, users can:

- Check out a published article and create another version by clicking **Checkout** on the Knowledge form.
  
  **Note:** Only the author, knowledge base owner, and users with the knowledge_admin role can edit an article in the Draft state.

- Recall an article that is being reviewed or scheduled for publish by clicking **Recall** on the Knowledge form.

- Select a previously published article in the Outdated state and make it the current published version by clicking **Make this current** in the Knowledge form header.

  **Note:** To edit a published article without having to create a new version, make sure the **glide.knowman.versioning.enable_minor_edits** property is enabled.

**Changes to the Knowledge list**

The article versioning feature adds the following to the Knowledge list:

- The **Version** column displays the article version number. The Knowledge list displays multiple versions of an article.
• The **Workflow** column includes the new **Outdated** state.

**Changes to the Knowledge form**

The article versioning feature adds the following to the Knowledge form:

• The **Version** field displays the article version number.
• The **Display number** field displays a combination of the article number and the version number. For example, KB0010004 v1.02. All references to a knowledge article use this display number.
• The **Base Version** field displays the knowledge article number and version on which the current article is based.
• The **Revised By** field displays the name of the user who checked out a published article and created a new version.
• The **Article Versions** related list displays a list of all versions for an article. From this list, you can:
  • Click the **Version** to view a specific version of an article.
  • Click the **View Article** related link to see the article page view.

**Note:** If necessary, configure the form to display the fields and the related list.

**Changes to Knowledge modules**

The article versioning feature introduces the following Knowledge module changes:

• **My Knowledge Articles**
  • For a knowledge user, this module includes records for the articles authored by the user as well as records for each article revised by the user.
  • For a knowledge reviser, this module includes records for the articles published by the user as well as records for each article revised by the user.

• **My Flagged**
  • For a knowledge user, this module includes records for each revision made to articles authored by the user.
  • For a knowledge reviser, this module includes records for each article revised by the user.

**Note:** Users that have customized these modules do not see these changes.

**Changes to Knowledge Management dashboard reports**

The Knowledge Management Overview dashboard reports have been updated to include article versioning-related changes when the Knowledge Management Advanced plugin is activated.

• Articles Flagged in the Last 30 Days
• Articles Marked Not Useful in the Last 30 Days
• Articles Used per Month
• Knowledge use
• Knowledge view
• Knowledge updated in past 30 days
• Knowledge flagged in past 30 days
• Knowledge by Workflow state
• Knowledge created by Author
• Knowledge created in past 30 days
• New Knowledge Articles Created in the Last 30 Days
• Knowledge Ratings for past 30 days

Versioning information available in the Knowledge Management Service Portal

Knowledge search results show the article number and the version number for each article.

Note:
To display the article version number next to the article number in the search results, enable the glide.knowman.search.show_article_number property in the Knowledge Search Properties section of the Knowledge Management Properties page.

If you are accessing an article from the base system or knowledge service portals using the URL to a KB article, you must also include the article version number in the URL. For example, to access the KB0000005 knowledge article, instead of using the https://<instance name>/sp?id=kb_article&sys_id=KB0000005 as the URL, you must use https://<instance name>/sp?id=kb_article&sys_id=KB0000005%20V1.0 to view the article.

The article view page shows a version history section for articles that have been updated. This section includes the version numbers, date updated, and the name of the author or reviser.

• Click Latest version or the version number and current state to expand the version history section.
• Click the version number to open that particular version of the article.
• When viewing an outdated article, a message informs the user that a newer updated version is available. The message includes a link to the latest version.

Feedback on article versions

With the article versioning feature, users can view and contribute to feedback on the current versions of knowledge articles.

For more information about feedback options, see Knowledge feedback.

<table>
<thead>
<tr>
<th>Feedback option</th>
<th>How this option works with article versioning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rating an article</td>
<td>The average rating for an article is carried over to the checked out version. The average rating calculation updates and displays on the current version of the article.</td>
</tr>
<tr>
<td>Marking an article as helpful</td>
<td>The helpfulness percentage of a previous version of an article is also considered for a new version when displayed in the helpfulness column on the homepage.</td>
</tr>
<tr>
<td>Comments</td>
<td>The Comments section at the bottom of an article displays comments from previous versions unless Live Feed is enabled. Live Feed only shows comments for the current version.</td>
</tr>
</tbody>
</table>
Feedback option | How this option works with article versioning
---|---
Flagging an article | Checking out an article or setting a previous version to the current version resets the flagged value to false.
View count | The view count is carried over to the checked out article. Any view of a version of an article increments the view count of all subsequent versions. Views to a newer version of an article do not affect the view count of previous versions.
Use count | The use count is carried over to the checked out article. Any use of a version of an article increments the use count of all subsequent versions. Any use of a newer version of an article does not affect the use count of previous versions.

**Knowledge article version numbers**

Knowledge article version numbers follow a specific pattern. Increments to the version number depend on the revision type.

Article version numbers follow this pattern: `<major release number.minor release number>`

The type of revision being made to an article determines the increment. A minor revision increments the version number by 0.01. A major revision, such as publishing an article, increments the version to the next whole number, for example, from version 2.02 to 3.0.

The following example illustrates the life cycle of a versioned article and the changes to the version number.

<table>
<thead>
<tr>
<th>User action</th>
<th>Article state</th>
<th>Version number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge author creates a new article</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author makes a change and updates the article.</td>
<td>Draft</td>
<td>0.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>0.02</td>
</tr>
<tr>
<td>Knowledge author recalls the article to make another change.</td>
<td>Draft</td>
<td>0.03</td>
</tr>
<tr>
<td>Knowledge article submits the article for review</td>
<td>Review</td>
<td>0.04</td>
</tr>
<tr>
<td>Approver rejects the article and requests a change.</td>
<td>Draft</td>
<td>0.05</td>
</tr>
<tr>
<td>Knowledge author makes the change and submits the article for review.</td>
<td>Review</td>
<td>0.06</td>
</tr>
<tr>
<td>Approver approves the article</td>
<td>Scheduled for publish</td>
<td>0.07</td>
</tr>
<tr>
<td>Article is published</td>
<td>Published</td>
<td>1.0</td>
</tr>
<tr>
<td>Knowledge author checks out the published article.</td>
<td>Draft</td>
<td>1.01</td>
</tr>
<tr>
<td>Knowledge author submits the article for review.</td>
<td>Review</td>
<td>1.02</td>
</tr>
</tbody>
</table>
Any change to the state of an article results in a version increment, except to and from the **Pending retirement**, **Retired**, and **Outdated** states.

### Knowledge article version information

Users can view version information for a knowledge article from the Knowledge view page.

The knowledge article number and the version number appear at the top of the article, just below the title. Clicking the version number expands the version history section, which includes a list of the available article versions. User roles determine what is included in this list:

- Users with read access to a knowledge base can see the latest published version and previous major versions.
- Users with read and contribute access to a knowledge base can see the latest published version, previous major versions, and any draft or review versions.

You can view any of the previous versions of an article by clicking the version number in the list. When you view a previous version, a message at the top of the article indicates that an updated version is available.

At the bottom of a knowledge article, you can see additional information about an article, including the name of the author or revisor and the date that the article was last modified.

### Knowledge article states

Knowledge article versions can be in one of several states as it progresses through the creation cycle.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>The article is in the process of being created.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> A versioned knowledge article in the <strong>Draft</strong> state can be modified only by the author or reviser with the contribute access to the knowledge base, owner of a knowledge base, users with the admin and knowledge_admin role, and ownership group members, if ownership group is added to the article.</td>
</tr>
<tr>
<td>Review</td>
<td>The draft version of the article is sent to reviewers to approve or reject.</td>
</tr>
<tr>
<td>Scheduled for publish</td>
<td>The draft version of a knowledge article is scheduled for publishing on a future date.</td>
</tr>
</tbody>
</table>
### Article versioning properties

The knowledge administrator can set configuration properties that enable users to edit specific fields on published articles without creating new versions.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable article versioning feature. (glide.knowman.versioning.enabled) | Select the Yes check box to enable the article versioning feature.  
- Type: true | false  
- Default value: true  
- Location: Knowledge > Administration > Properties |
### Table of Versioning Properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable minor edits to a published article without creating a new version.</td>
<td>Select the Yes check box to enable minor edits to published articles and associated attachments without creating a new version. When you enable this property, you can also add or remove any attachments associated with knowledge articles.</td>
</tr>
<tr>
<td>(glide.knowman.versioning.enable_minor_edits)</td>
<td>- Type: true</td>
</tr>
<tr>
<td></td>
<td>- Default value: false</td>
</tr>
<tr>
<td></td>
<td>- Location: Knowledge &gt; Administration &gt; Properties</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This feature is available for the following users: the knowledge administrator, the knowledge base manager, and the knowledge base owner.</td>
</tr>
<tr>
<td>A comma-separated list of fields that can be edited on published articles without creating a new version.</td>
<td>Enter the fields in a comma-separated list that can be edited on published articles without creating a new version.</td>
</tr>
<tr>
<td>(glide.knowman.versioning.minor_edit_fields)</td>
<td>- Type: string</td>
</tr>
<tr>
<td></td>
<td>- Default value: valid_to</td>
</tr>
<tr>
<td></td>
<td>- Location: Knowledge &gt; Administration &gt; Properties</td>
</tr>
</tbody>
</table>

---

### Check out a published article and create a new version

Create a new version of a knowledge article by checking out the latest published version.

Users with canContribute permissions, including the knowledge owner, knowledge manager, and knowledge administrator, can check out a published article unless there is already a checked out version. If a version has been checked out, the **Checkout** button does not appear on the Knowledge form header.

When you check out an article, the default value of **Valid to** field of the article is derived from the **Article Validity** field configured for the knowledge base (see [Create a knowledge base](#)). If the **Article Validity** field is blank, the date in the **Valid to** field date is set to January 1, 2100. An article author or editor can select whether to keep or change the default **Valid to** date.

When you check out an article, attachments from the article’s base version are copied into the new article version and relative paths to these attachments are also updated.

**Note:** For article versions that were created in the previous releases, the relative paths to the attachments may not be updated. To update them, activate and run the [Fix attachment links on article versions](#) fix script.

1. Navigate to **Knowledge > Articles > Published**.
2. Select the desired article from the list.
3. Click **Checkout** in the Knowledge form header.

   The system creates a new version of the knowledge article and displays a message to the user. The article number for the new version remains the same, the version number is...
increased by 0.01, and the state changes to Draft. The new version of the article is added to the Knowledge list and to the Article Versions related list on the Knowledge form.

**Schedule a knowledge article for publishing**

Set a specific time and day for a knowledge article to be published automatically.

You must have contribute access to the knowledge base that stores the knowledge article you want to schedule for publishing.

Ensure that the system administrator verifies the following settings:

- Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated. For more information, see [Activate the Knowledge Management Advanced plugin](#).
- The article versioning feature is enabled. For more information, see [Article versioning](#).

Role required: knowledge

1. Navigate to Knowledge > Articles and click Unpublished.
2. Click an article link.
3. In the Scheduled publish date field, click the select date and time icon 📅.
4. Select any future date from the calendar.
5. In the Time field, enter a time in the format hh:mm:ss.
6. Click the save (enter) icon 🗡️.
7. Click Publish to enable the publishing workflow.

The article is available in the All list. Go to Knowledge > Articles > All.

Tip: If you want to cancel an article’s scheduled publication and move the article back to the Draft state, click Recall.

The knowledge article is published on the scheduled publish date depending on the following workflow settings of its knowledge base:

- If the knowledge base workflow is set to Knowledge - Instant Publish, the knowledge article is automatically published on the scheduled publish date. The Workflow field on the Knowledge form of the article is updated to Scheduled for publish.
- If the knowledge base workflow is set to Knowledge - Approval Publish, the knowledge article is published on approval completion. The Workflow field on the Knowledge form of the article is updated to Review.

The approval completion affects the scheduled publishing as follows:

- If the approvals are completed before the scheduled publish date, the Workflow field on the Knowledge form of the article is updated to Scheduled for publish and the article is published on the scheduled publish date.
- If the approvals are completed after the scheduled publish date, the article is published immediately on the approval completion.

**Approve an article that is being reviewed**

Approve an article that is being reviewed and create a new published version.

When an article is in the Review state, only those users who are included in the Approvals related list can modify the article.

1. Navigate to Knowledge > Articles > Unpublished.
2. Open an article in the **Review** state and review the text.
3. In the **Approvals** related list, click **Requested** in the **State** column to display the Approval form for the article.
4. Click **Approve**.

The system displays the Knowledge form. The version number of the article increments to the next whole number (for example, from 2.02 to 3.0) and the state changes to **Published**. The new published version of the article is added to the Knowledge list and to the **Article Versions** related list on the Knowledge form.

**Recall an article that is being reviewed**

Recall an article that is being reviewed to make additional changes.

If ownership groups is not enabled, only the author of the article, knowledge administrators, or system administrators can recall the article.

If ownership groups is enabled, the author of the article, the ownership group manager, ownership group members, knowledge administrators, or system administrators can recall an article.

Recalling an article in the **Review** state results in a minor version increment.

When a revised article is in **Review** state, only the corresponding versions reviser can recall the article to make additional changes.

1. Navigate to **Knowledge > Articles > All**.
2. Open an article in the **Review** state.
3. Click **Recall** in the Knowledge form header.
   
   The system returns the state of the article to **Draft**, increments the version number by 0.01, and displays a message to the user.

**Revert an outdated article to the current state**

Use an outdated version of an article to create a new version.

Roles required: knowledge base owner, knowledge_manager, knowledge_admin

This action is available for earlier published version that have a state of **Outdated** and only when there is no checked out version. If a version has been checked out, the **Make this current** button does not appear on the Knowledge form header.

1. Navigate to **Knowledge > Articles > All**.
2. Open an article in the **Outdated** state.
3. Click **Make this current** in the Knowledge form header.
   
   The system displays the Knowledge form. The version number increments to the latest version number plus 0.01 and the state changes to **Draft**. For example, if the latest published version of an article is 3.0 and you select the outdated 1.0 version to become the current version, the version number increments to 3.01.

**View all versions of an article**

View a list of all available versions for a selected knowledge article and then view the selected version in a new tab.

The list of all available versions for a selected knowledge article is displayed in the **Article Versions** related list on the Knowledge form. Users with read access can see major versions. Users with contribute access can see major and minor versions.

1. Navigate to **Knowledge > Articles > All**.
2. Open the desired article.
3. Click the **Article Versions** tab to display the related list.
4. Click **Version** to display the desired article version in a new tab.
5. If desired, click the **View Version** related link to see the article view page.

**Compare two versions of an article**

Select and compare two versions of a knowledge article.

Role required: knowledge_manager, knowledge_admin

1. Navigate to a knowledge article with multiple versions.
2. In the **Article Versions** related list, select two versions of the article to compare.
3. In the **Actions** choice list below the list, select **Compare**.
   The Compare Versions page opens in a new tab and lists the fields for the selected articles in a side-by-side format. Differences between the two articles are highlighted.
4. When you are finished comparing the two versions, click **Done** to return to the Knowledge form.

**Retire a versioned article**

You can retire the latest published version of a knowledge article. Retiring a knowledge article does not create a new version. It simply marks the article as **Retired**.

This action is available only when there is no checked out version. If a version has been checked out, the **Retire** button does not appear on the Knowledge form header.

**Note:** For the Knowledge - Approval Retire workflow, this happens only when the retire request is approved.

In addition to the knowledge administrator and the knowledge manager, the following users can retire a versioned article:

- knowledge owner
- latest publisher of the versioned knowledge article

Users can still access outdated articles that have been attached to incidents by navigating to the article view page with the sys_id of the article. Outdated articles include a message that an updated article is available.

If versioning is disabled, only the latest version of the article is shown in search results and list views.

Retired knowledge articles cannot be searched for by external users or customers. To reuse a retired article, create a new article with the same content, which is published once approved.

1. Navigate to **Knowledge > Articles > Published**.
2. Open the desired article.
3. Click **Retire** in the Knowledge form header.
   The system returns to the Knowledge list. The state of the article changes to **Pending retirement** and the state of previously published versions change to **Outdated**.

**Note:** You cannot check out or edit a retired article.

**Disable the article versioning feature**

Users with the system administrator role can disable the article versioning feature by setting a property.
Role required: admin

The **Enable article versioning feature** property controls the article versioning feature. Setting this property to **false** disables the article versioning feature. Once disabled:

- The **Version** field is removed from the Knowledge form. The **Version** column remains on the Knowledge list and can be removed manually.
- The **Article Versions** related list is removed from the Knowledge form.
- The **Recall**, **Checkout**, and **Make this current** buttons are removed from the Knowledge form.
- Outdated articles are removed from Knowledge list views.
- The version history does not appear on the article view page.

Articles continue to be versioned in the background. Minor versions are incremented until an article is published and then the version number is increased to the next major version.

Users can still access outdated articles that have been attached to incidents. Outdated articles include a message that an updated article is available.

1. Navigate to **Knowledge > Administration > Properties**.
2. Locate the **Enable article versioning feature** property in the Article Versioning Properties section.
3. Click the check box to disable the property.
4. Click **Save**.

**Knowledge manager**

Having multiple knowledge bases allows an organization to spread management responsibilities across multiple users, known as knowledge managers.

As a knowledge manager, you can assign other managers, define category structures, configure which users can read and contribute articles, move and pin articles, and modify most fields on the Knowledge Base form. You can also approve the publishing or retiring of knowledge articles in those knowledge bases. You can enable Social Q&A for your knowledge bases if the Social Q&A application is active.

The primary manager of a knowledge base is the owner of that knowledge base. Each knowledge base must have one owner. There may be any number of additional managers for each knowledge base. The owner and all managers of a knowledge base automatically receive the knowledge_manager role. If the knowledge base is made inactive later, the knowledge_manager role is not automatically removed for these users.

**Add a knowledge article to featured content**

Add a knowledge article to appear in the Featured content section of the knowledge homepage and at the top of knowledge search results page.

Role required: knowledge_manager, knowledge_admin, or admin

Adding an article to featured content requires associating an article to specific keywords. You can search a keyword in the knowledge service portal or search results page to display articles in the Featured content section or at the top of the knowledge search results list.

**Note:** The articles added to the Featured content section do not appear in the global search results and Virtual Agent conversations.

- To display articles in the Featured content section, add a default keyword in the **glide.knowman.default_keyword** property **Value** field and add the same keyword to all articles you want to display in that section.
To display articles at the top of the knowledge search results list, add a list of keywords to each article you want to display at the top of the list.

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base.
3. In the Featured content related list, click New.
4. In the Knowledge field, search for and select the desired article.
5. In the Keywords field, click the lock/unlock toggle icon.
6. Click the lookup icon to open the Knowledge keywords list.

   Note: Each keyword must be a single word and cannot contain spaces.

7. Select the keyword to add for this article.
   - Add the default keyword to display this article in the Featured content section during search.
   - Add all related keywords for the article to display it at the top of the knowledge search results page during search.

   Note: You can create knowledge keywords, if it does not already exist in the list, and then add it to the article.

8. Click the lock/unlock toggle icon to add the keywords to the article.
9. Click Submit.

Define a knowledge article category

Each knowledge base has a hierarchy of categories that organizes the articles.

You must have CanContribute access to the knowledge base or have a knowledge_admin or admin role.

You can define a hierarchy for categories by creating parent-child relationships. The category hierarchy is saved in the Full category field in the Knowledge Category (kb_category) table.

You can create and edit categories separately for each knowledge base.

1. Navigate to Knowledge > Administration > Knowledge Bases.
2. Select a knowledge base you manage.
3. Choose an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a top-level category.</td>
<td>Navigate to the Knowledge Categories related list and click New.</td>
</tr>
<tr>
<td>Create a child category.</td>
<td>Expand an existing category and click New within the expanded section.</td>
</tr>
</tbody>
</table>

4. Enter a Label for the category. The label appears as the name of the category.
5. Optional: Enter a Value you can use when referencing the category in scripts.
6. Click Submit.

In addition to using categories defined by a knowledge manager, knowledge contributors can add and edit categories when editing an article.

Assign a knowledge base manager

You can assign users as managers of a knowledge base.
Role required: knowledge_admin, or admin

1. Navigate to Knowledge > Knowledge Bases.
2. Select a knowledge base you manage.
3. In the Managers field, click the unlock icon.
4. Add one or more users.
5. Click Update.

After you save the knowledge base record, users selected as managers automatically receive the knowledge_manager role if they do not have it already.

You can remove a knowledge base manager by removing that user from the Managers field. If the user is not a manager of any other knowledge base, the knowledge_manager role is removed from that user.

Managing access to knowledge bases and knowledge articles

Determine whether certain users or categories of users can access knowledge bases and knowledge articles by controlling contribute and read access.

At the knowledge base level, you can assign user criteria to control contribute and read access, where:

- Read access determines the ability to view knowledge articles in a knowledge base.
- Contribute access determines the ability to create, modify, and retire knowledge articles in a knowledge base. Contribute access to a knowledge base also provides read access to all articles in the knowledge base.

At the knowledge article level, you can assign user criteria and roles, or both, to control read access. Contribute access to a knowledge base also provides read access to all articles in the knowledge base even when read access is denied at the knowledge article level. If a user doesn’t have contribute access to a knowledge base, both roles and user criteria are evaluated to determine read access to a knowledge article.

Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge articles. Roles were used for this purpose in Knowledge Management v2.

Note: By default, when contribute access isn’t provided for a knowledge base, a user must meet both roles and user criteria conditions for read access. However, you can override roles set for a knowledge article and provide access through user criteria only by setting the glide.knowman.search.apply_role_based_security system property to false. Because this property isn’t available by default, you must add it. For more information, see Add a system property.

User criteria for knowledge access

You control access to knowledge bases or knowledge articles for a user through user criteria, which are described in the following table.

User criteria definitions

<table>
<thead>
<tr>
<th>User criteria</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cannot Contribute</td>
<td>Cannot contribute (that is can’t create, modify, or retire) knowledge articles within a knowledge base. The Cannot Contribute user criteria is available only for knowledge bases.</td>
</tr>
<tr>
<td>User criteria</td>
<td>Result</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Can Contribute</td>
<td>Can contribute (that is can view, create, modify, or retire) knowledge articles within a knowledge base. The Can Contribute user criteria is available only for knowledge bases.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>At the knowledge base level, cannot view knowledge articles within a knowledge base. At the knowledge article level, cannot view a knowledge article.</td>
</tr>
<tr>
<td>Can Read</td>
<td>At the knowledge base level, can view knowledge articles within a knowledge base. At the knowledge article level, can view a knowledge article.</td>
</tr>
</tbody>
</table>

Combining knowledge base and knowledge article user criteria

<table>
<thead>
<tr>
<th>Status</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>The user matches both Can Contribute and Cannot Contribute at the knowledge base level</td>
<td>The user is denied contribute access to the knowledge base and its articles.</td>
</tr>
<tr>
<td>The user matches both Can Read and Cannot Read at the knowledge base level</td>
<td>The user is denied read access to the knowledge base and its articles.</td>
</tr>
<tr>
<td>The user matches Can Read at the knowledge base level and Cannot Read at the knowledge article level</td>
<td>The user is denied read access to the knowledge article.</td>
</tr>
<tr>
<td>The user matches Cannot Read and Can Read at the knowledge article level</td>
<td>The user is denied read access to the knowledge article.</td>
</tr>
</tbody>
</table>

Users with special knowledge privileges

Users with special knowledge privileges aren’t evaluated based on user criteria and have knowledge bases and knowledge articles access as described in the following table.

Access of users with special privileges to knowledge bases and knowledge articles

<table>
<thead>
<tr>
<th>User</th>
<th>Access</th>
</tr>
</thead>
</table>
| Knowledge administrator     | • Contribute to and read all knowledge bases and their articles.  
                               | • Modify the definition of all knowledge bases and assign user criteria to them.  
<pre><code>                           | Note: This access doesn’t apply to scoped knowledge bases. For more information, see Scoped knowledge bases. |
</code></pre>
<table>
<thead>
<tr>
<th>User</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner of a knowledge base</td>
<td>• Contribute to and read that knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• Modify the definition of that knowledge base and assign user criteria to it.</td>
</tr>
<tr>
<td>Manager of a knowledge base</td>
<td>• Contribute to and read that knowledge base.</td>
</tr>
<tr>
<td></td>
<td>• Modify the definition of that knowledge base and assign user criteria to it.</td>
</tr>
<tr>
<td>Members of an ownership group associated with a knowledge article</td>
<td>Read, modify, and retire that knowledge article.</td>
</tr>
</tbody>
</table>

**Explicit roles and user criteria**

Explicit roles (snc_external and snc_internal) are added to your instance when you install a plugin, such as the Customer Service plugin (com.sn_customerservice), that also activates the Explicit Roles plugin. If you create a knowledge base with the Explicit Roles plugin activated, the application automatically adds the following predefined user criteria at the knowledge base level:

- **Users with 'snc_internal' role** – Added to the Can Read user criteria. Assigning this criteria means only users with the snc_internal role have read access to the knowledge base.
- **Users with snc_internal' and another role** – Added to the Can Contribute user criteria. Assigning this criteria means only users with the snc_internal role and at least one additional role have contribute access to the knowledge base.

When you upgrade to product versions that offer the Explicit Roles plugin, the predefined user criteria **Users with 'snc_internal' role** and **Users with 'snc_internal' and another role** aren’t automatically added to any existing knowledge bases created prior to the activation of the Explicit Roles plugin. To add these predefined user criteria to an existing knowledge base, run the `Fix unsecured knowledge bases` fix script. For more information about explicit roles and fix scripts, see Explicit Roles and Fix scripts.

**Knowledge access using user criteria**

The flowchart in this section illustrates the user criteria checks that determine contribute access to a knowledge base.

*Note: In order for an unauthenticated user to view knowledge articles within the knowledge base, ensure that the Knowledge Management Service Portal pages are publicly accessible.*
When the Can Contribute user criteria for a knowledge base isn’t set, the `glide.knowman.block_access_with_no_user_criteria` property value is further evaluated to determine contribute access, as explained in the following table.

Contribute access to a knowledge base flowchart

<table>
<thead>
<tr>
<th>Property value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>No user has contribute access to the knowledge base except users with special knowledge privileges.</td>
</tr>
<tr>
<td>false</td>
<td>Users with at least one role can contribute to the knowledge base.</td>
</tr>
</tbody>
</table>

**Note:** If the Explicit Roles plugin is activated, users who have at least one role other than snc_internal can contribute to the knowledge base.

The following flowchart illustrates the user criteria checks that determine read access to a knowledge article.
When the Can Read user criteria for a knowledge base isn’t set, the glide.knowman.block_access_with_no_user_criteria property value is further evaluated to determine read access, as explained in the following table.

<table>
<thead>
<tr>
<th>Property value</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>No user has read access except users with special knowledge privileges and users who have contribute access to the knowledge base.</td>
</tr>
<tr>
<td>false</td>
<td>All users, including unauthenticated users, have read access to the knowledge base and the article-level user criteria are further evaluated.</td>
</tr>
</tbody>
</table>

**Important:** After you add user criteria, you can use the user criteria diagnostics feature to verify the access that users have to a knowledge base or a knowledge article. For more information, see *User criteria diagnosis for Knowledge Management*.

Create user criteria for controlling access to knowledge bases and articles

Control access to knowledge bases and articles by creating user criteria.

Role required: user_criteria_admin

**Note:** To create a user criteria record from the Knowledge module, you must have the user_criteria_admin role in addition to the knowledge role. For more information about access, see *Managing access to knowledge bases and knowledge articles*.

1. Navigate to Knowledge > Administration > User Criteria.
2. Click New.
3. On the User Criteria form, fill in the fields.

**User Criteria form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the user criteria.</td>
</tr>
<tr>
<td>Users</td>
<td>Users that must match the user criteria.</td>
</tr>
<tr>
<td>Groups</td>
<td>Groups that must match the user criteria.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles to match the user criteria.</td>
</tr>
</tbody>
</table>

**Note:**
- Because the evaluation of a role is cached in the session, any change in the role requires you to log in again.
- User criteria are not applicable for elevated privilege roles.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Advanced</td>
<td>Option to display or hide the advanced option that includes the Script field on the User Criteria form.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to define any additional user criteria that returns true or false. This field is available when the Advanced option is selected on the User Criteria form.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>- A script is evaluated in the scope that the user criteria is created in.</td>
</tr>
<tr>
<td></td>
<td>- The evaluation of a script is cached in the session, so any change in the evaluation requires you to log in again. If a scripted user criteria is defined for a knowledge base, user access to knowledge bases is evaluated once per session. If the script results in changes after a session cache is built, the result takes effect in the next session.</td>
</tr>
<tr>
<td></td>
<td>- Do not use gs.getUser() or other session APIs because they cause conflicts when used in diagnostic tools. Use the predefined user_id variable available in the script to get the user ID of the user being used to evaluate the script.</td>
</tr>
<tr>
<td></td>
<td>- Scripts are evaluated dynamically. Therefore, including scripts in a user criteria can impact performance.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate or deactivate the user criteria.</td>
</tr>
<tr>
<td>Companies</td>
<td>Companies that the user record must match.</td>
</tr>
<tr>
<td>Locations</td>
<td>Locations that the user record must match.</td>
</tr>
<tr>
<td>Departments</td>
<td>Departments that the user record must match.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Match All</td>
<td>Option to determine whether all elements from each populated user criteria field must match. If selected, only users who match all user criteria are given access. If cleared, the user must meet one or more of the set user criteria to be given access.</td>
</tr>
<tr>
<td></td>
<td>By default, this check box is cleared so that any condition met provides a match.</td>
</tr>
<tr>
<td></td>
<td>For example, consider a user criteria record for the following:</td>
</tr>
<tr>
<td></td>
<td>· Locations A or B</td>
</tr>
<tr>
<td></td>
<td>· Company C or D</td>
</tr>
<tr>
<td></td>
<td>With Match All selected, only users meeting all these conditions are matched. For example, a user with a location A and a company C.</td>
</tr>
<tr>
<td></td>
<td>If Match All is not selected, users meeting any of these conditions are matched. For example, a user with a location B.</td>
</tr>
</tbody>
</table>

**Note:** If you select Match All, ensure that you don’t create contradictory conditions that can never be met. For example, if all users in location A work for company G, the conditions in this example can never be met.

4. Click Submit.

**Control access at the knowledge base level through user criteria**

You specify user criteria for a knowledge base to control which users are granted access to read and contribute knowledge articles to that knowledge base.

Role required: knowledge_manager, knowledge_admin, or admin

**Note:** To administer a scoped knowledge base, you must have the application-specific admin role in addition to the knowledge_admin or admin role. For more information, see *Scoped knowledge bases*.

You can assign user criteria to control read or contribute access. For example, you could enable all users in your Support department to have contribute access to a knowledge base by creating a user criteria record with the required department set to Support, and then including the user criteria record in the Can Contribute user criteria. For more information, see *Managing access to knowledge bases and knowledge articles*. Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge bases. Roles were used for this purpose in Knowledge Management v2.

1. Navigate to **Knowledge > Administration > Knowledge Bases**.
2. Click the link to knowledge base you manage.
3. Add user criteria to the knowledge base.
   a) Depending on the user criteria you want to set, select one or more of the relevant related lists.
### Related list

<table>
<thead>
<tr>
<th>Access</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can Read</td>
<td>Users can read knowledge articles in the knowledge base.</td>
</tr>
<tr>
<td>Cannot Read</td>
<td>Users can’t read knowledge articles in the knowledge base.</td>
</tr>
<tr>
<td>Can Contribute</td>
<td>Users can create, modify, and retire knowledge articles in a knowledge base.</td>
</tr>
<tr>
<td>Cannot Contribute</td>
<td>Users can’t create, modify, retire, or read knowledge articles in the knowledge base.</td>
</tr>
</tbody>
</table>

b) In the selected related list, add the required user criteria.

- To add a new user criteria record, click **New**, specify the required fields, and then click **Submit**.
- To add an existing user criteria record, click **Edit**, move the required user criteria from the **Collection** column to the **Knowledge** column, and then click **Save**.

4. On the Knowledge Base form, click **Update**.

After you add user criteria, you can use the user criteria diagnostics feature to verify the access that users have to a knowledge base or a knowledge article. For more information, see **User criteria diagnosis for Knowledge Management**.

**Important:** After making user criteria additions or changes, you may need to log out and back in to clear the prior configuration.

### Control access at the knowledge article level through user criteria

You specify user criteria for a knowledge article to control which users are granted read access to the knowledge article.

Role required: Users who have Contribute access to the knowledge article

**Note:** You may need to configure the form to add **Can Read** and **Cannot Read** fields.

Try to use only user criteria, which were introduced in Knowledge Management v3, to control access to knowledge articles. Roles were used for this purpose in Knowledge Management v2. For more information, see **Managing access to knowledge bases and knowledge articles**.

1. Open a knowledge article.

**Note:** You can update only the latest version of the knowledge article.

2. Assign access based on user criteria.

<table>
<thead>
<tr>
<th>Access</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow read access</td>
<td>In the <strong>Can Read</strong> field, search for and add user criteria. For example, to allow read access to a user, search for a user criteria that the user matches and add it to this field.</td>
</tr>
</tbody>
</table>
### Access

<table>
<thead>
<tr>
<th>Deny read access</th>
</tr>
</thead>
<tbody>
<tr>
<td>In the <strong>Cannot Read</strong> field, search for and add user criteria. For example, to deny read access to a user, search for a user criteria that user matches and add it to this field.</td>
</tr>
</tbody>
</table>

**Note:**
- If users have contribute access to the knowledge base, they also have read access to the knowledge article regardless of the **Cannot Read** setting.
- Users who meet both **Can Read** and **Cannot Read** user criteria are denied read access to the knowledge article. The **Cannot Read** setting overrides the **Can Read** setting for the knowledge article.

**Note:** If the **Can Read** and **Cannot Read** fields aren’t visible, configure the Knowledge form to display them. For more information, see Configuring the form layout.

3. On the Knowledge form, click **Update**, and then click **Publish** to apply the changes.

After you add user criteria, you can use the user criteria diagnostics feature to verify the access users have to a knowledge base or a knowledge article. For more information, see User criteria diagnosis for Knowledge Management.

### User criteria diagnosis for Knowledge Management

Manage user access to a knowledge base or an article using user criteria diagnostics. Understand what access users have to a knowledge base or an article and determine which user criteria define those permissions.

User access to a knowledge base or an article can be restricted based on:
- Domain separation
- Access control list (ACL) rules
- Knowledge work flows
- User criteria set for a knowledge base or an article

This feature considers domain separation and user criteria to determine the user access to knowledge bases and articles.

### Activating user criteria diagnostics

The user criteria diagnostics feature is activated with Knowledge Management v3 (com.snc.knowledge3) plugin.

### Diagnose user access to a knowledge base

Identify which users have access to a knowledge base and what enables that access.
Role required: knowledge_manager, knowledge_admin, or admin

1. Access the **User Criteria Diagnostics** landing page using one of these options:

<table>
<thead>
<tr>
<th>To access</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the application navigator</td>
<td>Knowledge &gt; Administration &gt; User Criteria Diagnostics</td>
</tr>
<tr>
<td>From a knowledge base</td>
<td>1. Knowledge &gt; Administration &gt; Knowledge Bases.</td>
</tr>
<tr>
<td></td>
<td>2. Select the knowledge base to diagnose user access.</td>
</tr>
<tr>
<td></td>
<td>3. In the Related Links section, click Run User Criteria Diagnostics.</td>
</tr>
<tr>
<td></td>
<td>The <strong>User Criteria Diagnostics</strong> landing page appears with the</td>
</tr>
<tr>
<td></td>
<td>Select knowledge base field pre-populated.</td>
</tr>
</tbody>
</table>

2. To diagnose user access:
   a) In the **Select user** field, select a user.
   b) From the **Select record type** choice list, select **Knowledge base**.
   c) In the **Select knowledge base** field, select a knowledge base.
      Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.
   d) Click **Diagnose**.
      The page displays these details:
      - Whether the user has access to the knowledge base based on their domain. Only system administrators can view domain information and change the domain to give access to a user.
      - Which user criteria provides read or read and contribute access for this user to the knowledge base and what type of **user criteria definition** enables this access.
      - Whether a role that the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
      - For a user with no access to this knowledge base, which user criteria may be modified to grant the access.

The following image shows an example of a diagnosis where the user Alene Reback does not have access to the IT knowledge base.

Alena can get access to the knowledge base if:
- Alena is added to one of the existing user criteria defined in the knowledge base.
- Alena is added to a new user criteria that is defined and added to the knowledge base.

Click the IT knowledge base link and provide the access by adding Alena to a user criteria for this knowledge base.
User Criteria Diagnostics

- **Select user**: Alene Rabeck
- **Select record type**: Knowledge Base
- **Select knowledge base**: IT

**No Access**

Alene Rabeck does not have access to knowledge base (IT).

⚠️ If ACLs were applied to this Knowledge Base, the ACLs will override the permissions defined by user criteria

**How to Provide Access**

To provide access to knowledge base (IT), add Alene Rabeck to one or more of the following user criteria.

<table>
<thead>
<tr>
<th>User Criteria</th>
<th>Access Type</th>
<th>Set on</th>
</tr>
</thead>
<tbody>
<tr>
<td>The ACME North America IT Department</td>
<td>Can Contribute</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME North America employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME Corporation employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
</tbody>
</table>

1 to 3 of 3 results
Diagnose user access to an article

Identify which users have access to an article and what enables that access.

Role required: knowledge_manager, knowledge_admin, or admin

1. Access the User Criteria Diagnostics landing page using one of these options:

<table>
<thead>
<tr>
<th>To access</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the application</td>
<td>Knowledge &gt; Administration &gt; User Criteria Diagnostics.</td>
</tr>
<tr>
<td>navigator</td>
<td></td>
</tr>
<tr>
<td>From an article</td>
<td>1. Knowledge &gt; Administration &gt; Knowledge Bases.</td>
</tr>
<tr>
<td></td>
<td>2. Select the knowledge base that has the article to diagnose for user access.</td>
</tr>
<tr>
<td></td>
<td>3. In the Knowledge related list, select the article.</td>
</tr>
<tr>
<td></td>
<td>4. In the Related Links section, click Run User Criteria Diagnostics.</td>
</tr>
<tr>
<td></td>
<td>The User Criteria Diagnostics landing page appears with the Select article</td>
</tr>
<tr>
<td></td>
<td>field pre-populated.</td>
</tr>
</tbody>
</table>

2. To diagnose user access:
   a) In the Select user field, select a user.
   b) From the Select record type choice list, select Article.
   c) In the Select article field, select an article.
      Every time you select a different user, record type, or knowledge base, the page refreshes and displays data for the selected user.
   d) Click Diagnose.
      The page displays these details:
      - Whether or not the user has access to the knowledge article based on their domain. Only system administrators can view domain information and change the domain to give access to a user.
      - Which user criteria provides read or read and contribute access for this user to the article and what type of user criteria definition enables this access.
      - Whether a role of the user has (knowledge_manager, knowledge_admin, or owner of the knowledge base) enables this access.
      - For a user with no access to this article, which user criteria may be modified to grant the access.

   Note: Members of an ownership group are automatically given Can Contribute access to knowledge articles that their ownership group is associated with.

The following image shows an example of a diagnosis where the user Adela Cervantsz has read access to the KB article, KB0000001 v5.0, in the IT knowledge base because Adela belongs to one of the Can Read user criteria defined in the knowledge base.
**User Criteria Diagnostics**

- **Select user**: Adela Cervantsz
- **Select record type**: Article
- **Select article**: KB0000001 v1.0

**Read Access**

No user criteria is configured at article level. Adela Cervantsz has read access to article KB0000001 in knowledge base IT, because the user has read access to the knowledge base.

⚠️ If ACLs were applied to this Article, the ACLs will override the permissions defined by user criteria.
⚠️ The article’s publication status may also impact the user’s access to it. If diagnostic results conflict with the user’s access, please check the publication status of the article.

**User Criteria Assigned**

<table>
<thead>
<tr>
<th>User Criteria</th>
<th>Access Type</th>
<th>Set on</th>
</tr>
</thead>
<tbody>
<tr>
<td>All ACME North America employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
<tr>
<td>All ACME Corporation employees</td>
<td>Can Read</td>
<td>Knowledge Base</td>
</tr>
</tbody>
</table>

I18N - Knowledge internationalization

Organizations with knowledge users who speak multiple languages can activate the optional knowledge internationalization features.

Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

When active, knowledge internationalization enables the knowledge management team to create language-specific knowledge articles and keep translations of the same article related to each other so they are easy to manage. Users can view and search within their own language while still being able to view articles in other languages when necessary.

**Note:**

To set the default language for searching articles to a language different from the logged in language of the user, specify the desired language in the glide.knowman.search.default_language system property. For example, if you are logged in using the French language and would like the default language for searched articles to be English, specify English in the system property. You can then switch to French from within the UI to see French articles. If no language is specified in the system property, articles default to the logged in language of the user.

To enable search for different languages simultaneously, navigate to Knowledge Administration > Knowledge Search > Properties > Enable multi language search. Select the Yes check box to enable the feature.

**Note:** If you do not enable this property, you can search in one language at a time. If the property is enabled, you can search for multiple languages simultaneously.

Refer to Search using Knowledge Management v3 for information on performing a search on all available languages simultaneously.

Social Q&A does not use language-specific questions and answers. All questions and answers appear in the language they were created in. For example, a question in English is not translated when the current user’s selected language is French.

Activate the knowledge management internationalization plugin

To enable translation of knowledge articles, you must activate multiple plugins.

- I18N:Knowledge Management Internationalization v2 plugin
- Internationalization plugins for each appropriate language

Activate a plugin

Installed Components

Activating the Knowledge Management Internationalization plugin installs these components:

- A relationship named Translated Versions that creates a related list on the Knowledge form showing other articles that have the same parent article.
- A business rule named knowledge query that automatically filters the knowledge portal and search results based on the user’s selected language.
- A UI macro named kb languages.
• Two fields, named **Language** and **Parent**, in the Knowledge table and the Knowledge form.

**Knowledge Form Changes**

Activating knowledge management internationalization adds these fields to the Knowledge form.

• **Language**: select the language for the article.
• **Parent**: enter the number of the article that represents the base language. This setting keeps translations of the same article related to each other. Consider choosing the same language consistently for the parent article.

Additionally, the **Translated Versions** related list is automatically added to the Knowledge form after you save an article.

**Enable ownership groups**

Configure ownership groups and associate them with knowledge articles to maintain article quality, manage approvals, and for timely resolution of feedback.

As a knowledge administrator, you perform the following tasks to configure ownership groups.

• Activate the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).
• Set the `glide.knowman.ownership_group.enabled` property to `true`.

**Note**: Once you have set this property to `true`, it is not recommended to set it back to `false`. Before setting this property back to false, manually reassign all knowledge articles associated with any ownership group, close all article approvals sent to ownership groups, and resolve all open feedback tasks assigned to ownership groups.

You may also need to configure the Knowledge form to add the **Ownership Group** field.

**Manage ownership groups**

Create ownership groups and associate them to knowledge articles. Knowledge group managers or knowledge administrators can edit ownership groups.

The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated.

Role required: Users with the `knowledge_domain_expert` or `knowledge_admin` roles can create ownership groups.

Users with the `knowledge_group_manager` or `knowledge_admin` roles can edit ownership groups.

Create an ownership group by adding members and a manager. Knowledge administrators approve ownership groups.

When knowledge articles are created, ownership groups can be associated to them. Ownership groups manage article approvals and feedback and can edit and retire knowledge articles that they are associated with.

Knowledge group managers can edit ownership groups managed by them by adding or removing members without the need for approval. They cannot change the manager assigned in their groups. Only knowledge administrators can reassign managers.

1. Navigate to **Knowledge > Ownership Groups > Manage Group**.
2. To create an ownership group, from the Request Type list, select **Create Ownership Group**.
3. Fill in the fields on the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the ownership group.</td>
</tr>
<tr>
<td>Group email</td>
<td>An email address for the ownership group._emails are sent to group members in these cases.</td>
</tr>
<tr>
<td></td>
<td>- Activity on articles they are associated with, for example, comments.</td>
</tr>
<tr>
<td></td>
<td>- Article quality checks (AQI) performed on articles they are associated with.</td>
</tr>
<tr>
<td></td>
<td>If no group email is defined, emails are sent to individual group member emails.</td>
</tr>
<tr>
<td>Description</td>
<td>Description that defines the ownership group.</td>
</tr>
<tr>
<td>Manager</td>
<td>Manager for the ownership group.</td>
</tr>
<tr>
<td>Group members</td>
<td>Members of the ownership group.</td>
</tr>
</tbody>
</table>

4. Click Order Now.

The ownership group is sent to the knowledge administrator for approval. Once approved, the ownership group is ready to use and associate to a knowledge article.

**Note:** You can also create an ownership group from an existing group.

2. Click a group.
3. In the Type field, enter Knowledge.

**Note:** If the Type field does not appear on the form, configure the form layout to add it.

4. In the Manager field, enter a manager and add the role knowledge_group_manager.
5. In the Roles related list, click Edit and add the role knowledge_group_member to the group.

**Configure the Knowledge Management Service Portal**

The Knowledge Management Service Portal enables users to perform the same operations that are available with the Knowledge Management V3 plugin. From the portal, users can view knowledge bases and articles, search for information, sort and filter search results, and provide feedback.
For new customers on the Madrid and later releases, the Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) is active by default.

For existing customers on release versions prior to Madrid, activate the plugin, if required.

Configure the Knowledge Management Service Portal properties, including the property that directs users to the Knowledge Management homepage in the Knowledge Management Service Portal.

Navigate to Service Portal > Portals and click Knowledge Portal. See Service Portal for more information about creating a custom interface.

System administrators can configure portal pages and configure widgets for searching, sorting, and filtering knowledge base information. To configure widget instance options and configure search, sort, and filter features, see Knowledge Management Service Portal widgets.

To add knowledge bases to the Knowledge Service Portal, complete the following steps.

1. Navigate to Service Portal > Portals and click Knowledge Portal.
2. Click the Knowledge Bases related list.
3. Click Edit to map one or more knowledge bases to the portal.

Note: If no knowledge bases are added, all knowledge bases are available in the portal.
If knowledge bases are mapped, only those knowledge bases are available in the portal. All search results and all widgets display results from the mapped knowledge bases only.

Section 508 compliance features

Users can view and interact with the Knowledge Management article view page in the Knowledge Management Service Portal using Section 508 compliance features. See Set up Section 508 compliance features for more information.

Enable external or public users to view knowledge articles from the Knowledge Management Service Portal

Enable knowledge articles on the Knowledge Management Service Portal to be visible to external or public users.

The Knowledge Management Service Portal plugin (com.snc.knowledge_serviceportal) must be enabled.

Role required: admin

If you are using Knowledge Management within the Customer Service application, you can automatically make knowledge public by activating and running the Make KM Service Portal Pages Public fix script after you install the Customer Service Management plugin (com.sn_customerservice).

If you are using Knowledge Management as a standalone application, perform the steps in this procedure.

1. Navigate to Service Portal > Pages.
2. Search for kb_home and open it.
3. You have to be in the Global application to edit. If a message appears, click here to edit.
4. Perform one of the following actions.
Make knowledge service portal pages visible to public users

1. Select the **Public** check box.
2. Click **Update**.

Make knowledge service portal pages visible to external users

1. Click the edit user roles icon.
2. Select snc_external and click **Done**.
3. Click **Update**.

5. Repeat these steps for `kb_article_view` and `kb_search`.

6. Perform one of the following actions.

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable access to the knowledge base for public users</td>
<td>Ensure that no <strong>Can Read</strong> user criteria is defined in the knowledge bases you want to give access to.</td>
</tr>
<tr>
<td>Enable access to the knowledge base for external users</td>
<td>Add <strong>Can Read</strong> access to the knowledge base.</td>
</tr>
</tbody>
</table>

### Knowledge Management Service Portal properties

Knowledge Management Service Portal properties determine how information is displayed on the Knowledge portal. You must have the admin role to set configuration properties.

The following system properties are set to direct users to the Knowledge Management Service Portal homepage, and to specify the URL suffix for the homepage.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| `sn_km_portal.glide.knowman.serviceportal.enable_redirect` | Directs users to the desired Knowledge homepage.  
- Type: true | false  
- Default value: false  
Set to **true** to redirect users navigating to v2 or v3 pages to the Knowledge Management Service Portal homepage.  
This property is not honored for the following use cases:  
- Contextual search in the Incident form  
- Connect |
| `sn_km_portal.glide.knowman.serviceportal.portal_url` | The URL suffix for the Knowledge Management Service Portal. The default is `kb`. |

The Knowledge Management Service Portal supports the **Knowledge Management V3 properties**. Configuring widget instance options on the portal pages can override these properties.
Knowledge Management Service Portal widgets

The Knowledge Management Service Portal uses a number of widgets to enable searches, display search results, and display articles, related articles, related items, and social Q&A.

In the Knowledge Management Service Portal, the Knowledge Management homepage, search results page, and article view page honor the Knowledge Management V3 system properties. If configured, widget instance options can override the system properties.

Users with the knowledge_admin or admin role can configure the widget instance options used on the Knowledge Management Service Portal pages. Use the control + right-click menu to access the widget instance options and configure a widget instance.

Note: Before configuring widget instance options, switch to the Knowledge Management - Service Portal scope.

Homepage widgets:
- Knowledge Homepage Search
  Customize search features for the homepage.
- Knowledge Bases Browse
  Displays knowledge base tiles in the homepage.
- Knowledge Featured Articles
  Displays a list of featured articles in the homepage.
- Knowledge Most Useful Articles
  Displays a list of most useful articles in the homepage.
- Knowledge Most Viewed Articles
  Displays a list of most viewed articles in the homepage.

Search results page widgets:
- Knowledge Breadcrumbs
  Displays navigation path to the current page.
- Knowledge Search
- Knowledge Facet Header
  Displays the title for the filter facets.
- Knowledge Field Facet
  Display search results filtered by knowledge base, knowledge category, and author.
- Knowledge Tags Facet
  Display search results filtered by article tags.
- Knowledge Resource Facet
  Display search results filtered by article resource.
- Knowledge Query Facet
  Display search results filtered by article rating, number of article views, and last modified.
- Knowledge Result Sort
  Displays search results filtered by sort options for returned results.
- Knowledge Selected Filter
  Displays the selected facet filters and allows you to clear the selections.
- Knowledge Result
Displays search results filtered by returned results.

Article view page widgets:

- **Knowledge Breadcrumbs**
  Displays navigation path to the current page.
- **Knowledge Article Content**
  Customize what information users can view and what actions they can perform in the article view page.
- **Knowledge Article Helpful**
  Enables users to mark the article as helpful.
- **Knowledge Article Comments**
  Enables users to add comments for the article.
- **Knowledge Attachments**
  Displays article attachments if the **Display Attachment** field for the article is enabled.
- **Related Catalog Item**
  Displays a list of catalog items mapped to the article. The widget appears only when the related catalog items are available for the selected article.
- **Knowledge Related Articles**
  Displays a list of related articles with information similar to the selected article. The related articles are manually mapped, automatically predicted, or both. The manually mapped articles appear first in the widget. The widget appears only when the related articles are available for the selected article.
- **Affected Products**
  Displays the products related to the knowledge articles available in the **Affected Products** related list for the article. The widget appears only when the affected products are available for the selected article.
- **Most Recent Tasks**
  Displays the tasks attached to the articles available in the **Attached Tasks** related list for that article. The widget appears only when the related tasks are available for the selected article.
- **Most Useful**
  Displays a list of knowledge articles that users found most useful.

**Activate the Knowledge Management Service Portal plugin**

The Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) is active by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid can activate the plugin, if required.

Role required: admin

This plugin requires the following plugins:

- **Knowledge Management V3** (com.snc.knowledge3)
- **Service Portal for Enterprise Service Management** (com.glide.service-portal.esm)

1. Navigate to **System Definition > Plugins**.
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   - If you're certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.
   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.
        If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
     4. If demo data is available and you want to install it, click Load demo data.
        Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
     5. Click Activate.
Role required: sp_admin or admin

The homepage uses the Knowledge Homepage Search widget and the search results page uses the Knowledge Search widget. Use the widget instance options to customize the search feature for these pages.

1. Navigate to the Knowledge Management Service Portal homepage or search results page.
2. Control + right-click the search bar.
3. Click **Instance Options**.
4. Configure the desired settings for the search widgets.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the search widget. The default for the homepage is <strong>Welcome to Knowledge</strong>.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears in the search bar.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the search widget. This field appears on the search results page only.</td>
</tr>
<tr>
<td>Bootstrap size</td>
<td>The size of the search widget. This field appears on the search results page only.</td>
</tr>
<tr>
<td>CSS</td>
<td>See widget CSS for details.</td>
</tr>
<tr>
<td>Search Placeholder</td>
<td>Default text that appears in the search bar. This field appears on the homepage only.</td>
</tr>
<tr>
<td>Allow Empty Search</td>
<td>Allow empty knowledge base searches. The default for the homepage uses the system property. The default for the search results page is <strong>Yes</strong>. For an empty search, the search results page returns all results.</td>
</tr>
<tr>
<td>Allow Instant Search On Keypress</td>
<td>Enables instant search results as you type a search term. The default for the search results page uses the system property. This field appears on the search results page only.</td>
</tr>
<tr>
<td>Minimum Number of Characters for Search</td>
<td>The minimum number of characters required to generate a search.</td>
</tr>
<tr>
<td>Wait time (ms) between searches, if instant search is enabled</td>
<td>The time, in milliseconds, to wait between searches if the instant search feature is enabled. The default wait time is <strong>500</strong> ms. This field appears on the search results page only.</td>
</tr>
<tr>
<td>Alternate URL Parameters for Search</td>
<td>Alternate parameters that appear in the search results URL. By default these parameters include keyword and query. This field appears on the search results page only.</td>
</tr>
</tbody>
</table>
5. **Click Save.**

**Configure knowledge base tile widget instance options**
Configure widget instance options for the knowledge base tile widgets on the Knowledge Management Service Portal homepage.

Role required: sp_admin or admin

The homepage uses the Knowledge Bases Browse widget to display knowledge base tiles.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click a knowledge base tile.
3. Click **Instance Options**.
4. Configure the desired settings for the knowledge base tile widgets.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternate URL Parameters for Language</td>
<td>Alternate parameters that appear in the URL denoting the selected language.</td>
</tr>
<tr>
<td></td>
<td>This field appears on the search results page only.</td>
</tr>
</tbody>
</table>

5. **Click Save.**

**Configure the home page widget instance options**
Configure widget instance options for the widgets used to display popular articles on the Knowledge Management Service Portal homepage.

Role required: sp_admin or admin
The homepage displays links to the featured, most viewed, and most useful articles using several widgets. The featured articles are displayed based on the keywords associated with the articles. For information on displaying articles in the Featured content section, see Pin a knowledge article. Most viewed and most useful articles are displayed based on the highest view and use count of the articles.

1. Navigate to the Knowledge Management Service Portal homepage.
2. Control + right-click one of the widgets.
3. Click Instance Options.
4. Configure the desired settings for the widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget.</td>
</tr>
<tr>
<td>Glyph</td>
<td>An icon that appears in the widget.</td>
</tr>
<tr>
<td>CSS</td>
<td>See widget CSS for details.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that contains the Source Field used to provide the featured, most viewed, and most useful articles widget options. The default table is Knowledge (kb_knowledge).</td>
</tr>
<tr>
<td>Display Field</td>
<td>The title displayed for each article in the list. By default, this is the article short description.</td>
</tr>
<tr>
<td>Secondary Fields</td>
<td>Additional information displayed for each article in the list below the title. By default, this information includes the author, view count, the date that the article was last modified, and the article rating.</td>
</tr>
<tr>
<td>Max number of records to show</td>
<td>The maximum number of articles to include in the list.</td>
</tr>
<tr>
<td>Show even when empty</td>
<td>Enable this check box to display the widget even if there are no articles in the list.</td>
</tr>
<tr>
<td>Show Secondary Fields Label</td>
<td>Enable this check box to display the field labels for the additional information displayed for each article.</td>
</tr>
<tr>
<td>Knowledge Base</td>
<td>To restrict the articles that appear in this list to a specific knowledge base, select the knowledge base from the knowledge base list.</td>
</tr>
</tbody>
</table>

5. Click Save.

Configure sort widget instance options
Configure widget instance options for the knowledge sort widget on the Knowledge Management Service Portal search results page.

| Role required: sp_admin or admin |

The search results page uses the Knowledge Result Sort widget to provide sort options for the returned list of results. Use the widget instance options to customize the sort options.

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click the sort options at the top of the results list.
3. Click Instance Options.
4. Configure the desired settings for the sort widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>

5. Click **Save**.

Configure filter facet widget instance options
Configure widget instance options for the filter facet widgets on the Knowledge Management Service Portal search results page.

Role required: sp_admin or admin

The homepage uses several widgets to filter the items in the search results list. There are two types of facet widgets:

- Simple field facets based on the Knowledge table fields
- Advanced query facets based on custom queries of the Knowledge table

Use the widget instance options to customize these facet widgets:

- Knowledge Field Facet (for filtering by knowledge base, knowledge category, and author)
- Knowledge Tags Facet (for filtering by tag)
- Knowledge Resource Facet (for filtering by resource, such as articles and social Q&A)
- Knowledge Query Facet (for filtering by rating, last modified, and number of views)

1. Navigate to the Knowledge Management Service Portal search results page.
2. Control + right-click a filter facet widget.
3. Click **Instance Options**.
4. Configure the desired settings for the selected type of facet widget.
<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Title of the filter facet widget.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that appears to the left of the title.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the filter facet widgets appear on the left side of the search results page. If empty, the filter facet widgets sort alphabetically.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color of the filter facet widget header.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Source Table</td>
<td>Table that contains the Source Field used to provide the filter facet widget options. The default table is Knowledge (kb_knowledge).</td>
</tr>
<tr>
<td>Source Field</td>
<td>Field in the Source Table that provides the filter facet widget options. Field types that can be used as a source field include string, choice, glide list, integer, reference, and boolean.</td>
</tr>
<tr>
<td>Facet Identifier</td>
<td>Unique name for the custom query facet that can be used in script code.</td>
</tr>
<tr>
<td>Facet Template</td>
<td>Template that determines the type of facet interaction.</td>
</tr>
<tr>
<td></td>
<td>Knowledge Field Facet widget templates:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Single Select</strong>: users can select only one filter from this widget.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Multi Select</strong>: users can select more than one filter from this widget.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Dropdown Select</strong>: users can select more than one filter from a drop-down menu.</td>
</tr>
<tr>
<td></td>
<td>Knowledge Query Facet widget templates</td>
</tr>
<tr>
<td></td>
<td>• <strong>Simple Query</strong>: shows a label for each facet value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Rating</strong>: shows rating stars.</td>
</tr>
<tr>
<td>Custom Template</td>
<td>Custom template that determines facet interaction and value selection.</td>
</tr>
<tr>
<td>Facet Options</td>
<td>Custom query in JSON format for the label, ID, order, and query for each facet value. Includes the table, value (encoded query), and display value (encoded query).</td>
</tr>
<tr>
<td>Order by</td>
<td>Order of the filter options within the facet widget. The default order is <code>label</code>, which sorts the options in alphabetical order. For reference fields, you can also state an order from the reference field table.</td>
</tr>
<tr>
<td>Minimum results for showing filter search bar</td>
<td>Minimum number of results required to display a search bar at the top of the filter facet widget.</td>
</tr>
<tr>
<td>Minimum results for showing scroll bar</td>
<td>Minimum number of results required to display a scroll bar in the filter facet widget.</td>
</tr>
<tr>
<td>Instance option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Maximum length for string field</td>
<td>Maximum field length. Only fields whose length is less than this value are allowed to be added as a filter facet.</td>
</tr>
<tr>
<td>Alternate URL Parameters</td>
<td>Names of the URL parameters used to initialize this filter facet, if used in the URL as a search parameter.</td>
</tr>
<tr>
<td>Fetch Maximum Values</td>
<td>If enabled, fetches all facet values instead of only those facets applicable for the initial load of results. Disabling this instance option can reduce the load time for the filter facet. Based on the <code>glide.knowman.search.facet_depth</code> property.</td>
</tr>
<tr>
<td>Show Empty Value</td>
<td>If enabled, shows an empty filter facet option that users can select to filter for articles that do not have this field set. For example, if an article does not have an assigned category, clicking the empty option lists all articles with no assigned category.</td>
</tr>
<tr>
<td>Show Only Facet Values Matching Results</td>
<td>Creates a dynamic filter facet widget that displays only those filter values that match the search results rather than showing all values. If you disable this instance option, the time needed to load the filter facet data is reduced.</td>
</tr>
<tr>
<td>Show category hierarchy (valid for <code>kb_category</code> only)</td>
<td>If enabled, shows categories with their hierarchy list up to the fourth-level. When you enable this option, you can select only one category at a time. Any articles that are included in the subcategories beyond the fourth-level also appear in the fourth-level of category. The search results filtered on a selected parent category include articles within that category and all the associated child categories.</td>
</tr>
</tbody>
</table>

Configure a user action for the article view page

Configure a user action for the Knowledge Management article view page in the Knowledge Management Service Portal.

Role required: sp_admin or admin

The article view page uses the Knowledge Article Content widget to provide user actions. Use the widget instance options to customize these actions.

Ensure that the application scope on the Now Platform is set to Knowledge Management Service Portal.

User actions available for the article view page appear in a menu after clicking the overflow icon (≡) in the article header. These actions enable users to flag an article, edit an article, or create an incident for an article.

1. Navigate to the Knowledge Management Service Portal article view page.
2. Control + right-click the article header.
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Content widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget header.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Hide All Actions</td>
<td>Hides the user actions in the article header including the <strong>Subscribe/Unsubscribe</strong> button and the overflow icon.</td>
</tr>
<tr>
<td>Show Version Information</td>
<td>Displays version information for the selected article. Requires the Knowledge Management Advanced plugin (com.snc.knowledge_advanced).</td>
</tr>
<tr>
<td>Show Create Incident Action</td>
<td>Displays the <strong>Create Incident</strong> user action when a user clicks the overflow icon in the article header.</td>
</tr>
<tr>
<td>Create Incident Action Label</td>
<td>The label for the user action that appears in the overflow icon menu. The default is <strong>Create Incident</strong>.</td>
</tr>
<tr>
<td>Create Incident Action URL</td>
<td>The target URL for the <strong>Create Incident</strong> user action.</td>
</tr>
<tr>
<td></td>
<td>If no URL is specified, the system uses the URL in the glide.knowman.create_incident_link system property.</td>
</tr>
</tbody>
</table>

5. Click **Save**.

**Configure article helpful widget instance options**

Configure the Knowledge Article Helpful widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal.

Role required: sp_admin or admin

The article view page uses the Knowledge Article Helpful widget to allow users to provide feedback on the helpfulness of the article, display a confirmation message after a feedback is provided, and display the percentage of users who found the article to be useful. Use the widget instance options to customize these actions.

1. Navigate to the Knowledge Management article view page in the Knowledge Management Service Portal.
2. Control + right-click **Helpful?**
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Helpful widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>The color of the widget header.</td>
</tr>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
<tr>
<td>Show helpful percentage information</td>
<td>Check box to enable the display of percentage of users who found this article to be helpful.</td>
</tr>
<tr>
<td>Helpful Action Label</td>
<td>Label for marking this article as helpful or not.</td>
</tr>
</tbody>
</table>
5. Click **Save**.

**Configure article helpful comments instance options**
Configure the Knowledge Article Comments widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal.

Role required: sp_admin or admin

The article view page uses the Knowledge Article Comments widget to allow users to rate an article, add a comment, or view existing comments for the article. Use the widget instance options to customize these actions.

1. Navigate to the Knowledge Management article view page in the Knowledge Management Service Portal.
2. Control + right-click the comments section.
3. Click **Instance Options**.
4. Configure the desired settings for the Knowledge Article Comments widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feedback Message</td>
<td>Text that displays when the user marks the article as helpful or not.</td>
</tr>
</tbody>
</table>

**Instance option**

<table>
<thead>
<tr>
<th>Bootstrap color</th>
<th>The color of the widget header.</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSS</td>
<td>See <a href="#">widget CSS</a> for details.</td>
</tr>
</tbody>
</table>

**Other Options**

<table>
<thead>
<tr>
<th>Show Star Rating</th>
<th>Enables article rating. Available options:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Yes - displays article rating that enables users to select a rating threshold between 1 and 5.</td>
</tr>
<tr>
<td></td>
<td>• No - hides article rating. Users do not have the option to rate articles.</td>
</tr>
<tr>
<td></td>
<td>• Use system property - display or hide the ability to rate articles using article view properties.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Show User Comments</th>

Configure related catalog item widget instance options
Configure the Related Catalog Item widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal. These options relate to the list of catalog items mapped to an article.

Role required: sp_admin or admin

The article view page displays a list of catalog items mapped to an article. Use the widget instance options to customize the Related Items section on the article view page.

1. Navigate to the Knowledge Management homepage in the Knowledge Management Service Portal by adding /kb to the end of your instance URL.

   Note: Your administrator might have changed this default navigation.

2. Search for and click the article for which you want to modify the instance options for the Related Catalog Item widget.
3. Press Control and right-click the Related Items section.
4. Click Instance Options.
5. Configure settings for the Related Catalog Item widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Table</td>
<td>Source table containing related catalog items. The source table specified in the base system is Related Catalog Items (kb_2_sc).</td>
</tr>
<tr>
<td>Source Column</td>
<td>Field in the source table referring to the source record. The source column specified in the base system is knowledge article (kb_knowledge).</td>
</tr>
<tr>
<td>Title</td>
<td>Title that appears on the widget header. The default title is Related Items.</td>
</tr>
<tr>
<td>Max Number</td>
<td>Maximum number of catalog items to include in the Related Items section on the article view page. The maximum number specified in the base system is 5.</td>
</tr>
<tr>
<td>Use Full Width</td>
<td>Option for displaying the widget in a 12-column grid at 100% of the available width. If you clear the check box, the widget displays at 75% of the available width.</td>
</tr>
<tr>
<td>Target Column</td>
<td>Field in the source table referring to the target record. The target column specified in the base system is Catalog Item (sc_cat_item).</td>
</tr>
<tr>
<td>Source Id</td>
<td>URL parameter containing the unique record identifier (sys_id) of the source record. For the article view page, the URL parameter containing the source ID is sys_kb_id.</td>
</tr>
</tbody>
</table>

6. Click Save.

Configure knowledge related articles widget instance options
Configure the Knowledge Related Articles widget instance options for the Knowledge Management article view page in the Knowledge Management Service Portal. These options relate to the list of related articles mapped to an article.

Role required: sp_admin or admin
The article view page displays a list of related articles mapped to an article. Use the widget instance options to customize the Related Articles section on the article view page.

1. Navigate to the Knowledge Management homepage in the Knowledge Management Service Portal by adding /kb to the end of the URL for your instance.

   **Note:** You can change the default navigation by configuring the property sn_km_portal.glide.knowman.serviceportal.portal_url.

2. Search for and click the article for which you want to modify the instance options for the Knowledge Related Articles widget.
3. Press Control and right-click the Related Items section.
4. Click **Instance Options**.
5. Configure settings for the Knowledge Related Articles widget.

<table>
<thead>
<tr>
<th>Instance option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Title that appears on the widget header. The default title is Related Articles.</td>
</tr>

<tr>
<td>Source Column</td>
<td>Field in the source table referring to the source record. The source column specified in the base system is Knowledge article (kb_knowledge).</td>
</tr>
<tr>
<td>Target Column</td>
<td>Field in the source table referring to the target record. The target column specified in the base system is Knowledge article (kb_knowledge).</td>
</tr>
<tr>
<td>Source Id</td>
<td>URL parameter containing the unique record identifier (sys_id) of the source record. For the article view page, the URL parameter containing the source ID is sys_kb_id.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

### Search using the Knowledge Management Service Portal

Enter one or more words in the search bar on the Knowledge Management Service Portal homepage to view all search results.

Search results include items in which the short description, content, or attached files include the search term. By default, knowledge search results include articles, pinned articles, and social Q&A.

You can also filter the search results.

### Enable multi-language search

The multi-language search facet is available when more than one supported language is enabled. All available languages are displayed in the facet and you can select which languages you want your search results to appear in. Your selection is maintained per session, but not across logins.

1. To enable different languages, activate the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) or activate one of the internationalization plugins for the language you require.

   **Note:** Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin.

2. Navigate to **Knowledge > Administration > Knowledge Search Properties > Enable multi language search**.

3. Select the **Yes** check box to enable the feature.
Note: If this property is not enabled, you can only search for one language at a time.

Search auto-correct feature

The Knowledge Management Service Portal homepage search tool also includes an auto-correct feature. When enabled, users can auto-correct a typing error in a search term by clicking one of the suggestions.

When a search term contains a misspelling, the search tool displays the search results page and includes one or more suggested terms at the top of the page under the heading Did you mean. Clicking one of these suggestions shows all the search results that match the selected term.

Users with the system administrator role can enable this feature.

1. Navigate to System Properties > Text Search.
2. Set the following properties to true:
   - Suggest alternate search spellings for knowledge or global search (glide.ts.dym.enable_spell_correct).
   - Suggest related searches for knowledge or global search (glide.ts.dym.enable_chain_suggest).
3. Click Save.

Integrating Knowledge Management features with the Service Portal

To create a consistent user experience for Knowledge Management, integrate Knowledge Management Service Portal in your end-user facing Service Portal.

The Knowledge Management Service Portal includes the following features:

- Multiple knowledge bases
- A Knowledge Management article view page with feedback options
- A Knowledge Management search results page with options to filter and sort search results
- A number of widgets to enable searches, display search results, display knowledge articles, and so on

By default, all knowledge articles in the Service Portal are redirected to the Knowledge Management article view page using the Knowledge Article View page route map. If upgrading from a previous release, a system administrator can activate the Knowledge Article View page route map to take advantage of the features of the Knowledge Management article view page. For more information, see Activate the Knowledge Article View page on upgrade.

System administrators perform the following tasks to integrate the Knowledge Management Service Portal features with the Service Portal:

- Integrate the Knowledge Management homepage with the Service Portal homepage.
- Integrate the Knowledge Management search results page with the Service Portal search results page.
- Add the Knowledge Management Service Portal widgets to quickly access knowledge articles from the Service Portal homepage (Optional).

Note: These configurations apply to the base system pages within the Service Portal only.
Integrate the Knowledge Management homepage with the Service Portal homepage

Use a page route map to access the enhanced Knowledge Management homepage from the Service Portal homepage.

The Knowledge Management - Service Portal plugin (com.snc.knowledge_serviceportal) is activated.

Note: This plugin is activated by default for customers on Madrid and later releases. Existing customers on release versions prior to Madrid must activate the plugin to perform this configuration task. For more information, see Activate the Knowledge Management Service Portal plugin.

Role required: admin

The Knowledge Management homepage displays knowledge articles and social Q&A items organized by knowledge base and category, featured content, and popular articles. You use a page route map to access the Knowledge Management homepage from the Service Portal homepage.

1. Navigate to Service Portal > Page Route Maps.
2. Click New.
3. On the Page Route Map form, fill in the fields.

**Page Route Map form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Portal(s)</td>
<td>Service Portal</td>
</tr>
<tr>
<td>Route from</td>
<td>kb_view2</td>
</tr>
<tr>
<td>Route to</td>
<td>kb_home</td>
</tr>
<tr>
<td>Active</td>
<td>Selected</td>
</tr>
</tbody>
</table>

Note: On the Page Route Map form, you can fill in the Short Description and Order fields as appropriate.

4. Click Submit.

You can now open the Knowledge Management homepage from the Service Portal homepage by clicking the Knowledge link or Knowledge Base icon link.

Integrate the Knowledge Management search results page with the Service Portal search results page

Use a custom knowledge search widget to access the enhanced Knowledge Management search results page from the Service Portal search results page.

Role required: admin

The Knowledge Management search results page in the Knowledge Management Service Portal includes options to filter and sort search results and a number of widgets to enable searches, display search results, display articles, and so on. In this procedure, to access the Knowledge Management search results page page from the Service Portal search results page, you create a custom knowledge search widget named Search Within and add it to the Service Portal search results page.

1. Create a custom knowledge search widget named Search Within.
   a) Navigate to Service Portal > Service Portal Configuration.
   b) On the Service Portal page, click Widget Editor.
c) Click **Create a new widget**.

d) In the Add a Widget dialog box, in the **Widget Name** field, enter **Search Within**.
   The **Widget ID** field is automatically populated based on the widget name.

e) Click **Submit**.
   The widget HTML template, client script, and server script display in the widget editor.

f) In the widget editor, enter the following field values to replace any existing text.

   - In the **HTML Template** field, enter the following code to add a link to the Knowledge Management search results page in the Search Within widget from the Service Portal.
     ```html
     <div role="list" class="list-group">
     <span class="list-group-item active">${Search Within}</span>
     <a role="link" class="list-group-item" ng-href="{"data.url}">${Knowledge}</a>
     </div>
     ```

   - In the **Server Script** field, enter the following code to set the URL parameters for the Knowledge Management search results page:
     ```javascript
     (function()
     {
     var q = encodeURIComponent($sp.getParameter('q'));
     var kb = $sp.getValue('kb_knowledge_base') || "";
     data.url = '/sp?id=kb_search';
     if(q) data.url += ";&keyword="+q;
     if(kb) data.url += ";&kb_knowledge_base="+kb;
     })();
     ```

   **Note:** For more information about these fields, see **Widget developer guide**.

   g) Click **Save**.

2. Add the custom knowledge search widget to the Service Portal search results page.
   a) Navigate to **Service Portal > Service Portal Configuration**.
   b) Click **Designer**.
   c) In the **Filter by title or Id** field, enter **sp_search**, the ID for the Service Portal search results page, and then select **Search**.
   d) In the **Filter Widget** field, search for the Search Within widget and drag it onto the container where you want the widget to appear on the Service Portal search results page.
Tip: To verify the location and appearance of the newly added Search Within widget on the Service Portal search results page, click the Preview tab.

The Search Within knowledge search widget is added to the Service Portal search results page. Clicking Knowledge in the widget and searching for a keyword will redirect you to the Knowledge Management search results page in the Knowledge Management Service Portal.

Add widgets to access knowledge articles from the Service Portal homepage
Add the Knowledge Management Service Portal widgets Featured Articles, Most Useful Articles, and Most Rated Articles to the Service Portal homepage to quickly access knowledge articles.

Role required: admin
For more information about Knowledge Management Service Portal widgets, see Knowledge Management Service Portal widgets.

1. Navigate to Service Portal > Service Portal Configuration.
2. Click Designer.
3. Select the Service Portal homepage.
4. In the Filter by title or Id field, enter index, the ID for the Service Portal homepage, and then select Service Portal.
5. In the Filter Widget field, search for the following Knowledge Management Service Portal widgets, and then drag them onto the container where you want them to appear on the Service Portal homepage.

<table>
<thead>
<tr>
<th>Widget Name</th>
<th>Widget Display Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge Featured Articles</td>
<td>Featured Articles</td>
</tr>
<tr>
<td>Knowledge MostUseful Articles</td>
<td>Most Useful Articles</td>
</tr>
<tr>
<td>Knowledge MostViewed Articles</td>
<td>Most Viewed Articles</td>
</tr>
</tbody>
</table>

Tip: To verify the location and appearance of the added widgets on the Service Portal, click the Preview tab.
Clicking a knowledge article link from one of the added widgets on the Service Portal homepage opens the Knowledge Management article view page in the Knowledge Management Service Portal.

**Features not yet supported on Knowledge Management Service Portal**

The following features are not yet supported on the Knowledge Management Service Portal:

- Article import on the Search results page
- Hierarchical categories on the Article view page
• Live Feed support for Social Q&A on the Article view page
• Tags added in Social Q&A are not honored in search results

The glide.knowman.portal.enable_redirect property is not honored for the following use cases:
• Contextual search in the Incident form
• Connect

Configure knowledge bases for a portal
Select which knowledge bases are displayed in a portal to view the associated knowledge articles. If no knowledge bases are configured, users can view articles from all knowledge bases in the portal.
Role required: admin
1. Navigate to Service Portal > Portals.
2. Select the portal for which you want to enable search for the desired knowledge bases.
3. In the Knowledge Bases related list, click Edit.
4. On the Edit Members form, move the desired knowledge bases from the available items in the Collection column to the Knowledge Bases List column.
5. Click Save.

Configure knowledge subscriptions
Configure knowledge subscriptions by activating the Knowledge Management Advanced plugin and setting the subscription properties.
Ensure that the Knowledge Management Advanced plugin (com.snc.knowledge_advanced) is activated.

Note: The Knowledge Management Advanced plugin activates the Subscriptions and Activity Feed Framework plugin (com.snc.activity_subscriptions).

Role required: knowledge_admin or admin
1. Navigate to Knowledge > Administration > Properties.
2. In the KM Subscription Properties section, configure the following properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable subscribe feature for KM (glide.knowman.enable_km_subscription)</td>
<td>Enables or disables the Knowledge Management knowledge subscriptions feature.</td>
</tr>
<tr>
<td>List of roles (comma-separated) who can have subscription feature (glide.knowman.enable_km_subscription.roles)</td>
<td>A comma-separated list of the roles that can use the knowledge subscriptions feature and subscribe to knowledge bases and articles.</td>
</tr>
<tr>
<td>List of workflow states (comma-separated) that can have subscription feature (glide.knowman.enable_km_subscription.workflow_states)</td>
<td>A comma-separated list of the article states for which the knowledge subscription feature is available. The default states include Draft, Review, and Published.</td>
</tr>
</tbody>
</table>

3. Click Save.
Knowledge subscription email notification templates

The knowledge subscription feature uses email notification templates to send subscription notifications to knowledge users.

<table>
<thead>
<tr>
<th>Email template</th>
<th>Subscription type</th>
</tr>
</thead>
<tbody>
<tr>
<td>KM Subscription: Article created</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article revised in KB</td>
<td>Knowledge base</td>
</tr>
<tr>
<td>KM Subscription: Article checked out</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article revised</td>
<td>Knowledge article</td>
</tr>
<tr>
<td>KM Subscription: Article commented</td>
<td>Knowledge article</td>
</tr>
</tbody>
</table>

Users with the admin or knowledge_admin role can customize these email notification templates. To locate the template, navigate to System Notifications > Email > Notifications. For more information about customizing a template, see Create an email notification.

Subscription notifications include a link at the bottom of the email to the user's Notification Preferences page.

Knowledge Management Analytics and Reporting Solutions

Analytics and Reporting Analytics and Reporting Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Analytics and Reporting Solutions

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With Analytics and Reporting Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

**Important:** Set up and test Analytics and Reporting Solutions on a sub-production instance before enabling them in production. You can set up Performance Analytics on a sub-production instance without a subscription.

**Note:**
- Analytics and Reporting Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.
- Analytics and Reporting solutions and in-form analytics provide all the configuration records required to analyze default applications. Customize these records for use in your production environment.

To enable the solution for Knowledge Management, an admin can navigate to Performance Analytics > Guided Setup. Click Get Started then scroll to the section for Knowledge Management. The guided setup takes you through the entire setup and configuration process.
Domain separation and 'Run As' user

By default, System Administrator is the Run As user for data collection jobs in the Analytics and Reporting Performance Analytics Solutions. Verify that this user exists on the instance, and whether this user has the appropriate level of access. An inappropriate Run As user can cause errors or limit the data that is collected. This setting only has an effect if domain separation is enabled.

New and deprecated versions of this solution

In London, this Solution was replaced with a new version, com.snc.pa.knowledge_v2. If you activated an earlier version of the Solution and then upgraded your instance, you still have and can still use the earlier Solution. You can also activate the newer version without losing data from existing indicators and breakdowns. If you activate the newer version, run a historical data collection job to populate any new indicators and breakdowns.

Knowledge Management dashboard

The Knowledge Management dashboard helps knowledge content owners and managers to determine the usage and quality of their knowledge content and ensure the proper processes and procedures are being followed for content creation.

CSM Knowledge Management dashboard indicators

The CSM Knowledge Management dashboard provides three views, into content usage, content governance, and content quality.

The Knowledge Management dashboard presents the following key performance indicators:

% of Knowledge Articles Published

A daily calculation using the formula \( \frac{\text{Number of knowledge articles published}}{\text{Number of knowledge articles active}} \)

% of Knowledge Articles Flagged

A daily calculation using the formula \( \frac{\text{Number of knowledge articles flagged}}{\text{Number of knowledge articles active}} \)

Monthly Average Article Rating

A monthly calculation of the sum of all article ratings for the month divided by the number of knowledge articles rated for the month.

Average Click Rank

A monthly calculation using the formula \( \frac{\text{Sum of knowledge search ranks}}{\text{Number of knowledge searches with rank}} \)

Click Through Rate

A monthly calculation using the formula \( \frac{\text{Number of knowledge searches with rank}}{\text{Number of knowledge searches}} \)

Article Quality Index

A monthly calculation using the formula \( \frac{\text{Sum of AQI scores}}{\text{Number of AQI records}} \)

Average Time to Publish

The average time to publish is recalculated daily, as a number of days. The goal of the indicator is for scores to minimize.

Sum of AQI Scores - Monthly
The sum of all Article Quality Index scores created in a month, calculated monthly. The goal is for scores to maximize.

**Number of AQI Records - Monthly**
The number of Article Quality Index records created in a month, calculated monthly. The goal is for the number to maximize.

**Number of Active Users Who Performed Searches - Monthly**
The number of knowledge searches made in a month, calculated monthly. The goal is for the number to maximize.

**Sum of Knowledge Search Ranks - Monthly**
The sum of feedback rankings of knowledge searches made in a month, excluding empty Highest Click Rank values. The goal is for the number to maximize.

**Number of Knowledge Searches with Rank - Monthly**
The number of knowledge searches in a month where the Highest Click Rank has a value higher than zero. The goal is for the number to maximize.

**Number of Knowledge Searches - Monthly**
The number of knowledge searches in a month. The goal is for the number to maximize.

**Number of Knowledge Articles Rated - Monthly**
The number of knowledge feedback records created in a month, excluding records where the Rating field is empty. The goal is for the number to maximize.

**Number of Knowledge Articles Published**
A daily count of the total number of knowledge articles that have entered the Published state. The goal is for the number to maximize.

**Number of Knowledge Articles Flagged**
A daily count of the number of active knowledge articles, with up-to-date workflows, that were flagged. The goal is for the number to maximize.

**Number of Knowledge Articles Active**
A daily count of the number of active knowledge articles with up-to-date workflows. The goal is for the number to maximize.

**Breakdowns**
The following breakdowns apply to the indicators on the dashboard:

- Time to Publish Groups
- Knowledge Base
- Knowledge Category

**Reports**
The dashboards include the following reports:
<table>
<thead>
<tr>
<th>Title</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Articles with Inactive Authors</td>
<td>Column</td>
<td>Active = true and Author.Active = False</td>
</tr>
<tr>
<td>Invalid Articles</td>
<td>Column</td>
<td>Active = true and Workflow is one of Draft, Review, Published or Pending Retirement and Valid to is before today and latest = true</td>
</tr>
<tr>
<td>Articles Created Over 1 Year</td>
<td>Column</td>
<td>Active = true and Created = before 1 year ago</td>
</tr>
<tr>
<td>Articles not Published</td>
<td>Column</td>
<td>Active = true and Workflow is Draft or Review</td>
</tr>
</tbody>
</table>

**Integration with external knowledge sources**

Use the external content integration feature to integrate content from various external sources and enable unified knowledge search results.

Users store and manage knowledge using various external sources and search each source separately for relevant results. External content integration enables acquiring and searching all WebDAV-compliant source content from a single location. This provides users with a seamless search experience across multiple knowledge sources and drives more usage to the platform.

Using this feature, knowledge administrators can define the external content to be imported into a knowledge base and periodically run a job to import the content. Knowledge users have a seamless user experience searching for relevant content across multiple knowledge sources.

**Activate the External Content Integration plugin**

The External Content Integration feature is activated with the Knowledge Management - External Content Integration plugin (com.snc.knowledge.external_integration).

Role required: admin

The Knowledge Management - External Content Integration plugin is not active by default.

The following plugins are automatically activated when the Knowledge Management - External Content Integration plugin is activated:

- Centralized Connection and Credentials plugin (com.snc.core.automation.connection_credential)
- Knowledge Management V3 plugin (com.snc.knowledge3)
- Knowledge Management Advanced Installer plugin (com.snc.knowledge_advanced.installer)
The Knowledge > Administration module displays the External Knowledge Sources and External Knowledge Jobs sub-modules when the Knowledge Management - External Content Integration plugin is activated.

1. Navigate to System Definition > Plugins.

A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

- If you’re certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.

- To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the Activate/Update related link.
  3. In the dialog box, review the dependent plugins.

     If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.

  4. If demo data is available and you want to install it, click Load demo data.

     Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin.
on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

### Define an external knowledge source

Before you import content, create and configure the connection between the a Web Distributed Authoring and Versioning (WebDAV) - compliant external knowledge source and the ServiceNow knowledge base into which you want to import content. Define import parameters for the external knowledge source.

Define **basic authentication credentials** and **create an HTTP connection** to the external source.

**Caution:** This feature expects that the external source endpoint is a publicly accessible endpoint. Mid-server configuration is not supported.

**Role required:** admin

Only basic authentication is supported for the external content integration feature.

1. Define the connection from the external source and the target knowledge base.
   a) Navigate to **Knowledge > Administration > External Knowledge Sources**.
   b) Click **New**.
   c) Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter unique name for the external source.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Select the knowledge base in which you want to create articles for the external content.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the connection alias to connect to the external source.</td>
</tr>
</tbody>
</table>

   d) Right-click the form header and click **Save**.

2. Set import parameters for the external content.
   a) In the **Parameter** related list, click **New**.
   b) In the **Name** field, select the name of the parameter from the drop-down list.
   c) In the **Value** field, enter the desired value for the parameter.

   The table below lists the parameters and the corresponding values that can be set for the external source.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Set maximum allowed content size for this source. Once this limit is reached, no further content is processed. Default value is 400 MB.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Instructions</td>
</tr>
<tr>
<td>-------------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Set maximum allowed size limit for each file from this external source. If a file exceeds this limit, that file is not processed. Default value is 4000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Set value to <strong>true</strong> to open search results in the external source system. Set value to <strong>false</strong> to open search results in the target knowledge base. Default value is set to <strong>false</strong>.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be included from this external source.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for folder names that need to be excluded from this external source.</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be included to create articles.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Enter a comma-separated list of regular expressions for file names that need to be excluded to create articles.</td>
</tr>
<tr>
<td>Maximum retry limit</td>
<td>Maximum number of retries to send request to the external source.</td>
</tr>
</tbody>
</table>

**d)** Click **Submit**.

**Import content from an external knowledge source**

Run an import job manually or set up a schedule to process the integrated external content.

Role required: admin or knowledge_admin

Each external source is associated with two handlers: the **Acquire handler** and the **Process handler**, for running the import job. The acquire handler uses a WebDAV client to acquire external content to create articles. You can customize the process handler to assign categories to articles or populate additional metadata for the knowledge articles.

1. Navigate to **Knowledge > Administration > External Knowledge Sources**.
2. Select the external knowledge source from which you would like to import content.
3. In the **Handler** tab, set a schedule to run the acquire and process handlers.
4. In the Related Links section, click **Run Scheduled Job**.
5. To view all jobs scheduled to run to import content for the external source, click the **Jobs**.

You can open the most recent job to monitor the status.

For each file in the external content source, a blank knowledge article is created and the external file is added as an attachment to the article. The short description of the article is derived from the file name of the external content source.

**Note:** If the externally imported content is infected, a notification about each infected file is sent to the users with the knowledge_admin role and Knowledge Base owners. The notified users can then take required actions on the infected files.
Open knowledge search results in source system

Configure the URL to the external source system to open articles from search results directly in the source system.

Make sure the Open search results in the original source system import parameter for the external knowledge source is set to true.

You can follow this procedure when you have a file as a knowledge article in Microsoft SharePoint, for example.

Role required: admin
1. Navigate to System Definition > Script Includes.
2. Open KBWebDAVContentHandler.
3. In the Script window, override the function getFileURL using script shown below. The getFileURL function is shown below.

```javascript
getFileURL: function(fileObj) {
  //write your logic here
},
```

4. Click Update.

Sample configuration for integrating external knowledge content

You can integrate content from multiple external sources so your users can acquire and search knowledge from a single location. Use this sample configuration to create a connection to your external account, configure external knowledge sources, and import content to enable search results for unified content.

Requirements for integrating external content

Make sure the Knowledge Management -- External Content Integration plugin (com.snc.knowledge.external_integration) is enabled and your external source is WebDAV-compliant.

Integrate external knowledge sources into the Knowledge Management application
Create authentication credentials and a connection alias to connect your external knowledge source to the ServiceNow Knowledge Management application. Define import parameters for your external source to import integrated content.

Role required: admin
1. Enable basic authentication on your external account.
2. Create the connection to your external account using the basic authentication credentials.
   a) Navigate to Connections and Credentials > Credentials.
   b) Click New.
   c) Click Basic Auth Credentials.
      Fill in the following fields:
      | Field    | Description                                      |
      |----------|--------------------------------------------------|
      | Name     | Name for the credential. For example, Demo_Auth.|
      | User name| The external account user name created for basic |
      |          | authentication.                                 |
      | Password | The external account password for the user name.|
   d) Click Submit.

3. Create an HTTP connection to your external account.
   a) Navigate to Connections & Credentials > Connection & Credential Aliases.
   b) Select New.
   c) In the Name field, enter the name of the connection alias. For example, Demo_Account.
   d) Right-click the form header and click Save.
   e) In the Connections related list, click New.
      Fill in the following fields:
      | Field     | Description                                                   |
      |-----------|---------------------------------------------------------------|
      | Name      | Name for the HTTP connection. For example, Demo_Connection.   |
      | Credential| Credential created to connect to the external account. For example, Demo_Auth. |
      | Connection URL | WebDAV URL to your external account. This is the WebDAV end point of your external account. |
      |           | Note: You can also import contents from a specific folder by appending the folder path to the URL. For example, https://<web link to your external_account>/KnowledgeIT. |
   f) Click Submit.

4. Configure the external knowledge source for importing content.
   a) Navigate to Knowledge > Administration > External Knowledge Sources.
   b) Click New and fill in the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the external source. For example, Demo_knowledge.</td>
</tr>
<tr>
<td>Target Knowledge Base</td>
<td>Knowledge base in which you want to create articles for the external content. For example, IT.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection alias to connect to the external source. For example, Demo_Account.</td>
</tr>
</tbody>
</table>

c) Right-click the form header and select Save.

d) In the Parameter related list, click New.

e) On the Parameter form, select the name of the import parameter that you want to configure for your external source and then set the value for the parameter.

The table below lists the parameters and the corresponding values that can be set for the external source.

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum size limit (in MB) for this source</td>
<td>Maximum allowable content size to import from your external source. For example, 250 MB.</td>
</tr>
<tr>
<td>Maximum size limit (in KB) per file/content in this source</td>
<td>Maximum allowable size for each article, including attachments, that you can import from this external source. For example, 2000 KB.</td>
</tr>
<tr>
<td>Open search results in the original source system</td>
<td>Opens search results in the external source system if this value is set to true.</td>
</tr>
<tr>
<td>Include folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to include from this external source. For example, to include all folders names that start with the letters a and b, enter a.<em>,b.</em>.</td>
</tr>
<tr>
<td>Exclude folders with names that match these regex patterns</td>
<td>Comma-separated list of regular expressions for folder names to exclude from this external source. For example, to exclude all folders names that start with the letters a and b, enter a.<em>,b.</em>.</td>
</tr>
<tr>
<td>Create articles when file names match these regex patterns</td>
<td>Comma-separated list of regular expressions for file names that to include when creating articles. For example, to include all file names have .docx and .pdf extensions, enter .<em>.docx,.</em>.pdf.</td>
</tr>
<tr>
<td>Do not create articles when file names match these regex patterns</td>
<td>Comma-separated list of regular expressions for file names to exclude when creating articles. For example, to exclude file names have .docx and .pdf extensions, enter .<em>.docx,.</em>.pdf.</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum retry limit</td>
<td>Maximum limit for the number of times a connection request can be sent to the external source. For example, 5.</td>
</tr>
</tbody>
</table>

Import content from an external knowledge source.

Use extension points for Knowledge Management

Use UI extension points to add knowledge article headers and footers to knowledge articles and to customize the email template for notifications when a knowledge article is commented on. Use scripted extension points to customize the feedback object used in the email template for notifications when a knowledge article is commented on.

The Knowledge Management Advanced plugin (com.snc.knowledge_advanced) must be activated to view the KMFeedbackNotification UI extension point and the KMFeedbackObject scripted extension point. These notifications are part of the Subscriptions feature, which is activated with this plugin.

Role required: admin

Using extension points makes it easier to integrate customizations without actually altering the base code. You can extend standard base functionality using customized scripts.

To use UI extension points in Knowledge Management, create an implementation and change the data as required. You can create multiple implementations per extension point, but for these scenarios, the use is limited to one implementation only. Example code is provided in the extension point, which can be edited, as required.

An implementation is delivered in the base system for scripted extension points. You can change the data and add additional fields, as required.

1. To use UI extension points to customize headers and footers in knowledge articles, and the email notification that is sent when a knowledge article is commented on:
   a) Navigate to System Extension Points > UI Extension Points.
   b) Click the UI extension point you want to use.

   Note:
   - Use the KMArticleViewFooter and KMArticleViewHeader UI extension points to add knowledge article headers and footers to the knowledge article view pages (kb_view.do) in Knowledge Management v3.
   - Use the KMFeedbackNotification UI extension point to customize the email template for notifications when a knowledge article is commented on.

   c) Click Create Implementation.
   d) Change the data as required.
   e) Click Update.

2. To use scripted extension points to update the feedback object used in the email template for notifications when a knowledge article is commented on:
   a) Navigate to System Extension Points > Scripted Extension Points.
Note: Use the KMFeedbackObject scripted extension point to customize the feedback object used in the email template for notifications when a knowledge article is commented on.

b) In the **API Name** column, click `global.KMFeedbackObject`.
c) In the **Implementations** related list, click the `KMFeedbackObjectBaseImpl` class.
d) Change the data and add additional fields, as required.
e) Click **Update**.

**Duplicate knowledge article numbers**

Importing knowledge articles into an instance can create articles with duplicate numbers.

The Knowledge **Number** field is auto-generated and is incremented every time you create a new article in an instance. The initial value for the **Number** field is 10,000. To customize this number:

1. Navigate to **System Definition > Number Maintenance**.
2. Search for **Knowledge** in the **Table** column.
3. Click the **Controls** related list tab.
4. Enter a new **Number** and click **Update**.

Importing knowledge articles from another instance or as part of the demo data for another application may introduce an article with a number that is already in use. Because the Knowledge **Number** field is not uniquely indexed, the import completes without error.

With duplicate knowledge article numbers present, links to article view pages that use the knowledge number can behave inconsistently. For example, if there are two articles with the same Knowledge number KB0000033, the following link may open either of these two articles randomly: `kb_view.do?sysparm_article=KB0000033`. This can happen in Knowledge search results where clicking on a result opens a different article instead of the article displayed in the search results.

**Avoiding duplicate Knowledge article numbers**

To avoid inserting Knowledge articles with duplicate numbers into a production environment:

- Do not import demo data articles in production environment.
- Verify the numbers of the articles to be inserted to make sure they are not already in use.
- Create a before insert business rule on the Knowledge table (kb_knowledge) to ensure the new number is not already in use.

You can also update the initial value for the Knowledge **Number** field so that newly created articles do not conflict with existing articles.

1. Navigate to **System Definition > Number Maintenance**.
2. Search for **Knowledge** in the **Table** column.
3. Click the **Knowledge** link to open the Knowledge table form.
4. Click the **Controls** related list tab.
5. In the **Number** field, update the count to a number greater than the largest value already in the system.

6. Click **Update**.

**Train the similarity solution for Knowledge Management to find related articles**

Train the Knowledge Similar Articles solution definition included within the Predictive Intelligence for Knowledge Management capability to find related knowledge articles when creating or viewing a knowledge article.

Ensure that the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) and Predictive Intelligence for Knowledge Management plugin (com.snc.knowledge_ml) are activated.

**Role required:** admin

1. Navigate to **Predictive Intelligence > Similarity > Solution Definitions**.
2. In the Similarity Definitions list, search for and select the Knowledge Similar Articles solution definition (ml_sn_global_knowledge_similar_articles).
3. On the Similarity Definition form, verify the default field values for knowledge articles. For more information about the Similarity Definition form fields, see *Create and train a similarity solution*.

   **Note:** If the application scope isn’t set to Knowledge Management - Machine Learning, you cannot edit the form and a warning message appears. To make the form editable, click the word **here** at the end of the message.

4. Click **Update & Retrain**.
5. Open the Similarity Definition form for the Knowledge Similar Articles solution definition (ml_sn_global_knowledge_similar_articles).
6. In the ML Solutions related list, view the training solution progress in the **Progress** column.

   **Note:** Alternatively, you can click the link for the solution in the **Active** column. On the ML Solution form, click the **Show training progress** related link to check the training solution progress.

When the solution is complete, the related knowledge articles appear in the Knowledge results section on the Knowledge form in the Now Platform, in the Related Articles section on the Knowledge Management article view page in the Knowledge Management Service Portal, and in Agent Assist when the **Similar Articles (ML)** option is selected.

- Review similarity examples: On the Similarity Definition form, in the ML Solutions related list, when **Progress** is 100%, in the **Active** column, click the link for the solution. On the ML Solution form, click the **Similarity Examples** related link to view the Similarity Examples list.
- Update the similarity score threshold: On the ML Solution form, on the **Solution Statistics** tab, enter the required value in the **Similarity Score Threshold** field. Right-click the ML Solution form and click **Save**.
- Test the prediction output for the records: On the ML Solution form, on the **Test solution** tab, enter your text in the **Short description** field and the maximum number of expected results in the **Top N** field, and then click **Run test**. The results above the similarity score threshold value are displayed.
Automating feedback management to improve content

Manage high volumes of article feedback by enabling task generation for negative feedback. When an article is rated poorly or marked as unhelpful, a feedback task is generated.

If an ownership group is assigned to the article, the feedback task is assigned to the manager of the ownership group. Ownership group managers can reassign tasks to another group member, or group members can assign a feedback task to themselves.

If no ownership group is assigned to the article, the feedback task is assigned to the author or reviser of the article.

The task assignee can update the article, create a new article, request additional feedback, or reassign the task and receives notification after the feedback is updated or resolved.

Note: The actionable feedback feature is available in the Knowledge Management Service Portal and Agent Workspace. To use the actionable feedback feature in other service portals, you can activate the Knowledge Article View page route map.

Beginning with New York, the Knowledge Article View page route map is activated by default. Existing customers on release versions prior to New York can activate the Knowledge Article View page route map. For more information, see Activate the Knowledge Article View page on upgrade.

Enable actionable knowledge feedback

The actionable knowledge feedback feature is available when the Knowledge Management Service Portal (com.snc.knowledge_serviceportal) plugin is activated and the actionable knowledge feedback properties are enabled.

Role required: admin

The actionable feedback feature is available in the Knowledge Management Service Portal and Agent Workspace. To use the actionable feedback feature in other service portals, you can activate the Knowledge Article View page route map. For new customers, the Knowledge Article View page route map is activated by default.

A feedback task is created for an article when the article is flagged. For generating feedback tasks when an article is marked as not helpful or rated below a set value, you must set the following associated properties.

1. Navigate to Knowledge > Administration > Properties.
2. In the Actionable Feedback Properties section, configure the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create actionable feedback task when an article is flagged</td>
<td>By default, the property is set to Yes and feedback tasks are created when the article is flagged.</td>
</tr>
<tr>
<td>Create actionable feedback task when an article is marked as not helpful</td>
<td>Select Yes.</td>
</tr>
</tbody>
</table>
Create actionable feedback task when an article is rated at or lower than this value. 0 or no value indicates that actionable feedback tasks are not enabled for Rating type feedback.

Enter a value from 1 to 5 to specify the rating threshold for generating a feedback task.

For example, if you set this value to 3, a feedback task is generated when a user selects three or less stars to rate an article.

**Note:** If you enter '0', a negative article feedback does not generate a feedback task.

3. Click **Save**.

**Work on a feedback task**

You can change the state of a task and resolve or reassign tasks generated by article feedback.

**Role required:** knowledge

- If no ownership group is assigned to the article, the feedback task is available to you as the author or reviser of the article.
- If an ownership group is assigned to the article, a feedback task is assigned to you as an ownership group manager. As a manager, you can reassign the task to another group member. All group members see the feedback task in **All Open Tasks**. As a group member, you can reassign the task to yourself to appear in **My Assigned Tasks**.

1. Navigate to **Knowledge > Feedback Management > My Assigned Tasks**.
2. Select a feedback task.
3. Review the feedback given by the submitter.

When a feedback task is generated, the information in the article feedback form is copied to the feedback task form as follows:

<table>
<thead>
<tr>
<th>Feedback task form field</th>
<th>Information from article feedback form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason</td>
<td>The selected reason for the feedback.</td>
</tr>
<tr>
<td>Description</td>
<td>Text in the <strong>Details</strong> field.</td>
</tr>
</tbody>
</table>

**Note:** If feedback is negative and the **Details** field is left blank, this field indicates whether the article was not helpful or rated poorly.

4. **To work on the feedback task:**

<table>
<thead>
<tr>
<th>Change the feedback task state to</th>
<th>If you want to</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Work in progress</strong></td>
<td>Start working on the feedback task.</td>
</tr>
<tr>
<td></td>
<td>You can save the feedback task and edit the article or create a new article if the information in the existing article is irrelevant or obsolete.</td>
</tr>
<tr>
<td><strong>Awaiting information</strong></td>
<td>Request clarification from the feedback submitter.</td>
</tr>
<tr>
<td></td>
<td>In the <strong>Additional Comments</strong> field, enter information you need from the submitter and click <strong>Update</strong>. This triggers an email notification for the feedback task submitter.</td>
</tr>
<tr>
<td>Change the feedback task state to</td>
<td>If you want to</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>Resolved</td>
<td>Resolve the feedback task. In the Resolution Code field, select the code for resolving the article. In the Resolution notes field, enter the reason for the resolution and click Update. An email notification is sent to the feedback submitter to accept or reject the feedback.</td>
</tr>
<tr>
<td>Closed</td>
<td>Close the feedback task without the submitter having to accept the feedback resolution.</td>
</tr>
</tbody>
</table>

**Note:** If the submitter accepts the feedback resolution, the state for the feedback task is automatically set to Closed. You can view all closed feedback tasks in your queue by navigating to Knowledge > Feedback Management > My Closed Tasks.

**Track the progress on a feedback task**

Monitor open and closed feedback tasks and track the duration of time a feedback task remains in each state.

Role required: Owner of the knowledge base, knowledge_manager, knowledge_admin, or admin

1. Navigate to the open or closed tasks you want to track.

<table>
<thead>
<tr>
<th>To</th>
<th>Navigate to</th>
</tr>
</thead>
<tbody>
<tr>
<td>View open feedback tasks</td>
<td>Knowledge &gt; Feedback Management &gt; All Open Tasks and select a feedback task.</td>
</tr>
<tr>
<td>View closed feedback tasks</td>
<td>Knowledge &gt; Feedback Management &gt; All Closed Tasks and select a feedback task.</td>
</tr>
</tbody>
</table>

2. In the Knowledge Feedback Task Metrics related list section, select a feedback task metric to view the start and end time and the duration of the feedback task.

   **Note:** If you are a knowledge administrator, you can view the feedback tasks and task metrics of articles in the knowledge bases. If you are a knowledge owner or knowledge manager, you can view feedback tasks and task metrics of all articles in the knowledge bases you own or manage.

**Knowledge-Centered Service configuration**

Knowledge-Centred Service configuration (KCS) is a method for the creation and continuous improvement of knowledge based on the experience of agents and the patterns observed by knowledge reuse.

ServiceNow Knowledge Management is a KCS (V6) verified product. As a KCS (V6) verified product, Knowledge Management provides features to improve knowledge, such as article quality reviews, in-context knowledge capture, and feedback management.
**Article quality index for knowledge management**

Assess the quality of knowledge articles with the article quality index (AQI). The AQI helps maintain consistent quality of knowledge articles attached to a knowledge base where articles are written by various authors.

Using AQI feature, a knowledge administrator (a user with knowledge_admin role) creates a checklist and adds a set of true or false questions to the checklist to assess the quality of knowledge articles. For each question, the knowledge_administrator assigns a weight based on its importance to the quality measurement and then attaches the checklist to a knowledge base.

A knowledge reviewer (a user with knowledge_coach and knowledge_domain_expert role) performs AQI review on knowledge articles attached to the knowledge base by answering the true or false questions in the checklist. The article quality is then scored based on the cumulative weight of all answers set to true in the checklist.

The average AQI scoring is displayed on the Content Quality tab of the Knowledge Management dashboard (see Knowledge Management dashboard).

**Activating article quality index**

The article quality index feature is activated with the Knowledge Management Advanced (com.snc.knowledge_advanced) plugin. For details see, Activate the Knowledge Management Advanced plugin.

**Create an AQI checklist**

Create a checklist of questions that reviewers can use to evaluate the quality of knowledge articles.

Role required: knowledge_admin or admin

1. Navigate to Knowledge > Article Quality Index > AQI checklists, and click New.
2. Fill in the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checklist</td>
<td>Name for the checklist.</td>
</tr>
<tr>
<td>Description</td>
<td>Description for the checklist.</td>
</tr>
</tbody>
</table>

3. Right-click the form header and click Save.
4. In the Checklist Questions related list, add questions to the checklist.

Add questions and adjust the weight of the questions until the combined weight of all questions is equal to 100. The weight defines the score that is added to the total AQI review score of the article when the answer for that question is set to true. The maximum score that can be applied to an article in an AQI review is 100.

**Note:** The default AQI pass score is 70. You can change the pass score in the Article Quality Index properties.

To add a question:

a) Click New.

b) Fill in the following fields:
### Checklist Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question</td>
<td>Text for the question to evaluate articles.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description for the question.</td>
</tr>
<tr>
<td>Order</td>
<td>Value for the display order of questions in the checklist. The lower the value in the <strong>Order</strong> field, the higher the question displays in the checklist.</td>
</tr>
<tr>
<td>Weight</td>
<td>A value for the question to score the article quality. This value is added to the AQI score when the answer for the question is set to true.</td>
</tr>
</tbody>
</table>

**Note:** Before you assign a value for the display order, think about how many questions you would create for the checklist. For example, if you have five questions in a checklist, you can assign the value in increments of 20. This ensures that you have enough values to assign if you add questions to the checklist later.

**Note:**
- The combined weight of all questions cannot exceed 100.
- The sum of weights of all questions in a checklist must be equal to 100 to be assigned to a knowledge base.

---

5. After you finish adding questions to the checklist, click **Update** on the AQI Checklist form.

After you create a checklist, **assign it to a knowledge base**.

**Assign an AQI checklist to a knowledge base**

Before a knowledge reviewer can start performing the AQI review, you must assign an AQI checklist to a knowledge base.

You can only assign a checklist to a knowledge base when the weight of all questions in the checklist is equal to 100. Each knowledge base can have one assigned checklist. However, a checklist can be assigned to more than one knowledge base.

Role required: knowledge_admin or admin
1. Navigate to **Knowledge > Administration > Knowledge Bases**.
2. Click a knowledge base to which you want to assign a checklist.
3. On the Knowledge Base form, click the search icon in the **Checklist** field and select the AQI checklist to apply.
4. Click **Update**.

After you assign an AQI checklist to a knowledge base, you can start performing AQI reviews.

### Remove an AQI checklist from a knowledge base

Before you can edit a checklist that is assigned to a knowledge base, you must remove it from the knowledge base.

A checklist with pending AQI reviews cannot be removed from the knowledge base until all AQI reviews associated with the checklist are complete.

Role required: knowledge_admin or admin

1. Navigate to **Knowledge > Administration > Knowledge Bases**.
2. Click a knowledge base from which you want to remove a checklist.
3. On the Knowledge Base form, delete the name of the AQI checklist from the **Checklist** field.
4. Click **Update**.

### Delete questions from an AQI checklist

Deleting a question in a checklist deletes the text in the question of previously performed AQI reviews that use the checklist. Deleting an AQI question from a checklist will not affect the score of the previously performed AQI reviews. However, the text of the question will not be displayed in the checklist.

You can delete questions from a checklist if the following conditions are met:
- The checklist is not attached to a knowledge base. For more information, see *Remove an AQI checklist from a knowledge base*.
- There are no AQI reviews using the checklist in progress.

Role required: admin

1. Navigate to **Knowledge > Article Quality Index > AQI checklists**.
2. Click the AQI checklist from which you want to delete one or more questions.
3. In the Checklist Questions related list, select the check box next to the questions that you want to delete.
4. From the **Actions on Selected Rows** choice list, select **Delete**.
5. In the Confirmation window, click **Delete**.

### Perform an AQI review

Perform the AQI review to evaluate the quality of the article.

The knowledge base must have an assigned AQI checklist.

Role required: knowledge_domain_expert, knowledge_coach, knowledge_admin, or admin

Configure the **glide.knowman.aqi.article_workflow_states** property to set the article workflow states where you could perform AQI reviews. You can perform several AQI reviews for an article. If
you perform several AQI reviews for the same version of the article, the latest AQI score appears in the Latest AQI field in the article.

1. Navigate to Knowledge > Articles > Published, and click on an article to perform the AQI review.

2. Perform one of the following actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Instructions</th>
</tr>
</thead>
<tbody>
<tr>
<td>The AQI review is not yet started.</td>
<td>Click Perform AQI in the form header.</td>
</tr>
<tr>
<td>The AQI review was started and is pending.</td>
<td>Click Continue AQI in the form header.</td>
</tr>
</tbody>
</table>

An Article Checklist Summary form appears.

3. In the Article Checklist Answers related list, read the questions and evaluate which ones are true. Double-click the Answer cell for each question that is true, select true, and click the green check mark.

   Note: The associated Weighted Score is applied to the AQI score when the answer is set to true.

4. Perform one of the following actions:
To submit the completed AQI review, click Submit. The form refreshes and the total score of the AQI review is displayed in the AQI score field. The system sends an email notification as follows:
