E-signature

Sign electronic documents from any desktop or mobile device with e-signature. E-signature is a scoped application that enables users to sign managed documents or knowledge articles with their typed or drawn e-signature, credentials, or as an acknowledgment.

Role assignment

Before you begin using e-signature, you must assign the e-signature roles to the appropriate roles, groups, or users in your application. See Components installed with e-signature for more information.

How to use e-signature templates

Users with the e-signature administrator [sn_esign.admin] or manager [sn_esign.config_manager] role can create e-signature templates. Each e-signature template pairs a document type to sign (managed document or knowledge article) with a signature type (signature, credential, or acknowledgment). For example, you could create an e-signature template for a non-disclosure agreement that requires a typed or drawn signature.

• Configure an e-signature template

You can then use the e-signature template in task forms to request electronic signatures from users. In the HR Service Delivery application, for example, you can add HR tasks to HR cases or configure HR task templates to request electronic signatures per the selected e-signature template. See HR e-signature for HR-specific examples.

Activation information

To use e-signature in your application, you must activate e-signature. For information on what components are installed with the feature, see Components installed with e-signature.

Activate e-signature

You can activate the e-signature plugin (com.snc.esign) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

E-signature activates these related plugins if they are not already active.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServiceNow document viewer [com.snc.documentviewer]</td>
<td>Document viewer is a platform feature that will enable users to view enterprise class documents inline within the platform attachment instead of downloading it to the local device and then opening the documents with a locally installed viewer.</td>
</tr>
<tr>
<td>Managed documents [com.snc.document_management]</td>
<td>Managed Documents application. To enable the ability to publish to the knowledge base, activate the knowledge document plugin.</td>
</tr>
<tr>
<td>Plugin</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Signature pad [com.snc.signaturepad]</td>
<td>Provides a tool to allow a digital signature in a .pdf document. The Human Resources application uses this with various documents.</td>
</tr>
</tbody>
</table>

1. Navigate to **System Applications > All Available Applications > All.**
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in *Request a plugin*. 
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

   **Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise they will receive the following error: *Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.*

### Components installed with e-signature

Several types of components are installed with activation of e-signature, including tables and user roles.

**Note:** The Application Files table lists the components installed with this application. For instructions on how to access this table, see *Find components installed with an application.*

Demo data is available for this feature.

### Roles installed

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>E-signature administrator [sn_esign.admin]</td>
<td>Can manage the e-signature module.</td>
<td>• sn_esign.config_manager</td>
</tr>
<tr>
<td>E-signature manager [sn_esign.config_manager]</td>
<td>Can manage the e-signature configurations.</td>
<td>• None</td>
</tr>
</tbody>
</table>

You can assign these roles to the appropriate roles, groups, or users in your application.
- To assign a role to another role, see *Add a role to an existing role.*
- To assign a role to a group, see *Assign a role to a group.*
- To assign a role to a user, see *Assign a role to a user.*

For further information on user administration and how to manage users, see *User administration.*
Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>E-Signature Configuration [sn_esign_configuration]</td>
<td>E-signature configuration table.</td>
</tr>
<tr>
<td>E-Signature Acknowledgement [sn_esign_acknowledgement]</td>
<td>E-signature acknowledgment table.</td>
</tr>
</tbody>
</table>

For further information on table administration and how to manage data, see *Table administration*.

**Configure an e-signature template**

Create or modify an e-signature template to define an electronic document and signature configuration for use in task forms. Each template is associated with a document type such as a managed document or knowledge article, and you can configure the template so that the signatory is required to sign the document with their typed or drawn signature, credentials, or as an acknowledgment.

Role required: sn_esign.admin or sn_esign.config_manager

1. Navigate to E-signature > E-signature template.
2. Click New or open a record.
3. Fill in the fields on the form.

**E-signature template form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

Understanding Edge Encryption

Edge Encryption is a network encryption system that resides on your network and that encrypts and decrypts sensitive data as it travels between your data center and the ServiceNow cloud.

What is Edge Encryption

The Edge Encryption proxy server is a network encryption application that, through encryption in motion, encrypts data within your network before it is sent over the Internet to your instance, where it remains encrypted at rest. When requested, the encrypted data is sent back to the Edge Encryption proxy server, which in turn decrypts your data before serving it to your web browser.

Who uses Edge Encryption

Only a user logged into the instance through a proxy server on your network can view encrypted data in clear text. Likewise, only a security_admin user logged in to an instance through a proxy server in your network can configure and administer Edge Encryption.

Because the proxy server resides in your network, you own and manage the encryption keys, and they are never sent to the instance. As a result, ServiceNow never shows sensitive data in clear text.
Encryption and tokenization

Edge Encryption supports both encryption (through encryption configurations) and tokenization (through encryption patterns) as a means of protecting your sensitive information.

Encryption configurations

You can encrypt individual fields using encryption configurations. Edge Encryption supports AES 128-bit and AES 256-bit encryption keys. Edge Encryption supports standard, equality-preserving, and order-preserving encryption types.

In addition to attachments, you can encrypt the following field types:

- String
- Date
- Date/Time
- Journal
- Journal Input
- URL

If a Journal field marked for encryption is added to the activity stream, all user input to the field is encrypted in the activity stream.

**Note:** Multi-byte characters within supported field types can be encrypted.

Encryption patterns

You can use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While encryption configurations should be the primary method of encryption, use encryption patterns as a supplement to secure sensitive information found outside of encrypted fields.

**Note:** The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see *Edge Encryption components.*
Edge Encryption on the Now Platform

Edge Encryption acts as a gateway between your browser and your ServiceNow instance. Traffic from your browser passes through the gateway on its way to the ServiceNow instance. The gateway, in turn, is configured to encrypt outbound data that is marked for encryption. Inbound traffic is decrypted through the gateway, and the end user sees clear text in the browser. The advantage of this implementation from a security control perspective is that the encryption and key management are handled externally from ServiceNow.

What to know before you begin

Because encryption and tokenization change the nature of your data, Edge Encryption can affect other instance processes. Before using Edge Encryption, carefully consider the impact on your instance.

Because the proxy server is installed and maintained in your network, Edge Encryption requires network administration and management. Review the network requirements to ensure a smooth implementation.
Review the following topics to understand the impact of Edge Encryption on your instance:

- Planning for Edge Encryption
- Edge Encryption system requirements
- Sizing your Edge Encryption environment
- Calculate the order-preserving and tokenization database size
- Edge Encryption limitations
- Key management

**Edge Encryption components**

Edge Encryption is comprised of the Edge Encryption proxy server that runs on a server in your network, and the Edge Encryption plugin that must be installed on your ServiceNow instance. If using order-preserving encryption types or encryption patterns, a proxy database must also be installed in your network.

**Proxy application**

When going through the Edge Encryption proxy server, the Edge Encryption plugin allows you to specify which fields, patterns, and attachments should be encrypted. You can also manage encryption rules to encrypt specific requests and schedule mass encryption jobs.

**Proxy server**

The Edge Encryption proxy server uses encryption rules to identify in an HTTP request what, if anything, needs to be encrypted and encrypts it before forwarding the request to the instance. For decryption, the Edge Encryption proxy server looks at the HTTP responses for any encrypted data and decrypts it before sending the response back to the client. In order for this to happen, all HTTP requests and responses must go through the Edge Encryption proxy server. This includes any requests originating from a browser, as well as any SOAP or REST requests.

**Proxy database**

If using order preserving encryption or encryption patterns, your proxy servers rely on a MySQL database located in your network. All proxy servers in your network must use the same database.

The proxy database contains these tables.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>db_id</td>
<td>Unique database ID</td>
</tr>
<tr>
<td>edge_token_map</td>
<td>Encryption pattern data</td>
</tr>
<tr>
<td>token_map</td>
<td>Order-preserving encryption data</td>
</tr>
</tbody>
</table>

**Backing up your proxy database**

Because encryption patterns rely on tokenization, clear text values are stored in your proxy database. If the database is lost, clear text values cannot be restored. It is critical that you maintain regular backups. To avoid data loss, back up your proxy database according to ServiceNow recommendations.

- Back up your database every 24 hours.
• Retain MySQL database binary log files for at least two days. After a backup has been restored, use the binary log to regenerate any data lost since the most recent backup. Refer to MySQL database backup best practices for your database version.

**Edge Encryption clients**

Edge Encryption uses three clients to inform the instance that the proxy is running, to synchronize requests between the proxy and the instance, and to forward all end user requests to the instance after any potential encryption.

<table>
<thead>
<tr>
<th>Client</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>heartbeat/keepalive client</td>
<td>In charge of sending a request to the ServiceNow instance every 5 seconds to let the instance know that this proxy is up and running. The requests drive the last_response_on field on the Edge proxy table, and as a consequence drive the state of the proxy. If your system has issues sending the requests, or if the request or request processing is delayed, the instance may mark the proxy as unresponsive, even if the other clients (including the one for user traffic) are up and running. This client also controls the online status of the proxy on the instance. The <strong>edgeencryption.proxy.keepalive.interval</strong> property controls the polling rate for this client. The default is 5 (seconds).</td>
</tr>
<tr>
<td>polling/sync client</td>
<td>In charge of various requests the proxy sends to the instance to synchronize on the Edge Encryption configuration (for example, which table, column, or attachment to encrypt, keys, jobs, rules, and tokenization patterns). The <strong>edgeencryption.config.poll.interval</strong> property controls the polling rate for this client.</td>
</tr>
<tr>
<td>default/user traffic client</td>
<td>For everything else, this client handles all end user requests and forwards them to the ServiceNow instance after any potential encryption. This client also handles responses from the instance, forwarding them to the end user after any potential decryption.</td>
</tr>
</tbody>
</table>

**Key management**

You are responsible for providing and managing the encryption keys used by Edge Encryption.

When obtaining and creating encryption keys to support the encryption types used by Edge Encryption, consider the following:

• Whether to use AES 128-bit or AES 256-bit. You must define a default AES 128-bit encryption key, even if it is not used.
• Whether to use file system, Java KeyStore, or Enterprise Key Management (EKM).
• When to rotate encryption keys.
• When and if to use a mass encryption job to re-encrypt data using the new key.
Before removing a key from the proxy configuration files and the keystore, it is critical that you decrypt all data on the instance that uses the key. You can do this by adding a new encryption key and scheduling a mass key rotation job.

**Keystores**

Edge Encryption supports the following types of key storage.

**File store**

Keys are stored in a file in a file system that is accessible by the Edge Encryption proxy. Encryption keys stored in a file are not encrypted, so it is your responsibility to protect these files.

**Java KeyStore**

Keys are stored in Java's JCEKS KeyStore. A Java KeyStore is protected by a password, so it is more secure than storing keys in a file in the file store. A single Java KeyStore can store multiple keys, and the keys are identified by a key alias, making it easier to manage multiple keys.

**Enterprise Key Management (EKM)**

Keys are stored and retrieved with the SafeNet KeySecure or Unbound Technology key management systems. The Edge Encryption proxy ships with the Java JCEKS KeyStore file named `keystore.jceks` in the `keystore` directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

**Note:** If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is `servicenow`.

In addition to the encryption keys, the Java JCEKS KeyStore is used to store the RSA key pair for digitally signing the encryption configuration and encryption rules that are stored in the instance, and the digital certificate that the Edge Encryption proxy uses to establish a secure connection with the browsers and any other clients.

**SafeNet key versioning**

Use SafeNet key versioning to simplify changing keys. Instead of creating a new alias for every new key, SafeNet key versioning keeps the same alias and increments the version.

You must set up key versioning in SafeNet before you can configure SafeNet key versioning on the Edge proxy server.

**Note:** Edge proxies installed before the London release support SafeNet keys, but do not support SafeNet key versioning. If you mistakenly use a versioned key on a Kingston or earlier proxy, when you upgrade to a London or later release, the London or later proxy detects this problem, and to prevent potential data loss the proxy does not start.

You must first schedule a mass key rotation job or a single key rotation job to replace the old SafeNet versioned key with a non-versioned key, and then create a new SafeNet versioned key, if needed. This new versioned key is safe to use with the London or later proxy, and you can restart the proxy.

**Encryption key configuration**

If using SafeNet versioned keys, the Change Default Keys section of the Encryption Key Configuration form includes new fields for the **Key version** of the default 128-bit and 256-bit keys. **Key version** fields are grayed out and cannot be edited.
For procedures, see *Configure encryption keys on the instance*.

**Versioned keys**

If using SafeNet versioned keys, when you navigate to *Edge Encryption Configuration > Encryption Key Configuration > All Keys*, versioned keys include the *Key version*.

A version number does not appear for the initial entries you make in the Change Default Keys section of the Encryption Key Configuration form. When the proxy server requests a key from SafeNet, the system adds a new line for the alias and adds the *Key version*.

In the above example, **AES128key** is listed three times:

- The first listing, with no *Key version* indicated, is the initial entry.
- The second listing, with 1 in the *Key version* column, is the first version of the key returned from SafeNet.
- The third listing, with 2 in the *Key version* column, is the second version of the key returned from SafeNet.
Encryption configurations and patterns

With Edge Encryption, you can encrypt fields and tokenize strings.

Encryption configurations

You can encrypt individual fields using encryption configurations. Edge Encryption supports AES 128-bit encryption keys. If the Java Cryptography Extension (JCE) Unlimited Strength Jurisdiction Policy files are installed, Edge Encryption supports AES 256-bit encryption keys for each encryption type. Edge Encryption supports the following types of encryption configurations.

Standard encryption

The encrypted value of a field is different each time the field is encrypted, even when the field value remains the same. Standard encryption is the most robust form of encryption. Fields using standard encryption cannot be sorted, grouped by, or filtered on.

Equality-preserving encryption

The encrypted value of a field is the same when the field value remains the same. Supports equality comparisons and group by operations on a field.

Note: When equality-preserving encryption is selected for a field that already contains data, performing a group by action on the field may not group fields with the same value if one is encrypted and the other is not.

Order-preserving encryption

Uses tokens and encryption to secure data in your proxy database. Supports equality comparisons, group by operations, and the ability to sort data. The order preserving encryption type is only supported if there is a MySQL database configured for the Edge Encryption proxy server.

Note: When using order-preserving encryption and the proxy database is down, updates can be made to fields using order-preserving encryption. However, the sort order will not be correct when trying to sort data based on those fields. Groups also will not work as expected. When the proxy database is again operational, schedule an order token repair job to repair missing tokens.

Encryption types

The following encryption types are listed in decreasing security quality.

<table>
<thead>
<tr>
<th>Encryption type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard AES 256</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Standard AES 128</td>
<td>Fields cannot be filtered, sorted, or compared.</td>
</tr>
<tr>
<td>Equality preserving AES 256</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Equality preserving AES 128</td>
<td>Fields can be filtered using equality comparisons.</td>
</tr>
<tr>
<td>Order preserving AES 256</td>
<td>Fields can be sorted and equality comparison filtering can be used. Requires the use of a MySQL database in your network.</td>
</tr>
</tbody>
</table>
### Encryption Patterns

You can secure sensitive data found in strings using encryption patterns. Once an encryption pattern is stored and activated, the Edge Encryption proxy server identifies strings that match the pattern in requests. Once located, the clear text string is stored in the proxy database and replaced on the instance with a token. Use encryption patterns to tokenize strings that match regular patterns such as social security and credit card numbers. While we recommend that encryption configurations be the primary method of encryption, use encryption patterns as a supplement to locate and secure sensitive information found outside of encrypted fields.

**Note:** The Edge Encryption proxy server requires a MySQL database in your network only if using order preserving encryption or encryption patterns. Clear text values are stored in the proxy database in your network. For this reason, it is critical that you secure and regularly back up your proxy database. For recommendations, see *Edge Encryption components*.

### Installed with Edge Encryption

Edge Encryption installs tables to store encryption-related data, system properties to configure default behavior, and the edge_encryption role to administer Edge Encryption.

#### Tables installed with Edge Encryption

Edge Encryption adds the following tables.

**Edge Encryption Configuration [sys_encryption_configuration]**
Contains encrypted fields and tables for which attachments are encrypted.

**Edge Encryption Rule [sys_encryption_rule]**
Contains a record for each rule. A rule has a name, the condition when it is used, a script, and an order field.

**Edge Encryption Invalid Insert Log [sys_edge_encryption_invalid_insert_log]**
Contains log messages created for attempts to save unencrypted data to an encrypted field.

**Edge Encryption Proxy [sys_encryption_proxy]**
Contains information about the encryption proxy application.

**Edge Proxy Encryption Type [sys_proxy_encryption_type]**
Used for enabling and disabling encryption types on the encryption form.

**Encryption Job Execution [sys_encryption_job_execution]**
Supports mass encryption jobs.

**Encryption Job Execution Chunk [sys_encryption_job_execution_chunk]**
Supports mass encryption jobs.

**Scheduled Encryption Job [sysauto_encryption_job]**
Lists scheduled jobs for encryption, decryption, key rotation, order token repair, and database recovery.
Encryption Key Configuration [sys_encryption_key_configuration]
Lists default encryption keys.

Encryption Key [sys_encryption_key]
Lists available keys and key attributes.

Proxy Encryption Key [sys_encryption_proxy_key]
Lists proxy encryption keys.

Properties installed with Edge Encryption
Edge Encryption adds the following properties.

Note: To open the System Properties [sys_properties] table, enter sys_properties.list in the navigation filter.

glide.edge.pattern.disallowed.chars
A list of characters that are not allowed in patterns.
• Type: a string of a comma-separated list of values
• Location: System Properties [sys_properties] table

glide.edge.pattern.min.size
The minimum pattern size allowed. Allowing smaller patterns means finding more matches, which increases overhead.
• Type: number
• Default value: 5
• Location: System Properties [sys_properties] table

sn_edge_encryption.logging.destination
Where messages are logged.
• Type: string
• Default value: file
• Location: System Properties [sys_properties] table

sn_edge_encryption.logging.verbosity
The logging level to use.
• Type: string
• Default value: info
• Location: System Properties [sys_properties] table

sn_edge_encryption.encryption.proxy.buildtag
The proxy version registered with your instance.
• Type: string
• Location: System Properties [sys_properties] table
sn_edge_encryption.cleartext.allowed
When true, allows clear text to be saved in an encrypted field. This happens when a user is accessing the instance without going through the Edge Encryption proxy. When false, the system prevents clear text from being saved in an encrypted field.

- **Type**: Boolean
- **Default value**: false
- **Location**: System Properties [sys_properties] table

Role installed with Edge Encryption

type

Edge Encryption proxies log into the instance as a user, with a user name and password. The user must have this role assigned.
Contains roles: None

Planning for Edge Encryption

Successful implementation of Edge Encryption requires planning and preparation.

Answer the following questions in the planning stage.

- Which fields are to be encrypted?
- Which encryption types are to be used?
- How many Edge Encryption proxies are needed? See *Sizing your Edge Encryption environment* for recommendations and considerations.
- If an order preserving encryption type or encryption patterns are to be used, where is the MySQL database located?
- Which key management system is to be used?

System administrators, network administrators, and security team members have different tasks to fulfill for implementing Edge Encryption.

- System administrators need the security-admin role. The system administrator needs to:
  - Download the Edge Encryption proxy application.
  - Set up an Edge Encryption user account for the proxies to use to connect to the instance. The user must be assigned the edge_encryption role.
  - Configure encryption keys, and set the default keys.
  - Configure Edge Encryption on the instance.
  - Schedule encryption jobs.
  - Monitor Edge Encryption.
  - Create and edit encryption rules.

- Your network administrator needs to:
  - Install the Edge Encryption proxy application.
  - Know the network addresses for the proxy servers and the proxy database used for order-preserving encryption and encryption patterns.
  - Install the proxy database to be used for order-preserving encryption and encryption patterns.
  - Start and stop the proxy applications.
  - Perform encryption key management.
• Determine how to map users to encryption proxy applications. This can be done with DNS settings or routing rules, and is specific to each network.
• Manage multiple proxy servers.
• Configure load balancer pools and settings.

• Your security administrator must determine the encryption types to be assigned to each field.

**Edge Encryption system requirements**

You can run the Edge Encryption proxy application on servers or virtual machines that run on Microsoft Windows or Linux operating systems. For optimum performance, ensure that your configuration meets these requirements.

**Java requirements**

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

• Java 8 update 121 (8u121)
• Java 8 update 141 (8u141)
• Java 8 update 151 (8u151) or later

**Note:** Java 8 update 131 (8u131) is not supported.

**Note:** Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

<table>
<thead>
<tr>
<th>Java Version</th>
<th>Enabling AES 256-bit Encryption</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java 8 update 141 (8u141) or earlier</td>
<td>Install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the &lt;Java-home-directory&gt;/jre/lib/security folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier.</td>
</tr>
<tr>
<td>Java Version</td>
<td>Enabling AES 256-bit Encryption</td>
</tr>
<tr>
<td>------------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Java 8 update 151 (8u151) or later</td>
<td>A <code>java.security</code> file is downloaded with the update. Edit the <code>java.security</code> file to enable AES 256-bit encryption. To edit the <code>java-security</code> file, see <em>Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later</em>.</td>
</tr>
</tbody>
</table>

**Note:** Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

**Support for OpenJDK**

Starting with the Orlando release, the Now Platform supports the following versions of openJDK:

- OpenJDK version 8
- AdoptOpenJDK version 8

**Proxy server minimum configuration**

A proxy server requires this minimum configuration:

- 4 GB of RAM per proxy server (6 GB is recommended for most deployments).

**Note:** The proxy server host requires at least 1 GB of RAM more than the proxy server. The proxy server host needs the extra 1 GB for operating system services. For example, if you configure a proxy server to use 4 GB of RAM, you must install at least 5 GB of RAM on the proxy server host.

Because the proxy server requires at least 4 GB of memory, 32-bit JREs and 32-bit operating systems are no longer supported starting with the London release.

- 3 or more GHz CPU (4-core CPU preferred for optimum performance).
- Multiple proxy servers behind a load balancer. The number of proxy servers you need depends on the number of application nodes, the number of simultaneous users, and the number of servers needed for failover. See *Sizing your Edge Encryption environment* for more information.
- Ability to run concurrently with other services, depending on the server utilization and resource availability.
- Java 8.

**Proxy server supported systems**

The following systems are supported:
<table>
<thead>
<tr>
<th>Supported System</th>
<th>Description</th>
</tr>
</thead>
</table>
| Windows Server 2012, 2012-R2, and 2016 editions     | • Virtual machines or physical hardware  
• 64-bit systems                                     |
| Linux                                                | • Virtual machines or physical hardware  
• 64-bit systems                                     |
|                                                      | On 64-bit Linux systems, you must install the  
32-bit GNU C library (glibc). The installation  
command for CentOS is yum install glibc.i686. |

**Proxy server connection requirements**

The proxy server that runs the Edge Encryption application must be able to communicate with machines in your network. Make sure that the proxy server has these network privileges:

<table>
<thead>
<tr>
<th>Network Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firewall access</td>
<td>Configure any firewalls between the proxy server and the client devices to allow a connection. If your network uses a DeMilitarized Zone (DMZ) to add an extra layer of security to your Local Area Network (LAN), and if your network security protocols limit port access from within the network to the DMZ, you might have to deploy a proxy server to a machine within the DMZ.</td>
</tr>
<tr>
<td>Network access</td>
<td>Configure each client to enable the proxy server to connect with it. If network security prevents you from configuring new machines that can connect to the clients, install the proxy server on an existing machine with connection privileges.</td>
</tr>
<tr>
<td>Instance access</td>
<td>Ensure that the proxy server has network access to the instance. Make sure that you configure the proxy server network to allow traffic over TCP port 443.</td>
</tr>
<tr>
<td>Network account</td>
<td>Install the proxy server with either a local or domain administrator.</td>
</tr>
</tbody>
</table>

**Order-preserving and tokenization database system requirements**

Order-preserving encryption and encryption patterns require that you configure an Oracle MySQL database for the Edge Encryption proxy server. Order-preserving encryption allows any comparison operation to be directly applied on encrypted data, without first decrypting the data. Encryption patterns let you replace string patterns with tokens (called tokenization) before they are sent to and stored in the database. Because of the size of the MySQL database, use a dedicated proxy server to run the order-preserving and tokenization database.

The minimum database system requirements include:

<table>
<thead>
<tr>
<th>MySQL Database</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>MySQL database versions 5.5 to 5.7</td>
</tr>
</tbody>
</table>
### MySQL Database Table

<table>

</tr>
</tbody>
</table>

### Sizing your Edge Encryption environment

Choosing the number of proxy servers for your environment is an important task. Consider the number of users, redundancy needs, and acceptable latency.

#### Redundancy

Maintain redundant proxy servers in case of hardware failure. Proxy servers should be located behind a load balancer to provide a functional path for all users if a proxy server is unreachable. At a minimum, ensure that two proxy servers are always available.

#### Size

Size refers to the number of proxy servers required to avoid additional latency that the encryption of data produces. Depending on use, you may want to reduce the amount of latency by adding additional proxy servers. For example, if regular mass encryptions are run, add additional proxy servers to handle the load, or run the mass encryptions when the user load is light. In addition, the hardware that the proxy server runs on influences performance and latency. Proxy servers running on hardware with faster CPUs, more CPUs, and more RAM have higher throughput than slower, limited systems.

The following guidelines assume that your proxy server is running on at least the minimum hardware requirements. To determine the number of proxy servers:

- Consider setting up one proxy server for every two application nodes on the instance.
- For redundancy, set up a minimum of two proxy servers behind a load balancer.
- Add an extra proxy server for every 500 simultaneous users.
- Depending on the desired redundancy, add additional proxy servers for failover.

For example, for an instance with 2,000 users, you should have at least five proxy servers behind a load balancer. This calculation includes one proxy server for every 500 users, with an extra proxy server for failover. Determine ahead of time when you will approach a threshold of 500 users and place another proxy server in the load balancer pool.
Load balancers

To balance requests and improve server response time, distribute proxy servers in a load balancer pool. Configure load balancers to use the "least connections" method. This method connects requests to the proxy server with the fewest active connections, preventing the overloading of a single proxy.

CPU utilization

Because data encryption and tokenization are CPU intensive operations, CPU spikes while encrypting data are normal and expected. When CPU utilization is over 80% for several minutes at a time, it likely means that the proxy server has too much work to do. When this happens, latency increases for the period that the CPU utilization is high. If latency persists, adding another proxy server may help decrease the latency.

Memory

The proxy server must have a minimum of 4 GB of RAM available (6 GB recommended). Set the proxy server initial and upper bound memory limits to the recommended settings.

Calculate the order-preserving and tokenization database size

If using order-preserving encryption or encryption patterns, determine the size of your MySQL database by multiplying the number of potential records by record size.

Use a dedicated machine to run the order-preserving and tokenization database. Do not run the database on the same hardware as the proxy server.

1. Determine the potential number of records that could include fields encrypted with order-preserving encryption.
   a) Multiply the number of encryption configurations using order-preserving encryption by the number of records each configuration is applied to.
   b) To allow for growth, multiply the result by three.

2. Multiply the result of step 1 by 1,536.
   1,536 is the average size of a record in bytes.

3. If using encryption patterns, perform steps 1–2 for tokenized records and add the result to the total.

The calculated value is the recommended size in bytes for your order-preserving and tokenization database.

Edge Encryption limitations

Edge Encryption impacts system functions. Carefully evaluate the impact of encrypting a field.

Field type restrictions

You can encrypt only the following field types:

- String
- Date
- Date/Time
- Journal
- Journal Input
You cannot encrypt the following field types:

- Choice fields
- Virtual fields
- Fields in system tables, except for certain fields in sys_user
- System fields in tables
- Number fields or fields associated with an auto-numbering scheme
- Any other field type not listed above

Additional restrictions:

- When a Journal field is encrypted, the Post button is disabled, even if there are multiple Journal fields and only one of those fields is encrypted.
- Encrypted fields are not available in Go to and header filter boxes.
- When encrypting fields used as an index, you can use only order-preserving and equality-preserving encryption types. Indexed fields cannot be encrypted using the standard encryption type.

For more information, see Field types.

Filtering and searching restrictions

Standard encryption

When you select a String, Date, Date/Time, or URL field with a standard encrypted field configuration as the left operand in a filter, no filtering options are available.

Equality-preserving encryption

When you select a String, Date, Date/Time, or URL field with an equality-preserving encrypted field configuration as the left operand in a filter, the following operators are available:

- is
- is not
- is empty
- is not empty

Order-preserving encryption

When you select a String field with an order-preserving encrypted field configuration as the left operand in a filter, the following operators are available, in addition to is, is not, is empty, and is not empty:

- greater than
- less than

When you select a Date or Date/Time field with an order-preserving encrypted field configuration as the left operand in a filter, the following operators are available, in addition to is, is not, is empty, and is not empty:

- after
- before
- after or on
- before or on

Date and Date/Time pickers

For Date fields, use the date picker to specify the date:
For Date/Time fields, use the date and time picker to specify the date and time:

List condition filters

The **Show Matching** and **Filter Out** options are supported in lists. Only exact matches are returned or filtered out.

**Note:** Adding encrypted fields in condition filters is supported in scripts such as UI policies and business rules.

Configuration restrictions

Restrictions and behavior of encryption configurations:

- After you add a field to the Edge Encryption Configuration table, you cannot delete the configuration record. If you no longer want a field to be encrypted, deactivate the record in the Edge Encryption Configuration table and schedule an encryption job to decrypt the data.
- If a field in a parent table is marked to be encrypted, the field is also encrypted in all inherited tables. For example, if the **Short description** field in the Task table is encrypted, then the contents of the **Short description** field in the Incident table are encrypted.
- If a field inherited from a parent table is marked to be encrypted, the field in the parent table cannot be encrypted. For example, if the **Short description** in the Incident table is marked to be encrypted, then the **Short description**
in the Task table cannot be encrypted. In this example, you can encrypt the Short description in the Problem table.

- When a field with an encryption configuration defined is exported to any format, the output includes encrypted values even when exported through the proxy server.
- You cannot import data to a field with an encryption configuration defined.
- You cannot encrypt inherited Date and Date/Time fields. Date or Date/Time fields inherited from a parent table are not listed on the Column field drop-down list, and you cannot create Date or Date/Time encryption configurations for those fields.
- You can encrypt a String or URL field only from a parent table or a child table, but not both.

**Instance restrictions**

Impact of using Edge Encryption on the instance:

- Back-end logic cannot process encrypted data. When the instance contains encrypted data, any business rule, back-end script, or back-end feature that relies on evaluating the data in the encrypted field does not run correctly.

  Note: Data encrypted with equality-preserving or order-preserving encryption still passes equivalence checks when compared against an identical encrypted value.

- Since email processing goes from the mail systems straight to the instance and cannot pass through the Edge proxy, data sent in or out via email cannot be encrypted or decrypted by the Edge proxy.
  - Data and attachments in inbound emails are not encrypted.
  - Data and attachments in outbound emails remain encrypted and cannot be decrypted.
- Scripts run on the server cannot change encrypted data.
- Global search is not supported. Because global search attempts to search both encrypted and clear text data, the results may not be as expected.
- Encrypted data cannot be copied and pasted into a record where the field is not encrypted.
- Depending on the type of encryption selected, the user interface functionality for the encrypted fields is reduced. For example, being able to compare, group by, sort, and search may be impacted. Generally, the stronger the encryption selected, the more functionality is reduced.
- Except for Java KeyStore, SafeNet, and Unbound Technology, no third-party software or hardware encryption key management is supported.
- Although multiple proxy servers connected to a single instance are supported, encryption proxy cluster management and monitoring are not available. Each proxy must be managed separately.
- System configurations such as workload and the number of encrypted fields can impact the performance of encrypted fields.
- The Edge Encryption proxy server can only connect to a single instance.
- If your instance uses an Oracle database and the String field you are marking to be encrypted is greater than 2925 characters, that field cannot be sorted even when order preserving encryption is selected.
- If your instance uses an Oracle database, Unicode AL32UTF8 is the only supported character set.
- Encrypted data cannot be used in reports.

**Edge Encryption installation**

You can install an Edge Encryption proxy manually or using the Edge Encryption interactive installer.

**Java requirements**

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:
• Java 8 update 121 (8u121)
• Java 8 update 141 (8u141)
• Java 8 update 151 (8u151) or later

**Note:** Java 8 update 131 (8u131) is not supported.

**Note:** Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

### Installing the proxy server

Installing Edge Encryption includes these steps:

- Install the Edge Encryption proxy application on a server in your network using the interactive installer or the manual installer.
- Generate the RSA key pair for digitally signing encryption configurations and encryption rules.
- Install the Java Cryptography Extension (JCE), if you plan to use AES 256 encryption.
- If you are using a secure SSL connection, obtain a server certificate and import it to the Java KeyStore.
- Set up your keystore and encryption key.
- If order preserving encryption types or encryption patterns are to be used, set up a MySQL database on a machine in your network.
- Set the desired properties. Properties are located in the edgeencryption.properties configuration file.
- Specify that a proxy server is a trusted source so that Edge Encryption can process requests coming from that proxy server.

### Accessing the proxy server

Once installation is complete, point each user's browser to an Edge Encryption proxy using the URL format: `<host>:<port>`. Values are determined by the **host and port properties** in the edgeencryption.properties file.

As an example with the following values:

<table>
<thead>
<tr>
<th>Property</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>edgeencryption.proxy.host</td>
<td>hostname.mycompany.com</td>
</tr>
<tr>
<td>edgeencryption.proxy.http.port</td>
<td>8081</td>
</tr>
</tbody>
</table>

A client will access the proxy server using the following address: `http://hostname.mycompany.com:8081/`.

**Note:** DNS settings and routing rules may be used. Host and port values are determined by your network administrator.
Request Edge Encryption

The Edge Encryption plugin (com.glide.edgeencryption) is available as a separate subscription.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Role required: none

1. Navigate to **System Applications > All Available Applications > All**.
2. On the All Applications page, click **Request Plugin** to open the request form on HI.

3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specified date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Set up an Edge Encryption user account

The Edge Encryption proxies connect to the instance as a user to obtain and update encryption configuration information. Create a user account for this purpose and give the edge_encryption role to the user.

The Edge Encryption plugin must be installed before you can assign the role.

Role required: admin

1. On your ServiceNow instance, create a user account to be used by the Edge Encryption proxy applications.
2. Assign the edge_encryption role to the user.

Download the Edge Encryption proxy server

Download the Edge Encryption proxy server application from your instance, and then copy the file to each computer that is to run the Edge Encryption proxy server.

Before starting this procedure, the Edge Encryption plugin must be installed and activated on your instance.
ServiceNow Orlando Now Platform capabilities

Note: The Edge Encryption proxy is officially supported only on Oracle JRE.

Role required: security_admin

1. Navigate to Encryption Configuration > Installation & Downloads > Downloads.
2. If using the interactive installer, click Download. If manually installing the proxy server, select the OS version for your proxy server.

Note: Because the proxy server requires at least 4 GB of memory to run, 32-bit JREs and 32-bit operating systems are no longer supported starting with the Orlando release.

3. Copy the installer to each computer that is to run the Edge Encryption proxy server. If manually installing the Edge Encryption proxy server, copy the ZIP file to each computer that is to run the Edge Encryption proxy server.

After downloading the Edge Encryption installer, Install the Edge Encryption proxy server using the interactive installer. If installing manually, Install the Edge Encryption proxy server using the command line installer.

Install the Edge Encryption proxy server using the interactive installer

Install the Edge Encryption proxy server on a Windows or Linux computer using the interactive installer.

Note: SafeNet KeySecure keystore files are not supported by the Edge Encryption installer. To use a SafeNet KeySecure keystore, Install the Edge Encryption proxy server using the command line installer.

The Edge Encryption plugin must be installed and activated on your instance before you start this procedure. Ensure that the latest version of Java 8 is installed on the machine running the Edge Encryption installer.

The latest version of Java 8 is Java SE 8u171/8u172.

- Java SE 8u171 includes important bug fixes. Oracle strongly recommends that all Java SE 8 users upgrade to this release.
- Java SE 8u172 is a patch-set update, including all of 8u171 plus additional bug fixes.

Role required:

- security_admin on your ServiceNow instance
- local or domain administrator on a Windows host
- service user with full file system access on a Linux host

After installing a new proxy server, you can run the installer again to perform tests to detect issues with an installation or modify current settings. Your options include:

- **Install New**: Install a new proxy server.
- **Verify Installation**: Perform tests to detect and fix issues in a previous installation.
- **Reinstall Existing**: Perform tests to detect and fix issues in a previous installation and view or modify existing settings.

Note: If installing the proxy server on a Linux machine on a privileged port (port 80 or 443), you must run the installer as a root user with full file system access. To restrict file system access after the proxy server is installed, you can use the SetUID feature in the proxy installer. To enable this feature, start the installer as root or sudo root. When prompted by the installer, provide the username and usergroup of an unprivileged user. The proxy server will install with file system privileges of the given user. You can skip this step to continue the default installation with root privileges.
Use the installer to install multiple proxies for your instance on multiple machines, ensuring that the following criteria apply:

- All proxies must have the same encryption keys and the same RSA key pair used to digitally sign encryption configurations and rules.
- The encryption key must be the default key configured on the instance.
- When a proxy database is set up as part of the installation, all proxies must use the same proxy database.

You may need a proxy database for equality-preserving encryption, order-preserving encryption, or tokenization. If you do not use any of these features, you do not need a proxy database.

To use NVDA, an Assistive Technology screen reader designed to read accessibility-enabled Java applications built for keyboard users, see Configure a Windows 64-bit host to use 32-bit NVDA with Java applications.

After installing the Edge Encryption proxy server, Set the proxy server initial memory limit and upper bound memory limit.

**Install the Edge Encryption proxy server (interactive installer)**

Install the Edge Encryption proxy on a Windows or Linux computer.

1. **Download the Edge Encryption proxy server installer.**
2. **Open the Edge Encryption proxy installer.**

   ![Note: If installing on a Windows machine, you must run the installer as Administrator.]

   a) To run the installer as Administrator on a Windows machine, right-click the Command Prompt and select **Run as administrator.**
   b) From the command line, navigate to the directory that contains the downloaded .jar file.
   c) Run the following command: `java -jar <file name>.jar`.
3. To install a new proxy server, select **Install New**.
   If a proxy is already installed, you can run the installer to:
   - **Verify Installation**: Perform tests to detect and fix issues in a previous installation.
   - **Reinstall Existing**: Perform tests to detect and fix issues in a previous installation and view or modify existing settings.

4. Configure the **Installation Location** and **Target ServiceNow Instance**.
   a) Click **Browse** to select an installation location or manually enter an installation path.
   b) Enter the URL of the target ServiceNow instance. Include the protocol and port number.
      `https://example.servicenow.com:443`
   c) Enter the user name and password for a user with the edge_encryption role on the target ServiceNow instance.

5. Click **Next**.

6. Configure the **Connection Settings** and **Proxy Settings**.
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy Host</td>
<td>Fully qualified domain name of the machine on which you are installing the proxy server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Click <strong>Detect FQDN</strong> to look up the machine's fully qualified domain name and auto-populate the <strong>Proxy Host</strong> field.</td>
</tr>
<tr>
<td></td>
<td>Along with the port, this property defines the URL used by the client to access the proxy server.</td>
</tr>
<tr>
<td>HTTP Port</td>
<td>Port on the proxy for HTTP communication.</td>
</tr>
<tr>
<td>HTTPS Port</td>
<td>Port on the proxy for HTTPS communication.</td>
</tr>
<tr>
<td>Proxy Name</td>
<td>Name of the proxy and the service. The proxy name must be unique.</td>
</tr>
<tr>
<td>Proxy Poll Interval</td>
<td>Poll interval in seconds. With the default setting, it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect proxies that have come online.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Changing the default setting of the Proxy Poll Interval can result in detection delays when a proxy comes online.</td>
</tr>
<tr>
<td>Proxy Keep-Alive Ping Interval</td>
<td>Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance. The default value is 10. The minimum value is 5.</td>
</tr>
</tbody>
</table>

7. Click **Install**. The Edge Encryption proxy server installs. The installation may take a few minutes.

**Configure CyberArk properties protection**

Optionally, configure CyberArk properties protection to securely store Edge Encryption passwords in a centralized and secure digital vault.

You must purchase and configure CyberArk AIM (Application Identity Management) before you can configure CyberArk connection parameters and protected credentials for a proxy server. As part of the installation of the AIM client, the `JavaPasswordSDK.jar` file is installed in the AIM client installation directory. The CyberArk vault is installed on an independent hardened server, and the AIM clients allow secure access to that server.

**Note:** You must install the CyberArk AIM client on every host computer where an Edge proxy is installed.

In the Edge installer, you must specify the location of the `JavaPasswordSDK.jar` file to set up the CyberArk connection to the Edge proxy. You must also enter other values you defined during the AIM client installation.

Setting up CyberArk password storage is optional. If you do not want to set up CyberArk password storage, click **Skip** through the CyberArk screens.

1. On the CyberArk Connection page of the Edge Encryption installer, enter the CyberArk connection parameters.
CyberArk connection parameters

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path to PasswordSDK.jar</td>
<td>The path to the JavaPasswordSDK.jar file installed on the host Windows machine during CyberArk configuration.</td>
</tr>
<tr>
<td>App ID</td>
<td>The App ID entered during CyberArk configuration.</td>
</tr>
<tr>
<td>Safe Name</td>
<td>The Safe Name entered during CyberArk configuration.</td>
</tr>
</tbody>
</table>

2. Click Next.

3. On the CyberArk Protected Credentials page of the installer, enter the credentials to be protected by CyberArk.
   - To use a single credential name for all protected passwords, select the **Apply one Credential Name to all Credentials** check box, enter the credential name, and click **Apply**.
   - Enter the credential name for one or more of the following fields. Credential names are the usernames entered for the SSH keys during CyberArk configuration.

CyberArk protected credentials

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edge Encryption User</td>
<td>The CyberArk credential name for an Edge Encryption user.</td>
</tr>
<tr>
<td>Signature Key Keystore</td>
<td>The CyberArk credential name for the signature key keystore.</td>
</tr>
<tr>
<td>HTTPS Cert Keystore</td>
<td>The CyberArk credential name for the HTTPS certification keystore.</td>
</tr>
<tr>
<td>Encryption Key Keystore</td>
<td>The CyberArk credential name for the encryption key keystore.</td>
</tr>
<tr>

</tr>
<tr>
<td>SafeNet HTTPS Cert Keystore</td>
<td>The CyberArk credential name for the SafeNet HTTPS certification keystore.</td>
</tr>
<tr>
<td>SafeNet Server</td>
<td>The CyberArk credential name for the SafeNet server.</td>
</tr>
<tr>
<td>Forward Proxy</td>
<td>The CyberArk credential name for the forward proxy.</td>
</tr>
</tbody>
</table>

4. Click Next.

**Configure the signature key**

Configure the signature key after installing the proxy server through the Edge Encryption proxy installer.

The signature key signs changes to configurations and properties made by the proxy server. The signature key must be an asymmetric RSA key pair in a JCEKS KeyStore.

**Note:** If installing multiple proxies, each proxy must use the same signature key.

1. On the Signature Key page of the Edge Encryption installer, select the keystore on the host machine to store the signature key.
   - **Create New Java KeyStore:** Enter the directory location, name, and password for the new keystore.
- **Use Existing Keystore**: Enter the keystore file location and password.

2. Click Next.

3. Select or create a signature key.
   - **New Key**: Create a signature key for this proxy.
   - **Use Existing Key**: Use an RSA key-pair from the selected keystore.
   - **Import Existing Key**: Import an RSA key-pair from a different keystore. Browse to the keystore file, enter the password for the keystore, and select the key alias. Provide a new alias for the key.

4. Click Next.

**Configure the HTTPS certificate**

To enable clients to connect to the Edge Encryption proxy server using a secure SSL connection, import the HTTPS certificate to the proxy server.

The Edge Encryption proxy provides the HTTPS certificate to clients trying to connect.

1. On the HTTPS Certificate page of the Edge Encryption installer, select the keystore to store the certificate.
   - **Create New Java KeyStore**: Enter the directory location, name, and password for the new keystore.
   - **Use Existing Keystore**: Enter the keystore file location and password.

2. Click Next.

3. Select or import a certificate.
   The key alias is the given alias for the certificate.
   - **Use Existing Certificate**: Use an existing certificate in the selected keystore.
   - **Import from File or KeyStore**: Import a certificate from a different keystore or a .cer file. Browse to the keystore or .cer file, enter the password, and select the alias. You must provide a new alias for the certificate.

4. Click Next.

**Configure the AES 128-bit encryption key**

After you configure the HTTPS certificate through the Edge Encryption proxy installer, configure the AES 128-bit encryption key to encrypt your data.

The encryption key is either a plain text file inside the `/keys` directory or a secret key inside a keystore. If you use a keystore for your AES 128-bit and AES 256-bit encryption keys, they must both use the same keystore.

If you are updating an SSL certificate on an Edge proxy server, see *Update SSL certificate*.

1. Select the encryption key location.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Store</td>
<td>Use a file to store a single encryption key. You can use an existing file in the <code>/keys</code> directory, or you can generate a new file. To generate a new file, enter an alias and click <strong>Generate</strong>. A file containing an encryption key is created.</td>
</tr>
<tr>
<td>Create New Java KeyStore</td>
<td>Create a keystore to store the encryption key.</td>
</tr>
<tr>
<td>Java KeyStore File</td>
<td>Store the encryption key in an existing Java KeyStore file.</td>
</tr>
</tbody>
</table>

2. Click Next.
3. Select or create the encryption key.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Key</td>
<td>Create an encryption key and alias.</td>
</tr>
</tbody>
</table>

**Note:** You must use lowercase letters and numbers for the alias name (key name, key alias), per Java KeyStore requirements. To find out more about the keytool utility, see the Java SE Documentation.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Existing Key</td>
<td>Use an existing encryption key in the selected keystore.</td>
</tr>
<tr>
<td>Import Existing Key</td>
<td>Import an encryption key from a different keystore.</td>
</tr>
</tbody>
</table>

4. Click Next.

5. Configure the key on the instance according to the requirements defined in your installer.

To configure the key on the instance, navigate to the instance and define a default key. See Configure encryption keys on the instance. Ensure that the key alias, size, and type match the requirements defined in the installer.
Default Encryption Key

This step requires you to go to your instance and create a default key. Click the links below and follow the instructions. Click 'Next' when you are done setting up the default key on your instance.

- The 'Key alias' must be: `aes128`
- The 'Key size' must be: `128`
- The 'Type' must be: Keystore

Click here for documentation
Click here to go to your default keys

6. Once the key is configured on the instance, return to the installer and click **Next**.
Configure the AES 256-bit encryption key

After you configure the AES 128-bit key through the Edge proxy installer, you can optionally configure an AES 256-bit encryption key to encrypt your data.

The encryption key is either a plain text file inside the /keys directory or a secret key inside a keystore. If you use a keystore for your AES 128-bit and AES 256-bit encryption keys, both keys must use the same keystore. If you do not want to configure an AES 256-bit encryption key, click Skip to continue installing the proxy server.

If you are updating an SSL certificate on an Edge proxy server, see Update SSL certificate.

1. Select the encryption key location.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| File Store           | Use a file to store a single encryption key. You can use an existing file in the /keys directory, or you can generate a new file. To generate a new file, enter an alias and click Generate. A file containing an encryption key is created.  

**Note:** This choice designates both the storage location and the encryption key. If you select File Store, click Next and go to step 5. |

<table>
<thead>
<tr>
<th>Create New Java KeyStore</th>
<th>Create a keystore to store the encryption key.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java KeyStore File</td>
<td>Store the encryption key in an existing Java KeyStore file.</td>
</tr>
</tbody>
</table>

2. Click Next.

3. Select or create the encryption key.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Key</td>
<td>Create an encryption key and alias.</td>
</tr>
</tbody>
</table>

**Note:** You must use lowercase letters and numbers for the alias name (key name, key alias), per Java KeyStore requirements. To find out more about the keytool utility, see the Java SE Documentation.

<table>
<thead>
<tr>
<th>Use Existing Key</th>
<th>Use an existing encryption key in the selected keystore.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import Existing Key</td>
<td>Import an encryption key from a different keystore.</td>
</tr>
</tbody>
</table>

4. Click Next.

5. Optional: If you want to use AES 256-bit encryption, do the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Java 8 update 141 or earlier</td>
<td>Install the Java Cryptography Extension (JCE) and overwrite the policy files in the Java home directory. See Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier.</td>
</tr>
<tr>
<td>Java 8 update 151 or later</td>
<td>Edit the java.security policy file to allow the use of unlimited strength keys. See Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later.</td>
</tr>
</tbody>
</table>

6. To use AES 256-bit encryption, you must also configure the AES 256-bit default encryption key on the instance by navigating to the instance and defining a default key.

See Configure encryption keys on the instance. Ensure that the key alias, size, and type match the requirements defined in the installer.

7. After the key is configured on the instance, return to the installer and click Next.
**Update SSL certificate**

When updating an SSL certificate on an Edge proxy server, you must delete the old one.

Role required: admin

When updating the SSL certificate on the Edge proxy server, you must also delete the old certificate. If you don't, the old certificate (in the form of an alias in the KeyStore file) continues to be used even though the Edge proxy server is configured to use the new certificate.

1. On the Edge proxy server, list the entries in the Java KeyStore:

   ```
   keytool -list -keystore keystore.jceks -storetype jceks -storepass MY_SUPER_PASSWORD
   ```

2. Remove the old SSL certificate:

   ```
   keytool -delete -alias MY_OLD_ALIAS -keystore keystore.jceks -storetype jceks -storepass MY_SUPER_PASSWORD
   ```

3. Add the new SSL certificate into the Java KeyStore.

**Configure the Edge Encryption proxy database**

If using order-preserving encryption types or encryption patterns, you can optionally configure the Edge Encryption proxy database properties.

To use order-preserving encryption types or encryption patterns, a MySQL database running in your network is mandatory. This task connects the proxy to the database, but it does not install or configure the database.

>**Note:** If using multiple proxy servers, all proxy servers must use the same proxy database. The values entered in the installer must be the same for all proxy servers.

1. Confirm or change the database URL. This URL is the location of the proxy database.
2. In the **Name** field, enter the name of the proxy database. The default value is **edgeencryption**.
3. Enter the username and password for accessing the proxy database.
4. Click **Next**.

**Launch the Edge Encryption proxy server**

After an Edge Encryption proxy is installed and configured, you can start the proxy from the installer.

1. After configuring keys on the instance and optionally configuring the proxy database, return to the Edge Encryption proxy installer and click **Launch**.
2. If an issue is detected, or to check the status of your proxy server, you can click **Check Status** to verify that the proxy is running.
   
   A message displays the proxy status.
After successfully installing the Edge Encryption proxy server, set the proxy server initial memory limit and upper bound memory limit.

**Verify and troubleshoot the Edge Encryption proxy server installation**

After your Edge Encryption proxy is installed, you can verify the installation to locate problems or start and stop the proxy.

1. Open the Edge Encryption proxy installer.
2. Select Verify Installation.
3. Click Proxy Directory and select the proxy directory.
4. Click Run Tests.
   Test results display.
Edge Encryption proxy installation tests

5. Click Next.
If an issue is encountered, you can move through the installer to correct the configuration. If no issues are encountered, the installer jumps to the **Launch** page. You can check the proxy status, stop the proxy, or start the proxy from the **Launch** page.

**Install the Edge Encryption proxy server using the command line installer**

Manually install multiple Edge Encryption proxy servers in your network.

Roles required: security_admin on your ServiceNow instance and local administrator on the host machine.

If order preserving encryption types or encryption patterns are to be used, set up a MySQL database on a machine in your network if not already present.

**Note:** If using Unbound Technology encryption keys with Edge Encryption, install the proxy server using the command line installer on the Unbound client machine. The Edge Encryption proxy server must run on the same machine as the Unbound technology client.

First, set up a single Edge Encryption proxy server. After your first proxy server is successfully running, add additional proxy servers for one instance to ensure an optimal environment. See [Sizing your Edge Encryption environment](#) to determine the number of additional proxy servers needed.

**Install the Edge Encryption proxy server (command line installer)**

Install an Edge Encryption proxy on a 64-bit Windows or Linux computer.

Java 8 is required to run the installer.

Install the Edge Encryption proxy server on a machine in your network using the appropriate command for your target machine. If installing the Edge Encryption proxy server on a Windows machine, you must additionally install the proxy server as a Windows service.

When you upgrade the Edge Encryption proxy server, the system backs up the old proxy in the `backup.dist-upgrade-<timestamp>` directory under the current installation directory. The backup directory is generated during the upgrade process and stores the old proxy information.

When you run an upgrade via the command line, a dist-upgrade.log may be generated in the directory where the command runs. The dist-upgrade.log contains logs for the upgrade process.

In case of a failed upgrade, the system creates a `failed-backup.dist-upgrade-<timestamp>` directory. In addition, `logs/wrapper.log` in the original proxy directory may also contain failure information.

1. Create the installation directory.
2. Download the Edge Encryption proxy archive file to the installation directory.
3. Open the terminal and change to the installation directory.

**Note:** If installing on a Windows machine, you must start the Windows Command Prompt with administrator privileges.

4. Run this command for the target machine and change the variables according to your configuration:

   ```
   java -jar edgeencryption-<version>-all.jar -m install -n <ProxyName> --instancehost <host> -p <InstancePort> --protocol https
   ```

<table>
<thead>
<tr>
<th>Option</th>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>version</td>
<td>Version number of the Edge Encryption proxy being used to perform the current operation.</td>
</tr>
<tr>
<td>-m</td>
<td>mode</td>
<td>The operation or mode to run in (install or dist-upgrade).</td>
</tr>
<tr>
<td>Option</td>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>-n</td>
<td>ProxyName</td>
<td>The name of the encryption proxy instance. Use a unique ProxyName to be able to identify specific proxy instances.</td>
</tr>
<tr>
<td>--instancehost</td>
<td>host</td>
<td>The host name of your ServiceNow instance (for example, mycompany.service-now.com).</td>
</tr>
<tr>
<td>-p</td>
<td>InstancePort</td>
<td>The port of your instance. When the protocol is https, the port is normally 443.</td>
</tr>
<tr>
<td>--protocol</td>
<td>protocol</td>
<td>The protocol used to access your ServiceNow instance (typically https).</td>
</tr>
</tbody>
</table>

**Note:** Do not copy and paste commands from the browser. Occasionally, copy/paste operations cause unexpected characters to be pasted to the target machine and results in the command being executed incorrectly. It is best to type out the command by hand using documentation as a reference.

To see the help screen, execute this command without arguments: `java -jar edgeencryption-<version>-all.jar`

5. If installing on a Windows machine, install the Edge Encryption proxy as a Windows service.
   a) Optionally change the name of the service. Open the `conf/wrapper.conf` file on the new proxy and set the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wrapper.ntservice.name</td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td>wrapper.ntservice.displayname</td>
<td>Edge Encryption proxy service display name.</td>
</tr>
<tr>
<td>wrapper.ntservice.description</td>
<td>Proxy server description.</td>
</tr>
</tbody>
</table>

   If this step is not performed, the Edge Encryption proxy service is installed under the name **Edge Encryption**.

   b) Save and close the file.

   c) Open the Windows Command Prompt and `cd` to `ServerName_port/bin`.

   d) Execute `edgeencryption.bat install`.

   The `ProxyName_port` directory is created in the current directory. The `edgeencryption.properties` file is updated with the host, port, and protocol values from the command line.

**Create and configure the RSA key pair for the digital signature**

Create an RSA key pair that the proxy server can use to create the digital signature for signing changes to the encryption properties and configuration.

To generate and validate the digital signature, an RSA key pair must be generated and stored in the JCEKS Java KeyStore and each proxy must be configured to use this key pair. Generate an encryption key pair using the keytool command.
To use the keytool utility with a proxy installed on SElinux (CentOS), you must enable loading of shared libraries from the proxy java-installation directory. To do this, run the following command as root.

```
chcon -R -t texrel_shlib_t proxy_install_dir/java/jre /lib
```

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

1. Change to the KeyStore directory in the proxy download directory.
2. Change the default password.

   The default password is `changeme`.

   ```
   keytool -keystore keystore.jceks -storetype jceks -storepass -new <newpassword>
   ```

3. Create an encryption key pair.

   **Note:** Do not enter a password for the key when the keytool utility prompts for one.

   Enter this command on a single line.

   ```
   keytool -genkeypair -alias <key alias> -keyalg rsa -keystore keystore.jceks -storetype jceks -storepass <keystore password> -keysize 2048
   ```

4. Update the encryption proxy property file (`edgeencryption.properties`).
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the digital signature.

   These properties must be the same for all proxies.

5. Save and close the `edgeencryption.properties` file.

**Import and configure the certificate for secure SSL connection**

To use a secure SSL connection, import a server certificate and add it to the Java KeyStore.

You must obtain the server certificate before you can add it to the Java KeyStore.

1. Add a server certificate to the Java KeyStore.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you have the RSA private key in the Java Keystore and generated the certificate from that key.</td>
<td>keytool -import -alias keyname -file server.cert -storetype JCEKS -keystore keystore.jceks -storepass &lt;keystore password&gt; -keysize 2048</td>
</tr>
<tr>
<td>If you have a PKCS12 (.pfx) file that contains the RSA key and the certificate.</td>
<td>keytool -importkeystore -destkeystore keystore.jceks -deststoretype jceks -srcstoretype pkcs12 -srcstoretype pkcs12 -srcstorepassword &lt;PKCS12 filename&gt; -srckeystore &lt;PKCS12 filename&gt; -destkeystore keystore.jceks -deststoretype jceks -storepass &lt;keystore password&gt; -storetype JCEKS</td>
</tr>
</tbody>
</table>

   Make sure that the private key password is the same as the Java KeyStore password.

   You can run this command to change the password.

   ```
   keytool -keypasswd -keystore keystore.jceks -alias <key alias>
   ```
For testing, you can use this command to generate a self-signed certificate.

```
keytool -genkeypair -alias cert -keystore keystore.jceks -storetype jceks -keyalg rsa
```

2. Update the `edgeencryption.properties` file.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the SSL certificate.

   The certificate must be the same for all proxies connecting to the same instance.

3. Save and close the `edgeencryption.properties` file.

**Enable AES 256-bit encryption**

256-bit encryption is more secure than 128-bit encryption, and you can optionally configure AES 256-bit encryption on the Edge Encryption proxy server host. How you enable AES 256-bit encryption depends on the Java update installed on each proxy server host.

Edge Encryption supports only AES 128-bit and AES 256-bit keys.

**Note:** Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

Follow the procedure for the Java version that is installed on your proxy server host:

- **Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier**
- **Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later**

**Enable AES 256-bit encryption for Java 8 update 141 (8u141) or earlier**

Copy the Java Cryptography Extension (JCE) jurisdiction policy files to the Java home directory of each Edge Encryption proxy server host to enable AES 256-bit encryption for Java update 141 or earlier. 256-bit keys provide greater security than 128-bit keys.

Role required: admin

Your Java home directory includes the AES 128-bit policy files by default. To enable AES 256-bit encryption, you must overwrite the Java home directory policy files with the AES 256-bit policy files. You only need to download the JCE once, but you must update every Edge Encryption proxy server host.

**Note:** Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

1. Download the JCE policy 8 ZIP file from Oracle.
2. Unzip the file.
3. On each proxy server host, copy the `local_policy.jar` and `US_export_policy.jar` files into the `<Java-home-directory>/jre/lib/security` folder.

**Enable AES 256-bit encryption for Java 8 update 151 (8u151) or later**

Edit the `java.security` policy file to enable AES 256-bit encryption for Java update 151 or later. 256-bit keys provide greater security than 128-bit keys.

Role required: admin

Perform this task in the Java home directory of each Edge Encryption proxy server host on which you want to enable AES 256-bit encryption.
Note: Java does not automatically allow unlimited strength keys. You must specifically enable the use of AES 256-bit encryption.

1. Navigate to `<jre_home>/lib/security/java.security` on the proxy server host, where JRE_HOME is an environment variable for both Microsoft Windows and Linux.
2. Open the `java.security` policy file and find the line for the `crypto.policy` parameter, which is commented out by default.
3. Remove the `#` character from the beginning of the `crypto.policy` line to uncomment the line, and then save the file.

Note: If you do not uncomment the `crypto.policy` line, Java uses `crypto.policy=limited`, which restricts encryption to AES 128-bit keys.

Set up a keystore and encryption keys

Set up the keystore and encryption keys used by the Edge Encryption proxy server.

1. Carefully determine the appropriate type of keystore to use based on your organization's needs.

<table>
<thead>
<tr>
<th>Supported keystore</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>File store</strong></td>
<td>Keys are stored in a file in a file system accessed by the Edge Encryption proxy server. Because encryption keys stored in a file are not encrypted, it is your responsibility to protect these files.</td>
</tr>
<tr>
<td><strong>Java KeyStore</strong></td>
<td>A Java KeyStore:</td>
</tr>
<tr>
<td></td>
<td>• Stores keys in a Java JCEKS KeyStore.</td>
</tr>
<tr>
<td></td>
<td>• Is password protected and more secure than storing keys in a file in the file system.</td>
</tr>
<tr>
<td></td>
<td>• Can store multiple keys. A key alias represents each key, making it easier to manage multiple keys.</td>
</tr>
<tr>
<td></td>
<td>The Edge Encryption proxy ships with the Java JCEKS KeyStore file named <code>keystore.jceks</code> in the <code>keystore</code> directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.</td>
</tr>
</tbody>
</table>
## Supported keystore

<table>
<thead>
<tr>
<th>Supported keystore</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise Key Management (EKM)</td>
<td><strong>SafeNet KeySecure</strong>  &lt;br&gt;Keys are stored and retrieved with SafeNet KeySecure key management.  &lt;br&gt;You must secure a license with Gemalto, download the libraries, and install the SafeNet KeySecure keystore on a host machine in your network before configuring the keystore on the Edge Encryption proxy server.</td>
</tr>
<tr>
<td>Unbound Technology</td>
<td><strong>Unbound Technology</strong>  &lt;br&gt;The base64-encoded wrapped encryption key is stored as text file on the Edge Encryption proxy server. The Unbound Technology implementation (previously Dyadic Security) maintains control of the wrapping key.  &lt;br&gt;The Edge Encryption proxy server must run on the same machine as the Unbound technology client.</td>
</tr>
</tbody>
</table>

**Note:** If using a keystore other than the base system Java JCEKS KeyStore, you must import the ServiceNow public key into your keystore. The public key alias is servicenow.

### Set up a Java KeyStore keystore

You can use a Java KeyStore keystore to store encryption keys.

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

The Edge Encryption proxy ships with the Java JCEKS KeyStore file named `keystore.jceks` in the `keystore` directory. This keystore file contains the ServiceNow public key used to validate encryption rules signed by ServiceNow.

1. Set up the keystore properties.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the Java KeyStore.

2. Save and close the `edgeencryption.properties` file.

After setting up the Java KeyStore, **Create encryption keys using the Java KeyStore keytool**.

Create encryption keys using the Java KeyStore keytool

You can use the keytool shipped with the encryption proxy distribution to create AES 128-bit and AES 256-bit encryption keys.

You must use the Java 1.8 version of the keytool utility. A copy of the utility can be found in `<proxy install dir>/java/jre/bin/keytool`.

To find out more about the keytool utility, see the [Java SE Documentation](#).

**Note:** The Java KeyStore requires that the alias name (key name, key alias) use lowercase letters and numbers.

1. Change to the keystore directory, `<installation directory>/keystore/`.

![Image](#)
2. To create the encryption key, run one of the following commands.

   ![Note: If you choose to run these commands from a directory other than the keystore directory, that is you skipped the previous step, you must change the -keystore option to include the path from your current directory to the keystore directory. For example, if you were in the <installation directory>\bin directory, the option would be -keystore ../keystore/keystore.jceks.]

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>keytool -genseckey -alias 128bitkey -keyalg aes -keysize 128 -keystore keystore.jceks -storetype jceks</td>
</tr>
<tr>
<td>AES 256</td>
<td>keytool -genseckey -alias 256bitkey -keyalg aes -keysize 256 -keystore keystore.jceks -storetype jceks</td>
</tr>
</tbody>
</table>

You add the alias on the instance when you assign default keys.

   ![Note: The key password must be the same as the keystore password.]

**Set up a SafeNet KeySecure keystore**

If you are using a SafeNet keystore, copy a set of libraries into the proxy distribution directory.

You must install and set up the SafeNet keystore before performing this step. Secure a license with Gemalto in order to download the libraries.

   ![Note: On Linux, file paths use a forward slash (/).]

1. Copy these files to the <installation directory>/lib directory:
   - ingrianNAE-<version>.jar
   - ingrianlog4j-api-<version>.jar
   - ingrianlog4j-core-<version>.jar

2. Change to the <installation directory>/conf/ directory, and open the edgeencryption.properties file.

3. Enter the properties for the SafeNet keystore.

   An example for a SafeNet keystore using username and password authentication.

   ```
   edgeencryption.nae.retries = 3
   edgeencryption.nae.enabled = true
   edgeencryption.nae.server = url
   edgeencryption.nae.port = 9000
   edgeencryption.nae.protocol = ssl
   edgeencryption.nae.keystore.path = keystore/safenet_truststore
   edgeencryption.nae.keystore.password = password
   edgeencryption.nae.user = safenet_user
   edgeencryption.nae.password = safenet_password
   ```

   An example for a SafeNet keystore using client certificate authentication. This authentication method eliminates the need to store the SafeNet server username and password in the properties file.

   ```
   edgeencryption.nae.retries = 3
   edgeencryption.nae.enabled = true
   edgeencryption.nae.server = url
   ```
**edgeencryption.nae.port** = 9000  
**edgeencryption.nae.protocol** = ssl  
**edgeencryption.nae.keystore.path** = keystore/safenet_clientcert  
**edgeencryption.nae.keystore.password** = password  
**edgeencryption.nae.client.certificate** = cert_name

4. Add or create a key in the SafeNet keystore.  
   You add the key name (alias) on the instance when you assign default keys.  
5. Save and close the `edgeencryption.properties` file.

Upgrade from Kingston or lower to London or higher
If you use a SafeNet NAE server for key storage with Edge, before upgrading the proxy from Kingston or lower to London or higher, you must copy Gemalto SafeNet client ProtectApp JAR files and add new properties.

> **Note:** On Linux, file paths use a forward slash (/).

1. Copy the following files from `<installation directory>/lib` to a directory path that is completely outside of the proxy installation directory path:
   - `ingrianNAE-<version>.jar`
   - `ingrianlog4j-api-<version>.jar`
   - `ingrianlog4j-core-<version>.jar`

2. On the current version (not upgraded) of the proxy, update the `<installation directory>/conf/edgeencryption.properties` file by adding the following two properties:
   - `edgeencryption.ekm.provider.classname` = `com.snc.edgeencryption.encryption.CloudEdgeNaeKeyProvider`
   - `edgeencryption.thirdparty.vendor.library.path` = `<directory path to the directory where you copied the jar files in step 1>`

3. Save the changes.  
4. Proceed with the upgrade to London or higher.

**Set up Unbound Technology keys**
To use Unbound Technology (previously Dyadic Security) keys with Edge Encryption, store the base64-encoded wrapped encryption key as text file on the Edge Encryption proxy server and provide the wrapping key alias. The Unbound Technology implementation maintains control of the wrapping key.

Role required: `security_admin`

In your Unbound Technology implementation, identify both the wrapping key and the wrapped key. Use the RSA/ECB/OAEPWITHSHA-256ANDMGF1PADDING algorithm for wrapping and padding. Export the wrapped key in base64-encoded text format. Save the file using the key alias as the name with no file extension.

> **Note:** If using Unbound Technology encryption keys with Edge Encryption, install the proxy server using the command line installer on the Unbound client machine. The Edge Encryption proxy server must run on the same machine as the Unbound technology client.

1. Add the wrapped encryption key in base64-encoded text format to the `<proxy-installation-directory>/keys` directory. The name of the file must be the key alias with no file extension.  
2. Update the `edgeencryption.properties` file.  
   a) Change to the `<proxy-installation-directory>/conf` directory.  
   b) Open the `edgeencryption.properties` file.
c) Enter the File store properties. Set the value of `edgeencryption.keyfile.directory` to `keys`. This property directs the proxy server to look for the encryption key in the `<Java-home-directory>/keys` directory.

For more information on Edge Encryption properties, see `Edge Encryption proxy server properties`.

d) Uncomment the properties for the Dyadic provider configuration. Set the value of `edgeencryption.ekm.provider.rsa.wrapping.key.alias` to the wrapping key alias in your Unbound implementation.

e) Save and close the file.

Add the encryption key alias to the instance. The encryption key alias is the file name of the wrapped encryption key added to the `<proxy-installation-directory>/keys` directory. For example, if the file in the directory is named `myunboundkey`, add this name to the **Key alias** field. See `Configure encryption keys on the instance`.

Create an encryption key stored in a file
You can use a simple text file as a keystore. Each file holds a single encryption key.

This step creates both the key storage and the encryption key.

```
Note: The name of the key file must match the key alias specified in the encryption keys table in the instance. See `Configure encryption keys on the instance`.
```

1. Create a file in the `/keys` folder of the proxy server installation directory.
2. Add the encryption key to the file.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AES 128</td>
<td>Place the encryption key, exactly 16 bytes, into the file.</td>
</tr>
<tr>
<td>AES 256</td>
<td>Place the encryption key, exactly 32 bytes, into the file.</td>
</tr>
</tbody>
</table>

3. Update the `edgeencryption.properties` file.
   a) Change to the `<installation directory>/conf/` directory.
   b) Open the `edgeencryption.properties` file.
   c) Enter the properties for the **file store**.
   d) Save and close the file.

Configure encryption keys on the instance
Edge Encryption provides the tools to manage encryption keys without taking the proxy offline.

Role required: security_admin

Before setting up new encryption keys on the instance:

1. Create the encryption key.
2. Make the new key available to all encryption proxies. Either copy the file or Java KeyStore file to each proxy, or ensure that each proxy has access to the Java KeyStore or Enterprise Key Management (EKM) device.

Key aliases must be unique. Each key alias must have the same key size and type on each proxy, or the key cannot be assigned as the default.

1. Navigate to **Edge Encryption Configuration > Encryption Key Configuration > Set Up Keys**.
2. On the Add New Keys section of the form, complete the following steps to add a new key.

Note: If using SafeNet versioned keys, an additional column appears for the **Key version**. The **Key version** cannot be edited.

Important: If using SafeNet versioned keys, click the **Retrieve latest key versions** link in the Related Links to retrieve the latest version of each key from the Edge proxy.

Rows in the list with an X in the left column can be deleted. Keys that have been used as the default or that have a **Status** of **Available** cannot be deleted.

a) Double-click in the row that says Insert a new row....

b) In the edit box, enter a name for the key, then click the check mark.
   
   Key aliases are lowercase letters and numbers. Capital letters are changed to lowercase letters when you click **Update**. Key aliases must be unique.

   Note: If using Unbound technology keys, add the encryption key alias. The encryption key alias is the file name of the wrapped encryption key added to the `<proxy-installation-directory>/keys` directory. For example, if the file in the directory is named myunboundkey, add this name to the **Key alias** field.

c) In the same row, double-click in the **Key size** column.

d) In the select box, select a key size, either 128 bits or 256 bits, then click the check mark.

e) In the same row, double-click in the **Type** column.

f) In the select box, select a key type, either **File**, **Keystore**, **SafeNet**, or **Unbound**, then click the check mark.

g) When you are done adding keys, click **Next Step**.
   
   You must specify an alias, key size, and key type for each key before moving on.

3. On the Keys Status section of the form, check the **State** of the key and ensure that it is **Available**. This may take a few minutes. When the key is **Available**, click **Next Step**.

   Note: If using SafeNet versioned keys, an additional column appears for the **Key version**. The **Key version** cannot be edited.

   The instance tracks the status of every encryption key available to any proxy. When a key is available on all proxies, its state becomes **Available**. If the state does not change after a few minutes, check to ensure that the key is available on all proxies. If the state remains **Unavailable**, one or more of the proxies does not have the key.

   **Encryption key states**

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available</td>
<td>All online proxies have the key.</td>
</tr>
<tr>
<td>Unavailable</td>
<td>This is a new key and the proxies have not yet loaded the key, or at least one proxy failed to load the key.</td>
</tr>
</tbody>
</table>

4. On the **Change Default Keys** section of the form, do one of the following:

   • Type in the key alias.
   
   • Click the magnifying glass icon and select an alias.
If using SafeNet versioned keys, an additional field appears for the **Key version**. The **Key version** is grayed out and cannot be edited.

**Note:** If using SafeNet versioned keys, choose only the most recent key version. If you choose an earlier version, the following message appears when you click **Update** or **Next Step**:

One of the default keys chosen is not the latest version available for the key. Please use the latest version.

**Note:** If using SafeNet versioned keys, and if the default keys are not the latest versions of the SafeNet keys, an **Update default keys to latest version** link appears in the Related Links. Click the link to update the default keys to use the latest version.

Click **Next Step**.

5. On the Schedule Key Rotation section of the form, schedule a mass key rotation job or single key rotation job to encrypt existing data using the new encryption key.

If you do not run a mass key rotation job or single key rotation job, existing data remains encrypted with the old key until the data is accessed again.

### Configure additional properties in the Edge Encryption properties file

After installing the Edge Encryption proxy server in your network and setting up your keystore and keys, configure the additional Edge Encryption properties.

1. Open the `<installation directory>/conf/edgeencryption.properties` file and configure the following Edge Encryption proxy server properties:
   - **Target (instance) properties**
   - **User account properties**
   - **Proxy properties**
   - If using order preserving encryption types or encryption patterns, configure the **Proxy database properties**
   - **Clear text and static IV properties**

2. Save and close the file.

### Configure a web proxy

If your network uses a web proxy, you can set up the Edge Encryption proxy to use the web proxy.

If your network does not use a web proxy, leave the **web proxy properties** in the configuration file commented out.

The Edge Encryption proxy server supports HTTP connection to and basic authentication with the web proxy.

1. Change to the `<installation directory>/conf/` directory.
2. Open the `edgeencryption.properties` file.
3. Configure the **web proxy properties**.
4. Save and close the `edgeencryption.properties` file.
5. If the web proxy is using a customer-specific server certificate, add this certificate to the JVM used by the Edge Encryption proxy server to establish trust between the web proxy and the Edge Encryption proxy server.
   a) cd to `<Java home directory>/jre/lib/security/cacerts`
b) Execute the command:
```
keytool -keystore cacerts -importcert -alias <chooseAlias> -file <certificateFile>
```

Set the proxy server initial memory limit and upper bound memory limit

Set the initial memory limit and upper bound memory limit to specify how much memory the proxy server can consume. Set these limits to avoid performance issues in your Edge Encryption implementation.

As a guideline, set both the initial memory limit and the upper bound memory limit to the same value. On any machine, allocate 2 GB of the physical memory to the operating system (OS). Then allocate the rest of the physical memory to the heap using the initial memory limit and upper bound memory limit properties. For example, on a machine with 8 GB of memory, allocate 2 GB to the OS, and allocate the remaining 6 GB (6144 m) to the initial and upper bound memory.

### Important: If your Edge Encryption proxy server is running, you must stop and restart the proxy server after updating these properties.

1. In your proxy server directory, open `<install dir>/conf/wrapper.conf`.
2. To set the initial memory limit, add the following line at the end of the file:
   ```
   wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m
   ```
   Set `<number>` to the next available `<number>` in the sequence of `wrapper.java.additional.<number>` properties defined in the `wrapper.conf` file.

   For example, you have the following list of `wrapper.java.additional.<number>` properties:
   ```
   wrapper.java.additional.1=
   wrapper.java.additional.2=
   ```

   The maximum `<number>` in the above list is 2. When you add the `wrapper.java.additional.<number>=-Xms<min_memory_in_MB>m` line, set `<number>` to 3, the next available number.

   ### Important: Do not leave gaps in the numbering sequence.

   Set `<min_memory_in_MB>` to the number of megabytes of memory remaining after allocating 2 GB of memory to the OS.

3. Set the upper bound memory limit.

   Because an upper bound memory limit is not set in the base system, the proxy server can use all available memory. If other services are running on the server, you may want to set the upper bound memory limit.

   Add the following line at the end of the file:
   ```
   wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m
   ```
   Set `<number>` to the next available `<number>` in the sequence of `wrapper.java.additional.<number>` properties defined in the `wrapper.conf` file.

   For example, you have the following list of `wrapper.java.additional.<number>` properties:
   ```
   wrapper.java.additional.1=
   wrapper.java.additional.2=
   ```

   The maximum `<number>` in the above list is 2. When you add the `wrapper.java.additional.<number>=-Xmx<max_memory_in_MB>m` line, set `<number>` to 3, the next available number.
Set \(<\text{max\_memory\_in\_MB}>\) to the number of megabytes of memory remaining after allocating 2 GB of memory to the OS.

4. Save and close the file.

**Example: Setting proxy server initial and upper bound memory limits**

```java
wrapper.java.additional.1 = -Djava.io.tmpdir=../tmp
wrapper.java.additional.2 = -Dcloudedge.home.dist=..
# must ensure UTF8 encoding when running on Windows
wrapper.java.additional.3 = -Dfile.encoding=UTF8
# additional properties for heap settings
wrapper.java.additional.4 = -Xms6144m
wrapper.java.additional.5 = -Xmx6144m
```

**Start the Edge Encryption proxy.**

**Start the Edge Encryption proxy**

After an Edge Encryption proxy is installed and configured, you can start the proxy from the command line.

Before starting the encryption proxy, verify the following:

- The Edge Encryption plugin is activated on the instance.
- The `edgeencryption.properties` file on this machine has been configured.
- If using an order preserving encryption type or encryption patterns, the proxy database is running.

- **Note:** The first time you set up the `edgeencryption.properties` file or change properties, you may not want to set the password encryption property. After you have verified that everything is working, you can set the password encryption property, shut down the proxy, and then restart the proxy.

1. Run the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>On a Linux machine</strong></td>
<td>1. cd to ServerName_port</td>
</tr>
<tr>
<td></td>
<td>2. Execute ./startup.sh</td>
</tr>
</tbody>
</table>

   | **On a Windows machine**       | Perform the following steps from the command line as admin: |
   |                                 | 1. cd to ServerName_port/bin      |
   |                                 | 2. Execute edgeencryption.bat start |

2. Check the log on the proxy server to verify that the proxy is running.

**Obfuscate passwords in the properties file**

You can obfuscate passwords in the `edgeencryption.properties` file to share the properties file without revealing clear text passwords.

Make sure that the Edge Encryption proxy server is set up and successfully running before you set this property. Before setting this property, **Stop the Edge Encryption proxy.**
Setting this property may make it difficult to debug connection and access issues during initial startup. Only set this property in production environments after the proxy has been set up and tested successfully.

1. Change to the `<installation directory>/conf/` directory.
2. In the `conf` directory, create a text file containing a complex string or phrase that can be used as a passphrase which the proxy uses to obfuscate the passwords in the `edgeencryption.properties` file. This passphrase should be a random and complex phrase not related to the passwords themselves.
3. Open the `edgeencryption.properties` file.
4. Set the `password encryption property`.
5. Save and close the `edgeencryption.properties` file.

After setting this property, you can **Start the Edge Encryption proxy.**

### Manually add an additional proxy

After the first Edge Encryption proxy is properly configured and tested, you can set up additional proxies on a Linux or Windows machine. Installing multiple proxies on the same machine is not recommended.

Add additional proxy servers on additional machines to ensure an optimal environment. See *Sizing your Edge Encryption environment* to determine the number of additional proxies needed.

**Note:** Make sure that all proxies have the same encryption keys and the same RSA key pair used to digitally sign encryption configuration and encryption rules. If a proxy database was set up as part of the installation, all proxies must use the same proxy database.

1. Install the proxy using the appropriate command. See *Install the Edge Encryption proxy server (interactive installer).*
2. Copy all the encryption keys and the `edgeencryption.properties` file from the first proxy to the new proxy. Encryption keys may be located in the proxy keystore, in the `/keys` directory, or in a SafeNet KeySecure keystore.
3. Open the `edgeencryption.properties` file on the new proxy.
4. Change the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edgeencryption.proxy.name</code></td>
<td>Unique name of the proxy server</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.host</code></td>
<td>The server name, IP address, or fully-qualified domain name of the computer running the proxy.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.http.port</code></td>
<td>Port on the proxy for HTTP communication. Must be unique across all processes on the machine.</td>
</tr>
<tr>
<td><code>edgeencryption.proxy.https.port</code></td>
<td>Port on the proxy for HTTPS communication. Must be unique across processes on the machine.</td>
</tr>
</tbody>
</table>

5. If installing the proxy server on a Windows machine, you must change the name of the service. Open the `conf/wrapper.conf` file on the new proxy and add the following properties.

**Note:** You must perform this step before launching the proxy server.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wrapper.ntservice.name</code></td>
<td>Unique name of the Edge Encryption proxy service.</td>
</tr>
<tr>
<td><code>wrapper.ntservice.displayname</code></td>
<td>Edge Encryption proxy service display name.</td>
</tr>
</tbody>
</table>
### Authenticate an Edge Encryption proxy server

Specify that a proxy server is a trusted source so that Edge Encryption can process requests coming from that proxy server.

If a proxy server is not authenticated, the console log includes the following message:

```
WARN This Edge Encryption proxy has not yet been authenticated by the instance.
Please navigate to the matching Proxy record on your ServiceNow instance and authenticate it.
```

If you attempt to access the proxy, you receive the following message: This site can't be reached.

To maintain the proxy in an operational state during the upgrade process, authentication is not required until after the proxy update is successful.

Role required: admin

1. Navigate to Edge Encryption Configuration > Proxies.
2. Select the proxy and click Authenticate.

The proxy moves from Unauthenticated to Pending to Authenticated. The status changes from Unauthenticated to Pending when you start the authentication. When authentication is complete, the status changes from Pending to Authenticated, and you can access the proxy and Edge Encryption can accept requests from the proxy.

**Note:** If you stop and restart the proxy, the proxy remains Authenticated and restarts successfully.

### Stop the Edge Encryption proxy

You can stop an Edge Encryption proxy from the command line.

1. Stop the proxy server.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On a Linux machine</td>
<td>Execute .%/shutdown.sh</td>
</tr>
<tr>
<td>On a Windows machine</td>
<td>Execute edgeencryption.bat stop</td>
</tr>
<tr>
<td></td>
<td>To remove the Windows service, execute edgeencryption.bat remove</td>
</tr>
</tbody>
</table>

2. Check the log on the proxy server to verify that the proxy has stopped.

### Uninstall the Edge Encryption proxy on Linux

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.
Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy. The encryption proxy running on Linux operates as a single process. You can end this process to accommodate such tasks as redeploying the encryption proxy to another host machine, updating the proxy version, updating the Java version, or changing the unique name of the encryption proxy when deploying the encryption proxy on multiple proxy servers.

1. You may want to save the `edgeencryption.properties` file before deleting the distribution directory.
2. Execute the `shutdown.sh` shell script.
3. Check the log on the proxy server to verify that the proxy server is shut down.
4. Delete the files in the distribution folder.

### Uninstall the Edge Encryption proxy on Windows

You can uninstall the Edge Encryption proxy. If you are upgrading the proxy, it is not necessary to shut down and uninstall the current version.

You must have access to the computer running the Edge Encryption proxy.

Before shutting down the Edge Encryption proxy, ensure that no users are connected to the instance using the proxy.

1. You may want to save the `edgeencryption.properties` file before deleting the distribution directory.
2. Execute `edgeencryption.bat stop`
3. Execute `edgeencryption.bat remove`
4. Check the log on the proxy server to verify that the proxy server is shutdown.
5. Delete the files in the distribution folder.

### Set up multiple provider SSO with Edge Encryption

If implementing multiple provider single sign-on (SSO) with Edge Encryption enabled, some users may need to log in to your instance through the Edge Encryption proxy server, while other users may not. Set up multiple provider SSO to enable logging in through the Edge Encryption proxy server URL or the instance URL.

- **Role required:** admin
- Enable the Edge Encryption plugin (`com.glide.edgeencryption`) and ensure that one or more proxy servers are set up in your network.
- Determine the URL for the Edge Encryption proxy server that users will log in through using multiple provider SSO. To determine the URL of an Edge Encryption proxy server, see [Edge Encryption installation](#).

- If routing all users through the Edge Encryption proxy server, set up your identify provider record and define the proxy server URL in the ServiceNow Homepage, Entity ID / Issuer, and Audience URI fields.
- To route some users through the proxy server and some users to the instance, create two identify provider records. Both records use the same value in the Identity Provider URL field. However, one of the records routes through the proxy server, while the other routes to the instance.

1. Enable the duplication of identity provider URLs in identity provider records.
   A unique constraint prevents duplication of the identity provider URL in two different identity provider records. You can enable duplication of the identity provider URL in multiple IdP records by setting a field to false.
   a) Navigate to System Definition > Dictionary.
   b) Open the definition record for the idp field of in the Identity Providers table `[saml2_update1_properties]`.
   c) Configure the form to add the Unique field.
d) Ensure that the value of the **Unique** field is set to **false**.

2. Navigate to **Multi-Provider SSO > Identity Providers**.

3. Create two identity provider records for the same identity provider: one using the instance URL and one using the Edge Encryption proxy server URL.

   To create an identity provider record, see *Create and update identity providers*.

   a) For the Edge Encryption proxy server URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
</tbody>
</table>
   | ServiceNow Homepage     | The URL for your proxy server homepage. For example: <br>
                           | https://<proxy hostname>:<port>/navpage.do                         |
   | Entity ID / Issuer     | https://<proxy hostname>:<port>                                      |
   | Audience URI          | https://<proxy hostname>:<port>                                      |

   b) Click **Submit**.

   c) For the instance URL, complete the form using these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Provider URL</td>
<td>Imported from IdP metadata.</td>
</tr>
<tr>
<td>ServiceNow Homepage</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Entity ID / Issuer</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
<tr>
<td>Audience URI</td>
<td>https://&lt;instance&gt;.service-now.com/navpage.do</td>
</tr>
</tbody>
</table>

   d) Click **Submit**.

4. Optional: If using more than one identity provider, modify the MultiSSO installation exit.

   a) Navigate to **System Definition > Installation Exits**.

   The system displays the current list of installation exits.

   b) Open the **MultiSSO** installation exit.

   c) Locate the following statement in the **Script** field.

   ```javascript
   var samlResponseTxt = request.getParameter("SAMLResponse");
   if (!GlideSession.get().isLoggedIn() &&
       GlideStringUtil.notNil(samlResponseTxt)) {
       var idpRecord = this.getIdPRecord(request);
       if (idpRecord) {
           SSO_Helper.debug("IdP found based on SAML response: "+
                           idpRecord.getUniqueValue());
           return new SSO_Helper(idpRecord.getUniqueValue(), false, null,
                                  true);
       }
   }
   ```

   d) Replace the statement with the following code.

   ```javascript
   var samlResponseTxt = request.getParameter("SAMLResponse");
   ```
if (!$GlideSession.get().isLoggedIn() &&
GlideStringUtil.notNil(samlResponseTxt)) {
    /* // You have two profiles that use the same IdP entity id it
cannot use
    // the IdP issuer / entity id from the response otherwise it may
result in the
    // wrong IdP profile. IdP initiated login will not work
    var idpRecord = this.getIdPRecord(request);
    if (idpRecord) {
        SSO_Helper.debug("IdP found based on SAML response: " +
        idpRecord.getUniqueValue());
        return new SSO_Helper(idpRecord.getUniqueValue(), false, null,
        true);
    }*/
    return new SSO_Helper(null, true);
}

Note: IdP initiated login does not work in this configuration.

e) Click Update.

5. Optional: If using more than one company, Configure users for Multi-Provider SSO. Update the sys_id of the
identity provider record depending on the user.
    • To configure a user to log in through the Edge Encryption proxy server, use the sys_id of the identity
provider record that uses the Edge Encryption proxy server URL.
    • To configure a user to log in to the instance, use the sys_id of the identity provider record that uses the
instance URL.

Login URLs

<table>
<thead>
<tr>
<th>URL</th>
<th>Login destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>https://&lt;instance name&gt;.service-now.com/login_with_sso.do?glide_sso_id=&lt;sys_id of IdP record for the instance URL&gt;</td>
<td>Logs in through the instance.</td>
</tr>
</tbody>
</table>

Edge Encryption proxy server properties

The edgeencryption.properties configuration file located in the <installation directory>/conf/ folder contains properties used to configure your environment.

You must restart the proxy server after making changes to any proxy server properties. Changes on the instance and changes to the log4j.properties do not require a proxy restart.

Target (instance) properties

dedgeencryption.target.host
Host name for the instance. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. For example, instancename.servicenow.com

**edgeencryption.target.port**
Instance port. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed.

**edgeencryption.target.protocol**
Instance protocol. Must be the same for all encryption proxies connecting to the same instance. This property is set when the proxy is installed. Options include:
- http
- https

**User account properties**

**edgeencryption.target.username**
User name that the proxy uses to log in to the instance. The user must have the edge_encryption role. See [Set up an Edge Encryption user account](#).

**edgeencryption.target.password**
Password that the proxy uses to log in to the instance.

**Proxy properties**

**edgeencryption.proxy.host**
Server name, IP address, or fully qualified domain name of the computer running the proxy. Along with the port, this property defines the URL used by the client to access the proxy server.

**edgeencryption.proxy.name**
Proxy name. Must be unique for each proxy.

**edgeencryption.proxy.http.port**
Port on the proxy for HTTP communication.

**edgeencryption.proxy.https.port**
Port on the proxy for HTTPS communication.

**SSL certificate properties**

Restart your proxy if you change the value of any SSL certificate property. The system uses the HTTPS keypair on startup to establish the proxy server connection and determine how the proxy answers client requests.

**edgeencryption.proxy.https.cert.alias**
Alias of the certificate provided by the proxy server to connecting clients.

**edgeencryption.proxy.https.keystore.path**
Path to the keystore that contains the HTTPS certificate.

**edgeencryption.proxy.https.keystore.password**
Password for the keystore that contains the HTTPS certificate.

**Proxy configuration locked property**

`edgeencryption.proxy.locked`

When true, the proxy does not accept encryption configuration changes or encryption rule changes from the instance. Set this property on the production instance after all encryption configurations and rules are final.

**Proxy database properties**

`edgeencryption.db.url`

Proxy database location. Must be the same for all encryption proxies connecting to the same instance.

`edgeencryption.db.user`

User name for accessing the proxy database. Must be the same for all encryption proxies connecting to the same instance.

`edgeencryption.db.password`

Password to access the proxy database. Must be the same for all encryption proxies connecting to the same instance.

`edgeencryption.db.name`

Proxy database name. Must be the same for all encryption proxies connecting to the same instance.

- Default value: edgeencryption

`edgeencryption.db.bootstrap.file`

Bootstrap file for the proxy database. The file is relative to the sql/ directory. Must be the same for all encryption proxies connecting to the same instance.

⚠️ **Warning:** Under normal circumstances, do not change this parameter.

**Digital signature properties**

`edgeencryption.proxy.signature.keystore.path`

Path and Java KeyStore file name.

`edgeencryption.proxy.signature.keystore.password`

Password. The default password is <changeme>. Change the password after installing the Java KeyStore.

`edgeencryption.proxy.signature.keystore.keyalias`

The key alias given as the -alias argument when the RSA key pair is generated.

NAE device keystore properties

`edgeencryption.nae.retries`

Number of retries to make.

`edgeencryption.nae.enabled`
Setting indicates whether an NAE device is available.

**edgeencryption.nae.server**
Name of the NAE server.

**edgeencryption.nae.port**
Port used by the NAE server.

**edgeencryption.nae.protocol**
Protocol used by the NAE server.

**edgeencryption.nae.keystore.path**
Path to the keystore on the NAE server.

**edgeencryption.nae.keystore.password**
NAE keystore password.

**edgeencryption.nae.username**
User name to use to authenticate with the NAE device.

**edgeencryption.nae.password**
Password to use to authenticate with the NAE device.

**edgeencryption.nae.client.certificate**
Certificate located in the keystore on the NAE server. Set this property to authenticate using a certificate instead of a username and password.

**Clear text and static IV properties**

**edgeencryption.customer.assigned.known.cleartext**
Clear text to let the instance verify that all proxies are using the same keys. At startup, the proxy encrypts the clear text and sends the encrypted text to the instance. The instance does not know the clear text, nor are keys sent to the instance. This property must be the same for all proxies.

**edgeencryption.encrypter.static.iv**
Static IV (initialization vector) used in equality-preserving and order-preserving encryption. This property must be the same for all proxies and must be exactly 16 bytes (16 ASCII characters).

**Password property**

**edgeencryption.encrypter.properties.password**
Name of the file in the `conf` folder that contains a string used within a secure process to obfuscate passwords in the `edgeencryption.properties` file.

If this property is not set, passwords in your properties file appear in clear text. Leave this property blank until after the proxy configuration has been set up and tested.

**Web proxy properties**

**edgeencryption.webproxy.host**
Web proxy name or IP address.

```plaintext
edgeencryption.webproxy.port
```

Port on the web proxy.

```plaintext
edgeencryption.webproxy.user
```

User name used to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.

```plaintext
edgeencryption.webproxy.password
```

Password to use to connect to the web proxy. If your web proxy does not use authentication, leave this property commented out.

### Java KeyStore properties

```plaintext
edgeencryption.keystore.path
```

Path to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out.

Example:

```plaintext
edgeencryption.keystore.path = keystore/keystore.jceks
```

```plaintext
edgeencryption.keystore.password
```

Password the proxy uses to connect to the Java KeyStore. If using a file store or a SafeNet KeySecure keystore, leave this property commented out.

### File store property

```plaintext
edgeencryption.keyfile.directory
```

The directory specifies where key files are stored. If using the Java KeyStore or a SafeNet KeySecure keystore, leave this property commented out.

Example:

```plaintext
edgeencryption.keyfile.directory=keys
```

If using Unbound Technology keys, uncomment this property and set the value to the keys directory.

### Unbound Technology provider properties

```plaintext
edgeencryption.ekm.provider.classname
```

Internal class name for the implementation.

⚠️ **Warning:** Do not change this property.

```plaintext
edgeencryption.ekm.provider.rsa.wrapping.key.alias
```

Path to the Unbound API JAR file on the Unbound client machine.
Wrapping key alias in the Unbound Technology implementation. Must be the same for all proxies.

**General configuration properties**

`edgeencryption.config.poll.interval`
Poll interval in seconds. The default setting means that it takes 5 seconds for the proxy to learn of encryption configuration changes. Larger values cause the instance to take longer to detect an offline proxy.

*Warning:* Do not change this property. Changing the default setting of the Proxy Poll Interval can result in detection delays when a proxy comes online.

`edgeencryption.rules.dir`
Folder where the encryption rules are stored on the proxy.

`edgeencryption.encryption.order_preserving.cache.enable`
Setting determines whether caching is used to support order-preserving encryption types.

`edgeencryption.encryption.order_preserving.cache.size`
Maximum cache size, in bytes.

`edgeencryption.jobs.concurrency`
Maximum number of mass encryption jobs that can run concurrently on this proxy.

`edgeencryption.jobs.requests_per_second`
Number of http job requests per second that can be sent to the instance by this proxy.

`edgeencryption.attachments.request.timeout.seconds`
Attachment upload request timeout in seconds.

`edgeencryption.request.buffer.size`
Size of an encryption request. If an encryption request is larger than this size, the excess is saved to disk.

*Warning:* Do not change this property.

`edgeencryption.httpclient.request.buffer.size`
Size of the client request. If the client request is larger than this size, the excess is saved to disk.

*Warning:* Do not change this property.

`edgeencryption.proxy.idle.timeout`
Time in seconds after which a transaction times out.

- Default value: 300 (seconds)

`edgeencryption.proxy.keepalive.interval`
Time in seconds between pings issued by the proxy to the instance. Pings are issued periodically to verify connectivity between the proxy and the instance.

- Default value: 10 (seconds)
- Minimum value: 5 (seconds)

**edgeencryption.register.retry.count**

Maximum number of times the proxy pings the instance to try to register.
- Default value: 0 (no limit)

**edgeencryption.tokenization.exclusion.list**

Encryption patterns cannot tokenize strings found in these fields.

**Proxy server performance properties**

Proxy server performance properties are not present in the configuration file by default. To change the default values, you must add the properties and restart the proxy server. For more information, see *Edge Encryption diagnostics and performance*.

**edgeencryption.stat.collection.enabled**

Enables the collection of statistics used by the Edge Encryption proxy server performance dashboard.
- Default value: true

Add this property and set the value to false to disable the collection of statistics used by the Edge Encryption proxy server performance dashboard.

**edgeencryption.stat.collection.interval**

Interval length in seconds during which the Edge Encryption proxy server collects statistics. The value cannot be less than 30 seconds.
- Default value: 30 (seconds)

**Deprecated proxy encryption properties**

**edgeencryption.encrypter.default.key128**

Specifies the name of the current AES 128 key. An AES 128 key must be available even if it is not used. Must be the same for all proxies.

Perform maintenance of these keys on the instance.

**edgeencryption.encrypter.default.key256**

Specifies the name of the current AES 256 key. Must be the same for all proxies.

Perform maintenance of these keys on the instance.

**edgeencryption.encrypter.key**

Specifies the key name for each key and is used to specify the default keys. This is the key alias integrated with the metadata that is included with each encrypted item and, therefore, is stored on the instance. The key name must use lowercase letters.

**edgeencryption.encrypter.type**

Specifies the type of encryption keystore system.

**edgeencryption.encrypter.file**
Specifies the path and file name of the text file associated with the key.

**edgeencryption.encrypter.password**

Specifies the password for accessing the keystore.

**CyberArk integration with the Edge proxy server**

Use CyberArk to store passwords in a centralized and secure digital vault to secure passwords that were previously stored in clear text and secured by file access, or that were previously encrypted via a second file.

CyberArk AIM (Application Identity Management) prevents unauthorized access by eliminating hard-coded and visible passwords. AIM stores passwords in a digital vault on an independent hardened server, where the passwords are represented as digital credentials. The AIM clients (the Edge proxy servers) use CyberArk digital credentials and access the independent server to retrieve the secured passwords. No passwords are stored on the Edge proxy servers or in the instance.

**CyberArk digital vault credentials**

You must purchase and configure CyberArk before you can set up CyberArk integration with the Edge proxy server.

To add a credential to CyberArk (which is read by the Edge proxy), set the **Platform Name** of the credential to **Unix via SSH** and make sure you either create a **Custom** credential **Name** or write down the **Auto-generated** credential **Name**. When you configure the Edge proxy to use this credential, the proxy server matches this credential **Name** to the setting in the proxy.

![Add SSH Key](image)

Each credential entry holds a **Password** that is being secured, as well as a credential **Name** used by an application to access that password.

**Note:** CyberArk credentials are not encryption keys.
Adding CyberArk during an Edge proxy installation

The proxy installer includes a new configuration page for a CyberArk integration. This page is optional if you do not want to include CyberArk when installing your proxy with the proxy installer. You can also manually set up and configure CyberArk integration in the configuration file.

![CyberArk Connection (Optional) 1/2](image)

The proxy installer also includes a new page for CyberArk protected credentials. This page allows configurations of different properties using a single credential name or multiple credential names. This page is optional if you do not want to include CyberArk when installing your proxy with the proxy installer.
CyberArk password protection

Any password field in the Edge proxy installer that has a CyberArk credential configured in the CyberArk vault and specified on the CyberArk Protected Credentials page of the installer is grayed out and contains the message Protected by CyberArk.
Using a load balancer with the Edge proxy server

You can use a load balancer to balance the load across the proxy servers in your Edge Encryption proxy setup. If the load balancer and proxy servers are using different ports, specify the host name and HTTPS port of the load balancer to enable users to view responses on their browser.

**Important:** All production environments should include at least two Edge Encryption proxy servers for redundancy.

Edge request processing without a load balancer

If you are not using a load balancer, a request is processed as described below.

1. The user issues a request from a browser.
2. The browser sends the request to the Edge proxy server.
3. The proxy server sends the request to the ServiceNow instance.
4. The ServiceNow instance returns the response to the proxy server.
5. The proxy server adds its own port number in the response header before returning the response to the user's browser.

The request is completed successfully because the user can view the response from the proxy server at the port number specified in the response header.
Edge request processing with a load balancer

However, if you are using a load balancer, the user's browser communicates directly with the load balancer, not with the proxy server. A request is processed as described below.

Note: The following example uses 1025 as the proxy server port number.

1. The user issues a request from a browser.
2. The browser sends the request to a load balancer Virtual IP (VIP), also known as a Virtual Server.
3. The VIP is configured to point to the proxy server (for example, 10.2.200.148:1025), so the load balancer forwards the request to the proxy server.
4. The proxy server sends the request to the ServiceNow instance.
5. The ServiceNow instance returns the response to the proxy server.
6. The proxy server rewrites the location header in the response with values configured in the properties for risk-servicenow.dev.echonet:1025.
   - Host: edgencryption.proxy.host
   - HTTP port: edgencryption.proxy.http.port
   - HTTPS port: edgencryption.proxy.https.port
7. The proxy server forwards the response to the load balancer with the location header pointing to the proxy server port.

The outcome depends on whether the load balancer and proxy servers are using the same port.

- If the load balancer and proxy servers are using the same port, the request succeeds because the user receives the response from the same port identified in the response header.
- If the load balancer and proxy servers are using different ports, the request fails because the user's browser communicates only with the load balancer, but the response is on the proxy server.

Solution

You could resolve the issue by simply using the load balancer and all Edge proxy servers on the same port, but this is not an ideal solution. A better solution is to enable the system to know which port the load balancer uses.

The following properties enable the Edge proxy server to reroute response messages to the load balancer if the proxy server and load balancer are using different ports.

- edgeencryption.proxy rewrite location host
- edgeencryption.proxy rewrite location https port

Configure the load balancer

If the load balancer and proxy servers are using different ports, specify the host name and HTTPS port of the load balancer to enable users to view responses on their browser.

Roles required:

- local or domain administrator on a Windows host
service user with full file system access on a Linux host

1. Login to the proxy server host as admin, domain admin, or a service user.
2. Navigate to the installation directory for the Edge proxy and select `conf/edgeencryption.properties`.
3. Set the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| `edgeencryption.proxy_rewrite.location.host`  | If your Edge configuration includes a load balancer to balance the load among proxy servers, rewrites responses to the load balancer so requests can be completed.  
• If there is a load balancer in the proxy setup, specify the host name used to access ServiceNow through the load balancer.  
• **Optional**: If there is no load balancer in the proxy setup, can be set to the host name used by the proxy server. |
| `edgeencryption.proxy_rewrite.location.https.port` | If your Edge configuration includes a load balancer to balance the load among proxy servers, specifies the HTTPS port used to access ServiceNow through the load balancer.  
• If there is a load balancer in the configuration, specify the HTTPS port used to access ServiceNow through the load balancer.  
• **Optional**: If there is no load balancer in the configuration, can be set to the HTTPS port used by the proxy server. |

4. Save the file.

Requests can be completed because users can now view responses on their browser.

**Edge Encryption upgrades**

Both instance upgrades and proxy server upgrades require special consideration in an Edge Encryption environment.

**Instance upgrades**

Instance upgrades in an Edge Encryption environment require caution to ensure that Edge controls work properly after the instance upgrade.

During an instance upgrade, you should not add, edit, or delete the following:

- Edge Encryption configurations
- Edge Encryption rules
- Edge Encryption tokenization patterns
- Edge Encryption scheduled jobs
- Edge Encryption key configurations
- Edge Encryption scheduled upgrades
- Edge Encryption blacklist IP configurations
Any scheduled job running during the instance upgrade will not complete. To complete the interrupted job, rerun
the job once the instance is upgraded. When you reschedule the job, the processing that occurred before the instance
upgrade is not lost, and the job continues to process only the data that has not yet been processed.

**Proxy server upgrades**

Schedule a proxy upgrade to enable the instance to upgrade the Edge Encryption proxy server, or manually upgrade
the proxy server at any time.

**Third party libraries**

Third party libraries, such as Gemalto, are lost during instance and proxy server upgrades if they are kept in the same
directory. You can perform the following to prevent the loss of third party libraries during upgrades:

1. Manually add the following property to edgeencryption.properties:
   
   ```
   edgeencryption.ekm.provider.classname =
   com.snc.edgeencryption.encryption.CloudEdgeNaeKeyProvider
   ```

2. Add the `edgeencryption.thirdparty.vendor.library.path` vendor library location property and set it to /path/to/jars.
   
   For example:
   
   ```
   edgeencryption.thirdparty.vendor.library.path = /app/servicenow/libs
   ```

3. Copy the SafeNet JARs into that path.

After you install the third party libraries outside of the Edge Encryption installation, they are no longer lost during
upgrades.

**Scheduled upgrades**

Schedule an upgrade to allow the instance to upgrade the proxy server at the scheduled time. This functionality is
available by default after upgrading. A scheduled upgrade includes these events:

1. The proxy server checks with the instance to see if there is a new version available for upgrade. New versions
generally become available when the instance is upgraded.

2. The administrator receives a notification upon logging in when a new version of the proxy server is available.

3. The administrator can Schedule an Edge Encryption proxy server upgrade for each proxy server.

   **Note:** Only users with the security_admin role can create an upgrade schedule through the proxy server.

4. Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the
upgrade, the proxy server is offline for only a short time.

   **Note:** Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of
time is determined by your environment and how long it takes to stop and restart the proxy service.

5. During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the
new directory. New properties are written to your existing properties file. The following files or directories in
your old proxy directory are copied to the new proxy directory.

   - `/conf` directory
   - `/keys` directory
ServiceNow® Orlando® Now Platform® capabilities

- /keystore directory
- java/jre/lib/security/cacerts file

As a result, your keys, keystores, settings, and certificates are preserved.

**Note:** Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory are not preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: `<original-proxy-directory>/tmp/upgrade-wrapper/bin`.

---

**Prerequisites for scheduled upgrades**

Before scheduling an upgrade for an Edge Encryption proxy, ensure the following:

1. The `JAVA_HOME` environment variable points to a java installation on the machine that is outside the Edge Encryption proxy’s directory structure.
2. The `JAVA_HOME` environment variable points to a java installation that is at version 1.8_u144 or higher.
3. The `-Djava.io.tmpdir` parameter in the wrapper.conf file of the Edge Encryption proxy points to a directory that is OUTSIDE the Edge Encryption proxy’s directory structure, and the proxy has read/write/execute permissions on the directory. Optionally, you could comment out the parameter entirely so that Java uses its default tmp location.

**Manual upgrades**

Instead of creating an upgrade schedule, you can manually upgrade each proxy server through the command line. See [Manually upgrade an Edge Encryption proxy server running on Linux](#) or [Manually upgrade an Edge Encryption proxy server running on Windows](#).

**Proxy build status**

You can easily identify whether a proxy server is out of date by navigating to **Edge Encryption Configuration > Proxies > All**. The status of your proxy build is indicated in the **Proxy build** column by the following colors:

- **Green**
  
  Your proxy server is up-to-date.

- **Yellow**
  
  Your proxy server is out-of-date and an upgrade is needed.

- **Orange**
  
  Upgrade failed. Your proxy server reverts to the old version to ensure that there is no downtime.
Troubleshoot a failed scheduled proxy upgrade

When a scheduled proxy upgrade fails, the proxy server reverts to the version you are upgrading from. All original data, keys, and configuration files are preserved. This process may take several minutes. Contact ServiceNow Technical Support to ensure a successful upgrade.

To determine the reason for the failure, you can check the **Failure Reason** in the upgrade schedule. In addition, the installation directory for the failed upgrade is maintained so that log files are available for troubleshooting.

**Note:** Before deleting any extra proxy directories, always confirm which directory is current by reviewing the log files. If the log files have recent activity, the proxy might be connected to your instance.

If a scheduled proxy upgrade fails repeatedly, you can manually upgrade your proxy server. See *Manually upgrade an Edge Encryption proxy server running on Linux* and *Manually upgrade an Edge Encryption proxy server running on Windows.*

Java minimum requirements

The host machine installing or running the Edge Encryption proxy server must maintain a supported version of Java:

- Java 8 update 121 (8u121)
- Java 8 update 141 (8u141)
- Java 8 update 151 (8u151) or later

**Note:** Java 8 update 131 (8u131) is not supported.

**Note:** Before installing the Edge Encryption proxy server, check that the $JAVA_HOME variable is pointing to a supported version of Java for each user that will run the proxy server. For example, if installing the proxy server as a local administrator on Windows, check that the $JAVA_HOME variable is pointing to the correct version of Java system-wide. If installing on Linux, check that each user that will run the proxy server has this...
variable correctly defined. If a supported version of Java is not found, the Edge Encryption proxy server will not run.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Mixed proxy-version environments

Although an environment running old versions of the proxy server with up-to-date versions of the proxy server is not recommended, it is supported if all proxy servers are within the same version family as your instance. For example, if you have an instance on the Orlando release, your environment supports proxy servers from any Orlando patch or hotfix. However, the following limitations apply.

- If one proxy server supports functionality that another proxy does not support, you will see inconsistent behavior, depending on which proxy server is used.
- If a proxy server is out-of-date, it may not include recent security enhancements.

If a proxy server from a previous release is registered with a newer release of the instance, you will receive regular notifications that the proxy server is out-of-date. To ensure an optimal and secure environment, ServiceNow recommends always upgrading your proxy server to the most recent version of the software supported by your instance.

Schedule an Edge Encryption proxy server upgrade

Create an upgrade schedule to enable the instance to upgrade an out-of-date proxy server.

To schedule an upgrade, you must be logged in to your instance through the proxy server.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Role required: security_admin

Once the upgrade is scheduled, the proxy server automatically upgrades at the scheduled time. During the upgrade, the proxy server is offline for only a short time.

**Note:** Because the proxy server restarts during the upgrade, it is offline for a short time. The amount of time is determined by your environment and how long it takes to stop and restart the proxy service.

During the scheduled upgrade, a new proxy directory is created and your configuration files are copied to the new directory. New properties are written to your existing properties file. The following files or directories in your old proxy directory are copied to the new proxy directory.

- `/conf` directory
- `/keys` directory
- `/keystore` directory
- `java/jre/lib/security/cacerts` file

As a result, your keys, keystores, settings, and certificates are preserved.
Note: Only the above files are copied to the new proxy directory. Any other customized files in the proxy server directory will not be preserved during a scheduled upgrade. The upgrade log file can be found in the original proxy directory in the following folder: `<original-proxy-directory>/tmp/upgrade-wrapper/bin`.

If multiple proxy servers are out-of-date, you must schedule an upgrade for each proxy server individually.

Note: Avoid hosting multiple proxy servers on the same machine. However, if your environment includes this configuration, do not schedule upgrades to multiple proxies on the same machine at the same time.

1. Navigate to **Edge Encryption Configuration > Proxies > Upgrade Schedules**.
2. Click **New**.
3. Complete the form.

### Edge Encryption Proxy Upgrade Schedule form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>Proxy server being upgraded.</td>
</tr>
<tr>
<td>Target version</td>
<td>Version to which you are upgrading your proxy server. This value is read-only and set to the most up-to-date proxy version available for your instance.</td>
</tr>
<tr>
<td>Scheduled Start Time</td>
<td>Date and time on which to start the upgrade.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the scheduled upgrade is active. If this field is not selected, the upgrade will not perform on the scheduled date and time.</td>
</tr>
</tbody>
</table>
| Status         | The status of the upgrade. This value is read-only. Possible statuses include:  
  - Pending  
  - Running  
  - Complete  
  - Failed |

4. Click **Submit**.

After an upgrade is executed, you can review the upgrade details to learn more about it. If your upgrade failed, review the **Failure Reason** to determine next steps.

### Upgrade details

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Version</td>
<td>The version that the server was upgraded from.</td>
</tr>
<tr>
<td>To Version</td>
<td>The version that the server was upgraded to.</td>
</tr>
<tr>
<td>Actual Start Time</td>
<td>Time that the upgrade began.</td>
</tr>
<tr>
<td>End Time</td>
<td>Time that the upgrade ended.</td>
</tr>
<tr>
<td>Failure Reason</td>
<td>Reason that the upgrade failed.</td>
</tr>
</tbody>
</table>
Manually upgrade an Edge Encryption proxy server running on Linux

Update a proxy running on Linux.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Role required: security_admin or local administrator on the host machine

1. Copy the Edge Encryption update-archive file to the installation directory.
2. Change to the installation directory.
3. Run the following command:

   ```
   java -jar edgeencryption-dist-<version>-linux-x86-64.jar -m dist-upgrade -c <proxy directory>
   ```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy directory</td>
<td>The directory in the installation directory where the proxy was initially installed. This directory is created by the install.</td>
</tr>
</tbody>
</table>

If you want to see the help screen, execute this command without arguments: java -jar edgeencryption-dist-<version>-linux-x86-64.jar

A new proxy directory is created with a current timestamp. A backup of the old proxy directory is maintained as backup.dist-upgrade_timestamp in the new proxy installation directory. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

4. Check the proxy log in the new directory and the instance to verify that the new proxy is running.

Manually upgrade an Edge Encryption proxy server running on Windows

Update a proxy running on Windows.

If using AES 256-bit encryption with Java 8 update 141 (8u141) or lower, you must install the Java Cryptography Extension (JCE) jurisdiction policy files by copying them into the system Java home directory of each Edge Encryption proxy server host. Add these files to the `<Java-home-directory>/jre/lib/security` folder before performing a scheduled or manual upgrade. To install the AES 256-bit encryption policy files, see Enable AES 256-bit encryption for Java 8 update 141 (8u141) or lower.

Role required: security_admin or local administrator on the host machine

1. Download the Edge Encryption proxy-update archive file to the installation directory.
2. Start the Windows cmd terminal program with administrator privileges.
3. Change to the installation directory.
4. Run the following command:

   ```
   java -jar edgeencryption-dist-<version>-all.jar -m dist-upgrade -c <proxy directory>
   ```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy directory</td>
<td>The directory in the installation directory where the proxy was initially installed. This directory is created by the install.</td>
</tr>
</tbody>
</table>
If you want to see the help screen, execute this command without arguments: `java -jar edgeencryption-dist-<version>-all.jar`

A new proxy directory is created with a current timestamp. A backup of the old proxy directory is maintained as backup.dist-upgrade_timestamp in the new proxy installation directory. The old proxy shuts down and the new proxy starts up. Any open connections/transactions on the old proxy server are terminated.

5. Check the proxy log in the new directory and the instance to verify that the proxy has been updated and is running.

Roll back an Edge Encryption proxy server upgrade

If a proxy upgrade is unsuccessful, you can go back to the earlier version.

If an upgrade fails when using the scheduled upgrade feature in the Orlando release, the proxy server will automatically roll back to the old version. The old proxy server is stored unmodified in a backup directory.

If you would like to roll back a manual upgrade, you can follow these steps.

1. Shut down the proxy.
2. Delete the new proxy directory.
3. Rename the backup directory to the proxy name.
   The backup directory is in the proxy installation directory with the name `<proxy name>_backup`
4. Start the proxy.
5. Check the proxy log and the instance to verify that the proxy is online.

Edge Encryption configuration

After the Edge Encryption proxy server is installed and running, manage Edge Encryption through the proxy server.

You must complete all the steps in *Edge Encryption installation* before creating encryption configurations and encryption patterns on the instance.

**Note:** To access the Edge Encryption configuration, you must log in through the proxy server and elevate to the security_admin role.

Rotate encryption keys

Perform encryption key rotation from the instance. Add a new key, change the default key assignment, and then schedule a mass key rotation or a single key rotation.

Before setting an encryption key as the default key, make the key available to each proxy. This ensures that the proxies have the key to encrypt data when the key is assigned as the default key. All proxies must have access to a key before that key can be assigned as the default key.

**Warning:** Before deleting a key from the proxy, set up and run a mass key rotation job to ensure that no data on the instance uses the key. If any information is still encrypted with that key, you cannot decrypt the information after you delete the key.

Edge filtering and sorting behavior

Whenever you change default keys, be sure to perform a key rotation (either mass or single key rotation). Otherwise, you may receive unexpected results when sorting and filtering records. For example, consider the following scenario:
1. You create encrypted records using one encryption key.
2. You create a new key and set it as default.
3. You create a new set of encrypted records using the new encryption key.

If you filter by any encrypted field when connected through the Edge proxy, all records may not be filtered out correctly, or records may appear unexpectedly. The filter works only for records encrypted using the current default key. The records encrypted using the previous default key still appear in the list view.

If you sort by any encrypted field when connected through the Edge proxy, you see two groups of records with the same human readable text in the encrypted field.

### Schedule a single key rotation job

Schedule a job to find data encrypted using a specified key alias and then re-encrypt the data with the current default encryption key. The data is decrypted before it is re-encrypted with the default key.

**Role required:** security_admin

Before scheduling this job, update the default key in **Edge Encryption Configuration > Encryption Key Configuration > Set Default Keys**.

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Single Key Rotation**.
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Single Key Rotation</strong>.</td>
</tr>
<tr>
<td>Key</td>
<td>Enter the key to be retired. Verify that this key is no longer the default key in <strong>Edge Encryption Configuration &gt; Encryption Key Configuration &gt; Set Default Keys</strong>.</td>
</tr>
<tr>
<td>Estimate record count</td>
<td>Total estimated number of records to process. Not available when running a single key rotation.</td>
</tr>
</tbody>
</table>
| Process Historical Records   | Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. This field is read only and active.  
To learn more about audited fields, see **Auditing**. |
| Estimate Maximum Audit Record Count | Estimated maximum number of audited records to process. Not available when running a single key rotation. |
| Active                       | Clear this check box if you want to deactivate this job.             |
| Run                          | Select the period between job executions.                            |
| Starting                     | Enter the date and time to run the job for the first time.           |

3. Click the menu icon in the form header and select **Save**.

**Estimate Record Count** is not supported when processing audited fields.

### Schedule a mass key rotation job

Schedule a job to find data encrypted with any previous key, and then re-encrypt the data with the current default encryption keys. The data is decrypted before it is re-encrypted with the current default key.
Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Mass Key Rotation**.
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Mass Key Rotation</strong>.</td>
</tr>
<tr>
<td>Estimate record count</td>
<td>Total estimated number of records to process. Not available when running a mass key rotation.</td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. This field is read only and active. To learn more about audited fields, see <strong>Auditing</strong>.</td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Not available when running a mass key rotation.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.

   **Estimate Record Count** is not supported when processing audited fields.

**Schedule an attachment key rotation job**

Schedule a job to find attachments encrypted using a specified key alias, and then re-encrypt the attachments with the current default encryption key. The attachment is decrypted before it is re-encrypted with the default key.

Role required: security_admin

1. Navigate to **Edge Encryption Configuration > Maintenance > Schedule Attachment Key Rotation**.
2. Fill in the fields on the form as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Attachment Key Rotation</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.
4. To see an estimated count of records to be updated, click **Estimated Record Count**.
5. To run the job immediately, click **Execute Now**.
Encrypt fields using encryption configurations

Encrypt fields by creating encryption configurations.

To configure Edge Encryption, you must be connected to the instance through the proxy. Test all changes on a non-production instance before making the changes to the production instance.

Define encryption keys

After setting up one or more proxies and configuring a default encryption key, the instance verifies that the keys are available to all proxies. You cannot make an encryption key the default key unless all proxies have the key. Once a default key is defined, you can create encryption configurations.

Assign fields and attachments to be encrypted

Assigning fields and attachments to be encrypted means assigning an encryption type to the field or attachment. Before marking a field as encrypted, evaluate these issues.

- Determine what system features might be impacted.
- Examine all scripts for use of the field.
- Make any desired adjustments to the field size. After a field has been configured for encryption, the field size cannot be changed.

Marking a field to be encrypted expands the field size to store the encrypted data. The process of expanding the field size can take a long time, depending on the number of records in the table.

Create an encryption configuration

Select the fields to be encrypted and identify the encryption type.

Role required: security_admin

2. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table that contains the field to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select Column.</td>
</tr>
</tbody>
</table>
### Field and Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column</td>
<td>The field to be encrypted. Appears only when the Type is Column. Only String, Date, Date/Time, Journal, Journal Input, and URL fields are supported. - <strong>String and URL fields:</strong> You can add an encryption configuration to either a parent table or a child table. - <strong>Date and Date/Time fields:</strong> You can add an encryption configuration to a parent table only. You cannot add a new encryption configuration to a child table.</td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use.</td>
</tr>
</tbody>
</table>

**Note:** Depending on the number of records affected by the Date and Date/Time fields you are encrypting, it may take up to a few minutes to create the encryption configuration. Make sure that you create the encryption configuration for Date and Date/Time fields when transaction volume on the instance is low.

### Encryption type

- **Note:** A specific table and field combination can have only one active configuration at a time.

1. Navigate to **Edge Encryption Configuration** > **Edge Encryption Configurations** > **All**.
   - The **Edge Encryption Configurations** list is shown.
2. Click on the encryption configuration to be deactivated.
   - The **Edge Encryption Configuration** form is shown.
3. Click on the **Active** box.
   - The **Active** box is clear.
4. Click **Update**.
   - The **Edge Encryption Configurations** list is shown.

**Warning:** Deactivating an encryption configuration does not delete the encryption record and the encryption type cannot be changed.

### Deactivate an encryption configuration

After configuring a field or a table's attachments to be encrypted, you can stop encryption by deactivating the encryption configuration. After deactivating encryption, you can run a Decryption job for fields or an Attachment Decryption job for attachments to remove the encrypted data from the instance.

Role required: security_admin

After you add the encryption configuration record, you can create an encryption job to encrypt existing data. If you do not run an encryption job, Edge encrypts the existing data the next time the data changes.

1. Navigate to **Edge Encryption Configuration** > **Edge Encryption Configurations** > **All**.
   - The **Edge Encryption Configurations** list is shown.
2. Click on the encryption configuration to be deactivated.
   - The **Edge Encryption Configuration** form is shown.
3. Click on the **Active** box.
   - The **Active** box is clear.
4. Click **Update**.
   - The **Edge Encryption Configurations** list is shown.

You can run a Decryption or Attachment Decryption job to decrypt data on the instance. If you do not run a job, the encrypted data is decrypted the next time it is changed.
Schedule an encryption job

You can schedule a job to find and encrypt any unencrypted data in a specified field, using the default encryption key configured for the field. If you do not create an encryption job after configuring a field for encryption, only new values are encrypted.

Role required: security_admin

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the field that you want to schedule an encryption job for.

The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for any previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Encryption.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Estimated record count</td>
<td>Total estimated number of records to process. Populates after selecting Estimate Record Count.</td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. To learn more about audited fields, see Auditing.</td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Populates after selecting Estimate Record Count. This field is only visible when Process Historical Records is selected.</td>
</tr>
</tbody>
</table>

Note: The estimate may be larger than the actual number of records processed.

Run                          | Select the period between job executions.                           |
Starting                      | Enter the date and time to run the job for the first time.          |

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

Schedule a decryption job

You can schedule a job to decrypt data in an encrypted field, to store clear data in the instance.

Note: You must mark the encryption record for the field as inactive (clear the Active box) in order to run the decryption job.
Role required: security_admin

1. Navigate to **Edge Encryption Configuration** > **Encryption Configurations** > **All**.
2. Click the field that you want to decrypt.
3. Under **Related Links**, click **Schedule Mass Decryption Job**.

   The **Scheduled Encryption Job** form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select <strong>Decryption</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Estimated record count</td>
<td>Total estimated number of records to process. Populates after selecting <strong>Estimate Record Count</strong>.</td>
</tr>
<tr>
<td>Process Historical Records</td>
<td>Select to process historical records in the Audit table if the field is audited. When encrypting historical records for a field in the Audit table, both new values and old values are encrypted. To learn more about audited fields, see <strong>Auditing</strong>.</td>
</tr>
<tr>
<td>Estimate Maximum Audit Record Count</td>
<td>Estimated maximum number of audited records to process. Populates after selecting <strong>Estimate Record Count</strong>. This field is only visible when <strong>Process Historical Records</strong> is selected.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select **Save**.
6. To see an estimated count of records to be updated, click **Estimate Record Count**.
7. To run the job immediately, click **Execute Now**.

**Encrypt attachments using standard encryption**

You can encrypt attachments for specific tables.

All attachments to a table use the same encryption type. Encrypted attachments are not searched when performing a text search. Only the standard encryption types are allowed for attachments. The order preserving or equality preserving encryption types are not allowed.

For a session bypassing the Edge Encryption proxy:

- On a record with attachment encryption activated:
  - The user can see that there are attachments and the attachment names.
  - The user cannot open or download the attachments.
• The user cannot add new attachments.
• On a record without attachment encryption activated:
  • The user can open and download existing attachments.
  • The user can add new attachments.

For a session using the encryption proxy, the user can open and download existing attachments and add new attachments.

**Configure attachment encryption**

Select the tables whose attachments are to be encrypted and identify the encryption type.

Role required: security_admin

1. Navigate to *Edge Encryption Configuration > Edge Encryption Configurations > Create New.*
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table whose attachments are to be encrypted.</td>
</tr>
<tr>
<td>Type</td>
<td>Whether to encrypt a table column or attachments for the table. Select <em>Attachment.</em></td>
</tr>
<tr>
<td>Column</td>
<td>The table field to be encrypted. This field appears when the <em>Type</em> is <em>Column,</em> and not when <em>Type</em> is <em>Attachment.</em></td>
</tr>
<tr>
<td>Encryption type</td>
<td>The encryption type to use. For attachments, only Standard AES128 and Standard AES256 are allowed.</td>
</tr>
</tbody>
</table>

3. Click *Submit.*

After the encryption record has been added, you can create an attachment encryption job to encrypt existing attachments. If you do not run an attachment encryption job, the system encrypts new attachments when you attach them.

**Schedule an attachment encryption job**

You can schedule a job to find and encrypt any unencrypted attachments for a specified table, using the default encryption key configured for the table.

Role required: security_admin

1. Navigate to *Edge Encryption Configuration > Encryption Configurations > All.*
2. Click the table you want to schedule an encryption job for.

   The *Scheduled Encryption Job* form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
</tbody>
</table>
Schedule an attachment decryption job

You can schedule a job to decrypt any encrypted attachments for a specified table, to store clear attachments in the instance.

Note: You must mark the encryption record for the table as inactive (clear the Active box) before the decryption job runs, otherwise, nothing happens.

Role required: security_admin

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.
2. Click the table with the attachments that you want to decrypt.

The Scheduled Encryption Job form is shown with all fields populated. The bottom of the form shows records for previous job executions.

4. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Attachment Decryption</td>
</tr>
<tr>
<td>Active</td>
<td>Clear the check mark if you want to deactivate this job.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

5. Click the menu icon in the form header and select Save.
6. To see an estimated count of records to be updated, click Estimate Record Count.
7. To run the job immediately, click Execute Now.

Change a field or attachment's encryption type

You can change a field or attachment's encryption type by selecting a new encryption type in the existing encryption configuration record. A specific table and field combination can only have one active configuration at a time.

Role required: security_admin

1. Navigate to Edge Encryption Configuration > Encryption Configurations > All.

The Edge Encryption Configurations list is shown.
2. Open the record for the encryption configuration to be changed.

3. Click the **Encryption type** dropdown and select a new encryption type.

   **Note:** For attachments, only Standard AES128 and Standard AES256 are allowed.

4. If needed, run an *encryption* or *attachment encryption* job.

   It is not necessary to run an encryption job. If you do not run an encryption job, the field or attachment is encrypted using the new encryption type the next time the field or attachment is changed.

---

### Tokenize strings using encryption patterns

You can replace string patterns with tokens before they are sent to and stored in the instance.

To use encryption patterns, you must install and set up a MySQL database in your network. This is the same database used for order-preserving encryption. To create or edit encryption patterns, you must be connected to the instance through the proxy.

**Role required:** security_admin

You can use base system patterns, or create your own patterns. Base system patterns are advanced patterns. Encryption patterns include the following limitations.

- A pattern of all alpha characters is not allowed.
- The minimum pattern size is five characters. You can change this setting using a system property.
- The * and + quantifiers are forbidden in encryption patterns.
- Encryption patterns match complete words, not parts of strings embedded in a larger string. Words are defined by spaces and characters not available for inclusion in a pattern.
- If the same string is sent to the instance multiple times, it is replaced with the same token.
- Text search on exact matches is supported. The query string is exchanged with a token when sent to the instance, the search is performed on tokens, and when the search results are returned to the proxy server, the tokens are replaced with the clear text. Features such as stemming are not supported.

When using patterns, the clear text never leaves your network. When the proxy server matches a pattern in a request going to the instance, the proxy replaces the string with a token of the same size. The token is sent to instance instead of the clear text string. When the response is sent from the instance to the proxy server, the proxy replaces the token with the string. When viewed through the proxy server, the string displays as clear text.

   **Note:** Encrypted fields are not checked for encryption patterns.

---

1. Navigate to **Edge Encryption Configuration > Encryption Patterns > Create New**.

   Alternatively, you can navigate to **Advanced Patterns** to activate or edit a preconfigured pattern.

2. Enter the pattern name.

3. **Define the Edge pattern input type.**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Basic</strong></td>
<td>A series of character types. In the <strong>Basic Pattern Input</strong> tab, click <strong>Add</strong> and select a character type. The <strong>Sample pattern</strong> displays the pattern as characters are added. Click <strong>New Block</strong> to move the next character to the next line. This enables you to group characters in a long pattern. Click <strong>X</strong> to delete the last character in the pattern.</td>
</tr>
</tbody>
</table>
The input type defines how you are going to enter the pattern. It does not impact how the pattern is used.

4. Click Submit.

### Repair or recover order-preserving encrypted data

If you have the security-admin role, you can schedule jobs performed by the Edge Encryption proxy to repair or recover fields that use order preserving encryption.

You can schedule jobs to:
- Repair order tokens.
- Recreate the proxy database.

Running these jobs can be a time-consuming operation which might impact the performance of the Edge Encryption proxy. Schedule these jobs at a time when no users or a minimum set of users are using the system, such as midnight on the weekend.

### Schedule an order token repair job

You can schedule a job to find and repair fields where the order token is missing.

Role required: security_admin

Use these jobs to repair individual fields in a table or to repair all fields using order preserving encryption. Run this job when the proxy database has been offline while the instance has been running, which results in order preserving fields that are missing order tokens.

1. Navigate to **Edge Encryption Configuration** > **Maintenance** > **Schedule Order Token Repair**.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Order Token Repair.</td>
</tr>
<tr>
<td>All fields</td>
<td>Select this check box to repair all tables.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Column</td>
<td>Select a column.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run the job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select **Save**.
4. To see an estimated count of records to be updated, click **Estimated Record Count**.
Schedule a proxy-database recovery job

Run this job when the proxy database has lost data. This job finds all records that have been encrypted with a token (order preserving encryption type) and sends them to the proxy so that the proxy database can be rebuilt.

Role required: security_admin

1. Navigate to Edge Encryption Configuration > Maintenance > Schedule Database Recovery.
2. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a descriptive name for this job.</td>
</tr>
<tr>
<td>Job Type</td>
<td>Select Database Recovery.</td>
</tr>
<tr>
<td>Active</td>
<td>Clear this check box if you want to deactivate this job.</td>
</tr>
<tr>
<td>Run</td>
<td>Select the period between job executions.</td>
</tr>
<tr>
<td>Starting</td>
<td>Enter the date and time to run this job for the first time.</td>
</tr>
</tbody>
</table>

3. Click the menu icon in the form header and select Save.
4. To see an estimated count of records to be updated, click Estimate Record Count.

Blacklist requests from an IP address in your network

Because the Edge Encryption proxy server resides in your network, it may be subject to vulnerability scans by your network software. To prevent IP scanner or other requests from being forwarded to your ServiceNow instance, you can blacklist IP addresses, IP ranges, or network masks. Any connection to the proxy server from a blacklisted address is terminated and is not forwarded to your instance.

Role required: security_admin

To blacklist an IP address, you must be logged in to your instance through the proxy server.

**Important:** Ensure that you understand your network topology before blacklisting IP addresses in your network. If an IP address is added to the blacklist, any user with that IP address will be blocked from accessing the Edge Encryption proxy server.

1. Navigate to Edge Encryption Configuration > Maintenance > Blacklist IP Addresses.
2. The Encryption Proxy IP Blacklists [edge_encryption_ip_blacklist] list view opens.
3. Click New.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy server</td>
<td>The Edge Encryption proxy server that is prevented from forwarding requests from blacklisted addresses.</td>
</tr>
</tbody>
</table>
| IP, IP range, or net-mask | Requests from this IP address, range, or network mask are not forwarded to your ServiceNow instance. Example values include:  
  • IP address: 10.10.10.5  
  • IP range: 10.10.10.1-15  
  • Network mask: 10.10.10.0/24  |
| Active              | Whether the record is active. Only IP addresses from active records are prevented from sending requests to the instance. |
4. Click Submit.
5. Repeat these steps for all other proxies for which an IP address should be blacklisted.

The Edge Encryption proxy server terminates any connection from a blacklisted IP addresses, range, or network mask and cannot forward the request to the instance.

## Encrypt data from a record producer

Record producers allow end users to create task-based records, such as incident records, from the Service Catalog and Service Portal. If a record producer attempts to insert data into a field marked for encryption, an invalid insert message displays and the data is not saved to the field. To configure your Edge Encryption proxy server to allow inserts from a record producer, create encryption rules from the record producer record.

Role required: security_admin

Encrypting data from a record producer requires an encryption configuration defined for the target field. Check that you have created an encryption configuration for the target field and table before creating an encryption rule from a record producer. See Create an encryption configuration. To encrypt attachments from a record producer, Configure attachment encryption.

1. Log in to your instance through the Edge Encryption proxy server.
2. Navigate to Service Catalog > Catalog Definitions > Record Producers.
3. Create a record producer record or open an existing record producer record.
   Two inactive encryption rules are automatically created to encrypt data sent from the record producer to the field marked for encryption.

<table>
<thead>
<tr>
<th>Encryption rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;RecordProducerName&gt;</td>
<td>Rule created to process POST parameters from the Service Catalog and map variables to fields in the instance.</td>
</tr>
<tr>
<td>&lt;RecordProducerName&gt;Json</td>
<td>Rule created to process a JSON payload from the Service Portal and map variables to fields in the instance.</td>
</tr>
</tbody>
</table>

5. Activate the necessary encryption rules created by the record producer.
   a) Navigate to Edge Encryption Configuration > Rules > All.
   b) Depending on where the record producer will be used, open the associated encryption rule created by the record producer and select the Active flag.
   
   If using the record producer in the Service Catalog, activate the <RecordProducerName> encryption rule. If using the record producer in the Service Portal, activate the <RecordProducerName>Json encryption rule.

6. Optional: Examine the Encryption rule Action field and add any necessary field names or statements.

   If a record producer directly maps a variable to a field in a table, the encryption rule automatically maps the variable to the correct field. However, if a variable is indirectly mapped through various scripts on the platform, you may need to update the rules to map each variable to the correct field.

   The below encryption rule was created from the Report Outage record producer and processes POST parameters from the Service Catalog to map variables to fields in the instance. Replace 'FILL ME IN' with the target field.
The below encryption rule was created from the Report Outage record producer and processes a JSON payload from the Service Portal to map variables to fields in the instance. Add additional statements to map any scripted variables to the target fields.
```javascript
function ReportOutageJsonCondition(request) {
  if (request.getPath().slice(0, '/services/catalog/items/').length == 0 && request.getPath().split('/')[1] !== '3Bc3f4d4deb3b7026052f2c3c71bf5fc8') {
    return true;
  }
  return false;
}

function ReportOutageJsonAction(request) {
  var tableName = 'incident';
  // Some fields are set in script, additional parameter lines may need to be added
  // current.comments is accessed via script from notes; // assignment to current.comments does NOT replace existing values
  // current.established is accessed via script from current.established;
  // current.description is accessed via script from current.description;
  // current.customer is accessed via script from current.customer;
  var currentPage = request.getRequestContent();
  for (var jsonElementIter = currentPage.iterator('variables'); jsonElementIter.hasNext();)
  {
    var jsonElement = jsonElementIter.next();
    jsonElement.setValueFor(tableName, jsonElement.getName());
  }
}
```
When the payload from the record producer is examined, the error_message element contains the value for the short_description field. By adding the following statement, you can map the scripted variable error_message to the short_description field.

```java
if (jsonElement.getName() == 'error_message')
    jsonElement.valueFor(tableName, 'short_description');
```

The value of the Action field becomes:

```java
function ReportOutageJsonAction(request) {
    var tableName = 'incident';
    // Some fields are set in script, additional parameter lines may need to be added
    // current.comments is accessed via script from notes; // assignment to current.comments does NOT replace existing values
    // current.short_description is accessed via script from short_description;
    // current.description is accessed via script from current.short_description;
    // current.caller_id is accessed via script from gs.getUserID();
    var jsonContent = request.getAsJsonContent();
    for (var jsonElementItr = jsonContent.getIterator('variables');
        jsonElementItr.hasNext();)
        { var jsonElement = jsonElementItr.next();
            if (jsonElement.getName() == 'error_message')
                jsonElement.valueFor(tableName, 'short_description');
            } else {
                jsonElement.valueFor(tableName, jsonElement.getName());
        }
}
```

The two encryption rules enable the record producer to insert values into fields marked for encryption from either the Service Catalog or Service Portal.

**Define a custom encryption rule**

It may be necessary to identify and encrypt sensitive information in HTTP requests on the way to your instance. You can write encryption rules to identify, interpret, and encrypt data in such requests, mapping fields in the request to table-field names on your instance.

**What is an encryption rule**

Encryption rules are scripts executed on the Edge Encryption proxy server to map fields in a request to fields in a table on your ServiceNow instance. An encryption rule tells the Edge Encryption proxy server how to encrypt data in custom payloads.

**Note:** Encryption rules only support ECMAScript 3 and below.

**When to use custom rules**

A set of encryption rules is included as part of the Edge Encryption plugin. These rules handle core platform use cases such as editing a field from the list edit form, updating a record from the record form, managing direct web services, and processing data from the REST API. Applications created using standard forms and lists should work without custom encryption rules.
If you develop scripted processors, scripted web services, scripted REST APIs, UIs, or Ajax scripts that contain data that should be encrypted, you must write encryption rules to find and map the data to Glide table-field names.

**Format of an encryption rule**

Rules include three parts:

- **Condition**: Identifies the type of request.
- **Action**: Maps fields in the request to fields in a table, encrypting values that map to fields with encryption configurations defined.
- **Order**: Priority of the rule. The lowest priority rule with a satisfied condition is the only rule that runs. Like business rules, rules run from lowest to highest.

Except for attachment requests, when an HTTP request hits the Edge Encryption proxy server, the Edge Encryption proxy server evaluates all encryption rule conditions in priority order until either all conditions return false, or one condition returns true. When a condition returns true, the action is executed on the request and the result is forwarded to the instance. No other conditions are evaluated. As a result, encryption rule conditions should be as specific as possible. A generic rule might evaluate as true for a request meant to be processed by another rule, causing the request to be processed by the wrong action. If a generic condition is unavoidable, the rule should be marked with a high-order value so that more specific rules are evaluated first.

**Guidelines for creating encryption rules**

Creating efficient, optimized encryption rules can reduce processing time for script validation.

**Overall guideline**: When rules get very long, do your best to minimize the number of blocks and break the rules apart whenever possible. Ideally, custom rules should apply to specific use cases, rather than encompassing several cases, with `if`s or switch statements in the action script.

1. Split rules whenever possible. For example,
   - Create different rules for different tables and ensure that each rule runs only on its respective table.
   - Create different rules for each record producer you are targeting, or at least for each subset of record producers. Instead of one rule targeting dozens of `sys_ids`, you could create several different rules targeting smaller subsets of record producers, or even create one rule per `sys_id`.

   **Note**: Creating multiple rules requires more maintenance. The trade-off is that multiple, simpler rules can be validated more efficiently than longer, more complex rules.

2. Minimize the number of blocks. Because the processing engine scans each block while evaluating scripts, a large number of blocks causes delays in validation. For example,
   - Replace all `if` blocks with an array lookup, and replace all blocks in the array lookup with just one `if` block.
   - Combine `if` blocks whenever it is possible to group them.

**Encryption rule APIs**

Encryption rules are written in JavaScript and utilize Edge Encryption APIs to locate and encrypt sensitive information in the body of a request. The API uses expressions similar to xPath to navigate through both JSON and XML content.

Edge Encryption APIs process the request off the stream as it is being written to the output stream. Stream parsing allows encryption rules to be network performant. However, fetching and parsing content from the body multiple...
times could lead to unexpected results. To account for this, requests should be processed by the action in a single pass.

When creating encryption rules, you cannot use Glide APIs, script includes, business rules, or any global parameters such as current. Because the rules are created for HTTP objects, a global request object is available.

When creating encryption rules, you cannot use APIs from the white list manager or scoped applications.

**Error handling**

If an encryption rule condition or action throws an exception, check the proxy log for troubleshooting information.

**Inspect the client request**

Before creating a custom encryption rule, you must determine the format of the client request entering the Edge Encryption proxy server.

Because encryption rules iterate over client requests and determine what, if anything, needs to be encrypted, you must understand the type of request you are creating a rule for. The format of the client request determines the structure of your encryption rule and the APIs available for use in the rule.

1. Inspect the client request.

   Depending on the source of the request, the following tools are available to inspect the request and determine the format.

<table>
<thead>
<tr>
<th>Source of request</th>
<th>Available tools</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client browser</td>
<td>Use the developer console in your browser to inspect the client request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>• Firefox Network Monitor</td>
</tr>
<tr>
<td></td>
<td>• Chrome Network Panel</td>
</tr>
<tr>
<td>Third-party/external source</td>
<td>Use an HTTP protocol analyzer to inspect the request. Useful tools include:</td>
</tr>
<tr>
<td></td>
<td>• Wireshark</td>
</tr>
<tr>
<td></td>
<td>• HTTP Scoop</td>
</tr>
<tr>
<td></td>
<td>Alternatively, you can often use documentation for the external source to determine the format of the request.</td>
</tr>
</tbody>
</table>

2. From the client request, inspect the packet and determine:

   • The client request method
   • The URL path of the request
   • The URL parameters
   • The POST parameters, if any
   • The format of the request body, if included
Inspecting the request provides an understanding of the fields you need to filter for and iterate over in your encryption rule. To understand the fields in the request object, see request.

Create an encryption rule

Encryption rules are used by the proxy to find content in HTTP requests that should be encrypted.

Role required: security_admin

Before creating an encryption rule, you must Inspect the client request to determine the format.

To create or edit encryption rules, you must be connected to the instance through an encryption proxy.

1. Navigate to Edge Encryption Configuration > Rules > Create New.
2. In the Name box, enter a name.
3. In the Request Type, select an HTTP method.
   - HTTP Post
   - HTTP Get
   - HTTP Put
   - HTTP Patch
   - HTTP Delete

   Note: Pre-Jakarta instances allow only HTTP Get and HTTP Post methods.

4. In the Condition box, enter a JavaScript statement defining when the rule should run.
5. In the Action box, enter a JavaScript function to be executed when the condition is true.
6. In the Order box, enter the relative priority of the rule.
7. Click Submit, or save the form.

Encryption rule conditions

Encryption rule conditions determine if the rule should be executed.

An encryption rule condition must return true if the rule is to handle the HTTP request; otherwise, it must return false.

As you build your condition, keep in mind that only one rule is executed per request. As a result, the condition must be as general or specific as needed to run under the intended circumstances.

Note: Be careful when performing checks on content in the condition. Excessive checks can be expensive for the proxy server and may cause increased latency when handling complex requests.

The condition can use the method type, content type, URL path, or any URL query string parameters to determine if the rule should handle the request. The condition has access to these fields via the request object. Be sure that, prior to
creating an encryption rule condition, you have inspected the client request and understand the conditions needed to trigger the rule.

**Note:** To build efficient rules, consider easy ways to rule out requests that you do not want to be evaluated by a rule. Build your condition to return false for those requests first. This method increases performance and quickly routes the request to the correct rule faster.

*Encryption rule objects and APIs* are available to encryption rule conditions.

**Example using path and postParams**

```javascript
/*This condition checks if the request coming in has a path ending in "/sample_processor.do" and if a post parameter exists in that request called myPostParam */

function SampleCondition(request) {
    if (endsWith(request.path, "/sample_processor.do") &&
        request.postParams.myPostParam) {
        return true;
    }
    return false;
}
```

**Example using urlParams and contentType**

```javascript
/* This condition checks if a url parameter exists in the query called myUrlParam and if the content type contains 'xml'
if so, you can expect the body to be an XML payload). Then, it checks if the xml payload contains myXmlTag */

function SampleCondition2(request) {
    if (request.urlParams.myUrlParam && request.contentType.indexOf('xml') > -1 && request.xmlContains('myXmlTag')) {
        return true;
    }
    return false;
}
```

**Encryption rule actions**

An encryption rule maps fields in a client request to fields in a table on your instance and identifies fields marked for encryption.

An encryption rule action only runs when the encryption rule condition returns true. An encryption rule identifies the data to be encrypted in your request payload. Because the rule iterates over the content in the request object, you must understand the form and structure of your request body and determine what in the request needs to be encrypted. The data to be encrypted might be located within:

- A **POST or URL parameter**.
- JSON or XML content within a **POST or URL parameter**.
- A **JSON** payload.
- An **XML** payload.

Before writing an encryption rule action, be sure to:

- **Inspect the client request**.
- Identify where the sensitive data is located in the request object.
- Determine the field and table name to insert data into, or understand how to dynamically pull this from the request.

Encryption rule objects and APIs are available to encryption rule actions and conditions.

**Encryption rule objects and APIs**

Use encryption rule APIs to parse and encrypt values in requests moving through the Edge Encryption proxy server to the instance.

The APIs available for your encryption rule depend on the format of the request object. For example, if the contentType parameter of the request object is XML, you can use the XML APIs to parse and encrypt values in the payload. After you determine the type of object in your request, you can build an encryption rule using the available APIs.

Encryption rule APIs are available in both encryption rule condition and action scripts.

*request*

The request object is a global object available in Edge Encryption rule action and condition scripts.

The request object is a JavaScript object that represents the client request coming in to the Edge Encryption proxy server. You must build your encryption rule to parse the request object, map request object values to fields in a table on the instance, and encrypt any sensitive data in the request object.

The request object includes the following attributes and data from the client request:

**Request object fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The path portion of the URL.</td>
</tr>
<tr>
<td>requestMethod</td>
<td>GET, POST, PUT, PATCH, DELETE.</td>
</tr>
<tr>
<td>contentType</td>
<td>The Content-Type header field.</td>
</tr>
<tr>
<td>urlParams</td>
<td>The parameters in the query string. This can also be evaluated to a String.</td>
</tr>
<tr>
<td>postParams</td>
<td>If this is a form post, this contains the post parameters.</td>
</tr>
</tbody>
</table>

request - getAsJsonContent()

Returns the request as an iterable object of type JsonNode.

This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Once the request is returned as a JsonNode object, you can use the JSON APIs to iterate over the object and encrypt fields.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
request - getAsXmlContent()
Returns the request content as an iterable object of type XMLContent.
This method is available only in an Edge Encryption rule if the request body is a valid XML payload. If you are not sure what format the request body includes, check the contentType field on the request object.
Once the request is returned as an XMLContent object, you can use the XML APIs to iterate over the object and encrypt fields.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

request - XMLContains(String path)
Returns true if the given path exists in the XML DOM.
This method is available only if the request body is a valid XML payload. If you are not sure what format the request body includes, check the contentType field on the request object.

Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>String</td>
<td>XPath statement you are searching for.</td>
</tr>
</tbody>
</table>

Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable object of type XMLContent.</td>
</tr>
</tbody>
</table>

POST and URL parameter APIs
POST and URL parameters can be accessed as properties of the request object using request.postParams and request.urlParams.

Any single parameter can be accessed as a property of the postParams and urlParams parent objects by calling request.postParams.myParam. Any parameter accessed this way is an object of the underlying class ParameterValue. Any APIs in this class can be called on any parameter.

After inspecting the client request, it may be necessary to access and encrypt parameter values from the request object. Depending on the data in the client request, you can encrypt values and map them to fields on the instance in multiple ways.
Encrypt the value of a known table and field

If you know the name of the instance table and field that will hold the encrypted data, you can explicitly define them in the encryption rule. For example, you may know that the request will be processed on the instance to create an incident and you want to encrypt the `text` parameter in the description field. In this case, you can create the following action.

```javascript
function SampleAction1() {
    request.postParams.text.valueFor('incident', 'description');
}
```

Encrypt the value of a dynamically defined table and field

If, conversely, you do not know the name of the field that the encrypted data will populate, you can dynamically define them using `tableName` and `fieldName`.

The below example processes a generic request that might store data in different task tables (such as incident, problem, and change_request) on the instance.

```javascript
function SampleAction2() {
    var tableName = request.urlParams.table;
    for (var parameter in request.postParams) {
        var currentParam = request.postParams[parameter];
        var fieldName = currentParam.toString();
        if (fieldName == 'text') {
            currentParam.valueFor(tableName, 'description');
        } else {
            currentParam.valueFor(tableName, fieldName);
        }
    }
}
```

This action:

- Gets the destination table from the URL parameters.
- Iterates over the URL parameters.
- Asks the Edge Encryption proxy server to encrypt any URL parameter with a name that matches a field marked for encryption.
- Looks for a specific parameter called `text` and asks the Edge Encryption proxy to encrypt the value based on the encryption configuration for the description field on the incident table.

In this example, the `valueFor()` method is not actually performing any encryption. Rather, the method asks the Edge Encryption proxy server to check whether the table/field pair in the request object is marked for encryption with an encryption configuration and, if applicable, encrypt it.

Encrypt JSON or XML within a parameter

A POST or URL parameter might include JSON or XML content. In this case, you can process the content within the parameter, iterate over the values, and encrypt required fields. In this example, the `tableName` is still accessed from a POST parameter, but the value of the field is the JSON object `data`.

```javascript
function SampleAction3() {
    var tableName = request.postParams.table;
    var data = request.postParams.data;
    var dataIterator = data.getAsJsonContent().iterator();
    ```
An example of an encryption rule action that processes XML within a POST parameter.

```javascript
function SampleAction4() {
    var tableName = request.postParams.table;
    var data = request.postParams.data;
    var dataIterator = data.getAsXmlContent().getIteratorOverAllChildren();
    while (dataIterator.hasNext()) {
        var jsonElement = dataIterator.next();
        var fieldName = jsonElement.getName();
        if (fieldName == 'text') {
            jsonElement.valueFor(tableName, 'description');
        } else {
            jsonElement.valueFor(tableName, fieldName);
        }
    }
}
```

Encrypt a query

You might encounter an encoded query within a parameter in the client request that contains sensitive data. To match a field in a query to an encrypted value in the instance database, you must create an encryption rule that asks the proxy to check whether a field in the query is marked for encryption. The `encodedQueryFor()` method parses an encoded query on a given table, and checks if any fields in the query have encryption configurations.

In this example, the rule iterates over the parameters looking for the `filter` parameter, which is expected to be a Glide encoded query.

```javascript
function SampleAction5() {
    var tableName = request.urlParams.table;
    for (var parameter in request.postParams) {
        var currentParam = request.postParams[parameter];
        var fieldName = currentParam.toString();
        if (fieldName == 'filter') {
            currentParam.encodedQueryFor(tableName);  
        } else {
            currentParam.valueFor(tableName, fieldName);
        }
    }
}
```

For example, if the value of `filter` is: `short_description=My sensitive information^number=INC000056^category=Outage`, the query would become `short_description=<Encrypted(My sensitive information)>^number=INC000056^category=Outage` on the instance.

ParameterValue - `toString()`

Converts the POST or URL parameter value to a string.
### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The parameter value as a string.</td>
</tr>
</tbody>
</table>

ParameterValue - getAsJsonContent()

Returns the request as an iterable object of type `JsonNode`.

This method is available only in an Edge Encryption rule if the request body is a valid JSON payload. If you are not sure what format the request body includes, check the `contentType` field on the `request` object.

Once the request is returned as a `JsonNode` object, you can use the `JSON APIs` to iterate over the object and encrypt fields.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The request as an iterable <code>JsonNode</code>.</td>
</tr>
</tbody>
</table>

ParameterValue - getAsXmlContent()

Returns the request content as an iterable object of type `XMLContent`.

This method is available only in an Edge Encryption rule. This method assumes that the request body is a valid XML payload. You can check the `contentType` to make sure.

Once the request is returned as an `XMLContent` object, you can use the `XML APIs` to iterate over the object and encrypt fields.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLContent</td>
<td>The request as an iterable <code>XMLContent</code>.</td>
</tr>
</tbody>
</table>

ParameterValue - encodedQueryFor(String tableName)
Specifies that the value of the element is an encoded query on the specified table.

Calling this function on a parameter tells the proxy that the value of the parameter is an encoded query for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

ParameterValue - valueFor(String tableName, String fieldName)

Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

**XML APIs**

XML APIs can be used after calling getAsXmlContent() on either the request object or a ParameterValue property.

When using XML APIs to write your encryption rule, you can follow a general format:

1. Call getAsXmlContent() on the request object or ParameterValue property. This returns an iterable object of the XMLContent underlying class.
2. Call getIterator() or getIterator(String xPath) on the XMLContent object. This returns an XMLElementIterator object that can be used to iterate over XML elements.
3. Call the hasNext() method on the XMLElementIterator object to determine whether another element is available.
4. Call next() on the XMLElementIterator object to return the next XML element. You cannot call next() without first calling hasNext().
5. Call `valueFor(String tableName, String fieldName)` on the XML element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted.

**Note:** To determine if you want to call `valueFor(String tableName, String fieldName)` on an XML element, you can use the `getName()` method to return the name of the element.

### Mapping to a known table-field on the instance

In this example, the XML payload will be processed on the instance to insert records in the incident table. The description field will populate `short_description` on the incident.

```
<data>
  <record>
    <name>'Test Record 1'</name>
    <description>'Test Record 1 Description'</description>
    <tag>critical</tag>
  </record>
  <record>
    <name>'Test Record 2'</name>
    <description>'Test Record 2 Description'</description>
    <tag>security</tag>
  </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction1() {
  var xmlContent = request.getAsXmlContent();
  // This loop iterates over all description tags that match the given path
  var xmlElementIterator = xmlContent.getIterator('data/record/description');
  while (xmlElementIterator.hasNext()) {
    var xmlElement = xmlElementIterator.next();
    xmlElement.valueFor('incident', 'short_description');
  }
}
```

This action iterates through the **description** tags and asks the proxy server to encrypt the values and insert them into `incident.short_description` on the instance.

**Note:** This rule finds all `description` tags within all `record` tags in the XML payload. If there is only one occurrence of a tag to encrypt, the rule still uses the XPath and iterator structure. However, it iterates only once in the loop.

### Mapping to an unknown table-field on the instance

In this example, the rule iterates over the `record` tags, but does not know what tags to expect within the `record` tag. The only known is that the tags within the `record` tags match the names of the columns specified in the table URL parameter.
The rule also specifies that, if the table is incident, then the data in the **description** tag should be encrypted and stored in the short_description field on the instance.

```javascript
function sampleXmlAction2() {
    var xmlContent = request.getAsXmlContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var xmlElementIterator = xmlContent.getIterator('data/record');
    while (xmlElementIterator.hasNext()) {
        encryptFieldsInRecord(xmlElementIterator.next());
    }
}

function encryptFieldsInRecord(xmlElement) {
    // Then, iterate over all tags representing fields in the table
    var fieldIterator = xmlElement.getIteratorOverAllChildren();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldName = childElement.getName();
        // if table is incident, then description is encrypted for the short_description field
        if (tableName == 'incident' && fieldName == 'description') {
            field.valueFor(tableName, 'short_description');
        } else {
            // if table is not incident, ask the proxy to check if the given field is encrypted for the given table
            field.valueFor(tableName, fieldName);
        }
    }
}
```

In the `encryptFieldsInRecord()` function, the `valueFor()` method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the tag does not match a field in the table, the proxy skips that tag. If the tag matches a field marked for encryption, then the Edge Encryption proxy server encodes the value.

### Using an encoded query

In this example, all tags have the `filter` attribute, which indicates whether the tag contains an encoded query.

```xml
<data>
    <record>
        <name filter="false">'Test Record 1'</name>
        <description filter="false">'Test Record 1 Description'</description>
        <query filter="true">category=1^name=edge</query>
    </record>
    <record>
        <name filter="false">'Test Record 2'</name>
        <description filter="false">'Test Record 2 Description'</description>
        <query filter="true">category=2^severity=3</query>
    </record>
</data>
```

The following encryption rule action can apply:

```javascript
function sampleXmlAction3() {
    var xmlContent = request.getAsXmlContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var xmlElementIterator = xmlContent.getIterator('data/record');
    while (xmlElementIterator.hasNext()) {
        encryptFieldsInRecord(xmlElementIterator.next());
    }
}
```
// This first iterator will iterate over all record elements
var xmlElementIterator = xmlContent.getIterator('data/record');
while (xmlElementIterator.hasNext()) {
    encryptFieldsInRecord(xmlElementIterator.next());
}
}
function encryptFieldsInRecord(xmlElement) {
    // this time we want to iterate over all tags representing fields in the table
    var fieldIterator = xmlElement.getIteratorOverAllChildren();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldname = childElement.getName();
        // let's look at the filter attribute, if true, then encrypt as encoded query
        if (field.getAttributeValue('filter') == 'true') {
            field.encodedQueryFor(tableName);
        } else {
            // if it is false then check if the field should be encrypted
            field.valueFor(tableName, fieldName);
        }
    }
}

If the filter attribute value is true, the rule asks the proxy server to encrypt the values in the encoded query. If false, the rule asks the proxy to check whether the field should be encrypted.

XMLContent
A global object that provides methods to iterate over the XML content.
You can access an XMLContent object by calling getAsXmlContent() on a request object.
You access XML data in a POST or URL parameter by calling request.postParams.<parameter name>.getAsXmlContent() or request.urlParams.<parameter name>.getAsXmlContent().

XMLContent - getIterator()
Returns an XMLElementIterator object for the XML content.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

XMLContent - getIterator(String xPath)
Returns an XMLElementIterator object for the XML content based on the specified parameter.
## Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath-like expression that specifies where in the XMLContent object to start.</td>
</tr>
</tbody>
</table>

## Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElementIterator</td>
<td>An object that can be used to iterate over elements in the XMLContent object.</td>
</tr>
</tbody>
</table>

### XMLElementIterator

Provides methods for iterating over XML elements.

You get an `XMLElementIterator` object by calling the `getIterator()` method of the `XMLContent` class.

### XMLElementIterator - hasNext()

Determines if there is another element available.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another element is available.</td>
</tr>
</tbody>
</table>

### XMLElementIterator - next()

Returns the next element in the iterator.

You cannot call `next()` without first calling `hasNext()`.

#### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLElement</td>
<td>The next XML element.</td>
</tr>
</tbody>
</table>

### XMLElement

Provides methods for iterating through XML elements and mapping values to fields in a table.
You get an XMLElement object by calling the `next()` method of an XMLElementIterator object.

**XMLElement - getIterator(String xPath)**

Returns an XMLElementIterator object for the XML element based on the specified parameter.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>xPath</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>XMLElementIterator</td>
</tr>
</tbody>
</table>

**XMLElement - getIteratorOverAllChildren()**

Returns an XMLElementIterator object that includes all sub-elements for the XML element based on the specified parameter.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>None</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>XMLElementIterator</td>
</tr>
</tbody>
</table>

**XMLElement - valueFor(String tableName, String fieldName)**

Specifies that the value of the element maps to the specified field in the specified table.

Calling this method on an element value tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks if the field must be encrypted. If the table and field names are unknown, you can call the `valueFor()` method on a table and a field that are dynamically assigned based on the request.

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>tableName</td>
</tr>
<tr>
<td>fieldName</td>
</tr>
</tbody>
</table>
XMLElement - encodedQueryFor(String tableName)

Specifies that the value of the element is an encoded query for the specified table.

Calling this function on an element tells the proxy that the value of the element is an *encoded query* for the specified table. The proxy parses the encoded query and encrypts the fields in the encoded query that must be encrypted.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

XMLElement - getName()

Returns the element name.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The element name.</td>
</tr>
</tbody>
</table>

XMLElement - getAttributeValue(String attribute)

Returns the value of the specified attribute.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>String</td>
<td>Attribute name.</td>
</tr>
</tbody>
</table>
Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The attribute value.</td>
</tr>
</tbody>
</table>

**JSON APIs**

JSON APIs can be used after calling `getAsJsonContent()` on either the request object or a `ParameterValue` property.

When using JSON APIs to write your encryption rule, you can follow a general format:

1. Call `getAsJsonContent()` on the request object. This returns an iterable object of the `JsonNode` underlying class.
2. Call `getIterator()` or `getIterator(String xPath)` on the `JsonNode` object. This returns a `JsonNodeIterator` object that can be used to iterate over nodes in the JSON object.
3. Call the `hasNext()` method on the `JsonNodeIterator` object to determine whether another element is available.
4. Call `next()` on the `JsonNodeIterator` object to return the next JSON element. You cannot call `next()` without first calling `hasNext()`.
5. Call `valueFor(String tableName, String fieldName)` on the JSON element. This method tells the proxy that the value for this element maps to the specified field in the specified table. The proxy then checks whether the field must be encrypted.

**Note:** To determine if you want to call `valueFor(String tableName, String fieldName)` on a JSON element, you can use the `getName()` method to return the name of the element.

**Mapping to a known table-field on the instance**

In this example, the JSON payload is processed on the instance to insert records in the incident table. The description field populates short_description on the incident.

```json

{  
  data: {  
    records: [  
      {  
        "name": "Test Record 1",  
        "description": "Test Record 1 Description",  
        "tag": "security"  
      },  
      {  
        "name": "Test Record 1",  
        "description": "Test Record 1 Description",  
        "tag": "security"  
      }  
    ],  
    "query":  
      "assigned_to=3D4860165813e63a00d00abd322244b092^category=vulnerability"  
  },  
  "source": "10.11.13.14"  
}

```
The following rule can apply:

```javascript
function sampleJsonAction1() {
    var jsonContent = request.getAsJsonContent();
    // This loop iterates over all description elements in the records array
    var jsonNodeIterator = jsonContent.getIterator('/data/records/description');
    while (jsonNodeIterator.hasNext()) {
        var jsonNode = jsonNodeIterator.next();
        jsonNode.valueFor('incident', 'short_description');
    }
}
```

This action iterates through the `description` nodes and asks the proxy server to encrypt the values and insert them into `incident.short_description` on the instance.

**Note:** This rule finds all `description` nodes within the JSON payload. If there is only one occurrence of a node to encrypt, the rule still uses the XPath and iterator structure. However, it iterates only once in the loop.

### Mapping to an unknown table-field on the instance

In this example, the rule iterates over `records`, but is not sure what nodes to expect. The only known is that for each object within `records`, the nodes match the names of the columns specified in the table URL parameter.

The rule also specifies that, if the table is `incident`, then the data in the `description` node should be encrypted and stored in the `short_description` field on the instance.

```javascript
function sampleJsonAction2() {
    var jsonContent = request.getAsJsonContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var jsonNodeIterator = jsonContent.getIterator('data/records');
    while (jsonNodeIterator.hasNext()) {
        encryptFieldsInRecord(jsonNodeIterator.next());
    }
}
```

```javascript
function encryptFieldsInRecord(jsonNode) {
    // this time we want to iterate over all nodes
    var fieldIterator = jsonNode.iterator();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldName = childElement.getName();
        if (fieldName == 'description') {
            field.valueFor(tableName, 'short_description');
        } else {
            field.valueFor(tableName, fieldName);
        }
    }
}
```

In the `encryptFieldsInRecord()` function, the `valueFor()` method is called on a table and a field that are dynamically assigned based on the request. Even though the table and field names can change, the rule asks the proxy to check whether the field in the table must be encrypted based on the encryption configurations defined.

If the field is not configured for encryption, or if the node name does not match a field in the table, the proxy skips that node. If the node name matches a field marked for encryption, then the proxy encrypts the value.
Using an encoded query

```javascript
function sampleJsonAction3() {
    var jsonContent = request.getAsJsonContent();
    var tableName = request.urlParam.table;
    // This first iterator will iterate over all record elements
    var jsonNodeIterator = jsonContent.getIterator('data');
    while (jsonNodeIterator.hasNext()) {
        var jsonNode = jsonNodeIterator.next();
        if (jsonNode.getName() == 'records')
            encryptRecords(jsonNodeIterator.next());
        else if (jsonNode.getName() == 'query')
            jsonNode.encodedQueryFor(tableName);
    }
}
function encryptRecords(jsonNode) {
    // we iterate over all fields in the node
    var recordIterator = jsonNode.iterator();
    while (recordIterator.hasNext()) {
        encryptFieldsInRecord(recordIterator.next());
    }
}
function encryptFieldsInRecord(jsonNode) {
    // this time we want to iterate over all nodes
    var fieldIterator = jsonNode.iterator();
    while (fieldIterator.hasNext()) {
        var field = fieldIterator.next();
        var fieldName = childElement.getName();
        field.valueFor(tableName, fieldName);
    }
}
```

In this example, the rule iterates over `data`. As it finds `records`, it performs the same logic as in the second example, iterating over fields in each node. When it finds the `query` node, it calls `encodedQueryFor()` to encrypt values that should be encrypted in the query.

**JsonNode**

A global object that provides methods to iterate over the JSON content.

You can access a `JsonNode` object by calling `getAsJsonContent()` on a `request` object.

You access JSON content from a `POST` or `URL` parameter by calling `request.postParms.<parameter name>.getAsJsonContent()` or `request.urlParms.<parameter name>.getAsJsonContent()`.

**JsonNode - getIterator(String xPath)**

Returns a `JsonNodeIterator` object for the JSON content.

This method can only be used on the root node, but can be used to traverse deep into the JSON object. Subsequent traversals must use the `iterator()` method.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xPath</td>
<td>String</td>
<td>An xPath expression.</td>
</tr>
</tbody>
</table>
### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

#### JsonNode - iterator()

Returns a **JsonNodeIterator** object that iterates over all child nodes of the current node.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNodeIterator</td>
<td>An object that can iterate over nodes in the JSON object.</td>
</tr>
</tbody>
</table>

#### JsonNode - getAsString()

Returns the current node value as a string.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The current node value.</td>
</tr>
</tbody>
</table>

#### JsonNode - getAsString(String propertyName)

Returns the string value of the specified property.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propertyName</td>
<td>String</td>
<td>Name of the property.</td>
</tr>
</tbody>
</table>

**Returns**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>The property value.</td>
</tr>
</tbody>
</table>

#### JsonNode - getName()
Returns the name of the current JSON node.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Name of the current JSON node.</td>
</tr>
</tbody>
</table>

JsonNode - `valueFor(String tableName, String fieldName)`

Specifies that the JSON property maps to the specified field in the specified table.

Calling this method on a JSON property tells the proxy that the value for this property maps to the specified field in the specified table. The proxy then decides if the field must be encrypted. If the table and field names are unknown, you can call the `valueFor()` method on a table and a field that are dynamically assigned based on the request.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table name.</td>
</tr>
<tr>
<td>fieldName</td>
<td>String</td>
<td>The field name.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>

JsonNode - `encodedQueryFor(String tableName)`

Specifies that the value of the JSON property is an encoded query for the specified table.

Calling this function on a JSON node tells the proxy that the value is an encoded query for the specified table. The proxy parses the encoded query and encrypts the values for fields in the encoded query that must be encrypted.

**Parameters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table that you expect the query to run on.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
JsonNodeIterator

You get a JsonNodeIterator object by calling the getIterator() or iterator() methods of the JsonNode class.

JsonNodeIterator - hasNext()

Determines if there is another property available.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean</td>
<td>True if another property is available.</td>
</tr>
</tbody>
</table>

JsonNodeIterator - next()

Returns the next property in the iterator.

You cannot call next() without first calling hasNext().

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JsonNode</td>
<td>The next JsonNode.</td>
</tr>
</tbody>
</table>

**print(String message)**

Prints a message to the wrapper log file: `<proxy server directory>/logs/wrapper_<date>.log`.

This method is available only in an Edge Encryption rule action script.

### Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>String</td>
<td>The message to be written to the wrapper log file.</td>
</tr>
</tbody>
</table>

### Returns

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void</td>
<td></td>
</tr>
</tbody>
</table>
Prohibited keywords

The Edge Encryption proxy validates encryption rule scripts before saving the rule. Many JavaScript keywords are not allowed in encryption rule scripts.

<table>
<thead>
<tr>
<th>Keyword</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DIR</strong></td>
</tr>
<tr>
<td><strong>FILE</strong></td>
</tr>
<tr>
<td><strong>LINE</strong></td>
</tr>
<tr>
<td><strong>parent</strong></td>
</tr>
<tr>
<td><strong>proto</strong></td>
</tr>
<tr>
<td>Error</td>
</tr>
<tr>
<td>eval</td>
</tr>
<tr>
<td>getClass</td>
</tr>
<tr>
<td>getPrototypeOf</td>
</tr>
<tr>
<td>Java</td>
</tr>
<tr>
<td>javax</td>
</tr>
<tr>
<td>javafx</td>
</tr>
<tr>
<td>JavaImporter</td>
</tr>
<tr>
<td>load</td>
</tr>
<tr>
<td>loadWithNewGlobal</td>
</tr>
<tr>
<td>new</td>
</tr>
<tr>
<td>Packages</td>
</tr>
<tr>
<td>Object</td>
</tr>
<tr>
<td>prototype</td>
</tr>
<tr>
<td>RegExp</td>
</tr>
<tr>
<td>setPrototypeOf</td>
</tr>
<tr>
<td>this</td>
</tr>
<tr>
<td>throw</td>
</tr>
</tbody>
</table>

Edge Encryption dictionary attributes

You can add Edge Encryption dictionary attributes to tables and fields.

To set an Edge Encryption dictionary attribute to true, you must enter attribute=true in the Attributes field. To add a dictionary attribute to a record, see Dictionary attributes.

Edge Encryption Excluded [edge_encryption_excluded]

When set to true, the field or table cannot be encrypted.

- Value: true/false
• Target element: field or table
• Default value: false

**Edge Encryption Enabled [edge_encryption_enabled]**

When set to true, the field is eligible for encryption through an encryption configuration. Because this attribute is used by the system and cannot be modified, it is not always displayed to the user.

**Note:** This attribute does not indicate that a field is encrypted, nor does it trigger any encryption logic on the field. Rather, the attribute determines the possibility of the field being encrypted by a user.

• Value: true/false
• Target element: field
• Default value: true for String fields

**Edge Encryption Clear Text Allowed [edge_encryption_clear_text_allowed]**

When set to true, allows server-side scripts to append non-encrypted data to an encrypted string within the field for user actions performed through the proxy server, or any server-side automated scripts, such as scheduled jobs.

• Value: true/false
• Target element: field
• Default value: false

**Domain separation in Edge Encryption**

Edge Encryption provides the ability to encrypt data from within the customer's environment through the use of specific configurations, rules, and keys defined on the Edge Encryption proxy. The Edge Encryption proxy is not domain aware and cannot support domain-specific settings. With domain separation you can separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: No support**

• The domain field may exist on data tables, but there is no business logic to manage data.
• This level is not considered domain-separated.

For more information, see [Application support for domain separation](#).

**How domain separation works in Edge Encryption**

Edge Encryption can be used where domain-specific keys, configurations, and rules are not required.

**Data integration with Edge Encryption**

To integrate third-party data with an instance using Edge Encryption, you must route the data through the Edge Encryption proxy server using supported integrations. Supported integrations use base system encryption rules that map data in each payload to fields in a table.
Upload data to fields marked for encryption

Edge Encryption does not support importing data from or exporting data to Excel, CSV, XML, or other file types to or from fields with encryption configurations defined.

**ODBC driver**

Encrypt requests and query data through the Edge Encryption proxy server using the ODBC driver.

Learn more: *Edge Encryption ODBC driver integration*

**MID Server**

You can configure the MID Server to route data through an Edge Encryption proxy server. However, some restrictions apply.

Learn more: *Edge Encryption MID Server integration*

**REST/SOAP web services**

Use REST/SOAP web services to update or retrieve record data through the Edge Encryption proxy server.

Learn more: *Web services*

**JSONv2 web service**

Use JSONv2 web service APIs to update or retrieve record data through the Edge Encryption proxy server. Base system encryption rules support data retrieval and data modification APIs.

- To insert a single record using the data modification API, use the `insert()` or `insertMultiple()` methods.
- To insert multiple records using the data modification API, use the `insertMultiple()` method.

Learn more: *JSONv2 Web Service*

To encrypt data from custom third-party integrations not listed above, create custom encryption rules. See *Define a custom encryption rule*.

Upload attachments to records marked for encryption

Attachments can be uploaded to tables with attachment encryption configured using REST and SOAP web services.

**Edge Encryption ODBC driver integration**

Configure your ODBC driver to query data encrypted by Edge Encryption. The Edge Encryption proxy server encrypts ODBC driver requests to the ServiceNow instance when Edge Encryption is integrated with the ODBC driver.

Encrypted responses from the instance are decrypted through the Edge Encryption proxy server before passing to the ODBC driver in your network.
For a successful integration, the ODBC driver must trust the Edge Encryption proxy server certificate. If the Edge Encryption proxy server certificate is signed by a Certificate Authority trusted by the ODBC driver, the Edge Encryption proxy server is automatically trusted. However, if a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import the self-signed certificate to the ODBC truststore.
Import a self-signed certificate to the ODBC truststore

If a Certificate Authority trusted by the ODBC driver has not signed the Edge Encryption proxy server certificate, you must import a self-signed certificate to the ODBC truststore. You can export the certificate from the Edge Encryption proxy server and import it into the ODBC truststore.

To determine whether a Certificate Authority trusted by the ODBC driver has signed the Edge Encryption proxy server certificate, run the following command in the keystore directory in the proxy home directory to view a list of Certificate Authorities trusted by the ODBC driver:

```
keytool -keystore "<ODBC directory>\ip\Java\jre\lib\security\cacerts" -list
```

1. Change to the keystore directory in the proxy home directory.
2. Check the keystore for the self-signed certificate.
   a) To check the keystore for the certificate, you can run the following command to list all the items in the keystore.

```
keytool -list -keystore keystore.jceks -storetype jceks -v
```

   b) Locate the key alias in the list of items.

3. Using the key alias, export the certificate to a .cer file.

```
keytool -export -alias <key alias> -keystore keystore.jceks -storetype jceks -rfc -file <file name>.cer
```

4. Change to your ODBC truststore directory: ODBC\ip\Java\jre\lib\security\cacerts.
5. Import the certificate to your ODBC truststore.

```
keytool -keystore cacerts -importcert -alias $<key alias> -file <file name>.cer
```

Set the ODBC driver properties

Set the ODBC driver properties to route requests through the Edge Encryption proxy server.

1. In Windows, navigate to Start > Programs > ServiceNow ODBC Management Console.
2. Expand the console tree root to: ServiceNow ODBC Manager\Manager\<installation location>\Services\ServiceNow_ODBC\Data Source Settings\ServiceNow\IP Parameters.
3. Double-click the DataSourceIPProperties attribute.
4. Change the Value to the URL of your Edge Encryption proxy server, such as https://<IP address>::<port>
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DataSourceIPType</td>
<td>String</td>
<td>DAMP</td>
</tr>
<tr>
<td>DataSourceIPSchemaPath</td>
<td>String</td>
<td>C:\Program Files\ServiceNow\ODBC\sql\seed\ServiceNow schema.sql</td>
</tr>
</tbody>
</table>
5. Click OK.

The ODBC driver is now configured to route requests to the instance through the Edge Encryption proxy server.

Edge Encryption MID Server integration

Configure the MID Server to route data through an Edge Encryption proxy server.

When integrated with the MID Server, the Edge Encryption proxy server acts as the MID Server's endpoint. The Edge Encryption proxy server then encrypts and decrypts data passing between the ServiceNow instance and the MID Server.

Limitations when integrating with the MID Server

When MID Server data is configured to pass through the Edge Encryption proxy server, the following limitations apply:

- Encryption of ECC Queue fields is not supported.
- Encrypted data cannot be used with Discovery or Service Mapping.

Point the MID Server to the Edge Encryption proxy server

To pass data from the MID Server through the Edge Encryption proxy server, update the MID Server configuration file to point the MID Server to the Edge Encryption proxy server.

When configuring the MID Server to pass through the Edge Encryption proxy server, you cannot use the web proxy properties in the MID Server configuration file to route traffic through the Edge Encryption proxy server to your instance. Instead, you must set the Edge Encryption proxy server as the MID Server's endpoint.

1. Navigate to your local MID Server directory and open the config.xml file.

2. Find the element `<parameter name="url" value="https://YOUR_INSTANCE.service-now.com" />` and change the value property to the URL of your Edge Encryption proxy server. For example, http://hostname.mycompany.com:8081.

   This step directs the MID Server to pass traffic to the Edge Encryption proxy server instead of the instance. The Edge Encryption proxy server in turn encrypts any necessary fields and passes the payload to the instance.

3. Save and close the file.

4. If running, restart the MID Server.

Edge Encryption diagnostics and performance

Monitor Edge Encryption proxy server performance trends and drill into errors generated by the Edge Encryption proxy server.

Edge proxy performance

View key Edge Encryption proxy server performance trends using the Edge Proxy graph set on the ServiceNow Performance homepage. Monitored trends include:

- Maximum and average response times between the client, proxy server, and instance.
- CPU, disk space, and memory usage of the host machine.
- Maximum and average network latency between the proxy server and the ServiceNow instance.
Note: Edge Encryption proxy servers with duplicate names do not report performance trends.
Maximum and average time in milliseconds to process a request. These data points are general trends over time.

- **Total Time**: Time for the proxy server to receive a request from a client and send a response. This data point is the sum of the subsequent data points.
- **Proxy Response**: Time for the proxy server to process a response from the instance.
- **Proxy-Instance Round Trip**: Time for the proxy server to send a request to the instance and receive a response. Includes network latency between the proxy server and the instance and time spent by the instance to process the request.
- **Rules**: Time for the proxy server to evaluate a request using defined encryption rules.
- **Proxy Request**: Time for the proxy server to process a client request and forward it to the instance.

**Edge Proxy Performance (Max and Average)**

Maximum and average percentage of resources used on the host machine.

- CPU Usage
- Memory Usage
- Disk Usage

**Edge Proxy Latency**

Maximum and average network latency in milliseconds at a given point in time. Latency is determined by round-trip time for a proxy server to send a simple ping to the instance and receive a response.

**Proxy Error Reports**

Navigate to [Edge Encryption Configuration > Diagnostics and Troubleshooting > Proxy Error Reports](#) to view all proxy server errors collected over the past seven days.
Errors are collected over a one-minute period. Each minute, an error report is generated. The vertical axis displays the number of error reports over the last seven days that include each error. For example, even if the DEFAULT_ERROR_CODE error is thrown multiple times over a one-minute report period, the DEFAULT_ERROR_CODE bar will only reach one on the **Number of Error Reports** axis.

From this view, you can:

- Click each proxy error code bar to see the report on a single error for each proxy server. From this view, you can click the bar again to view the error text in the Edge Encryption Proxy Stat table [edge_encryption_stat]. Follow links in the error text to see more information and possible remediation steps.
- Click **Other** to see page two of the error report.

**Note:** If you have more than one proxy server with the same name, a single DUPLICATE_PROXY_NAME error appears in the Proxy Error Report. No other errors are reported for proxy servers with duplicate names. If you encounter this error, make sure that all proxy servers have unique names.

### Additional monitoring resources

The instance tracks all encryption proxies. Each Edge Encryption proxy server registers when it starts up. The instance is notified when:

- A new Edge Encryption proxy server starts up.
- An Edge Encryption proxy server is intentionally shut down.

If an Edge Encryption proxy server attempts to register with an instance that does not have Edge Encryption installed, the proxy does not start.
All encryption configuration files are audited. Deleted records are audited on all encryption configuration files. Audit records are put in the sys_audit table. To view the history of a specific configuration record, view the record, and click History > List in the menu. The Mass Encryption Job is not audited.

Use the following additional resources to monitor your proxy servers.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invalid Insert Attempts</td>
<td>List of attempts to save the following data to encrypted fields:</td>
</tr>
<tr>
<td>[sys_edge_encryption_invalid_insert_log]</td>
<td>• Unencrypted data.</td>
</tr>
<tr>
<td></td>
<td>• Data that did not come from an Edge Encryption proxy.</td>
</tr>
<tr>
<td></td>
<td>The instance rejects and then logs any attempts to save this data. If you have</td>
</tr>
<tr>
<td></td>
<td>the security-admin role, you can view the logs in the Invalid Insert Attempts</td>
</tr>
<tr>
<td></td>
<td>list.</td>
</tr>
<tr>
<td>Job Failures</td>
<td>A list of jobs that did not execute successfully.</td>
</tr>
<tr>
<td>[sys_encryption_job_execution]</td>
<td></td>
</tr>
<tr>
<td>System logs</td>
<td>The instance periodically checks for messages from each registered proxy</td>
</tr>
<tr>
<td></td>
<td>server. If a proxy server has not sent a message in the required time frame,</td>
</tr>
<tr>
<td></td>
<td>an error is logged. The log message contains information about the encryption</td>
</tr>
<tr>
<td></td>
<td>proxy and the last time the proxy pinged the instance. If the instance</td>
</tr>
<tr>
<td></td>
<td>determines that none of the encryption proxies are online, it logs a message.</td>
</tr>
<tr>
<td></td>
<td>These messages are added to the system log.</td>
</tr>
</tbody>
</table>

**Disable or reduce Edge Proxy statistic collection**

Prevent the Edge Encryption proxy server from sending Edge Proxy Graph Set statistics to the ServiceNow Performance homepage, or reduce the frequency of statistic collection.

Role required: admin or security_admin

By adding properties in the edgeencryption.properties configuration file, you can:

- Disable the Edge Proxy graph set.
- Change the interval during which statistics are collected by the Edge Encryption proxy server. By default, statistics are collected every 30 seconds.

1. In your proxy server installation directory, open the edgeencryption.properties configuration file located in the <installation_directory>/conf/ folder.
2. Add one of the Edge Encryption proxy server properties.
3. Restart the proxy server.

**Flow Designer**

Flow Designer is a Now Platform® feature for automating processes in a single design environment. Flow Designer lets process owners use natural language to automate approvals, tasks, notifications, and record operations without coding.

You can expand Flow Designer to communicate with external instances and third-party systems by requesting a separate subscription to IntegrationHub.

Watch this seven-minute video to learn how to create and test a flow in Flow Designer.

For developer training, see Using Flow Designer on the ServiceNow® Developer Site.
Benefits

Flow Designer provides process owners and developers these benefits.

- Consolidates multiple Now Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes from a single interface. Includes flows and actions triggered by ServiceNow® Service Catalog events. See Create a flow with a Service Catalog trigger.
- Consolidates configuration and runtime information into a single environment so process owners and developers can create, operate, and troubleshoot flows from a single interface.
- Provides natural-language-descriptions of flow logic to help non-technical users understand triggers, actions, inputs, and outputs.
- Promotes process automation by enabling subject matter experts to develop and share reusable actions with flow designers.
- Reduces upgrade costs, with upgrade-safe Now Platform logic replacing complex custom script.
- Reduces development costs by providing a library of reusable actions.
- Enables extending Flow Designer content by subscribing to ServiceNow IntegrationHub or installing spokes.

Interactions with existing automation processes

While learning Flow Designer, make sure that you understand how existing Now Platform automation processes such as business rules and workflows change records to avoid creating conflicting logic. See the Architecture Overview to understand how Flow Designer works within the Now Platform. Avoid duplicating existing business logic from business rules and workflows. If you're replacing an existing automation process, you may need to deactivate it before replacing it with Flow Designer flows and actions.

Flow Designer content

Flow Designer consists of the following content types.

Flows

A flow is an automated process consisting of a sequence of actions and a trigger. Flows automate business logic for a particular application or process. For example, the VTB Sample Flow creates and assigns a VTB card whenever a priority 1 incident is created. Flows require some familiarity with the Now Platform tables and fields that the application or process uses. Process analysts can create flows using available actions or copy an existing flow to use it as a template. You can add application-specific flows by activating the associated spoke.

Subflows

A subflow is an automated process consisting of a sequence of reusable actions and specific data inputs that allow the process to be started from a flow, subflow, or script. Subflows automate generic business logic that can be applied to multiple applications or processes. For example, you could create a subflow to notify users of record changes. Subflows require some familiarity with the Now Platform tables and fields that the application or process uses. Process analysts can create subflows using available actions or use an existing flow as a template.

Actions

An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. ServiceNow core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to preset configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.
Core actions

A ServiceNow core action is a ServiceNow-provided action available to any flow that cannot be viewed or edited from the Action Designer design environment. For example, the Ask for Approval action is a ServiceNow core action that allows process analysts to use Now Platform approvals. Flow Designer provides a set of ServiceNow core actions to automate Now Platform processes. You can add application-specific ServiceNow core actions by activating the associated spoke.

Action steps

An action step or step is a single reusable operation within an action. For example, the Create Record step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of ServiceNow core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

Spokes

A spoke is a scoped application containing Flow Designer content dedicated to a particular application or record type. For example, the ITSM Spoke contains actions for managing Task records such as the Create Task action. Spokes are activated when their parent application is activated. For example, the ITSM Spoke is activated when the Incident, Problem, and Change applications are activated. Creating a spoke requires familiarity with application development because developers must add Flow Designer content to a scoped application. See Spokes for a list of available spokes.

Consolidated design and operation environment

The design environment consists of these components.

Landing page
Access or create actions, flows, subflows, or their execution details.

Flow Designer
Create and edit flows by defining a trigger and adding actions. Test flows to see if they complete successfully and to review the runtime values they generate. Activate flows to make them available for execution on your instance and to preserve their current actions, inputs, and sequence as a snapshot separate from further configuration changes.

Action Designer
Create and edit actions by defining inputs and adding action steps. Test actions to verify if they complete successfully and review the runtime values they generate. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

Flow and action execution details
View runtime information about an action or flow directly from the design environment such as the current state, actions or steps run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

Operations dashboard
Identify and troubleshoot potential issues by reviewing action and flow executions, their result state, and their runtime duration.

Getting started with flows
Create a sample flow with a trigger and base system actions that requires an approval.
Role required: admin

**Note:** While Flow Designer is designed to use the flow_designer and delegated_developer roles in most scenarios, this tutorial uses the admin role to illustrate functionality without requiring additional roles to set up records and approve requests.

The ITSM application is required to access the Task table.

Watch this 11-minute video for an introduction to using the flow designer.

A flow can include these components:

- **Trigger:** An activity that initiates the flow, such as a record created in a specified table or a scheduled job.
- **Conditions:** Statements that determine when or how an action runs. For example, run an action only if a field is over a certain value.
- **Actions:** Operations executed by the system, such as a field value updated, approval requested, or a value logged.

To understand basic flows, create an expense approval flow. This flow:

1. Runs when an Expenses record is created.
2. Uses the total amount to determine which action to run.
3. Approves the request if it is under the specified dollar amount.
4. Requires manager approval if it is over a specified dollar amount. Another approver can be manually added.

1. Create a custom application for the flow. Creating flows and actions within an application enables you to publish flows and actions to an application repository and deploy them on other instances. While this example does not use delegated development, you can optionally delegate action and flow designer development by assigning developers to the application.
   a) Navigate to **System Applications > Studio**.
   b) Create a custom application called **Expenses Getting Started**.

2. In Studio, create an Expenses table.
   a) Click **Create Application File**.
   b) Under Data Model, select Table and click **Create**.
      A Table form opens.
   c) Complete the form with the following values.
      - **Label:** Expenses
      - **Extends table:** Task
   d) Save the form.
   e) Add three additional columns to the table.

<table>
<thead>
<tr>
<th>Column label</th>
<th>Type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>Floating point number</td>
<td>None</td>
</tr>
<tr>
<td>Destination</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Requested for</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
</tbody>
</table>

3. Add four records to the Expenses table to use in Flow Designer tests. When you test your flow in later steps, you can specify which record is used as the trigger, enabling you to test specific record values.
   a) On the Expenses table record, click the **Show list** related link.
b) Click New.

c) Configure the form to add the Amount, Destination, and Requested for fields, and the Approvers related list.

d) Complete the Destination and Requested for fields. In the Amount field, add a value under 100.00. Make sure that the user in the Requested for field in the test record has a manager assigned in the system. If the user in the test record does not have a manager, configure the User form to add the Manager field, and assign a manager to the user.

e) Submit the form.

f) Add another record to the table with an amount under 100.00.

g) Add two more records to the table with a value over 100.00 in the Amount field.

4. In Studio, create a new flow.
a) Click Create Application File.
b) Under Flow Designer, select Flow and click Create.
c) Select the Flow option, click Next.
d) In the Flow Name field, enter Expense Approval.
e) Click Submit.

An Expense Approval flow is created in the Expenses Getting Started scope.

5. Create a trigger that runs the flow when a record is created in the Expenses table.
   • Trigger: Created
   • Table: Expenses [x_expenses_getting_expenses]

   ![Trigger Configuration](image)

   6. Add an if condition to the flow.
a) Select Flow Logic > If.
b) In the right-hand pane, expand the Trigger - Record Created category and the [Expenses Record] pill. Drag-and-drop the [Amount] pill into Condition 1. A data pill represents the value of a record or a field at
a particular stage in your flow. Dragging the [Amount] data pill from the trigger populates the condition with the value of the field in the triggering record.

c) Set Condition 1 to [Trigger->Expenses Record->Amount] [less than] [100.00].

7. Underneath action 1, click + to add an action that runs when the If condition is met.

8. Create an Update Record action that approves the request.
   - Action: **Update Record**
   - Record: Expand the **Trigger - Record Created** category and drag the [Expenses Record] data pill from the right-hand pane.
   - Table: Set to Expenses [x_expenses_getting_expenses].
   - Fields:
     - Approval: **Approved**
9. Add an else condition to the flow.
   a) Select Flow Logic > Else.

10. Underneath action 2, click + to add an Ask for Approval action that runs when the Else condition is met.
    a) Complete the fields in the Ask for Approval step.
       - Action: Ask for Approval
       - Record: Expand the [Trigger - Record Created] category and drag the [Expenses Record] data pill from the right-hand pane.
       - Table: Set to Expenses [x_expenses_getting_expenses].
       - Approval Field: Set to Approval.
       - Journal Field: Set to Approval history.
b) Define the rules in the Ask for Approval step.

- **[Approve]** when **[Anyone approves]** from the field **[Trigger->Expenses Record->Requested for- >Manager]**, [OR]

- **[Anyone approves]** from the **[Manual User(s)]** list. Select to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see *Generate approvals using the approvers related list*.

Select **Add another OR rule set** to define rejection rules. When defining approvals, make sure to include rejection rules to avoid creating flows that remain in a waiting state if there are no matching approval rules.

- **[Reject]** when **[Anyone rejects]** from the field **[Trigger->Expenses Record->Requested for- >Manager]**, [OR]

- **[Anyone rejects]** from the **[Manual User(s)]** list.
c) Define a due date to automatically approve, cancel, or reject an approval if the request is not approved or denied by the designated time. Adding a due date ensures that the flow does not remain in a waiting state.

- [Approve] if pending by [Relative date] [1][Days] from [Trigger->Expenses Record->Created].
- Days schedule [8-5 weekdays excluding holidays].

This due date automatically approves all requests that have not been approved or denied within one day from when the request was created.

<table>
<thead>
<tr>
<th>Rule</th>
<th>After Due Date</th>
<th>Trigger Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approve</td>
<td>if pending by</td>
<td>Expenses RecordRequested for Manager</td>
</tr>
<tr>
<td>Reject</td>
<td></td>
<td>Expenses RecordRequested for Manager</td>
</tr>
</tbody>
</table>

11. Click **Save**.

12. Test the flow using a record with an amount below the designated limit.
   a) From the flow, click **Test**.
      The Test flow modal appears.
   b) In the **Record** field, select a record you created in earlier steps that has value in the **Amount** field under the 100.00 limit. This field is a reference to the table defined in the trigger.

   **Note:** Testing a flow bypasses the trigger conditions and immediately runs it. To test a flow with a record-based trigger, you must select a specific record to act as the trigger.

   c) Select **Run Test**.
   d) After the flow executes, click **Flow has been executed. To view the flow, click here**.
The Execution Details open.

Because the amount is less than 100.00, the first condition is met and the request is approved.

**Execution Details** Expense Approval

---

**FLOW STATISTICS**

**TRIGGER**

[Expenses] Created

---

**ACTIONS**

1. If ( Expenses Record > Amount less than 100.00 ) then

1.1 Update Record

2. Else

2.1 Ask For Approval

---

13. Navigate back to the flow and run the test again using a record with an amount over the designated amount.

14. After the flow executes, open the flow Execution Details.

Because the amount is over the designated limit, the request must be approved. Until a manager or a manual approver approves the request, the state is **Waiting**.
15. Approve the request. In an active flow, a user from the Approvers list would approve or reject the request. However, because the flow is being tested, an admin can approve the flow.
   
a) Navigate to the test record.
   The associated manager appears in the Approvers related list with Requested in the State field.
   Alternatively, you can edit the list to add manual approvers.
   
b) Change the value of the State field in the Approvers related list to Approved.
   
c) Navigate back to the flow Execution Details and refresh the browser.
   Because the request is approved, the flow completes.
Transform the Ask for Approval action into a reusable action using Action Designer. Actions enable flow designers to add complex actions to multiple flows with minimal configuration. See *Getting started with actions*.

**Getting started with actions**

Transform the Ask for Approval action into a reusable action that always requires manager approval.

Role required: admin

**Note:** While Action Designer is designed to use the action_designer and delegated_developer roles in most scenarios, this tutorial uses the admin role to illustrate functionality without requiring additional roles to set up records and approve requests.

Complete the steps in *Getting started with flows*. This tutorial replaces the Ask for Approval action in the Expense Approval flow.

Actions are made up of:

- **Inputs:** Data variables used in your action.
- **Steps:** Operations on the inputs or results from a prior step that generate data that can be used in later steps.
• Outputs: Data variables that represent the results of the action. These results are available to other actions in a flow.

Unlike the core Ask for Approval action where flow designers must manually configure the approval rules, this custom action always uses the same approval rules when added to a flow. You might create a reusable action if your flow designers often use an action with the same configuration. For example, if your flow designers always use the request manager approval and due date options, this action automatically uses them and therefore requires less flow configuration.

1. Open the Expenses Getting Started application in Studio.
   Alternatively, you can navigate to Flow Designer > Designer and select New Action to access Action Designer in the platform. In the Action Properties, select your scoped application in the Application field.

2. Create an action.
   a) Click Create Application File.
   b) Under Flow Designer, select Action and click Create.
   c) In the Name field, enter Ask for Manager Approval.
   d) In the Description field, enter Approve or reject a request based on manager approval or rejection. Allow manual approvers to be added.
   e) Click Submit.
   An Ask for Manager Approval action is created in the Expenses Getting Started scope.

3. Define the inputs in the Ask for Manager Approval action.
   a) Select + Create Input and add the following values.
      • Name: Request
      • Type: Reference
      • Reference Table: Expenses [x_expenses_getting_expenses]

This input enables you to reference any field or record from the Expenses table. Use the data pills on the right-hand side to add the record or its fields to action steps.

4. Add an Ask for Approval step.
   a) Click the + underneath Inputs in the Action Outline.
   b) Select Ask for Approval.
c) Complete the fields in the Ask for Approval step.
   • Record: Under the **Input Variables** category, drag the [Request] data pill from the right-hand pane.
   • Table: Set to **Expenses [x_expenses_getting_expenses]**.
   • Approval Field: Set to **Approval**.
   • Journal Field: Set to **Approval history**.

1. **Ask for Approval step**

   ![Approval Request Definition](image)

   - [Approve] when [Anyone approves] from the field [action->Request->Requested for->Manager], [OR]
   - [Anyone approves] from the field [Manual User(s)].

   Select **Add another OR rule set** to define rejection rules:

   - [Reject] when [Anyone rejects] from the field [action->Request->Requested for->Manager], [OR]
   - [Anyone rejects] from the field [Manual User(s)].
e) Define a due date in the Ask for Approval step.

- [Approve] if pending by [Relative date] [1][Days] from [action->Request->Created].
- Days schedule [8-5 weekdays excluding holidays].

This due date automatically approves all requests that have not been approved or denied within one day from when the request was created.

5. Define the outputs in the Ask for Manager Approval action. Adding an output makes data available to a flow. For example, this action outputs the approval state of the record.

a) Select + Create Outputs and add the following values.

- Name: Approval state
• Value: In the right-hand pane, expand the **Ask for Approval step** category and drag the **[Approval State]** data pill.

b) Click **Save**.

6. Add a custom icon for your application that displays in Flow Designer. All actions in the application scope use the custom icon.
   a) In Studio, navigate to **File > Settings**.
      The application settings open.
   b) In the **Logo** field, select **Click to add...**
   c) Upload an icon to use with your reusable actions.

7. Test the reusable action within your flow.
   a) Return to the Expense Approval flow.
   b) Remove the 2.1 Ask for Approval action from the flow. This action will be replaced by the reusable Ask for Manager Approval action.
   c) Set **Show draft actions** to true.
   d) Add the Ask for Manager Approval action to your flow.
   e) In the right-hand pane, expand the **Trigger - Record Created** category and drag the **[Expenses Record]** data pill into the **Request [Expenses]** field.
8. Click **Save**.

9. Test the flow using a record with an amount below the designated limit.
   a) From the flow, click **Test**.
      The Test flow modal appears.
   b) In the **Record** field, select a record you created in earlier steps that has value in the **Amount** field under the 100.00 limit. Verify that you have not already run tests using this record.
c) Select **Run Test**.

d) After the flow executes, click **Flow has been executed. To view the flow, click here**.

   The Execution Details open.

Because the amount is less than 100.00, the first condition is met and the request is approved. The Else condition is not evaluated.

---

10. Test a record with an amount over the designated limit. Verify that you have not already run a test on the test record.

   Because the amount is over the designated limit, the second condition is evaluated.
11. Approve the request.
   a) Navigate to the test record and change the value of the **State** field in the Approvers related list to **Approved**.
   b) Navigate back to the flow execution details and refresh the browser. Because the request is approved, the flow completes.
12. Navigate to the Ask for Manager Approval action and click Publish. Publishing an action enables you to activate any flow that uses it.

13. Navigate to the flow and set Show draft actions to false.

14. Click Activate. Activating a flow sets it to run every time the trigger conditions are met.

The Expense Approval flow runs every time a record is created in the Expenses table. Now that the flow is activated and working as expected, you can publish it to the application repository and deploy it to other instances.

**Architecture Overview**

Understand how Flow Designer works within the Now Platform to activate, trigger, and process flows and actions.

A flow consists of a trigger and one or more actions. The trigger specifies when to start the flow, which can be record-based, schedule-based, or application-based. Record-based triggers run a flow after a record has been created, updated, or deleted. The flow can use the triggering record as input for actions. Schedule-based triggers run a flow at the specified date and time. The flow can use the execution time as input for actions. Application triggers are added when the associated application is activated. For example, the MetricBase trigger is present when the MetricBase application is active.
Flow processing

Flow processing occurs in this sequence.

1. When the flow trigger conditions occur or an API directly calls the flow, the system creates an entry in the event queue to start the flow.
2. The scheduler processes the event and starts the flow in the background.
3. The system builds a process plan from the flow.
4. The system runs the process plan using the record that triggered the flow.
5. The system stores the execution details in a context record.

1. Process Flow Triggers

2. Process Events in the Queue

3. Build Process Plan

4. Run Process Plan

1. Process flow triggers and API calls

Each time trigger conditions are met or an API directly calls a flow, Flow Designer creates an event entry. The system processes triggers after database operations. To learn more, see *Execution order of scripts and engines*. Typically, *business rules* and *workflows* that run synchronously run before a triggered flow.

2. Process events in the queue

Each flow event contains a reference to the flow to start and a reference to either the triggering record or the execution time. The system processes these events using *Standard event processing* where a scheduler periodically works through the current items in the event queue in the order in which they were added. Depending on what other events are in the queue, the system may not immediately start a flow. Flow designers should expect some lag time between when the trigger conditions occur and when the flow actually starts.

3. Build the process plan

When Flow Designer pulls an event from the queue, it builds a *process plan* to actually run the flow. A process plan contains all the information necessary to execute a flow such as the sequence of published actions or subflows, the input values for each subflow or action, the action steps to run for each action, and the data provided by the trigger or subflow output.
Flow Designer uses a just-in-time compilation scheme to ensure that process plans contain the latest changes to flows, subflows, and actions. If no changes are detected, Flow Designer uses a cached copy of the process plan. Otherwise, it builds a new process plan.

By automatically checking for updated flows, subflows, and actions with process plans, Flow Designer enables you to apply changes from update sets and upgrades without having to edit current flows. If you move published actions to a target instance, every flow that uses the published action will automatically update the next time it is executed.

**Warning:** If changing subflows or actions used in activated flows, do not change the inputs and outputs used in the subflow or action. Changing inputs and outputs may cause errors when the activated flow is next triggered because it has not been configured to use the new inputs and outputs. Any currently running flows are unaffected by changes to inputs or outputs as the flow uses the compiled subflows and actions from the process plan.

### 4. Run the process plan

Flow Designer runs the process plan as the **System** user within the flow application scope.

When running a flow with a record-based trigger, Flow Designer stores the triggering record in memory as an *instance* that is represented in the interface as a *data pill*.

The instance contains the record values from when the flow started, which may be different than the current record stored in the database. For example, suppose that creating an incident record triggers a flow. Any changes a user makes to the incident record after the flow has started do not update the triggering record unless an action specifically looks up the current record value.

### 5. Store flow execution details

Flow Designer stores flow execution details in a *flow context record*, which contains this information.

- Flow outcome state
- Flow runtime duration
- Flow log messages
- Flow configuration and runtime values

Each time a flow runs, Flow Designer adds an entry to the **Flow Executions** list. Each entry has its own context record and matching execution details page.

**Note:** A flow execution context runs in a single thread. However, there may be times when you want to run flows within separate contexts even though this may consume more of your instance's resources. To run subflows in separate flow contexts within the same flow, see *Dynamic flows*.

A flow can have one of these outcome states.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The flow completed successfully.</td>
</tr>
<tr>
<td>In Progress</td>
<td>The flow is running. By default, a transaction quota rule prevents flows from running longer than an hour.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The flow is waiting for another event to occur. For example, a user must update a task or approval, or a record must reach a specific state. When in the waiting state, the flow is quiesced and serialized into a context record.</td>
</tr>
<tr>
<td>Canceled</td>
<td>The flow was canceled by a user.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Error</td>
<td>The flow encountered an error and has stopped running. For example, an action is missing an input value, or a quota transaction rule has stopped the flow.</td>
</tr>
</tbody>
</table>

**Flow, subflow, and action life cycle**

Flow Designer uses the flow or action status to describe the current state of configuration changes.

**Flow and subflow status and activation state**

The *Status* field indicates whether there is a process plan associated with the flow or subflow.

<table>
<thead>
<tr>
<th>Flow status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Modified</td>
<td>Indicates that there are unsaved changes to a flow or subflow. Modified flows or subflows have not been saved.</td>
</tr>
<tr>
<td>Draft</td>
<td>Indicates that there are saved changes to a flow or subflow, which have not been stored in a process plan. Draft flows have been saved but not activated. Draft subflows have been saved but not published.</td>
</tr>
<tr>
<td>Published</td>
<td>Indicates that there is a stored process plan for the flow or subflow. Published flows have either been activated or deactivated.</td>
</tr>
</tbody>
</table>

The *Active* field indicates whether the system runs a flow or subflow.

<table>
<thead>
<tr>
<th>Active</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>True</td>
<td>Indicates that the flow or subflow is active and runs when triggered or called. The flow has been activated or the subflow has been published. Active flows run when the trigger conditions are met or when called. Active subflows run when called.</td>
</tr>
<tr>
<td>False</td>
<td>Indicates that the flow is inactive and does not run when triggered or called. An inactive flow has either never been activated or has been deactivated. An inactive subflow has never been published.</td>
</tr>
</tbody>
</table>

When working with flows, you can:

- **Save** a flow: Creates a draft of the flow.
- **Activate** a flow: Enables the flow trigger and transform the flow into a process plan.
- **Deactivate** a flow: Disables the flow trigger and prevents new flow executions. Currently running flows continue to run.

When working with subflows, you can:

- **Save** a subflow: Creates a draft of the subflow. If the subflow is modified after being published, the subflow moves into a draft state. Any active flows that use the subflow only run the published subflow.
- **Publish** a subflow: Enables you to activate a flow containing the subflow. Publishing adds the subflow to the list of available subflows in a flow.
Action status

The Action Designer interface does not display the configuration status of actions. To view action status, navigate to the Action Types table [sys_hub_action_type_definition] and display the Draft state field.

<table>
<thead>
<tr>
<th>Action Draft status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>Indicates that there are changes to an action that have not been published. Draft actions are only available to flows when the Show draft actions option is enabled. You cannot activate a flow containing draft actions.</td>
</tr>
<tr>
<td>Published</td>
<td>Indicates that the action has been published. Published actions are available to all flows and allow flows to be activated.</td>
</tr>
</tbody>
</table>

When working with actions, you can:

- **Save** an action: Creates a draft of the action that is only available to flows when Show draft actions is enabled. If the action is modified after being published, the action moves into a draft state. Any active flows that use the action only run the published action.
- **Publish** an action: Enables you to activate a flow containing the action. Publishing adds the action to the list of available actions in a flow. Only actions in a published state run during flow execution.

Application development

When designing an action or a flow, use these design considerations as a guide.

Use standard Now Platform application development capabilities to create, manage, protect, and deploy Flow Designer content. Flow and action designers typically perform these application development tasks.

- Create a custom application to store flows and actions.
- Set application permissions to share or restrict access to application data.
- Grant application developers access to Flow Designer.
- Publish custom applications to the application repository to deploy flows and actions on other instances.
Security

Control access to Flow Designer processes and records.

- Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer delegated development permission. Delegated development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. See Developer and deployment permissions.

- Administrators can also grant access to Flow Designer by directly assigning users the flow_designer user role, which includes the role to view flow execution details.

  Warning: Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer can run flows as the System user, which has access to all tables and all database operations.

- Flow and action designers can use standard Application access settings to manage how their content interacts with other applications.

Action limit

By default, flows can have no more than 50 actions. To change the default behavior, increase the value of the sn_flow_designer.max_actions system property. However, consider the performance impact that a large flow may have on your instance.

Trigger options for record updates

Flow designers can specify how often a flow can update a particular record with the Run Trigger option. Use the Once option when you want a flow to run only once. The first time a record is updated, the flow runs, but any further record updates do not trigger the flow. Use the Always option when you want the flow to run every time a record is updated and there is not already an active flow running for it. For example, you might set a flow that assigns an incident record to run only once, and set a flow that notifies the incident watch list to always run. The Run Trigger field is only available for these trigger types.

- Created or Updated
- Updated

Direct recursion prevention and indirect recursion limit

To prevent instance outages and consumption of system resources, Flow Designer ignores any request to start a flow that is the result of direct recursion. Direct recursion occurs under these conditions.

- An action calls the same flow that it is part of. For example, a script step makes an API call to a flow.
- An action or subflow produces a result matching the flow trigger. For example, a flow that runs when an incident record is updated contains an update record action that updates an incident record.

Flow Designer also limits the number of times a flow can be started from indirect recursion. Indirect recursion occurs under these conditions.

- The same flow is called multiple times in a chain of subflow calls. For example, if subflow A calls subflow B, and subflow B calls subflow A, then calling either subflow produces indirect recursion.
- The same flow is triggered multiple times in a chain of subflows. For example, suppose that there are two flows triggered by record creation. Suppose that creating record A triggers flow A and also creates record B.
Furthermore, creating record B triggers flow B and creates record A. Creating either record type produces indirect recursion.

By default, the system stops triggering flow runs after the run count reaches the indirect recursion limit of three runs. Administrators can change the limit by setting the system property `com.glide.hub.flow_engine.indirect_recursion_limit` to an integer value equal to or greater than one. The system ignores any property value less than one and instead uses a limit of one. Consider the performance impact that increasing the indirect recursion limit may have on your instance.

**Note:** By default, a transaction quota rule prevents flows from running longer than an hour.

### Flow and action testing

Testing a flow bypasses the trigger conditions and immediately runs it. Testing a flow with a record-based trigger requires selecting a specific record to act as the trigger. Flow designers should generate appropriate sample records prior to testing.

During the design phase, you can test an inactive flow and unpublished actions by setting **Show draft actions** on the flow. If testing with draft actions, use these guidelines:

- Design flows and actions on a non-production instance. Only deploy active, working flows to your production instance.
- Leave **Show draft actions** set to true until your draft is in a final state. Once final, publish each action, set **Show draft actions** to false, and activate the flow.

**Warning:** Disabling **Show draft actions** before publishing your actions removes all draft actions from your flow.

- Any change you make to an active flow or published action causes it to return to a draft state. If the flow is triggered, the system only runs the activated flow and published actions, and the flow execution details only display what was run. When there is a draft of an active flow, the trigger and actions listed in the flow execution details may be different than those listed in the draft flow.

### Flow Designer data

Each time you add an action to a flow, Flow Designer adds a data pill to store its results. The data pill name indicates its sequence in the flow and its data type.

Flow designers use action result data pills to provide input for other flows, actions, or subflows. Flow designers can use the sequence value in the data pill name to ensure that they select the correct data pill as an input value. When a flow runs an action, it generates the data pill runtime value, which remains the same for the duration of the flow. For example, if a data pill for `[Trigger->Incident record]` gets populated with incident record values at the start of a flow, the data pill preserves these values for the rest of the flow.

### Data pill population

Flow Designer populates data pill values as soon as the data becomes available regardless of where the data pill is located in the flow sequence. For example, suppose that you have a flow triggered by the creation of an incident record with the following actions.

1. **Update [Incident] Record** that adds a text string to `[Trigger->Incident Record->Short description]`.
2. **Log** the value of `[Trigger->Incident Record->Short description]`.

© 2020 ServiceNow, Inc. All rights reserved.
3. **Log** the value of [1->Incident Record->Short description].

Action-1 and Action-2 both use the data pill [Trigger->Incident Record->Short description]. Since the trigger record is available as soon as the flow starts, these values are set before running these actions.

**Delayed data pill population**

When an action, flow logic, or step includes more than one data pill in the same input, the system delays running it until all data pill values have been populated. This delay might produce unexpected values or prevent flow logic from running at all.

For example, this flow produces unexpected values.

1. **Update** [Incident] Record that adds a text string to [Trigger->Incident Record->Short description].
2. **Log** the value of [Trigger->Incident Record->Short description].
3. **Log** the value of [1->Incident Record->Short description].
4. **Log** the value of [Trigger->Incident Record->Short description] and [1->Incident Record->Short description].

This flow produces the unexpected result of both data pills in Action-4 evaluating to the same value.

**Flow administration modules**

Identify and troubleshoot potential issues by reviewing action and flow executions, their result state, and their runtime duration.

Flow Designer provides administrators and flow operators these modules to manage flows.

**Today's Executions**

Displays a list of flow context records for flows run today. Use this information to identify flows run today.

**Active flows**

Displays a list of flow context records for running flows where the **State** is Waiting. Use this information to identify flows that are waiting for a trigger or condition to continue.

**Event Queue**

Displays a filtered list of event records where the **Queue** is flow_engine and the **State** is Ready. Use this information to identify flows that are waiting on event processing.

**Operations Dashboard**

Displays a responsive dashboard containing a count of flows run and the average flow runtime. View statistics for today or over the last 30 days. Use this information to determine the health and performance of flow execution.

**Settings**

Displays the list of Flow and Action Settings records. Use this table to identify which actions and flows have had reporting disabled. Create records on this table to control whether reporting is done on an action or flow.

**Properties**

Displays the system properties used to configure how the system processes flows.

**Usage Overview**

Displays transaction counts between your instance and third-party systems. The Usage Overview is not available in the base system and requires the ServiceNow® IntegrationHub subscription.
Flow Designer landing page

Access or create actions, flows, subflows, or their execution details.

Flows
The Flows screen contains all the flows that your installation of Flow Designer can use. Selecting a flow opens the flow in a new tab. You can see the scope the flow was created in, the internal name of the flow, whether the flow is published or in draft status, whether the flow is active, and update information.

Subflows
The Subflows screen contains all the subflows that your installation of Flow Designer can use. Selecting a subflow opens the subflow in a new tab. You can see the scope the subflow was created in, the internal name of the subflow, whether the subflow is published or in draft status, whether the subflow is active, and update information.

Actions
The Actions screen contains all the actions that your installation of Flow Designer can use. Selecting an action opens the action in a new tab. You can see the scope the action was created in, where the action is accessible from, whether the action is active, and update information.

Executions
The Executions screen shows a history of actions and flows run, including the current state and duration of each run.

Help
The Help landing page contains links to Flow Designer Guided Tour, Documentation, Videos, and Forum Discussion.

+ New
You can create a new flow or action by selecting an action from the list.
Flow Designer system properties

Configure how the system processes flows.

These properties are available for Flow Designer.

To set Flow Designer system properties, click **Flow Designer > Properties** or navigate to the System Properties [sys_properties] table.

Flows

Automate processes with a sequence of reusable actions such as manage records, ask for approvals, create tasks, and send notifications. Define trigger conditions to start a flow and variables to pass information between actions.

All flows consist of properties, a trigger, a sequence of actions, and the data collected or created.

Flow properties

The flow properties information about the flow.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Select an application for the flow. This property is set when creating the flow and cannot be changed afterwards.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description of the flow.</td>
</tr>
<tr>
<td>Run As</td>
<td>Choose whether the flow runs as System User or the user who initiates the session.</td>
</tr>
</tbody>
</table>

Triggers

The trigger specifies the conditions that start the flow. When the trigger condition is true, the system starts the flow.

Flow Designer supports record-based, schedule-based, and application-based trigger types. For detailed descriptions of trigger types, see Flow trigger types.

Actions

Within Actions, flow designers can add actions, flow logic, subflows, or other flows.

Each action is a set of reusable business logic that produces a specific outcome when provided with its input values. Flow designers configure actions by specifying where they go in a flow sequence and by selecting the data they use as input values. As a flow runs, actions earlier in the sequence generate outcomes or output values that become available as data to actions later in the flow.

By default, the system provides a collection of core actions that can be added to any flow. Core actions cannot be viewed or edited from the Action Designer interface. Some applications include spokes which add application-specific flows and actions. Spoke actions are typically read-only but can be copied and customized. Developers may also create their custom actions from the Action Designer interface.

Flow data

Flows store any data gathered or generated as variables in the Data pane. Each variable has its own pill that Flow designers can use to drag the variable value to an action input or output. Flow Designer generates the pill name based on the contents and its data type. The system specifies the variable data type next to the pill.
Example flow data

Flow logic

Flows may contain flow logic to specify conditional or repeated actions. The system provides these flow logic options.

For detailed descriptions of flow logic types, see Flow logic.

Testing flows

After adding a trigger and one or more actions, flow designers can test a flow. Testing a flow sets the trigger conditions to true and runs all actions. For flows that have record-based triggers, flow designers may specify an existing test record to use as input. Flow designers should always test flows on non-production instances containing relevant demonstration data since testing a flow creates or changes records on the instance.

Flow execution details

The system generates flow execution records, log messages, and reports for each flow run. The flow context is a related record containing the current state and runtime values of the flow. The system generates a context record each time a flow is run.
Roles

To access Flows, a user must have the flow_designer or admin roles.

Design considerations

Create a subflow when you only want a flow to run from a script

A flow runs whenever its trigger conditions are met. If you want a flow to run only when it is called from a script, create a subflow instead. Since a subflow has no trigger conditions, it will only run when called by another flow or a script call.

Use flow logic or a schedule-based trigger to control flow timing

To pause a flow for a specific duration, use Wait for a duration flow logic. To run a flow at a specific time, use a schedule-based trigger. Avoid using the gs.sleep() method to wait within a flow.

More Actions

Click the More Actions button to access additional options for the flow.

Stages

Access the stages for a flow.

Manage flow catalog variables

Manage the catalog variables available to Service Catalog-triggered-flows.

Copy flow

Create a copy of the open flow in an application you specify.

Configurations

Enable or disable the Show draft actions, Show triggered flows, Show store spokes, and Show inline script toggle options.

Code Snippet

Generate a code snippet to call a specific flow, subflow, or action.

Manage security

Enable or disable the Callable by Client API option.

Manage natural language title

Create or edit a flow title with styled or dynamic text. For more information, see Manage natural language titles.

Flow trigger types

The trigger specifies the conditions that start the flow. When the trigger condition is true, the system starts the flow.
Record triggers

Follow these design considerations when creating record triggers.

Add conditions to only start record flows when needed

Use conditions to specify what record values start your flow. Starting a flow only when needed consumes fewer system resources than starting a flow, pausing it, and waiting to resume the flow until a specific record condition applies. Instead of creating a flow that starts with a Wait for condition action, redesign the flow to include the wait condition as part of the record trigger.

Create unique filter conditions for record triggers on the same table

To prevent flows from overwriting each other, create unique filter conditions for each flow running on the same table. If multiple flows on the same table have the same filter, there is no way to know the order in which the flows will run.

Ignore records added or updated by import and update sets

Record triggers ignore records added or updated by applying an update set or importing an XML file. These operations apply to the entire application or table rather than an individual record.

Replace record triggers on Service Catalog tables with Service Catalog application triggers

Flow Designer no longer displays Service Catalog tables as options for record triggers. Instead, create flows that use the Service Catalog application trigger type.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Starts a flow when a record is created in a specific table.</td>
</tr>
<tr>
<td>Trigger</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Updated</td>
<td>Starts a flow when a record is updated in a specific table. Requires selecting when to run the flow.</td>
</tr>
<tr>
<td></td>
<td>• <strong>For each unique change</strong>: Triggers the flow for every unique update to a non-system field even if the flow is currently running.</td>
</tr>
<tr>
<td></td>
<td>Note: The system stores a history of every change to a record and determines whether the change is unique. For example, if an incident record’s State field changes from In Progress to On Hold, the flow will run. However, if the State field then changes back to In Progress, the flow will not run.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Once</strong>: Triggers the flow once for the life of the record.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Only if not currently running</strong>: Triggers the flow for every unique change if the flow is not currently running. This behavior is the same as the <strong>Always</strong> option in previous releases.</td>
</tr>
<tr>
<td></td>
<td>• <strong>For every update</strong>: Triggers the flow every time the record is updated, regardless of whether there has already been or there currently are any running contexts for the flow.</td>
</tr>
<tr>
<td>Trigger</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Created or Updated</td>
<td>Starts a flow when a record is either created or updated in a specific table. Requires selecting when to run the flow.</td>
</tr>
<tr>
<td></td>
<td>• <strong>For each unique change</strong>: Triggers the flow for every unique update to a non-system field even if the flow is currently running.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: The system stores a history of every change to a record and determines whether the change is unique. For example, if an incident record's <strong>State</strong> field changes from In Progress to On Hold, the flow will run. However, if the <strong>State</strong> field then changes back to In Progress, the flow will not run.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Flows that have a record trigger that runs <strong>For each unique change</strong> can produce recursions when run in a non-interactive session. When such flows make a change to the trigger record, the change meets the flow trigger conditions and causes a recursion.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Once</strong>: Triggers the flow once for the life of the record.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Only if not currently running</strong>: Triggers the flow for every unique change if the flow is not currently running. This behavior is the same as the Always option in previous releases.</td>

</tbody>
</table>

### Application triggers

Use application triggers to start a flow when application-specific conditions are met.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetricBase</td>
<td>Starts a flow when a MetricBase trigger is met. Requires the MetricBase application. For more information, see Create a flow with a MetricBase trigger.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>Starts a flow from a Service Catalog item request. For more information, see Create a flow with a Service Catalog trigger.</td>
</tr>
<tr>
<td>SLA Task</td>
<td>Starts a flow from an SLA Definition record. For more information, see Create a flow with an SLA Task trigger.</td>
</tr>
</tbody>
</table>

### Inbound email triggers

Start a flow when your instance receives an email.

Inbound email flows take priority over inbound email actions. If you create flows with inbound email triggers, emails are first processed by the inbound email triggers before they are processed by inbound email actions.

With inbound email actions, you don't have full control over email attachment handling or assigning the target record of an email. When you create a flow with an inbound email trigger, you can perform these actions with the Move Email Attachments to Record action and the Associate Record to Email action. For greater control over email attachments, you can also use the Look up email attachments action to access a specific attachment as a data pill.

Although you can process an inbound email with multiple inbound email actions, you can't process an inbound email with multiple flows by default. Additional configuration is required. For information on how to stop processing in inbound email actions, see Specifying the inbound email processing order.

For more information on running multiple flows on an inbound email, see Allow multiple triggers to process an inbound email.

The following diagram shows how inbound emails are processed by inbound email triggers. After the email has been classified as a reply, forward, or new email, the system tries to match the email to an active inbound email trigger. If the email meets the conditions of an inbound email trigger, the flow runs. If the flow issues stop processing, the email is finished being processed. If the flow does not issue stop processing, the system tries again to match the email to an active inbound email trigger. If at any point the email does not match an active inbound email trigger, the system tries to match the email with an active inbound email action instead.
Processing emails with inbound email triggers

**Note:** With other types of flows, you can choose to run as a system user or the user who initiates the session. However, inbound email flows always run as the sender of the inbound email. If the system does not recognize the sender, inbound email flows will run as the Guest user. The actions of inbound email flows are limited by user ACL restrictions. To test access controls for an inbound email flow, impersonate a typical inbound email user and manually trigger the flow.
Advanced options

Specify the user session requirements needed to start a flow with Advanced Options.

When to run the flow

Determine the type of session that can trigger the flow, and whether to run the flow when triggered by certain users.

Interactive session options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only Run for Non-Interactive Session</td>
<td>Flow that is only triggered in non-interactive sessions. See Non-interactive sessions.</td>
</tr>
<tr>
<td>Only Run for User Interactive Session</td>
<td>Flow that is only triggered in interactive sessions.</td>
</tr>
<tr>
<td>Run for Both Interactive and Non-Interactive Sessions</td>
<td>Flow that is triggered in all sessions.</td>
</tr>
</tbody>
</table>

User options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not run if triggered by the following users</td>
<td>Flow that does not trigger for a selected list of users. Click the Add User icon to add users to the list.</td>
</tr>
<tr>
<td>Only run if triggered by the following users</td>
<td>Flow that triggers only for a selected list of users. Click the Add User icon to add users to the list.</td>
</tr>
<tr>
<td>Run for any user</td>
<td>Flow that runs for any user.</td>
</tr>
</tbody>
</table>

Where to run the flow

Determine whether to run the flow in the background or in the current session.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run flow in background (default)</td>
<td>Flow that runs asynchronously in the background. Use this option for flows that do not require immediate updates and to allow other system processes to run at the same time.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Run flow in foreground</td>
<td>Flow that runs synchronously in the current session. Use this option to provide immediate updates to an end user. For example, if a flow opens a task after the previous task closes, use this option to open the next task immediately after a user closes one.</td>
</tr>
</tbody>
</table>

**Note:** Running a flow in foreground may block the current session thread and prevent user input until the flow finishes. Avoid running flows in the foreground when they contain actions that cannot be interrupted, such as actions that run script. Actions or flow logic that pause a flow will not block a session.
## Data pills available by trigger type

Flow designers have access to data pills from the trigger.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Data pills available</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td><strong>[Table Label] Record</strong>&lt;br&gt;An object containing the triggering record.</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td><strong>Table Name</strong>&lt;br&gt;The table name containing the requested catalog item.</td>
</tr>
</tbody>
</table>
Create a flow

Automate a process to run one or more actions when a trigger condition occurs.

- Setting up an application in Guided Application Creator to store Flow Designer content.
- Role required: flow_designer or admin

Users with flow_designer or admin role should know the application table structure and be aware of any existing business logic associated with the target tables of a flow or subflow. Be sure to disable any conflicting business rules or workflows before creating a flow or subflow.

Creating a custom application to contain your Flow Designer content enables you to deploy the application using the application repository or the ServiceNow Store.

1. Navigate to Flow Designer > Designer.
2. Click + New > New Flow.
3. On the form, fill in the fields.

Flow Properties form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify your flow. The system computes the internal name of the flow from the name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of your flow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Selection to specify if the flow is read-only. You can only select a value when you create the flow in an application scope that you own.</td>
</tr>
<tr>
<td>Run As</td>
<td>Selection to specify if the flow runs as system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, when you want incident record comments to come from the current user, or approval emails to originate from the approver. Run As settings for a flow don't apply to child subflows. When flows run as the user who initiates the session, the system limits flow actions by user ACL restrictions. Ensure that security restrictions don't prevent users who trigger the flow from performing flow actions. Flows run by the initiating user also respect user-specific settings such as date/time formats.</td>
</tr>
</tbody>
</table>

Note: Inbound email flows ignore this setting and always run as the user who initiates the session. To test access controls for an inbound email flow, impersonate a typical inbound email user and manually trigger the flow.

4. Click Submit.
The system displays the Flow Designer page.
5. Add a trigger.
   a) From the Trigger list, select the type of trigger.
      For more information on trigger types, see Flow trigger types.
      The system displays a set of fields depending on the type of trigger that you've selected.
   b) To specify the trigger, fill in the fields.
      For a record-based trigger, for example, fill in the table and conditions.
   c) Click Done.
6. To add actions, flows, subflows, or flow logic, click Select to add an Action, Flow Logic, or Subflow.
a) Select an option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Select the desired action. Flow Designer includes a set of Actions available to flows and subflows. Alternatively, a user with the action_designer role can create additional actions to add to flows. The IntegrationHub and spoke plugins install additional actions. To add draft actions from the More Actions menu, set Show draft actions to true. To view spokes available in the ServiceNow Store, set Show store spokes to true from the More Actions menu.</td>
</tr>
<tr>
<td>Flow Logic</td>
<td>Select an option to specify conditional or repeated operations.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Select a published subflow and define input values. In addition to adding a subflow as a flow action, you can enable the Show triggered flows option from the More Actions menu to select an activated flow and define the required inputs. Running a triggered flow ignores its trigger conditions and runs all actions.</td>
</tr>
<tr>
<td>Manage natural language title</td>
<td>Create a flow, subflow, or action title with styled and dynamic text.</td>
</tr>
</tbody>
</table>

To change the order of an action in a flow, drag the handle on the left side of the action to the desired location.

The system displays a set of fields depending on the option selected.

b) To configure the action, flow, or subflow, fill in the fields.

c) Click Done.

d) Repeat adding actions until complete.

7. Click Save.

Flow Designer saves a draft of the flow, trigger, and actions.

- Test your flow until it is ready to activate.

   **Note:** The system only triggers active flows.

  - Transfer your flow to another instance.
    - Deploy your flow from the application repository when your application is complete and ready for release.
    - Transfer your flow from an update set XML file when you want to test the flow on another instance. When you save a flow, Flow Designer generates a single update set file containing its subflows and actions.

**Create a flow with an inbound email trigger**

Start a flow when your instance receives an email.

Role required: flow_designer or admin

1. Navigate to Flow Designer > Designer.
2. Click + New > Flow.
3. Define the flow properties, and then click Submit.
   For more information, see Create a flow.
4. In the Trigger section, click the plus icon
to add a trigger.
5. Select Inbound Email.
6. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email conditions</td>
<td>Conditions to qualify which emails start your flow. The condition builder uses fields from the Email [sys_email] table. For example, to trigger a flow for an inbound email in which a user replies to a system notification, set the condition to [Receive type] [is] [Reply].</td>
</tr>
<tr>
<td>Reply Record Type</td>
<td>Table that is associated with the target email. For example, to trigger a flow from a reply email that a user sends from an incident record notification, select Incident [incident].</td>
</tr>
</tbody>
</table>

7. Click Done.
8. Add actions, subflows, and flow logic to the flow.
9. Optional: Add stages to the flow to report progress to the requester.
   See Flow Designer stages.
10. Test the flow. If the test is successful, activate the flow.
    For more information, see Test a flow and Activate a flow.

When an inbound email meets the conditions that you set, the associated flow triggers and runs the actions.

Allow multiple triggers to process an inbound email
Configure Flow Designer to allow an inbound email to be processed by multiple inbound email triggers in a specific order.

Role required: admin

Although you can process an inbound email with multiple inbound email actions, you can't process an inbound email with multiple flows by default. You can add a system property to let process owners use multiple triggers to process an inbound email.

**Warning:** Allowing multiple triggers to process an inbound email may increase maintenance and decrease system performance.

1. Add a system property with the following settings:
   - Name: glide.hub.flow.inbound_email_trigger.show_advanced
   - Type: true | false
   - Value: true

After you activate the system property, the Order and Stop processing fields appear on the inbound email trigger, as shown in the following figure.
2. Create multiple flows with an inbound email trigger.
   For more information, see Create a flow with an inbound email trigger.
3. Specify the processing order for each of the inbound email flows:
   a) Open each flow and enter a value in the Order field.
      To give the flow higher priority over other flows, enter a lower number.
   b) Enable or disable stop processing for each flow in your sequence.
      To allow an inbound email to be processed by the next flow in your sequence, clear the Stop processing option.
      To end the sequence on a particular flow, leave the option selected in that flow.
Create a flow with a MetricBase trigger

Start a flow when a MetricBase trigger is met. MetricBase triggers track time series data and can monitor when a threshold is reached, when a trend is detected, or when a system stops reporting data.

Role required: flow_designer or admin

MetricBase triggers are not available on the base system. The MetricBase application requires a separate subscription and must be activated by ServiceNow personnel.

1. Navigate to Flow Designer > Designer.
2. Click + New > New Flow.
3. Define the flow properties.
   For more information, see Create a flow.
4. In the Trigger section, add a trigger and select MetricBase.
5. Complete the trigger fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MetricBase Trigger</td>
<td>Select or create a MetricBase trigger record to start the flow. For types of MetricBase triggers, see MetricBase triggers.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only table that contains the metric.</td>
</tr>
<tr>
<td>Condition</td>
<td>Click Add filters to set field-based conditions that determine when the flow runs.</td>
</tr>
<tr>
<td>Condition Script</td>
<td>Define a script in the Additional MetricBase Trigger Filtering and Moderation table to prevent duplicate metric events from re-triggering a flow. For example, if a metric hovers at a defined trigger threshold, create a script that defines whether to run the flow once when the metric is met, or every time the triggering threshold is exceeded.</td>
</tr>
</tbody>
</table>

6. Add actions, subflows, and flow logic to the flow.
7. Test the flow. Once behaving as desired, activate the flow.
   For more information, see Test a flow and Activate a flow.

The MetricBase application monitors time series data on the Now Platform. When the selected trigger is met, the flow runs.

Create a flow with a Service Catalog trigger

Start a flow when a Service Catalog item is requested to automate the fulfillment process.

Role required: flow_designer or admin

Unlike a record trigger which runs on all records in a table, the Service Catalog trigger runs on all catalog item requests for a specific item when the catalog item is configured to run a specific flow. For example, you can define a flow that runs every time there is a request for a tablet. The requested item becomes the flow trigger record.

1. If not already created, create the catalog item to associate with the flow.
   a) Navigate to Service Catalog > Catalog Definition > Maintain Items.
      The Catalog Items [sc_cat_item] table opens.
   b) Click New.
   c) Complete the fields.
      For a detailed description of catalog item fields, see Create or edit a catalog item.
2. Create the flow to associate with the catalog item. When triggered, this flow processes the catalog item request.
   a) Navigate to **Flow Designer > Designer**.
   b) Click **+ New > New Flow**.
   c) Define the flow properties.
      For more information, see **Create a flow**.
   d) In the Trigger section, add a trigger and select **Service Catalog**.
   e) Optional: Create flow-specific catalog variables available only to flow actions. See **Create flow Service Catalog variables**.
   f) Add actions, subflows, and flow logic to the flow.
      Some actions enable you to manage catalog items. For example, the Create Catalog Task action generates a task for the requested item, and the Get Catalog Variables action enables you to access catalog variables as data pills in the flow. See **Create Catalog Task action** and **Get Catalog Variables action**.
   g) Optional: Add stages to the flow to report progress to the requester.
      See **Flow Designer stages**.
   h) Test the flow. Once behaving as desired, activate the flow.
      For more information, see **Test a flow** and **Activate a flow**.

3. Add the flow to the **Flow** field of the catalog item you created.
   a) Navigate to the catalog item.
   b) In the **Flow** field, select the flow you created.

   **Note:** The **Flow** field only displays flows with a Service Catalog trigger.
   c) Click **Update**.

When the catalog item is requested, the associated flow triggers and runs the actions.

**Create flow Service Catalog variables**

Create Service Catalog variables that are only available to a specific Service Catalog-triggered-flow. Flow-specific variables are available to catalog tasks and actions in the flow.

**Role required:** flow_designer or admin

Flow Service Catalog variables display in the **Catalog Variables** field of the Create Catalog Task and Get Catalog Variables actions. They display in the **Flow:variablename** format and are only available to the flow in which they are defined.

For more information about Service Catalog actions, see **Create Catalog Task action** and **Get Catalog Variables action**.

1. Open or create a flow with a Service Catalog trigger.
2. Click ![image](image.png) and select **Manage flow catalog variables**.
   The Flow catalog variables table opens.
3. Click **New** to add a new variable available to the flow.
4. Complete the form.

**Variable form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>The <em>variable type</em> that you want to create.</td>
</tr>
<tr>
<td><strong>Application</strong></td>
<td>Read-only field that indicates which applications can use this variable.</td>
</tr>
<tr>
<td><strong>Catalog item</strong></td>
<td>Catalog item using the variable.</td>
</tr>
<tr>
<td><strong>Mandatory</strong></td>
<td>Check box to make the variable mandatory as part of the ordering process.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>This behavior is applicable only on page load, and can be changed via client APIs.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Check box to make the variable available for use</td>
</tr>
<tr>
<td><strong>Selection Required</strong></td>
<td>Check box to require users to select the check box variable. For example, use this option to require users to select an <em>I agree</em> check box for an agreement form. If users try to submit the agreement form without selecting the check box, an alert message is displayed to tell users that they must select the check box.</td>
</tr>
<tr>
<td><strong>Order</strong></td>
<td>Order that the variable is placed on the page for the catalog item. The variables are organized from top to bottom from least to greatest order value. For example, a variable with an order value of 1 is placed above other variables with higher-order values.</td>
</tr>
<tr>
<td><strong>Global</strong></td>
<td>If selected, the variable is available for all catalog tasks within service catalog workflows or execution plans by default. If deselected, the variable must be associated with individual catalog tasks.</td>
</tr>
<tr>
<td><strong>Map to field</strong></td>
<td>Maps the variable to a specific field on the table for the record producer. This field appears if the variable belongs to a record producer.</td>
</tr>
<tr>
<td><strong>Field</strong></td>
<td>Field that the variable maps to. This field appears if the variable belongs to a record producer.</td>
</tr>
<tr>
<td><strong>Record producer table</strong></td>
<td>Table that the record producer creates a record in. This field appears if the variable belongs to a record producer.</td>
</tr>
<tr>
<td><strong>Question</strong></td>
<td>Question to ask users ordering the catalog item.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>A name to identify the question.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this field is empty, its value is auto-populated based on the Question field for all variable types except break, container split, and container end.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Tooltip text to display when users point to the variable. Enter a brief note to describe the purpose of the 'Question'.</td>
</tr>
<tr>
<td>Example text</td>
<td>Hint that is displayed in the question field before a user enters a value.</td>
</tr>
<tr>
<td></td>
<td>Applicable for the following variables:</td>
</tr>
<tr>
<td></td>
<td>• IP Address</td>
</tr>
<tr>
<td></td>
<td>• Email</td>

This field appears for lookup multiple choice and lookup select box variables.                                                                                                                              |
| Lookup label field(s)            | Comma-separated list of fields in the lookup table whose values are used to display options.  
This field appears for lookup multiple choice and lookup select box variables.                                                                                                                          |
| Lookup price field               | Field in the lookup table whose value is used to modify the price of the item being ordered.  
This field appears for lookup multiple choice and lookup select box variables.                                                                                                                            |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lookup recurring price field</td>
<td>Field in the lookup table whose value is used to modify the recurring price of the item being ordered. This field appears for lookup multiple choice and lookup select box variables.</td>
</tr>
<tr>
<td>Macro</td>
<td><em>UI macros</em> to insert into the catalog item. This field appears for macro, macro with label, and UI page variables.</td>
</tr>
<tr>
<td>Summary macro</td>
<td>Applicable only for Macro, and Macro with Label type variables.</td>
</tr>
<tr>
<td>Widget</td>
<td>Applicable only for Marco, and Macro with Label type variables.</td>
</tr>
<tr>
<td>Price if checked</td>
<td>Price of the item. This field appears for check box variables.</td>
</tr>
<tr>
<td>Recurring price if checked</td>
<td>Price that increments for the item, when the user requests more than one order of the item. This field appears for check box variables. For more information about prices and recurring prices, see <em>Using variables for price setup</em>.</td>
</tr>
<tr>
<td>Reference</td>
<td>Reference table for the variable. The table should have a display column specified. This field appears for reference variables.</td>
</tr>
<tr>
<td>Reference qual</td>
<td>Qualifiers to restrict data that is available in the field. Supports reference qualifiers and advanced reference qualifiers. Returns all matching results (no maximum).</td>
</tr>
<tr>
<td>Scale max</td>
<td>Highest value on the scale of available options for the variable. This field appears for numeric scale variables.</td>
</tr>
<tr>
<td>Scale min</td>
<td>Lowest value on the scale of available options for the variable. This field appears for numeric scale variables.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

<tr>
<td>Unique values only</td>
<td>Check box to require a unique value for the field. When this check box is selected, two records cannot have the same value for that field. This field appears for lookup multiple choice, lookup select box, and select box variables.</td>
</tr>
<tr>
<td>Use confirmation</td>
<td>Check box to prompt users to reenter data to verify their entries. This field appears for masked variables.</td>
</tr>
<tr>
<td>Use encryption</td>
<td>Check box to store the answer in encrypted format in the database. If not encrypted, the answer is stored in plain text format. Encryption uses Triple DES with system encryption. This field appears for masked variables.</td>
</tr>
<tr>
<td>Use reference qualifier</td>
<td>Type of qualifier to use. This field appears for reference variables.</td>
</tr>
<tr>
<td>Validation Regex</td>
<td>Regular expression that validates the variable value. This field is displayed only for Single Line Text and Wide Single Line Text variable types. To define regular expressions, see Define a regular expression for a variable.</td>
</tr>
</tbody>
</table>

**Note:**
- This field is also applicable in Service Portal.
- The max_length attribute value is valid even when the validation regex is set.
- You cannot add a catalog item with regex validation errors to the wishlist.

**Default Value**

<table>
<thead>
<tr>
<th>Default value</th>
<th>Default value for the variable.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable attributes</td>
<td>Attributes for this variable.</td>
</tr>
</tbody>
</table>

**Permission**

If no role is specified in this tab for the read, write, or create actions, all users who can access the catalog item can perform these actions irrespective of their role. For example, if no role is specified for the Write roles field, all users who can access the catalog item can edit the variable value in the variable editor.

A user with a role that does not match any of the following roles cannot set variable values even through scripting:

- These roles are not available for Label, Break, Container Split, Container End, Macro, Macro with Label, and UI Page variables.

<table>
<thead>
<tr>
<th>Read roles</th>

</tr>
<tr>
<td>Visible on Guides</td>
<td>If selected, the variable is visible when it is added to an order guide, or when it is added to a catalog item that is included in the order guide.</td>
</tr>
<tr>
<td>Visible on Summaries</td>
<td>If selected, the variable is visible on any variable summarizer of the catalog item.</td>
</tr>
<tr>
<td></td>
<td>In Service Portal, the variable is visible in the RITM ticket page and the Approval page.</td>
</tr>
<tr>
<td></td>
<td>In Now Mobile, the variable is visible in the RITM and the Approval records.</td>
</tr>
</tbody>
</table>

| Note: If an order guide has too many items and variables, consider clearing this check box on as many items as possible, to improve loading performance on order guides. |

5. Click Submit.

Access the variable in the flow by adding a Create Catalog Task or Get Catalog Variables action.

### Create a flow with an SLA Task trigger

Configure your Service Level Agreement (SLA) definition to run a flow as the action plan.

- Setting up an application in Guided Application Creator to store Flow Designer content.
- Role required: flow_designer or admin

An SLA Task trigger only runs when a task record matches the conditions of a Service Level Agreement (SLA) definition. For example, you can run a flow whenever an incident record matches the Priority 1 resolution (8 hour) SLA Definition.

1. Navigate to Flow Designer > Designer.
3. On the form, fill in the fields.
Flow Properties form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify your flow. The system computes the internal name of the flow from the name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create your flow in. Global is the default.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of your flow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Selection to specify if the flow is read-only. You can only select a value when you create the flow in an application scope that you own.</td>
</tr>
<tr>
<td>Run As</td>
<td>Selection to specify if the flow runs as system user or the user who initiates the session. Select the user who initiates the session option when updates should come from the user who triggered the flow. For example, when you want incident record comments to come from the current user, or approval emails to originate from the approver. Run As settings for a flow don't apply to child subflows. The system runs flow actions as the user who initiates the flow. Verify that all users who can trigger a flow have the necessary security access to run its actions. The initiating user also determines user-specific settings such as date/time formats. <strong>Note:</strong> Inbound email flows ignore this setting and always run as the user who initiates the session. To test access controls for an inbound email flow, impersonate a typical inbound email user and manually trigger the flow.</td>
</tr>
</tbody>
</table>

4. Select Submit. The system displays the Flow Designer page.

5. Select Select to add a Trigger > Application > SLA Task.

6. Add actions, subflows, and flow logic to the flow.

Add SLA Percentage Timer actions to specify what to do when a task record attached to an SLA reaches specific percentages of completion.

7. Test the flow. Once behaving as desired, activate the flow.

For more information, see Test a flow and Activate a flow.

8. Create an SLA definition
   a) In the Flow field, select the SLA Task flow you previously created.

   **Note:** The Flow field only displays flows with an SLA Task trigger.

   b) Click Submit.

When the SLA Definition conditions are true, the system runs the specified SLA task flow.

**Test a flow**

Before activating a flow so other users can access it, test to make certain it works the way you expect.

Role required: flow_designer or admin.

Testing a flow bypasses the flow trigger conditions to run it with sample data, which you provide. For example, testing a flow with a record Created trigger causes the system to act as if the selected record was created. For a list of data pills available by trigger type, see Flow trigger types.

1. If necessary, navigate to Flow Designer > Designer, then double click the row for the flow you want to test.
2. If necessary, save the flow.
3. Select Test.
   The system displays the Test flow dialog. The contents of the Test flow dialog depend on the type of trigger.

4. If the flow has a record trigger, create or select a record to use for the test.

To create a record, select the Create new record button.

5. If the flow has a record updated or Created or Updated trigger, specify which fields and values changed in the update.

To specify a field value change, select the Create new changed field button for each field whose value you want to change. Complete the changed field details for each changed field.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Name</td>
<td>The field updated by the test.</td>
</tr>
<tr>
<td>Previous Value</td>
<td>The field value prior to the update.</td>
</tr>
<tr>
<td>Current Value</td>
<td>The field value after the update.</td>
</tr>
<tr>
<td>Previous Display Value</td>
<td>The field display value prior to the update.</td>
</tr>
<tr>
<td>Current Display Value</td>
<td>The field display value after the update.</td>
</tr>
</tbody>
</table>

6. Select Run Test.
   The system tests the flow.

7. Select Flow has been executed. To view the flow, click here.
   The system displays the flow execution details for the test.

Review the Flow execution details.

Activate a flow
Activate a flow to make it available to other users.
Role required: flow_designer or admin
When you save a flow, you can test it, but no other users on the instance can see or run it. To make the flow available to other users, activate it.

1. Navigate to Flow Designer > Designer.
2. Locate the flow you want to activate from the list of saved flows and open it.
3. Click Activate.

Edit a flow
Edit an existing flow.
Role required: flow_designer or admin

1. If necessary, navigate to Flow Designer > Designer, then double click the row for the flow you want to edit.
   The system displays the flow designer page.
2. Take the appropriate actions to edit the flow.
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change the flow name or description</td>
<td>Click <strong>Edit Properties</strong>, enter the values you want into the appropriate fields, then click <strong>Update</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You cannot change the scope of an automationHub flow after you have saved it.</td>
</tr>
<tr>
<td>To edit the trigger</td>
<td>Click the trigger description, fill in the fields as desired, then click <strong>Done</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Modifying triggers can result in the deletion of referenced action configurations.</td>
</tr>
<tr>
<td>To edit an existing action</td>
<td>Click the action description, fill in the fields as desired, then click <strong>Done</strong>.</td>
</tr>
<tr>
<td>To add a new action</td>
<td>Click the plus icon in the ACTION section then proceed as you would for adding an action to a new flow.</td>
</tr>
</tbody>
</table>

3. To save your changes, click **Save**.

### Delete a flow

Delete a flow that you no longer need.

Role required: flow_designer or admin

You can only delete records that are in the same application scope as the current session.

1. If necessary, navigate to **Flow Designer > Designer** to display the flow designer page.
2. Check the selection box for the row corresponding to the flow you want to delete.
3. Click **Actions on selected rows . . .**, then click **Delete**.

### Allow flow designers to dynamically set field values

Enable flow designers to dynamically set field values when adding the subflow or action to a flow. For example, allow flow designers to set the priority and short description of a Create Task action.

A dynamic field can only be created in a subflow action or action step that creates or updates a record, such as Create Catalog Task, Create Task, Create Record, and Update Record.

Role required: admin or action_designer

When creating or updating a record in a subflow action or action step, you can set static or dynamic values. A static value is the same every time a flow runs. A dynamic value allows a flow designer to change it every time a flow runs. For example, setting the Urgency to the static value 1 - High generates an urgent catalog task every time the flow runs.

1. Open an action in Action Designer or a subflow in Flow Designer that you want to create a dynamic value for.
2. Create an input.
   a) In the **Label** field, enter a label to help flow designers understand the purpose of the field. This is the label for the field when the flow designer adds the subflow or action to a flow. For example, enter Select fields.
   b) In the **Type** field, select Template Value. Select the table containing the record you will create or update. For example, if you are adding a Create Catalog Task action in a subflow, set the Type to Template Value.Requested Item [sc_req_item].
3. Add an action step or action that will use the template value.
   The action step or action must create or update a record. For example, add a Create Task action to a subflow that will create an incident task.

4. Drag the Template Value data pill into the Field Values or Fields field.

5. Optional: Add static values in addition to the dynamic field by selecting + Add Field Value.

   **Note:** Avoid setting static values that you want flow designers to set from the dynamic field. The flow always uses the static value from the subflow or action step over a value entered from a dynamic field. You can use static values to enforce business policies that you do not want flow designers to change.

When the subflow or action is added to a flow, a flow designer can set field values for the record being created or updated.

---

**View activated flows for a table**

View flows with record-based triggers that run on a specific table.

Role required: flow_designer or admin

1. Navigate to a table.
2. Right-click the form header and select Configure > Flow Designer Flows.
The Flows table opens and displays all flows that have been activated to run on the specified table.

**Actions**

Actions can be added to any flow, enabling process analysts to automate Now Platform features without having to write code.

An *action* is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the **Create Record** action allows process analysts to generate records in a particular table with particular values when certain conditions occur. ServiceNow core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to pre-set configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

In Flow Designer, a process analyst adds actions to a flow and defines the configuration options.

**ServiceNow Core actions**

A *ServiceNow core action* is a ServiceNow-provided action available to any flow that cannot be viewed or edited from the Action Designer design environment. For example, the **Ask for Approval** action is a ServiceNow core action that allows process analysts to use Now Platform approvals. Flow Designer provides a set of ServiceNow core actions to automate Now Platform processes. You can add application-specific ServiceNow core actions by activating the associated spoke.

**Custom actions**

Using a core action enables the process analyst to configure the desired behavior within the flow. To create an action with a pre-set configuration, or to define custom configuration options, a subject matter expert can create a custom action in **Action Designer**.

**Action limit**

By default, flows can have no more than 50 actions. To change the default behavior, increase the value of the `sn_flow_designer.max_actions` system property. However, consider the performance impact that a large flow may have on your instance.

**Add Worknote Link to Context action**

Add a journal field entry containing a link to the current flow context record. Use the link to view the flow execution details of the current flow. You can add a flow context link to any record that has a journal field.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record. For example, the Task table.</td>
</tr>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record. For example, the trigger record.</td>
</tr>
<tr>
<td>Journal Field</td>
<td>The journal field to insert the link to the flow context record. For example, the work notes field of a task record.</td>
</tr>
<tr>
<td>Additional Comments</td>
<td>The text you want to add to the journal field in addition to the link to the flow context record. For example, the name of the flow run.</td>
</tr>
</tbody>
</table>

Ask for Approval action

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

*Approvals* is a platform feature that enables users or groups to approve or reject a task.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panell and drag the record pill into the Record field. If selecting a table with an approval field already configured, the Approval field is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval.</td>
</tr>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Rules    | Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:  
  - Anyone approves  
  - All users approve  
  - All responded and anyone approves  
  - % of users approve  
  - # of users approve  
  
In the field beside the approval rule, add the desired approvers. To add approvers:  
  - Select individual users or groups.  
  - Drag-and-drop or select a field from a record.  
  
Select to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list.  

Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.  

**Note:** If you set an approval rule with no rejection rule (or vice versa) and the expected approval state is not met, the runtime value will be canceled.  

| Due Date | Define a due date to ensure that the flow does not remain in a waiting state if the request is not approved or denied.  
  - None: The approval is not dependent on a specific date.  
  - Approve: Automatically approve the step if an action is still pending by the specified date.  
  - Reject: Automatically reject the step if an action is still pending by the specified date.  
  - Cancel: Automatically cancel the step if an action is still pending by the specified date. |
Example

**TRIGGER**

[Incident] Created or Updated

---

**ACTION**

1. **Ask For Approval**

<table>
<thead>
<tr>
<th>Action</th>
<th>Ask For Approval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Trigger ➔ Incident Record 👎</td>
</tr>
<tr>
<td>Table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Approval Field</td>
<td>Approval</td>
</tr>
<tr>
<td>Journal Field</td>
<td>Approval history</td>
</tr>
</tbody>
</table>

**Rules**

- Approve  When: Anyone approves  Trigger ➔ Incident Record ➔ Assigned to ➔ Manager 👎
- Reject   When: Anyone rejects   Trigger ➔ Incident Record ➔ Assigned to ➔ Manager 👎

**Due Date**

- Approve ➔ if pending by Relative date ➔ 1 ➔ Days ➔ From ➔ Trigger ➔ 8-5 weekdays 👎

</tr>
</tbody>
</table>

**Associate Record to Email action**

Associate a record with an Email [sys_email] record so that you can track which record is affected by the email.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Email [sys_email] record that the Target Record associates with.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Record to associate to the email record</td>
</tr>
</tbody>
</table>

**Output**

- This action updates the **Target** field on the Email [sys_email] record.

**Example**

In the following example, a process owner adds the Associate Record to Email action under an inbound email trigger. The user has also added a Create Catalog Task action in the flow. In the **Email Record** field, the user selects to associate a record to the email that triggered the flow. In the **Target Record** field, the user selects to associate the Catalog Task [sc_task] record that is created in the Create Catalog Task action.
Create Catalog Task action

Creates a record in the Catalog Task [sc_task] table associated to a requested item in the Requested Items [sc_req_item] table. Adds the catalog task record as data to be used in the flow.

Roles and availability

• Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
# Fields

<table>

<tr>
<td>Catalog Variables</td>
<td>Select catalog variables to show on the catalog task form to provide more information or allow the fulfiller to modify the variables. You can define flow-specific variables that are displayed in the Available list. To define flow-specific variables, see Create flow Service Catalog variables.</td>
</tr>
</tbody>
</table>
Example

**TRIGGER**

- [Service Catalog]

**ACTIONS**

1. **Create Catalog Task**
   - **Action**: Create Catalog Task
   - **Table Name**: Catalog Task [sc_task]
   - **Requested Item [Requested Item]**: Trigger > Requested Item Record
   - **Short Description**: Order from vendor or move from in-stock inventory
   - **Fields [Catalog Task]**: + Add Field Value
   - **Wait**: ✔
   - **Template Catalog Item [Catalog Item]**: Apple iPhone 5
   - **Catalog Variables**:
     - **Available**:
       - data_plan
       - color
     - **Selected**:
       - storage
       - carrier
       - duration

[Controls: Delete, Cancel, Done]
Create Record action

Creates a record on any table. You can dynamically add and configure fields for the record.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the values of fields in the record to be created. For example, to set the short description to a certain value, select Short description and set the desired value. If adding the action to a subflow, you can Allow flow designers to dynamically set field values.</td>
</tr>
</tbody>
</table>

Create or Update Record action

Create or update a record in a ServiceNow table using a single action. Update a record that exists, or create a record using the values provided.

Identification of existing records

The Create or Update Record action identifies existing records by searching for matching values in the fields that you select as unique identifiers. For example, you can specify that the short description and priority fields uniquely identify an incident. When the action finds an incident with a matching short description and priority, it updates the matching record rather than creating a new record.

Note:

- If no field is selected as a unique identifier, the action creates a record with the field values provided.
- If more than one record matches the value of the unique identifiers, the action doesn't update any records and displays an error message in the flow execution details.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Table in which a record is created or updated.</td>
</tr>
<tr>
<td>Fields</td>
<td>Values of fields in the record to be created or updated.</td>
</tr>
<tr>
<td></td>
<td>If adding the action to a subflow, you can <em>Allow flow designers to dynamically set field values</em>. Dynamically set field values can trigger server-side validation rules such as data policies, business rules, and dictionary-defined mandatory fields, but cannot trigger UI policies.</td>
</tr>
<tr>
<td>Determines uniqueness</td>
<td>Option for selecting the field as a unique identifier. This field appears when the required table name and fields are selected.</td>
</tr>
</tbody>
</table>

Create Task action

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

### Field Values
Set the values of fields in the task to be created. For example, to set the short description to a certain value, select **Short description** and set the desired value. To associate the task with a parent record, define the **Parent** field.

If adding the action to a subflow, you can **Allow flow designers to dynamically set field values.**
**Wait**  
Waits to complete the action until the task completes and is no longer active (active=false). Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the **Wait** field. The flow only waits for the task to complete when the condition field is true.

---

**Copy Attachment action**  
Copies an attachment from the Attachments [sys_attachment] table to a target record.

**Roles and availability**  
- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Note:** Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Attachment Record [Attachment]</td>
<td>Select an attachment record from the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Select a record to attach the <strong>Source Attachment Record</strong> to, or drag a Record data pill from the data pane.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table from the list to select a Target Record.</td>
</tr>
</tbody>
</table>

**Delete Attachment action**  
Removes one or all attachments associated with a record and deletes the attachment record from the Attachments [sys_attachment] table.

**Roles and availability**  
- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Record</td>
<td>Drag a Record data pill from the data pane to delete one or all attachment records from.</td>
</tr>
<tr>
<td>Table</td>
<td>Automatically populates with the <strong>Source Record</strong> table.</td>
</tr>
</tbody>
</table>
Field | Description
---|---
Attachment File Name | Enter the name of the attachment file to delete a single attachment associated with the selected record.

**Note:** If a record has multiple attachments with the same name, all matching attachments are deleted.

Delete All Attachments? | Select to delete all attachments associated with the selected record.

**Delete Record action**

Deletes a record on any table.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
</tbody>
</table>

**Get Attachments on Record action**

Access the list and count of the attachments associated with the provided source record as data pills in a flow. Use flow logic or scripting to process each attachment in the list of the attachments that the action returns.

**Roles and availability**

Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Name</td>
<td>Entire file name or part of the file name.</td>
</tr>
<tr>
<td>Source Record</td>
<td>Record as a data pill from the data pane or the record that the attachment is associated with.</td>
</tr>
</tbody>
</table>

**Get Catalog Variables action**

Access Service Catalog variables as data pills in a flow.
Roles and availability

Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Submitted Request [Requested Item]</td>
<td>Submitted request from any ServiceNow table.</td>
</tr>
<tr>
<td>Template Catalog Item [Catalog Item]</td>
<td>Item from the Catalog Items [sc_cat_item] table to populate the Catalog Variables list with the associated variables.</td>
</tr>
<tr>
<td>Catalog Variables</td>
<td>Catalog variables to be displayed in the data panel. Select variables or single-row variable sets.</td>
</tr>
</tbody>
</table>

**Note:** For optimal performance, avoid selecting Masked variables.

You can define flow-specific variables that are displayed in the Available list. To define flow-specific variables, see [Create flow Service Catalog variables](#).

Get Email Header action

Access an email header value as a data pill in a flow.

Roles and availability

- Available as a Flow Designer core action. Process analysts use the flow_designer role to add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Record from the Email [sys_email] table.</td>
</tr>
<tr>
<td>Target Header</td>
<td>Header from the email record. Upon completion of the action, the header value is added as a data pill in the flow.</td>
</tr>
</tbody>
</table>

**Note:** If multiple headers have the same name, the action gets the value of the first header that appears.

Example

In the following example, a process owner adds the Get Email Header action under an inbound email trigger. In the Email Record field, the user selects to get an email header from the email that triggered the flow. In the Target Header field, the user selects to get the Subject header from the email.
Log action
Logs a message in the Flow Designer log table.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Warn</td>
</tr>
<tr>
<td></td>
<td>• Info</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

Look up email attachments action
Look up files that are attached to an email so that you can perform an action on the files.
Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email record</td>
<td>Record from the Email [sys_email] table. For example, select the email record from the flow trigger. After you select an email record, the related Email Attachment [sys_email_attachment] record and its fields become available as data pills.</td>
</tr>
</tbody>
</table>

Output

- This action generates a list of Email Attachment [sys_email_attachment] records, which list the attachments that are associated with a given email record. To perform an action on an attachment, add flow logic that runs for each Attachment pill under the Email Attachment Record pill. For more information, see For each flow logic.

Example

In the following example, a process owner adds the Look up email attachments action under an inbound email trigger. In the Email record [Email] field, the user selects to look up files that are attached to the email that triggered the flow.

![Diagram of a process flow](image-url)
Look Up Record action

Look up a record from any table based on defined conditions.

Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to be met by the returned record. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format <code>[reference field][is][Reference type data pill-&gt;Sys ID]</code>. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition <code>[Requested by][is][Trigger-&gt;incident record-&gt;Caller-&gt;Sys ID]</code>.</td>
</tr>
<tr>
<td>Order by</td>
<td>Determines how to sort results when more than one record matches the defined conditions. Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>If multiple records are found</td>
<td>Determines what is returned if more than one record matches the defined conditions.</td>
</tr>
<tr>
<td></td>
<td>• Return only the first record</td>
</tr>
<tr>
<td></td>
<td>• Fail the step</td>
</tr>
</tbody>
</table>
Example

Look Up Records action
Look up multiple records on any table using defined conditions.

Roles and availability

• Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Conditions to be met by the returned records.</td>
</tr>
<tr>
<td></td>
<td>When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format <code>[reference field][is] [Reference type data pill-&gt;Sys ID]</code>. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition <code>[Requested by][is][Trigger-&gt;incident record-&gt;Caller-&gt;Sys ID]</code>.</td>
</tr>
<tr>
<td>Order by</td>
<td>Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>Max Results</td>
<td>Maximum number of results returned.</td>
</tr>
</tbody>
</table>
### Lookup Attachment action

Looks up an attachment associated with a record and returns the Attachment Sys ID as a data pill.

### Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Note:** Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Name</td>
<td>Enter the name of the attachment to look up.</td>
</tr>
<tr>
<td></td>
<td>If the record includes multiple attachments with the same file name, the system returns the first Sys ID encountered.</td>
</tr>
<tr>
<td>Source Record</td>
<td>Drag a Record data pill from the data pane, or select the record that the attachment is associated with.</td>
</tr>
</tbody>
</table>

Move Attachment action

Associates a record from the Attachment [sys_attachment] table with a target record. Removes the attachment from any other associated records.

Roles and availability

• Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Note: Server-side validation rules, such as data policies, business rules, and dictionary-defined mandatory fields are enforced. UI policies do not apply.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Attachment Record [Attachment]</td>
<td>Select an attachment record from the Attachments [sys_attachment] table.</td>
</tr>
<tr>
<td>Target Record</td>
<td>Drag a Record data pill from the data pane to attach the Source Attachment Record to.</td>
</tr>
<tr>
<td>Table</td>
<td>Automatically populates with the Source Record table.</td>
</tr>
</tbody>
</table>

Move Email Attachments to Record action

Move attachments from an email to a record so that the files are available to your users when they view the record.

Roles and availability

• Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Record</td>
<td>Email [sys_email] record to move attachments from.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Record</td>
<td>Record to move attachments to.</td>
</tr>
</tbody>
</table>

### Output

- This action updates the Email Attachment [sys_email_attachment] record. The **Action** field changes to **Attached to Target Record**.

### Example

In the following example, a process owner adds the **Move Email Attachments to Record** action under an inbound email trigger. The user has also added the **Create Catalog Task** action in the flow. In the **Email Record** field, the user selects to move attachments from the email that triggered the flow. In the **Target Record** field, the user selects to move email attachments to the Catalog Task [sc_task] record that is created in the Create Catalog Task action.

#### TRIGGER

- **Inbound Email**

#### ACTIONS

1. **Create Catalog Task**
2. **Move Email Attachments to Record**

**Action**  

- **Email Record**  
  - Trigger > Email Record
- **Target Record**  
  - 1 > Catalog Task

### Send Email action

Send an email to specified users or groups as an action in a flow.
Roles and availability

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Record</td>
<td>Record that the email is associated to. When a user sends a reply to your email, the target record is updated with the reply email content.</td>
</tr>
<tr>
<td>Table</td>
<td>Table of the target record.</td>
</tr>
<tr>
<td>Include Watermark</td>
<td>Option to apply a watermark to the email that is sent. To include a watermark, you must set a target record.</td>
</tr>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field, such as a User record. For example, if your action involves an incident record and you want to send an email to the group assigned to the incident, drag the [Assignment group] data pill from the data panel.</td>
</tr>
<tr>
<td>CC</td>
<td>Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>BCC</td>
<td>Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>Subject</td>
<td>Subject of the email. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
<tr>
<td>Body</td>
<td>The content of the message body. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

Note: Flow Designer does not support the ${URI} parameter for creating a link to a record in the email message body. Instead, consider inserting the information from the record in the email body using data pills, or create a notification step.

Testing the email action

To verify that the email was generated when testing the action, review the email record in the Email [sys_email] table. The Headers field indicates whether the email was successfully generated. For example:

```
X-ServiceNow-Source:FlowDesigner-9ad2747db0b710300f4eb8bf637673a1e
Message-ID:<193756824.0.1508534586438@[10.0.66.70]>
X-ServiceNow-Generated: true
```
ACL restrictions apply to the Send Email action. If you configured your flow to run as the user who initiates the session, ensure that the user has access control to send email. To test access controls for a Send Email action, impersonate a typical email sender and manually trigger the flow.

**SLA Percentage Timer action**

Identify when a task SLA record reaches a specific percentage value and perform other actions or flow logic that is based on the SLA percentage. For example, send a notification when an SLA percentage timer completes.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for percentage</td>
<td>The positive integer percentage of the total SLA duration used to compute an end time. For example, a 50% percentage results in the system computing an end date-time value that is 50% of the total SLA duration. If an SLA requires tasks to be completed within 24-hours, then 50% of that SLA would be 12 hours.</td>
</tr>
</tbody>
</table>

**Scheduled End Date/Time**

The **Scheduled End Date/Time** data pill lists when the SLA percentage timer action is expected to end.

- If the end date is in the future, the system creates a system event to continue running the action at that future date. While the system waits for the scheduled end date, it pauses the flow and action.
- If the end date is in the past, the system immediately sets the **Status** of the SLA Percentage Timer action.

**Status**

The **Status** data pill contains the result of the SLA percentage timer.

**SLA Percentage Timer status descriptions**

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Completed</td>
<td>The timer action reached its scheduled end date/time. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Paused</td>
<td>The timer was paused before its scheduled end date/time. If the timer resumes running, Flow Designer generates a new scheduled end date/time value. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Repair</td>
<td>The flow is running in repair mode, and the scheduled end date/time is in the past. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Status</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Skipped</td>
<td>The timer did not run because the scheduled end date/time is in the past. Flow designers can build specific flow logic for this action status.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The timer is running and has yet to reach the scheduled end date/time.</td>
</tr>
</tbody>
</table>

Flow Designer sets the action status when the SLA state matches an *SLA condition* or when certain UI actions are selected.

**Action status set for SLA state**

<table>
<thead>
<tr>
<th>SLA state</th>
<th>Action status set</th>
<th>Flow run state</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLA attaches and the scheduled end date/time is in the future.</td>
<td>Set action status to <em>Waiting</em>.</td>
<td>The flow waits until the SLA timer completes, is cancelled, or is paused.</td>
</tr>
<tr>
<td>SLA attaches and the scheduled end date/time is in the past.</td>
<td>• If the flow was started in Repair mode, set action status to <em>Repair</em>. • Otherwise, set action status to <em>Skipped</em>.</td>
<td>The flow runs the next action or flow logic in the flow sequence.</td>
</tr>
<tr>
<td>SLA Cancels.</td>
<td>Set action status to a null value.</td>
<td>The flow stops with a state of <em>Cancelled</em>.</td>
</tr>
<tr>
<td>SLA Pauses.</td>
<td>Set action status to <em>paused</em>.</td>
<td>The flow waits until the SLA Task flow is cancelled or is resumed.</td>
</tr>
<tr>
<td>SLA reaches Scheduled End Date/Time.</td>
<td>Set action status to <em>Completed</em>.</td>
<td>The flow runs the next action or flow logic in the flow sequence.</td>
</tr>
<tr>
<td>SLA Resumes.</td>
<td>Set action status to <em>Waiting</em>.</td>
<td>The flow waits until the SLA timer completes, is cancelled, or is paused.</td>
</tr>
<tr>
<td>SLA Stops.</td>
<td>Set action status to a null value.</td>
<td>The flow stops with a state of <em>Cancelled</em>.</td>
</tr>
</tbody>
</table>

**Total Duration**

The *Total Duration* data pill lists the total number of seconds that the action ran. The total duration is computed from the action start time and the time when the action reached the *Completed* status. Status values other than *Completed* produce a null value *Total Duration*.

**Design considerations**

Follow these design considerations when creating flows that contain SLA Percentage Timer actions.

**Add SLA Percentage Timer actions only to flows with an SLA Task trigger**

An SLA Percentage Timer action can only run when the flow starts from an SLA Task trigger. You cannot activate a subflow containing an SLA Percentage Timer action.

**Create conditional flow logic for expected Status values**
Use the value of the **Status** field as a condition for flow logic. Build flow logic for expected **Status** values such as **Completed**, **Repair**, and **Skipped**. For example, add an **If** flow logic block to send a notification when the SLA Percentage Timer has a status of **Completed**.

**Assign each SLA Percentage Timer action a unique cumulative Wait for percentage value**

Each SLA Percentage Timer action computes its own Scheduled End Date/Time using its Wait for percentage value. If you create multiple SLA Percentage Timer actions, give each action its own unique cumulative Wait for percentage value. For example, create three separate actions with different percentage complete values such as 25%, 50%, and 75% complete. Setting all three actions to the same percentage complete value such as 25% causes the timers to complete at the same time.

**Copy existing flows to make customizations**

Reduce development time by copying the default SLA flows and customizing the copies with your own logic. Select a customized flow to run from the SLA definition. See *Create an SLA definition*.

**Update Record action**

Update an existing record in a table. You can dynamically add and configure fields for the record.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set the values of fields in the record to be updated. For example, to set the short description to a certain value, select <strong>Short description</strong> and set the desired value. If adding the action to a subflow, you can <em>Allow flow designers to dynamically set field values.</em></td>
</tr>
</tbody>
</table>

**Wait For Condition action**

Pause a flow until record values match a specific set of conditions.

**Roles and availability**

- Available as a Flow Designer ServiceNow core action. Users with the flow_designer or admin role can add an action to a flow and define configuration details.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step.</td>
</tr>
</tbody>
</table>

*Note:* If this record is deleted while the flow is waiting, the flow stops waiting and continues running.

<table>
<thead>
<tr>
<th>Table</th>
<th>Read-only. Set to the table associated with the record. Confirm that the system supports Wait for Condition for your selected table.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Select the record values necessary to resume running the flow. For example, if the condition is [State][is][Closed], the flow pauses until the condition is met. Once met, the flow moves on to the next step or action. Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field.</td>
</tr>
</tbody>
</table>

Unsupported tables

The system does not support Wait for Condition for the following tables.

<table>
<thead>
<tr>
<th>Table Category</th>
<th>Table Names</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audit</td>
<td>Sys Audit [sys_audit], Audit Deleted Record [sys_audit_delete], Audit Relationship Change [sys_audit_relation], Audit Roles [sys_audit_role], Audit Relationship Change [sys_audit_relation], Audit Deleted Record [sys_audit_delete]</td>
</tr>
<tr>
<td>Email</td>
<td>Email [sys_email], Email Account [sys_email_account], Email Log [sys_email_log]</td>
</tr>
<tr>
<td>Events</td>
<td>Event [sysevent], Notification [sysevent_email_action], Stationery [sysevent_email_style], Email Template [sysevent_email_template], Inbound Email Actions [sysevent_in_email_action], Slow Event [sysevent_pattern], Event Registration [sysevent_registration], Script Action [sysevent_script_action]</td>
</tr>
<tr>
<td>Import Sets</td>
<td>Import Set [sys_import_set], Import Set Row [sys_import_set_row], Import Set Row Error [sys_import_set_row_error], Transform History [sys_import_set_run], Computer [imp_computer], Notification [imp_notification], Location [imp_location], User [imp_user]</td>
</tr>
<tr>
<td>Table Category</td>
<td>Table Names</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>JRobby</td>
<td>JRobin Database [jrobin_database], JRobin Shard [jrobin_shard], Graph Line [jrobin_graph_line], JRobin Shard Fragments [jrobin_shard_location],</td>
</tr>
<tr>
<td></td>
<td>Member [jrobin_graph_set_member], Round Robin Archive [jrobin_archive], Round Robin Data Source [jrobin_datasource], Round Robin Definition [jrobin_definition], Round Robin Graph [jrobin_graph], Round Robin Graph Set [jrobin_graph_set]</td>
</tr>
<tr>
<td>Logs</td>
<td>Log Entry [syslog], Service Portal Log Entry [sp_log]</td>
</tr>
<tr>
<td>MID Server</td>
<td>MID Server Property [ecc_agent_property], Mid Server Log [ecc_agent_log], Queue [ecc_queue], Configuration [ecc_queue_config], ECC Queue Statistics (by ECC Agent) [ecc_queue_stats_by_ecc_agent]</td>
</tr>
<tr>
<td>Performance Analytics</td>
<td>Job Log [pa_job_logs]</td>
</tr>
<tr>
<td>Record Watcher</td>
<td>Responders [sys_rw_action], Channel Responders [sys_rw_amb_action]</td>
</tr>
<tr>
<td>Reporting</td>
<td>Summary Set [sys_report_summary], Report Summary Line [sys_report_summary_line]</td>
</tr>
<tr>
<td>Scheduled Jobs</td>
<td>Schedule Item [sys_trigger], Broadcast Message [sys_broadcast_message], Broadcast Message Relationships [sys_broadcast_message_m2m], Progress Worker [sys_progress_worker], Progress Worker Domain [sys_progress_worker_domain]</td>
</tr>
<tr>

</tr>
<tr>
<td>System Events</td>
<td>Event Processor [sys_event_processor]</td>
</tr>
<tr>
<td>System Fields</td>
<td>Field Class [sys Glide_object]</td>
</tr>
<tr>
<td>System Performance</td>
<td>Component Status [sys_status], Cluster Message [sys_cluster_message], Node State [sys_cluster_state]</td>
</tr>
</tbody>
</table>
Condition Evaluation

The condition in a Wait for Condition action is evaluated only when the record in the **Record** field is updated. The conditions must be record value changes rather than a relative time period. For conditions that depend on a specific duration, consider using **Wait for a duration flow logic**.

In this example, the wait condition is valid because it is when the **Record** field is updated and the state is **Closed**.
Valid wait condition

In this example, the wait condition is invalid because it is a time relative to the `Created` date. Actions that have a condition that relies on a time interval will not be met, so the action is never performed.
Invalid wait condition
Output

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
</table>
| State | The completion status of the action as a numeric value.  
• 0 (success)  
• 1 (error) | Choice |

Design considerations

Follow these design considerations when creating flows that wait for a condition.

**Use record triggers instead of wait conditions to start flows**

If you only want a flow to run when certain record conditions are met, create a flow with a record trigger instead of starting and pausing a flow. A waiting flow consumes more system resources than a flow trigger.

**Cancel flows whose resume conditions can never occur**

Prevent your flows from waiting indefinitely by specifying flow stop conditions with *End flow logic*. To free up system resources, you can also cancel any flow whose resume conditions can never be met. For example, cancel flows waiting for incident record updates where the related incident is closed.

**Flow Designer stages**

Communicate the current stage of a request or flow with an end user.

When configuring stages in Flow Designer, you can:

• Create any number of stages.  
• Change stage labels and names.  
• Set the estimated duration for a stage.  
• Import a copy of a pre-defined stage set from the Stage Sets table. To learn more about stage sets, see *Workflow stage sets*. Any changes made to the copy do not affect the original stage set record.

While stages can be added to a flow with a scheduled trigger, the stages are never displayed to an end user because there is no associated record for the stage field. Only use stages in flows with record and Service Catalog triggers. Stages are not supported on subflows.

View the stages of a flow in the flow execution details.

**Displaying stages in a stage field**

A stage field is a field of type Workflow that displays the stages of a flow to a user. For example, the Service Catalog uses a *Stage* field to indicate progress of a request as it is processed by an associated flow or workflow.

Stage fields display:

• Stages from flows with record or Service Catalog triggers.  
• Stages from the associated flow. If the associated flow calls another flow, stages set on the child flow do not display.
• Stages from flows that have started.

State icons in stage fields cannot be modified. Limit the number of stages and the length of each stage name to represent each stage in a stage field without causing text and icons to wrap onto multiple lines.

Note: Only add one stage field per table. If there is more than one stage field, the system only displays stages from the first stage field defined in the table dictionary entry.

Stage field and trigger types

Associating a flow to a stage field depends on the flow trigger type.

<table>
<thead>
<tr>
<th>Flow trigger type</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>For a stage field to report stages on a record-based flow, a stage field must be present on the same table as the triggering record. When a flow has stages, Flow Designer communicates the status of each stage back to the triggering table and displays the current stage state as an icon. If more than one stage field exists on the table, only the first stage field defined in the table's dictionary definition is used.</td>
</tr>
<tr>
<td>Service Catalog</td>
<td>If using the Service Catalog trigger, the flow must be associated with the Service Catalog item through the Flow field. Remove any workflows associated with the item by clearing the Workflow and Execution Plan fields. The Stage field displays the current stage state on any list view of the Requested Items [sc_req_item] table.</td>
</tr>
</tbody>
</table>
Stage states

During flow execution, each stage can be in one of five states.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending</td>
<td>This stage has not yet started.</td>
</tr>
<tr>
<td>In progress</td>
<td>This stage is executing.</td>
</tr>
<tr>
<td>Skipped</td>
<td>This stage was skipped and did not run. Typically, this state is reached when a conditional flow logic block is not executed.</td>
</tr>
<tr>
<td>Complete</td>
<td>This stage is complete.</td>
</tr>
<tr>
<td>Error</td>
<td>This stage has reached an error condition.</td>
</tr>
<tr>
<td></td>
<td>When designing a flow, you can manually set the flow to report an Error state. To set an Error state:</td>
</tr>
<tr>
<td></td>
<td>• The flow must have at least one stage defined.</td>
</tr>
<tr>
<td></td>
<td>• The Error can only be set within a stage. When an Error condition is reached, the current stage is set to Error.</td>
</tr>
<tr>
<td></td>
<td>• The Error can only be set within a conditional flow logic block.</td>
</tr>
<tr>
<td></td>
<td>While setting the Error state does not affect flow execution, it communicates to the user that the state of the current stage is Error. For example, if an approval is not approved within the required limit you may want to communicate an error to the user.</td>
</tr>
</tbody>
</table>

Each stage can have its own custom state labels. For example, suppose that you have a flow with two stages. Stage 1 could have the Pending state with the label Waiting, and Stage 2 could have a Pending state with a label of Not yet started. Flow Designer provides options to generate either the default states or approval states.

Design considerations

Follow these design considerations when creating flows with stages.

**Avoid defining stages that depend upon changes within a For Each flow logic block**

Flow Designer prevents you from adding stages within a For Each block. You can only add stages before or after a For Each block.

**Avoid having multiple flows with stages on the same table**

A stage field always displays the stage information provided by the last flow to run on a table or record. If multiple flows run on the same records, then the stages defined in one flow can in theory overwrite the stages from another flow. To avoid multiple flows overwriting each other's stages, define unique trigger conditions for each flow.

**Ensure multiple flows on the same table have unique trigger conditions**

Adding unique trigger conditions to each flow ensures the flows only run under those conditions and prevents the stages from one flow overwriting the stages of another flow. Specifying unique trigger conditions makes it easier to troubleshoot flows by limiting the number of flow executions that can produce record changes.

**Use error stages to communicate with the user**

The flow error state does not affect flow execution. A flow will continue running even if it reaches an error stage. Use a conditional flow logic block to set the error stage and communicate to the user that the state of the current
stage is Error. For example, if an approval is not approved within the required limit, you may want to communicate an error to the user.

**Use the error stage to stop processing a flow**

Use a conditional flow logic block to identify when the stage is error and stop processing the flow or take some kind of remediation action. For example, you may want to change a record state or assignment when a flow reaches an error state.

**Configure stages and add them to a flow**

Configure when stages display to a user, define stage state labels, and add stages to a flow within Flow Designer.

While stages can be added to a flow with a scheduled trigger, the stages are never displayed to an end user because there is no associated record for the stage field. Only use stages in flows with record and Service Catalog triggers.

**Role required:** flow_designer or admin

1. **Optional:** If not already present, create a stage field on the table that triggers the flow. A stage field is a field of type Workflow that displays the stages of a flow to a user. The Service Catalog Requested Items [sc_req_item] table has a stage field by default.
   
   For a stage field to report stages on a record-based flow, a stage field must be present on the same table as the triggering record.
   
   To add a field to a table, see *Add and customize a field in a table.*

2. **Optional:** If adding stages to a flow with a Service Catalog trigger, select the flow in the **Flow** field of the Service Catalog Item [sc_cat_item] table.
   
   If using the Service Catalog trigger, the flow must be associated with the Service Catalog item through the **Flow** field. Remove any workflows associated with the item by clearing the **Workflow** and **Execution Plan** fields. This enables a request for a catalog item to initiate a flow specific to that catalog item.

3. **Open the flow in Flow Designer.**

4. **Optional:** Create and configure stages in the More Actions menu. Alternatively, you can create stages within the flow itself.
   
   a) Click ![Stages](image.png) and select **Stages.**
   
   The Flow Stages / State menu opens.

   b) Click **New Stage** to add a new stage and configure the stage options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name for the stage. Must be unique.</td>
</tr>
<tr>
<td>Value</td>
<td>Internal name for the stage. Must be unique.</td>
</tr>
<tr>
<td>Duration</td>
<td>Estimated duration displayed to the user.</td>
</tr>
<tr>
<td>Always Show</td>
<td>If selected, the stage always displays in the stage field, even if the stage is set within a flow logic block that might not execute.</td>
</tr>
</tbody>
</table>

   c) **Optional:** Select a stage set to import from the Stage Sets table.
   
   To learn more about stage sets, see *Workflow stage sets.* Any changes made to the copy do not affect the original stage set record.

5. **Point to a location in the flow and click **Add a Stage.** Select a stage or click + to add a new stage inline. Stages can be applied at the beginning of any Flow Designer action or flow logic block, or within an If block. Stages are not supported within a For Each flow logic block.
6. Optional: Set a stage to the Error state within a conditional flow logic block.
   a) Point to a location and select **Set "Error" State**.

To set a stage to the Error stage:

- The flow must have at least one stage defined.
- The Error can only be set within a stage. When an Error condition is reached, the current stage is set to Error.
- The Error can only be set within a conditional flow logic block.

When the flow reaches the indicated point, the currently executing stage is set to Error in the stage field.
In a flow with a record-based trigger, Flow Designer communicates the status of each stage back to the triggering table and displays the current stage state as an icon. In a flow with a Service Catalog trigger, the **Stage** field displays the current stage state on any list view of the Requested Items [sc_req_item] table.

**Flow execution details**

View runtime information about an action or flow directly from the design environment such as the current state, actions or steps run, and values produced. Open related records from embedded Now Platform editors or in a new tab.

Each time a flow or action runs, the system stores information about the configuration and runtime values produced, which process analysts can view from the Flow Designer design environment **Flow Executions** tab. Select a flow execution to open its associated execution details page.

**Note:** To avoid performance issues, turn off reporting during production with the `com.snc.process_flow.reporting.level` system property. For more information, see *Flow Designer system properties.*
Sample execution details of the VTB Sample Flow

Each execution details page displays:
Calling source

The calling source lists what started a flow or subflow.

<table>
<thead>
<tr>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow Designer Test</td>
<td>The flow started because a user selected the <strong>Test</strong> option from the Flow Designer interface. The flow trigger conditions were ignored.</td>
</tr>
<tr>
<td>CRUD Trigger</td>
<td>The flow started when the record-based trigger conditions were met.</td>
</tr>
<tr>
<td>Date Trigger</td>
<td>The flow started when the schedule-based trigger conditions were met.</td>
</tr>
<tr>
<td>Metric Trigger</td>
<td>The flow started when the MetricBase trigger conditions of a <strong>MetricBase</strong> were met.</td>
</tr>
<tr>
<td>Service Catalog Trigger</td>
<td>The flow started when a Service Catalog item was requested.</td>
</tr>
<tr>
<td>Script</td>
<td>The flow started from an API method call in a script, such as a business rule.</td>
</tr>
<tr>
<td>Background Script</td>
<td>The flow started from an API method call in the <strong>Scripts - Background</strong> module.</td>
</tr>
</tbody>
</table>

Flow state

All active flows are in one of these states.

**Completed**
The flow successfully ran all actions. The flow statistics display configuration and run-time details for each action.

**Waiting**
The flow paused on an action that is waiting for some condition to be met before continuing. The flow statistics display configuration and run-time details for completed actions and configuration details for any actions waiting for a condition to be met. Flows in the Waiting state display a **Cancel Flow UI** action in the header.

**Error**
The flow stopped with an error. The flow statistics display configuration and run-time details for completed actions and configuration details for the action that produced the error. Flows in the Error state display a **Go to error UI** action in the header.

Related record options

From the Execution details page, you can access records related to the current flow.

**Refresh Flow Data**
Use this option to update flow runtime data.

**Open Flow**
Use this option to make configuration changes and publish a new instance of the flow. Changing the flow configuration does not change any currently active flow.
Open Context Record

Use this option to view the flow state, run duration, and related log entries from a standard form view. This option opens the context record in a new tab.

Open Flow Logs

Use this link to view detailed log information about each action. This link opens the log entries list in a new tab.

Open Current Record

For flows that have a record-based trigger, use this link to view the triggering record in a pop-up window.

Open Action

Use this link to make configuration changes and publish a new instance of the action. Changing the action configuration does not change any currently active flow. This link is unavailable for ServiceNow-provided core actions.

Flow statistics

Use flow statistics to see configuration details and run-time values for each flow component. Clicking a trigger or action expands the row and displays configuration and run-time details about it.

</tbody>
</table>

**No Logs**

**Steps**
The following types of execution details are available.

**Integration Metadata**

Use Integration Metadata to view transaction data such as connection and credential used, target host, and payload size. Integration Metadata only displays for integration steps and requires a separate IntegrationHub subscription. For more information, see Integration steps.

**Configuration Details**

Use the list of input variables to identify any configuration errors with the action. Each variable has its own row displaying its name, data type, configuration settings, and run-time value. The configuration settings display dynamic values as pills. The run-time values display generated records as a link.

**Output Data**

Use the list of output variables to identify any configuration errors with the action.

**Logs**

Use the log entries to identify potential processing or performance issues. Each log entry has its own row displaying the creation date, log level, and log message. If the action does not generate any logs, the statistics displays the string No Logs.

**Steps**

Use the list of steps to identify any configuration errors with the action. Each step has its own row displaying the variable name, data type, configuration settings, and run-time value. Core actions do not display steps because users cannot change their configuration.

Change the com.snc.process_flow.reporting.serialized.val_size_limit system property to truncate runtime values in the flow execution details step configuration. To learn more, see Flow Designer system properties.

**Run duration**

Use the run duration to identify potential processing or performance issues. Each action and step displays the duration in milliseconds. System quota rules prevent any action from running longer than a minute.

**Embedded text viewer**

Flow Designer displays large text-based configuration and runtime output records such as email output, XML payloads, or script steps using an embedded text viewer. The embedded text viewer can format text as HTML, plain text, or color-coded JavaScript. For script steps, the text viewer highlights code lines containing errors.
Error: missing ; before statement (Process Automation.05c45050db5e8300efc57416bf961939; line 4)

(function execute(inputs, outputs) {
    var vtblane = new GlideRecord('vtb_lanee');
    vtblane.addQuery('board', inputs.vtblBoard.sys_id)
    vtblane.query();
    vtblane.next();

    var vtblcard = new GlideRecord('vtb_card');
    vtblcard.task = inputs.task.sys_id;
    vtblcard.board = inputs.vtblBoard.sys_id;
    vtblcard.lane = vtblane.sys_id;
    vtblcard.insert();

    outputs.vtblCard = vtblCard;
})(inputs, outputs);
Viewing results for each item in flow logic

Flow Designer displays a selector control to view the configuration and run-time results for each item processed by flow logic. Select a record number to see its configuration and run-time details.
## Flow Designer

### Trigger
- **[Group Member] Created**

### Actions
1. **Look Up Records**
- Completed: 2017-03-18 09:03:02, Duration: 8ms
2. **For Each Item in**

3. **Send Email**
   - Completed: 2017-03-18 09:03:02, Duration: 27ms
Flow execution details retention

Due to the large amount of data used for flow designer reporting, your instance uses data retention policies to delete this data after a set time period.

Scheduled table cleanup

The time period used for scheduled table cleanup depends on the type of data stored. Once a record is older than its default retention period, it is deleted if it is in a completed state and the default skip_schedule_cleanup value is false.

Flow reporting data tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Default retention period</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_flow_action_report</td>
<td>Flow engine context action reports</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_flow_context</td>
<td>Flow context</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_flow_flow_report</td>
<td>Flow designer executions</td>
<td>6 Months</td>
</tr>
<tr>
<td>sys_flow_step_report</td>
<td>Flow engine context step reports</td>
<td>1 Week</td>
</tr>
</tbody>
</table>

Disable scheduled cleanup

The scheduled data cleanup for a flow can be disabled by setting the Skip Schedule Cleanup [skip_schedule_cleanup] field to true on the Flow engine contexts [sys_flow_context] record for the flow.

Change scheduled cleanup times

The retention periods shown in the preceding tables can be changed from their defaults by updating the Age in seconds field on the Auto Flushes [sys_auto_flush] table.

Disable reporting on a flow

Disable reporting on a flow by creating a record on the Settings [sys_flow_execution_setting] table for the flow, and setting the Reporting field to false. Navigate to Flow Designer > Settings to access this table. Create a record, and select a flow, subflow, or action. Enable or disable reporting using the Reporting field.

**Note:** Each record on the Settings table controls reporting for a single flow, subflow, or action. A setting record cannot have a value in both the Action and Flow fields.

**Note:** Setting records do not effect actions and subflows running within a parent flow. These settings are only honored when an action or subflow is run using the action API or script API. Setting records are honored for subflows executed with the Test button.

Reporting can be disabled for all flows using a system property. To disable the flow execution details, add the com.snc.process_flow.reporting.enabled system property to the System Properties [sys_properties] table and set the value to false. If disabled, details are not saved for actions in the flow. However, the flow context record and related log messages are available. If a flow runs while the property is false, execution details are never available for the flow, even if the property value changes. If a flow runs while the property is true, execution details are always available for the flow, even if the property value changes.
Settings [sys_flow_execution_setting] records override this system property. For example, set the property to false in your production instance to disable all reporting, and use setting records to enable reporting specific flows. Limiting reporting in this way can increase performance of flow execution on your instance.

Unavailable flow data

A message displays at the top of the flow report to indicate that action reports are not available for a flow because of table cleanup. The Show Action Details link and Action states are not available in this case. A similar message is shown to indicate when reporting for a flow has been disabled. In this case, a link to the report settings also displays.
Flow logic

Enable flows and subflows to specify conditional or repeated actions. Combine the elements of flow logic to create workflows in a graphical interface with little or no scripting.
The system provides these flow logic options.

<table>
<thead>
<tr>
<th>Flow logic option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If</td>
<td>Selectively apply one or more actions only when a list of conditions is met.</td>
</tr>
<tr>
<td>For each</td>
<td>Apply one or more actions to each record in a list of records.</td>
</tr>
<tr>
<td>Do the following until</td>
<td>Apply one or more actions repeatedly until an end condition is met. You can use the flow data to specify the end conditions.</td>
</tr>
<tr>
<td>Do the following in parallel</td>
<td>Run actions and subflows in separate paths within an isolated flow logic block.</td>
</tr>
<tr>
<td>Make a decision</td>
<td>You can use the decision table branching logic in situations where multiple conditional paths are required, as an alternative to nested If, Else If, or Else flow logic. For example, if you want to determine what kind of car insurance you need, you can add inputs such as your age, accident history, and car model to the decision table to determine a level of insurance coverage. This logic can save you time and present a more readable format than nested if conditions or switch case statements.</td>
</tr>
<tr>
<td>Wait for a duration of time</td>
<td>Use this flow logic to give your users time to act during automated processes or to wait for a specific date and time to complete actions.</td>
</tr>
<tr>
<td>Call a Workflow</td>
<td>Run a published and active workflow from your flow. You can use the flow data as a workflow input. For example, you can specify the current record as a workflow input.</td>
</tr>
<tr>
<td>End</td>
<td>Use this flow logic to stop a flow within flow designer.</td>
</tr>
<tr>
<td>Dynamic Flow</td>
<td>Identify and run a flow or subflow dynamically using runtime data. Build templates to provide expected inputs for dynamically called flows or subflows.</td>
</tr>
<tr>
<td>Get Flow Outputs</td>
<td>Use this flow logic to access flow contexts and derive the runtime values for dynamic flow outputs.</td>
</tr>
</tbody>
</table>

**Flow logic inputs**

Each flow logic option displays one or more fields that are used to determine its behavior. For example, the **Call Workflow** flow logic has an input where you are able to select a workflow to run. Use these inputs to define the behavior of the flow and enable optional functionality depending on your needs. See flow logic option documentation for a list of the available inputs and how they control the function of that element.

**Flow logic outputs**

Flow logic options may also have outputs. These represent information that is returned by the flow logic. For example, the **Make a decision** flow logic has an output that contains a decision answer record representing the decision reached by the flow. See the documentation for a flow logic option to see definitions for its outputs.

**If flow logic**

Selectively apply one or more actions only when a list of conditions is met.
Use this flow logic by specifying conditions that are based on the current record. Actions or subflows can be added to the flow within the if flow logic. The flow only applies the actions within this flow logic if the conditions evaluate to true. Conditions are based on data in records, such as a records state or urgency.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition label</td>
<td>Descriptive label for the branch.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions under which the branch runs.</td>
</tr>
</tbody>
</table>

**Perform an action on if an incident has a high urgency**

In this example, the action is triggered when the incident record has a high urgency value.
Execution details

1. The header shows the state, start time, and runtime for the flow logic.
2. The Configuration Details section shows the details about the variables that are used by the flow, including the type, configuration, and runtime values for each variable. Use the condition variable to see if the branch conditions were met.

For Each flow logic

Apply one or more actions to each record in a list of records.

The For Each flow logic requires a list of records to act upon. The flow applies all actions within the for each flow logic to each record in that list.

Note: Iterating over a large number of records can be resource intensive, especially when the For Each logic block includes complex actions for each iteration. To avoid performance issues, turn off reporting using the com.snc.process_flow.reporting.level system property. For more information, see Flow Designer system properties.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Items</td>
<td>Data pill that contains a list of records. For example, you could use the additional Assignee list for an incident record. For information on data pills, see Flow Designer data.</td>
</tr>
</tbody>
</table>
### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Table name] Record</td>
<td>Current record in the loop.</td>
</tr>
</tbody>
</table>

**Note:**

To optimize performance, avoid iterating over lists with more than one thousand records. If you need to iterate over large lists, divide the lists into smaller sections and use multiple flows.

You can nest a **For Each** flow logic block inside of another flow logic block to repeat an action over a series of records. However, avoid nested For Each loops that process many records. Nested loops may cause the flow to run until it is stopped by the flow transaction quota rule, which prevents flows from running longer than an hour. For more information about transaction quotas, see *Transaction quotas*.

**Send an email to each person assigned to a problem**

In this example, a flow is created to send an email to each additional assignee of a problem record when a record is created. If the **For Each** flow logic is selected, and the **Additional Assignee** data pill is dragged in from the trigger record, the **For each** logic performs actions for each user in the **Additional Assignee** field of the trigger record.

When the loop is created, a new entry appears in the Data pane on the right called **1 - For Each**. In that entry, you see an **Additional assignee list Record** data pill that contains the user information for the users in that field.

**Inputs used in for each flow logic**

In this example, you configure a flow to send an email to each user in the **Additional Assignee** field on the triggering problem record. The plus icon
below this email action is used to add additional actions, such as logging, to the loop.

**Execution details**

![Image of execution details]

The flow execution details tab provides runtime information on the flow logic.

1. The header shows the state, start time, and runtime for the flow logic.
2. This flow logic can run actions or subflows multiple times. Use the arrow keys to cycle through each of these instances to see their values.
3. The **Configuration Details** section shows which records the flow has evaluated.
4. After the **For Each** section are the actions taken within it. The values for these actions change as you cycle through the actions that are taken by this flow logic.

**Do the following until flow logic**

Apply one or more actions repeatedly until an end condition is met. You can use the flow data to specify the end conditions.
You can use **Do the following until** flow logic to create a loop that repeatedly applies actions. This flow logic requires a condition specifying when to stop the loop.

### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition label</td>
<td>Descriptive label for the loop.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions under which the loop terminates. You could, for example, end a loop when the state of an incident changes.</td>
</tr>
</tbody>
</table>

**Note:** Avoid using the same record you used to trigger the flow in your condition, because the flow populates its values when the flow starts and they remain static.

**Send a daily email until an incident is resolved**

In this example, the flow sends a daily email about the incident, until the incident is in a closed or canceled state. Inside the **Do the following** branch, there is a step for looking up the incident record. This is necessary because the record that triggers the flow is only loaded when it is triggered. By adding this look up step, you can get the current state of the incident each time the loop runs.
Outputs

This flow logic produces no outputs.
Execution details

Execution details for Do the following until

1. The header shows the state, start time, and runtime for the flow logic.
2. This flow logic can run actions or subflows multiple times until it's condition is met. Use the arrow icons to select an iteration and its values.
3. The Actions section shows details on the actions, flows, or subflows that are run during this loop iteration.

Do the following in parallel flow logic

Run actions and subflows in separate paths within an isolated flow logic block.

With this flow logic, you can run actions and subflows in separate paths. If any action within the Do the following in parallel flow logic block must wait, other actions run until all paths within the block finish processing.
Paths in a Do the following in parallel flow logic block

Note: Paths in a Do the following in parallel flow logic block do not run in multiple threads, since a flow execution context runs in a single thread. However, there may be times when you want to run flows within separate contexts even though this may consume more of your instance's resources. To run subflows in separate flow contexts within the same flow, see Dynamic flows.
Inputs

Do the following in parallel flow logic does not have field inputs. Instead, it displays a plus (+) icon that enables you to create a path with actions or subflows.

The actions and subflows in each path run until all tasks within the flow logic block have completed.

Outputs

This flow logic has no outputs, but actions and subflows in each path may have outputs. While the flow is running, outputs from a path are only accessible to other actions in the same path. After the Do the following in parallel flow logic completes, its final outputs are accessible to the rest of the flow.

Create two tasks in parallel when a change request is created

In this example, a flow triggers when a new change request is created. Using **Do the following in Parallel**, two tasks are created in separate paths and are assigned to different groups. The flow uses the **Number** field data pill from the triggering change request to display the number in the short description for the task record.
Do the following in parallel flow logic inputs
Execution details

Do the following in parallel execution details

1. The header shows the state, start time, and runtime for the flow logic.
2. The Configuration Details section shows the state, start time, and runtime for each path in the flow logic block.

Make a decision flow logic

You can use the decision table branching logic in situations where multiple conditional paths are required, as an alternative to nested If, Else If, or Else flow logic. For example, if you want to determine what kind of car insurance you need, you can add inputs such as your age accident history, and car model to the decision table to determine a level of insurance coverage. This logic can save you time and present a more readable format than nested if conditions or switch case statements.

The Make a decision flow logic requires that you create an external decision table for its branch paths. Each answer that is defined in the decision table results in a branch path within Flow Designer. Decision tables accept any number of inputs, include any number of decisions, and result in a finite set of decision paths. You can configure a decision table to determine a single path or multiple paths. For more information on decision tables, see Decision Tables.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decision Label</td>
<td>Descriptive label for the decision that you want to make. For example, you can create the Recommended Insurance Policy label if you want to determine the level of insurance coverage that you need. This value overrides the default action label.</td>
</tr>
<tr>
<td>Decision table</td>
<td>Reference to a Decision Table [sys_decision] record. This record provides the decision input answers that are available to the flow.</td>
</tr>
</tbody>
</table>
### Input

<table>
<thead>
<tr>
<th>Execution approach</th>

<tbody>
<tr>
<td>Decision answer record</td>
<td>Record that was created after the decision inputs were evaluated.</td>
</tr>
</tbody>
</table>

---

**Use make a decision flow logic to determine insurance coverage**

In this example, the flow uses a decision from the **Insurance Coverage** decision table, which an administrator had configured to determine the insurance coverage that was based on three inputs. The flow displays all the inputs that were used by the decision table in Flow Designer. These inputs can be entered manually, or by dragging data pills into the inputs from the Data pane on the right side of the screen. Below this section, the branches for each answer are shown in the decision table.

The Flow execution details tab provides runtime information about the flow logic.

1. The header shows the state, start time, and runtime for the flow logic.
2. The action shows details about the decision table configuration and inputs.
3. Each possible answer for the decision table is represented as a branch. The state field indicates whether the branch was evaluated and the evaluation result. This section also displays details about the actions that are taken within a branch. Branches that evaluate to true are highlighted in green.

Wait for a duration flow logic

Use this flow logic to give your users time to act during automated processes or to wait for a specific date and time to complete actions.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
</table>
| Duration Type | - **Explicit Duration**: Wait for a specific time period, such as 5 minutes.  
- **Relative Duration**: Wait for a specific time period from a selected Duration data pill or date/time value, such as 5 minutes after the flow start.  
- **Percentage Duration**: Type to specify a certain percentage of time duration between the start of the flow logic and specified end time.  
  
  ![Note](image) The percentage value must be from 0 through 100 only. |

| Wait for | Set this value manually or select a Duration data pill from the data pill picker ( ).  
- **Explicit Duration**: Wait duration in hours, minutes, and seconds.  
- **Relative Duration**: Wait duration in hours, minutes, and seconds before or after a specific time. Select **Relative Duration** to specify a wait duration from a specific date.  
  
  ![Note](image) Past dates don't affect the wait duration. |

You can enter a wait value of up to 999 hours.

![Note](image) The actual wait duration can vary due to the instance processing time. The flow always waits for the time that you specify for this field, but other work in the queue may add to the wait time.
<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for Percentage</td>
<td>Wait duration as a percentage of the time period between the start of flow logic and specified end time. If you select a past date for the end time, the wait duration is set to 0. This field appears when Percentage Duration is selected from the Duration Type list.</td>
</tr>
<tr>
<td>During the following schedule</td>
<td>Select the schedule used to calculate the Scheduled End date/time value from the selected wait duration. For example, waiting for a 10-hour duration as part of an 8-5 weekdays schedule causes the flow to wait for one or more business days. If you leave this field blank, the timer runs without a schedule. For information on creating schedules, see Define a schedule.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration</td>
<td>Total time that the flow ran in milliseconds. You can drag this data pill into the duration fields.</td>
</tr>
<tr>
<td>Date/time</td>
<td>Date/time that the flow completed. You can drag this data pill into the date/time fields.</td>
</tr>
</tbody>
</table>

**Close an incident if it has been in the resolved state for 10 days**

In this example, a flow starts when the incident state changes to Resolved.
### Wait 10 days after the last update to a record

In this example, the flows waits for 10 days after the incident record has been resolved.
Update a record after 10 days

In this example, the flows closes the incident record 10 days after it was resolved.
Wait for a duration of 50% of the time between the start of the flow logic and the due date

In this example, the flows send a notification email to the relevant manager when a critical problem is created and 50% of the time between the problem record creation and the problem due date has lapsed.
Relative Duration type

When the duration type is **Relative Duration**, the flow logic first evaluates the relative date and time, the schedule, and finally, the duration. Schedules, dates, and times set in the past don't affect the wait duration. This table provides examples of how the flow processes the wait duration in these scenarios.

<table>
<thead>
<tr>
<th>Duration Setting</th>
<th>Relative Date/Time</th>
<th>Schedule</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set to 0.</td>
<td>None</td>
<td>None</td>
<td>Duration ends immediately.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Past date</td>
<td>None</td>
<td>Duration ends immediately.</td>
</tr>
<tr>
<td>Duration Setting</td>
<td>Relative Date/Time</td>
<td>Schedule</td>
<td>Effect</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------</td>
<td>--------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>None</td>
<td>Flow waits for the date/time, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Past date</td>
<td>Future date</td>
<td>Flow waits for schedule, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>Past date</td>
<td>Flow waits for the date/time, and then waits for the duration.</td>
</tr>
<tr>
<td>Greater than 0.</td>
<td>Future date</td>
<td>Future date</td>
<td>Flow waits for the future date, then for the schedule, and then for the duration.</td>
</tr>
</tbody>
</table>

The timer waits for the next instance of a selected schedule. For example, if you set a schedule for Monday through Friday from 8 a.m. to 5 p.m., and the timer is initiated on Saturday, the timer waits until Monday at 8 a.m. before starting.

</tbody>
</table>

**Execution details for Wait for a duration flow logic**

1. The header shows the state, start time, and runtime for the flow logic.
2. The Configuration Details section shows details about the variables that are used by the flow, including the type, configuration, and runtime values for each variable.

**Call a workflow flow logic**

Run a published and active workflow from your flow. You can use the flow data as a workflow input. For example, you can specify the current record as a workflow input.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select a Workflow</td>
<td>Published and active workflow that you can select to run. The workflow that you select determines the records that are associated with it. If the workflow has inputs, Flow Designer displays them as additional flow inputs.</td>
</tr>
<tr>
<td>Wait?</td>
<td>Workflow that you set to true so that the flow waits for workflow completion before continuing. Only workflows that wait for completion can return certain output values to the flow. Set to false to continue running the flow separately from the workflow.</td>
</tr>
<tr>
<td>Current</td>
<td>Current record that the workflow processes. Select a data pill that contains a record from the associated workflow table.</td>
</tr>
</tbody>
</table>

**Outputs**

The flow execution details only display workflow output values that are generated while the flow is running. If you configure the flow to wait for the workflow to finish, the flow execution details can display all workflow output values. If the flow does not wait, the flow execution details only display the workflow output values that were generated before the **Call a Workflow** flow logic completes. If **Call a Workflow** completes before the workflow finishes, the workflow output values stop updating and only display the last known value.
### Output

<table>
<thead>
<tr>
<th>Description</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>State of the workflow. This value comes from the workflow context record. The state will be <strong>Complete</strong> if the workflow executes successfully. If the workflow is canceled, the workflow state is set to <strong>Canceled</strong>. If the context record is deleted prior to the workflow finishing, the workflow state is set to <strong>Invalid</strong>.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Context</th>
<th>Reference to the workflow context record.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th></th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>String that contains the result from the workflow. This value comes from the workflow context record.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>Return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>String that contains the return_value from the workflow. This value comes from the workflow context record.</td>
<td></td>
</tr>
</tbody>
</table>

### Calling the Routine Change workflow

In this example, the flow calls the **Routine Change** workflow. The **Wait?** option is checked, so the flow pauses until this workflow completes. The **Current** field is filled using a data pill representing the record that triggered this flow.
Execution details

1. The header displays a link so that you can view the workflow progress in the Workflow Editor, the flow logic state, the start time, and the runtime duration.

2. The Workflow Configuration section displays how the flow logic was configured for this flow and the runtime values that were generated.

3. The Workflow Output section displays the output that is generated by the workflow while the flow is running.

Note: If you cancel the workflow or delete the context record prior to the workflow finishing, the flow logic state is set to Complete.

End flow logic

Use this flow logic to stop a flow within flow designer.

End flow logic can be contained within a conditional flow logic block, such as an If, Else If, or Else flow logic block. Use this flow logic to stop a flow when certain conditions are met. You cannot add actions or flow logic after you use the End flow logic. All branches of a flow are ended when a flow reaches the End flow logic, including the Wait for a duration logic. Any branches that run in parallel also stop their progress when you use the End flow logic.
Inputs

This flow logic has no inputs.

Execution Details

When a flow ends, the flow state becomes Complete.

Dynamic flows

Identify and run a flow or subflow dynamically using runtime data. Build templates to provide expected inputs for dynamically called flows or subflows.

The Dynamic Flow flow logic calls a flow or subflow during runtime by using the data that you specify during the flow design. You can use Dynamic Flow to select which flow to run when multiple flows have similar names or purposes.

To use Dynamic Flow, the flow designer does the following:

1. Creates and publishes a flow or subflow to use as a template.
2. Adds Dynamic Flow to a parent flow.
4. Enters the flow name for Dynamic Flow.
5. Enters the required inputs specified by the flow template.

Dynamic flow templates

The template for Dynamic Flow can be a flow or a subflow. The template's inputs must match the inputs of any flow or subflow that you call dynamically. An input matches when it has the same Label and Name field values in each flow or subflow.

After you build a template, consider copying it to create similarly named and similarly performing flows or subflows. Make sure that you name each flow or subflow with a standard naming convention that can be generated by Dynamic Flow. For more information on creating a template for Dynamic Flow, see Getting started with Dynamic Flow and Get Flow Outputs.

Inputs

The following inputs always appear when you add the Dynamic Flow flow logic to a flow.

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow Template</td>
<td>Template whose inputs the dynamic flow copies and displays. The inputs for</td>
</tr>
<tr>
<td></td>
<td>the template must match the inputs of the subflow that you want to run.</td>
</tr>
</tbody>
</table>
### Input

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Flow</strong></td>
<td>Name of the flow or subflow that you want to run. Generate a flow or subflow name dynamically by entering a string and concatenating it with data pill values.</td>
</tr>
</tbody>
</table>

**Note:** You can call a flow or subflow that is associated with another application scope by entering a scope-name.flow-name format. The user running the flow or subflow must have access to the application scopes that you specify. If you do not specify an application scope, the dynamic flow runs in the parent flow's scope.

**Note:** If the system can't find the flow or subflow, it skips the Dynamic Flow flow logic step and logs an error message.

| Wait for completion | Option to force the parent flow to wait until the dynamic flow finishes running before proceeding with the next action. |

**Note:** You see more inherited inputs after you select a Flow Template.

### Get flow outputs

Dynamic Flow outputs appear in the data pane as Record type data pills that are named as Context. You can use these flow contexts to derive the runtime values for dynamic flow outputs with the Get Flow Outputs flow logic. To use Get Flow Outputs, the flow designer does the following:

1. Adds a Dynamic Flow to a flow.
2. Adds Get Flow Outputs after the dynamic flow.
3. Specifies the value for the Context input by clicking the data pill picker () and selecting Dynamic Flow > Context.

For more information on using Get Flow Outputs, see Getting started with Dynamic Flow and Get Flow Outputs.

### Design considerations

**Consider using dynamic flows if you have multiple subflows with similar functionality**

Dynamic flows let you compartmentalize your processes by applying a template to handle the inputs of multiple similar subflows. Compartmentalization lets you distinguish between subflows that perform similar functions, such as subflows for IntegrationHub spokes.

**Ensure dynamically called subflow inputs match template flow inputs**

If the inputs of the dynamic flow don't match the inputs of the flow template, the system throws an error and the main flow can't run properly.
Use the correct context when getting flow outputs

If you are using Dynamic Flow more than once within a flow, make sure to drop in the correct context data pill from Get Flow Outputs.

Get started with Dynamic Flow and Get Flow Outputs
Create a sample flow that dynamically calls subflows for provisioning cloud services.

Role required: flow_designer or admin

To understand how to use the Dynamic Flow and Get Flow Outputs flow logic together, the flow that you create in this task dynamically runs subflows that are related to provisioning cloud services. This flow does the following:
1. Triggers when a Cloud Instance Provisioning Request record is created.
2. Calls the appropriate subflow to create a Cloud Instance record.
3. Gets an output from the dynamically called subflow and updates the Cloud Instance Provisioning Request record with the output's value.

1. Navigate to System Applications > Studio.
2. On the Select Application screen, click Create Application.
3. On the Guided App Creator welcome screen, click Let's get started.
4. In the Name field, enter Cloud Instance Provisioning and then click Create.
5. In the Roles field, enter flow_designer or admin and then click Continue.
6. From the list of app formats, select Classic and then click Continue.
7. Select Create new table > Create table from scratch > Continue to create two new tables for your application.
   • Add the following fields for the first table and name the table Cloud Instance.

<table>
<thead>
<tr>
<th>Field label</th>
<th>Field type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Instance Type</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Instance URL</td>
<td>URL</td>
<td>None</td>
</tr>
<tr>
<td>Build Status</td>
<td>String</td>
<td>None</td>
</tr>
</tbody>
</table>

• Add the following fields for the second table and name the table Cloud Instance Provisioning Request.

<table>
<thead>
<tr>
<th>Field label</th>
<th>Field type</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requested Instance Type</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Requested by</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Approval Status</td>
<td>String</td>
<td>None</td>
</tr>
<tr>
<td>Approved Instance URL</td>
<td>URL</td>
<td>None</td>
</tr>
</tbody>
</table>

8. After creating both tables, click Done with tables.
9. Select Start > Create > Done with apps to finish creating your application.

Create a subflow template

Role required: flow_designer or admin

1. Under Business logic, process automation, and integrations, click Go to Flow Designer.
2. In the Flow Designer landing page main header, click New > New Subflow.
3. On the Subflow Properties screen, enter **TEMPLATE: Create Cloud Instance Record** in the **Name** field and then click **Submit**.

4. Under Inputs & Outputs, click the plus icon (+) to create two inputs for your subflow template.

<table>
<thead>
<tr>
<th>Label</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requested by</td>
<td>Reference.User</td>
</tr>
<tr>
<td>Requested Instance Type</td>
<td>String</td>
</tr>
</tbody>
</table>

5. Click the plus icon (+) to create one output for your subflow template.

<table>
<thead>
<tr>
<th>Label</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance URL</td>
<td>URL</td>
</tr>
</tbody>
</table>

6. Under your output, click **Done**.

7. Click the add action, flow logic, or subflow to end of flow icon (+) and then click **Action**.

8. From the list of ServiceNow Core actions, select **Log**.

9. In the Data pane, drag the data pills for the **Requested by** and **Requested Instance Type** inputs you created earlier, and drop both of the pills into the **Message** field.

10. In the Subflow header, click **Save** and then click **Publish** to publish your subflow template.

Create a subflow for Jira cloud instance provisioning requests

**Role required:** flow_designer or admin

1. In the Subflow header, click the more actions icon

2. On the Copy Subflow screen, enter **Create Cloud Instance Record - Jira** in the **New Subflow Name** field, and then click **Copy**.

3. Under the Log action, add a **Create Record action**.

4. In the **Table Name** field, select **Cloud Instance** and then fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner</td>
<td>Click the data pill picker (+) and select Subflow - Inputs &gt; Requested by.</td>
</tr>
<tr>
<td>Instance Type</td>
<td>Click the data pill picker (+) and select Subflow - Inputs &gt; Requested Instance Type.</td>
</tr>
</tbody>
</table>
Create a subflow for Salesforce cloud instance provisioning requests

Role required: flow_designer or admin

1. In the Subflow header, click the more actions icon

   and select **Copy subflow**.

2. On the Copy Subflow screen, enter Create Cloud Instance Record - Salesforce in the **New Subflow Name** field, and then click **Copy**.

3. Expand the Create Cloud Instance Record action and replace the .atlassian.net value for the **Instance URL** field with .salesforce.com

4. In the Subflow header, click **Save** and then **Publish** to publish the subflow.

Create a flow that runs your subflows dynamically

Role required: flow_designer or admin

1. Under the Flow Designer header, click the **Create flow, subflow, or action** ( ) icon and select **Flow**.

2. On the Flow Properties screen, enter Process Cloud Instance Provisioning Request in the **Name** field, and then click **Submit**.

3. Under **Trigger**, click the plus icon

   to add a trigger to your flow, and then fill out the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trigger</td>
<td>Select Created.</td>
</tr>
<tr>
<td>Table</td>
<td>Enter Cloud Instance Provisioning Request [x_cloud_instance_p_cloud_instance_provisioning_request].</td>
</tr>
</tbody>
</table>

4. Under Actions, click the plus icon

   then click **Flow Logic > Dynamic Flow**.

5. Fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow Template</td>
<td>Enter TEMPLATE: Create Cloud InstanceFlow</td>
</tr>
</tbody>
</table>
Field | Value
--- | ---
Flow | Enter Create Cloud Instance — and then click the data pill picker ( ) and select Trigger - Record Created > Cloud Instance Provisioning Request Record > Requested Instance Type.
Wait for completion | Enable this option to run your subflow dynamically first before other actions in your flow occur.
Requested by | Click the data pill picker ( ) and select Trigger - Record Created > Cloud Instance Provisioning Request Record > Requested by.
Requested Instance Type | Click the data pill picker ( ) and select Trigger - Record Created > Cloud Instance Provisioning Request Record > Requested Instance Type.

6. Under your **Dynamic Flow** flow logic, add the Get Flow Outputs flow logic, and then fill in the following fields.

7. Next to the **Context** field, click the data pill picker ( ) and select 1 - Dynamic Flow - > Context.

8. Under your **Get Flow Outputs** flow logic, click the plus icon and then click **Action > Update Record** to add an **Update Record action** to your flow.

9. Fill in the following fields.

Field | Value
--- | ---
Record | Click the data pill picker ( ) and select Trigger - Record Created > Cloud Instance Provisioning Request Record.
Approved Instance | Click the data pill picker ( ) and select 2 - Get Flow Outputs - > Instance URL.

a) Click **Save**.

Test your flow

Role required: flow_designer or admin

1. In the Flow header, click **Test** to test your flow.
2. On the Test Flow screen, click the Create new record (+) icon, and then click the Lookup using list icon ( ) and select any user from the list.

3. Enter either Jira or Salesforce in the Requested Instance Type field.
   The value you enter determines which subflow runs dynamically at runtime. Entering Jira runs the Create Cloud Instance Record - Jira subflow, and entering Salesforce runs the Create Cloud Instance Record - Salesforce.

4. Click Run Test, and when the flow finishes running, click Flow has been executed. To view the flow, click here.
   Your flow runs successfully if the values in the State column for each step in your flow shows Completed and each step's runtime value populates appropriately.

5. Select the tab for your Process Cloud Provisioning Requests flow and close the Test Flow modal.

6. In the Flow header, click Activate to make your flow accessible within the Cloud Instance Provisioning application scope.

When a user in your instance creates a new record in the Cloud Provisioning Request table, your Process Cloud Provisioning Requests flow runs automatically. This flow dynamically creates the proper Cloud Instance record that is based on the requested instance type. It also generates a cloud instance URL, which populates in the Cloud Instance Provisioning Request record.

Subflows

Define a sequence of reusable actions that can be started from a flow, subflow, or script. Define inputs and outputs to pass data to and from the subflow.

Unlike flows, subflows lack a trigger. Use a subflow when:

- You only want to start a flow by calling it from another flow or script.
- You want to create a set of reusable operations for use in multiple flows.
- You want to add flow logic in addition to actions.
- You want to specify the inputs available to the subflow when it starts.
- You want to specify the outputs available to the parent flow after the subflow ends.

All subflows consist of properties, one or more inputs, one or more outputs, a sequence of actions, and the data collected or created. Unlike flows, subflows:

Subflow properties

The subflow properties specify the subflow name, application, category, description, in-flow annotation, and status. Flow designers can update the subflow name, category, description, and in-flow annotation at any time, but can only set the application during subflow creation. The subflow status is set when you save or publish a subflow.

Subflow inputs

Subflow inputs specify the data available to the subflow when it starts. Each input you define for a subflow becomes a configuration option in the Flow Designer interface. To use the subflow in a flow, flow designers must define a value for each mandatory input. The more inputs a subflow has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the subflow effectively.
Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring a subflow to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

Subflow outputs

Subflow outputs specify the data available to the parent flow after the subflow completes. Subflow outputs are defined as variables with a name and data type. Subflow designers assign values to an output using the Assign Subflow Output flow logic. Output values can be based on the subflow logic conditions, action results, or a manually set value. For example, an output may have one value when a condition is met and another value when a condition is not met. During runtime, the value of the output is determined by the condition that is met.

Consider the following example of a subflow with two conditions that both result in a value for a single output variable. The value of the variable depends on which condition is met during runtime.

**Outputs**

[Manager ID] [String]

**Actions**

- 1 Look Up [User] Record where (Created on Today)
- 2 If (  [1->User Record->Title] contains Manager) then
  - 2.1 Assign Subflow Outputs [Manager ID] to [1->User Record->User ID]
- 3 Else
  - 3.1 Assign Subflow Outputs [Manager ID] to [1->User Record->Manager->User ID]

In this case, if the user's title contains "Manager" then the user ID is assigned as output. Otherwise, the subflow looks up the user's manager and assigns the user ID of the manager as output.

Flow Designer allows you to define a value for the same variable multiple times. However, if a variable is given two or more possible values without conditional logic, only the last value defined in the subflow is applied to the output at runtime.

**Outputs**

[Manager ID] [String]

**Actions**

- 1 Look Up [User] Record where (Created on Today)
- 2 Assign Subflow Outputs [Manager ID] to [1->User Record->User ID]
- 3 Assign Subflow Outputs [Manager ID] to [1->User Record->Manager->User ID]

In this example, action three overwrites the value of action two and [1->User Record->Manager->User ID] is applied to the [Manager ID] output at runtime because it was the last value defined. Typically, subflows should only include multiple values for one variable if conditional flow logic is used.

**Actions**

Within Actions, flow designers can add actions, flow logic, flows, or other subflows.
An action is a reusable operation that enables process analysts to automate Now Platform features without having to write code. For example, the Create Record action allows process analysts to generate records in a particular table with particular values when certain conditions occur. ServiceNow core actions like Create Record require some familiarity with Now Platform tables and fields. Action designers can create application-specific actions to pre-set configuration details. For example, creating a Create Incident Task action ensures that the process analyst uses the correct table and field configuration each time the action is used. You can add application-specific actions by activating the associated spoke.

Flow logic

Subflows can contain flow logic to specify conditional or repeated actions, or to assign output variables to subflow data. The system provides these flow logic options.

Available flow logic

<table>
<thead>
<tr>
<th>Flow logic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>For Each</td>
<td>Applies actions to each record in a list of records. Flow designers must specify the list of records in subflow data.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can nest a For Each flow logic block inside of another flow logic block to repeat an action over a series of records. However, avoid nested For Each loops that process many records. Nested loops may cause the flow to run until it is stopped by the flow transaction quota rule, which prevents flows from running longer than an hour. For more information on transaction quotas, see Transaction quotas.</td>
</tr>
<tr>
<td>If</td>
<td>Applies actions when a list of conditions is met. Flow designers can specify the conditions with subflow data. Once an If condition is added, you can add an Else or Else If flow logic option to define behavior when conditions are not met.</td>
</tr>
<tr>
<td>Assign Subflow Outputs</td>
<td>Assigns an output variable to subflow data. Only outputs defined in Inputs &amp; Outputs can be assigned a value. Assigning outputs enables you to assign a different output variable for each logical path in a subflow.</td>
</tr>
</tbody>
</table>

More Actions

Click the More Actions button to access additional options for the subflow.

Copy action

Create a copy of the open subflow in an application you specify.

Configurations

Enable or disable the Show draft actions, Show triggered flows, Show store spokes, and Show inline script toggle options.

Code Snippet

Generate a code snippet for the action.

Manage security
Enable or disable the **Callable by Client API** option.

**Manage natural language title**

Create or edit a subflow title with styled or dynamic text. For more information, see *Manage natural language titles*.

**Testing subflows**

You can test a subflow alone, or when added to a flow. When testing a subflow alone, you must define the inputs that the subflow uses in its actions. Because a subflow does not have a trigger, testing a subflow runs the actions using the defined input values.

*i Note:* Flow designers should always test flows and subflows on sub-production instances containing relevant demonstration data since testing a subflow creates or changes records on the instance.

**Roles**

To access subflows, a user must have the flow_designer or admin role.

**Create a subflow**

Create a reusable sequence of actions that can be added to multiple flows.

- **Role required:** flow_designer or admin
- **Setting up an application in Guided Application Creator** to store Flow Designer content.

Users with flow_designer or admin role should know the application table structure and be aware of any existing business logic associated with the target tables of a flow or subflow. Be sure to disable any conflicting business rules or workflows before creating a flow or subflow.

Creating a custom application to contain your Flow Designer content allows you to **deploy** it using the application repository or the ServiceNow Store.

1. **Navigate to Flow Designer > Designer.**
2. **Click + New > New Subflow.**
   The Subflow properties dialog displays.
3. **Fill in the following properties:**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the subflow.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope to create the subflow in.</td>
</tr>
<tr>
<td>Category</td>
<td>Logical group for subflow.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the subflow is read-only. You can only select a value when</td>
</tr>
<tr>
<td></td>
<td>create the subflow in an application scope you own. The default value is</td>
</tr>
<tr>
<td></td>
<td>None.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the subflow title in Flow Designer to help</td>
</tr>
<tr>
<td></td>
<td>flow designers understand what the subflow does when used in a flow.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the subflow.</td>
</tr>
</tbody>
</table>
4. Create subflow inputs to specify the data available to the subflow when it starts.
   Each input you define for a subflow becomes a configuration option in the Flow Designer interface. To use the subflow in a flow, flow designers must define a value for each mandatory input. The more inputs a subflow has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the subflow effectively.
   a) Click + to open the Inputs & Outputs pane.
   b) Click + to add a new input.
   c) Define the name and type for the input.
   d) To make the input a mandatory configuration option, select the Mandatory flag.
   e) Click to view the advanced options and define values.

   Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring a subflow to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

5. Create subflow outputs by defining the names and data types.
   Subflow outputs specify the data available to the parent flow after the subflow completes.
   a) Click + to add a new output.
   b) Define the name and the data type.
   Output values are assigned in later steps.
6. To add actions, flows, subflows, or flow logic, click **Select to add an Action, Flow Logic, or Subflow**.
   a) **Select an option.**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Select the desired action. Flow Designer includes a set of <em>Actions</em> available to flows and subflows. Alternatively, a user with the action_designer role can create additional actions to add to flows. The <em>IntegrationHub</em> and <em>spoke</em> plugins install additional actions. To add draft actions from the More Actions menu, set <strong>Show draft actions</strong> to <strong>true</strong>. To view spokes available in the ServiceNow Store, set <strong>Show store spokes</strong> to <strong>true</strong> from the More Actions menu.</td>
</tr>
<tr>
<td>Flow Logic</td>
<td>Select an option to specify conditional or repeated operations.</td>
</tr>
</tbody>
</table>

**Inputs & Outputs**

**Inputs**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incident</td>
<td>Reference.Incident</td>
<td>▼</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Caller name</td>
<td>String</td>
</tr>
<tr>
<td>Incident short description</td>
<td>String</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Subflow</td>
<td>Select a published subflow and define input values. In addition to adding a subflow as a flow action, you can enable the Show triggered flows option from the More Actions menu to select an activated flow and define the required inputs. Running a triggered flow ignores its trigger conditions and runs all actions.</td>
</tr>
<tr>
<td>Manage natural language title</td>
<td>Create a flow, subflow, or action title with styled and dynamic text.</td>
</tr>
</tbody>
</table>

To change the order of an action in a flow, drag the handle on the left side of the action to the desired location.

The system displays a set of fields depending on the option selected.

b) To configure the action, flow, or subflow, fill in the fields.

c) Click **Done**.

d) Repeat adding actions until complete.

7. Assign subflow outputs to a value.

You can assign a subflow output to multiple values, enabling you to create conditional outputs based on flow logic.

a) Under **Actions**, click + and select **Flow Logic**.

b) Click **Assign Subflow Outputs**.

c) In the **Name** field, select an output you created in the Inputs & Outputs section. You can only assign values to outputs that have already been given a name and data type.

d) In the **Data** field, enter a value or select a data pill from the data panel.

e) Click **Done**.

Test the subflow, and publish it when it is ready to be added to a flow or called from a script.

**Note:** You can only test or publish subflows that contain at least one action.
Test a subflow

You can test a subflow alone, or when added to a flow. When testing a subflow alone, you must define the inputs that the subflow uses in its actions. Because a subflow does not have a trigger, testing a subflow runs the actions using the defined input values. Unless updated, subsequent tests use the same inputs defined in the initial test run.

Role required: flow_designer or admin

Create a subflow that contains at least one action and save it. Flow Designer only tests saved subflows that contain at least one action.

Flow designers should always test flows and subflows on sub-production instances containing relevant demonstration data since testing a subflow creates or changes records on the instance.

1. Navigate to Flow Designer > Designer.
2. Click the subflows tab and open a saved subflow.
3. Click Test.
   The Test Subflow dialog opens.
4. Define input values for the subflow to use in its actions. The values defined are remembered on future test runs.
5. Click Run Test.
6. After the flow executes, click Subflow has been executed. To view the subflow, click here.
   The Execution Details open.

Once the subflow behaves as desired, you can publish the subflow and add it to a flow.

Publish a subflow

Publish a subflow to make it available to other users and to add it to activated flows.

Role required: flow_designer or admin

Create a subflow, test the subflow, and verify that it is working as expected.

When you make changes to a published subflow, the changes remain in the draft state until you publish the subflow again. You must publish a changed subflow to make the changes available to activated flows.

1. Navigate to Flow Designer > Designer.
2. Click the subflows tab and open a tested subflow.
3. Click Publish.

The subflow can be added to activated flows. If you update the subflow after it is published, you must click Publish again to see the changes when the parent flow is run. After publishing changes, all parent flows that use the subflow are automatically updated to use the current version.

Complex data

Use a graphical interface to work with collections of complex structured data. Help design users understand the organization of structured data, and add, remove, or configure its individual elements.

Complex data allows you to encode and store structured data in a machine-readable format such as JavaScript Object Notation (JSON) or eXtensible Markup Language (XML). You can use the Flow Designer interface to view and understand the organization of structured data as well as create data structures. For example, you can create a contact data structure consisting of information you look up from a user record such as first name, last name, and email address.

You can create complex data from these Flow Designer interfaces.
Complex data usage examples

<table>
<thead>
<tr>
<th>Flow Designer interface</th>
<th>Example usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action inputs and outputs</td>
<td>Create an action that generates an object from record data. Populate the object using record data the action looks up.</td>
</tr>
<tr>
<td></td>
<td>See <a href="#">Create a custom action to generate an object from a record</a></td>
</tr>
<tr>
<td>Script step input and output variables</td>
<td>Write a script to create an array of objects from a list of records.</td>
</tr>
<tr>
<td></td>
<td>See <a href="#">Create a custom action to generate an array of objects from a list of records</a></td>
</tr>
<tr>
<td></td>
<td>Write a script to parse a JSON document into an output of type Object.</td>
</tr>
<tr>
<td>Subflow inputs and outputs</td>
<td>Create a subflow that accepts an object as an input and uses it to call an external service.</td>
</tr>
<tr>
<td>XML parser step Target field configurations</td>
<td>Parse an XML payload into a complex data object using the XML parser step.</td>
</tr>
</tbody>
</table>

Benefits

Complex data offers these benefits.

- Parse and format data without having to write code. For example, create data variables to parse a response message or format a request message.
- Create arbitrary data structures. For example, create an issue data structure that combines information from existing interaction and incident records, or create a data structure to support a custom integration.
- View the organization of data structures. For example, an issue data structure might consist of a user object to describe who to contact about the issue and a history object to describe the work done to resolve it. You could configure a notification action with the path to the email address listed in the user object, and call an escalate issue subflow with the path to the status or reassign count from the history object.
- Allow access to data structure from API calls. For example, call an action or subflow from a script and use the predefined data structure as input values.
- Save and reuse data structures as templates. For example, save the user object as a template data structure for reuse in other actions and flows.

Data structure

A data structure is a collection of related data elements organized into a hierarchy. Each element in a data structure has its own data type and its own unique position in the hierarchy.

The Editor pane displays data structure hierarchy with indentation. The indentation level identifies whether an element is a parent, child, or sibling in the hierarchy. Parent elements have children indented underneath them, and siblings have the same indentation level.

**Note:** The Flow Designer interface allows you to create hierarchies with an unlimited number of child levels, but you may have to scroll horizontally to see them.

For example, this data structure consists of an Employee parent element with four child elements for ID Number, Name, Start Date, and Contact Email. The Contact Email element is also a parent element with one child.
### Sample inputs for an Employee object

The Data pane displays data structure hierarchy as a tree of collapsible and expandable data pills just like it does with record variables. Parent elements have an arrow icon to collapse or expand the hierarchy.

For example, here is the Employee data structure as seen from the Data pane.

#### Sample data pill for an Employee object

<table>
<thead>
<tr>
<th>Label</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>ID Number</td>
<td>Integer</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Start Date</td>
<td>Date/Time</td>
<td></td>
</tr>
<tr>
<td>Contact Email</td>
<td>Array/String</td>
<td></td>
</tr>
<tr>
<td>Contact Email_childID</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>
You can use the Data pane or Data picker to select specific values from a data structure. Data structures are similar to data pills for records in that you can dot-walk or navigate to specific elements within the structure. When you select a data element, Flow Designer displays the path to it as a data pill just like any other data element selection. For example, if you select the Start Date data element, the path is [Input->Employee->Start Date].

You can use an element data path the same way you can an XPath or JPath. Sometimes you may even convert the data pill path into one of these path notations.

**Complex data types**

You build data structures using one or more Array or Object variables. Only these variable data types support child variables.

An Array variable contains values for one type of item. The parent variable is always of an Array data type, and there is always only one child variable, which is one instance of the data type supported by the array. Create Array variables when an input or output accepts multiple values of the same data type.

For example, you could create a Contact Email array to list all the email addresses associated with a given person.

### Sample data structure for the Contact Email array

<table>
<thead>
<tr>
<th>Component label</th>
<th>Data Type</th>
<th>Sample Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Email</td>
<td>Array.String</td>
<td><a href="mailto:beth.anglin@example.com">beth.anglin@example.com</a> and <a href="mailto:beth@anglin.com">beth@anglin.com</a></td>
</tr>
<tr>
<td>Contact Email_child0</td>
<td>String</td>
<td></td>
</tr>
</tbody>
</table>

An Object variable contains any number and arrangement of child variables that each have their own data type and values. Nesting Object variables allows you to create complex data structures similar to a table schema where one table has related records in another table. Create Object variables when an input or output accepts one or more related properties.

For example, you can create an Employee object to define information about the people who work at a company.
Sample data structure for the Employee object

<table>
<thead>
<tr>
<th>Component label</th>
<th>Data Type</th>
<th>Sample Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee</td>
<td>Object</td>
<td></td>
</tr>
<tr>
<td>ID Number</td>
<td>Integer</td>
<td>20190304000101</td>
</tr>
<tr>
<td>Name</td>
<td>String</td>
<td>Beth Anglin</td>
</tr>
<tr>
<td>Start Date</td>
<td>Date/Time</td>
<td>March 4, 2019</td>
</tr>
<tr>
<td>Contact Email</td>
<td>Array.String</td>
<td><a href="mailto:beth.anglin@example.com">beth.anglin@example.com</a> and <a href="mailto:beth@anglin.com">beth@anglin.com</a></td>
</tr>
</tbody>
</table>

Only these variable data types can be parents.

Parent data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Array</td>
<td>A container for arrays. Adds a read-only child item of type Array.</td>
</tr>
<tr>
<td>Array.True/False</td>
<td>A container for true/false values. Adds a read-only child item of type True/False.</td>
</tr>
<tr>
<td>Array.Choice</td>
<td>A container for choice values. Adds a read-only child item of type Choice.</td>
</tr>
<tr>
<td>Array.Date/Time</td>
<td>A container for date/time values. Adds a read-only child item of type Date/Time.</td>
</tr>
<tr>
<td>Array.Integer</td>
<td>A container for integer values. Adds a read-only child item of type Integer.</td>
</tr>
<tr>
<td>Array.Object</td>
<td>A container for objects. Adds a read-only child item of type Object, which displays the <strong>Add Child Item</strong> option.</td>
</tr>
<tr>
<td>Array.String</td>
<td>A container for string values. Adds a read-only child item of type String.</td>
</tr>
<tr>
<td>Object</td>
<td>A container for other data elements. Displays the <strong>Add Child Item</strong> option.</td>
</tr>
</tbody>
</table>

Array and Object variables only support these child data types.

- Array
- True/False
- Choice
- Date/Time
- Integer
- Object
- String

**Note:** The data types in array and object variables are not Glide elements. There may not be complete compatibility between these items and Now platform types.
Advanced options

Object variables have advanced options to save and load data structures. These options allow you to reuse a data structure defined in one location in another. For details on advanced options see Advanced options for action inputs.

Data structure templates

Data structure templates allow you to reuse Object variables in multiple actions or subflows. For example, you can create a data structure to parse a response and then later reuse that same data structure to format a request. A template stores the list of child variables and their structure within an object. Each Object variable has an Advanced Option to save it as a template.

When you apply a template, you are creating a copy of the original structure. Any changes you make after applying a template do not affect the template, nor do they affect other actions that use the template.

Array data pills

Objects that contain array data may require For Each flow logic to process. For example, a user object that contains an array of email addresses would require a For Each flow logic loop to send a notification to each email address.

Object data pills

You can design actions that accept object data pills as input values. For example, you might create a notification action that accepts a user object as an input. If the user object consists of values for first name, last name, and addresses, then the notification action has access to all these values. To configure an action input with an object data pill, you must create an object earlier in the flow.
Sample action that accepts an object data pill

You can use an object data pill or any of its child elements to configure an input. When you configure an input value with an object data pill, Flow Designer makes any child elements of the object read-only, and the action uses the values provided by the object. For example, you can create a flow where one action generates a user object and another action sends a notification to the user specified in the object.
Sample action configured to use an object data pill

When you configure the child elements of an object, you must manually provide data pills for each child element of the object. For example, you can manually configure the user object with record values from an earlier action.

Script support

Create and reference complex data from a script. Use a script when your source data comes from a data stream, a REST step response, or a Look Up Records step. See Script support for complex data for more information about scripting with complex data.
Null values

When a name-value pair contains an empty or unknown value, the value is set to the null data type. For example, here is an object constructed from an approval record. In this case, the `note` has a null value.

```json
{
    "Approval Details": {
        "approvalStatus": "pending_approval",
        "approver": {
            "approver_assignee": "Approver",
            "approver_email": "approver@example.com",
            "approver_firstname": "Approval",
            "approver_lastname": "User",
        },
        "note": null,
        "reasons": [
            "The requester has no manager defined."
        ],
    }
}
```

Design considerations

Follow these design guidelines to create reusable and maintainable data structures.

**Minimize the number of child levels in the hierarchy**

The more child levels a data structure has, the more difficult it is to view and select any specific data variable from the hierarchy. While you can build data structures with any number of child levels, it becomes difficult to navigate and understand data structures with more than seven child levels. For the best user experience, avoid creating data structures that have so many child levels you must scroll horizontally to see and populate them.

**Create a separate object for each type of record data**

Most Flow Designer data is record data whether it is from an instance or an external system. This design method ensures that you know what the object contains and where the data came from.

**Recreate record data structures**

When building objects that receive or transmit record data, review the database dictionary entries for these records and create matching object data structures. For example, suppose that you want an object to contain data from incident and configuration item records. You might create a string element for the incident short description field and an array of strings element for the configuration item class field.

**Create objects to combine different types of records**

If you need information from multiple types of records, create an object that contains all the information you need. You can then use the object to format or parse data in Flow Designer.

Create data structure

Organize multiple data variables into a structure to process them as a unit and identify the individual items within it.

- Role required: action_designer, flow_designer, or admin
- Setting up an application in Guided Application Creator to store Flow Designer content.
- Create an action or Create a subflow
A data structure is a collection of related data elements organized into a hierarchy. Each element in a data structure has its own data type and its own unique position in the hierarchy.

1. Create a data variable.

<table>
<thead>
<tr>
<th>Action or subflow input</th>
<th>Action or subflow output</th>
<th>XML parser step</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click Create Input</td>
<td>Click Create Output</td>
<td>See XML parser step</td>
</tr>
</tbody>
</table>

2. Set Type to Object.
The top level of a data structure hierarchy must be an Object variable.

3. Click the Add Child Item icon.
Flow Designer adds a child data variable to the bottom of the object list.

- **Note:** You can insert a child variable between existing variables by hovering your mouse pointer between two variables, and click the insert item icon that appears.

- **Note:** When hovering your mouse pointer between a child and sibling variable, you will see a add child icon.
Click the left side of the icon to add a new sibling variable to the child's parent, or the right side to add another child variable under the current variable.

4. Set the child variable **Label** and **Type**.
   To add another branch to the data structure hierarchy, set the Type to Object.

5. Repeat steps 3-4 for each data variable in the hierarchy.

Use the data structure to populate action, step, or subflow inputs. If you can reuse the data structure, save it as a template.

### Save data structure

Save the data structure of child variables within an Object variable for later reuse.

- **Role required:** action_designer, flow_designer, or admin
- **Setting up an application in Guided Application Creator** to store Flow Designer content.
- **Create an action** or **Create a subflow**

1. **Create data structure.**
2. Expand the Advanced options for the Object variable you want to save.
3. Click Save as Template.
   Flow Designer displays a pop-up dialog.
4. Enter the template name.
5. Click **Save**.
   If the template name already exists, Flow Designer displays a confirmation dialog to overwrite the existing template.

Load the data structure in another action or subflow. Make updates to the data structure and save them.
Load data structure

Load a data structure of child variables within an Object variable.

- Role required: action_designer, flow_designer, or admin
- Setting up an application in Guided Application Creator to store Flow Designer content.
- Create an action or Create a subflow

1. Create a data variable.
2. From Type, select Object.
3. Expand the Advanced options for the Object variable whose data structure you want to replace.
4. From Structure, select Start from Template.
   Flow Designer displays the Template field.
5. From Template, select the template containing the template you want to load.
   If the Object variable has no existing data structure, Flow Designer loads the data structure into it. If the Object variable has an existing data structure, Flow Designer displays a confirmation dialog to replace the existing structure.

Create a custom action to generate an object from a record

Generate an object from a User record. Learn how to use an Action output to create an object from record values.

Role required: admin

Use this example to see demonstrations of these operations and steps.

- Create action inputs for the User record fields First name, Last name, and Email.
- Lookup a User record matching the action input values.
- Create an action output for a contact object.
- Save the contact object as a template.
- Map contact object values to User record field values.
- Test the action with a sample user.

1. Create an application to store your work.
   Use the Guided Application Creator.
   For example, create My Application.
   The system displays the Flow Designer landing page.
3. Select New > Action
   The system displays the Action Properties dialog.
4. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contact Object From User</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Accessible From</td>
<td>All application scopes</td>
</tr>
</tbody>
</table>

5. Select Submit.
   The system displays the Action Designer interface.
6. From the Action Outline, select Inputs > Create Input
   The system displays a new action input.
7. Configure the action input with these values.
8. From the Action Outline, select **Inputs > Create Input**
The system displays a new action input.
9. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>First name</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

10. From the Action Outline, select **Inputs > Create Input**
The system displays a new action input.
11. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Last name</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

12. From Action Outline, select **Outputs > Create Output**.
The system displays a new action output.
13. Configure the output variable with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contact</td>
<td>contact</td>
<td>Object</td>
<td>False</td>
</tr>
</tbody>
</table>

14. From the row for the contact Object, select **Add Child Item**.
15. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>first_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

16. From the row for the contact Object, select **Add Child Item**.
17. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last name</td>
<td>last_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

18. From the row for the contact Object, select **Add Child Item**.
19. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email address</td>
<td>email_address</td>
<td>String</td>
<td>False</td>
</tr>
</tbody>
</table>

20. From the row for the contact Object, select **Toggle Advanced Inputs**.
21. From the Advanced Options, select **Save As Template**.
   The system displays the Save As Template dialog.
22. For **Enter a Name**, enter contact.
23. Click **Save**.
24. Select **Exit Edit Mode**.
   The System displays the output fields you created.
25. Configure the outputs with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>[step-&gt;Look Up Record step-&gt;Record-&gt;First name]</td>
</tr>
<tr>
<td>Last name</td>
<td>[step-&gt;Look Up Record step-&gt;Record-&gt;Last name]</td>
</tr>
<tr>
<td>Email Address</td>
<td>[step-&gt;Look Up Record step-&gt;Record-&gt;Email]</td>
</tr>
</tbody>
</table>

**Note:** You can select data pills from the Data pane or from the Data Pill Picker button.

26. Select **Save**.
27. Select **Test**.
   The system displays the Test Action dialog.
28. Enter these test values.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>Abel</td>
</tr>
<tr>
<td>Last name</td>
<td>Tuter</td>
</tr>
</tbody>
</table>

29. Select **Run Test**.
   The system runs the action with the test values provided.
30. Select **Action has executed. To view the action, click here**.
   The system displays the action execution details.
31. Review the runtime value for the action Output data.
   The system displays output data in JSON format.
   For example, sample contact object JSON for the user Abel Tuter.

```json
{
    "contact": {
        "email_address": "abel.tuter@example.com",
        "last_name": "Tuter",
        "first_name": "Abel"
    }
}
```

You have a custom action that looks up a User record and converts it into a contact object.
Customize the action to use your own logic.

**Create a custom flow to generate an object for each record in a list**

Generate an object for each User record in a list. Learn how to use flow logic to iterate through a list of records.

- Role required: admin

**Create a custom action to generate an object from a record**

Use this example to see demonstrations of these operations and steps.
- Create a flow that runs on a daily schedule.
- Look up User records filtered by the Department provided as an input.
- Add flow logic that runs for each User record you looked up previously.
- Create a contact object for each User record using the custom action you created previously.
- Create a log message for each User record.

1. Navigate to **Flow Designer > Designer**.  
   The system displays the Flow Designer landing page.
2. Select **New > Flow**.  
   The system displays the Flow Properties dialog.
3. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contact Objects From Users</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Run As</td>
<td>User who initiates session</td>
</tr>
</tbody>
</table>

4. Select **Submit**.  
   The system displays the Flow Designer interface.
5. Select **Click to add a Trigger > Date > Daily**.
6. Select **Done** to close the trigger.
7. Select **Click to add an Action, Flow Logic, or Subflow > Action > ServiceNow Core > Look Up Records**.  
   The system adds the action to the flow.
8. For **Table**, select **User [sys_user]**.
9. For **Conditions**, add these values.
   - [Department][is][Development] [AND]
   - [Email][is not empty]
10. Configure these field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order by</td>
<td>Name</td>
</tr>
<tr>
<td>Sort</td>
<td>a to z</td>
</tr>
<tr>
<td>Max Results</td>
<td>1000</td>
</tr>
</tbody>
</table>

11. Select **Done** to close the action.
12. Select **Click to add an Action, Flow Logic, or Subflow > Flow Logic > For Each**.  
   The system adds the flow logic to the flow.
13. For **Items**, select [1->User Records].

   **Note:** You can select the Action 1 User Records data pill from the Data pane or from the Data Pill Picker button.

14. Select **Done** to close the flow logic.
15. Select the plus icon to add a child item to the For Each flow logic.
16. Select **Action > My Application > Create Contact Object**.
17. For **userRecord [User]**, select [2->User Record].
18. Select **Done** to close the flow logic action.
19. Select the plus icon to add a child item to the For Each flow logic.
20. Select **Action > ServiceNow Core > Log**.
21. For **Message**, select **[2.1->contact]**.

**Note:** You can select the **Action 2.1 contact** data pill from the Data pane or from the Data Pill Picker button.

22. Select **Done** to close the flow logic action.
23. Select **Save**.

### Script support for complex data

Create and reference complex data from a script. Use a script when your source data comes from a data stream, a REST step response, or a Look Up Records step.

Use script to create complex data when data comes from these sources.

<table>
<thead>
<tr>
<th>Data source</th>
<th>Create/map complex data from</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Stream action response stream</td>
<td>Script Parser step</td>
</tr>
<tr>
<td>REST step response</td>
<td>Script step</td>
</tr>
<tr>
<td>Look Up Records step</td>
<td></td>
</tr>
</tbody>
</table>

### Data Stream action response stream

Data Stream actions use a parser script to map stream item values to complex object values. When writing a parser script, use JavaScript methods appropriate to the data stream format. For example, use the *JSON* class to parse or encode a JSON data stream.

Parser scripts have access to the data stream input and output objects as well as a **targetObject** property. See *Data Stream actions and pagination* for more information about parsing a response stream to create complex data.

### REST step response

You can convert a REST step response into one or more complex objects by parsing it with a Script step. To access a response from a Script step, you must create an input script variable and map it to the response payload from the prior REST step. See *Script step* for more information about creating script input variables.

Write a script that maps REST response values to complex object values. When writing REST response script, use JavaScript methods appropriate to the response format such as the JSON parse() method.

**Note:** When you use complex data as the source of a string input, Flow Designer automatically converts it into a JSON string.
You do not need to use a Script step to create a REST request from complex data. You can generate complex data in a prior action or step and then map it to a string input of the REST step. At run time, the action or flow converts the complex data into a JSON representation.

**Look Up Records step**

While flows can use *For each* flow logic to process a list of records, actions require a Script step. The Script step replaces the *For each* flow logic with JavaScript such as a *For* or *While* loop.

To access record data from a Script step, you must create an input script variable and map it to the record data from the prior look up step. See *Script step* for more information about creating script input variables.

See *Create a custom action to generate an array of objects from a list of records* for an example action that converts a list of user records into an array of contact objects.

**Note:** The Look Up Records action does not require a Script step to convert record data into complex data. You can create a custom action to convert a record into an object and apply *For each* flow logic to the custom action. See *Create a custom action to generate an object from a record* and *Create a custom flow to generate an object for each record in a list* for an example of creating a complex object without using script.

**Dot-walking object structures**

You can reference elements from the structure of an object by dot-walking the path of the structure. All complex data paths start with the name of the data source, which is either the global object for inputs, the global object for outputs, or the name of the array or object you created in script.

Next in the path are the names of each structural element referenced separated by period characters (also known as dots). Listing the names of structural elements is identical to dot-walking a reference field where you list the table structure to a particular reference field.

**Note:** A dot-walk path always lists the name of a structural element rather than its label.

For example, suppose that you define a contact object as an Output variable. The object has the following structure.
## Sample Contact object

<table>
<thead>
<tr>
<th>Place in structure</th>
<th>Label</th>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent</td>
<td>Contact</td>
<td>contact</td>
<td>Object</td>
</tr>
<tr>
<td>Place in structure</td>
<td>Label</td>
<td>Name</td>
<td>Type</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------</td>
<td>-----------------</td>
<td>-----------</td>
</tr>
<tr>
<td>Child</td>
<td>First name</td>
<td>first_name</td>
<td>String</td>
</tr>
<tr>
<td>Child</td>
<td>Last name</td>
<td>last_name</td>
<td>String</td>
</tr>
<tr>
<td>Child</td>
<td>Email Addresses</td>
<td>email_addresses</td>
<td>Array.Object</td>
</tr>
<tr>
<td>Grandchild</td>
<td>Email Address</td>
<td>email_address</td>
<td>Object</td>
</tr>
<tr>
<td>Great grandchild</td>
<td>Type</td>
<td>type</td>
<td>Choice</td>
</tr>
<tr>
<td>Great grandchild</td>
<td>Email</td>
<td>email</td>
<td>String</td>
</tr>
<tr>
<td>Child</td>
<td>Telephone</td>
<td>telephone_number</td>
<td>Array.Object</td>
</tr>
<tr>
<td>Child</td>
<td>Mailing Addresses</td>
<td>mailing_address</td>
<td>Array.Object</td>
</tr>
</tbody>
</table>

The dot-walk path to the **First name** structural element would be `outputs.contact.first_name` while the path to the **Email** structural element would be `outputs.contact.email_addresses[0].email` since you must specify an individual element of the array by its JavaScript index value.

**Note:** A dot-walk path omits the name of the repeated element within the array. For example, an array of objects does not have to specify the object element name. However, since objects are containers for other elements, you can specify a child element of the object within a dot-walk path.

### Design considerations

Keep these design considerations in mind when scripting with complex data.

**Use string inputs to convert complex data into a JSON string**

When you map complex data to a string input, Flow Designer automatically converts it into a JSON string. Instead of writing a script, you can add a string input to a REST step and map it to complex data from a prior action or step.

**Save your objects as templates**

Save your objects as templates so you can reuse them in other actions, flows, and Script steps.

**Create script input variables to access prior data**

Create a script input variable for any data you want to access from the action input or a prior step. Map the script input variable to the input or step data pill. For example, map the script input variable to a list of user records you looked up in a prior step.

**Create a script output variable to store complex data**

Create a script output variable to store any complex data your script creates. The script output variable data structure, data types, and names must match the values defined in the script. For example, create a contacts array of objects to store multiple contact objects. Save the contact object as a template so you can reuse it.

**Map the action output to the script output variable**

When you want a custom action to output complex data, add an action output and map it to the data pill for your Script step output variable. For example, create a contacts array and load the contact object template you saved earlier. Map the action output to the contacts array produced by your Script step.

**Create a custom action to generate an array of objects from a list of records**

Generate an array of objects from a list of User records. Learn how to use a Script step to iterate through a list of records.

Role required: admin
Use this example to see demonstrations of these operations and steps.

- Create an action input for a Department record.
- Look up a maximum of three User records for the Department action input.
- Configure a Script step to process a list of User records.
- Create a script input variable containing the list of User records.
- Write script that creates an empty contacts array.
- Write script that iterates through the list of User records.
- Write script that creates a contact object and maps User record field values to the contact object.
- Write script that populates the contacts array with the current contact object.
- Create script output variables for the contacts array and child contact object.
- Save the contact object as a template.
- Output the generated contacts array of objects as a data pill.
- Test the action with a sample department.

1. Create an application to store your work.
   Use the Guided Application Creator.
   For example, create My Application.

   The system displays the Flow Designer landing page.

3. Select New > Action
   The system displays the Action Properties dialog.

4. Enter these sample values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Create Contacts Array Of Objects</td>
</tr>
<tr>
<td>Application</td>
<td>My Application</td>
</tr>
<tr>
<td>Accessible From</td>
<td>All application scopes</td>
</tr>
</tbody>
</table>

5. Select Submit.
   The system displays the Action Designer interface.

6. From the Action Outline, select Inputs > Create Input
   The system displays a new action input.

7. Configure the action input with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Department</td>
</tr>
<tr>
<td>Type</td>
<td>Record.Department [Reference.cmn_department]</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
</tbody>
</table>

8. From the Action Outline, select Add a new step.
   The system displays a list of available steps.

9. Select Look Up Records

10. Configure the step with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Department][is][action-&gt;Department]</td>
</tr>
<tr>
<td>Order by</td>
<td>Name</td>
</tr>
</tbody>
</table>
Note: This example limits the Max Results setting to three records just for demonstration purposes.

11. From the Action Outline, select **Add a new step**. The system displays a list of available steps.
12. Select **Script**.
13. For **Required Runtime**, select **Instance**.
14. From the Input Variables section, select **Create Variable**.
15. Configure the input variable with these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>userRecords</td>
</tr>
<tr>
<td>Value</td>
<td>[step-&gt;Look Up Records step-&gt;Records]</td>
</tr>
</tbody>
</table>

Note: You can select the User records data pill from the Data pane or from the Data Pill Picker button.

16. For **Script**, enter the following text.

```javascript
(function execute(inputs, outputs) {
  //Create an empty array
  var contactsArray = [];
  var i = 0;
  //Iterate through the list of User records
  while(inputs.userRecords.next()) {
    //Create an empty object for each iteration
    var contactObject = {};
    //Query User records to assign object values
    contactObject.first_name = inputs.userRecords.getValue('first_name');
    contactObject.last_name = inputs.userRecords.getValue('last_name');
    contactObject.email = inputs.userRecords.getValue('email');
    //Add current object to array
    contactsArray[i] = contactObject;
    i += 1;
  }
  outputs.contacts = contactsArray;
}) (inputs, outputs);
```

17. From Output Variables, select **Create Variable**.
18. Configure the output variable with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contacts</td>
<td>contacts</td>
<td>Array.Object</td>
<td>True</td>
</tr>
</tbody>
</table>

19. Expand the contacts Array.Object, and rename the child item as contact.
20. From the row for the contact Object, select **Add Child Item**.
21. Configure the child item with these values.
<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>first name</td>
<td>first_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

22. From the row for the contact Object, select **Add Child Item**.
23. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>last name</td>
<td>last_name</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

24. From the row for the contact Object, select **Add Child Item**.
25. Configure the child item with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>email address</td>
<td>email_address</td>
<td>String</td>
<td>True</td>
</tr>
</tbody>
</table>

26. From the row for the contact Object, select **Toggle Advanced Inputs**.
27. From the Advanced Options, select **Save As Template**.
The system displays the Save As Template dialog.
28. For **Enter a Name**, enter *contact*.
29. Click **Save**.
30. From the Action Outline, select **Outputs > Create Output**.
31. Configure the Action Output with these values.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>contacts</td>
<td>contacts</td>
<td>Array.Object</td>
<td>True</td>
</tr>
</tbody>
</table>

32. Expand the contacts Array.Object.
33. From the row for the contact Object, select **Toggle Advanced Inputs**.
34. From the Advanced Options, select **Structure > Start from Template**.
The system displays **Template**.
35. For **Template**, select the template you previously saved.
   For example, select *My application: contact*.
36. Select **Exit Edit Mode**.
The System displays the output fields you created.
37. For **contacts**, select *[step->Script step->contacts]*.

**Note:** You can select the Script step **contacts** data pill from the Data pane or from the Data Pill Picker button.

38. Click **Save**.
39. Select **Test**.
The system displays the Test Action dialog.
40. Enter the following test value:

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department</td>
<td>Development</td>
</tr>
</tbody>
</table>

41. Select **Run Test**.
The system runs the action with the test values provided.
42. Select **Action has executed. To view the action, click here**.
The system displays the action execution details.

43. Review the runtime value for the action Output data.

The system displays output data in JSON format.

For this example, the contacts object contains an array of contact objects with first name, last name, and email information for three users in the Development department.

```json
{
    "contacts": {
        "contact": [
            {
                "email_address": "allyson.gillispie@example.com",
                "first_name": "Allyson",
                "last_name": "Gillispie"
            },
            {
                "email_address": "alva.pennigton@example.com",
                "first_name": "Alva",
                "last_name": "Pennigton"
            },
            {
                "email_address": "andrew.och@example.com",
                "first_name": "Andrew",
                "last_name": "Och"
            }
        ]
    }
}
```

You have a custom action that looks up the Users for a given department and converts those users into an array of contact objects.

Customize this action to use your own logic.

**Inline scripts**

Enable users with coding experience to write inline scripts that set and modify input values during the configuration of an action or flow. Use inline scripts to modify input values that require small format conversions, data transformations, or math operations.

Flow Designer displays a Script button when you configure these components.

- Action instance inputs when you configure the action for a flow
- Action instance outputs when you configure the action for a flow
- Flow logic inputs when you configure the flow logic for a flow
- Flow logic outputs when you configure the flow logic for a flow
- Step inputs when you configure the step for an action.
- Subflow inputs when you configure the subflow for a flow.
- Subflow outputs when you configure the subflow for a flow.

Inline scripts must return values in the same data type as the input expects. For example, an inline script for a Record input must return a GlideRecord object and an inline script for a Date input must return a date-time value. Always test actions and flows containing inline scripts, and verify that there are no runtime errors in the flow execution details.

Script writers should be familiar with Now Platform table structures and field types. In addition, they should know how to work with record and system data using the ServiceNow API.
Benefits

Inline scripts offer these benefits.

- Enable simple data conversion or transformation without having to create custom actions or flows.
- Identify which input data a script affects.
- Restricted access to scripting features to users or groups who are knowledgeable with the available ServiceNow APIs.

Access to inline script

You can grant users access to online scripting by either granting them the flow_designer_scripting role or the Allow Scripting delegated development permission. Both the role and the developer permission display a script button field for each Flow Designer input.

Script button

When you enable a user to create inline scripts, Flow Designer displays a script button next to flow and step inputs.

Script buttons display beside inputs

Clicking the Script button opens the Script editor, which replaces the standard input interface. Enter a script to compute the input value. Script writers can use the fd_data object to access data from previous actions and steps. Ensure your script includes a return statement with the results of your script. For example, return shortDesc; returns the value of the shortDesc variable.
Script editor for input

Clicking the **Collapse Script** button hides the Script editor and displays a read-only version of the input. Clicking the **Expand Script** button displays the Script editor and allows you to edit the script.
Input containing script

**Design considerations**

Follow these design guidelines to create reusable and maintainable inline scripts.

**Write inline script for small non-reusable logic**

Use inline script to format or modify the data for specific inputs and use cases. For reusable logic, create an action or subflow instead.

**Create custom actions or subflows for reusable code rather than inline script**

Create custom actions or subflows for reusable or complex data logic such as changing the data type of source data. You may also want to provide custom actions or subflows for flow designers who are not comfortable with code.

**Avoid duplicating action and flow functionality**

Avoid writing inline script that duplicates action and flow functionality. For example, rather than write inline script to perform record operations, use the create and update record baseline actions.

**Avoid data type changes**

Avoid runtime errors by verifying that your inline script provides information in the same data type as the input or output expects.

**Create variables by declaring them with the var keyword**

Use the var keyword to declare variables so that they remain within the proper JavaScript scope. When you create a variable by assigning it a value, JavaScript may attach it to the global object, which can result in variable values persisting outside of the local scope and causing errors.

**Process records outputs with For Each flow logic and the flow data object**

Inline script can only access the records output of a Look Up Records action from For Each flow logic. Add a Look Up Records action to the flow to generate the records output. Add a For Each flow logic to the flow to process each record in the records output. Create an inline script reference to the For Each flow logic using the fd_data and
item objects. For example, this reference assumes the For Each flow logic is the second item in your flow outline `fd_data._2__for_each.item`.

**Use type ahead suggestions to generate references to flow and action data.**

Create references to flow and action data using the `fd_data` object. The script editor displays type ahead suggestions for existing flow and action data when you type `fd_data.a`. Select a suggestion to build references to flow and action data.

---

**Note:** Refer to record data in a For Each flow logic using the `item` object.

---

**Licensing considerations**

Inline scripts that call integration APIs are subject to IntegrationHub licensing.

**Code editor**

The code editor provides text editor support for inline scripts.

The code editor has these features for the supported language services and scripts.

- Syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes
- Auto-suggestions and auto-completions

---

**Editing tips**

- To insert a fixed space anywhere in your code, press Tab.
- To indent a single line of code, click in the leading white space of the line and then press Tab.
Action Designer

Automate a task with a sequence of related steps such as lookup a record, create a record, and log details about the record creation. Actions separate complexity from the Flow Designer environment, enabling flow designers to add actions to multiple flows with minimal configuration.

Using Action Designer, subject matter experts can:

- Create application-specific actions with pre-set configuration details, enabling process analysts to easily add actions to a flow with little configuration.
- Create scripted actions that appear code-less when added to a flow.
- Build integrations using IntegrationHub.

Custom actions

Unlike core actions where flow designers must manually configure flow logic, custom actions always use the same configuration when added to a flow. If your flow designers often use an action with the same configuration, you might create a reusable action.

A reusable action includes these components.

Inputs

Inputs are data variables used in your action. For example, if an action step creates a record in the incident table, your input might be a reference to the incident table. Once added as an input, the table and its fields are available to steps and outputs in the flow.

Each input you define for an action becomes a configuration option in the Flow Designer interface. To use the action in a flow, flow designers must define a value for each mandatory input. The more inputs an action has, the more data flow designers must define and the more familiar they must be with the underlying data model to use the action effectively.

Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring an action to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see field types.

Action steps

An action step or step is a single reusable operation within an action. For example, the Create Record step allows action designers to specify the table and field values to use during record creation. Action steps require subject matter expertise with application tables, fields, and business logic. Application developers or IT generalists add action steps to actions from the Action Designer design environment. Flow Designer provides a set of ServiceNow core action steps to automate Now Platform processes. You can add application-specific action steps by activating the associated spoke.

Outputs

Outputs are data variables that represent the results of the action. These results are available to other actions in a flow.
**Action Designer environment**

Subject matter experts build custom actions in Action Designer.

Create and edit actions by defining inputs and adding action steps. Test actions to verify if they complete successfully and review the runtime values they generate. Copy actions to use existing actions as templates. Publish actions to activate them, which makes them available to activated flows and to preserve their current action steps, variables, and sequence as a snapshot separate from further configuration changes.

**More Actions**

Click the **More Actions** button to access additional options for the action.

**Copy action**

Create a copy of the open action in an application you specify.

**Configurations**

Enable or disable the **Show inline script toggle** option.

**Code Snippet**

Generate a code snippet for the action.

**Manage security**

Enable or disable the **Callable by Client API** option.

**Manage natural language title**

Create or edit an action title with styled or dynamic text. For more information, see *Manage natural language titles*.

**Testing actions**

After adding inputs and action steps, users with the flow_designer role can test an action. To test an action, users must provide the required inputs.

**Note:** Inputs must be provided for all the mandatory fields.

Flow designers should always test actions on non-production instances containing relevant demonstration data since testing an action creates or changes records on the instance.
Note: User must have the flow_designer or admin role to view the executions.

Roles

To create custom actions, a user must have the action_designer or admin roles.

Action input and output data types

Action inputs and outputs are data variables that store data of a particular data type.

Flow Designer supports action inputs and outputs with these data types:

- Array
  - Array.Boolean
  - Array.Choice
  - Array.Datetime
  - Array.Integer
  - Array.Object
  - Array.String
- Audio
- Choice
- Color
- Condition String
- Conditions – Reference table required
- Currency
- Data Structure
- Date
- Date/Time
- Document ID – Reference table required
- Due Date
- Duration
- Dynamic Choice
- Dynamic Template
- Encrypted Text
- Field Name
- Floating Point Number
- HTML
- IP Address (Validated IPV4, IPV6)
- Icon
- Image
- Integer
- Journal
- Journal Input
- Journal List
- List
- Long
- Name-Value Pairs
- Password (1 Way Encrypted)
- Password (2 Way Encrypted)
• Percent Complete
• Phone Number (E164)
• Price
• Records – Reference table required
• Reference – Reference table required
• Script
• Script (Plain)
• String
• String (Full UTF-8)
• Table Name
• Template Value – Reference table required
• Time
• Translated HTML
• Translated Text
• True/False
• URL
• Video
• Wiki
• Workflow

Advanced options for action inputs

Use advanced options to further configure your inputs.

All

The following options are available for all advanced inputs.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name that identifies the array in script calls.</td>
</tr>
<tr>
<td>Hint</td>
<td>Text to display to flow designers so they know what information the array contains.</td>
</tr>
<tr>
<td>Default Value</td>
<td>The value used when an input value is not provided. For example, the default selection of a choice field or a default string in a string field.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>The input requires a value.</td>
</tr>
</tbody>
</table>

Some action inputs have additional options. The details of these options are listed below.

Array

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max Rows</td>
<td>The maximum number of rows you want to display in the user interface. This does not set a limit on the maximum number of rows in the array object.</td>
</tr>
</tbody>
</table>
### Array.Choice

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max length</td>
<td>The maximum length the system stores for an input choice value. Use this option to restrict the length of input values stored during action design.</td>
</tr>
</tbody>
</table>
| Choice       | Select from:  
  - Dropdown with --None--  
  - Dropdown without --None-- |
| Choice list  | Select from:  
  - Create New Choice list to manually create choices. Use the add button (+) to create a choice with Name, Value, and Order values.  
  - Reference existing choice list on a table to select a choice list from and field on an existing table using the Choice Table and Choice field buttons. |

### Array.Object

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Structure    | Select from:  
  - Create Structure Manually  
  - Start from Template         |
| Template     | Select a template to use for this array.                                   |
| Save as Template | Save the current array as a template.                                    |

### Array.String

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max Length</td>
<td>The maximum length the system stores for an input string value. Use this option to restrict the length of input values stored during action design.</td>
</tr>
</tbody>
</table>

### Password (2 Way Encrypted) design considerations

Follow these guidelines when designing flows containing Password (2 Way Encrypted) data.

- To specify the encryption algorithm and the roles allowed to access encrypted data, see [Set up encryption contexts](#).
- Flow Designer prevents manual entries in Password (2 Way Encrypted) values in flow inputs.
• Fields containing Password 2 data cannot be used in conditions.
• To assign a value to a password2 field, drag an existing password2 data pill. Dragging values from other field types is not supported. Flow Designer presents a warning message when password2 data is required.

• Flow Designer prevents dragging Password2 data pills into other field types, and presents a warning message when the field is incompatible type.

• Flow Designer only allows Password2 data pills to be dragged into the following field types.
  • Email body fields
  • HTML fields
  • Password 2 Fields
  • PowerShell Input Variables
  • REST fields
    • Variables
    • REST payload body
    • Query parameters
    • Headers
    • REST multi-part form values
    • Form URL-encoded values
  • SOAP fields
    • Headers
    • Envelope

Flow Designer performs a validation check when a user saves, publishes, or tests actions and flows. This check shows an alert for any data pills dropped in restricted field types and prevents the action or flow from executing. Update the action or flow to remove the invalid data pill and then retry the action.

**Retry policy**

Automatically retry failed requests when a step encounters an intermittent issue such as a network failure or request rate limit. Set a retry policy to prevent having to manually trigger the step again.

**Features**

Retry policies can be:
• Created to support connection timeouts or failed requests based on header, status, response body, error, and HTTP method.
• Applied to all actions that use a given connection alias.
• Applied directly to an action step.

Use retry policies to define:
• The conditions that must be met to retry a step.
• The time interval to wait before retrying a step.
• The maximum number of retry attempts the step makes before stopping.

Associate a default retry policy to a Connection & Credentials alias and apply the retry policy to all HTTP connections.

Note: You can only create retry policies for REST and SOAP steps.

Create a retry policy

Role required: flow_designer or admin

1. Navigate to IntegrationHub > Retry Policy > Create New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the retry policy.</td>
</tr>
<tr>
<td>Connection Type</td>
<td>HTTP</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions that must be met to trigger the retry policy. Conditions that trigger a retry policy include the is, is not, contains, and contains not operators.</td>
</tr>
<tr>
<td>Retry Strategy</td>
<td>• Exponential Backoff: Option to exponentially increase the time interval for the subsequent retry attempts. The multiplier is 2. • Fixed Interval: Option to specify a fixed time interval after which a retry attempt should be made.</td>
</tr>
<tr>
<td>Interval (seconds)</td>
<td>Time interval in seconds after which a retry attempt should be made.</td>
</tr>
<tr>
<td>Count</td>
<td>Maximum number of retry attempts. If no value is specified, the maximum number of retry attempts is based on the value provided in the glide.fdih.retry.max_count system property. Default value of the glide.fdih.retry.max_count system property is 0. For more information about system properties, see Available system properties.</td>
</tr>
</tbody>
</table>

Note: If Retry Strategy is Exponential Backoff, the time interval exponentially increases after every retry attempt till the maximum numbers of attempts is reached.
3. Click Submit.

**Sample retry policy**

In this example, the policy is defined to attempt retry when one of these conditions is met:

- HTTP Method is GET and Error is Connection Timeout
- HTTP Method is GET and Status Code is 429
When the condition is met, retry attempts are made for a maximum number of three times. The time interval between the retry attempts is exponentially increased. The time intervals in this example are 10 seconds, 20 seconds, and 40 seconds.

- **Create Connection & Credential alias**, if you do not have the required alias.
- Assign the retry policy as **Default Retry Policy** to the required Connection & Credential alias.

  **Note:** A default retry policy is provided and is selected as **Default Retry Policy**. If you have created retry policies, you can select the required policy as **Default Retry Policy**.

- Create an HTTP(s) Connection in the Connections related list for the Connection & Credential alias. For more information, see credentials, connections, and aliases.
- Verify and view the details of the retry attempts by navigating to **System Logs > Outbound HTTP Requests**.

### Dynamic inputs

Build dynamic choice and template inputs for an action. Dynamically display and assign values to the inputs during flow design.

**Note:** Dynamic inputs are not available in the base system. To use dynamic inputs in Flow Designer, you must request an IntegrationHub Enterprise Pack subscription.

During flow design, dynamic inputs retrieve values and display them as inputs within an action dynamically. Dynamic input types include:

- Dynamic choice
- Dynamic template

A dynamic input must point to a data gathering action that collects the displayed data. For example, a data gathering action can retrieve values from a third-party system and populate a dynamic choice for an action that runs in an IntegrationHub spoke. To use a dynamic input in Flow Designer:

1. An action designer creates a data gathering action.
2. An action designer creates a parent action with a dynamic input that points to the child data gathering action.
3. A flow designer adds the parent action to a flow.

### Data gathering actions

A data gathering action collects data, typically from a third-party system via a REST call, and dynamically builds its output based on the returned payload. A data gathering action must:

- Have a *script step* that contains an output variable of type JSON.
- Have an action output named *output* of type JSON whose value is derived from the script step's JSON output variable.

  **Note:** The action can have multiple outputs, but there can only be one of type JSON.

- Format the payload in the script step so that *output* has a property named *data*.
- Wait for up to 300 seconds (5 minutes) to gather data before it times out.
Dynamic choice

A dynamic choice displays gathered data as a list of choice values during flow design. For more information on building a dynamic choice, see [Create a data gathering action for a dynamic choice](#).

Dynamic template

A dynamic template displays a gathered list of fields whose associated values can be specified during flow design. Because this list populates dynamically, you don't have to change the flow if new fields are added to or removed from the table that is accessed in the data gathering action. For more information on building a dynamic template, see [Create a data gathering action for a dynamic template](#).

Design considerations

Consider dynamic inputs for third-party integrations

Dynamic inputs let you create flows that fetch data dynamically from external sources. In third-party integrations, dynamic inputs can provide data values that pertain to a particular endpoint. For more information on setting up third-party integrations with Flow Designer, see [IntegrationHub](#).

Be aware of the time required to retrieve large amounts of data

By default, dynamic inputs have up to 300 seconds to gather data before they time out. If your data gathering action needs more time to gather data, set the `sn_flow_designer.sync_action_execution_timeout_in_seconds` system property to a higher value. However, don't use long timeout values for interactive flows where an end user must enter or select a value.

Be aware of scripting errors

Because all data gathering actions use a script step, potential errors could occur from scripting. When using scripts to output JSON variables for your dynamic inputs, you may encounter errors which prevent inputs from receiving the JSON values they need. When a dynamic input scripting error occurs, the following warning message may appear.

![Warning message](image)

Get started with dynamic inputs

Create a sample action that builds a dynamic choice and dynamic template for use in a flow.

Role required: action_designer or admin
In this task, you create a custom action that dynamically generates a list of tables and associated fields in your instance. To accomplish this, you create two data gathering actions: one that collects a list of tables in your instance, and another that collects a list of fields for the selected table. Each data gathering action consists of the following:

- A REST step to gather table and field data from your instance
- A script step to construct the payload from the REST step's Response Body
- An output variable named output of type JSON

You then use these data gathering actions to build a dynamic choice and a dynamic template. Finally, you will create a custom action that calls the data gathering action during flow design.

**Note:** This task recreates the demo actions that are installed when you request a ServiceNow IntegrationHub Enterprise Pack subscription for your instance.

1. Navigate to Flow Designer > Designer.
2. Click New and select New Action.
   a) On the Action Properties screen, in the Name field, enter Get ServiceNow Tables (Dynamic).
   b) Click Submit.

3. In the Action Outline, click the Add a new step icon ( ) under Inputs and select the REST step. Enter the following information.

4. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave Use Connection Alias selected</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the Create new record icon ( ) to create a new HTTP(s) connection, or use an existing connection for your instance. The Credential for the HTTP(s) connection must use basic auth. Additionally, the Connection URL must be the base URL for your instance, including the forward slash at the end. For more information on connections and credentials, see Getting started with connections and Getting started with credentials.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave the Manually option selected</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/doc/table/schema</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
</tbody>
</table>

5. In the Action Outline, click the Add a new step icon ( ) under your REST step and select the Script step.
   a) In the Input Variables section, click Create Variable.
   b) In the Name field, enter payload.
   c) Next to the Value field, click the data pill picker ( ) and select REST Step > Response Body.
d) In the **Script** field, enter the following code.

```javascript
(function execute(inputs, outputs) {
    var payload = JSON.parse(inputs.payload);
    var tables = payload.result
        .filter(function(table) { return table.value.indexOf('_') < 0; }) // Filter the tables we want
        .map(function(table) {
            return { label: table.label, name: table.value }; //
        });
    outputs.tables = { data: tables }; // Final, properly formatted output
})(inputs, outputs);
```

e) In the Output Variables section, click **Create Variable**.
f) In the **Label** and **Name** fields, enter `tables`.
g) In the **Type** field, select `JSON`.

6. In the Action Outline, click **Outputs**.
   a) Click **Create Output**.
   b) In the **Label** and **Name** fields, enter `output`.
   c) In the **Type** field, select `JSON`.
   d) Click **Exit Edit Mode**.
   e) Next to the **Value**, click the data pill picker (>Create Variable<) and select **Script Step > tables**.

7. In the Action header, click **Save** and then click **Test** to test the action.
   a) Click **Run Test**.
   b) Check the action's execution details. Your data gathering action runs successfully if the runtime value for `tables` is a complex object containing an array of key-value pairs for `label` and `name` as shown in the following abbreviated example.

```json
{
    "data": [
        {
            "name": "sla",
            "label": "Agreement"
        },
        {
            "name": "announcement",
            "label": "Announcement"
        },
        {
            "name": "cmdb",
            "label": "Base Configuration Item"
        },
        {
            "name": "checklist",
            "label": "Checklist"
        }, ...
    ]
}
```
8. In the Action header, click **Publish** to make the Get ServiceNow Tables (Dynamic) action available to other flows and actions within the Global scope.

**Create the Get ServiceNow Fields (Dynamic) action**

Role required: action_designer or admin

1. In the main header, click the Create flow, subflow, or action icon (➕) and select **Action**.
   a) On the Action Properties screen, in the **Name** field, enter **Get ServiceNow Fields (Dynamic)**.
   b) Click **Submit**.

2. In the Action Outline, select **Inputs**.
   a) In the Action Input header, click **Create Input**.
   b) In the **Label** and **Name** fields, enter **Table**.
   c) In the **Type** field, select **String**.
   d) To make the input required, toggle the **Mandatory** slider so that it is active.

3. In the Action Outline, click the Add a new step icon (➕) under **Inputs** and select the **REST** step. Enter the following information.

4. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Input</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave Use Connection Alias selected.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the Create new record icon (➕) to create a new HTTP(s) connection, or use an existing connection for your instance. The <strong>Credential</strong> for the HTTP(s) connection must use basic auth. Additionally, the <strong>Connection URL</strong> must be the base URL for your instance, including the forward slash at the end.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave Manually selected.</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/table/ and then click the data pill picker (➕). Select <strong>Inputs &gt; Table</strong>.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
</tbody>
</table>

5. In the Action Outline, under the REST step, click the Add a new step icon (➕) and select the **Script** step.
   a) In the Input Variables section, click **Create Variable**.
   b) In the **Name** field, enter **payload**.
   c) Next to the **Value**, click the data pill picker (➕) and select **REST Step > Response Body**.
   d) In the **Script** field, enter the following code.

```javascript
(function execute(inputs, outputs) {
```
```javascript
var payload = JSON.parse(inputs.payload);
var fields = Object.keys(payload.result[0]).map(function(property) {
    var label = property.charAt(0).toUpperCase() + property.slice(1).replace(/_/g, ' ');
    return {
        name: property,
        value: '' // value is always empty
    };});
final properly formatted output
})((inputs, outputs);
```

e) In the Output Variables section, click **Create Variable**.

f) In the **Label** and **Name** fields, enter `fields`.

g) In the **Type** field, select **JSON**.

6. In the Action Outline, click **Outputs**.
   a) On the Action Output header, click **Create Output**.
   b) In the **Label** and **Name** fields, enter `output`.
   c) In the **Type** field, select **JSON**.
   d) Click **Exit Edit Mode**.
   e) Next to the **Value** field, click the data pill picker (●) and then select **Script Step > fields**.

7. In the Action header, click **Save** and then click **Test** to **test the action**.
   a) On the Test Action screen, in the **Table** field, enter `incident`.
   b) Click **Run Test**.
   c) Check the action's execution details.

Your data gathering action runs successfully if the runtime value for `fields` is a complex object containing an array of key-value pairs for `label`, `name`, and `value` as shown in the following abbreviated example.

```javascript
{
    "data": [
    {
        "name": "Parent",
        "label": "parent",
        "value": ""
    },
    {
        "name": "Made sla",
        "label": "made_sla",
        "value": ""
    },
    {
        "name": "Caused by",
        "label": "caused_by",
        "value": ""
    }]
}
```
8. In the Action header, click **Publish** to make the Get ServiceNow Fields (Dynamic) action available to other actions within the Global scope.

*Create the Create ServiceNow Record (Dynamic) action*

Role required: action_designer or admin

1. Click the Create flow, subflow, or action icon (新增) and then select **Action**.
   a) On the Action Properties screen, in the **Name** field, enter Create ServiceNow Record (Dynamic).
   b) Click **Submit**.

2. In the Action Outline, click **Inputs**.
   a) Click **Create Input**.
   b) In the **Label** and **Name** fields, enter Table.
   c) In the **Type** field, select **Dynamic Choice**.
   d) To make the input required, toggle the **Mandatory** slider so that it is active.
   e) Click the Toggle advanced inputs icon (增加) to display the advanced options for the Table input.
   f) Under Dynamic Options, in the **Action** field, select Get ServiceNow Tables (Dynamic).
   g) Click **Create Input** to create another action input.
   h) In the **Label** and **Name** fields, enter Fields.
   i) In the **Type** field, select **Dynamic Template**.
   j) To make the input required, toggle the **Mandatory** slider so that it is active.
   k) Click the Toggle advanced inputs icon (增加) to display the advanced options for the Table input.
   l) Under Dynamic Options, in the **Action** field, select Get ServiceNow Fields (Dynamic).
   m) Toggle the **Depends-On Another Input** slider to make it active.
   n) In the **Table** field, select Table.

3. In the Action Outline, under Inputs, click the Add a new step icon (新增) and then select the **Script** step.
   a) In the Input Variables section, click **Create Variable**.
   b) In the **Name** field, enter table.
   c) Next to the **Value** field, click the data pill picker (新增) and select Inputs > Table.
   d) Click **Create Variable** to create another input variable.
   e) In the **Name** field, enter fields.
   f) In the **Type** field, select **String**.
g) Next to the **Value** field, click the data pill picker ( >>= ) and select **Inputs > Fields**.

h) In the **Script** field, enter the following code.

```javascript
(function execute(inputs, outputs) {
  var gr = new GlideRecord(inputs.table);
  gr.applyEncodedQuery(inputs.fields);
  gr.insert();
})(inputs, outputs);
```

4. In the Action header, click **Save** and then click **Test** to *test the action*.
   a) On the Test Action screen, in the **Table** input, select any dynamically-generated choice value.
   b) Click **Add Field Value** and then select any field and enter any value.
   c) Click **Run Test**.
   d) Check the action's execution details. Your action runs successfully if the runtime values for **Table** and **Field** match the values you entered for the test.

5. In the Action header, click **Publish** to make the **Create ServiceNow Record (Dynamic)** action available to flows within the Global scope.
You can now add the **Create ServiceNow Record (Dynamic)** action to a flow in Flow Designer. This sample action dynamically generates a list of tables and associated fields in your instance whose values you can assign during flow design.

### Create a data gathering action for a dynamic choice

Create an action to collect input values to pass to a parent action as a dynamic choice.

Role required: action_designer or admin

1. Navigate to **Flow Designer > Designer**.
2. Click the **New** button and select **New Action**.
3. Enter a **Name** for your action and choose the proper **Application** scope. Then, click **Submit**.
4. Under **Action Outline**, click the **Add a new step** icon under **Inputs** and select the **REST** step. Configure your REST step to get data from the proper **Base URL** and **Resource Path** with any applicable **Query Parameters** for the **HTTP Method** GET. For more information on using the REST step in IntegrationHub, see **REST step** and **REST in IntegrationHub**.
5. Under Action Outline, click the Add a new step icon under your REST step and select the Script step. This script step must transform the REST step's Response Body into a format that can be used as a dynamic choice for a parent action. Format the JSON output variable so that it contains a property named data with a structure similar to the following example.

```
{
  data: [
    {
      label: "Choice Option 1",
      name: "choice_option_1"
    },
    {
      label: "Choice Option 2",
      name: "choice_option_2"
    },
    {
      label: "Choice Option 3",
      name: "choice_option_3"
    }
  ]
}
```

6. Under Action Outline, click Outputs. Create an output named output of type JSON. Then, use the data pill picker to assign the data pill for the JSON output variable from your script step to the action output's Value.

**Note:** The action can have multiple outputs, but there can only be one of type JSON.

7. Click Save and test the action. In the execution details, your data gathering action runs successfully if the runtime value for output contains the data property in the proper format.

8. Click Publish to make the action available to other flows and actions within the same application scope.
You can now use your data gathering action to populate the options that appear for a dynamic choice input in a parent action.

Create a data gathering action for a dynamic template

Create an action to collect input values to pass to a parent action as a dynamic template.

Role required: action_designer or admin

1. Navigate to Flow Designer > Designer.
2. Click the New button and select New Action.
3. Enter a Name for your action and choose the proper Application scope. Then, click Submit.
4. Under **Action Outline**, click the **Add a new step** icon under **Inputs** and select the **REST** step. Configure your REST step to get data from the proper **Base URL** and **Resource Path** with any applicable **Query Parameters** for the **HTTP Method** **GET**. For more information on using the REST step in IntegrationHub, see **REST step** and **REST in IntegrationHub**.

5. Under **Action Outline**, click the **Add a new step** icon under your REST step and select the **Script** step. This script step must transform the REST step's **Response Body** into a format that can be used as a dynamic choice for a parent action. Format the JSON output variable so that it contains a property named **data** with a structure similar to the following example.

   ```json
   {  
       data: [  
           {  
               label: "Template Option 1",  
               name: "template_option_1",  
               value: ""  
           },  
           {  
               label: "Template Option 2",  
               name: "template_option_2"  
           },  
           {  
               label: "Template Option 3",  
               name: "template_option_3",  
               value: "",  
               type: "choice",  
               choices: [  
                   { label: "Choice 1", value: "choice_1" },  
                   { label: "Choice 2", value: "choice_2" }  
               ]  
           }  
       ]  
   }
   ```

   **Note:** The JSON output structure for a dynamic template can include the optional properties **type** and **choices**.

   - **type**: Specify a valid **field type** to render the appropriate UI control for the dynamic template.
   - **choices**: If specifying **choice** for the **type** property, you can then specify an array of choice options that will render in a list for the dynamic template.

6. Under **Action Outline**, click **Outputs**. Create an output named **output** of type JSON. Then, use the data pill picker (**-pill**) to assign the data pill for the JSON output variable from your script step to the action output's **Value**.

   **Note:** The action can have multiple outputs, but there can only be one of type JSON.

7. Click **Save** and **test the action**. In the execution details, your data gathering action runs successfully if the runtime value for **output** contains the **data** property in the proper format.

8. Click **Publish** to make the action available to other flows or actions within the same application scope.
You can now use your data gathering action to populate the options that appear for a dynamic template input in a parent action.

Dynamic input configuration options

Use these options to configure your dynamic inputs for a parent action.

Dynamic input configuration

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a label that will appear for the action input when the action is added to a flow.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the dynamic choice or template.</td>
</tr>
<tr>
<td>Max length</td>
<td>Enter the maximum character length for one choice or template field value.</td>
</tr>
<tr>
<td>Hint</td>
<td>Enter a hint to display for the dynamic input.</td>
</tr>
<tr>
<td>Choice</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>• Dropdown with --None--</td>
</tr>
<tr>
<td></td>
<td>• Dropdown without --None--</td>
</tr>
<tr>
<td>Default Value</td>
<td>Enter a string value to use as a default for the dynamic input.</td>
</tr>
<tr>
<td>Action</td>
<td>Select a data gathering action that generates values as JSON output.</td>
</tr>
<tr>
<td>Depends-on Another Input</td>
<td>Enable this option to require an input value from the parent action to be passed as an input to the data gathering action. If enabled, select a dependent input from the parent action.</td>
</tr>
</tbody>
</table>

**Dynamic outputs**

Access action and subflow outputs as dynamically generated data pills during flow design. You can also build data gathering actions to generate complex objects from Now Platform and IntegrationHub outputs.

**Note:** Dynamic outputs are not available in the base system. To use dynamic outputs in Flow Designer, you must request an IntegrationHub Enterprise Pack subscription.

During flow design, a dynamic output retrieves a complex object's schema values and displays them as data pills in the data pane.

A dynamic output must point to a data gathering action that collects the data it displays. For example, a data gathering action can retrieve values from a third-party system as part of an IntegrationHub spoke. To use a dynamic output in Flow Designer:

1. An action designer creates a data gathering action.
2. An action designer creates a parent action with a dynamic output that points to the child data gathering action.
3. A flow designer adds the parent action to a flow.

**Data gathering actions**

A data gathering action collects data, typically from a third-party system via a REST call, and dynamically builds its output based on the returned payload. A data gathering action must:

- Have a `script step` that contains an output variable of type JSON.
- Have an action output named `output` of type JSON whose value is derived from the script step's JSON output variable.

**Note:** The action can have multiple outputs, but there can only be one of type JSON.
- Format the payload in the script step so that `output` has a property named `data`.
- Wait for up to 300 seconds (5 minutes) to gather data before it times out.

**Note:** To change the timeout period for a data gathering action, modify the value of the `sn_flow_designer.sync_action_execution_timeout_in_seconds` system property.

### Dynamic object

A dynamic object is either a complex object or an array of complex objects. Action designers build the object structure dynamically with a data gathering action rather than hard-coding it. For more information on building a dynamic object, see *Create a data gathering action for a dynamic object*.

### Design considerations

**Consider dynamic outputs for third-party integrations**

Use dynamic outputs to introspect and fetch data from external systems during flow design. For example, specify service endpoints or call actions that interact with specific endpoint APIs. For more information on setting up third-party integrations with Flow Designer, see *IntegrationHub*.

**Be aware of time required to retrieve large amounts of data**

By default, dynamic outputs have up to 300 seconds to gather data before the system stops them. If your data gathering action needs more time to gather data, set the `sn_flow_designer.sync_action_execution_timeout_in_seconds` system property to a greater value. Avoid long timeout values for interactive flows where an end user is expecting to enter or select a value.

**Be aware of scripting errors**

Since all data gathering actions use a script step, be aware of any potential errors that could arise from scripting. Review any scripts used to output JSON variables as script errors may prevent the outputs from receiving the JSON values they need. When a dynamic output scripting error occurs, the following warning message may appear.

![Warning: A dynamic action error occurred.](image)

**Message displayed for scripting error**

### Get started with dynamic outputs

Create a sample action that builds dynamic objects for use in a flow.

**Role required: action_designer or admin**

In this task, you create two data gathering actions: one that collects the schema for a record on your instance, and another that collects the schema for multiple records in the same table on your instance. The goal is to create both a complex object and a complex object array to use as dynamic outputs. Each data gathering action will consist of the following:

- A REST step to gather table schema data from your instance.
- A script step to construct the payload from the REST step's Response Body.
- An output variable named `output` of type JSON.

You use these data gathering actions to build two dynamic objects. Then, you create a custom action that calls the data gathering actions during the flow design.

**Note:** This task re-creates the demo actions that are installed when you request an IntegrationHub Enterprise Pack subscription for your instance.

1. Navigate to **Flow Designer > Designer**.
2. **Click New** and select **New Action**.
   a) On the Action Properties screen, in the **Name** field, enter **Get ServiceNow Object Schema (Dynamic)**.
   b) **Click Submit**.
3. In the Action Outline, click **Inputs**.
   a) In the Action Input header, click **Create Input**.
   b) In the **Label** and **Name** fields, enter **Table**.
   c) In the **Type** field, select **String**.
   d) To make this input required, toggle the **Mandatory** slider so that it is active.
4. In the Action Outline, click the add a new step icon ( carp) under Inputs and select **REST Step**.
5. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave the <strong>Use Connection Alias</strong> option selected.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td><a href="#">Click the create new record icon ( carp) to create a new <strong>HTTP(s)</strong> connection, or use an existing connection for your instance. The <strong>Credential</strong> for the HTTP(s) connection must use <strong>basic auth</strong>. Additionally, the <strong>Connection URL</strong> must be the base URL for your instance, including the forward slash at the end. For more information on connections and credentials, see <strong>Getting started with connections</strong> and <strong>Getting started with credentials</strong>.</a></td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave the <strong>Manually</strong> option selected.</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter <code>api/now/processflow/table/</code> and then click the data pill picker ( carp). Select <strong>Inputs &gt; Table</strong>. Next, enter <code>/schema</code>.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter <strong>GET</strong></td>
</tr>
<tr>
<td>Query Parameters</td>
<td><a href="#">Click the plus icon ( carp) to add a new query parameter. Then, in the <strong>Name</strong> field, enter <code>get_choices</code> and <code>true</code> in the <strong>Value</strong> field.</a></td>
</tr>
</tbody>
</table>
6. In the Action Outline, click the add a new step icon (➕) under your REST step and select the **Script** step.
   a) In the Input Variables section, click **Create Variable**.
   b) In the **Name** field, enter `payload`.
   c) Next to the **Value** field, click the data pill picker (🔍) and select **REST Step > Response Body**.
   d) In the **Script** field, enter the following code:

   ```javascript
   (function execute(inputs, outputs) {
     var payload = JSON.parse(inputs.payload);
     var columns = payload.result.data.columns;
     var schema = columns.map(function(column) {
       var value = {
         label: column.label,
         name: column.name,
         type: getCOType(column.definition.base_type),
       };
       if (column.definition.type === 'choice') {
         value.type = 'choice';
         value.choices = column.definition.choices;
       }
       if (column.definition.base_type === 'GUID') {
         value.children = [
           { label: 'Link', name: 'link', type: 'string' },
           { label: 'Value', name: 'value', type: 'string' },
         ];
       }
       return value;
     });
     outputs.schema = {
       data: {
         type: 'object',
         children: schema,
       },
     };
     function getCOType(type) {
       if (type === 'GUID') return 'reference';
       return type;
     }
   })(inputs, outputs);
   
   e) In the Output Variables section, click **Create Variable**.
   f) In the **Label** and **Name** fields, enter `schema`.
   g) In the **Type** field, select **JSON**.

7. In the Action Outline, click **Outputs**.
   a) In the Action Output header, click **Create Output**.
   b) In the **Label** and **Name** fields, enter `output`.
   c) In the **Type** field, select **JSON**.
   d) In the Action Output header, click **Exit Edit Mode**.
e) Next to the **Value** field, click the data pill picker and select **Script Step > schema**.

8. In the Action header, click **Save** and then click **Test** to **test the action**.
   a) On the Test Action screen, enter **incident** for the **Table** input.
   b) Click **Run Test**.
   c) Check the action's execution details.

Your data gathering action runs successfully if the runtime value for **fields** is a complex object in a format that is similar to the following abbreviated example.

```
{
    "data": {
        "type": "object",
        "children": [
            {
                "name": "active",
                "label": "Active",
                "type": "boolean"
            },
            {
                "name": "activity_due",
                "label": "Activity due",
                "type": "datetime"
            }, ...
        ]
    }
}
```

9. In the Action header, click **Publish** to make the **Get ServiceNow Object Schema (Dynamic)** action available to other flows and actions within the Global scope.

**Create the Get ServiceNow Array.Object Schema (Dynamic) action**

Role required: action_designer or admin

1. In the main header, click the create flow, subflow, or action icon and select **Action**.
   a) In the Action Properties modal, in the **Name** field, enter **Get ServiceNow Array.Object Schema (Dynamic)**.
   b) Click **Submit**.

2. In the Action Outline, click **Inputs**.
   a) In the Action Input header, click **Create Input**.
   b) In the **Label** and **Name** fields, enter **Table**.
   c) In the **Type** field, select **String**.
   d) To make the input required, toggle the **Mandatory** slider so that it is active.

3. In the Action Outline, click the add a new step icon under Inputs and select the **REST** step.

4. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave Use Connection Alias selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the create new record icon (➕) to create a new HTTP(s) connection, or use an existing connection for your instance. The Credential for the HTTP(s) connection must use basic auth. Additionally, the Connection URL must be the base URL for your instance, including the forward slash at the end.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave Manually selected</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/processflow/table/ and then click the data pill picker (➕). Select Inputs &gt; Table. Finally, enter /schema</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
<tr>
<td>Query Parameters</td>
<td>Click the plus icon (➕) to add a new query parameter. Then, in the Name field, enter get_choices and true in the Value field.</td>
</tr>
</tbody>
</table>

5. In the Action Outline, click the Add a new step(➕) icon under your REST step and select the Script step.
   a) In the Input Variables section, click Create Variable.
   b) In the Name field, enter payload.
   c) Next to the Value field, click the data pill picker (➕) and select REST Step > Response Body.
   d) In the Script field, enter the following code.

```javascript
(function execute(inputs, outputs) {
  var payload = JSON.parse(inputs.payload);
  var columns = payload.result.data.columns;
  var schema = columns.map(function(column) {
    var value = {
      label: column.label,
      name: column.name,
      type: getCOType(column.definition.base_type),
    };
    if (column.definition.type === 'choice') {
      value.type = 'choice';
      value.choices = column.definition.choices;
    }
    return value;
  });
})
```
outputs.schema = {
    data: {
        type: 'array.object',
        attributes: {
            child_type: 'object',
        },
        children: schema,
    },
};

function getCOType(type) {
    if (type === 'GUID') return 'string';
    return type;
}

})(inputs, outputs);

e) In the Output Variables section, click **Create Variable**.
f) In the **Label** and **Name** fields, enter `schema`.
g) In the **Type** field, select `JSON`.

6. In the Action Outline, click **Outputs**.
a) On the Action Output header, click **Create Output**.
b) Enter `output` in the **Label** and **Name** fields.
c) Select `JSON` for the **Type** field.
d) Click **Exit Edit Mode**.
e) Next to the **Value** field, click the data pill picker (🔗) and select `Script Step > schema`.

7. In the Action header, click **Save** and then click **Test** to **test the action**.
a) On the Test Action screen, in the **Table** field, enter `incident`.
b) Click **Run Test**.
c) Check the action's execution details.

Your data gathering action runs successfully if the runtime value for `fields` output is a complex object that contains an array of key-value pairs for `label`, `name`, and `value` as shown in the following abbreviated example.

```json
{
    "data": {
        "type": "array.object",
        "children": [
            {
                "name": "active",
                "label": "Active",
                "type": "boolean"
            },
            {
                "name": "activity_due",
                "label": "Activity due",
                "type": "datetime"
            }, ...
        ]
    }
}
```

8. In the Action header, click **Publish** to make the **Get ServiceNow Array.Object Schema (Dynamic)** action available to other actions within the Global scope.
Create the Get ServiceNow Records (dynamic) action

Role required: action_designer or admin

1. In the main header, click the create flow, subflow, or action icon  and select **Action**.
   a) In the Action Properties modal, in the **Name** field, enter *Get ServiceNow Records (Dynamic)*.
   b) Click **Submit**.

2. In the Action Outline, click **Inputs**.
   a) In the Action Input header, click **Create Input**.
   b) In the **Label** and **Name** fields, enter *Table*.
   c) In the **Type** field, select *Dynamic Choice*.
   d) To make the input required, toggle the **Mandatory** slider so that it is active.
   e) Click the Toggle advanced inputs icon to display the advanced options for the Table input.
   f) In the **Default value** field, enter *incident*.
   g) Under Dynamic Options, in the **Action** field, select *Get ServiceNow Tables - Dynamic*.
   h) Click **Create Input** to create another action input.
   i) In the **Label** and **Name** fields, enter *NumberOfRecords*.
   j) In the **Type** field, select *Integer*.
   k) To make the input required, toggle the **Mandatory** slider so that it is active.
   l) Click the Toggle advanced inputs icon to display the advanced options for the Table input.
   m) In the **Default value** field, enter *3*.

3. In the Action Outline, click the add a new step icon under Inputs and select the **REST** step.

4. Under the REST step header, fill in the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Leave Use Connection Alias selected.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Click the Create new record icon to create a new HTTP(s) connection, or use an existing connection for your instance. The Credential for the HTTP(s) connection must use basic auth. Additionally, the Connection URL must be the base URL for your instance, including the forward slash at the end.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Leave Manually selected</td>
</tr>
<tr>
<td>Resource Path</td>
<td>Enter api/now/table/ and then click the data pill picker. Select Inputs &gt; Table.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>Enter GET</td>
</tr>
</tbody>
</table>
5. In the Action Outline, click the Add a new step icon (＋) under Inputs and select the Script step.
   a) In the Input Variables section, click Create Variable.
   b) In the Name field, enter payload.
   c) Next to the Value field, click the data pill picker (⋯) and select REST Step > Response Body.
   d) In the Script field, enter the following code.

   ```javascript
   (function execute(inputs, outputs) {
     var response = JSON.parse(inputs.payload);
     var records = response.result;
     outputs.record = records[0];
     outputs.records = JSON.stringify(records);
   })(inputs, outputs);
   ```

   e) In the Output Variables section, click Create Variable.
   f) In the Label and Name fields, enter record.
   g) Select JSON for the Type field.
   h) Toggle the Mandatory slider so that it is active.
   i) Click Create Variable to create another output variable for the script step.
   j) In the Label and Name fields, enter records.
   k) In the Type field, select JSON.
   l) To make the input required, toggle the Mandatory slider so that it is active.

6. In the Action Outline, click Outputs.
   a) In the Action Output header, click Create Output.
   b) In the Label and Name fields, enter Records.
   c) In the Type field, select Dynamic Object.
   d) Click the Toggle advanced inputs icon (⋮) to display the advanced options for the Records output.
   e) Under Dynamic Options, select Get ServiceNow Array.Object Schema (Dynamic) as the Action.
   f) To make the Table input dependent on another input, toggle the Depends-On Another Input slider to make it active.
   g) In the Table field, select Table.
   h) In the Action Output header, click Exit Edit Mode.
i) Next to the Value field, click the data pill picker ( ) and select Script Step > records.

j) In the Action Output header, click Edit Outputs > Create Output to create another action output.

k) In the Label and Name fields, enter Record.

l) In the Type field, select Dynamic Object.

m) Click the Toggle advanced inputs icon ( ) to display the advanced options for the Record output.

n) Under Dynamic Options, in the Action field, select Get ServiceNow Object Schema (Dynamic).

o) To make the Table input dependent on another input, toggle the Depends-On Another Input slider to make it active.

p) In the Table field, select Table.

q) In the Action Output header, click Exit Edit Mode.

r) For the Value, click the data pill picker ( ) and select Script Step > record.

7. In the Action header, click Save and then click Test to test the action.

a) On the Test Action screen, select any dynamically generated choice value for the Table input.

b) Click Run Test.

c) Check the action’s execution details.

   Your action runs successfully if the runtime value for Record is a properly formatted complex object and the runtime value for Records is a properly formatted complex object array.

8. In the Action header, click Publish to make the Get ServiceNow Records (Dynamic) action available to flows within the Global scope.

   You can now add the Get ServiceNow Records (Dynamic) action to a flow in Flow Designer. This sample action dynamically generates two action outputs, Record and Records, which can be accessed
as data pills in the data pane. The data pills refresh dynamically when the value for the Table input changes.

Create a data gathering action for a dynamic object

Create an action to collect output values. Then, pass the values to a parent action as a dynamic object.

Role required: action_designer or admin

1. Navigate to Flow Designer > Designer.
2. Click the New button and select New Action.
3. Enter a Name for your action and choose the proper Application scope. Then, click Submit.
4. Under Action Outline, click the Add a new step icon under Inputs and select the REST step. Configure your REST step to get data from the proper Base URL and Resource Path with any applicable Query Parameters for the HTTP Method GET. For more information on using the REST step in IntegrationHub, see REST step and REST in IntegrationHub.
5. Under Action Outline, click the Add a new step icon under your REST step and select the Script step. This script step must transform the response from the REST step's Response Body into a format that defines the schema of a dynamic object output for a parent action. Your script step must:
   - Have a single JSON output variable. The script step can have other output variables, but one and only one must be of type JSON.
• Format the JSON output variable so that it contains a property named `data`. For a complex object output, your `data` property must have a format similar to the following example:

```json
{
  data: {
    type: "object",
    //Required
    children: [
      //Required - This is a collection of field definitions
      {
        name: "Name 1",
        //Required - Unique name
        label: "Label 1",
        //Required - Display name
        type: "string"
        //Required - Supported field type (See the Note below)
      },
      {
        name: "Name 2",
        label: "Label 2",
        type: "string"
      }
    ]
  }
}
```

For a complex object array output, your `data` property must have a format similar to the following example:

```json
{
  data: {
    type: "object",
    //Required
    attributes: { child_type: "object" }  
    //Required - Indicates that the array's children are of type object
    children: [
      //Required - This is a collection of field definitions
      {
        name: "Name 1",
        //Required - Unique name
        label: "Label 1",
        //Required - Display name
        type: "string"
        //Required - Supported field type (See the Note below)
      },
      {
        name: "Name 2",
        label: "Label 2",
        type: "string"
      }
    ]
  }
}
```
Note: Supported action input data types for the type property include:

- string
- integer
- datetime
- choice
- boolean
- object
- array.string
- array.integer
- array.datetime
- array.choice
- array.boolean
- array.object

6. Under Action Outline, click Outputs. Create an output named output of type JSON. Then, use the data pill picker to assign the data pill for the JSON output variable from your script step to the action output's Value.

   Note: The action can have multiple outputs, but there can only be one of type JSON.

7. Click Save and test the action. In the execution details, your data gathering action runs successfully if the runtime value for output contains the data property in the proper format.

8. Click Publish to make the action available to other flows or actions within the same application scope.
You can now use your data gathering action to populate the schema values for a dynamic object in a parent action.

**Dynamic output configuration options**

Use these options to configure your dynamic outputs for a parent action.

### Dynamic output configuration

#### Dynamic output options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a label that will appear within the output data pill for the action.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a descriptive name for the dynamic object.</td>
</tr>
<tr>
<td>Action</td>
<td>Select a data gathering action that generates values as JSON output.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Depends-on Another Input</td>
<td>Enable this option to require an input value from the parent action to be passed as an input to the data gathering action. If enabled, select a dependent input from the parent action.</td>
</tr>
</tbody>
</table>

## Create an action

Create a reusable component to automate one or more steps of a process.

- **Setting up an application in Guided Application Creator** to store Flow Designer content.
- **Role required:** flow_designer, action_designer or admin

Action designers should know the application table structure and be aware of any existing business logic associated with the target tables of an action. Be sure to disable any conflicting business rules or workflows before creating an action.

Creating a custom application to contain your Flow Designer content enables you to *deploy* it using the application repository or the ServiceNow Store.

1. Navigate to **Flow Designer > Designer**.
2. Click the **Actions** tab and select **New Action**.
3. Fill in the **Action Properties** and click **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the input. This value is used as the name of the data pill in the right-hand pane.</td>
</tr>
</tbody>
</table>

**Note:** Action input names can’t include any of the following reserved system names:
- sys_id
- sys_created_by
- sys_created_on
- sys_updated_on
- sys_updated_by
- sys_mod_count

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessible From</td>
<td>Accessible from all application scoped or only within the specified application scope.</td>
</tr>
<tr>
<td>Category</td>
<td>Defined category within the application scope for an action.</td>
</tr>
<tr>
<td>Protection</td>
<td>Select whether the action is read-only. You can only select a value when you create the action in an application scope you own. The default value is None.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the action.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the action.</td>
</tr>
<tr>
<td>In-Flow Annotation</td>
<td>Help text that appears under the action title in Flow Designer to help flow designers understand what the action does when used in a flow.</td>
</tr>
</tbody>
</table>

An empty action opens.

4. Define action inputs to make data available to the action steps and outputs.
   a) Select + **Create Input** and complete the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the output. This value is the name of the data pill in the right-hand pane when the action is added to a flow.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Action output names can't include any of the following reserved system names:</td>
</tr>
<tr>
<td></td>
<td>• sys_id</td>
</tr>
<tr>
<td></td>
<td>• sys_created_by</td>
</tr>
<tr>
<td></td>
<td>• sys_created_on</td>
</tr>
<tr>
<td></td>
<td>• sys_updated_on</td>
</tr>
<tr>
<td></td>
<td>• sys_updated_by</td>
</tr>
<tr>
<td></td>
<td>• sys_mod_count</td>
</tr>
<tr>
<td>Type</td>
<td>Data type of the input. For supported data types, see <em>Action input and output data types</em>.</td>
</tr>
<tr>
<td>Reference Table</td>
<td>Reference table for the data type. Only required for the following data types:</td>
</tr>
<tr>
<td></td>
<td>• Conditions</td>
</tr>
<tr>
<td></td>
<td>• Document ID</td>
</tr>
<tr>
<td></td>
<td>• Records</td>
</tr>
<tr>
<td></td>
<td>• Reference</td>
</tr>
<tr>
<td></td>
<td>• Template Value</td>
</tr>
<tr>
<td>Advanced options</td>
<td>Inputs provide advanced options based on their data type. All inputs have advanced options to add a hint or provide a default value. Use advanced options to guide flow designers through adding and configuring an action to a flow. For example, create a choice input to provide flow designers with a pre-defined list of configuration options to choose from. For more information about the configuration options available to particular data types, see <em>field types</em>.</td>
</tr>
<tr>
<td></td>
<td>Click to view the advanced options and define values.</td>
</tr>
</tbody>
</table>

Inputs are represented as data pills in the right-hand pane. You can add inputs to steps and outputs in the flow by dragging and dropping data pills.

5. **Add an action step to perform an operation on the action inputs.**
   a) Click the + underneath Inputs in the Action Outline.
   b) Select the step you would like to perform.
   c) Complete the fields in the step.

6. **Add action outputs to make data available to a flow.**
   a) Select + **Create Outputs** and complete the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the output. This value is the name of the data pill in the right-hand pane when the action is added to a flow.</td>
</tr>
</tbody>
</table>

| Value  | Data used previously in the action either in a step or input. Adding a variable to the output makes the value available to the flow. |

7. Click **Save**.  
Action Designer saves a draft of the action.

**Test the action** until it is ready to be published.

**Note:** By default, the system only runs published actions.

**Test an action**

Test an action before publishing it for other users.

- **Create an action** and save it.  
- Role required: flow_designer, flow_operator, action_designer, or admin.

A user with the flow_designer role should always test actions on non-production instances containing relevant demonstration data because testing an action creates or changes records on the instance.

1. Navigate to **Flow Designer > Designer**.  
2. Click the **Actions** tab and select the action that you want to test.  
3. Click **Test**.  
The system displays the Test Action dialog box.  
4. Fill in the fields for the action.  

**Note:** Complete all mandatory fields in the Test Action dialog box.

5. Click **Run Test**.

Click **Action has been executed. To view the action, click here to view the action execution details.** See **Flow execution details** for information about the executions.

**Note:** Users must have the flow_operator or admin role to view the executions.
Ask for Approval step

Request approval for a record with an approval field. You can configure a rule set for an approval, rejection, or cancellation. If a due date is added to an approval, the approval is automatically approved, rejected, or canceled if the approvers have not responded by the designated time.

*Approvals* is a platform feature that enables users or groups to approve or reject a task.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select a record under the data panel and drag the record pill into the Record field. If selecting a table with an approval field already configured, the Approval field is set to the correct field.</td>
</tr>
<tr>
<td>Table</td>
<td>Set to the table name associated with the record.</td>
</tr>
<tr>
<td>Approval field</td>
<td>Select a field from the designated table to use for approval.</td>
</tr>
<tr>
<td>Journal field</td>
<td>Select a field from the designated table to use for journal.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Rules   | Define the approval and rejection rules. Approval rules determine which users can approve or reject requests, and what happens after approval or rejection. Approval or rejection rules include:  
  - Anyone approves  
  - All users approve  
  - All responded and anyone approves  
  - % of users approve  
  - # of users approve  
  
In the field beside the approval rule, add the desired approvers. To add approvers:  
  - Select individual users or groups.  
  - Drag-and-drop or select a field from a record.  
  
Select ![+] to allow a manual approver to process an approval or rejection. A manual approver is a user manually added to the Approvers related list who can then approve the request. For example, you can manually add a subject matter expert to a task to approve the request. To learn more about adding manual approvers, see Generate approvals using the approvers related list.  

Define rejection rules by adding another OR rule set. When defining approvals, include rejection rules that run when there are no matching approvals. Such rejection rules prevent the flow from remaining in a waiting state. For example, if an approval can be approved by anyone, create a time-based rejection rule in case no one approves it.  

Note: If you set an approval rule with no rejection rule (or vice versa) and the expected approval state is not met, the runtime value will be canceled. |

| Due Date | Define a due date to ensure that the flow does not remain in a waiting state if the request is not approved or denied.  
  - None: The approval is not dependent on a specific date.  
  - Approve: Automatically approve the step if an action is still pending by the specified date.  
  - Reject: Automatically reject the step if an action is still pending by the specified date.  
  - Cancel: Automatically cancel the step if an action is still pending by the specified date. |
**Example**

### 1. Ask for Approval step

#### Approval Request Definition

- **Record**
  - Incident

- **Table**
  - Incident

- **Approval Field**
  - Approval

- **Journal Field**
  - Approval history

#### Rules

- **Approve**
  - When:
    - Anyone approves

- **Reject**
  - When:
    - Anyone rejects

#### Due Date

- Approve if pending by Relative date 1 Days From

Days schedule: 8-5 weekdays excluding holidays

### Output

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval State</td>
<td>State of the approval request</td>
<td>Choice</td>
</tr>
</tbody>
</table>

### Create Record step

Creates a record on any table. You can dynamically add and configure fields for the record.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select Short description and set the desired value. To add dynamic values, see Allow flow designers to dynamically set field values.</td>
</tr>
</tbody>
</table>

Create or Update Record step

Create or update a record in a ServiceNow table by determining if it already exists. Add records that do not exist, and update existing ones. Identify existing records by selecting unique fields. Set field values dynamically and enforce server-side validation rules (data policy, business rules, dictionary-defined mandatory fields). UI policy does not apply.

Roles and availability

Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Table in which a record is created or updated.</td>
</tr>
<tr>
<td>Fields</td>
<td>Values of fields in the record to be created or updated.</td>
</tr>
<tr>
<td>Determines uniqueness</td>
<td>Option for selecting the field as a unique identifier. This field appears when the required table name and fields are selected.</td>
</tr>
</tbody>
</table>

Create Task step

Create a task on any ServiceNow task table. After you choose the task table, you can dynamically select the fields to configure the action. Defining the Parent field associates the task to a parent record.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
## Fields

<td>• Stale CI Remediation [stale_ci_remediation]</td>
</tr>
<tr>
<td></td>
<td>• Standard Change Proposal [std_change_proposal]</td>
</tr>
<tr>
<td></td>
<td>• Ticket [ticket]</td>
</tr>
</tbody>
</table>

### Field Values

Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select **Short description** and set the desired value.

To add dynamic values, see *Allow flow designers to dynamically set field values.*

To associate the task with a parent record, define the **Parent** field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait</td>
<td>Waits to complete the step until the task completes and is no longer active (active=false). Alternatively, you can add a wait condition by dragging-and-dropping a true/false field from the data panel into the <strong>Wait</strong> field. The flow only waits for the task to complete when the condition field is true.</td>
</tr>
</tbody>
</table>

**Delete Record step**

Deletes a record on any table.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be deleted. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
</tbody>
</table>

**JDBC step**

Create a reusable action to send SQL commands to a relational database.

**Note:**

- The JDBC step is not available in the base system and requires the subscription to IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later. For more information about the ServiceNow®IntegrationHub subscription packages, see **IntegrationHub usage and subscription**. After the required plugin is activated, the step is visible under Integrations.
- The JDBC step runs only on a ServiceNow® MID Server with JDBC step capabilities. Activate the plugin, IntegrationHub Standard Pack Installer (com.glide.hub.integrations.standard) or later to use the JDBC capability for the MID Server.

**Roles and availability**

The JDBC step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
Sanitizing inputs

Escape all user inputs to eliminate the possibility of a malicious user from executing malicious SQL statements that can result in SQL injection on your target database. When you use data pills in JDBC step SQL statements, sanitize them first using Sanitize SQL transform functions. This transform function category automatically appears when a data pill is dropped into the SQL Statement input.

Whitelisting SQL operations

By default, you can run the following SQL operations.

- SELECT
- INSERT
- UPDATE
- DELETE
- SHOW
- DESCRIBE

To enable only some of these SQL operations that the JDBC step can perform, create a MID Server property, mid.property.jdbc_operations and enter the whitelisted SQL operations, separated by comma. To learn more about MID Server properties, see MID Server properties.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Details</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td>Connection</td>
<td>• Define Connection Inline: Define connection information within the action step.</td>
</tr>

<tr>
<td></td>
<td>Way Encrypted) data pill on the data pane. This field is available when Use Connection Alias is</td>
</tr>
<tr>
<td></td>
<td>selected from the Connection list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane. This field is available when Define Connection Inline is selected from the Connection list.</td>
</tr>
</tbody>
</table>
| Database Type         | Database type for this connection. The choices are:  
  - MySQL  
  - Oracle  
  - SQLServer  
  - Custom  

The default choice is Custom. This field is available when Define Connection Inline is selected from the Connection list. |
| JDBC Driver           | Driver to use for this connection when it's not a default database type such as DB2 Universal and Sybase. The database Type is Custom. This field is available when Define Connection Inline is selected from the Connection list and Custom is selected from the Database Type list. |
| Connection URL        | URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases. This field is available when Define Connection Inline is selected from the Connection list and Custom is selected from the Database Type list. |
| MID Application       | Application that the MID Server must support to be eligible for selection. This field is available when Define Connection Inline is selected from the Connection list. |
| Capabilities          | Capability of the MID Server. Select JDBC. This field is available when Define Connection Inline is selected from the Connection list. |
| Connection Timeout    | Maximum elapsed time, in seconds, for the activity to wait while attempting to connect to the target database. This field is available when Define Connection Inline is selected from the Connection list. |
| Query Timeout         | Maximum elapsed time, in seconds, that the query is allowed to run without a response. This field is available when Define Connection Inline is selected from the Connection list. |
| JDBC Configuration    | SQL Statement that the step executes.                                                                                                                                                                         |
| Maximum Rows          | Maximum number of rows to be returned from the SQL statement. The default value is 1000.                                                                                                                      |
| Maximum Payload Size (KB) | Maximum allowable payload size, in KB, to be returned from the SQL statement. The default payload size is 5120 KB. The maximum payload size is 5 MB.                                                                 |

**Note:** When you use data pills in step SQL statements, sanitize them first using a preprocessing Script step. For more information, see Sanitizing inputs using the escape functions.
Test JDBC step

Test the JDBC step before testing or publishing an action that contains the JDBC step.

It is mandatory that you test the JDBC step before testing the action. Testing ensures that the relevant complex object output schema is created from table columns, which can be used as data pills in subsequent steps.

1. Navigate to Flow Designer > Designer.
2. Create an action with a JDBC step.
3. Click Test JDBC Step.
   The Test JDBC Step pop-up window is displayed.
4. If the JDBC step takes an action input or output of the previous step as its input, provide required input values in the Step input pills field to test the JDBC step.

   Note: Input values in the Step input pills fields are not needed when records are updated, inserted, or deleted.
5. Click Run Test.
   • When a SELECT query is executed, Sample Result is displayed in the Test JDBC Step pop-up window. Sample Result includes column names, columns types, and the values of the first row.
   • When an UPDATE, INSERT, or DELETE query is executed, a message is displayed mentioning the number of rows affected.
6. To use the sample result as the JDBC step output, click Use Result.

   Note: Use Result is not displayed when records are updated, inserted, or deleted.
7. To retrieve schema of a different table when a SELECT query is executed in the JDBC step, enter the required value in the Step input pills field and click Run Test.

   When a SELECT query is executed in the JDBC step, ResultSet is displayed under Outputs. The relevant complex object output is populated. To learn more about complex objects, see Complex data.

Test and publish the action.

Log step

Logs a message in the Flow Designer log table.

Roles and availability

• Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log level</td>
<td>Level of importance of the log message.</td>
</tr>
<tr>
<td></td>
<td>• Error</td>
</tr>
<tr>
<td></td>
<td>• Warn</td>
</tr>
<tr>
<td></td>
<td>• Info</td>
</tr>
<tr>
<td>Log message</td>
<td>Message to display in the log. Enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

### Look Up Record step

Look up a record from any table based on defined conditions.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table from the list.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field. When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format [reference field][is][Reference type data pill-&gt;Sys ID]. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition [Requested by][is][action-&gt;incident-&gt;Caller-&gt;Sys ID] where incident is an input variable for an incident record.</td>
</tr>
<tr>
<td>Order by</td>
<td>Determines how to sort results when more than one record matches the defined conditions. Select the field you want to use to sort results.</td>
</tr>
<tr>
<td>Sort Type</td>
<td>Select whether to sort alphabetically in ascending or descending order.</td>
</tr>
<tr>
<td>If multiple records are found</td>
<td>Determines what is returned if more than one record matches the defined conditions.</td>
</tr>
<tr>
<td></td>
<td>• Return only the first record</td>
</tr>
<tr>
<td></td>
<td>• Fail the step</td>
</tr>
</tbody>
</table>
Example

Look Up Record step

Look up multiple records on any table using defined conditions.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Table          | Select a table from the list.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Conditions    | Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field.  
When building a condition that looks up the value of a reference field, use a data pill that explicitly provides the Sys ID value. Ensure the condition has the format `[reference field][is] [Reference type data pill->Sys ID]`. For example, both the Change and Incident tables contain a reference field to the User table. To look up change records where the requester is the caller from an incident record, create the condition `[Requested by][is][action->incident->Caller->Sys ID]` where `incident` is an input variable for an incident record. |
| Order by      | Select the field you want to use to sort results.                                                                                                                                                                                                                                                                                          |
| Sort Type     | Select whether to sort alphabetically in ascending or descending order.                                                                                                                                                                                                                                                                 |
| Max Results   | Maximum number of results returned.                                                                                                                                                                                                                                                                                                       |

**Example**

### 1. Look Up Records step

<table>
<thead>
<tr>
<th>Table</th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>All of these conditions must be met</td>
</tr>
<tr>
<td></td>
<td><strong>AND</strong></td>
</tr>
<tr>
<td></td>
<td>Assigned to  ▼  is  ▼  Bow Ruggeri</td>
</tr>
<tr>
<td></td>
<td>State       ▼  is       ▼  New</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>New Criteria</td>
</tr>
<tr>
<td>Order by</td>
<td>Short description</td>
</tr>
<tr>
<td>Sort Type</td>
<td>a to z</td>
</tr>
<tr>
<td>Max Results</td>
<td>1000</td>
</tr>
</tbody>
</table>
Notification step

Trigger a notification as a step within an action by selecting a record (such as an incident, change request, problem, or user record) to trigger a notification and defining the associated notification.

Notifications is a platform feature. Before triggering a notification as an action step in Flow Designer, ensure that the notification is set up for use in the platform.

- When you create or update the notification, set the Send when field in the When to send tab of the Notification form to Triggered.
- Verify that your users have an active primary email channel and that all their notifications are active.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step. This is the record that will trigger a notification.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Some notifications are not associated with a specific record or table, such as the Passwords Require Updating notification. If configuring such a notification, leave this field blank.</td>
</tr>
<tr>
<td>Table name</td>
<td>Read-only. Set to the table of the triggering record.</td>
</tr>
<tr>
<td>Notification</td>
<td>Select the notification to be triggered. The notifications that can be selected are associated with the table of the specified record. If no record was selected, you can select a notification that does not have an associated record or table. To create notifications, see Create an email notification.</td>
</tr>
</tbody>
</table>

Example

1. Notification step

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>action -&gt; incident</td>
</tr>
<tr>
<td>Table Name</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Notification</td>
<td>Incident Priority Raised</td>
</tr>
</tbody>
</table>
Payload Builder step

Enable action designers to easily create name-value pairs in JSON and XML payloads using dynamic data.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name Value Pairs | The name-value pairs to include in the payload. Click the plus icon to add name-value pairs. Drag data pills into either field to produce dynamic payloads. The Name becomes a key in JSON and an element in XML. For example, suppose you create this name-value pair.  
  • Name: short_description  
  • Value: [action]->[short_description]  
  When the system formats the name-value pair as JSON:  
  "short_description": "[action]->[short_description]"  
  When the system formats the name-value pair as XML:  
| Omit if empty    | The option to exclude a name-value pair if the value is empty or null.  
  Note: This field is only visible after clicking the down arrow to display advanced options. |
| Output Format    | The payload file format.  
  • JSON: Select to format the payload as a JSON document.  
  • XML: Select to format the payload as an XML document. |
<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
</table>
| Namespace           | The XML namespace to apply to each element. For example, when the namespace is set to `incident`:<br><br>```xml<br>&lt;incident:short_description&gt;&lt;action&gt;&gt;&lt;short_description&gt;&lt;/incident:short_description&gt<br>```
|                     | **Note:** This field is only visible when the **Output Format** is set to XML.                                                                                                                                   |
| Include Outer Structure | The option to include or exclude a top level container appropriate to the output format. When the **Output Format** is JSON, curly braces contain the name-value pairs. When the **Output Format** is XML, a specified XML element contains the name-value pairs.<br><br>For example, when the system formats the name-value pair as JSON:<br><br>```json<br>{<br>  "short_description": "[action]-&gt;[short_description]"
}<br>```
|                     | When the system formats the name-value pair as XML:<br><br>```xml<br>&lt;xml&gt;&lt;short_description&gt;&lt;action&gt;&gt;&lt;short_description&gt;&lt;/short_description&gt;&lt;/xml&gt<br>```
| Send Empty Structure | The option to send valid JSON or XML structures when the payload is empty. Enable this option to include JSON or XML structural text in the payload.<br><br>For example, when the system formats an empty structure as JSON:<br><br>```json<br>{}<br>```
|                     | When the system formats an empty structure as XML:<br><br>```xml<br>&lt;xml&gt;&lt;/xml&gt<br>```
|                     | Disable this option to produce an empty payload. Empty payloads can occur when you select the **Omit if empty** option for every name-value pair, and all name-value pairs in the payload produce empty values. |
### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent Node</td>
<td>The name of the XML element that contains the name-value pairs. The default parent node element is <code>xml</code>. <strong>Note:</strong> This field is only visible when the <strong>Output Format</strong> is set to XML and the option to <strong>Include Outer Structure</strong> is enabled.</td>
</tr>
<tr>
<td>Preview</td>
<td>The read-only payload the step produces.</td>
</tr>
</tbody>
</table>

### PowerShell step

Run PowerShell scripts on remote machines from your ServiceNow instance through a MID Server.

PowerShell is built on the Windows .NET Framework and is designed to control and automate the administration of Windows machines and applications. ServiceNow supports PowerShell 3.0 to 5.1. PowerShell 3.0 does not support Windows 2003 Server.

**Note:** PowerShell step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

### Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Define Connection Inline:</strong> Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use Connection Alias:</strong> Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Connection Alias   | Connection & Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.  
|                   | Note: This field is available when Use Connection Alias is selected from the Connection list.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Credential Alias   | Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.  
|                   | Note: This field is available when Define Connection Inline is selected from the Connection list.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Host               | Specify the fully-qualified domain name of the target host where the system runs the action step. For example, host.domain.com.  
|                   | Note: This field is only visible when the Connection is Define Connection Inline.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Port               | Specify the communications port on which the target host listens for connections. For example, 5985. Leave blank to use the default port.  
|                   | Note: This field is only visible when the Connection is Define Connection Inline.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| MID Application    | Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application. If you use a data pill for this field, the pill must reference the MID Application's name, not the MID Application record.  
<p>|                   | Note: This field is only visible when the Connection is Define Connection Inline.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Capabilities       | Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                   | Note: This field is only visible when the Connection is Define Connection Inline.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remoting Type</td>
<td>The location where the PowerShell script runs such as the MID or a remote server.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Explicit Remoting (Most Common)</strong>: Establish a connection with and run the script on a remote server.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Implicit Remoting (Advanced)</strong>: Run a script on a MID Server while importing necessary modules from a remote server. If selected, define the <strong>Remote name prefix</strong> and <strong>Modules to import</strong> fields. For optimal performance, only import modules necessary to the step. If blank, all available modules are imported from the server.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Run on a MID Server or have your script establish a remote session</strong>: Run a script directly on a MID Server, or define remoting specifications within the script. This value is the default.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: To invoke a function in a PowerShell script command or PowerShell script file, the command must define the function param block if the function has input parameters. This requirement applies to explicit and implicit remoting. For additional information on param block, see Microsoft's documentation on Windows Powershell parameters at <a href="https://technet.microsoft.com/">https://technet.microsoft.com/</a>.</td>
</tr>
<tr>
<td>Remote name prefix</td>
<td>The file path, excluding file names, to the modules to load from the remote server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Remoting Type</strong> is <strong>Implicit Remoting (Advanced)</strong>.</td>
</tr>
<tr>
<td>Modules to import</td>
<td>The comma-separated list of modules to import from the remote server at the defined file path.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when the <strong>Remoting Type</strong> is <strong>Explicit Remoting (Most Common)</strong> or <strong>Implicit Remoting (Advanced)</strong>.</td>
</tr>
<tr>
<td>Script type</td>
<td>The type of script to run on the PowerShell host.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Inline script</strong>: Enter the script to run in the <strong>Command</strong> field of the step.</td>
</tr>
<tr>
<td></td>
<td>• <strong>MID Server Script File</strong>: Select the PowerShell script to run from the MID Server Script Files [ecc_agent_script_file] table. This is the default value and separates scripting logic from the action, enabling you to update the script without having to modify and redeploy the action.</td>
</tr>
<tr>
<td>MID Server Script</td>
<td>Pre-defined PowerShell script from the MID Server Script Files table [ecc_agent_script_file].</td>

<tr>
<td>Input variables</td>
<td>The optional name-value pairs that represent the values of PowerShell script variables. You can use action inputs and data from other steps within the PowerShell script. Define the following fields for each variable:</td>
</tr>
<tr>
<td></td>
<td>• Name: The name of the script variable to pass a value to. The name cannot match a reserved or prohibited PowerShell variable. Some variable names are reserved for internal processing and should not be used as input variables. See Reserved variables in PowerShell scripting variables.</td>
</tr>
<tr>
<td></td>
<td>• Type: The type of PowerShell variable. Select plain text, encrypted, or boolean. If encrypted is selected, the value appears in plain text in this field and is only encrypted when it passes to the ECC Queue.</td>
</tr>
<tr>
<td></td>
<td>• Value: The value to map to the variable. Manually enter a value, or drag a data pill into the field.</td>
</tr>
<tr>
<td>Command</td>
<td>The inline PowerShell script to run on the target host.</td>
</tr>
<tr>
<td></td>
<td>Note: This field is only visible when the Script type is Inline script.</td>
</tr>
</tbody>
</table>

**PowerShell scripting variables**

To access input variables from the **Command** field, you must call them using special syntax. The syntax you use depends on the value of a system property. If the **Remoting Type** is **Run on a MID Server or have your script establish a remote session**, some reserved variables are available in addition to input variables.

**Input variable syntax**

By default, prefix variable names with a $ character. For example, if an input variable is named **message**, use $message to access the variable in script.

If the **mid.powershell.command.script.parameter_passing** parameter is set to false, prefix the variable name with $env:SNC_. For example, if an input variable is named **message**, use $env:SNC_message to access the variable in script. To learn more about the mid.powershell.command.script.parameter_passing parameter, see **MID Server parameters**.

**Reserved variables**

When the **Remoting Type** is **Run on a MID Server or have your script establish a remote session**, the following variables are available for use in script. Reserved variables cannot be used as custom input variable names.

<table>
<thead>
<tr>
<th>Reserved variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$computer</td>
<td>Host IP address defined in the Connection alias record.</td>
</tr>
<tr>
<td>$cred</td>
<td>Credential object that contains the credentials defined in the connection record. Use this variable with any PowerShell cmdlet that supports the credential parameter. For example, New-PSSession -credential $cred.</td>
</tr>
<tr>
<td>$log_info</td>
<td>If the <strong>mid.property.powershell.log_info</strong> property is set to true, adds logging information to a PowerShell script.</td>
</tr>
</tbody>
</table>

The following variable names are reserved for internal processing and should not be used as input variables.

- script
REST step

Send an outbound REST web service request to an external system.

Note: REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

Outbound REST web service is a platform feature that enables you to retrieve, create, update, or delete data on a web services server that supports the REST architecture.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection</td>
<td>Type of connection to use.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Define Connection Inline</strong>: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Use Connection Alias</strong>: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.</td>
</tr>
</tbody>
</table>

To learn more about connections and credentials, see credentials, connections, and aliases.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Alias</td>
<td>Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available when Use Connection Alias is selected from the Connection list.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available when Define Connection Inline is selected from the Connection list.</td>
</tr>
<tr>
<td>Use MID</td>
<td>Option to use a ServiceNow® MID Server to run the REST step. Select this check box to display the MID Application and Capabilities fields.</td>
</tr>
<tr>
<td>Note:</td>
<td>The system doesn't log REST request, response, and parameter runtime data sent via a MID server in the same way that outbound web services logging occurs. Instead, you can view this data in the flow execution details.</td>
</tr>
<tr>
<td>Base URL</td>
<td>Base URL for the REST request. If Use Connection Alias is selected, this field is read-only and displays the base URL associated with alias. If Define Connection Inline is selected, enter a base URL for the connection.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available when the Use MID check box is enabled.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available when the Use MID check box is selected.</td>
</tr>
<tr>
<td>Build Request</td>
<td>Option to create the request manually, or import an OpenAPI Specification.</td>
</tr>
<tr>
<td></td>
<td>• Manually: Create action inputs and complete the REST step form manually.</td>
</tr>
<tr>
<td></td>
<td>• From OpenAPI specification: Import an OpenAPI Specification to generate action inputs and complete the REST step form. For more information, see OpenAPI support in the REST step.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>API Source</strong></td>
<td>Option to select an OpenAPI Specification used to construct the request, or select <strong>Import OpenAPI</strong> to import a new OpenAPI Specification. You can import specifications by providing a URL to the YAML or JSON, or copying and pasting content.</td>
</tr>
<tr>
<td>Note: This field is available when you select <strong>From OpenAPI specification</strong> from the Build Request list.</td>
<td></td>
</tr>
<tr>
<td><strong>API Operation</strong></td>
<td>Option to select an operation from the list. Available operations are provided by the OpenAPI Specification in the <strong>API Source</strong> field.</td>
</tr>
<tr>
<td>Note: This field is available when you select <strong>From OpenAPI specification</strong> from the Build Request list.</td>
<td></td>
</tr>
<tr>
<td>Resource Path</td>
<td>Path for the resource.</td>
</tr>
<tr>
<td>HTTP Method</td>
<td>HTTP method used to process the request.</td>
</tr>
<tr>
<td>• GET</td>
<td>• POST</td>
</tr>
<tr>
<td>• PUT</td>
<td>• PATCH</td>
</tr>
<tr>
<td>• DELETE</td>
<td></td>
</tr>
<tr>
<td>Query Parameters</td>
<td>Name-value pairs to pass to the REST endpoint. You can create these parameters manually, or drag input variables into the parameter fields, and then assign a value.</td>
</tr>
<tr>
<td>Note: When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.</td>
<td></td>
</tr>
<tr>
<td>Headers</td>
<td>Headers to send with the request. You can create headers manually, or drag input variables into the parameter fields, and then assign a value.</td>
</tr>
<tr>
<td>Note: When importing an OpenAPI Specification, the system adds all parameters and headers present in the specification to the REST step. Review the final REST step values and remove parameters you do not want to send in the request. For example, if the API accepts content type headers for both JSON and XML, the system adds both headers to the REST step. Remove one of the headers depending on the content type you want to receive in the response.</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Request Type</strong></td>
<td>Format of the request. Options include.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Text</strong>: A request in JSON, XML, or other text format.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Binary</strong>: A request in a binary file format.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Multipart</strong>: A request consisting of multiple content types.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Form URL-Encoded</strong>: A request in a URL-encoded query.</td>
</tr>
<tr>
<td></td>
<td>Note: This field is editable when the HTTP Method is POST, PUT, PATCH, or DELETE.</td>
</tr>
<tr>
<td><strong>Request Body [Text]</strong></td>
<td>Body of the request in JSON or XML format. The flow execution details display the response body as either a link to the embedded text viewer or the sys_id of the attachment record containing the response.</td>
</tr>
<tr>
<td></td>
<td>Note: This field is editable if you select Text from the Request Type list.</td>
</tr>
<tr>
<td><strong>Attachment</strong></td>
<td>Attachment record containing the request. You can look up this record in a prior step or define it as an input variable.</td>
</tr>
<tr>
<td></td>
<td>Note: This field is available when you select Binary from the Request Type list.</td>
</tr>
<tr>
<td><strong>Name, Type, Value</strong></td>
<td>Content of a multiple part request. For each request part, specify its name, content type, and value. The name can be any valid string and the type can be any valid type. The value must match the content type.</td>
</tr>
<tr>
<td></td>
<td>For attachments, specify:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type</strong>: attachment.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Value</strong>: The sys_id of the Attachment record containing the content. You can look up this record in a prior step or define it as an input variable.</td>
</tr>
<tr>
<td></td>
<td>Note: These fields are available when you select Multipart from the Request Type list.</td>
</tr>
<tr>
<td><strong>Name, Value</strong></td>
<td>Content of a form URL-encoded request. Specify each part of the URL-encoded request with a name-value pair.</td>
</tr>
<tr>
<td></td>
<td>Note: This field is available when you select Form URL-Encoded from the Request Type list.</td>
</tr>
<tr>
<td><strong>Enable Retry Policy</strong></td>
<td>Option to enable the retry policy. For more information, see Retry policy.</td>
</tr>
<tr>
<td><strong>Override Default Policy for Alias</strong></td>
<td>Option to override the default retry policy. This check box is not applicable when Define Connection Inline is selected from the Connection list.</td>
</tr>
<tr>
<td><strong>Retry Policy</strong></td>
<td>Default retry policy associated with Connection Alias. If Override Default Policy for Alias is selected, you can override the default retry policy and select another existing retry policy based on your requirement.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Save As Attachment</td>
<td>Option to specify whether to save the response as a record in the Attachment [sys_attachment] table.</td>
</tr>
<tr>
<td>Attachment File Name</td>
<td>Name of the attachment created by the REST response. For example, rest-response.txt. Note: This field is available when Save As Attachment is selected.</td>
</tr>
<tr>
<td>Attachment File Record</td>
<td>Target record to which the attachment is associated. The target record must be a data pill of type Record. For example, a specific incident record. You can look up this record in a prior step or define it as an input variable. The flow execution details display the sys_id of the associated record. Note: This field is available when Save As Attachment is selected.</td>
</tr>
</tbody>
</table>

**REST response size limits**

By default, the system limits the size of REST responses that are not saved as attachments to 5 MB. Direct REST responses that exceed this limit generate an error. To support larger response sizes, either save the response as an attachment or increase the response size limit with the `glide.pf.rest.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

**Script step**

Add custom JavaScript to execute within a reusable action. While most core actions and steps fit common use cases, you can build a Script step to execute behavior not satisfied by the core steps.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
- The Script step is available by default to run JavaScript on a local instance.

**Fields**

The JavaScript step includes separate input and output variables that enable you to map JavaScript data to Flow Designer data. By defining input and output variables within the step, you can define what Flow Designer data is available within your script, and which scripting variables are available to other steps in your action.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required Runtime</td>
<td>The runtime environment required to support the script. Choices include:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Instance</strong>: The action step runs the script from instance. Select this option when the script needs access to the ServiceNow API or instance data. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>MID</strong>: The action step runs the script from the MID Server. Select this option when the script needs access to <em>MID Server script files</em> and APIs. Selecting this option displays the <strong>Select MID Server Using</strong> field.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Vanilla (Core JavaScript)</strong>: The action step runs the script from either the instance or MID Server. Select this option when the script only needs the core JavaScript APIs and not the ServiceNow API or instance data.</td>
</tr>
<tr>
<td></td>
<td>The runtime you select determines the JavaScript objects and methods displayed in the <em>Context-sensitive help</em>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when IntegrationHub is activated.</td>
</tr>
<tr>
<td>Select MID Server Using</td>
<td>Specify the MID Server selection process to use. Choices include:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Any MID</strong>: The system runs the action step from any available MID Server.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use Connection Alias</strong>: The system runs the action using the connection alias you specify. Selecting this option displays the <strong>Connection Alias</strong> field.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use Inline Selection</strong>: The system runs the action using the connection details you specify in the action. Selecting this option displays the <strong>Host</strong>, <strong>MID Application</strong>, and <strong>Capabilities</strong> fields.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when IntegrationHub is activated, and you select MID from Required Runtime.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection &amp; Credential alias record that the system uses to run the action step. Users with the <em>flow_designer</em> or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see <em>credentials, connections, and aliases</em>. Only aliases of connection type Basic are supported.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when IntegrationHub is activated, and you select Use Connection Alias from Select MID Server Using.</td>
</tr>
<tr>
<td>Host</td>
<td>The fully-qualified domain name of the MID Server where the system runs the action step. For example, mid-server.domain.com.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when IntegrationHub is activated, and you select Use Inline Selection from Select MID Server Using.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Specify the application the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected application.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is only visible when IntegrationHub is activated, and you select Use Inline Selection from Select MID Server Using.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capabilities the MID Server must support to be eligible for selection. The system runs the action step from a MID Server that supports the selected capabilities.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is only visible when IntegrationHub is activated, and you select Use Inline Selection from Select MID Server Using.</td>
</tr>
<tr>
<td>Input variables</td>
<td>Name-value pairs that represent data from the action, enabling you to use action inputs and data from other steps within a script.</td>
</tr>
<tr>
<td>Script</td>
<td>Script that executes within the action. To access input and output variables in your script, use the global objects <code>inputs</code> and <code>outputs</code>. For example, <code>inputs.myVariable</code>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Script step input and output names can't include any of the following reserved system names:</td>
</tr>
<tr>
<td></td>
<td>- <code>sys_id</code></td>
</tr>
<tr>
<td></td>
<td>- <code>sys_created_by</code></td>
</tr>
<tr>
<td></td>
<td>- <code>sys_created_on</code></td>
</tr>
<tr>
<td></td>
<td>- <code>sys_updated_on</code></td>
</tr>
<tr>
<td></td>
<td>- <code>sys_updated_by</code></td>
</tr>
<tr>
<td></td>
<td>- <code>sys_mod_count</code></td>
</tr>
<tr>
<td>Output variables</td>
<td>Map JavaScript output to Flow Designer data pills. Define output variables when you want other steps in the action to use the script output.</td>
</tr>
</tbody>
</table>

**Example**

This example builds a JSON payload that can be easily updated or changed and added to a subsequent REST step.

**Note:** REST step is not available in the base system and requires the ServiceNow® IntegrationHub subscription.
By creating an output variable that represents the payload, you can drag the [Payload] data pill into the REST step Body field.

Send Email step

Send an email to specified users or groups as an action in a flow.

Roles and availability

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Record</td>
<td>Record that the email is associated to. When a user sends a reply to your email, the target record is updated with the reply email content.</td>
</tr>
<tr>
<td>Table</td>
<td>Table of the target record.</td>
</tr>
<tr>
<td>Include Watermark</td>
<td>Option to apply a watermark to the email that is sent. To include a watermark, you must set a target record.</td>
</tr>
<tr>
<td>To</td>
<td>The main recipients of the email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field, such as a User record. For example, if your action involves an incident record and you want to send an email to the group assigned to the incident, drag the <strong>[Assignment group]</strong> data pill from the data panel.</td>
</tr>
<tr>
<td>CC</td>
<td>Additional recipients copied on this email. Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>BCC</td>
<td>Additional recipients of this email, who are visible only to the sender (blind copied). Enter a list of user email addresses separated by commas or white spaces. You can also drag-and-drop data pills that contain email addresses into the field.</td>
</tr>
<tr>
<td>Subject</td>
<td>Subject of the email. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
<tr>
<td>Body</td>
<td>The content of the message body. You can enter text or drag-and-drop data pills into the field.</td>
</tr>
</tbody>
</table>

**Note:** Flow Designer does not support the ${URI} parameter for creating a link to a record in the email message body. Instead, consider inserting the information from the record in the email body using data pills, or create a notification step.

Testing the email step

To verify that the email was generated when testing the action, review the email record in the Email [sys_email] table. The **Headers** field indicates whether the email was successfully generated. For example:

```plaintext
X-ServiceNow-Source:FlowDesigner-9ad2747b0b710300f4eb8bf637673a1e
Message-ID:<193756824.0.1508534586438@[10.0.66.70]>
X-ServiceNow-Generated:true
```

ACL restrictions apply to the Send Email action. If you configured your flow to run as the user who initiates the session, ensure that the user has access control to send email. To test access controls for a Send Email action, impersonate a typical email sender and manually trigger the flow.

**SFTP step**

Create a reusable action to manage files and directories on an SFTP server and to move files from one SFTP server to another.
Note:

- The SFTP step is not available in the base system and requires the subscription to IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional). For more information about the ServiceNow® IntegrationHub subscription packages, see [IntegrationHub usage and subscription](#). After the required plugin is activated, the step is visible under Integrations.
- The SFTP step runs only on a ServiceNow® MID Server with SSH capabilities. Activate the plugin, IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) to use the JDBC capability for the MID Server.

Roles and availability

The SFTP step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

Prerequisite

Activate the Managed File Transfer Extensions for the SFTP Step (com.glide.hub.action_step.sftp_mft) plugin.

SFTP commands

- **Copy File**
- **Copy Directory**
- **Create Directory**
- **Get File List**
- **Remove File**
- **Remove Files**
- **Delete Directory**
- **Rename File or Directory**
- **Set File Attributes**

Note: The SFTP commands can be performed on a maximum of 10,000 files at a time.

Copy File

Copies a file from the source SFTP server to target SFTP server.

**Create Directory**

Creates a new directory on an SFTP server.
## Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Connections</strong></td>
<td></td>
</tr>
<tr>
<td>Source Connection</td>
<td>Type of connection to use to connect to the source SFTP server.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Define Connection Inline</strong>: Define connection information within the action step.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use Connection Alias</strong>: Define connection information using the Connection Alias table. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action.</td>
</tr>
<tr>
<td></td>
<td>To learn more about connections and credentials, see <em>credentials, connections, and aliases</em>.</td>
</tr>
<tr>
<td>Source Connection Alias</td>
<td>Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see <em>credentials, connections, and aliases</em>. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane. This field is available when <strong>Use Connection Alias</strong> is selected from the Source Connection list.</td>
</tr>
<tr>
<td>Source Credential alias</td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see <em>credentials, connections, and aliases</em>. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane. This field is available when Define Connection Inline is selected from the Source Connection list.</td>
</tr>
<tr>
<td>Host</td>
<td>Name or IP address of the SFTP server that contains the file or directory you wish to rename.</td>
</tr>
<tr>
<td>Port</td>
<td>Port number to communicate with the server.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Option to use a MID Server to run the SFTP step. This field is available when Define Connection Inline is selected from the Source Connection list.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capability of the MID Server. Select SSH. This field is available when Define Connection Inline is selected from the Source Connection list.</td>
</tr>
<tr>
<td>Command Details</td>
<td></td>
</tr>
<tr>
<td>Source Path</td>
<td>Full path to the file or directory.</td>
</tr>
<tr>
<td>Target Path</td>
<td>Full path with the renamed file or directory.</td>
</tr>
<tr>
<td>Retry Policy</td>
<td></td>
</tr>
<tr>
<td>Enable Retry Policy</td>
<td>Option to enable the retry policy. For more information, see Retry policy.</td>
</tr>
<tr>
<td>Override Default Policy for Alias</td>
<td>Option to override the default retry policy. This option is not applicable when Define Connection Inline is selected from the Connection list.</td>
</tr>
</tbody>
</table>
Set File Attributes

Sets common file attributes, such as timestamps, size, permissions, and UID/GID, for a file or directory on an SFTP server.

A good practice is to use the Get File List command to return a list of files and their attributes first. Then, after you have moved the files from a source host to a target host, use the Set File Attributes command to set the source file attributes on the target file.

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Connection Alias</td>
<td>Connection &amp; Credential alias record that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using an action in multiple environments. Likewise, if the connection information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases.</td>
</tr>
</tbody>
</table>
## ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Credential alias</td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don’t need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane. This field is available when Define Connection Inline is selected from the Source Connection list.</td>
</tr>
<tr>
<td>Host</td>
<td>Name or IP address of the SFTP server that contains the file you wish to remove.</td>
</tr>
<tr>

<tr>
<td>Retry Policy</td>
<td>Default retry policy associated with <strong>Connection Alias</strong>. If <strong>Override Default Policy for Alias</strong> is selected, you can override the default retry policy and select another existing retry policy based on your requirement.</td>
</tr>
</tbody>
</table>

### SSH step

The SSH step executes SSH commands on an external *nix system through a ServiceNow® MID Server. The step also stores scripts and commands for the *nix systems.

**Note:**

- The SSH step is not available in the base system. The step requires the subscription to ServiceNow® IntegrationHub and activation of IntegrationHub Professional Pack Installer (com.glide.hub.integrations.professional) or later. For more information about the IntegrationHub subscription packages, see [IntegrationHub usage and subscription](#). After you activate the required plugin, the step is visible under Integrations.
- IntegrationHub supports ServiceNow SSH only.

### Roles and availability

The SSH step is available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

### Sanitizing inputs

Escape all user inputs to eliminate the possibility of a malicious user executing arbitrary commands on your target server. Escape and validate data pills before the command field uses them by sanitizing arguments using [Sanitize shell arguments transform functions](#). This transform function category automatically appears when a data pill is dropped into the Command input.
## Fields

<table>

</tr>
<tr>
<td><strong>Credential Alias</strong></td>
<td>Credential alias that the system uses to run the action step. Users with the flow_designer or admin role can create or select an associated Connection record. Using an alias eliminates the need to configure multiple credentials when using an action in multiple environments. Likewise, if the credential information changes, you don't need to update your custom action. To learn more about connections and credentials, see credentials, connections, and aliases. The credential value is displayed as a Password (2 Way Encrypted) data pill on the data pane. This field is available when <strong>Define Connection Inline</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td><strong>Host</strong></td>
<td>Host name or IP address of the target server. This field is available when <strong>Define Connection Inline</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td><strong>MID Application</strong></td>
<td>Option to use a MID Server to run the SSH step. This field is available when <strong>Define Connection Inline</strong> is selected from the Connection list.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Capability of the MID Server. Select SSH. This field is available when Define Connection Inline is selected from the Connection list.</td>
</tr>
<tr>
<td>SSH Configuration</td>
<td>Working Directory</td>
</tr>
<tr>
<td>Command</td>
<td>Command that runs on the target directory. The command can also include MID Serverscripts. See Advanced SSH script options for more information.</td>
</tr>
<tr>
<td>Note: Escape and validate data pills before the command field uses them by sanitizing arguments using a preprocessing Script step. For more information, see Sanitizing arguments using the escape class and function.</td>
<td></td>
</tr>
<tr>
<td>Long Running</td>
<td>Option to disable the SSH connection timeout for commands that might take longer than the default time of 120 seconds to run. When selected, the engine detaches from the execution thread until completion.</td>
</tr>
<tr>
<td>Sudo Mode</td>
<td>Option to elevate privileges to execute the script.</td>
</tr>
</tbody>
</table>

For more information, see SSH credentials.

Advanced SSH script options

To run a MID Server script on the target host, specify the script type and pass the name of the script into the ${syncFile()} parameter. The system uses this parameter to locate the named script in the MID Server Script File [ecc_agent_script_file] table and run it on the target host. For example, a bash script can be expressed as:

```
bash ${syncFile("<MID script name>")} argument1 argument2 argument3
```

A base script (main_script.bash) can reference another script (my_include.bash) as well as a separate file (.my_profile) located on the target host. Both scripts and the file referenced must be synced to the MID Server, using the ${syncFile()} parameter, to execute properly.

```
source ${syncFile(".my_profile")}
cp ${syncFile("my_include.bash")} /usr/ssmith/my_include.bash
bash ${syncFile("main_script.bash")} one two three four five six
rm /usr/ssmith/my_include.bash
```

A Python example with inline comments might look like this:

```
set $LIB_DIR=/usr/bin;
# Sync a file that is referenced inside myF5CreateLBPool.py
cp ${syncFile("specialFunctions.py")} ~/specialFunctions.py
# set up environment variables
source ${syncFile(".python_profile")}
# call script that sets up dependencies on the box from remote package repos
python ${syncFile("setupPythonDependencies.py")} pycontrol
```
# call a script that requires functions from the package as well as a function from myIncludedFile
python ${syncFile("myF5CreateLBPool.py")} snow_pool myActualValue
# user is responsible for their own cleanup
rm ~/specialFunctions.py

To see the list of available MID Server scripts, navigate to MID Server > Script Files.

**SOAP step**

Enable action designers to send outbound SOAP web service requests to external systems.

**Note:** SOAP step is not available in the base system and requires the ServiceNow® IntegrationHub subscription. After the required plugin is activated, the step is visible under Integrations.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
- Action designers need the web_service_admin role to perform these web services tasks.
  - Select WSDL
  - Load new WSDL
  - Select a WS-Security policy
- The ServiceNow® MID Server doesn't support WS-Security policies

</table>
| Select a WSDL         | The WSDL to use to build the SOAP envelope. Select an existing WSDL record or click Load New WSDL to download or manually enter a WSDL file. The selected WSDL populates the values of the Operation, SOAP action, and SOAP Envelope fields.  

*Note:* This field is available when you select From WSDL from the Build Envelope list.                                                                                                                                                                                                 |
| Load New WSDL         | Option to download or manually enter a WSDL file.                                                                                                                                                                                                                                                                                               |
| Operation             | The operation to run from the selected WSDL. Each WSDL has its own list of available operations.                                                                                                                                                                                                                                            |
| SOAP Action           | The URL to run the SOAP action. If Build Envelope is set to From WSDL, this field is read-only and displays the URL to run SOAP action. If Build Envelope is set to Manually, enter a URL to run the SOAP action.                                                                                                                                 |
| SOAP Envelope         | The XML text sent to the endpoint. If Build Envelope is set to From WSDL, the system adds the necessary XML for the Operation that you select. If Build Envelope is set to Manually, enter the XML text that you want to use. Enter record values in the appropriate SOAP envelope elements. For example, enter an incident short description in the <short_description> element. |
| Reset Envelope        | Option to discard all manual changes that you made to the SOAP envelope. Select this check box to revert the SOAP envelope to its original state.                                                                                                                                                                                                 |

*Note:* This field is available when you select From WSDL from the Build Envelope list.                                                                                                                                                                                                                                                    |
| New WSDL              |                                                                                                                                                                                                                                                                                                                                            |
| Name                  | The name of the WSDL record you want to create.                                                                                                                                                                                                                                                                                              |
| Import Method         | The method to enter WSDL.                                                                                                                                                                                                                                                                                                                 |
|                       | • Download from URL: Select to display the WSDL URL, User name, and Password fields to retrieve the WSDL from an external source, typically the web service provider.                                                                                                                                                                             |
|                       | • Manually Populate WSDL Content: Select to display the WSDL Content field to manually enter or paste WSDL text.                                                                                                                                                                                                                     |
| WSDL URL              | The URL to the SOAP web service.                                                                                                                                                                                                                                                                                                             |

*Note:* This field is available when you select Download from URL from the Import Method list.

</table>
**ServiceNow Orlando Now Platform capabilities**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Omit if empty</td>
<td>Option to exclude a name-value pair if the value is empty or null.</td>
</tr>
</tbody>
</table>

**Note:** This check box is available after clicking the down arrow to display the advanced options.

**SOAP response size limit**

The system limits the size of SOAP responses to 5 MB. Direct SOAP responses that exceed this limit generate an error. To support larger response sizes, increase the response size limit with the `glide.pf.soap.response_payload_max_size` system property. This system property supports a maximum value of 10 MB.

**Update Record step**

Update an existing record in a table. You can dynamically add and configure fields for the record, or use a template to set field values.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.

**Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>The record to be updated. Drag-and-drop a record data pill or use the data pill picker to select a record.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record.</td>
</tr>
<tr>
<td>Field Values</td>
<td>Set static or dynamic values of fields in the record. For example, to set the short description to a static value, select <strong>Short description</strong> and set the desired value. To add dynamic values, see <strong>Allow flow designers to dynamically set field values.</strong></td>
</tr>
</tbody>
</table>

**Wait For Condition step**

Pause a flow until record values match a specific set of conditions.

**Roles and availability**

- Available as an Action Designer action step. Users with the action_designer role can create a custom action with one or more action steps.
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Drag-and-drop an input record or a record from a previous step.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this record is deleted while the flow is waiting, the flow stops waiting and continues running.</td>
</tr>
<tr>
<td>Table</td>
<td>Read-only. Set to the table associated with the record. Confirm that the system supports Wait for Condition for your selected table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Select the record values necessary to resume running the flow. For example, if the condition is <code>[State][is][Closed]</code>, the flow pauses until the condition is met. Once met, the flow moves on to the next step or action. Set static or dynamic conditions to filter records. To define a static condition applied each time the action runs, define the conditions with the condition builder. To enable flow designers to dynamically apply conditions, define an input of type Conditions and drag-and-drop the input data pill into the Conditions field.</td>
</tr>
</tbody>
</table>

Unsupported tables

The system does not support Wait for Condition for the following tables.

</tbody>
</table>
Example

### Transform functions

Transform data pill values without the need to write a script. Use transform functions to reformat text, perform mathematical calculations, sanitize potentially unsafe SQL statements, and serialize complex objects to raw XML.

Available transform function categories include *date and time*, *string*, *utilities*, *simple math*, *sanitize shell arguments*, *sanitize SQL*, and *complex data*. Some examples of transform function uses include:

- Trimming white space from a string before integrating it into the CMDB.
- Adding days, hours, minutes, and seconds to a date or time to localize for a specific time zone.
- Sanitizing SQL values to prevent injection as part of a *JDBC step* for an IntegrationHub spoke.
- Retrieving an appropriate value from a map of priorities that have equivalent values in a third-party database.
- Transforming a complex object into raw XML as part of a *REST step Request Body* field.

**Note:** Custom transform functions are not currently supported. For information on creating custom functions to transform Flow Designer data, see *Inline scripts*. 
Applying a transform function

You can apply a transform function to a data pill when you are designing or creating a flow. To apply a transform function, point or tab to a data pill and select the $f(x)$ icon that appears. Selecting the icon displays the Available Transforms list. Select the transform function that you want to apply to your data pill, enter information into any required fields, and select Apply. Your selected transform function appears in the Applied Transforms list.
Applying multiple transform functions

You can apply multiple transform functions to the same data pill. The system applies transform functions sequentially from top to bottom as listed in the Applied Transforms list. For example, you can apply a String to Date transform function followed by the Add Time transform function.

Viewing applied transform functions

You can find out which transform functions are applied to a data pill by looking at the Applied Transforms list. When you are designing or creating a flow or action, point to or tab into the data pill and select the \( f(x) \) icon. You can also view applied transform functions in the flow execution details.

Note: The output values for applied transform functions are field values, not display values.

When a data pill is dropped into certain types of inputs, the system automatically suggests a transform function category that is related to the input. For example, the system suggests transform functions to escape special characters in SQL statements, prevent script injection in shell scripts, and validate API or operation requests. Currently, the system suggests transform function categories for these inputs:

- For data pills dropped in the JDBC step's SQL Statement input, the sanitize SQL transform function category is displayed automatically.
- For data pills dropped in the SSH step's Command input, the sanitize shell arguments transform function category is displayed automatically.

Design considerations

Apply transform functions to valid input data pill types

Be sure to check the input data pill type before applying a transform function. Applying a transform function to an invalid data pill type results in the system skipping the transform. An error also occurs if transform functions produce results that the system cannot parse. For example, when transforming a string into a date, the system throws an error if the transform does not produce a valid date.

Confirm applied transform functions for multiple inputs with the same data pill

Transform functions only affect the runtime value of a data pill for one specific input. The actual field value that is associated with a data pill remains unchanged. To apply a transform function to the same data pill across multiple actions or steps, you must apply the transform function to the data pill in each input separately.

View final transformed values in the flow execution details

Only the final transformed value, and not the value for each applied transform, appears in the flow execution details.

Test transform functions to verify they produce expected results

Verify that your transform functions produce the expected data pill runtime values. For more information on confirming the runtime values for data pills with applied transform functions, see Test a flow and Test an action.

Date and time transform functions

Use date and time transform functions to recalculate or reformat data pills for Date/Time values.
Date and time transform functions require a Date/Time or String input data pill. Make sure to use the correct input data pill type when applying date and time transform functions. If a date and time transform function is applied to an improper data pill type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

Note: Runtime Date/Time values are not localized and appear in the UTC (Coordinated Universal Time) time zone. For more information, see time zones and time zone representation.

Add Time

Adds days, hours, minutes, or seconds to the input Date/Time, Date, or Due Date.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date/Time, Date, or Due Date</td>
<td>Duration - Amount of time to add in days, hours, minutes, and seconds</td>
<td>Date/Time - Transformed Date/Time value after adding the specified Duration</td>
</tr>
</tbody>
</table>

- **Input:** 2019-09-12 11:00:00
- **Duration:** 3 hours
- **Output:** 2019-09-12 13:00:00

In this example, the flow retrieves a CMDB Configuration Item record from a remote instance. The Subtract Time transform function then localizes the value of the Created field by subtracting three hours from the input Date/Time.
Subtract Time

Subtracts days, hours, minutes, and/or seconds from the input Date/Time, Date, or Due Date. Enter a Duration of time to subtract from the input Date/Time.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date/Time, Date, or Due Date</td>
<td><strong>Duration</strong> - Enter an amount of time to subtract in days, hours, minutes, and seconds</td>
<td>Date/Time - Transformed Date/Time value after subtracting the specified Duration</td>
</tr>
</tbody>
</table>

Note: If the input is a Date or Due Date, the transform creates a full Date/Time value using time values of hour 0, minute 0, and second 0.

- **Input:** 2019-09-12 11:00:00
- **Duration:** 2 days, 1 hours, 5 minutes, 10 seconds
- **Output:** 2019-09-10 09:54:50

Example

String to Date

Converts the input String to a Date/Time.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String formatted as specified in the <strong>Input Date Format</strong></td>
<td><strong>Input Date Format</strong> - Date/Time or date format of the input String&lt;br&gt;<strong>Custom Format</strong> - Valid Date/Time or date format represented as a String. Required only if Custom Format is selected as the <strong>Input Date Format</strong>.</td>
<td>Date/Time</td>
</tr>
</tbody>
</table>

Note:
- If the Date/Time value for the **Custom Format** input is incomplete, the transform creates a full Date/Time value using default dates and times. In such a case, the transform defaults to the current year, the current month, day 1 of a month, hour 0, minute 0, and second 0. For example, an input data pill value of **Oct 2019** and a custom date format of **MMM yyyy** produces an output of **2019-10-01 00:00:00**.
- If you use an incorrect data pill type or invalid **Custom Format**, the flow cancels during runtime.

- **Input:** '1995-11-20'
- **Input Date Format:** ISO Date (2004-06-28)
• Output: 1995-11-20 00:00:00

Example

Date to String

Converts the input Date/Time, Date, or Due Date to a String. Select a **Date Format** for the input Date/Time. Alternatively, enter a **Custom Format** for the input Date/Time.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date/Time, Date, or Due Date</td>
<td>• <strong>Output Date Format</strong> - Date/Time or date format of the output String</td>
<td>String formatted as specified in the <strong>Output Date Format</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>Custom Format</strong> - Valid Date/Time or date format represented as a String. Required only if selecting Custom Format as the <strong>Date Format</strong>.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** If you use an incorrect input data pill type or invalid **Custom Format**, the flow cancels during runtime.

• Input: 1969-12-31 14:23:57
• Output Date Format: Custom (enter below)
• Custom Format: 'On' MMM dd, yyyy 'at' hh:mm a
• Output: 'On Dec 31, 1969 at 2:23 PM'

In this example, the flow retrieves a User [sys_user] record from a third-party database. The Date to String transform function converts the format of the **Created** field and then logs the date, time, and name that is associated with the record.
### Custom date formats

You can specify a custom date format with a sequence of specific date and time pattern strings. A pattern string consists of one or more uppercase and lowercase letters from A to Z. Any text within quotation marks is ignored and is instead copied into the date output.

<table>
<thead>
<tr>
<th>String</th>
<th>Description</th>
<th>Output Format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>Era designator</td>
<td>Text</td>
<td>AD</td>
</tr>
<tr>
<td>y</td>
<td>Year</td>
<td>Year</td>
<td>2019; 19</td>
</tr>
<tr>
<td>Y</td>
<td>Week in year</td>
<td>Year</td>
<td>2019; 19</td>
</tr>
<tr>
<td>M</td>
<td>Month in year (within date)</td>
<td>Month</td>
<td>July; Jul; 07</td>
</tr>
<tr>
<td>L</td>
<td>Month in year (standalone value)</td>
<td>Month</td>
<td>July; Jul; 07</td>
</tr>
<tr>
<td>w</td>
<td>Week in year</td>
<td>Number</td>
<td>52</td>
</tr>
<tr>
<td>W</td>
<td>Week in month</td>

</tr>
<tr>
<td>Z</td>
<td>Time zone in RFC 822 format</td>
<td>Time zone in RFC 822 format</td>
<td>-0800</td>
</tr>
<tr>
<td>X</td>
<td>Time zone in ISO 8601 format</td>
<td>Time zone in ISO 8601 format</td>
<td>-08; -0800; -08:00</td>
</tr>
</tbody>
</table>

### String transform functions

Use string transform functions to reformat or perform calculations on String data pills.
String transform functions require a String input data pill. Make sure to use the correct input *data pill type* when applying string transform functions. If a string transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see *Test a flow*.

### First Character

Returns the first character of the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - Transformed String as first character of the input String</td>
</tr>
</tbody>
</table>

- **Input**: Madrid
- **Output**: M

In this example, the flow triggers when a User [sys_user] record is created. The flow then updates the **City** field for the User [sys_user] record with a code that is represented as the first character of the city's name.
Update user city code

**TRIGGER**
User Created

**ACTIONS**
1. Update User Record

   - **Action**: Update Record
   - **Record**: Trigger + User Record
   - **Table**: User [list, user]
   - **Fields**: City

   ![Search Transform Functions](image)

   - **Applied Transforms**: None
   - **Input Transform**: None
   - **String Transform**: None
   - **Date & Time Transform**: None
   - **Utilities Transform**: None
   - **Simple Math Transform**: None
   - **Sanitize Shell Arguments Transform**: None
   - **Sanitize SQL Transform**: None
   - **Complex Data Transform**: None

   ![Select to add an Action, Flow Logic, or Subflow](image)
Last Character

Returns the last character of the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - Transformed String as last character of the input String</td>
</tr>
</tbody>
</table>

- Input: Madrid
- Output: d

Example

Size

Returns the total number of characters in the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Integer</td>
</tr>
</tbody>
</table>

- Input: Example input string.
- Output: 21

Example

Split

Returns an Array.String based on a provided Separator that splits the input String. If the Separator field is left blank, the transformation is ignored and the system returns the input String. If entering any data type other than a String as the Separator, the system converts the provided value to a String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td><strong>Separator</strong> - Enter a delimiter that specifies where the input String should be split. If left blank, the input String is not transformed at runtime.</td>
<td>Array.String - An array of substrings from the input String</td>
</tr>
</tbody>
</table>

- Input: Example, input, string.
- Separator: ,
- Output: ["Example", "input", "string."]

Example
**Substring**

Returns a substring from the input String that is based on the provided **Start Index** and **End Index**. Input String index starts at 0.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
</table>
| String          | - **Start Index** - Index of the first character to include in the returned substring  
|                 | - **End Index** - Index of the last character to include in the returned substring | String - Transformed String as a substring of the input String |

- **Input:** Example input string  
- **Start Index:** 3  
- **End Index:** 6  
- **Output:** mple

**Example**

**To Lowercase**

Converts the input String to all lowercase characters.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String in all lowercase characters</td>
</tr>
</tbody>
</table>

- **Input:** ExamPle input stRing  
- **Output:** example input string

**Example**

**To Uppercase**

Converts the input String to all uppercase characters.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String in all uppercase characters</td>
</tr>
</tbody>
</table>

- **Input:** ExamPle input stRing
• Output: EXAMPLE INPUT STRING

Example

**Trim**

Removes white space from the beginning and end of the input String. Does not remove white space within the input String.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - Transformed String with trimmed white space</td>
</tr>
</tbody>
</table>

• Input: SQL Server APAC 1
• Output: SQL Server APAC 1

In this example, the action makes a REST call to a third-party system and GETs a response body containing data about a server. Then, the Trim transform function removes any unwanted white space before adding the server's name to a new record in the Server [cmdb_ci_server] table.
Utilities transform functions

Use utilities transform functions to return specified values from Array or Name-Value Pairs data pills.
Utilities transform functions require an Array or Name-Value Pairs input data pill. Make sure to use the correct input data pill type when applying utilities transform functions. If a utilities transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

Get Item from Array

Returns a Complex Object from the input Array. Enter a value for the Nth Item in the input Array that you want to return. The Nth Item represents the Array index, starting at 0.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array</td>
<td><strong>Nth Item</strong> - Enter the index of the target object in the input Array. Array index starts at 0.</td>
<td>Complex Object</td>
</tr>
</tbody>
</table>

Get Item from Name/Values

Returns a value that is associated with a matching key from a map of Name-Value Pairs.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name-Value Pairs</td>
<td>• <strong>Key</strong> - Name of the key that is used to look up its corresponding value</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <strong>Default</strong> - The default value that is returned if the provided key is not found in the map of Names and Values</td>
<td>String as the value that is associated with the matching key</td>
</tr>
</tbody>
</table>

**Note:** When applying the Get Item from Name/Values transform function, consider that the runtime value might be the system value, not the display value. For example, if mapping the Priority field in the Incident table to a similar field in a remote table, the returned runtime value might be 2, not 2 - High.

- Input: "username":"abel.tuter"
- Key: username
- Default: example.username
- Output: abel.tuter

In this example, an action makes a REST call to a third-party system and GETs ticket data as a map of Name-Value Pairs. A Ticket ID is provided as an output for this action. The Get Item from Name/Values transform function returns either the value that is associated with the ticket_id key or Ticket ID not found.
### Example

**Simple math transform functions**

Use simple math transform functions to perform basic mathematical calculations on Array.Number data pills.

Simple math transform functions require an Array.Number, Array.Integer, or Array.Decimal input data pill. Make sure to use the correct input *data pill type* when applying simple math transform functions. If a simple math transform
function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

**Max**

Returns the highest value found in the input Array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, or Array.Decimal</td>
<td>Number as highest value in the input Array</td>
</tr>
</tbody>
</table>

- Input: [1, -5, 20, 6]
- Output: 20

Example

**Min**

Returns the lowest value found in the input Array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, or Array.Decimal</td>
<td>Number as lowest value in the input Array</td>
</tr>
</tbody>
</table>

- Input: [1, -5, 20, 6]
- Output: -5

Example

**Sum**

Returns the sum of all values in the input Array.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Array.Number, Array.Integer, or Array.Decimal</td>
<td>Number as sum of all values in the input Array</td>
</tr>
</tbody>
</table>

- Input: [1, -5, 20, 6]
- Output: 22

Example
Sanitize shell arguments transform functions

Use sanitize shell arguments transform functions to remove any potentially unsafe command injections in String data pills to be used for Bash shell scripting.

Sanitize shell arguments transform functions require a String input data pill. Make sure to use the correct input data pill type when applying sanitize shell arguments transform functions. If a sanitize shell arguments transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

Note: When a data pill is dropped into the Command input for an SSH step, the sanitize shell arguments transform function category automatically appears.

Sanitize Bash shell arguments

Returns a String free of any unsafe command injections in your Bash shell script. Wraps the input String with single quotes and escapes any existing single quotes so that you can pass the String directly to a shell function as a safe argument.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>String - String with Bash shell arguments properly escaped</td>
</tr>
</tbody>
</table>

Sanitize SQL transform functions

Use sanitize SQL transform functions to escape special characters and prevent injection in String data pills to be used for SQL statements.

Sanitize SQL transform functions require a String input data pill. Make sure to use the correct input data pill type when applying sanitize SQL transform functions. If a sanitize SQL transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see Test a flow.

Note: When a data pill is dropped into the SQL Statement input for a JDBC step, the sanitize SQL transform function category automatically appears.

Sanitize SQL Identifier

Returns a String with escaped special characters/injected values for SQL identifiers (such as table, view, and column names). Wraps the input String in database-specific quotes.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Database - The database-specific context in which characters are escaped. Choices include MySQL, Oracle, PostgreSQL, and Microsoft SQL Server.</td>
<td>String - String with SQL identifiers that are properly escaped based on the selected database</td>
</tr>
</tbody>
</table>
• Input: `simple_column`
• Database: MySQL
• Output: `''simple_column''`

Example

**Note:**
- If your input String contains a period character, `Sanitize SQL Identifier` returns an error. To join SQL identifiers using a period, use two data pills concatenated with a period and apply `Sanitize SQL Identifier` to both pills.
- Don't enclose the input data pill in quotes. The system automatically wraps the input value with the type of quotes or backticks that apply to your database type.

## Sanitize SQL Value

Returns a String with escaped special characters or injected values for SQL values. Wraps the input String in database-specific quotes.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Parameters</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td></td>
<td>String - String with SQL values that are properly escaped based on the selected database</td>
</tr>
</tbody>
</table>

- Input: `'1'='1`  
- Database: SQLServer  
- Output: `''1''='''1'`  

Example

**Note:**
- Don't enclose the input data pill in quotes. The system automatically wraps the input value with the type of quotes or backticks that apply to your database type.

## Complex data transform functions

Use complex data transform functions to serialize Complex Object data pills into an XML format.

Complex data functions require a Complex Object input data pill. Make sure to use the correct input `data pill type` when applying complex data transform functions. If a complex data transform function is applied to an improper data type, the data is not transformed at runtime and the input value is returned instead. For more information on confirming your flow runtime values, see *Test a flow.*
To XML

Serializes the input Complex Object to XML.

<table>
<thead>
<tr>
<th>Input data pill</th>
<th>Output data pill</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complex Object</td>
<td>XML - XML document formatted as a String</td>
</tr>
</tbody>
</table>

- **Input:** { "article_id": KB3843202, "article_description": "How do I reset my Active Directory password?" }

- **Output:** `<article_id>KB3843202</article_id> <article_description>How do I reset my Active Directory password?</article_description>`

In this example, an action makes a REST call to a third-party knowledge base and retrieves KB article IDs and descriptions. The To XML transform function changes the response body's JSON text into XML format before it is integrated into the system's knowledge base.
Example

**Domain separation and Flow Designer**

Flow Designer supports domain separation of business logic, which lets each tenant domain have its own flows, actions, and subflows. With domain separation you can separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Support level: Standard*

The support level is Standard but has some exceptions or special conditions.

- Includes Basic level
- Business logic: Processes can be created or modified per customer by the service provider (SP). The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The owner of the instance needs to be able to configure minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Use case: An admin needs to be able to make comments mandatory when a record closes for one tenant, but not for another.

How domain separation works in Flow Designer

The system domain separates Flow Designer content according to these rules.

Flows, actions, and subflows belong to the domain of the user who creates them. For example, when a Service Provider (SP) administrator in the TOP domain creates a flow, it belongs to the TOP domain.

**Note:** The domain selected from the domain picker overrides the domain the user belongs to. For example, when an SP administrator in the TOP domain selects the ACME domain from the domain picker, any content created belongs to the ACME domain.

Flow Designer content runs from the domain from which it is triggered or initiated

Flows, actions, and subflows run from the domain of the record or user who initiates them. For example, when a user from the child domain ACME triggers a flow belonging to the parent domain TOP, the flow runs in the context of the child domain ACME.

**Domain assignment by trigger type**

<table>
<thead>
<tr>
<th>Trigger type</th>
<th>Domain assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>API call</td>
<td>Domain of the user making API call</td>
</tr>
<tr>
<td>Email trigger</td>
<td>Domain of the email sender</td>
</tr>
<tr>
<td>Record trigger</td>
<td>Domain of the triggering record</td>
</tr>
<tr>
<td>Scheduled trigger</td>
<td>Domain of the flow</td>
</tr>
<tr>
<td>Service Catalog trigger</td>
<td>Domain of the requested item record</td>
</tr>
</tbody>
</table>

**Flow Designer only runs content accessible from the current domain context**

The system can only run content to which the current domain context allows access. See Understanding domain separation to understand data separation and the domain hierarchy. For example, a user in the child domain ACME can trigger flows belonging to the parent domain TOP, but cannot trigger flows belonging to a sibling domain such as INITECH.

Flow Designer runs record operations from the current user domain context. A read operation such as the Lookup Records action returns records based on the currently selected domain and its children. For example, if the currently selected domain is the TOP domain, you will see records from the TOP domain and all its children such as the
ACME and INITECH domains. If the currently selected domain is the ACME domain, you will see records from the ACME domain and its children, but you will not see records from the parent TOP domain.

**Note:** Record operations use the data or process separation rules applied to the table the record belongs to. For example, suppose you have process-separated the Business Rule table. If you add a business rule to the TOP domain, the business rule will be accessible to record operations in child domains such as the ACME domain because process separation allows access to records from parent domains.

Flows that call another application such as a decision table or workflow also run from the current user domain context.

**Flow Designer runs all flows whose trigger conditions are met**

A flow in one domain cannot override or prevent a flow from another domain from running. Flow Designer runs any flow that is visible to the current user and whose trigger conditions have been met. For example, a flow belonging to the TOP domain that is triggered by the creation of an incident record runs anytime an incident is created, regardless of whether the incident is created in the ACME or INITECH child domains.

**Design considerations**

Follow these design considerations when using domain separation with Flow Designer.

**Have a Service Provider (SP) administrator in the TOP domain author and manage tenant flows, actions, and subflows**

Since tenants cannot override Flow Designer content, an SP administrator from the TOP domain must author and manage them to ensure they run properly for all domains. While you can create domain-specific flows, be aware that users working from domains higher in the hierarchy may trigger multiple child domain flows. For example, a user working in the TOP domain can trigger flows in child domains such as ACME and INITECH.

**Note:** Flow authors can see only Flow Designer content available from their current domain and any parent domains in the hierarchy. Flow Designer does not display content visible from Contains domains.

**Provide a unique name for each flow, action, and subflow**

Since all domains share the same Flow Designer content, have an SP administrator in the TOP domain uniquely name each flow, action, and subflow to ensure that a flow intended for one domain does not duplicate the name of a flow in another domain. For example, add the domain to the flow name such as Validate incidents - TOP, Validate incidents - ACME, and Validate incidents - INITECH.

**Ensure flows and actions only contain artifacts available from the current or parent domains**

Flow Designer prevents the activation of any flow containing artifacts unavailable to the current or parent domains. For example, if you create a domain-specific flow that belongs to the ACME domain, it cannot contain actions or subflows belonging to the sibling domain INITECH.

**Edit Flow Designer content in the domain to which it belongs**

While users in a parent domain can see flows, actions, and subflows in a child domain, they must edit them in the domain they belong to. For example, an administrator in the TOP domain can see flows from the ACME domain but must switch to the ACME domain to edit it.

**User access to Flow Designer**

Administrators can grant users access to Flow Designer by assigning delegated development permissions or directly assigning a user role.
Access by delegated development permissions

Administrators can grant users access to Flow Designer by creating an application and assigning users as developers with the Flow Designer *delegated development* permission. Delegated development allows administrators to control whether flow designers can access features normally restricted to admin users such as assigning user roles, creating access controls, or creating scripts. See *Developer and deployment permissions*.

Access by user roles

Administrators can also grant access to Flow Designer by directly assigning users the flow_designer *user role*, which includes the role to view flow execution details.

**Warning:** Directly granting a user the flow_designer role is equivalent to giving the user the admin role, because Flow Designer can run flows as the System user, which has access to all tables and all database operations.

Flow Designer roles

Grant users one or more Flow Designer roles to enable them to create flows and subflows, to see flow execution details, and to create actions.

<table>
<thead>
<tr>
<th>Role title [name]</th>
<th>Description</th>
<th>Contains Roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>flow_designer</td>
<td>Enables a user to launch the Flow Designer design environment to create and edit flows and subflows.</td>
<td>flow_operator</td>
</tr>
<tr>
<td>flow_operator</td>
<td>Enables a user to view flow execution details, dashboards, and logs. Administrators can grant this role to users they want to be able to view flow results but not create, change, or test them.</td>
<td>none</td>
</tr>
<tr>
<td>action_designer</td>
<td>Enables a user to launch the Action Designer design environment to create and edit actions.</td>
<td>none</td>
</tr>
</tbody>
</table>

API access to Flow Designer

Application developers can access Flow Designer functionality through APIs for flows, subflows, and actions. Flow designers can enable individual flows, subflows, and actions to be client callable during design.

Available Flow Designer APIs

Trigger flows, subflows, and actions using these APIs from server or client scripts.

**Server side**

*FlowAPI:* Trigger a flow, subflow, or action using synchronous or asynchronous methods, with or without execution details.

**Client side**
GlideFlow: Perform client-side interactions with actions, flows, and subflows. Flow designers must enable a flow, subflow, and action to be called from the client.

FlowAPI quick methods

Use quick methods in the FlowAPI class to run an action, flow, or subflow from a server-side script without creating execution details or other related records. Use these methods to increase the speed of high-volume processing in a production environment, and to improve performance by eliminating record-keeping overhead. Methods include:

- `executeActionQuick()`, `executeFlowQuick()`, `executeSubflowQuick()` : Run an action, flow, or subflow from a server-side script synchronously from the current user session.
- `startActionQuick()`, `startFlowQuick()`, `startSubflowQuick()` : Run an action, flow, or subflow from a server-side script asynchronously.

Client callable APIs

By default, the flows, subflows, and actions can only be called by the FlowAPI within a server script. Flow and action designers can make individual flows, subflows, or actions available to client calls by enabling the Client callable option during design.

Run as support

Flows and subflows can run as either the system user or the user who initiates the session. Set this behavior from the flow properties. All API quick methods ignore the run as property, and always run as the system user.

Actions always run as the user who initiates the session.

Code snippets

Application developers can generate a JavaScript function that calls a specific flow, subflow, or action with the Code Snippet option. Use the code snippet in scripts such as business rules or the Scripts - Background module to call specific Flow Designer elements. The system only generates code snippets for published flows, subflows, and actions. Flow Designer elements in the draft or modified status do not generate code snippets.

Create code snippets for flows, sub-flows, and actions

Generate a code snippet to call a specific flow, subflow or action.

- Role required: flow_designer or admin
- Activate the flow or subflow you want to call.
- Publish the action you want to call.

1. Navigate to Flow Designer > Designer.
2. Open a flow, subflow, or action.
3. Click the More Actions icon in the upper right corner of the flow designer.
5. A modal window appears containing the code snippet. The text of the snippet is selected by default. To copy the code, manually copy the code from the pop-up modal, or click the Copy Code Snippet Clipboard button.
Create a client callable flow, subflow, or action

Enable a client script to trigger a flow, subflow, or action.

- Role required: security_admin
- Consider the implications of making a flow, subflow, or action client callable, such as whether it exposes protected data or bypasses validation logic.

By default, the flows, subflows, and actions can only be called by the FlowAPI within a server script. Flow and action designers can make individual flows, subflows, or actions available to client calls by enabling the **Client callable** option during design.

1. Elevate privileges to security_admin.
2. Navigate to **System Security > Access Control (ACL)**.
3. Click New.
4. Create an access control.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>client_callable_flow_object</td>
</tr>
<tr>
<td>Operation</td>
<td>create</td>
</tr>
<tr>
<td>Admin overrides</td>
<td>Selected</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a name for the ACL.</td>
</tr>
<tr>
<td>Requires role</td>
<td>Create a role to provide access to the APIs. For example, create a flow_api_access role.</td>
</tr>
</tbody>
</table>

5. Assign the role to the user you would like to grant access to.
6. Enable a client script to trigger the flow, subflow, or action.
   a) Open the flow, subflow, or action you want to make client callable.
   b) In the More Actions menu, select Manage security.
   c) Select Callable by Client API.
   d) Add the access control record created earlier to the ACLs field.
   e) Click Update.

The user with the designated permissions can trigger a client callable flow, subflow, or action from a client script using the GlideFlow API.

**Spokes**

Add application-specific content to Flow Designer by installing spokes.

A *spoke* is a scoped application containing Flow Designer content dedicated to a particular application or record type. For example, the **ITSM Spoke** contains actions for managing Task records such as the Create Task action. Spokes are activated when their parent application is activated. For example, the **ITSM Spoke** is activated when the Incident, Problem, and Change applications are activated. Creating a spoke requires familiarity with application development as developers must add Flow Designer content to a scoped application.
### Default spokes available

<table>
<thead>
<tr>
<th>Spoke</th>
<th>Description</th>
<th>Plugin</th>
<th>Included with</th>
</tr>
</thead>
<tbody>
<tr>
<td>Benchmarks Spoke</td>
<td>Provides read-only actions for the read-only Benchmark Recommendation Evaluator flow.</td>
<td>[com.sn_bm_client.spoke]</td>
<td>Benchmarks application.</td>
</tr>
<tr>
<td>Connect Spoke</td>
<td>Provides actions to automate the creation of conversations, to add users to a conversation, and to send messages to a conversation. These actions work with Connect API version 3 and later.</td>
<td>[com.glide.connect_v3plus.core.ah]</td>
<td>Now Platform</td>
</tr>
<tr>
<td>External Related Files Spoke</td>
<td>The External Related Files spoke stores information about files in third-party systems and helps you manage the information.</td>
<td>[com.sn.external.files]</td>
<td>Now Platform</td>
</tr>
<tr>
<td>Field Service Spoke</td>
<td>Provides actions for flow designers to use when creating Field Service Management business processes.</td>
<td>[com.snc.field_service.spoke]</td>
<td>Field Service Management application</td>
</tr>
<tr>
<td>ITSM Spoke</td>
<td>Provides flow and actions associated with ITSM. Requires the ITSM application suite.</td>
<td>[com.snc.itsm.spoke]</td>
<td>IT Service Management application</td>
</tr>
<tr>
<td>Visual Task Board (VTB) Spoke</td>
<td>Provides VTB actions for flow designers to manage the boards, lanes, cards, board members, and assignees.</td>
<td>[com.glide.ui.vtb.ah]</td>
<td>Now Platform</td>
</tr>
</tbody>
</table>

Additional spokes are available with an IntegrationHub subscription. To see a list of IntegrationHub spokes, see IntegrationHub available spokes. For more information about requesting an IntegrationHub subscription, see Request IntegrationHub.

**Benchmarks Spoke**

Provides read-only actions for the read-only Benchmark Recommendation Evaluator flow.

The Benchmarks Spoke is designed for the Recommendations feature of the Benchmarks application.
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Recommendation Activity Records</td>
<td>Create or update recommendation activity records.</td>
<td>• Recommendation</td>
<td>N/A</td>
</tr>
<tr>
<td>Delete Recommendation Evaluations</td>
<td>Delete recommendation evaluations for the specified month.</td>
<td>• Activity record</td>
<td>N/A</td>
</tr>
<tr>
<td>Evaluate Recommendation Condition</td>
<td>Evaluate the conditions and script specified for the recommendation.</td>
<td>• Record count • Threshold • Direction • Recommendation • Activity record</td>
<td>• Result • Score</td>
</tr>
</tbody>
</table>

**Connect spoke**

Provides actions to automate the creation of conversations, to add users to a conversation, and to send messages to a conversation. These actions work with Connect API version 3 and later.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Group Users to Task Conversation</td>
<td>Create a task conversation, and add all users of a group to it.</td>
</tr>
<tr>
<td>Add User to Task Conversation</td>
<td>Create a task conversation, and add a user to it.</td>
</tr>
<tr>
<td>Send Message to Task Conversation</td>
<td>Send a message to all users of a task conversation.</td>
</tr>
</tbody>
</table>

**Customer Service Spoke**

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Case</td>
<td>Retrieve a case record using the case number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Case</td>
<td>Create a case using one or more attributes. This action mimics the structure of the Case table (sn_customerservice_case) and exposes the fields present on the Case table.</td>
</tr>
<tr>
<td>Create Quick Case</td>
<td>Create a case using the customer, description, channel, priority, and category attributes.</td>
</tr>
<tr>
<td>Create Task on Case</td>
<td>Create a case task and optionally associate it with a case.</td>
</tr>
<tr>
<td>Update Case</td>
<td>Update a case by providing the case reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Assign Case</td>
<td>Assign a case using matching rules. To use this action, you must first define the matching rules that match cases with resources (assignment groups, agents).</td>
</tr>
<tr>
<td>Escalate Case</td>
<td>Request case escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Escalate Account</td>
<td>Request account escalation. This action does not automatically approve escalation. Approval is based on the selected escalation template.</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a case or case task).</td>
</tr>
<tr>
<td>Add Comment to Task</td>
<td>Add a comment to a task or to task extended objects (for example, a case or case task).</td>
</tr>
</tbody>
</table>

### External Related Files spoke

The External Related Files spoke stores information about files in third-party systems and helps you manage the information.

#### External Related Files spoke tables

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>External Provider [sn_ext_files_spoke_provider]</td>
<td>Stores information about the external provider. For example, Box or DocuSign services.</td>
</tr>
<tr>
<td>External Related Files [sn_external_related_files]</td>
<td>Stores metadata information about the files in third-party systems. This table is extensible.</td>
</tr>
</tbody>
</table>

**Note:** If you extend the table, ensure that you perform the data separation for the scoped applications.

- To store metadata information of files in a specific third-party system, create a table with a column that contains a reference field to the External Related Files table. For more information about reference fields, see reference field type.
- To establish a relationship between a specific ServiceNow table and External Related Files table, create defined related lists.

#### External Related Files spoke actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create External File Record</td>
<td>Creates a record in the External Related Files table.</td>
</tr>
<tr>
<td>Update External File Record</td>
<td>Updates a record in the External Related Files table.</td>
</tr>
<tr>
<td>Delete External File Record</td>
<td>Deletes a record in the External Related Files table.</td>
</tr>
</tbody>
</table>
External Related Files spoke user roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sn_ext_files_spoke.doc_reader</td>
<td>Read records in the External Related Files and External Provider tables.</td>
</tr>
<tr>
<td>sn_ext_files_spoke.file_admin</td>
<td>• Read, update, and delete records in the External Related Files table.</td>
</tr>
<tr>
<td></td>
<td>• Read records in the External Provider table.</td>
</tr>
<tr>
<td>sn_ext_files_spoke.provider_admin</td>
<td>Read, update, and delete records in the External Provider table.</td>
</tr>
</tbody>
</table>

Field Service Spoke
Provides actions for flow designers to use when creating Field Service Management business processes.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Work Order</td>
<td>Retrieve a work order record using the work order number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order</td>
<td>Create a work order and optionally associate it with a case.</td>
</tr>
<tr>
<td>Update Work Order</td>
<td>Update a work order by providing the work order reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Get Work Order Task</td>
<td>Retrieve a work order task record using the work order task number. If multiple records are found, only the first record is returned.</td>
</tr>
<tr>
<td>Create Work Order Task</td>
<td>Create a work order task and optionally associate it with a work order.</td>
</tr>
<tr>
<td>Update Work Order Task</td>
<td>Update a work order task by providing the work order task reference and the fields that you want to update.</td>
</tr>
<tr>
<td>Add Work Note to Task</td>
<td>Add a work note to a task or to task extended objects (for example, a work order or work order task).</td>
</tr>
</tbody>
</table>

ITSM spoke
Provides flow and actions associated with ITSM. Requires the ITSM application suite.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Comment</td>
<td>Adds a comment to a task record.</td>
</tr>
<tr>
<td>Add Worknote</td>
<td>Adds a work note to a task record.</td>
</tr>
<tr>
<td>Assign Incident to CI Support Group</td>
<td>Updates an incident record to assign it to the CI Support Group.</td>
</tr>
<tr>
<td>Create Catalog Task on Request</td>
<td>Creates a Catalog Task record from a Request record.</td>
</tr>
<tr>
<td>Create Catalog Task on Request Item</td>
<td>Creates a Catalog Task record from a Request Item record.</td>
</tr>
<tr>
<td>Create Change Task on Change Request</td>
<td>Creates a Change Task record from a Change Request record.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create Emergency Change Request</td>
<td>Creates a Change Request record of type Emergency.</td>
</tr>
<tr>
<td>Create Emergency Request from Incident</td>
<td>Creates a Change Request record of type Emergency from an Incident record.</td>
</tr>
<tr>
<td>Create Incident</td>
<td>Creates an Incident record.</td>
</tr>
<tr>
<td>Create Incident Task on Incident</td>
<td>Creates an Incident Task record from an Incident record.</td>
</tr>
<tr>
<td>Create Normal Change Request from Incident</td>
<td>Creates a Change Request record of type Normal from an Incident record.</td>
</tr>
<tr>
<td>Create Outage</td>
<td>Creates a cmdb_ci outage record for a configuration item. The Task field is populated only if the source is a task record. If the source is non-task record such as an alert record, the Task field is empty.</td>
</tr>
<tr>
<td>Create Problem from Incident</td>
<td>Creates a Problem record from an Incident record.</td>
</tr>
<tr>
<td>Create Request</td>
<td>Creates a Request record.</td>
</tr>
<tr>
<td>Create Standard Change Request</td>
<td>Creates a Change Request record of type Standard.</td>
</tr>
<tr>
<td>Create Task</td>
<td>Creates a child task record for a Task table record. For example, creates an Incident Task record for an Incident record.</td>
</tr>
<tr>
<td>Create Task Outage Relationship</td>
<td>Creates a Task Outage Relationship record where cmdb_ci outage record and task record are inputs to the action.</td>
</tr>
<tr>
<td>Create Standard Change Request from Incident</td>
<td>Creates a Change Request record of type Standard from an Incident record.</td>
</tr>
<tr>
<td>Update Assignee</td>
<td>Updates the Assigned to field of a Task table record.</td>
</tr>
<tr>
<td>Update Assignment Group</td>
<td>Updates the Assignment Group field of a Task table record.</td>
</tr>
</tbody>
</table>

**Security Operations spoke**

**Security Incident Response flow templates**

The Security Incident Response flow templates are created using the *Flow Designer*.

**Note:** Each of the flows is triggered when the Category in a security incident is set or changed.

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Incident Confidential Data Exposure flow template</td>
<td>Perform a series of tasks designed to handle the exposure of sensitive data.</td>
<td></td>
</tr>
<tr>
<td>Security Incident Denial of Service flow template</td>
<td>Perform a series of tasks designed to handle Denial of Service (DOS) attacks.</td>
<td></td>
</tr>
<tr>
<td>Security Incident Lost Equipment flow template</td>
<td>Perform a series of tasks designed to handle lost equipment.</td>
<td></td>
</tr>
<tr>
<td>Security Incident Malicious Software flow template</td>
<td>Perform a series of tasks designed to handle malicious software on your network.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security Incident Phishing flow template</td>
<td>Perform a series of tasks designed to handle spear phishing emails on your network.</td>
</tr>
<tr>
<td>Security Incident Policy Violation flow template</td>
<td>Perform a series of tasks designed to handle security policy violations.</td>
</tr>
<tr>
<td>Security Incident Reconnaissance flow template</td>
<td>Perform a series of tasks designed to handle reconnaissance on your network.</td>
</tr>
<tr>
<td>Security Incident Rogue Server or Service flow template</td>
<td>Perform a series of tasks designed to handle activity from rogue servers or services affecting your network.</td>
</tr>
<tr>
<td>Security Incident Spam flow template</td>
<td>Perform a series of tasks designed to handle email spam on your network.</td>
</tr>
<tr>
<td>Security Incident Unauthorized Access flow template</td>
<td>Perform a series of tasks designed to handle unauthorized access to your network.</td>
</tr>
<tr>
<td>Security Incident Web/BBS Defacement flow template</td>
<td>Perform a series of tasks designed to handle vandalism directed against one of your BBS or web sites.</td>
</tr>
</tbody>
</table>

### Visual Task Board (VTB) Spoke

Provides VTB actions for flow designers to manage the boards, lanes, cards, board members, and assignees.

#### Board Management Actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
</table>
| Create Freeform VTB Action    | Creates a Freeform VTB for any task type. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane | • Name  
• Board Owner  
• Default view  
• Label visibility  
• Picker visibility  
• Background color | • Board record |
| Create Flexible VTB Action    | Creates a Flexible VTB bound to a single Task table. The default lanes are: Todo, Doing, and Done. These lanes can be modified with actions: Add Lane, Rename Lane, Reorder Lane, and Delete Lane | • Name  
• Task table  
• Filter  
• Board Owner  
• Default view  
• Label visibility  
• Picker visibility  
• Background color | • Board record |
<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Inputs</th>
<th>Action Outputs</th>
</tr>
</thead>
</table>
| Create Guided VTB Action | Creates a data-driven VTB bound to a single Task table along with the fields the lanes are derived. | • Name  
• Task table  
• Land field  
• Filter  
• Board Owner  
• Default view  
• Label visibility  
• Picker visibility  
• Background color | • Board record |
| Add VTB Member Action | Add a user to a VTB. Only members of the VTB can access the board. Any VTB member can add other members. | • Board record  
• User record | N/A |
| Remove VTB Member Action | Remove a user from a VTB. Only members of a VTB can access the board. Any VTB member can remove other members. | • Board record  
• User record | N/A |

### Lane Management Actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
</table>
| Add VTB lane | Add a lane to a Freeform or Flexible VTB. This action does not apply to Guided boards, which are constrained to fixed lanes based on fields configured. | • Board record  
• Lane name | • VTB lane record |
| Rename VTB Lane | Rename an existing lane on a Freeform or Flexible VTB. | • Lane record  
• New lane name | N/A |
| Reorder VTB Lane | Reorder lanes on any VTB. | • Lane record  
• New lane name | N/A |
| Delete VTB Lane | Delete an existing lane from a Freeform or Flexible VTB. | • Lane record | N/A |

### Card Management Actions

<table>
<thead>
<tr>
<th>Flow/Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
</table>
| Create VTB Card | Create a VTB card on a Freeform board for a task. | • Lane record  
• Task record | • Card record |
| Assign VTB Card | Assign a user to a VTB card. | • Card record  
• User record | N/A |
<table>
<thead>
<tr>
<th>Flow/Action</th>
<th>Description</th>
<th>Action Steps</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move VTB Card</td>
<td>Move a VTB card from one lane to another lane.</td>
<td>• Card record</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Lane record</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For Flexible boards, use the Update Record action to change the state of the underlying task. For Guided boards, this action changes the field on the task associated with that card.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Remove Assignee from VTB Card</td>
<td>Remove an assignee from a card.</td>
<td>• Card record</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Create a natural language title**

Create a flow, subflow, or action title with styled and dynamic text.

Role required: admin, flow_designer, or action_designer

1. Navigate to **Flow Designer > Designer**.
2. On the Flow Designer landing page, click **New** and then select **New Flow**, **New Subflow**, or **New Action** from the list.
3. In the Flow Designer main header, click the more actions icon.
4. Click **Manage natural language title**.
5. On the Natural Language Title screen, enter a title.
   a) Use any combination of the following options to create a styled title:

<table>
<thead>
<tr>
<th>Text style</th>
<th>Example input for natural language title</th>
<th>Example output in Flow Designer environment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bold</td>
<td>A <em>bold</em> title</td>
<td><img src="example_output.png" alt="Example output" /></td>
</tr>
<tr>
<td>Italic</td>
<td>An <em>italic</em> title</td>
<td><img src="example_output.png" alt="Example output" /></td>
</tr>
<tr>
<td>Text style</td>
<td>Example input for natural language title</td>
<td>Example output in Flow Designer environment</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>Underline</td>
<td>An <del>underlined</del> title</td>
<td></td>
</tr>
<tr>
<td>Strikethrough</td>
<td>A <del>strikethrough</del> title</td>
<td></td>
</tr>
<tr>
<td>Title (bold and colored)</td>
<td>A #titled# title</td>
<td></td>
</tr>
</tbody>
</table>

b) Add dynamically generated text for your title from an input, output, action, or action step by clicking the data pill picker ( Jazeera ) and selecting the input, output, action, or action step that you want to include in your title.

**Note:** The value that is associated with the Label field for an input or output appears in the title.

6. Click Submit.

When you add your action or subflow with a natural language title to a flow, the title appears in the Flow Designer environment.

**Instance Data Replication (IDR)**

Instance Data Replication (IDR) copies data updates from one instance to one or more other instances. IDR enables you to maintain consistent data across different organizations in your company.

IDR provides a one-to-many replication, which enables one instance to propagate data across different departments and business units to keep data in sync. With IDR, you can also modify data during replication. For example, you could localize the data during replication.

Watch this video to learn how to set up IDR between multiple instances on the Now Platform.
Benefits

- Data is automatically replicated to one or more other instances.
- Data can be modified and mapped to any table and table column on other instances. For example, you can modify and map table columns to localize data for different locales.
- Data that is updated on consumer instances can be replicated to the producer instance.

Data, such as problem requests, can be given on consumer instances to third parties. The third parties can update the problem issue and return it to the consumer instance. The data can then be updated on the producer instance.
- Business rules can trigger post-replication workflows, such as generating notifications or validating the replication.
- Data that is in transit during a crash is recoverable.

How Instance Data Replication works

You use the Instance Data Replication plugin to replicate data updates on one instance, called the producer instance, to one or more other instances, called consumer instances.

By configuring a producer replication set, you can specify the tables and table columns on the producer instance to replicate. When you configure a consumer data set, you can specify the tables and table columns on the consumer instances that receive the producer replication set data.

Next, you activate both producer and consumer replication sets to turn on the IDR functionality. The data that is updated in a producer replication set automatically updates the corresponding data in the consumer replication sets.

Syncing the producer and consumer replication sets requires that you do a one-time download called seeding of all the producer replication set data to the consumer instances. You can initiate seeding requests on a consumer instance while you are activating a consumer replication set. After seeding, your future replications involve data updates only. An audit trails contain a history of those record updates.

By default, the table data on a producer instance goes into the tables of the same name on consumer instances. Transformation is the process of replicating producer data in differently named tables or table columns on consumer instances.

IDR adapters modify data before storing it on consumer instances. Adapters perform string and mathematical operations, such as converting one currency to another, or converting one time zone to another.
IDR overview

**Warning:** IDR overwrites data on instances and can replicate sensitive data. Given the potential for data loss and data exposure, test your IDR implementation in a pre-production environment.

### Producer and Consumer instance data replication delays

After IDR has been set up on the producer instance, a job (IDRProducerJob) runs on producer instances to detect data updates. When there are updates to replicate, the producer instance sends the updates to consumer instances.

The IDRConsumerJob runs on the consumer instances to detect the data updates from a producer. When IDRConsumerJob finds updates, it updates the data in consumer tables.
It takes some time for the data updates in a producer replication set to appear in consumer replication sets. You can look on the monitoring dashboard to see how long data updates move from a producer replication set to consumer replication sets.

If you have significant data delays, contact ServiceNow Technical Support.

**Domain separation**

IDR runs in ServiceNow datacenters only. It functions at the data level so IDR does not explicitly support domain separation. Data moves from a producer instance to a consumer instance without regard to which domain the instance is in. However, you can use business rules to convert from one domain to another. For more information, see About Before Query business rules.

**When not to use IDR**

- Do not use IDR to clone instances.
  - IDR does not replicate metadata tables, child metadata tables, and most user and system tables. IDR is designed to replicate data, not clone instances.
- Do not use IDR if your use case breaks any of the following IDR limitations:
  - Replication must not take longer than seven days to complete.
  - Initial seeding of the tables must be less than 3 million records per replication set.
  - Producer and consumer instances must be in the same geographic region.

**What to do next**

Get an overview of *setting up IDR*.

**Request an Instance Data Replication (IDR) subscription**

The Instance Data Replication (IDR) plugin requires a separate subscription and must be activated by ServiceNow personnel.

Role required: admin

New York is the earliest version that supports IDR. The IDR plugin ID is com.glide.idr. When purchasing an IDR subscription, ServiceNow personnel also activate the following plugins that IDR depends upon:

- com.snc.db.data_replicate
- com.glide.transform
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

1. Navigate to **System Applications > All Available Applications > All**.
2. On the All Applications page, click **Request Plugin** to open the request form on HI.

3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>and time you would</td>
<td>Note: Plugins are activated in two batches each business day in the Pacific</td>
</tr>
<tr>
<td>like this plugin</td>
<td>time zone, once in the morning and once in the evening.</td>
</tr>
<tr>
<td>to be enabled</td>
<td>If the plugin must be activated at a specific time, enter the request in</td>
</tr>
<tr>
<td></td>
<td>the Reason/Comments field.</td>
</tr>
</tbody>
</table>

| Reason/Comments     | Information that would be helpful for the ServiceNow personnel who are    |
|                     | activating the plugin. For example, if you need the plugin activated at   |
|                     | a specific time instead of during one of the default activation windows,   |
|                     | specify it in the comments.                                              |

5. Click Submit.

Create and activate a producer replication set.

Set up Instance Data Replication (IDR)

IDR requires a separate subscription and only ServiceNow can install the plugin. After the plugin activates, you can configure the producer and consumer instances.

Role required: admin

1. Request that ServiceNow install the IDR plugin.
2. Create and activate a producer replication set.
   The producer replication set specifies the tables and table columns that you want to replicate to one or more consumer instances.
3. Create and activate one or more consumer replication sets and request data from the producer.
   The consumer replication set specifies the tables and table columns on consumer instances that receive producer data updates. The replicated data overwrites the corresponding consumer instance data. Consumers must apply to producers to receive the replication data.
4. **Approve or deny consumer requests** to access replication data on your producer instance to access the replication data.

   ![Note: You must have the producer replication admin role to approve or deny consumer requests.]

5. Optional: **Map replicated data into different tables or table columns** on consumer instances.

6. Optional: **Modify records** during replication.
   
   As an example, you might change time zone or currency records to make them appropriate for a different geographic region.

7. Optional: Set up **bi-directional replication**.

**Create a producer replication set in Instance Data Replication (IDR)**

You can use a producer replication set to specify the tables and table columns to replicate on consumer instances.

- **Purchase an IDR subscription** and have ServiceNow personnel install the IDR plugin.
- Verify that the producer and consumer instances are in the same geographic region and belong to the same customer.
- Role required: idr_admin or admin

Seeding is the initial download of all the records in the producer replication set to the tables in the consumer replication set. After seeding, IDR only replicates data updates. The seeding limitations are:

- The maximum record size is 32 MB.
- The maximum seeding size is 3 million records.

   ![Note: If your replication set contains more than 3 million records, seeding cannot start. To fix this situation, break the replication set into multiple replication sets with fewer records in each.]

- The maximum seeding time is 7 days.
1. On the producer instance, navigate to Instance Data Replication > Producer Replication Sets and click New.
2. Fill in the following fields and click Submit:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name   | Names can only contain alphanumeric characters and hyphens.  
**Note:** The consumer replication set must have the same name as the producer replication set, so the name should not be producer-specific. |
| Description | A brief description of the replication set. |
| Entry Set | A set of replication entries. You can choose an existing entry set if you imported as an update set from another instance or you created earlier on your instance. |

In the Producer Replication Set form, the system auto-generates the producer ID, which you can't edit. The **Producer ID** field identifies the producer instance in the system.
3. Optional: Select the **Require Consumer Sync** option to enable bidirectional replication on consumer instances.
Bidirectional replication replicates changes that are made directly on consumer instances back to the producer instance. For bidirectional replication to happen, the consumer replication set must synchronize the configuration changes. Bidirectional replication only works for records that originated on the producer. For more information, see Bidirectional replication.

4. Identify the table and the table columns to include in the replication set:
   a) On the Replication Entries tab, click New.
b) In the **Source Table name** field, select one of the tables on the producer instance to replicate. For example, select **Incident**.

c) Optional: Select the **Include Attachments** option to replicate files that are associated with the records that are being replicated.

d) Optional: Click **Add Filter Condition** and select filter criteria in the **Filter** section to prevent a group of records in a selected table from being replicated.

   For example, you might want to replicate only active records. In that case, select **Active** in the **choose field** – list, **Is** in the **oper** – list, and **True** in the **value** – list. If you do not use a filter, all the fields in the producer replication set table appear in the Available column.

   ![Note:](image)

   **Note:** The Available column contains the fields in the Source Table that you specified. That table may not contain the **Active** field.

e) In the **Included Fields** columns, use the arrows to move table fields into the Selected column to replicate them or into the Available column to prevent replicating them, and then click **Submit**.
<table>
<thead>
<tr>
<th>Source Table Name</th>
<th>Incident (incident)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter</td>
<td>Add Filter Condition</td>
</tr>
<tr>
<td></td>
<td>-- choose field --</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Include Attachments</td>
<td></td>
</tr>
</tbody>
</table>

- Assigned to
- Business duration
- Business resolve time
- Business service
- Caller
- Category
- Caused by change
- Charge request
- Child incidents
- Closed

Note: Edge Encrypted fields, Password (2-Way Encrypted) type fields are not available for replication.

5. Repeat step 4 for each table that you want to include in the replication set.

Note: Some fields, such as SYS ID (Mandatory), must be replicated. Other fields, such as Edge Encrypted and Password1, can't be replicated and do not appear in either column.
Note: If the table that you add to the replication set has child tables, add the child tables to the replication set to maintain data integrity.

6. Click **Activate**.

   Replication can't happen until you link the producer replication set to one or more consumer replication sets. Activation just makes the producer data available for replication.

7. Click the **Replication Setup Instructions** related link to view the information and close the modal.

   The Replication Setup Instructions modal shows important configuration information that you use to associate this producer instance with its consumer instances.

8. Click the **Notification Configuration** related link and configure who receives replication notifications.
   a) On the **When to send** tab, specify the conditions for sending a notification.
   b) On the **Who will receive** tab, specify who receives the notifications.

   The fields that appear on the tab vary with the **Send when** value:

   - **Record inserted of updated**—The **Updated** and **Inserted** options, when selected, send notifications when records are updated or inserted.
   - **Event is fired**—The Event Name specifies the event type that sends the notification.
   - **Triggered**—A notification is sent when triggered by a Flow Designer flow. For more information, see **Flow Designer**.

   The **Updated** and **Inserted** options, when selected, send notifications when records are updated or inserted.
   c) On the **What it will contain** tab, specify the notification content.
   d) Click **Update**.

The producer is ready to send the data that is specified in the replication set to one or more consumer instances.

Note: If you believe that a consumer set should no longer receive replication data, you can **revoke the consumer set's access**.

- **Create and activate a consumer replication set.**
- **Grant access to replication data.**

   After creating a consumer replication set, you must ask for permission to receive the producer's replication data. See **Grant access to replication data** to see how to grant or deny access.

**Create a consumer replication set for Instance Data Replication (IDR)**

You can use a consumer replication set to specify the tables and columns on a consumer instance that receives the producer data.

- **Create and activate a producer replication set.**
- Make sure that the producer and consumer instances are in the same geographic region and belong to the same customer.
- Role required: idr_admin or admin

Create a consumer replication set and link it to a producer replication set. The data from the producer replicates into the tables and table columns of the same name on the consumer instance. The administrator of the producer replication set must grant the consumer instance access to the replication data.
If the producer replication set administrator generates a new encryption key, the encryption key value that is stored in the consumer replication set may not automatically update. If not, replication stops. To restore access, see Restore access to replication data.

1. On a consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets**.
2. Click **New** and fill out the Consumer Replication Set form:

   **Required Consumer Replication Set fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Producer Instance URL</td>
<td>Name of the consumer replication set.</td>
</tr>
<tr>
<td>Producer Replication Set Name</td>
<td>Unique ID for the created producer replication set. Access from the producer administrator.</td>
</tr>
<tr>
<td>Description</td>
<td>Unique ID for the created producer replication set. Access from the producer administrator.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

   The list of all consumer replication sets appears. A request is sent to the producer replication set administrator to approve or deny your request for a shared encryption key.

   **Warning**: Do not change any of the values.

4. In the list of all consumer replication sets, click the replication set.

   The Consumer Replication Set displays the replication set information.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>george-test</td>
</tr>
<tr>
<td>Description</td>
<td></td>
</tr>
<tr>

<td>Search</td>
</tr>
</tbody>
</table>
The Consumer Approval Status shows as Approval Pending. The producer administrator must approve your request to be a consumer.

**Note:** If you receive an error that your encryption key does not work, call ServiceNow Technical Support.

5. Wait until the producer administrator approves the request. The Consumer Approval Status changes to Approved. For more information, see [Grant access to replication data](#).

6. After you receive confirmation, click the **Synchronize Replication Configuration** related link.
   - If you do not see this option, refresh the page.
   - A modal confirms the synchronization. The tables that are selected for replication in the producer replication set are replicated in the consumer replication set and appear on the **Consumer Replication Entries** tab. The initial seeding of all the table data may take some time. In the future, only data updates are replicated to consumer replication sets. For more information about seeding, see [Seed a consumer instance](#).

7. Click the **Notification Configuration** related link and configure who receives replication notifications.
   - **Option** | **Description**
     - When to send | Specify the trigger for sending a notification.
     - Who will receive | Specify who receives the notifications.
     - What it will contain | Specify the notification content.

8. Click **Update**.

9. Activate the consumer replication set by selecting the option next to the replication set that you want to activate.
   - Then, on the **Consumer Replication Entries** tab, click one of the following buttons:
     - **Activate with Seeding** — Makes the replication set ready to take producer updates and replicates the current records (only) specified in the producer replication set.
     - **Activate with Seeding (Include History)** — Same as **Activate with Seeding** but also replicates the entire history of record updates.

   With both seeding options, IDR generates audit trails of all record updates. If you encounter an error during seeding, see [Fix seeding errors](#). For more information about seeding, see [Seed a consumer instance](#).

**Note:** **Activate without Seeding** under **Related Links** makes the replication set ready to take producer updates but does not download any data from the producer. Do not use this option when setting up replication. Always start with seeding the consumer instance. Use this option, for example, after updating the producer's ID, producer set ID, or encryption key.

10. Optional: Cancel a seeding request:
    - a) On the **Seeding Requests** tab, click a seeding request.
    - b) On the Seeding Request form, click **Cancel**.

11. Optional: On the **Consumer Replication Entries** tab, click a source table name to modify the behavior of the consumer.
    - a) On the Consumer Replication Entry form, select the **Preserve Modified By** option to add the name of a user to an Activities entry.

    **Preserve Modified By** preserves the name of the person who updated a field of type Activity in a record. For example, the **Work Notes** field is of type Activity in change request records. When someone updates a change request, the work note moves into the Activities stream. If the option is unselected, the Activities entry attributes the update to Instance Data Replication in consumer records. With the option selected, the person who updated the change request is identified in the entry and IDR is prepended to their name.
The following image shows two Activities entries. A name is attached to one entry to demonstrate that the **Preserve Modified By** option was selected.

b) Select the **Run Business Rule** option to run business workflows after a replication.

A business rule is a server-side script that is associated with a table. Use business rules to trigger workflows that are associated with replications, such as sending a notification or validating the replicated data. For more information, see [Trigger workflows after replication](#).

c) Click **Enable Transform** to replicate the data from the producer tables into tables of different names on the consumer instance.

For more information, see [Transform replication data](#).

d) Click **Update**.

The consumer instances contain, at a minimum, the current data in producer replication set tables. The consumer instances are now ready to accept replicated data updates. By default, the data in producer tables is replicated into tables and table columns of the same name on the consumer instances. [Transform replicated data](#) describes how to map the data into different tables and table columns, and how to modify the data as it is replicated.

- **Map the replication data to different tables** on the consumer instance.
- **Modify the values** during replication.
- Set up business rules to **trigger post-replication workflows**.
Reconfigure a replication set in Instance Data Replication (IDR)

Reconfigure replication sets on the producer instance if you need to change or update your original replication set.

Role required: idr_admin or admin

After activating a revised producer replication set, update the producer replication set's name, shared key, producer ID, and producer set ID on each consumer instance.

**Note:** Make sure that a seeding request is not in progress before you reconfigure a producer instance. Check the consumer replication sets seeding requests status.

1. Reconfigure a producer instance:
   a) On the producer instance, navigate to Instance Data Replication > Producer Replication Sets.
   b) Select a producer replication set and make one or more of the following changes to the set:
      - On the Replication Entries tab, click New to add a table to the set.
      - On the Replication Entries tab, click a replication set. In the Replication Entry form, modify the columns that are included in the replication set, and click Update.
      - On the Replication Entries tab, click a replication set and click Delete to remove the table from the replication set.
      - Click Generate New Shared Key to change the shared encryption key.

      You only generate new shared keys when you discover that they have been compromised or if you want to stop sending data to a consumer. After changing the encryption key on the producer instance, consumers that have the Consumer Approved Status of Denied must reapply for access to the producer replication set. For more information, see Grant access to replication data.

      These changes stop replication and produce this status message on the consumer instance: "Producer Replication Set configuration has been modified." On the consumer instance, click Synchronize Replication Configuration and then click Activate with Seeding.

2. To update consumers with the changes that were made on the producer, on each consumer instance, navigate to Instance Data Replication > Consumer Replication Sets and click the consumer replication set that you want to update. The status of the replication set is Replication Error. See the following table to learn what action to take according to the status message.

<table>
<thead>
<tr>
<th>Status Message</th>
<th>What to do</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval was denied by producer instance.</td>
<td>The producer changed the shared key and this consumer's access to the replication data was revoked. Replication stops. Click the Request shared key related link. The producer must approve your request. For more information, see Grant access to replication data. If the consumer's access was not revoked, replication continues. Nothing needs to be done on the consumer instance.</td>
</tr>
<tr>
<td>Producer Replication Set configuration has been modified.</td>
<td>The producer added or subtracted tables or table columns in the producer replication set. Replication stops. Click Synchronize Replication Configuration and then click Activate with Seeding. If the producer set contains fewer tables, you can click Activate Without Seeding instead. The tables on the consumer instance that the producer no longer replicates are not deleted.</td>
</tr>
</tbody>
</table>

3. Optional: Delete a replication set.
   - To delete a producer replication set from the producer instance, navigate to Instance Data Replication > Producer Replication Sets. Click the producer replication set that you want to delete, and then click Delete.
• To delete a consumer replication set on a consumer instance, navigate to Instance Data Replication > Consumer Replication Sets. Click the consumer replication set that you want to delete, and then click Delete.

Deploy a producer or consumer replication configuration by update set

Package a replication set configuration from a producer or consumer instance to another instance and then deploy through an update set. For example, you copy a configuration from a test to production environment.

Role required: admin

Note: To learn about access to update sets, see update set administration.

Once you deploy the update set, you must still activate the producer replication set. You must also update the consumer replication set with the producer instance URL on each consumer instance.

1. Export the update set from the instance where you created the replication set.
   To learn about update sets, see Get started with update sets.
2. Import the update set to the instance where you must set up the replication set.
   To learn about update sets, see Get started with update sets.
3. On the producer instance, navigate to Instance Data Replication > Producer Replication Sets and select the producer replication set that you imported.
4. Click Activate.
   Replication can't happen until you link the producer replication set to one or more consumer replication sets. Activation just makes the producer data available for replication.
5. On the consumer instance, navigate to Instance Data Replication > Consumer Replication Sets and select the consumer replication set that you imported.
   Update the consumer replication set with the producer instance URL on each consumer instance.

Note: If the producer instance URL does not automatically retrieve the producer ID and the producer set ID, you must enter these IDs.

Grant access to the replicated data for Instance Data Replication (IDR)

Approve or deny a request to grant access to the replication data.

Role required: admin

You can review consumer access requests for all of your producer replication sets or for a specific producer replication set. The administrators of consumer sets must apply for access before they can receive the replication data.

1. On the producer instance, navigate to Instance Data Replication > Consumers Pending Approval.
2. Select the option for each consumer replication set that you want to approve.
3. On the Actions on selected rows... list, select Approve.
   The approved consumer sets start receiving the replicated data.

Note: You can change the Consumer Approval Status to Denied to prevent the consumer from receiving the replicated data.

4. To approve a consumer access request for a specific producer replication set:
   a) On the producer instance, navigate to Instance Data Replication > Producer Replication Sets.
   b) Select the producer replication set where you want to approve consumer access.
c) Under Related Links, on the **Consumer Subscriptions** tab, select the option for the consumer replication set that you want to approve.

d) On the Actions on selected rows... list, select **Approve**.
   The approved consumer set starts receiving replicated data.

**Note:** You can change the Consumer Approval Status to Denied to prevent the consumer from receiving the replicated data.

---

### Revoke access to replicated data for Instance Data Replication (IDR)

Revoke a consumer's access to replicated data if you believe that consumer instance should no longer receive that data.

**Role required:** admin

When you generate a new, shared encryption key, approved consumer sets automatically receive the new key and data replication is not interrupted. Any consumer set with a status of Denied or Pending Approval does not receive the new encryption key, and replication ceases.

1. On the producer instance, navigate to **Instance Data Replication > Producer Replication Sets**.
2. Select the producer replication set that has consumers whose access needs to be revoked.
   The instance identifies the consumers under the **Consumer Subscriptions** tab.
3. On the **Consumer Subscriptions** tab, select the option for the consumer instance whose permissions you want to revoke.

4. In the Actions on selected rows... list, select **Revoke**.

   Instance Data Replication generates a new encryption key and shares it with all approved consumer sets. All other consumer sets stop receiving replication data. Admins of those consumer replication sets must **reapply to restore access to the replication data**.

**Restore access to replication data for Instance Data Replication (IDR)**

Restore access to replicated data by sending a request to the producer replication set admin.

Role required: admin

When the producer replication set administrator generates a new encryption key, approved consumer sets automatically receive the new key and data replication is uninterrupted. Consumer sets with a status of Denied or Pending Approval do not receive the new encryption key and replication ceases.

1. On the consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets**.
2. Select the consumer replication set to restore access to.
3. Click the **Request Shared Key** related link.
A request is sent to the producer replication set administrator. If you are granted access, the consumer's Approval Status changes to Approved.

4. Optional: If the producer's replication set has changed, click the Synchronize Replication Configuration related link.

5. On the Consumer Replication Entries tab, select all of the tables and click Activate with Seeding to get the latest data in the producer’s replication set.

Transform replication data for Instance Data Replication (IDR)

Transform the producer instance data to tables or table columns that are named differently on consumer instances.

- Create and activate a producer replication set.
- Create, activate, and seed one or more consumer replication sets.
- Role required: idr_admin or admin

By default, the replicated data from producer tables and table columns goes into tables and table columns of the same name on consumer instances. You can map the producer data into any table or table column on consumer instances. If existing tables or table columns have different names, you can replicate the data to a different table or table column. Adapters modify the data before storing it on consumer instances. You can use adapters to localize the data and transforms to create the producer for business systems (consumer instances) that refer to the same entity by different names.

You can also use adapters to modify the producer data during replication. For example, you can localize the data or populate the data that has been labeled differently in consumer tables.

Transformations have the following limitations:

- sys_created, sys_created_by, sys_domain, sys_updated_by, sys_id, and sys_mod_count are automatically mapped to the consumer and can't be remapped.
  
  No other sys_ fields can be replicated.

- Adapters can't operate on the sys_journal field type such as Comments or Worknotes columns in a Task table.

- Calculated fields won't be transformed.

  A calculated field, such as the name field from sys_user, will replicate but cannot be transformed. Allowing a transformation breaks the calculation for the resulting field.

  Note: Calculated fields will not show as an option to transform.

1. On the consumer instance, navigate to Instance Data Replication > Consumer Replication Sets and click a consumer replication set.

2. On the Consumer Replication Entries tab, click a consumer replication entry.
A consumer replication entry appears.
3. Select the **Enable Transform** option.

4. In the Target Table Name list, select the table into which you want to replicate the source table data and click **Update**.

5. On the **Consumer Replication Entries** tab, click the same consumer replication entry.

6. Click the lock icon next to **Transform Map** to unlock it.

   The image shows a Transform Map, with the field names from the source table appearing in the left column. The middle column shows matching field names in the target table. All fields that do not have the same names in both tables appear in the – choose source field – or – choose target field – lists.
**Note:** If a table in a producer replication set is not on a consumer instance, the table is created on the consumer instance. If no entries are in the – choose source field – and – choose target field – columns, the producer and consumer tables do not have identically named columns. Grayed out values are not configurable.

7. Map a producer column to a consumer column that has a different name:
   a) Click **choose source field** and select the source field that you want to map.
   b) Click **choose target field**, select the target field into which you want to map the data, and then click **Add**.
   c) If you want to remove a field from replicating the producer instance to the consumer instance, click the **X** at the end of the row to delete the field.

8. To modify the producer data before replicating it in the consumer instance, click **Add Adapter**.
   The image shows the type of Adapter rules that you can create.
What kind of Adapter Rule do you want to create?

- Concatenate String Adapter Rule
- Replace Adapter Rule
- Split Adapter Rule
- Fixed-Width Format Adapter Rule
- Pattern Adapter Rule
- Task Number Adapter Rule
- Calculation Adapter Rule
- Map Adapter Rule
- Time Zone Conversion Adapter Rule

9. Click the adapter that you want to use and then configure it.
   For more information about configuring adapters, see "Adapter descriptions."

   Note: Adapters do not modify the data on the producer instance.

Bidirectional replication for Instance Data Replication (IDR)

Bidirectional replication enables data to not only flow from a producer instance to a consumer instance, but also to accept data from a consumer instance and flow back to the producer instance.

By default, replicated data flows from a producer instance to a consumer instance. Bidirectional replication reverses that flow. For example, a company might outsource its networking issues. The third party receives the networking incident records from the consumer instance, fixes the networking issues, updates the records, and returns them to the consumer instance. Bidirectional replication then updates the incident records on the producer instance. Bidirectional replication only works for records that originated on the producer instance.

To make data flow bidirectionally on the consumer instance, the system creates a producer instance on the consumer instance and a consumer instance on the producer instance.
Choosing bidirectional replication creates producer and consumer instances

If you look at the replication sets on the original producer instance, you see the replication set name and the automatically generated consumer instance. It has the same name appended with the suffix, \(-<long-number>-reverse\), where \(<long-number>\) is a randomly generated number. For example, if Test is the replication set name on the producer instance, Test-2034802-reverse might be the name of the consumer replication set that is automatically generated on the same instance. On the original consumer instance, you see the same names. Replication sets with the reverse suffix are read-only.

You can see the automatic creation of a consumer on a producer instance and a producer on a consumer instance by running \(https://<producer-instance-name>/xmlstats.do?include-idr\) and \(https://<consumer-instance-name>/xmlstats.do?include=dir\) on the producer and consumer instances. In the following image, the original producer instance is on the left and the original consumer instance is on the right.
Bidirectional replication has the following limitations:

- Auto-conflict resolution is unsupported.
- Merge conflicts happen if producer and consumer instances modify the same record at the same time. The most recent update wins, which means that the data on the consumer and producer tables might be different.
- Deleting data on a consumer instance does not delete the same data on the producer instance.
- Bidirectional replication supports the Number adapter but none of the other adapters.

Create a bidirectional replication for Instance Data Replication (IDR)

Replicate updated data on a consumer instance to the producer instance.

Role required: idr_admin or admin

1. On a producer instance, navigate to Instance Data Replication > Producer Replication Sets and click a producer replication set.
2. On the Producer Replication Set pane, select the Require Consumer Sync option to enable bidirectional replication.
3. On a consumer instance, navigate to Instance Data Replication > Consumer Replication Sets and click a consumer replication set that is connected to the producer replication set.
4. On the Consumer Replication Set pane, click the Synchronize Replication Configuration related link.

Data that is updated on this consumer instance automatically replicates on the producer instance, which then replicates the updates to its other consumer instances.

Seed a consumer instance for Instance Data Replication (IDR)

Seed all or some of the tables in your replication sets depending on the needs of your consumer instance.

Role required: idr_admin or admin

You can initiate seeding requests on a consumer instance while you are activating a consumer replication set.
Note: Seeding continues even if errors occur on some consumer tables. You can restart seeding specifically on the tables that have errors or on all tables in a replication set.

1. On the consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets** and click a consumer replication set.
2. On the **Consumer Replication Entries** tab, select the option next to the tables to seed.
3. Click either **Activate with Seeding** to download only the current field values from the producer or **Activate with Seeding (Include History)** to download the current field values and the history of all field updates.
   Once seeded, the consumer instance maintains a history of all field updates.
4. To cancel a seeding request:
   a) On the **Seeding Requests** tab, click a seeding request.
   b) On the Seeding Request form, click **Cancel**.

Note: If you encounter an error during seeding, see **Fix seeding errors**.

In a successful seeding, all selected data on a producer instance is replicated on a consumer instance.

- Records that exist on the producer instance and not on the consumer instance are copied to the consumer instance.
- If the identical record exists on a consumer instance, the record on the consumer instance is not modified.
- The sys_ID of the record identifies the record on both instances.
- If a replication set changes and no longer includes a table, the records in the corresponding table on the consumer instances are not altered.
- The producer instance handles one seeding request at a time. When the producer instance is busy with a seeding request, subsequent seeding requests are queued and initiated in the order that they are received.

Note: In bidirectional replication, the same rules apply.

**Trigger workflows after replications for Instance Data Replication (IDR)**

Use platform business rules to trigger workflows after replications.

Role required: idr_admin or admin

A business rule is a server-side script that is associated with a table. Use business rules to trigger workflows that are associated with replications, such as sending a notification or validating the replicated data.

Business rules are part of the Now Platform. For more information, see **Business rules**.

1. On a consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets** and click a consumer replication set.
2. On the **Consumer Replication Entries** tab, click a replication set table.
3. Select the **Run Business Rule** option.
4. Repeat this procedure for the other tables in the replication set.
5. Click **Update**.
   IDR invokes the business rules that are associated with the specified table after replicating the data to the table.

**Instance Data Replication (IDR) dashboard**

The IDR dashboard enables you to monitor the status of active producer and consumer replication sets, scheduled jobs, and producer or consumer seeding requests.
Accessing the IDR dashboard

Users with the admin or idr_admin role can access the dashboard.

Navigate to the IDR dashboard in the following way:

- **Instance Data Replication > Monitoring Dashboard**

The IDR dashboard monitors the following:

- Active Producer Replication Sets
- Active Consumer Replications Sets
- IDR Scheduled Jobs
- Producer Seeding Requests Within Last 7 Days
- Consumer Seeding Requests Within Last 7 Days
### Active Producer Replication Sets

<table>
<thead>
<tr>
<th>Name</th>
<th>Replication Queue Reading Lag</th>
<th>Status</th>
<th>Status Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>credb-ci-san-disk</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>credb-ci-storage-device</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>idr:incident-sync-up-bf1a6176b54f1b10</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>idr:problem-sync-up</td>
<td>00:00:39</td>
<td>active</td>
<td>Active Replication</td>
</tr>
</tbody>
</table>

### Active Consumer Replication Sets

<table>
<thead>
<tr>
<th>Name</th>
<th>Data Lag</th>
<th>Network Lag</th>
<th>Status</th>
<th>Status Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>idr:incident-sync-up</td>
<td>00:00:43</td>
<td>00:00:04</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>idr:problem-sync-up-l77c13d1b104412df9</td>
<td>00:00:00</td>
<td></td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>interaction</td>
<td>00:00:43</td>
<td>00:00:04</td>
<td>active</td>
<td>Active Replication</td>
</tr>
<tr>
<td>label</td>
<td>00:00:43</td>
<td>00:00:04</td>
<td>active</td>
<td>Active Replication</td>
</tr>
</tbody>
</table>
Active Producer Replication Sets

The Active Producer Replication Sets monitors your producer replication set status and reports data lag time between your instance and the replication queue.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the producer replication set.</td>
</tr>
<tr>
<td>Replication Queue Reading Lag</td>
<td>Time between a record change on the producer instance and the moment it is</td>
</tr>
<tr>
<td></td>
<td>sent over the outbound replication queue.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

Active Consumer Replication Sets

The Active Consumer Replication Sets monitors your consumer replication set status, reports network lag time, and reports data lag time between the producer and consumer instance.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the consumer replication set.</td>
</tr>
<tr>
<td>Data Lag</td>
<td>Time between a record change on the producer instance and the moment it is</td>
</tr>
<tr>
<td></td>
<td>recorded in the consumer instance.</td>
</tr>
<tr>
<td>Network Lag</td>
<td>Time between a record change logs in the outbound replication queue and the</td>
</tr>
<tr>
<td></td>
<td>moment it is recorded in the consumer instance.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

IDR Scheduled Jobs

The suite of IDR scheduled jobs poll for data changes, requests, and check the health of your producer and consumer instances. You can monitor the following jobs:

**IDRConsumerJob**
Polls for record changes and seeding requests on the consumer instance in 15-second intervals.

**IDRHeartBeatJob**
Updates information about the health of every active producer or consumer set.

**IDRMetadataConsumerJob**
Polls for metadata record changes on the consumer instance in 15-second intervals.

**IDRProducerJob**
Polls for new, updated, or deleted records in the data replication queue for a producer instance in 15-second intervals.
**IDRSeedingProducerJob**

Checks for new seeding requests coming from consumer instances.

You can set when your IDR scheduled jobs run and configure a periodic trigger specifying how often the job runs.

**IDR Scheduled Jobs fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Scheduled job name.</td>
</tr>
<tr>
<td>Next Action</td>
<td>Date and time when the job next runs.</td>
</tr>
<tr>
<td>Trigger type</td>
<td>Job that you can configure to run daily, weekly, monthly, periodically, once, on-demand, or business calendar start or end date. The trigger can repeat daily, hourly, by minute, or by second.</td>
</tr>
<tr>
<td>Job ID</td>
<td>ID of the scheduled job.</td>
</tr>
<tr>
<td>State</td>
<td>State of the job, for example, ready.</td>
</tr>
</tbody>
</table>

**Producer Seeding Request Within Last 7 Days**

You can monitor the status of a producer seeding request within the last seven days.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Set</td>
<td>Producer set and the consumer set.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of the seeding request. The status can be completed, in progress, or failed.</td>
</tr>
<tr>
<td>Start Time</td>
<td>Time that the seeding begins.</td>
</tr>
<tr>
<td>End Time</td>
<td>Time that the seeding ends.</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>Percentage of the seeding request job that is complete.</td>
</tr>
</tbody>
</table>

**Consumer Seeding Request Within Last 7 Days**

You can monitor the status of a consumer seeding request within the last seven days.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replication Set</td>
<td>Corresponding consumer set.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of the seeding request. The status can be completed, in progress, or failed.</td>
</tr>
<tr>
<td>Start Time</td>
<td>Time that the seeding begins.</td>
</tr>
<tr>
<td>End Time</td>
<td>Time that the seeding ends.</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>Percentage of the seeding request job that is complete.</td>
</tr>
</tbody>
</table>
IDR Dashboard Properties

You can navigate to the IDR dashboard properties in the following way:

- **Instance Data Replication > Properties**

You can change the following properties on your dashboard:

<table>
<thead>
<tr>
<th>Property field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minutes of lag before the Data Lag field is highlighted in red on the IDR Monitoring Dashboard</td>
<td><strong>Data Lag</strong> field that is part of the Active Consumer Replication set. The field highlights if the actual lag time is greater than the time threshold that you set. The default is 15 minutes.</td>
</tr>
<tr>
<td>Minutes of lag before the Network Lag field is highlighted in red on the IDR Monitoring Dashboard</td>
<td><strong>Network Lag</strong> field that is part of the Active Consumer Replication set. The field highlights if the actual lag time is greater than the time threshold that you set. The default is 15 minutes.</td>
</tr>
<tr>
<td>Minutes of lag before the Replication Queue Reading Lag field is highlighted in red on the IDR Monitoring Dashboard</td>
<td><strong>Replication Queue Reading Lag</strong> field that is part of the Active Consumer Replication set. The field highlights if the actual lag time is greater than the time threshold that you set. The default is 15 minutes.</td>
</tr>
</tbody>
</table>

**Note**: You can set colors on fields through personalize list columns (v_idr_dashboard_list.do).

Resolve errors for Instance Data Replication (IDR)

Resolve common errors and issues when completing an IDR.
Role required: idr_admin or admin

Resolving common issues in (IDR)

Before calling ServiceNow customer support, review the checklist for commonly found issues and solutions.
Role required: idr_admin or admin

1. Make sure that the Name, Shared Key, Producer ID, and Producer Set ID are exactly the same on the producer and consumer instances. The names must match.
2. On the producer instance, navigate to **Instance Data Replication > Producer Replication Sets**.
3. Select a producer replication set and make sure that the producer replication set status is Active Replication. If you see the status as In Draft, click **Activate**. Only active producer and consumer replication sets replicate.
4. Optional: On the Consumer Replication Set page, if there are no tables on the Consumer Replication Entries tab, click **Synchronize Replication Configuration**.
5. Confirm that the producer and consumer instances are connected:
   a) On the producer instance, navigate to **Instance Data Replication > Producer replication set**
   b) Select a producer replication set.
   c) Click the **Open Metadata Logs** related link.
   d) See if the Payload Type INIT_TOPIC shows Sent as the status.
If the status is not Sent, the producer instance is not connected to the consumer instances. To learn how to connect the producer and consumer instances, see create a consumer replication step.

e) Repeat the procedure on the consumer instance and see if there are any records where the status of the INIT_TOPIC is Sent.

If the status is not Sent, the consumer instance is not connected to the producer instance. To learn how to connect the consumer instance to the producer instance, see create a consumer replication step.

6. To see if the producer-side and consumer-side replication jobs are running, navigate to Instance Data Replication > Replication Log and check the entries in the Source column.

The entries should have IDRProducerJob and IDRConsumerJob. The Created column specifies when the jobs ran. Make sure that the jobs ran recently.

7. To check for payload errors, on either producer or consumer instance navigate to Instance Data Replication > Replication Payload Error and review the error messages.

Test Instance Data Replication (IDR) connectivity

You can test your IDR instance connectivity, to determine the connectivity of your instance to the message queue.

Role required: admin

1. Navigate to Instance Data Replication > Test Connectivity.
2. Click Test Connectivity.
   
   If you have connectivity, the message or relay test shows how long the successful test took. If you do not have connectivity, the message or relay shows the test results as unsuccessful.

Find Instance Data Replication (IDR) errors

Identify IDR errors by viewing the metadata for messages between producer and consumer instances, payload error logs, and message logs.

Role required: idr_admin or admin

1. View the producer or consumer metadata logs:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Producer</strong></td>
<td>Navigate to Instance Data Replication &gt; Producer Replication Sets, select a producer replication set and click the Open Metadata Logs related link.</td>
</tr>
<tr>
<td><strong>Consumer</strong></td>
<td>Navigate to Instance Data Replication &gt; Consumer Replication Sets, select a consumer replication set and click the Open Metadata Logs link.</td>
</tr>
</tbody>
</table>

2. On either the producer instance or the consumer instance, to view transformation errors and replications that failed to load:
   a) Navigate to Instance Data Replication > Replication Payload Error.

   In this view, if the Source value is Seeding, the error happened during seeding. If the source value is different, the error occurred during a replication set update. If any column breaks during transformation, transformation for the entire table breaks and data is not replicated in the table.

   b) Select an error in the Created column.

   The Error Message field on the Payload Error pane describes the payload error.

3. View the replication log on either the producer instance or the consumer instance:
   a) Navigate to Instance Data Replication > Replication Log.
b) Select an entry.
   The Instance Data Replication Log form shows the message and message level.

**Review synchronization errors in Instance Data Replication (IDR)**

Review the status field to check that synchronizations are done correctly on the consumer instance.

Role required: idr_admin or admin

Complete the tasks in *check for common issues* before identifying synchronization errors.

Synchronization errors occur when a producer instance does not send data or a consumer instance does not receive data. Synchronization errors appear in the **Status** field on the consumer instance as **Replication Error**.

1. Determine if the consumer successfully sent the synchronize request to the producer:
   a) On the consumer instance, navigate to **Instance Data Replication > Consumer Replication Sets**.
   b) Select a consumer replication set.
   c) Click the **Open Metadata Logs** related link.
   d) Sort the logs in a descending order that is based on the sequence that is in the Log Sequence column.
   e) Find the most recent payload with the REPL_SET_DETAIL_REQUEST type.
      If you do not see this payload type, refresh the log until you see REPL_SET_DETAIL_REQUEST.
   f) Verify that you see the correct producer instance ID in the To column.
      If the producer instance ID is incorrect, update the ID and click the **Activate Without Seeding** Related Link.
   g) Verify that you see "Sent" in the Status column.
      If you do not see this status, the producer did not send any updates.

2. Determine if the producer received the synchronize request from the consumer:
   a) On the producer instance, click **Instance Data Replication > Producer Replication Sets**.
   b) Select a producer replication set.
   c) Click the **Open Metadata Logs** related link.
   d) Sort the logs in a descending order that is based on the sequence that is in the Log Sequence column.
   e) Find the most recent payload with the REPL_SET_DETAIL_REQUEST type.
      If you do not see this payload type, refresh the log until you see REPL_SET_DETAIL_REQUEST.
   f) Verify that you see the correct consumer instance ID in the From column.
      If the consumer instance ID is incorrect, update the ID.
   g) Verify that you see "Received" in the Status column.

**Fix seeding errors in Instance Data Replication (IDR)**

You can retry seeding on tables with seeding errors, which occur from errors such as network problems and failed inserts. This alleviates the need to do a full seeding.

Role required: idr_admin or admin

The maximum for a partial reseeding request is 10,000 errors. If you have more errors, perform a **full seeding**.

Do not retry seeding if the errors include any of the following problems:
• Record size exceeds 32 MB.
• Seeding request exceeds 3 million records.
• Replication takes longer than seven days to complete.

**Note:** To fix these problems, reduce the number of tables in the seeding request or reduce the size of the records.

1. On the consumer instance, navigate to **Instance Data Replication > Consumer Replication sets**
2. Select a consumer replication set.

3. On the **Seeding Requests** tab of the Consumer Replication Set pane, click a seeding request that failed.
4. On the Seeding Request pane, click the **Payload Errors** tab and examine the values in the Message column.
5. Click **Retry All Errors** or select specific errors, and then click **Retry Selected Errors**. The image shows areas where you can retry errors.
Seeding Request - Created 2018-11-12 16:13:30 [consumer_seeding view]

- Replication Set: problem-sync-swapnesh
- Producer Name: idrhardenings
- Percent Complete: 93.75%
- Status: Failed

Discover replication delays in Instance Data Replication (IDR)

Monitor possible data replication issues using the IDR Monitoring Dashboard.

Role required: admin

1. To view the time lag on a producer instance, go to Instance Data Replication > Monitoring Dashboard. Check the Active Producer Replication Sets for the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the producer replication set.</td>
</tr>
<tr>
<td>Replication Queue Reading Lag</td>
<td>Time between a record change on the producer instance and the moment it is sent over the outbound replication queue.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

To get additional information, you can also view the producer instance xmlstats
https://<producer-instance-name>/xmlstats.do?include=idr.

xmlstats shows:

- The producer_last_run indicates the last time that the replication job ran on the producer instance.
- The last_message_sent_on indicates the last time that the producer sent updated data to consumers.

**Note:** The timestamps are GMT.

2. To view the time lag on a consumer instance, go to Instance Data Replication > Monitoring Dashboard. Check the Active Consumer Replication Sets for the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the consumer replication set.</td>
</tr>
<tr>
<td>Data Lag</td>
<td>Time between a record change on the producer instance and the moment it is recorded in the consumer instance.</td>
</tr>
<tr>
<td>Network Lag</td>
<td>Time between a record change logs in the outbound replication queue and the moment it is recorded in the consumer instance.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of a replication set, either active or in error.</td>
</tr>
<tr>
<td>Status Message</td>
<td>Message that describes the error status.</td>
</tr>
</tbody>
</table>

To get additional information, you can also view the consumer instance xmlstats
https://<consumer-instance-name>/xmlstats.do?include=idr.
The xmlstats shows:

- The `consumer_last_run` indicates the last time that the consumer job ran and received changes from the producer.
- The `last_heartbeat_received_on` shows the timestamp of when the consumer last received a heartbeat from the producer instance.

**Note:** The timestamps are GMT.

### Verify producer instance is reading from the replication queue in Instance Data Replication (IDR)

You can check that the producer instance is reading from the replication queue in IDR, to determine if there is a problem with your instance replication.

Role required: idr_admin or admin

Perform the steps in ['Check for common issues'](Check for common issues).

1. Get the producer instance’s `queue_reading_lag` from the monitoring dashboard.
2. If `queue_reading_lag` is greater than 0 and the `Producer cursor last updated time` is less than 60 minutes, the producer instance encountered an error.
   
   If there is an error, look in the syslog, replication log, and localhost log for errors that occurred after the most recent `Producer cursor last updated time`.

### Status messages for Instance Data Replication (IDR)

Review these status messages with recovery information so that you can troubleshoot or fix IDR issues.

- All `Producer Replication Sets` have been deactivated due to fatal replication error
  
  All consumer replication sets are moved to the error state. Contact ServiceNow Technical Support.

- Error while seeding data. Please refer to the Replication Payload Error table for details

  On the consumer instance, more than one record failed to seed. To recover, go to the `Replication Payload Error` table to find and fix the error, and then activate the replication set.

- Error while seeding data. Please retry seeding this table

  To recover, reseed the table.

- Producer has encountered an error while seeding
To recover, contact the administrator of the producer instance to determine the cause of the problem.

- **Producer Replication Set configuration has been modified**
  
  To recover, activate the replication set on the consumer instance, either with seeding or without seeding.

- **Producer Replication Set has been deactivated due to replication error**
  
  Contact ServiceNow Technical Support.

- **Producer Replication Set has been deactivated**
  
  To recover, activate the replication set on the consumer instance, either with seeding or without seeding.

- **Producer Replication Set has been deleted**
  
  To recover, delete the consumer replication set.

- **Producer Replication Set is inactive**
  
  To recover, activate the producer replication set, and then activate the consumer replication set.

- **Producer Replication Set not found**
  
  To recover, delete the consumer replication set.

- **Replication Set Paused**
  
  To recover, click **Resume** or **Activate with Seeding**.

- **Replication set was in pause/error/seeding pause state for more than 7 days**
  
  The consumer replication set has been in the pause state, error state, or seeding pause state for more than the timeout period. The replication set is put into the disabled state. To recover, check for seeding errors and activate the replication with seeding.

- **Seeding has been terminated due to timeout**
  
  To recover, retry the seeding request or contact ServiceNow Technical Support.

- **Seeding request for a Producer Replication Set containing more than X number of records is not supported**
  
  To recover, change the filter criteria to reduce the number of records to be seeded. The default limit is 10 million records. Contact ServiceNow Technical Support to change the default limit.

- **Seeding was cancelled by a consumer admin**
  
  To recover, activate the replication set with or without seeding.

- **Seeding was cancelled by a producer admin**
  
  To recover, activate the consumer replication set with or without seeding. Only seeding requests in the queued, paused, or started states can be canceled. In this case, the consumer replication state is Replication Error.

- **Shared key not matching**
  
  The producer and consumer replication sets have different shared keys. To recover, copy the shared encryption key on the producer replication set, paste it into the consumer replication set, and activate the replication set.

**Adapter descriptions for Instance Data Replication (IDR)**

During replication, adapters modify the producer data before inserting the data on consumer instances.

**Adapter fields**

Each adapter has **Name** and **Description** fields. The name appears in the Adapter column. Use the **Description** field to explain the purpose of the data conversion.
Calculation adapter

Use the calculation adapter on the producer data to specify the operation and the value that is used in the operation.

Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
</table>
| **Operation**: Multiply  
**Constant Value**: 1.08 | 10 | 10.80 |
| **Operation**: Max  
**Constant Value**: 1000 | 1020 | 1000 |
| **Operation**: Floor  
**Constant Value**: 0 | 5.5 | 5 |

**Max** specifies the highest and **Min** specifies the lowest possible values. Values above or below those limits are set to those limits. Value types such as int and long have maximum and minimum values. Values above or below those limits cause precision errors.

Concatenate String adapter

Use the concatenate string adapter to append a specified string to the source data.

Parameter example

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>String</strong>: _v2</td>
<td>Patch10236</td>
<td>Patch10236_v2</td>
</tr>
</tbody>
</table>

Fixed-width format adapter

Use the fixed-width format adapter to reformat fixed-width input data. Use # to represent any positive integer, @ to represent any character, and \ as the literal escape character.

Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
</table>
| **Match**: #########  
**Output**: (###) ####-#### | 7605551212 | (760) 555-1212 |
| **Match**: ######  
**Output**: ###.## | 10000 | 100.00 |
| **Match**: ##,###  
**Output**: ###### | 10,000 | 10000 |
Map adapter

Use the map adapter for comma-separated pairs of literals to map source-to-target conversions. Matches must be exact. For example, PRB=TASK would not convert PRB1000 to TASK1000.

Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Map</strong>: PRB=TASK, done=complete</td>
<td>PRB</td>
<td>TASK</td>
</tr>
<tr>
<td><strong>Map</strong>: PRB=TASK, done=complete</td>
<td>done</td>
<td>complete</td>
</tr>
<tr>
<td><strong>Map</strong>: PRB=TASK, done=complete</td>
<td>PRB1000</td>
<td>(no mapping)</td>
</tr>
</tbody>
</table>

Pattern adapter

Use the pattern adapter for regular expressions to identify input patterns. Use parentheses in the **Regex** to identify groups. In **Output Pattern**, use $ to specify groups. $0 represents the entire input, $1 represents the first group, $2 represents the second group, and so on. You can also insert, prefix, and append literal characters, including spaces so they appear in the adapter output.

Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Regex</strong>: (.<em>),(.</em>)</td>
<td>Smith, John</td>
<td>John Smith</td>
</tr>
<tr>
<td><strong>Output pattern</strong>: $2 $1</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Regex</strong>: (ABC[a-zA-z][a-zA-z]) (ABC[a-zA-z][a-zA-z])</td>
<td>ABCDEABCFG</td>
<td>ABCDE ABCDEABCFG</td>
</tr>
<tr>
<td><strong>Output pattern</strong>: $1 $0</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Regex</strong>: (ABC[a-zA-z][a-zA-z]) (ABC[a-zA-z][a-zA-z])</td>
<td>ABCDEABCFG</td>
<td>ABCDE release ABCDEABCFG</td>
</tr>
<tr>
<td><strong>Output pattern</strong>: $1 release $0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In the second example, the match is ABC followed by two letters, followed by ABC and two letters. $1 of this input is ABCDE. $2 of this input is ABCFG. $0 is the entire input string. So $1 $0 is ABCDE ABCDEABCFG.

Replace adapter

Use the replace adapter to replace a specified input string or substring with a specified string. Use $ to replace only some of the occurrences of the string. $1 replaces only the first occurrence; $2 replaces only the second. Use curly braces to replace the first N occurrences. For example, $ (3) replaces the first three occurrences.
Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>

<td><strong>Replace:</strong> Madrid</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Split adapter

Use the split adapter for a specified delimiter, such as a space, to break a string into two or more strings. In **Output Pattern**, use $ to specify groups. $0 represents the entire input, $1 represents the first group, $2 represents the second group, and so on. You can repeat a group in an output pattern, for example, $2, $1, $1. Multiple instances of a delimiter in source data create three or more groups.

Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Delimiter:</strong> “ “</td>
<td>John Smith</td>
<td>Smith, John</td>
</tr>
<tr>
<td><strong>Output Pattern:</strong> $2, $1</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Delimiter:</strong> “ “</td>
<td>John Harry Smith</td>
<td>Harry, John, John</td>
</tr>
<tr>
<td><strong>Output Pattern:</strong> $2, $1, $1</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Delimiter:</strong> “ “</td>
<td>John Harry Smith</td>
<td>Smith</td>
</tr>
<tr>
<td><strong>Output Pattern:</strong> $3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Task number adapter

Use the task number adapter to add a prefix or suffix to a task number or replace the task number's prefix.

Parameter examples

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Modification:</strong> Replace</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Number Prefix:</strong> PRB</td>
<td>PRB80899</td>
<td>STRY80899</td>
</tr>
<tr>
<td><strong>New Number Prefix:</strong> STRY</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Modification:</strong> Add Prefix</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Prefix:</strong> STRY</td>
<td>080999</td>
<td>STRY80899</td>
</tr>
</tbody>
</table>
**Time zone conversion adapter**

Use the time zone conversion adapter to convert one time zone to another.

**Parameter example**

<table>
<thead>
<tr>
<th>Parameter and value</th>
<th>Source data</th>
<th>Adapter output</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output time zone: PDT</td>
<td>07:00:00 am GMT</td>
<td>00:00:00 am PDT</td>
</tr>
</tbody>
</table>

**Instance Data Replication (IDR) and blacklisted tables**

Some tables can't be included in IDR replication sets. Child tables of blacklisted tables are also blacklisted.

**Blacklisted tables**

These tables get blacklisted from IDR:

- Tables with the prefixes `V_PREFIX`, `SYSX_`, `sys`, `ts_`, `ua_`, `usageanalytics_`, `wf_`, `ecc_`, `clone_`, `jrobin_`, `rrd_`, `imp_`, `pf_`, `pfld_`, `idr_`
  - `sys_domain` is an exception.
- Rotated tables, including `syslog`, `sys_querystat`, `ecc_queue`, `ecc_event`, `cmdb_metric`, `sysevent`
- Tables without a `sys_id`
- `sso_federation`
- `saml2_update1_properties`
- `sso_properties`
- `digest_properties`
- `Instance`

**IntegrationHub**

Automate integration tasks using ServiceNow-built components for Flow Designer, or develop custom integrations. Requires a separate subscription.

**Capabilities**

IntegrationHub enables execution of third-party APIs as a part of a flow when a specific event occurs in ServiceNow. These integrations, referred to as *spokes*, are easy to configure and enable you to quickly add powerful actions without the need to write a script. For example, you can post a message and incident details in a Slack channel when a high priority incident is created.

IntegrationHub provides the following functionality:

**Spokes for base system integrations**

Using IntegrationHub actions in Flow Designer, you can:

- Post messages and ServiceNow incident, problem, and change record details to *HipChat*, *Slack spoke*, or *Microsoft Teams spoke* communications channels.
- Synchronize data across multiple production instances using the *eBonding* spoke as an example.
Create custom integrations

Build custom integrations with Action Designer using a REST step or a Script step.

Automate the administration of servers and applications in your network

Use custom actions to delegate Flow Designer processes to a MID Server in your network. For example, actions that use the PowerShell step or REST step.

Connection and Credentials

IntegrationHub takes advantage of aliases to manage connection information and credentials when integrating with external systems. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. IntegrationHub only requires an alias, which then resolves to use the correct credentials and connection information during runtime. Learn more about Introduction to credentials, connections, and aliases.

Benefits

IntegrationHub provides process owners and developers these benefits.

- Consolidates multiple Now Platform automation capabilities into a single environment so process owners and developers can build and visualize business processes and integrations from a single interface.
- Extends Flow Designer content to integrate business processes with external systems.
- Promotes business process automation by enabling subject matter experts to develop and share spokes with flow designers.
- Provides natural-language-descriptions of integration logic to help non-technical users understand triggers, actions, inputs, and outputs.

Development process

When developing a custom integration, develop all actions for the integration within a scoped application. When deployed to a target instance, these actions are grouped as a spoke in Flow Designer. Brand the spoke by adding a custom icon to the application record. To learn more about application development, see Applications.

When developing spokes, flow and action designers typically perform these application development tasks.

1. Create a scoped application on a development instance to build spokes.
2. Publish a test version of the scoped application to the application repository.
3. Deploy the scoped application to a test instance from the application repository.
4. Test the scoped application on the test instance.
5. When working as expected, publish the scoped application in one of the following ways.
   - Publish to the application repository for deployment on production instances.
   - Publish to the ServiceNow Store as an application that customers can request for their environments.
   - Publish to ServiceNow Share to provide content to other customers in the ServiceNow community.

Review Flow Designer design considerations in the Architecture Overview.
Request IntegrationHub

IntegrationHub lets you build reusable integrations with third-party systems and call them from anywhere in the Now Platform®. For example, you can request IntegrationHub to call external systems using integration APIs from the Action Designer Script step, run the Script step on the MID Server, and activate protocol steps like REST, SOAP, and PowerShell.

Flow Designer is a Now Platform feature that enables you to automate processes within a single instance. Without an IntegrationHub subscription, you can use base system actions or steps, including the Script step, to manipulate records, send emails, trigger notifications, and perform operations within the instance. Request IntegrationHub to automate and create integrations with external systems from the Flow Designer interface.

IntegrationHub usage and subscription

Choose an IntegrationHub subscription package to build reusable integrations with third-party systems. Review the usage dashboard to determine the number of transactions used within your current subscription, and to view transaction details.

IntegrationHub usage overview

Navigate to IntegrationHub > IntegrationHub Usage to view the current transaction count for your instance and feature usage.

Request an IntegrationHub plugin

IntegrationHub plugins require a separate subscription and must be activated by ServiceNow personnel.

To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

### Adobe Experience Platform spoke v2

Automate the process of managing datasets and entities in Adobe Experience Platform from your ServiceNow instance.

### Request apps on the Store

Visit the [ServiceNow Store](https://store.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](https://store.servicenow.com/release_notes).

### IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see [Request IntegrationHub](https://store.servicenow.com).

### Supported versions

This spoke was built for Adobe Experience Platform released on September 10, 2019, but may be compatible with later versions.
**Spoke requirements**

- Registered Adobe ID account
- User with developer access
- Details such as API key and client secret

See the *Adobe Experience Platform documentation* for instructions on creating Adobe ID and adding developer.

**Spoke actions**

The Adobe Experience Platform spoke provides actions manage datasets and entities when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dataset Management</td>
<td>Get All Data Inlets</td>
<td>Retrieves the details of all data inlets.</td>
</tr>
<tr>
<td></td>
<td>Get All Datasets</td>
<td>Retrieves the details of all datasets.</td>
</tr>
<tr>
<td></td>
<td>Get All Union Schemas</td>
<td>Retrieves the list of all schemas that are part of unions.</td>
</tr>
<tr>
<td>Entity Management</td>
<td>Get Entity Information</td>
<td>Retrieves the information of an entity as a dynamic object.</td>
</tr>
<tr>
<td></td>
<td>Load Entity Data</td>
<td>Ingest the information of an entity to Adobe Experience Platform.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Metadata For All Attributes In A Schema</td>
<td>Retrieves all attributes for the selected union schema.</td>
</tr>
<tr>
<td></td>
<td>Get All Sandboxes</td>
<td>Retrieves information about all active sandboxes.</td>
</tr>
<tr>
<td></td>
<td>Get Metadata For All Data Inlets</td>
<td>Retrieves the metadata of all data inlets.</td>
</tr>
<tr>
<td></td>
<td>Get Metadata For All Datasets</td>
<td>Retrieves the metadata of all datasets.</td>
</tr>
<tr>
<td></td>
<td>Get Metadata For All Fields In A Union</td>
<td>Retrieves the metadata of all fields in the selected union.</td>
</tr>
<tr>
<td></td>
<td>Get Metadata For All Identity Fields</td>
<td>Retrieves the metadata of all identity fields or namespaces.</td>
</tr>
<tr>
<td></td>
<td>Get Metadata For All Union Schemas</td>
<td>Retrieves the list of all schemas that are part of unions.</td>
</tr>
<tr>
<td></td>
<td>Get Metadata For All Unions</td>
<td>Retrieves the metadata of all union views.</td>
</tr>
<tr>
<td></td>
<td>Get Metadata For Union Schema</td>
<td>Retrieves schema for the selected fields of a union.</td>
</tr>
</tbody>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Note: Two connection and credential alias records are needed for the Adobe Experience Platform spoke; one for data inlet management and batch ingestion, and other for data collection. Each alias should be associated with the respective Adobe Experience Platform API.

Set up Adobe Experience Platform spoke

Integrate your Adobe Experience Platform account with your ServiceNow instance. Create a custom OAuth application in Adobe Experience Platform and authenticate requests from ServiceNow.

- Request IntegrationHub subscription
- Activate Adobe Experience Platform spoke
- Role required: admin

The Adobe Experience Platform spoke can also be set up using the Connection & Credential configuration templates. However, using templates, only one set of alias records can be used at a time.

Attach a Java Key Store certificate to the Adobe Experience Platform spoke

Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the Adobe Experience Platform spoke.

- Valid Java KeyStore certificate
- Role required: admin

1. Navigate to System Definition > Certificates.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, AEP Certificate.</td>
</tr>
<tr>
<td>Expiration notification</td>
<td>Option to send a notification when the certificate is about to expire.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the certificate.</td>
</tr>
<tr>
<td>Format</td>
<td>Certificate format. The instance supports the PEM and DER formats.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of certificate. Select Java Key Store.</td>
</tr>
<tr>
<td>Valid from</td>
<td>Date from which the certificate is valid.</td>
</tr>
<tr>
<td>Expires</td>
<td>Date on which the certificate expires.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Number of days until the certificate expires.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Key store password</td>
<td>Password associated with the certificate.</td>
</tr>
<tr>
<td>Short description</td>
<td>Summary about the certificate.</td>
</tr>
<tr>
<td>PEM Certificate</td>
<td>Contents of the X509 certificate.</td>
</tr>
</tbody>
</table>

4. Click the attachments icon (_attach) and attach a JKS certificate.

5. Click Validate Stores/Certificates.

The JKS certificate is created and attached to the Adobe Experience Platform spoke.

Create a JWT signing key for the Adobe Experience Platform spoke
Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

Role required: admin

1. Navigate to System OAuth > JWT Keys.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>JWT Keys form fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the JWT signing key. For example, AEP JWT Keys.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Valid JKS certificate attached in the previous task. For example, AEP Certificate.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Key ID to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Adobe Experience Platform spoke.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Algorithm to sign with the JWT key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Password associated with the signing key.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the certificate.</td>
</tr>
</tbody>
</table>

4. Click Submit.

The JWT key is created and assigned to the JKS certificate.

Create a JWT provider for the Adobe Experience Platform spoke
Add a JSON Web Token (JWT) provider to your ServiceNow instance.

Role required: admin

1. Navigate to System OAuth > JWT Providers.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>JWT Provider form fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the JWT provider. For example, AEP JWT Provider.</td>
</tr>
</tbody>
</table>
4. Right-click the form header, and click Save. The Standard Claims and Custom Claims related lists are displayed.

5. Enter values for iss, sub, and aud in the Standard Claims related list. See the Adobe Experience Platform documentation for instructions.

6. Enter these values in the Custom Claims related list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim Name</td>
<td><a href="https://ims-na1.adobelogin.com/s/entdataservices_sdk">https://ims-na1.adobelogin.com/s/entdataservices_sdk</a></td>
</tr>
<tr>
<td>Claim Value Type</td>
<td>true</td>
</tr>
<tr>
<td>Claim Value</td>
<td>true</td>
</tr>
</tbody>
</table>

7. Click Update.

The JWT provider is added to your ServiceNow instance.

Register Adobe Experience Platform as OAuth Provider
Use the information generated during Adobe ID account creation and configuration to register Adobe Experience Platform as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to System OAuth > Application Registry.

2. Click New.
The system displays the message What kind of OAuth application?

3. Select Connect to a third party OAuth Provider.
The system displays a blank Application Registries form.

4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter AEP OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Consumer key you generated during the Adobe ID account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Consumer secret you generated during the Adobe ID account configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthUtilAEP.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select JWT Bearer.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Note: You can use only Authorization Code as the Default Grant type when PKCE is enabled.</td>
<td></td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Adobe Experience Platform.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>This field should be left blank.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   - The system validates the OAuth credentials and populates the Redirect URL.
   - The system populates OAuth Entity Profile with Grant Type as JWT Bearer. For example, OAuth Entity Profile is created with default Name, AEP default_profile

6. Open the record of OAuth Entity Profile.
7. Select the JWT Provider record for JWT Provider. For example, AEP JWT Provider.
8. Click Update.

The instance can request OAuth 2.0 tokens for the spoke.

**Note:** When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

*Create Credential records for the Adobe Experience Platform*

Create Credential records to the Adobe ID account you created. The Adobe Experience Platform spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin

You must create two credential records; one for data inlet management and batch ingestion, and other for data collection.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   - The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   - The pop-up window displays a blank OAuth 2.0 Credentials form.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter AEP for data inlet management and batch ingestion, and AEP_Ingestion for data collection.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile you created when you registered the Salesforce connected app as an OAuth provider. For example, select AEP_OAuth_default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>This field isn't applicable.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. Click the **Get OAuth Token** related link to generate the OAuth token.

The credential records for the Adobe Experience Platform spoke is created.

*Create Connection records for the Adobe Experience Platform spoke*

Create Connection records to your Adobe ID account. The Adobe Experience Platform spoke connection and credential alias uses these connections to perform actions in Adobe Experience Platform.

Role required: admin

Two connection and credential alias records are available by default; one for data inlet management and batch ingestion, and other for data collection. Perform these steps to associate each alias with the respective Adobe Experience Platform API.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the required Adobe Experience Platform spoke record.

   **Note**: There are two connection and credential records; AEP and AEP_Ingestion. The AEP record is for data inlet management and batch ingestion, and AEP_Ingestion is for data collection.

3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter AEP Platform for data inlet management and batch ingestion, and AEP dcs for data collection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Adobe Experience Platform. For example, select AEP and AEP_Ingestion.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note</strong>: Do not select the check box.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Adobe Experience Platform.</td>
</tr>
<tr>
<td></td>
<td>• If the connection record is for data inlet management and batch ingestion, enter <a href="https://platform.adobe.io/">https://platform.adobe.io/</a>.</td>
</tr>
<tr>
<td></td>
<td>• If the connection record is for data collection, enter <a href="https://dcs.adobedc.net">https://dcs.adobedc.net</a>.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>This field isn't applicable.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. In the **Attributes** tab enter these values.

   • Internal name of the sandbox in **Sandbox**.

   **Note:** Ensure that you provide the internal name of the required sandbox and not its label in **Sandbox**. To obtain the internal name of the required sandbox, use the Get All Sandboxes action.

   • If the connection record is for data inlet management and batch ingestion, enter **API Key** and **Organization ID**.

   • If the connection record is for streaming ingestion, enter **Organization ID**.

6. Right-click the form header and click **Save**.

The Adobe Experience Platform spoke is set up and integrated with the ServiceNow instance.

**Adobe Sign spoke v1.1.1**

Automate the process of sending a legal document to an individual or list of recipients for digital signature using Adobe Sign. For example, automate employee onboarding and offboarding, or sending non-disclosure agreements, legal agreements, and statements of work for digital signature. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see **Request IntegrationHub**.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Compatible versions**

This spoke was built for Adobe Sign API version v6, but may be compatible with later versions.

**Key features**

Adobe Sign spoke enables a flow designer to:

- Automate the process of sending a legal document to an individual or list of recipients for digital signature.
- Copy and customize sample flows for sending transient documents or Adobe Sign library documents for digital signature.
- Discover and synchronize the Adobe Sign documents.
- Pause a flow until an agreement or document is signed. A scripted REST API webhook waits for the recipient to sign the document.
- Use values from a signed document in a flow.
- Manage the life cycle of documents in Adobe Sign from the ServiceNow instance.

**Spoke requirements**

- Adobe Sign account
- Adobe Sign account admin credentials to perform the required account specific tasks in Adobe Sign
- Adobe Sign group admin credentials to perform the required group specific tasks in Adobe Sign

**Note:** Account admin or group admin can add users to the groups. These users can access information specific to their group only.

- Adobe Sign application configured to integrate with ServiceNow
- Adobe Sign application details such as application ID and client secret.
- ServiceNow admin credentials to create and synchronise the required Adobe Sign groups with ServiceNow

**Note:**

- This is the default admin role that is created when the Adobe Sign spoke is activated.
- ServiceNow admin has access to information about all Adobe Sign groups synchronized with ServiceNow and all tables part of the Adobe Sign spoke.
- User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. Group users have access to information specific to their Adobe Sign groups only and can view only the group-specific data from the tables that are part of the Adobe Sign spoke.

- IntegrationHub subscription

See the Adobe Sign development documentation for instructions on creating and configuring custom applications.
Spoke flows

The Adobe Sign spoke provides sample flows to demonstrate automating the Adobe Sign tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adobe Sign - Send NDA Demo</td>
<td>Sends a statement of work for digital signature using a Adobe Sign library document when a Service Catalog request is created by the Adobe Sign - Statement of Work Demo item. Before using this flow, activate the Adobe Sign - Statement of Work Demo catalog item.</td>
</tr>
<tr>
<td>Adobe Sign - Statement of Work Demo</td>
<td>Sends a non-disclosure agreement for digital signature using a Adobe Sign library document when a Service Catalog request is created by the Adobe Sign - Statement of Work Demo item. Before using this flow, activate the Adobe Sign - Statement of Work Demo catalog item.</td>
</tr>
</tbody>
</table>

The Adobe Sign spoke adds catalog items for use with the Adobe Sign spoke sample flows. Before triggering an Adobe Sign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adobe Sign - Send NDA Demo</td>
<td>Sends a non-disclosure agreement for digital signature using a Adobe Sign library document.</td>
</tr>
</tbody>
</table>

Spoke subflows

The Adobe Sign spoke provides a sample subflow to demonstrate automating Adobe Sign tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Get Documents Per Group. The subflow retrieves documents relevant to an Adobe Sign group and stores them in the AdobeSign Documents table.

Spoke actions

The Adobe Sign spoke provides actions to automate Adobe Sign tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Management</td>
<td>Attach Adobe Sign Document To Agreement Record</td>
<td>Downloads an Adobe Sign document and attaches it to the relevant ServiceNow agreement record.</td>
</tr>
<tr>
<td></td>
<td>Convert Transient to Library Document</td>
<td>Converts a transient document to a library document. Ensures that the document is available in the library for more than the stipulated transient 7-day purging period.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Get Library Documents</td>
<td>Get Library Documents</td>
<td>Discovers the documents and document templates from Adobe Sign. Populates ServiceNow tables with the document names and descriptions.</td>
</tr>
<tr>
<td></td>
<td>Get Form Field Value From An Agreement</td>
<td>Retrieves value of the required field from an existing agreement in Adobe Sign.</td>
</tr>
<tr>
<td></td>
<td>Get Signing URL</td>
<td>Creates an embedded signing URL for in-person signing.</td>
</tr>
<tr>
<td></td>
<td>Cancel Agreement</td>
<td>Cancels an agreement that has been sent for signature.</td>
</tr>
<tr>
<td></td>
<td>Wait For Signature From Adobe Sign</td>
<td>Waits for the Adobe Sign webhook until the participant has either signed or rejected the document. Updates the status in the ServiceNow Agreement table.</td>
</tr>
<tr>
<td></td>
<td>Send Agreement</td>
<td>Sends document for signature to one or more participants.</td>
</tr>
<tr>
<td>Signature Management</td>
<td>Add Participant to Agreement</td>
<td>Builds a participant list iteratively over time and adds a participants to the local ServiceNow agreement record.</td>
</tr>
<tr>
<td></td>
<td>Check Agreement Status</td>
<td>Retrieves the status of an agreement.</td>
</tr>
<tr>
<td></td>
<td>Create Draft Agreement</td>
<td>Creates an agreement in the draft state in Adobe Sign and draft record in the ServiceNow Agreement table.</td>
</tr>
<tr>
<td></td>
<td>Finalize Draft and Send Agreement</td>
<td>Sends a draft agreement to the participant list for signature.</td>
</tr>
<tr>
<td></td>
<td>Get Form Field Value From An Agreement</td>
<td>Retrieves value of the required field from an existing agreement in Adobe Sign.</td>
</tr>
<tr>
<td></td>
<td>Get Signing URL</td>
<td>Creates an embedded signing URL for in-person signing.</td>
</tr>
<tr>
<td>User Management</td>
<td>Activate A User</td>
<td>Activates an existing user in Adobe Sign.</td>
</tr>
<tr>
<td></td>
<td>Send Agreement</td>
<td>Sends document for signature to one or more participants.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Deactivate A User</td>
<td>Deactivates an existing user in Adobe Sign.</td>
</tr>
<tr>
<td></td>
<td>Lookup User ID by Email</td>
<td>Retrieves the user ID of an existing user in Adobe Sign.</td>
</tr>
<tr>
<td>Webhook Management</td>
<td>Create Webhook</td>
<td>Creates a webhook to notify the signing events in Adobe Sign.</td>
</tr>
<tr>
<td></td>
<td>Remove Webhook</td>
<td>Removes a webhook from Adobe Sign.</td>
</tr>
</tbody>
</table>

**Spoke module**

The Adobe Sign spoke adds an Adobe Sign module to your ServiceNow instance. The Adobe Sign spoke synchronizes and stores information about groups, documents, and agreements in ServiceNow. The Adobe Sign spoke includes the following tables.  

- Agreements [sn_adobesign_spoke_agreement]
- Documents [sn_adobesign_spoke_adobe_sign_documents]
- Groups [sn_adobesign_spoke_adobesign_group_details]
- Client Details [sn_adobesign_spoke_client_details]

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Fields</th>
</tr>
</thead>
</table>
| Agreements     | Adobe Sign agreements from the synchronized Adobe Sign groups and accounts. Records in the Agreements table are updated with the signing status only when webhook is configured for the Adobe Sign account. | • Name  
• Agreement ID  
• Declined Reason  
• Status  
• Participants Info  
• Form Fields Info  
• Next Signer  
• Group Name |
| Documents      | Adobe Sign documents from the synchronized Adobe Sign groups and accounts. To synchronize accounts, see [Synchronize Adobe Sign with ServiceNow](https://www.servicenow.com). The Get Documents Per Group subflow retrieves a list of documents in each Adobe Sign group. |
| Note: Access to the documents is based on the group user roles. |
• Document ID  
• Document Owner  
• Document Last Modified  
• Group  
• Document Name  
• Document Type |
<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Groups</td>
<td>Adobe Sign groups that are synchronized with ServiceNow. Administrator creates groups in the ServiceNow instance and provides the required details to synchronize with Adobe Sign.</td>
<td>• Group Name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Group ID</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Connection Alias</td>
</tr>
<tr>
<td>Client Details</td>
<td>Credentials of the Adobe Sign groups that are synchronized with ServiceNow.</td>
<td>• Name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Authentication Key</td>
</tr>
</tbody>
</table>

**Groups and user roles**

Create a group in your ServiceNow instance to synchronize the group with the corresponding group in Adobe Sign. User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. For example, a HR group user role, sn_adobesign_spoke.HR, is created when the HR group is created in ServiceNow. ServiceNow admin can assign these group user roles to users and control access to the group-specific information such as:

- Documents and agreements
- Connection and credential aliases
- Credential records
- Application registries
- Data in tables of the Adobe Sign spoke

To run flows and subflows, group users must also have these roles:

- connection_admin
- credential_admin
- flow_designer
- oauth_admin
- script_debugger
- view_changer

Only ServiceNow admin has access to information about all Adobe Sign groups that are synchronised with the ServiceNow instance.

**Adobe Sign account requirements**

The Adobe Sign spoke requires creating a custom app on your Adobe Sign account to generate OAuth 2.0 tokens.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Note: A connection and credential alias is specific to a group in Adobe Sign.

A sample connection and credential alias is provided for demonstration purpose. ServiceNow admin must create an alias for each Adobe Sign group to synchronize that group with the ServiceNow instance. For example, you can have different connection and credential alias records one for each BU in your organization such as HR, Legal, Finance and so on.

Synchronize Adobe Sign group with ServiceNow

Synchronize ServiceNow with the required group in Adobe Sign to access the group specific documents, and agreements from the Adobe Sign spoke.

• Request IntegrationHub subscription
• Activate the Adobe Sign spoke
• Role required: admin

These steps are performed to synchronize only one Adobe Sign group. To synchronize another Adobe Sign group, repeat this process.

Create custom OAuth application in Adobe Sign account

Create a custom OAuth application from your Adobe Sign account to enable OAuth 2.0 authentication with the Adobe Sign spoke.

• Adobe Sign account
• Adobe Sign admin credentials

Complete these steps from your Adobe Sign account. See the Adobe Sign development documentation for instructions on creating and configuring custom applications.

1. From your Adobe Sign account, create an application.
2. Copy and record the Application ID and Application Secret for later use. These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

The custom OAuth application from your Adobe Sign account is created and can be integrated with the ServiceNow instance.

Configure webhook in Adobe Sign application

Configure the webhook in your Adobe Sign application to enable Adobe Sign to send data to ServiceNow when a participant signs an agreement or document.

Role required: admin

If the scope of the Adobe Sign application is Account, use the same webhook for all the groups defined within the account scope. If the scope of the Adobe Sign application is Group, you must configure for each group.

1. Navigate to System Web Services > Scripted REST APIs.
2. Open the Adobe Sign record.
3. Copy and record the Base API path.
4. From your Adobe Sign account, create a webhook with these configurations.
   a) Enter the target URL in URL in this format: https://<instance-name>.service-now.com/ <Base-API-path>.
b) Enter Agreement all events in Events.
c) Select all the required agreement events in Notification Parameters.
See the Adobe Sign development documentation for more information about creating webhooks in your Adobe Sign account.

Webhook is created in your Adobe Sign account and signing events in Adobe Sign are updated in the tables of the Adobe Sign spoke.

Register Adobe Sign as OAuth provider
Use the information generated during Adobe Sign account configuration to register Adobe Sign as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to System OAuth > Application Registry.
2. Click New.
The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Adobe Sign OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during the Adobe Sign account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Application Secret created during the Adobe Sign account configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

Note: You can use only Authorization Code as the Default Grant type when PKCE is enabled.

<table>
<thead>
<tr>
<th>Application</th>
<th>Application scope that contains this record. Select Adobe Sign Spoke.</th>
</tr>
</thead>
</table>

Note: You must ensure that the application scope is Adobe Sign Spoke.

Accessible from          | Application scope that this registry is accessible from.                      |
Active                   | Option to actively use the application registry.                              |
**Field** | **Value required**
--- | ---
Token Revocation URL | OAuth server token revocation endpoint.
Redirect URL | OAuth callback endpoint. System generates the URL upon saving the application registry.
Use mutual authentication | Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.

5. Insert records for group scope modifiers in the OAuth Entity Scopes related list in this format, `<scope>:<modifier>`. For example, if the user_read scope for the Group modifier is enabled in the Adobe Sign application, insert the following record in the OAuth Entity Scopes related list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_read:group</td>
<td>user_read:group</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials and populates the **Redirect URL**.

7. Copy and record the **Redirect URL**.

8. Login to your Adobe Sign account and edit the configuration of your custom Adobe Sign application. See the Adobe Sign development documentation for instructions.

The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

**Create Credential records for the Adobe Sign spoke**

Authorize the Adobe Sign spoke actions by creating credential records for the application registered in Adobe Sign. The Adobe Sign spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Adobe Sign Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Adobe Sign spoke as an OAuth provider. For example, select Adobe Sign OAuth profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.

6. To generate the OAuth token, click the Get OAuth Token related link.

The credential record for the Adobe Sign spoke is created.

Create Connection and Credential Alias for Adobe Sign group
Manage connection and credential information of an Adobe Sign group to authorize the group-specific actions by creating connection and credential alias for the Adobe Sign group.

Role required: admin

A sample connection and credential alias is provided for demonstration purpose. If you are using the sample alias, it is not necessary to create a connection and credential alias. However, admin must create an alias for every other Adobe Sign group to synchronize that group with the ServiceNow instance.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Click New.
3. On the form, fill in the fields.

Connection & Credential Aliases form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the alias. For example, AdobeSign_Legal.</td>
</tr>
<tr>
<td>ID</td>
<td>System generated unique ID.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Adobe Sign Spoke.</td>
</tr>
<tr>
<td>Type</td>
<td>Alias type. Select Connection and Credential.</td>
</tr>
<tr>
<td>Connection type</td>
<td>Connection type. Select HTTP.</td>
</tr>
<tr>
<td>Support Multiple Active Connections</td>
<td>Option to specify if the alias supports multiple active connections.</td>
</tr>
</tbody>
</table>

4. Click Save.

The connection and credential alias is created for the Adobe Sign group and the group can be synchronised with the ServiceNow instance.

Create Connection record and Connection Attributes for the Adobe Sign spoke
Perform actions in Adobe Sign by creating connection records and connection attributes for your Adobe Sign group. The Adobe Sign spoke connection and credential alias uses these connections to perform actions on Adobe Sign.
Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Adobe Sign.
3. In the Connections related list, click New.
4. On the form, fill in the fields.

HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Adobe Sign Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Adobe Sign spoke. For example, Adobe Sign Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL. For example, <a href="https://api.eu1.echosign.com/">https://api.eu1.echosign.com/</a>.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click Submit.
6. In the Connections Attributes related list, click New.
7. On the form, fill in the fields.

Connection Attributes form

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Connection attribute type. Select String.</td>
</tr>
<tr>
<td>Label</td>
<td>Name to identify the connection attribute. Enter Version.</td>
</tr>
<tr>
<td>Column name</td>
<td>System generated value that is based on the value entered in Label.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection attribute.</td>
</tr>
<tr>
<td>Read only</td>
<td>Option to disable modifications to the connection attribute. Enter false.</td>
</tr>
</tbody>
</table>

| Default value | Default value of the connection attribute. Enter v6. |
8. Click Submit.

The connection record and connection attribute is created for the connection and credential alias.

Configure Application Access to ServiceNow tables

Allow Adobe Sign spoke to create group admin user role when an Adobe Sign group is synchronized with ServiceNow tables by configuring the application access of the required ServiceNow tables.

Role required: admin

1. Navigate to System Definition > Tables.

2. For each of the following tables, ensure that the Can read, Can create, and Can update options are selected in the Application Access related list.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Role</td>
<td>sys_user_role</td>
</tr>
<tr>
<td>Access Control</td>
<td>sys_security_acl</td>
</tr>
<tr>
<td>Access Roles</td>
<td>sys_security_acl_role</td>
</tr>
<tr>
<td>Application Menu</td>
<td>sys_app_application</td>
</tr>
<tr>
<td>Module</td>
<td>sys_app_module</td>
</tr>
</tbody>
</table>

3. Click Update.

Application access of the required ServiceNow tables is configured.

Create Adobe Sign group in ServiceNow

Synchronize ServiceNow with the required group in Adobe Sign by creating a record in the AdobeSign Group Details [sn_adobesign_spoke_adobesign_group_details] table.

Role required: admin

1. Navigate to Adobe Sign Spoke > Groups.

2. Click New.

3. On the form, fill in the fields.

AdobeSign Group Details form

<table>
<thead>
<tr>
<th>Group Name</th>
<th>Name to uniquely identify the Adobe Sign group. For example, Legal.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>Unique ID associated with the record.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Connection alias created to synchronize the Adobe Sign group with ServiceNow.</td>
</tr>
</tbody>
</table>

The required Adobe Sign group is created in ServiceNow and can be managed from the Adobe Sign spoke.

User role specific to the group is created in ServiceNow, when the group is created in the ServiceNow instance. For example, a HR group user role, sn_adobesign_spoke.HR, is created when the HR group is created in ServiceNow. ServiceNow admin can assign these group user roles to users and control access to the group-specific information such as:

- Documents and agreements
- Connection and credential aliases
- Credential records
- Application registries
- Data in tables of the Adobe Sign spoke

© 2020 ServiceNow, Inc. All rights reserved.

1063
To run flows and subflows, group users must also have these roles:

- connection_admin
- credential_admin
- flow_designer
- oauth_admin
- script_debugger
- view_changer

Only ServiceNow admin has access to information about all Adobe Sign groups that are synchronised with the ServiceNow instance.

**Synchronize documents in Adobe Sign group with ServiceNow**

Synchronize ServiceNow with the required group in Adobe Sign to access the documents and agreements that are specific to the group, from the Adobe Sign spoke.

Role required: admin

Ensure that the groups are setup and configured with their respective connection and credential aliases before synchronizing the group documents.

1. Navigate to **Adobe Sign Spoke > Documents**.
   

2. Click the Get Documents related list.

   ![Note]
   
   **Note:**
   
   - If you have logged in as an admin, you can synchronize the documents of all Adobe Sign groups.
   - If you have logged in as a group admin, you can synchronize only those documents that are specific to your Adobe Sign groups.

Details of all documents specific to the required Adobe Sign groups are synchronized with ServiceNow.

**Activate Adobe Sign spoke catalog items**

Trigger events in Adobe Sign when an item is requested in Service Catalog. For example, the Adobe Sign - Statement of Work Demo catalog item triggers a sample flow that sends a Adobe Sign document to a designated recipient.

- **Synchronize Adobe Sign group with ServiceNow**
- **Role required:** admin

The Adobe Sign spoke adds catalog items for use with the Adobe Sign spoke sample flows. Before triggering a sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adobe Sign - Send NDA Demo</td>
<td>Sends a non-disclosure agreement for digital signature using a Adobe Sign library document.</td>
</tr>
</tbody>
</table>

1. Navigate to **Self-Service > Service Catalog**.
2. Click the add content icon

3. Search for and select **Adobe Sign - Statement of Work Demo**.
4. Click Add here.
5. Search for and select Adobe Sign - Send NDA Demo.
6. Click Add here.

When one of these items is requested in the Service Catalog, the associated Adobe Sign spoke sample flow is triggered and necessary actions are performed in Adobe Sign.

**Ansible spoke**

Integrate your ServiceNow instance with Ansible Tower. Automate Ansible Tower tasks when events occur in ServiceNow.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

**Supported version**

This spoke was built for Ansible Tower v2, but may be compatible with later versions.

**Spoke requirements**

- Ansible Tower
- Ansible Tower administrator credentials to create a custom application
- Application information such as Client ID and Client Secret

**Spoke actions**

The Ansible spoke provides actions to automate Ansible Tower tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ansible Tower</td>
<td>Cancel Job</td>
<td>Cancels the required job in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Create Job Template</td>
<td>Creates a job template in Ansible Tower.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a user in the Ansible Tower environment.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the required user in the Ansible Tower environment.</td>
</tr>
</tbody>
</table>
## Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

## Set up the Ansible spoke

Integrate the instance and Ansible Tower by creating a custom OAuth application to authenticate ServiceNow requests.

### Table of Actions and Descriptions

| Category               | Action                                 | Description                                                                 |
|------------------------|----------------------------------------|                                                                            |
|                        | Get Job                                | Retrieves details of the required job in the Ansible Tower environment.    |
|                        | Get Status From Ad-Hoc Command         | Retrieves the run status of an ad-hoc command.                            |
|                        | Get User                               | Retrieves details of the required user in the Ansible Tower environment.  |
|                        | Launch Job Template                    | Launches a job templates in the Ansible Tower environment.                |
|                        | List Hosts From Inventory              | Retrieves list of hosts from an inventory in the Ansible Tower environment.|
|                        | List Instance Groups From Inventory    | Retrieves list of instance groups from an inventory in the Ansible Tower environment.|
|                        | List Job Templates                     | Retrieves the list of job templates.                                      |
|                        | List Jobs                              | Retrieves the list of jobs.                                               |
|                        | List Users                             | Retrieves the list of users.                                              |
|                        | Relaunch Job                           | Relaunches job in the Ansible Tower environment.                          |
|                        | Run An Ad-Hoc Command                  | Runs an ad hoc command on one or more target devices.                     |
|                        | Schedule Job                           | Schedules a job in the Ansible Tower environment.                         |

Create a custom application in Ansible Tower

Obtain OAuth 2 token by creating a custom application in Ansible Tower.

Role required: admin

1. Create an application in Ansible Tower. See Ansible documentation for information on creating and configuring an application.
   a) Select Authorization code for Authorization Grant Type.
   b) Specify the ServiceNow instance URL in Redirect URI in this format, https://<instance-name>.service-now.com/api/sn_ansible_spoke/ansible_oauth_redirect. For more information on obtaining the Redirect URI, see Register Ansible Tower as OAuth provider.

2. Upon creating the application, access the application information.
3. Copy and record the Client ID and Client Secret for later use. These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

The custom OAuth application from your Ansible Tower is created and can be integrated with the ServiceNow instance.

Register Ansible Tower as OAuth provider

Use the information generated during Ansible Tower application configuration to register Ansible Tower as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to System OAuth > Application Registry.
2. Open for the record for Ansible.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Ansible Tower OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the application in Ansible Tower.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret of the application in Ansible Tower.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

Note: You can use only Authorization Code as the Default Grant type when PKCE is enabled.

Application scope that contains this record. Select Ansible Tower Spoke.
4. Right-click the form header, and click Save.
5. Paste the Redirect URL value into the Redirect URI for your custom Ansible Tower application. For example, paste https://<instance-name>.service-now.com/api/sn_ansible_spoke/ansible_oauth_redirect.

The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

Create Credential record for the Ansible spoke
Create Credential records for your application in Ansible Tower. The Ansible spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for Ansible.
3. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?.
4. Select OAuth 2.0 Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Ansible Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Ansible spoke as an OAuth provider. For example, select Ansible OAuth profile.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click Save.
7. To generate the OAuth token, click the Get OAuth Token related link.
The credential record the Ansible spoke is created.

Create Connection record for the Ansible spoke
Create Connection record for your application in Ansible Tower. The Ansible spoke connection and credential alias uses these connections to perform actions in Ansible Tower.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for Ansible.
3. From the Connections tab, click New.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Ansible Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Ansible Tower. For example, select Ansible Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the Ansible Tower instance.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Amazon DynamoDB spoke
Manage streams, tables, and tags in your Amazon DynamoDB database from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

This spoke was built for API version 2012-08-10, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon DynamoDB.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke actions

The Amazon DynamoDB spoke provides actions to automate Amazon DynamoDB tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stream Management</td>
<td>Disable Stream</td>
<td>Disables the stream for the specified table.</td>
</tr>
<tr>
<td></td>
<td>Enable Stream</td>
<td>Enables the stream for the specified table.</td>
</tr>
<tr>
<td></td>
<td>Get Shard Iterator</td>
<td>Returns a shard iterator. Use the shard iterator in a subsequent Get Records request to read the stream records from the shard.</td>
</tr>
<tr>
<td></td>
<td>Get Stream</td>
<td>Returns information about the specified stream.</td>
</tr>
<tr>
<td></td>
<td>Look up Records</td>
<td>Retrieves the stream records from a given shard.</td>
</tr>
<tr>
<td></td>
<td>Look up Streams</td>
<td>Returns the list of all the streams associated with the current account.</td>
</tr>
<tr>
<td>Table Management</td>
<td>Create Backup</td>
<td>Creates a backup for an existing table.</td>
</tr>
<tr>
<td></td>
<td>Create Table</td>
<td>Creates a table in the account.</td>
</tr>
<tr>
<td></td>
<td>Delete Backup</td>
<td>Deletes an existing backup of a table.</td>
</tr>
<tr>
<td></td>
<td>Delete Table</td>
<td>Deletes the specified table.</td>
</tr>
<tr>
<td></td>
<td>Get Backup</td>
<td>Retrieves the details of an existing backup.</td>
</tr>
<tr>
<td></td>
<td>Get Continuous Backup</td>
<td>Retrieves the status of continuous backups and point in time recovery of the specified table.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Table</td>
<td>Retrieves information about the table.</td>
</tr>
<tr>
<td></td>
<td>Look up Backups</td>
<td>Retrieves the list of all the backups associated with the account or backups of the specified table.</td>
</tr>
<tr>
<td></td>
<td>Look up Tables</td>
<td>Retrieves the list of table names.</td>
</tr>
<tr>
<td></td>
<td>Restore Table From Backup</td>
<td>Creates a table from an existing backup.</td>
</tr>
<tr>
<td></td>
<td>Restore Table To Point In Time</td>
<td>Restores the specified table to the specified point in time within Earliest Restorable Date Time and Latest Restorable Date Time.</td>
</tr>
<tr>
<td></td>
<td>Update Continuous Backup</td>
<td>Enables or disables point in time recovery for the specified table.</td>
</tr>
<tr>
<td></td>
<td>Update Table</td>
<td>Updates the specified table.</td>
</tr>
<tr>
<td>Tag Management</td>
<td>Add Tags To DynamoDB Resource</td>
<td>Adds tags to DynamoDB resource.</td>
</tr>
<tr>
<td></td>
<td>Look up Tags Of DynamoDB Resource</td>
<td>Lists the tags of the DynamoDB resource.</td>
</tr>
<tr>
<td></td>
<td>Remove Tags From DynamoDB Resource</td>
<td>Removes the tags from the DynamoDB resource.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Note:** Two Credential aliases are available for the Amazon DynamoDB spoke.

**Set up the Amazon DynamoDB spoke**

Integrate the ServiceNow instance and Amazon DynamoDB account using AWS credential to authenticate ServiceNow requests.
- Request an IntegrationHub subscription
- Activate the Amazon DynamoDB spoke
- Role required: admin

*Create Credential records for the Amazon DynamoDB spoke*

Create two Credential records for your Amazon DynamoDB account. The Amazon DynamoDB spoke connection and credential alias uses these credential records to perform actions in your Amazon DynamoDB account.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Amazon DynamoDB.
3. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Amazon DynamoDB Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon DynamoDB.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon DynamoDB.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated Amazon DynamoDB credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select Amazon DynamoDB.</td>
</tr>
</tbody>
</table>

Note: Users are cautioned against directly modifying the default authentication algorithm.

6. Click Submit.

8. Open for the record for Amazon DynamoDB Streams.

9. From the Credentials tab, click New.
   
   The system displays the message *What type of Credentials would you like to create?*. 

10. Select AWS Credentials.

11. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Amazon DynamoDB Streams Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon DynamoDB.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon DynamoDB.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated Amazon DynamoDB Streams credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select Amazon DynamoDB Streams.</td>
</tr>
</tbody>
</table>

Note: Users are cautioned against directly modifying the default authentication algorithm.

12. Click Submit.
Amazon Cloudwatch spoke

Integrate ServiceNow instance with Amazon Cloudwatch. Manage and monitor your Amazon Web Services (AWS) resources and applications from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Amazon Cloudwatch version 2010-08-01, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon Cloudwatch account.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Amazon Cloudwatch Spoke provides actions to automate Amazon Web Services (AWS) resource and application monitoring tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm Management</td>
<td>Create Composite Alarm</td>
<td>Creates a composite alarm.</td>
</tr>
<tr>
<td></td>
<td>Delete Composite Alarm</td>
<td>Deletes the specified alarms.</td>
</tr>
<tr>
<td></td>
<td>Look Up Alarm</td>
<td>Retrieves a list of specified alarms.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Set Alarm State</td>
<td>Assigns a temporary state to an alarm for testing.</td>
</tr>
<tr>
<td>Anomaly Management</td>
<td>Create Anomaly Detector</td>
<td>Creates an anomaly detection model for a CloudWatch metric.</td>
</tr>
<tr>
<td></td>
<td>Delete Anomaly Detector</td>
<td>Deletes the specified anomaly detection model from an account.</td>
</tr>
<tr>
<td>Metric Management</td>
<td>Delete Metric Alarm</td>
<td>Deletes the specified alarms.</td>
</tr>
<tr>
<td></td>
<td>Look up Metric Data</td>
<td>Retrieves different metrics in a single request.</td>
</tr>
<tr>
<td></td>
<td>Upsert Metrics Alarm</td>
<td>Create a new alarm or updates an alarm and associates the alarm with the specified metric, metric math expression, or an anomaly detection model.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the Amazon Cloudwatch spoke**

Integrate the ServiceNow instance and Amazon Cloudwatch by using the AWS credentials to authenticate ServiceNow requests.

- Request an IntegrationHub subscription.
- Activate Amazon Cloudwatch spoke.
- Role required: admin

*Create a credential record for the Amazon Cloudwatch spoke*

Create a credential record for the Amazon Cloudwatch account. The Amazon Cloudwatch Spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials**.
2. Click **New**.
   
   The system displays this message: *What type of Credentials would you like to create?*
3. Select **AWS Credentials**.
4. On the form, fill these values.

**AWS Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Amazon CloudWatch Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of your AWS account. Secret Access Key of the user with full access to Amazon Cloudwatch.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AmazonCloudWatchAlgo. Users are cautioned against directly modifying the default authentication algorithm.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke. AWS_Cloud_Watch</td>
</tr>
</tbody>
</table>

### Amazon EBS spoke

Manage block level storage volumes and snapshots in Amazon EBS from your ServiceNow instance.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

### IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

### Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
Supported version

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

Note: If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

- User with full access to Amazon EC2.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke actions

The Amazon EBS spoke provides actions to automate Amazon EBS tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic Block Store Management</td>
<td>Attach Volume</td>
<td>Attaches an EBS volume to a running or stopped instance.</td>
</tr>
<tr>
<td></td>
<td>Create Snapshot</td>
<td>Creates a snapshot of an EBS volume.</td>
</tr>
<tr>
<td></td>
<td>Create Volume</td>
<td>Creates an EBS volume that can be attached to an instance in the same Availability Zone.</td>
</tr>
<tr>
<td></td>
<td>Delete Snapshot</td>
<td>Deletes the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Delete Volume</td>
<td>Deletes the specified EBS volume.</td>
</tr>
<tr>
<td></td>
<td>Detach Volume</td>
<td>Detaches an EBS volume from an instance.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Amazon EBS spoke

Integrate the ServiceNow instance and Amazon EBS account using AWS credential to authenticate ServiceNow requests.

- Request anIntegrationHub subscription
- Activate the Amazon EBS spoke
- Role required: admin
Create Credential record for the Amazon EBS spoke

Create Credential record for your Amazon EBS account. The Amazon EBS spoke connection and credential alias uses this credential to perform actions on Amazon EBS.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Amazon EBS.
3. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter EBS Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon EC2.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon EC2.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AmazonEBSAuthAlgo.</td>
</tr>
</tbody>
</table>

6. Click Submit.

The credential record the Amazon EBS spoke is created.

Amazon EC2 spoke

Integrate ServiceNow instance with Amazon Elastic Compute Cloud (EC2). Manage Amazon instances, Amazon Machine Images (AMIs), Key Pairs, and Tags from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHubsubscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported Versions

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon EC2.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Amazon EC2 spoke provides actions to automate Amazon EC2 tasks when events occurs in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon Machine Image Management</td>
<td>Copy Image</td>
<td>Copies an Amazon Machine Image (AMI) from the specified source region to the current region.</td>
</tr>
<tr>
<td></td>
<td>Create Image</td>
<td>Creates an Amazon EBS supported AMI from an Amazon EBS supported instance that is either running or stopped.</td>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Setup the Amazon EC2 spoke

Integrate the ServiceNow instance and Amazon EC2 using AWS credentials to authenticate ServiceNow requests.

- Request an IntegrationHub Enterprise subscription
- Activate the Amazon EC2 spoke
- Role required: admin

Create Credentials record for the Amazon EC2 spoke

Create Credential records for the Amazon EC2 instance. The Amazon EC2 spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for AWS EC2.
3. From the Credentials tab, click New.
   - The system displays the message What type of Credentials would you like to create?.
4. Select AWS Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AmazonEC2AuthAlgo.</td>
</tr>
</tbody>
</table>

- Note: Do not directly modify the default authentication algorithm.

6. Click Submit.

Amazon RDS spoke

Integrate ServiceNow instance with Amazon Relational Database Service (RDS). Manage the process of performing various operations like set up, operate, and scale on Amazon RDS using this spoke.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported Versions

This spoke was built for API version 2014-09-01 and 2014-10-31, but may be compatible with later versions.

Spoke Requirements

- User with full access to Amazon RDS.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Amazon RDS spoke provides actions to automate Amazon RDS tasks when events occurs in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>List Account Attributes</td>
<td>Retrieves the list of attributes of an account.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>---------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>List Certificates</td>
<td>Retrieves the list of certificates of an account.</td>
</tr>
<tr>
<td>DB Engines Management</td>
<td>List DB Engines</td>
<td>Retrieves the list of available database (DB) engines.</td>
</tr>
<tr>
<td>DB Instance Management</td>
<td>Create DB Instance</td>
<td>Creates an instance of DB.</td>
</tr>
<tr>
<td></td>
<td>Create DB Instance Read Replica</td>
<td>Creates a read replica of a DB instance.</td>
</tr>
<tr>
<td></td>
<td>Delete DB Instance</td>
<td>Deletes an existing provisioned DB instance.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note: When you delete a DB instance, all the automated backups of that instance are also deleted and cannot be recovered.</td>
</tr>
<tr>
<td></td>
<td>List DB Instances</td>
<td>Retrieves the list of provisioned DB instances.</td>
</tr>
<tr>
<td></td>
<td>List Reserved DB Instances</td>
<td>Retrieves the list of reserved DB instances.</td>
</tr>
<tr>
<td></td>
<td>Promote DB Instance Read Replica</td>
<td>Promotes a read replica of a DB instance to standalone DB instance.</td>
</tr>
<tr>
<td></td>
<td>Reboot DB Instance</td>
<td>Reboots a DB instance.</td>
</tr>
<tr>
<td></td>
<td>Restore DB Instance From DB Snapshot</td>
<td>Creates a DB instance from a DB snapshot.</td>
</tr>
<tr>
<td></td>
<td>Start DB Instance</td>
<td>Starts a DB instance.</td>
</tr>
<tr>
<td></td>
<td>Stop DB Instance</td>
<td>Stops a DB instance.</td>

<tr>
<td>DB Snapshots Management</td>
<td>Create DB Snapshot</td>
<td>Creates a snapshot of a DB instance.</td>
</tr>
<tr>
<td></td>
<td>Delete DB Snapshot</td>
<td>Deletes a snapshot of a DB instance.</td>
</tr>
<tr>
<td></td>
<td>List DB Snapshots</td>
<td>Retrieves the list of snapshots of a DB instance.</td>
</tr>
<tr>
<td></td>
<td>Update DB Snapshot</td>
<td>Updates a snapshot of a DB instance.</td>
</tr>
<tr>
<td>Event Management</td>
<td>Create Event Subscription</td>
<td>Creates an RDS event notification subscription.</td>
</tr>
<tr>
<td></td>
<td>Delete Event Subscription</td>
<td>Deletes an event notification subscription.</td>
</tr>
<tr>
<td></td>
<td>List Event Categories</td>
<td>Retrieves a list of categories for the specified or all event source types.</td>
</tr>
<tr>
<td></td>
<td>List Event Subscriptions</td>
<td>Retrieves a list of all subscription descriptions of a customer account.</td>
</tr>
<tr>
<td></td>
<td>List Events</td>
<td>Retrieves a list of events of the RDS resources.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Update Event Subscription</td>
<td>Updates an existing event notification subscription.</td>
</tr>
<tr>
<td>Groups Management</td>
<td>Create DB Parameter Group</td>
<td>Creates a DB parameter group.</td>
</tr>
<tr>
<td></td>
<td>Create DB Subnet Group</td>
<td>Creates a DB subnet group.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> A DB subnet group must contain at least one subnet in at least two Availability Zones (AZ) in the Amazon Web Services (AWS) region.</td>
</tr>
<tr>
<td></td>
<td>Create Option Group</td>
<td>Creates an option group.</td>
</tr>
<tr>
<td></td>
<td>Delete DB Parameter Group</td>
<td>Deletes the specified DB parameter group.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Before deleting the DB parameter group, ensure that DB parameter group is not associated with any DB instances.</td>
</tr>
<tr>
<td></td>
<td>Delete DB Subnet Group</td>
<td>Deletes a DB subnet group.</td>
</tr>
<tr>
<td></td>
<td>Delete Option Group</td>
<td>Deletes an existing option group.</td>
</tr>
<tr>
<td></td>
<td>List DB Parameter Groups</td>
<td>Retrieves a list of DB parameter groups.</td>
</tr>
<tr>
<td></td>
<td>List DB Subnet Groups</td>
<td>Retrieves a list of DB subnet group descriptions.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> If a DB subnet group name is specified, the list contains descriptions of only the specified DB subnet group.</td>
</tr>
<tr>
<td></td>
<td>List Option Groups</td>
<td>Retrieves a list of option groups.</td>
</tr>
<tr>
<td></td>
<td>Reset DB Parameter Group</td>
<td>Modifies the parameters of a DB parameter group to the engine or system default values.</td>
</tr>
<tr>
<td></td>
<td>Update DB Parameter Group</td>
<td>Updates the parameters of the specified DB parameter group.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Update DB Subnet Group</td>
<td>Updates an existing DB subnet group.</td>
<td><strong>Note:</strong> A DB subnet group must contain at least one subnet in at least two availability zones (AZs) in the Amazon Web Services (AWS) region.</td>
</tr>
<tr>
<td>Update Option Group</td>
<td>Updates an existing option group.</td>
<td></td>
</tr>
<tr>
<td>Logs Management</td>
<td>List DB Log Files</td>
<td>Retrieves a list of all the log files of a DB instance.</td>
</tr>
<tr>
<td></td>
<td>View DB Log File</td>
<td>Displays a part of or an entire specified log file.</td>

<tr>
<td>Tags Management</td>
<td>Add Tags To RDS Resource</td>
<td>Adds tags to RDS resource.</td>
</tr>
<tr>
<td></td>
<td>List Tags For RDS Resource</td>
<td>Retrieves a list of tags of RDS resource.</td>
</tr>
<tr>
<td></td>
<td>Remove Tags From RDS Resource</td>
<td>Removes the tags from an RDS resource.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the Amazon RDS spoke**

Integrate the ServiceNow instance and Amazon RDS using AWS credentials to authenticate ServiceNow requests.

- Request an IntegrationHub Enterprise subscription
- Activate the Amazon RDS spoke
- Role required: admin

*Create Credentials records for the Amazon RDS spoke*

Create Credential records for the Amazon RDS instance. The Amazon RDS spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin

1. Navigate to *Connections & Credentials > Connection & Credentials Aliases*.
2. Open for the record for Amazon RDS.
3. From the *Credentials* tab, click *New*.
   - The system displays the message *What type of Credentials would you like to create?*.
4. Select *AWS Credentials*. 
5. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter AWS Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon RDS.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon RDS.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select Amazon RDS Auth Algorithm.</td>
</tr>
</tbody>
</table>

**Note:** Do not directly modify the default authentication algorithm.

6. Click Submit.

**Amazon Route53 spoke**

Integrate ServiceNow instance with Amazon Route 53. Manage domain registrations, Domain Name System (DNS) routing, and health checking from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for Amazon Route 53 API version 2013-04-01, but may be compatible with later versions.

**Spoke requirements**

- User with full access to Amazon Route 53 account.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• Complex Object (com.glide.cobject)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**

The Amazon Route53 Spoke provides actions to automate Amazon Route 53 tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain Management</td>
<td>Check Domain Availability</td>
<td>Checks and returns the availability of a domain name.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
<td>If a domain name is in pending state, you must check the availability of the domain name again, until the status is processed.</td>
</tr>
<tr>
<td></td>
<td>Get Domain Details</td>
<td>Retrieves detailed information about a specified domain that is associated with the current AWS account.</td>
</tr>
<tr>
<td></td>
<td>Look up Domain Suggestions</td>
<td>Retrieves a list of suggested domain names.</td>
</tr>
<tr>
<td></td>
<td>Look up Domains</td>
<td>Retrieves all the domain names registered with Amazon Route 53 for the current AWS account.</td>
</tr>
<tr>
<td></td>
<td>View Billing</td>
<td>Retrieves all the domain related billing records for the current AWS account for a specified period.</td>
</tr>
<tr>
<td>Hosted Zone Management</td>
<td>Create Hosted Zone</td>
<td>Creates a new public or private hosted zone.</td>
</tr>
<tr>
<td></td>
<td>Delete Hosted Zone</td>
<td>Deletes a hosted zone.</td>
</tr>
<tr>
<td></td>
<td>Get Change</td>
<td>Retrieves the current status of a change batch request.</td>
</tr>
<tr>
<td></td>
<td>Get Hosted Zone</td>
<td>Retrieves information about a specified hosted zone.</td>
</tr>
<tr>
<td></td>
<td>Get Hosted Zone Count</td>
<td>Retrieves total number of hosted zones for the account.</td>
</tr>
<tr>
<td></td>
<td>Get Hosted Zone Limit</td>
<td>Retrieves the specified limit for a specified hosted zone.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up Hosted Zones</td>
<td>Retrieves a list of associated public and private hosted zones.</td>
</tr>
<tr>
<td></td>
<td>Look up Hosted Zones By Name</td>
<td>Retrieves a list of the hosted zones in alphabetical order.</td>
</tr>
<tr>
<td></td>
<td>Update Hosted Zone Comment</td>
<td>Updates the comment for a specified hosted zone.</td>
</tr>
<tr>
<td>Record Set Management</td>
<td>Delete GeoLocation Record Set</td>
<td>Deletes a GeoLocation resource record set that contains authoritative DNS information for a specified domain name or subdomain name.</td>
</tr>
<tr>
<td></td>
<td>Delete Simple Record Set</td>
<td>Deletes a simple resource record set that contains authoritative DNS information for a specified domain name or subdomain name.</td>
</tr>
<tr>
<td></td>
<td>Delete Weighted Record Set</td>
<td>Deletes a weighted resource record set that contains authoritative DNS information for a specified domain name or subdomain name.</td>
</tr>
<tr>
<td></td>
<td>Look up Record Sets</td>
<td>Retrieves a list of resource record sets in a specified hosted zone.</td>
</tr>
<tr>
<td></td>
<td>Test DNS Answer</td>
<td>Retrieves the value that Amazon Route 53 returns in response to a DNS request for a specified record name and type.</td>
</tr>
<tr>
<td></td>
<td>Upsert Geolocation Record Set</td>
<td>Creates a GeoLocation resource record set or updates an existing GeoLocation resource record set that contains authoritative DNS information for a specified domain name or subdomain name.</td>
</tr>
<tr>
<td></td>
<td>Upsert Simple Record Set</td>
<td>Creates a simple record set or updates an existing simple resource record set that contains authoritative DNS information for a specified domain name or subdomain name.</td>
</tr>
<tr>
<td></td>
<td>Upsert Weighted Record Set</td>
<td>Creates a weighted resource record set or updates an existing weighted resource record set that contains authoritative DNS information for a specified domain name or subdomain name.</td>
</tr>
<tr>
<td>Tag Management</td>
<td>Add Tags For Domain</td>
<td>Assigns a set of tags to a domain.</td>
</tr>
<tr>
<td></td>
<td>Add Tags For Hosted Zone</td>
<td>Assigns a set of tags to a hosted zone.</td>
</tr>
<tr>
<td></td>
<td>Look up Tags For Domain</td>
<td>Retrieves a list of tags that are associated with the specified domain.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up Tags For Hosted Zone</td>
<td>Retrieves a list of tags that are associated to the specified domain.</td>
</tr>
<tr>
<td></td>
<td>Remove Tags From Domain</td>
<td>Removes tags that are associated to a domain.</td>
</tr>
<tr>
<td></td>
<td>Remove Tags From Hosted Zone</td>
<td>Removes tags that are associated to a hosted zone.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Amazon Route53 spoke**

Integrate the ServiceNow instance and Amazon Route 53 by using the AWS credentials to authenticate ServiceNow requests.

- Request an IntegrationHub subscription.
- Activate Amazon Route53 spoke
- Role required: admin

Create a credential record for the Amazon Route53 spoke

Create a credential record for the Amazon Route53 custom application. The Amazon Route53 spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to IntegrationHub > Connections & Credentials > Credentials.
2. Click New.
   
   The system displays this message: What type of Credentials would you like to create?
3. Select AWS Credentials.
4. On the form, fill these values.

**AWS Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Amazon Route53 Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of your AWS account.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of your AWS account.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select Amazon Route53.</td>
</tr>
</tbody>
</table>

*Note:* Users are cautioned against directly modifying the default authentication algorithm.
5. Right-click the form header and click Submit.

Amazon S3 spoke v1.0.1

Integrate ServiceNow with Amazon S3. Manage buckets, objects, tags, and related ACLs in Amazon S3 from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported version

This spoke was built for API version 2010-03-31, but may be compatible with later versions.

Spoke requirements

- User with full access to Amazon S3.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For information about creating and accessing keys, see the AWS Security Credentials documentation.

Spoke actions

The Amazon S3 spoke provides actions to automate Amazon S3 tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bucket Management</td>
<td>Create Bucket</td>
<td>Creates a bucket in Amazon S3.</td>
</tr>
<tr>
<td></td>
<td>Create ACL</td>
<td>Create new ACL for a bucket and delete the existing one.</td>
</tr>
<tr>
<td></td>
<td>Get Bucket ACLs</td>
<td>Retrieve the ACLs present on a bucket.</td>
</tr>
<tr>
<td></td>
<td>List Buckets</td>
<td>List Amazon S3 buckets.</td>
</tr>
<tr>
<td>Object Management</td>
<td>Copy Object</td>
<td>Copies object from source to destination.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Delete Object</td>
<td>Deletes specified object from a bucket.</td>
</tr>
<tr>
<td></td>
<td>Get ACL</td>
<td>Retrieves the ACL details for the requested resource.</td>
</tr>
<tr>
<td></td>
<td>List Objects By Bucket</td>
<td>Lists the objects in the specified Amazon S3 bucket.</td>
</tr>
<tr>
<td></td>
<td>List Tags</td>
<td>Lists tags of the specified Amazon S3 resource.</td>
</tr>
<tr>
<td></td>
<td>Update Tags</td>
<td>Updates the tags of the specified Amazon S3 resource.</td>
</tr>
<tr>
<td></td>
<td>Download S3 Object to ServiceNow Record</td>
<td>Downloads the requested object from Amazon S3 and attaches it to a record in ServiceNow.</td>
</tr>
<tr>
<td></td>
<td>Upload ServiceNow Attachment to S3</td>
<td>Uploads file from the System Attachment Table (sys_attachment) to a specified Amazon S3 bucket.</td>
</tr>
</tbody>
</table>

**Note:** Spoke actions can be used independently without subscribing to notifications from Amazon S3.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the Amazon S3 spoke**

Use Amazon S3 as file storage in place of attachments in ServiceNow. Adds Amazon S3 storage to your ServiceNow instance and enables users to reference Amazon S3 files in ServiceNow records.

- Request an IntegrationHub subscription
- Activate the Amazon S3 spoke
- Role required: admin

**Create Credential record for the Amazon S3 spoke**

Create Credential record for your AWS account. The Amazon S3 spoke uses this credential to perform actions on Amazon S3.

1. Navigate to *Connections & Credentials > Connection & Credential Aliases*.
2. Open for the record for *Amazon S3*.
3. From the *Credentials* tab, click *New*.
   
   The system displays the message *What type of Credentials would you like to create?*.

4. Select *AWS Credentials*.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter S3 Credentials.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Select <strong>Active</strong> to use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of your AWS account.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of your AWS account.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>sn_amazon_s3_spokeAmazon S3</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>Amazon S3</strong>.</td>
</tr>
</tbody>
</table>

**Note:** Users are cautioned against directly modifying the default authentication algorithm.

| Note: | To create the Access key ID and secret access key, log into the AWS console. From your account menu, select **My Security Credentials**. |

6. Click **Submit**.

The credential record for the Amazon S3 spoke is created.

**Amazon SNS spoke**

Integrate ServiceNow with Amazon SNS. Manage topics and subscriptions, and delegate roles in Amazon SNS from your ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see **Request IntegrationHub**.

**Supported version**

This spoke was built for API version 2010-03-31, but may be compatible with later versions.

**Spoke requirements**

- User with full access to Amazon SNS.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For information about creating and accessing keys, see the **AWS Security Credentials** documentation.
Spoke subflows

The Amazon SNS spoke provides a sample subflow to demonstrate automating Amazon SNS tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Amazon SNS Subscription. The subflow receives three types of messages; Notification, Subscription Confirmation, and Unsubscribe Confirmation. This subflow is triggered when you configure your ServiceNow instance to receive events from Amazon SNS. For more information about the required configurations, see Receive events at your ServiceNow instance from Amazon SNS.

Note: Spoke subflow can be used independently to subscribe for notifications from Amazon SNS. For more information about the configurations, see Receive events at your ServiceNow instance from Amazon SNS.

Spoke actions

The Amazon SNS spoke provides actions to automate Amazon SNS tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permission Management</td>
<td>Add Permission</td>
<td>Adds a statement to a topic's access control policy and grants access for the specified AWS accounts for the specified actions.</td>
</tr>
<tr>
<td></td>
<td>Remove Permission</td>
<td>Removes a statement from a topic's access control policy and revokes access for the specified AWS accounts for the specified actions.</td>
</tr>
<tr>
<td>Subscription Management</td>
<td>Confirm Subscription</td>
<td>Verifies intent of endpoint owner to receive messages by validating the token sent to the endpoint through an earlier Subscribe action.</td>
</tr>
<tr>
<td></td>
<td>Create Subscription</td>
<td>Creates a subscription on a topic.</td>
</tr>
<tr>
<td></td>
<td>Delete Subscription</td>
<td>Deletes a subscription on a topic.</td>
</tr>
<tr>
<td></td>
<td>Get Subscription Attributes</td>
<td>Retrieves all properties of a subscription.</td>
</tr>
<tr>
<td></td>
<td>List Subscriptions</td>
<td>Retrieves a list of all subscriptions to a specific region.</td>
</tr>
</tbody>
</table>

Note: In your flow, use the Get Subscription Attributes action before this action to populate the required records.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List Subscriptions By Topic</td>
<td>Retrieves a list of the subscriptions to a specific topic.</td>
<td><strong>Note:</strong> In your flow, use the Get Subscription Attributes action before this action to populate the required records.</td>
</tr>
<tr>
<td>Set Subscription Attributes</td>
<td>Enables a subscription owner to set an attribute of the subscription to a new value.</td>
<td></td>
</tr>
<tr>
<td>Topics Management</td>
<td>Create Topic</td>
<td>Creates a topic for which notifications can be published.</td>
</tr>
<tr>
<td></td>
<td>Delete Topic</td>
<td>Deletes a topic and all its subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Get Topic Attributes</td>
<td>Retrieves all properties of a topic. Topic properties retrieved may differ based on the authorization of the user.</td>
</tr>
<tr>
<td></td>
<td>List Topics</td>
<td>Retrieves a list of the requester's topics.</td>
</tr>
<tr>
<td></td>
<td>Set Topic Delivery Policy</td>
<td>Enables a topic owner to set a delivery policy of the topic to a new value.</td>
</tr>
<tr>
<td></td>
<td>Set Topic Display Name</td>
<td>Enables a topic owner to set a display name of the topic to a new value.</td>
</tr>
</tbody>
</table>

**Note:** Spoke actions can be used independently without subscribing to notifications from Amazon SNS.

**Spoke module**

The Amazon SNS spoke adds an AWS Configurations module to your ServiceNow instance. If you want receive events at your ServiceNow instance from Amazon SNS, you must specify the subflow internal name here. For more information about the required configurations, see *Receive events at your ServiceNow instance from Amazon SNS*.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*. 
Set up the Amazon SNS spoke

Integrate the ServiceNow instance and Amazon SNS using AWS credential to authenticate ServiceNow requests.

- Request an IntegrationHub subscription
- Activate the Amazon SNS spoke
- Role required: admin

To receive events at your ServiceNow instance from Amazon SNS, see *Receive events at your ServiceNow instance from Amazon SNS*. Spoke set up described here enables you to use spoke subflow and actions.

*Create Credential record for the Amazon SNS spoke*

Create Credential record for your AWS account. The Amazon SNS spoke uses this credential to perform actions on Amazon SNS.

1. Navigate to *Connections & Credentials > Connection & Credential Aliases*.
2. Open for the record for *Amazon SNS*.
3. From the *Credentials* tab, click *New*.
   - The system displays the message *What type of Credentials would you like to create?*.
4. Select *AWS Credentials*.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter SNS Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of your AWS account.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of your AWS account.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select SNS Algorithm.</td>
</tr>
</tbody>
</table>

- Note: Users are cautioned against directly modifying the default authentication algorithm.

6. Click *Submit*.

The credential record for the Amazon SNS spoke is created.

*Receive events at your ServiceNow instance from Amazon SNS*

Receive events (Notification, Subscription Confirmation, and Unsubscribe Confirmation) from Amazon SNS at your ServiceNow instance.

- Request an IntegrationHub subscription
- Activate the Amazon SNS spoke
- Role required: admin

You can receive events at your ServiceNow instance from Amazon SNS even without setting up the Amazon SNS spoke. To set up the Amazon SNS spoke and use the spoke actions, see *Set up the Amazon SNS spoke*.

*Create secret for the Amazon SNS spoke*

Create a client secret to authorise requests from Amazon SNS.

1. Navigate to *System Definition > Scripts - Background*. 
2. Enter this command in the Run script (JavaScript executed on server) text field:
   ```javascript
gs.info(GlideSecureRandomUtil.getSecureRandomString(32));
```
3. Click Run Script.
4. Copy and record the generated value for later use.

Create a record in AWS Configurations

Create a record in AWS Configurations to authorise requests from Amazon SNS spoke.

1. Navigate to AWS Configuration > All Configurations.
2. Click New.
3. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property Value</td>
<td>Internal name of the Amazon SNS Subscription subflow. For example, amazon_sns_subscription.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: The Amazon SNS Subscription subflow is a sample subflow. You must create a copy of</td>
</tr>
<tr>
<td></td>
<td>this subflow and use it to customize event management as per your requirement. In this case,</td>
</tr>
<tr>
<td></td>
<td>specify the internal name of the customized subflow.</td>
</tr>
<tr>
<td>Property Name</td>
<td>Name to identify the record.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret generated by the script. For information about generating Client Secret see,</td>
</tr>
<tr>
<td></td>
<td>Create secret for the Amazon SNS spoke.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click Save.
5. Right-click the form header and click Copy sys_id. Record this value for later use.

Record the Base API path of the Amazon SNS spoke

Record the Base API path of the Amazon SNS spoke to authorise requests from Amazon SNS.

1. Navigate to System Web Services > Scripted Web Services > Scripted REST APIs.
2. Open the record for Amazon SNS.
3. Copy and record the value of **Base API path** for later use.
Create topic
Use the Create Topic spoke action to create a topic in Amazon SNS for your ServiceNow instance.

1. In Flow Designer, create a flow and include the Create Topic spoke action. For information about creating flows in Flow Designer, see Flows.
2. Customize flow to provide these values as inputs to the Create Topic spoke action:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Region</td>
<td>AWS geographic area where the infrastructure is housed.</td>
</tr>
<tr>
<td>Topic Name</td>
<td>Name to identify the topic.</td>
</tr>
</tbody>
</table>

3. Test the flow and check the Executions tab to ensure that flow is executed as expected.

Create subscription
Use the Create Subscription spoke action to create subscription in Amazon SNS for your ServiceNow instance.

1. In Flow Designer, create a flow and include the Create Subscription spoke action. For information about creating flows in Flow Designer, see Flows.
2. Customize flow to provide these values as inputs to the Create Subscription spoke action:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Region</td>
<td>AWS geographic area where the infrastructure is housed.</td>
</tr>
<tr>
<td>Topic ARN</td>
<td>ARN to uniquely identify the required topic. Subscriptions are created for this topic.</td>
</tr>
<tr>
<td>Protocol</td>
<td>HTTPS</td>
</tr>
</tbody>
</table>

Note: For information about obtaining the required values, see Record the Base API path of the Amazon SNS spoke, Create a record in AWS Configurations, and Create secret for the Amazon SNS spoke.

3. Test the flow.
The flow internally triggers the default Amazon SNS Subscription subflow.
4. In the Executions tab, open the record associated with the subflow execution.

Note: Ensure that you check the execution details of the default Amazon SNS Subscription subflow, not the flow you had created.
5. In the Execution Details page, click RUNTIME VALUE.
6. Copy and record the value of Token for later use. This confirmation token is needed to Confirm subscription.
Subscription for the required topic in Amazon SNS for your ServiceNow instance is created.

**Confirm subscription**

Use the Confirm Subscription spoke action to confirm subscription in Amazon SNS for your ServiceNow instance.

1. In Flow Designer, create a copy of the default Amazon SNS Subscription subflow. For information about using subflows in Flow Designer, see [Subflows](#).

2. In Flow Designer, create a flow that includes the copy of the default subflow. For information about creating flows in Flow Designer, see [Flows](#).

Note: Ensure that you use the confirmation token to **Confirm subscription** within its validity period.
3. Customize the subflow to include the Confirm Subscription spoke action.

4. Customize subflow to provide these values as inputs to the Confirm Subscription spoke action:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Region</td>
<td>AWS geographic area where the infrastructure is housed.</td>
</tr>
<tr>
<td>Topic ARN</td>
<td>ARN to uniquely identify the required topic. Subscriptions are created for this topic.</td>
</tr>
<tr>
<td>Token</td>
<td>Confirmation token generated after creating subscription. See Create subscription, for more information.</td>
</tr>
</tbody>
</table>

5. Test the flow and check the Executions tab to ensure that flow is executed as expected.

The Amazon SNS subscription for your ServiceNow instance is confirmed.

**Customize event management**

Customize the management of events (Notification, Subscription Confirmation, and Unsubscribe Confirmation) you receive for your ServiceNow instance from Amazon SNS.

1. In Flow Designer, create a copy of the default subflow, Amazon SNS Subscription and customize the subflow as per your requirement. For more information about creating subflows, see Subflows.
2. Copy and record the internal name of the customized subflow.
3. Navigate to AWS Configuration > All Configurations.
4. Open the record you had created to receive events. In this record, the internal name of the default Amazon SNS Subscription subflow is specified in Property Value.
5. Update this record by replacing the internal name of default subflow with the internal name of the customized subflow in Property Value.

Note: Use the same Client Secret.

The event management is customized as per your requirement.

**Amazon VPC spoke v1.0.1**

Provision a logically isolated section of the AWS cloud using Amazon VPC and launch the required AWS resources in a virtual network, from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version

This spoke was built for API version 2016-11-15, but may be compatible with later versions.

Note: If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

- User with full access to Amazon VPC.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke subflows

The Amazon VPC spoke provides sample subflows to demonstrate automating Amazon VPC tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete Subnet</td>
<td>Deletes the specified subnet. Before you delete the subnet, you must terminate all the running instances in the subnet.</td>
</tr>
<tr>
<td>Delete VPC</td>
<td>Deletes the specified VPC. Before you delete the VPC, you must terminate all the associated instances.</td>
</tr>
</tbody>
</table>
### Spoke actions

The Amazon VPC spoke provides actions to automate Amazon VPC tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network &amp; Security Group</td>
<td>Add Egress Rules To A Security Group</td>
<td>Adds the specified egress rules to a security group.</td>
</tr>
<tr>
<td>Management</td>
<td>Add Ingress Rules To A Security Group</td>
<td>Adds the specified ingress rules to a security group.</td>
</tr>
<tr>
<td></td>
<td>Create Security Group</td>
<td>Creates a security group.</td>
</tr>
<tr>
<td></td>
<td>Delete Egress Rules From Security Group</td>
<td>Removes the specified egress rules from security group. Values must match the existing rule's values</td>
</tr>
<tr>
<td></td>
<td>Delete Ingress Rules From Security Group</td>
<td>Adds the specified ingress rules to a security group.</td>
</tr>
<tr>
<td></td>
<td>Delete Security Group</td>
<td>Deletes a security group.</td>
</tr>
<tr>
<td></td>
<td>List Security Groups</td>
<td>Lists the specified security groups or all of your security groups.</td>
</tr>
<tr>
<td></td>
<td>Lookup Security Group</td>
<td>Retrieves the specified security group.</td>
</tr>
<tr>
<td>Virtual Private Cloud Management</td>
<td>Create Subnet</td>
<td>Creates a subnet in an existing VPC.</td>
</tr>
<tr>
<td></td>
<td>Create VPC</td>
<td>Creates a VPC with the specified IPv4 CIDR block and can optionally request an IPv6 CIDR block for the VPC.</td>
</tr>
<tr>
<td></td>
<td>Delete NAT Gateway</td>
<td>Deletes the specified NAT gateway. Deleting a NAT gateway disassociates its Elastic IP address, but does not release it.</td>
</tr>
<tr>
<td></td>
<td>Delete Route Table</td>
<td>Deletes the specified route table. You must disassociate the route table from any subnets before you can delete it.</td>
</tr>
<tr>
<td></td>
<td>Delete Subnet</td>
<td>Deletes the specified subnet. You must terminate all running instances in the subnet before you can delete the subnet.</td>
</tr>
<tr>
<td></td>
<td>Delete VPC</td>
<td>Deletes the specified VPC. You must detach or delete all gateways and resources that are associated with the VPC before you can delete it or use Delete VPC subflow.</td>
</tr>
<tr>
<td></td>
<td>Delete VPC Peering Connection</td>
<td>Deletes a VPC peering connection. Either the owner of the requester VPC or the owner of the accepter VPC can delete the VPC peering connection if it's in the active state.</td>
</tr>
</tbody>
</table>
### Category | Action | Description
---|---|---
Virtual Private Network Management | Detach Internet Gateway | Detaches an internet gateway from a VPC, disabling connectivity between the internet and the VPC.
| Detach Route Table | Disassociates a subnet from a route table.
| List Internet Gateways | Retrieves the details of the required internet gateways.
| List NAT Gateways | Retrieves the details of the required NAT gateways.
| List Route Tables | Retrieves the details of the required route tables.
| List Subnets | Retrieves the details of the required subnets in an existing VPC.
| List VPC Peering Connections | Retrieves the details of the required VPC peering connections.
| Detach VPN Gateway | Detaches a virtual private gateway from a VPC.
| List VPN Gateways | Retrieves the details of the required virtual private gateways.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

### Set up the Amazon VPC spoke

Integrate the ServiceNow instance and Amazon VPC using AWS credential to authenticate ServiceNow requests.

- Request an IntegrationHub subscription
- Activate the Amazon VPC spoke
- Role required: admin

Create Credential record for the Amazon VPC spoke
Create Credential record for your Amazon VPC account. The Amazon VPC spoke connection and credential alias uses this credential to perform actions on Amazon VPC.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Amazon VPC**.
3. From the **Credentials** tab, click **New**.
   - The system displays the message *What type of Credentials would you like to create?*.
4. Select **AWS Credentials**.
5. On the form, fill these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>VPC Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to Amazon VPC.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to Amazon VPC.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>AmazonVPCAuthAlgo</strong>.</td>
</tr>
</tbody>
</table>

**Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click Submit.

The credential record the Amazon VPC spoke is created.

**Automation Anywhere spoke**

Manage workflows and robotics processes in Automation Anywhere instance from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.
Spoke actions

The Automation Anywhere spoke provides actions to automate Automation Anywhere tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bot Management</td>
<td>Deploy Bot</td>
<td>Deploys a bot in the bot runner devices.</td>
</tr>
<tr>
<td></td>
<td>Get Bot</td>
<td>Retrieves details of the specific bot.</td>
</tr>
<tr>
<td></td>
<td>Look up Bots</td>
<td>Retrieves information about all the bots.</td>
</tr>
<tr>
<td>Device Management</td>
<td>Get Device Details</td>
<td>Retrieves details of the specific device.</td>
</tr>
<tr>
<td></td>
<td>Look up Devices</td>
<td>Retrieves details of all the devices.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Get Folder</td>
<td>Retrieves details of the requested folder.</td>
</tr>
<tr>
<td></td>
<td>Look up Folders</td>
<td>Retrieves information about all the folders.</td>
</tr>
<tr>
<td>Queue Management</td>
<td>Look up Queues</td>
<td>Retrieves all queues for the Enterprise Control Room.</td>
</tr>
<tr>
<td></td>
<td>Look up Work Items in Queue</td>
<td>Retrieves details of all the work items in a queue.</td>
</tr>
<tr>
<td>User Management</td>
<td>Get User</td>
<td>Retrieves details of the requested user.</td>
</tr>
<tr>
<td></td>
<td>Look up Users</td>
<td>Retrieves details of all the users.</td>
</tr>
</tbody>
</table>

Note: Only users with bot runner or admin role can execute the spoke actions.

Spoke module

The Automation Anywhere spoke adds the Automation Anywhere application to your instance and includes the Authentication module. In this module, you should provide details in the default credential record to authenticate ServiceNow requests. See Create a Credential record for the Automation Anywhere spoke for more information.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Automation Anywhere spoke

Integrate ServiceNow and Automation Anywhere instances by using the Automation Anywhere credential record to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate Automation Anywhere spoke.
- Role required: admin

*Create a Credential record for the Automation Anywhere spoke*

Create a credential record for the Automation Anywhere instance. The Automation Anywhere spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Automation Anywhere > Authentications**.
2. Open the record, **Automation Anywhere Credential**.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Default name of the credential record.</td>
</tr>
<tr>
<td><strong>Note:</strong> Users are cautioned against modifying the default credential name.</td>
<td></td>
</tr>
<tr>
<td>User Name</td>
<td>Credentials to log in to your Automation Anywhere instance.</td>
</tr>
<tr>
<td>Password</td>
<td></td>
</tr>
<tr>
<td>Credential alias</td>
<td>Default credential alias available along with the Automation Anywhere spoke. For example, select <code>sn_autoanywher_spk.Automation_Anywhere</code>.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>Automation Anywhere</strong>.</td>
</tr>
<tr>
<td><strong>Note:</strong> Users are cautioned against directly modifying the default authentication algorithm.</td>
<td></td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL to connect to your Automation Anywhere instance.</td>
</tr>
<tr>
<td>Dedicated Integration User</td>
<td>Option to specify if you are using a dedicated user for the purpose of integrating Automation Anywhere and ServiceNow instances.</td>
</tr>
<tr>
<td><strong>Note:</strong> The dedicated user mentioned here, should be used only for the purpose of integrating Automation Anywhere with ServiceNow. If you aren't using a dedicated user, the ServiceNow instance makes 2 or 3 API calls to execute an action. If you are using a dedicated user, the ServiceNow instance makes only one API call to execute an action.</td>
<td></td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.
5. Click **Get Token**.

**Note:** This step is applicable when you select the **Dedicated Integration User** check box.

The confirmation message, **Token retrieval successful** is displayed.

**AWS Certificate Manager spoke**

Manage certificates in AWS Certificate Manager account from your ServiceNow instance.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for AWS Certificate Manager API version 2015-12-08, but may be compatible with later versions.

Spoke requirements

- User with full access to AWS Certificate Manager.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The AWS Certificate Manager spoke provides actions to automate AWS Certificate Manager tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certificate Management</td>
<td>Delete Certificate</td>
<td>Deletes a certificate and its associated private key.</td>
</tr>
<tr>
<td></td>
<td>Get Certificate</td>
<td>Retrieves an Amazon-issued certificate and its certificate chain.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Get Certificate Details</td>
<td>Retrieves detailed metadata about the specified ACM certificate.</td>
</tr>
<tr>
<td></td>
<td>Import Certificate</td>
<td>Imports a certificate to AWS Certificate Manager (ACM) to use with services that are integrated with ACM.</td>
</tr>
<tr>
<td></td>
<td>Look up Certificates</td>
<td>Retrieves a list of certificate ARNs and domain names.</td>
</tr>
<tr>
<td></td>
<td>Request Certificate</td>
<td>Requests an ACM certificate for use with other AWS services.</td>
</tr>
<tr>
<td></td>
<td>Resend Validation Email</td>
<td>Resends the email that requests domain ownership validation.</td>
</tr>
<tr>
<td></td>
<td>Update Certificate Option</td>
<td>Updates details of the specified certificate.</td>
</tr>
<tr>
<td>Tag Management</td>
<td>Add Tags To Certificate</td>
<td>Associates a set of tags with the required certificate.</td>
</tr>
<tr>
<td></td>
<td>Look up Tags For Certificate</td>
<td>Retrieves all tags that are associated with the specified certificate.</td>
</tr>
<tr>
<td></td>
<td>Remove Tags From Certificate</td>
<td>Removes the association of tags from certificate.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

### Set up the AWS Certificate Manager spoke

Integrate the ServiceNow instance and AWS Certificate Manager by using the AWS credentials to authenticate ServiceNow requests.

- Request an IntegrationHub subscription.
- Activate AWS Certificate Manager spoke.
- Role required: admin

*Create a credential record for the AWS Certificate Manager spoke*

Create a credential record for the AWS Certificate Manager account. The AWS Certificate Manager spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   
   The system displays this message: *What type of Credentials would you like to create?*
3. Select **AWS Credentials**.
4. On the form, fill these values.
ServiceNow Orlando Now Platform capabilities

AWS Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to AWS Certificate Manager.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to AWS Certificate Manager.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AWS Certificate Manager. Note: Users are cautioned against directly modifying the default authentication algorithm.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

5. Click Save.

AWS CloudFormation spoke

Model and provision AWS resources in your cloud environment using AWS CloudFormation from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for AWS CloudFormation API version 2010-05-15, but may be compatible with later versions.

Spoke requirements

- User with full access to AWS CloudFormation.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.
Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

ℹ️ **Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The AWS CloudFormation spoke provides actions to automate AWS CloudFormation tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Set Management</td>
<td>Create Change Set</td>
<td>Creates a list of changes that will be applied to a stack so that you can review the changes before executing them.</td>
</tr>
<tr>
<td></td>
<td>Delete Change Set</td>
<td>Deletes the specified change set.</td>
</tr>
<tr>
<td></td>
<td>Execute Change Set</td>
<td>Updates the stack using the input information that was provided when the specified change set was created.</td>
</tr>
<tr>
<td></td>
<td>Get Change Set</td>
<td>Returns the details of the specified change set.</td>
</tr>
<tr>
<td></td>
<td>Look up Change Sets</td>
<td>Returns basic information of each active change set for a stack.</td>
</tr>
<tr>
<td>Stack Management</td>
<td>Cancel Update Stack</td>
<td>Cancels an update on the specified stack.</td>
</tr>
<tr>
<td></td>
<td>Continue Update Rollback</td>
<td>For the specified stack that is in the UPDATE_ROLLBACK_FAILED state, continues rolling the state back to the UPDATE_ROLLBACK_COMPLETE state.</td>
</tr>
<tr>
<td></td>
<td>Create Stack</td>
<td>Creates a stack as specified in the template.</td>
</tr>
<tr>
<td></td>
<td>Delete Stack</td>
<td>Deletes the specified stack.</td>
</tr>
<tr>
<td></td>
<td>Get Stack Policy</td>
<td>Returns the stack policy for a specified stack.</td>
</tr>
<tr>
<td></td>
<td>Get Template</td>
<td>Returns the template body for a specified stack.</td>
</tr>
</tbody>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the AWS CloudFormation spoke

Integrate the ServiceNow instance and AWS CloudFormation using AWS credential to authenticate ServiceNow requests.

- Request anIntegrationHub subscription
- Activate the AWS CloudFormation spoke
- Role required: admin
Create Credential record for the AWS CloudFormation spoke

Create Credential record for your AWS CloudFormation account. The AWS CloudFormation spoke connection and credential alias uses this credential to perform actions in AWS CloudFormation.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Amazon VPC.
3. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?
4. Select AWS Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter CloudFormation Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to AWS CloudFormation.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to AWS CloudFormation.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AWS_CloudFormation.</td>
</tr>
</tbody>
</table>

Note: Users are cautioned against directly modifying the default authentication algorithm.

6. Click Submit.

The credential record the AWS CloudFormation spoke is created.

AWS Elastic Beanstalk spoke

AWS Elastic Beanstalk enables you to quickly deploy and manage applications in the Amazon AWS Cloud. Elastic Beanstalk reduces management complexity without restricting choice or control. When you upload your application, Elastic Beanstalk automatically handles capacity provisioning, load balancing, scaling, and application health monitoring.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.
Supported versions

API version

2010-12-01

Spoke subflows

There are no subflows provided with the AWS Elastic Beanstalk spoke.

Spoke actions

The AWS Elastic Beanstalk spoke provides actions to perform Elastic Beanstalk tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Look Up Account Attributes</td>
<td>Retrieves attributes related to AWS Elastic Beanstalk that is associated with the calling AWS account.</td>
</tr>
<tr>
<td>Application Management</td>
<td>Check DNS Availability</td>
<td>Checks if the specified CNAME is available.</td>
</tr>
<tr>
<td></td>
<td>Create application</td>
<td>Creates an application that has one configuration template name default and no application versions.</td>
</tr>
<tr>
<td></td>
<td>Create Application Version</td>
<td>Creates an application version for the specified application.</td>
</tr>
<tr>
<td></td>
<td>Create Configuration Template</td>
<td>Creates an AWS Elastic Beanstalk configuration template, associated with a specific Elastic Beanstalk application.</td>
</tr>
<tr>
<td></td>
<td>Delete Application</td>
<td>Deletes the specified application along with all associated versions and configurations.</td>
</tr>
<tr>
<td></td>
<td>Delete Application Version</td>
<td>Deletes the specified version from the specified application.</td>
</tr>
<tr>
<td></td>
<td>Delete Configuration Template</td>
<td>Deletes the specified application along with all associated versions and configurations.</td>
</tr>
<tr>
<td></td>
<td>Look Up Application Versions</td>
<td>Retrieves the descriptions of existing applications.</td>
</tr>
<tr>
<td></td>
<td>Look up Applications</td>
<td>Retrieves the descriptions of existing applications.</td>
</tr>
<tr>
<td></td>
<td>Update Application</td>
<td>Updates the specified application to have the specified properties.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>----------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Update Application Version</td>
<td>Update Application Version</td>
<td>Updates the specified application version to have the specified properties.</td>
</tr>
<tr>
<td>Update Configuration Template</td>
<td>Update Configuration Template</td>
<td>Updates the specified configuration template to have the specified properties or configuration option values.</td>
</tr>
<tr>
<td>Environmental Management</td>
<td>Create Environment</td>
<td>Launches an AWS Elastic Beanstalk environment for the specified application.</td>
</tr>
<tr>
<td></td>
<td>Create Storage Location</td>
<td>Creates a bucket in Amazon S3 to store application versions, logs, and other files used by Elastic Beanstalk environments.</td>
</tr>
<tr>
<td></td>
<td>Get Environment Health</td>
<td>Lists the overall health information of the specified environment.</td>
</tr>
<tr>
<td></td>
<td>Look up Available Solution Stacks</td>
<td>Lists the available solution stack names.</td>
</tr>
<tr>
<td></td>
<td>Look up Environment Resources</td>
<td>Lists AWS resources for the specified environment.</td>
</tr>
<tr>
<td></td>
<td>Look up Environments</td>
<td>Retrieves the information about the existing environments.</td>

AWS Elastic Beanstalk account requirements

The AWS Elastic Beanstalk spoke requires a credential that you create in the Amazon Web Services Management Console.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.
Create Credential record for the AWS Elastic Beanstalk spoke

Create Credential records to integrate AWS Elastic Beanstalk with ServiceNow. The AWS Elastic Beanstalk connection and credential aliases use these credentials to authorize actions. Once connected, Elastic Beanstalk uses basic authentication to authenticate ServiceNow requests.

To set up the AWS Elastic Beanstalk spoke, you must be able to configure security credentials in Amazon Web Services and have a ServiceNow admin role.

- Role required: admin
- Request IntegrationHub subscription
- Activate AWS Elastic Beanstalk spoke

2. From the menu under your user name, select My Security Credentials.
3. Click Create access key.
4. Copy the access key ID and the secret access key to a text file.
   You can only show the secret access key once, but you can delete and create keys if necessary.
5. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases and click New.
7. Enter a unique name for the credential, for example, Elastic Beanstalk 01.
8. Enter the Access Key ID and Secret Access Key of the access key you created in the AWS console.
9. In the box labeled Credential alias, enter sn Aws beanstk spk.AWS_Elastic_Beanstalk.
10. In the box labeled Authentication Algorithm, enter AmazonElasticBeanstalkAuthAlgo.
11. Click Submit.

The AWS Elastic Beanstalk spoke is set up and integrated with the ServiceNow instance.

AWS Elastic Load Balancing spoke

Manage load balancers, tags, and target groups in AWS account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for AWS Elastic Load Balancing API version 2012-06-01.
Spoke requirements

- User with full access to AWS Elastic Load Balancing.
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The AWS Elastic Load Balancing spoke provides actions to automate AWS Elastic Load Balancing tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic Load Balancer Management</td>
<td>Create Load Balancer</td>
<td>Creates an application load balancer or network load balancer.</td>
</tr>
<tr>
<td></td>
<td>Create Load Balancer Listener</td>
<td>Creates a listener for the specified application load balancer or network load balancer.</td>
</tr>
<tr>
<td></td>
<td>Delete Load Balancer</td>
<td>Deletes the specified application load balancer or network load balancer.</td>
</tr>
<tr>
<td></td>
<td>Delete Load Balancer Listener</td>
<td>Deletes the specified listener.</td>
</tr>
<tr>
<td></td>
<td>Get Account Limits</td>
<td>Lists the Elastic Load Balancing resource limits for the AWS account.</td>
</tr>
<tr>
<td></td>
<td>Get Load Balancer Attributes</td>
<td>Lists the attributes for the specified application load balancer or network load balancer.</td>
</tr>
<tr>
<td></td>
<td>Look up Listeners</td>
<td>Retrieves list of the specified listeners</td>
</tr>
<tr>
<td></td>
<td>Look up Load Balancers</td>
<td>Retrieves list of the specified load balancers or all the load balancers.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up SSL Policies</td>
<td>Lists all policies used for SSL negotiation.</td>
</tr>
<tr>
<td></td>
<td>Update Load Balancer Attributes</td>
<td>Updates the specified attributes of the specified application load balancer or network load balancer.</td>
</tr>
<tr>
<td>Tag Management</td>
<td>Add Tags</td>
<td>Adds the specified tags to the specified Elastic Load Balancing resource.</td>
</tr>
<tr>
<td></td>
<td>Delete Tags</td>
<td>Removes the specified tags from the specified Elastic Load Balancing resource.</td>
</tr>
<tr>
<td></td>
<td>Look up Tags</td>
<td>Retrieves list of the tags for the specified resources.</td>
</tr>
<tr>
<td>Target Group Management</td>
<td>Create Target Group</td>
<td>Creates a target group.</td>
</tr>
<tr>
<td></td>
<td>Deregister Target</td>
<td>Deregisters the specified targets from the specified target group.</td>
</tr>
<tr>
<td></td>
<td>Get Target Group Attributes</td>
<td>Lists the attributes for the specified target group.</td>
</tr>
<tr>
<td></td>
<td>Get Target Health</td>
<td>Lists the health of the targets.</td>
</tr>
<tr>
<td></td>
<td>Look up Target Groups</td>
<td>Retrieves details of the specified target groups or all of your target groups.</td>
</tr>
<tr>
<td></td>
<td>Register Target</td>
<td>Registers the specified targets with the specified target group.</td>
</tr>
<tr>
<td></td>
<td>Update Target Group</td>
<td>Updates the health checks used for evaluating the health state of the targets in the specified target group.</td>
</tr>
<tr>
<td></td>
<td>Update Target Group Attribute</td>
<td>Updates the specified attributes of the specified target group.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the AWS Elastic Load Balancing spoke**

Integrate the ServiceNow instance and AWS Elastic Load Balancing account using AWS credential to authenticate ServiceNow requests.

- Request an IntegrationHub subscription
- Activate the AWS Elastic Load Balancing spoke
- Role required: admin
*Create Credential record for the AWS Elastic Load Balancing spoke*

Create credential record for the AWS Elastic Load Balancing account. The AWS Elastic Load Balancing spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record, **AWS_Elastic_Load_Balancing**.
3. In the **Credentials** tab, click **New**.
   
   The system displays the message **What type of Credentials would you like to create?**.
4. Select **AWS Credentials**.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>Elastic Load Balancing Cred</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to AWS Elastic Load Balancing.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to AWS Elastic Load Balancing.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>AmazonElasticLoadBalancingAuthAlgo</strong>.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click **Submit**.

**AWS IAM spoke v1.0.2**

Integrate ServiceNow instance with AWS IAM to manage access to AWS services and resources securely. Manage groups, policies, and roles in AWS IAM from your ServiceNow instance.

**Request apps on the Store**

Visit the [ServiceNow Store](https://store.service-now.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](https://store.service-now.com/).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see [Request IntegrationHub](https://store.service-now.com/).
Supported version

This spoke was built for API version 2010-05-08, but may be compatible with later versions.

Note: If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

• User with full access to IAM.
• Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see AWS Identity and Access Management Documentation site.

Spoke subflows

The Jenkins spoke provides sample subflows to demonstrate automating AWS IAM tasks. Available subflows are:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete Group</td>
<td>Deletes the specified AWS IAM group.</td>
</tr>
<tr>
<td>Delete User</td>
<td>Deletes the specified AWS IAM user.</td>
</tr>
<tr>
<td>Delete Policy</td>
<td>Deletes the specified policy from the AWS IAM account.</td>
</tr>
</tbody>
</table>

Spoke actions

The AWS IAM spoke provides actions to automate AWS IAM tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds user to a group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Get Group</td>
<td>Searches for the required group in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Get Group Users</td>
<td>Lists all the users in the required group.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes a user from a group in AWS IAM.</td>
</tr>
<tr>
<td>Group Policy Management</td>
<td>Attach Inline Policy In Group</td>
<td>Adds or updates an inline policy document embedded in the specified IAM group.</td>
</tr>
<tr>
<td></td>
<td>Attach Policy To Group</td>
<td>Attaches the specified managed policy to the required IAM group.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Detach Inline Policy From Group</td>
<td>Deletes the specified inline policy from the specified AWS IAM group</td>
</tr>
<tr>
<td></td>
<td>Detach Policy From Group</td>
<td>Detaches the specified managed policy from the required IAM group.</td>
</tr>
<tr>
<td></td>
<td>List Attached Group Policies</td>
<td>Retrieves the list of all policies attached to the IAM group.</td>
</tr>
<tr>
<td></td>
<td>List Group Policies</td>
<td>Retrieves all the inline policies of the specified group. If none exists, the operation returns an empty list</td>
</tr>
<tr>
<td>Policy Management</td>
<td>Create Policy</td>
<td>Creates managed policy in the specified IAM group.</td>
</tr>
<tr>
<td></td>
<td>Delete Policy</td>
<td>Deletes specified Policy from AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Detach Policy From Roles</td>
<td>Detaches the specified managed policy from the specified IAM Role.</td>
</tr>
<tr>
<td></td>
<td>List Entities For Policy</td>
<td>Lists all entities (Users, Group, and Roles) attached to this policy.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a user in AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>Deactivate MFA Device</td>
<td>Deactivates the required MFA device attached to a user.</td>
</tr>
<tr>
<td></td>
<td>Delete Access Key For User</td>
<td>Deletes the access key of the AWS IAM user.</td>
</tr>
<tr>
<td></td>
<td>Delete Login Profile</td>
<td>Deletes the password for the specified IAM user, which terminates the user's ability to access AWS services through the AWS Management Console.</td>
</tr>
<tr>
<td></td>
<td>Delete Service Specific Credential</td>
<td>Deletes the required service-specific credential.</td>
</tr>
<tr>
<td></td>
<td>Delete Signing Certificate</td>
<td>Deletes a signing certificate associated with the specified IAM user.</td>
</tr>
<tr>
<td></td>
<td>Delete SSH Public Key</td>
<td>Deletes the specified SSH public key.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the required IAM User.</td>
</tr>
<tr>
<td></td>
<td>Delete Virtual MFA Device By User</td>
<td>Deletes the specified Virtual MFA device.</td>
</tr>
<tr>
<td></td>
<td>Detach Policy From User</td>
<td>Detaches the specified managed policy from the specified IAM role.</td>
</tr>
<tr>
<td></td>
<td>Get User</td>
<td>Searches for the required user in the AWS IAM.</td>
</tr>
<tr>
<td></td>
<td>List Access Keys By User</td>
<td>Lists the access key of the AWS IAM user.</td>
</tr>
<tr>
<td></td>
<td>List Groups For User</td>
<td>Retrieves the list of all the groups, a particular user belongs to.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>User Policy Management</td>
<td>List Inline User Policies</td>
<td>Retrieves all the inline policies of the specified IAM user. If none exists, the operation returns an empty list.</td>
</tr>
<tr>
<td></td>
<td>List MFA Devices By User</td>
<td>Retrieves information about the MFA services associated with the specified IAM user. If none exists, the operation returns an empty list.</td>
</tr>
<tr>
<td></td>
<td>List Service Specific Credentials</td>
<td>Retrieves information about the service-specific credentials associated with the specified IAM user.</td>
</tr>
<tr>
<td></td>
<td>List Signing Certificates By User</td>
<td>Retrieves information about the signing certificates associated with the specified IAM user. If none exists, the operation returns an empty list.</td>
</tr>
<tr>
<td></td>
<td>List SSH Public Keys By User</td>
<td>Retrieves information about the SSH public keys associated with the specified IAM user. If none exists, the operation returns an empty list.</td>
</tr>
<tr>
<td></td>
<td>Attach Policy To User</td>
<td>Attaches the specified managed policy to the specified user.</td>
</tr>
<tr>
<td></td>
<td>Delete Inline User Policy</td>
<td>Deletes an inline policy attached to the user.</td>
</tr>
<tr>
<td></td>
<td>List Attached User Policies</td>
<td>Retrieves all the attached policies of the user.</td>

</tbody>
</table>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the AWS IAM spoke

Integrate the ServiceNow instance and AWS IAM using AWS credential to authenticate ServiceNow requests.

- Request an IntegrationHub subscription
- Activate the AWS IAM spoke
- Role required: admin

Create Credential record for the AWS IAM spoke

Create Credential record for your AWS IAM account. The AWS IAM spoke connection and credential alias uses this credential to perform actions on AWS IAM.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for AWS IAM.
3. From the Credentials tab, click New.
The system displays the message *What type of Credentials would you like to create?*. 

4. **Select AWS Credentials.**
5. **On the form, fill these values.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <em>AWS Credentials</em>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to IAM.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to IAM.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <em>AWS IAM Auth Algo</em>.</td>
</tr>
</tbody>
</table>

**Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. **Click Submit.**

The credential record the AWS IAM spoke is created.

**AWS Lambda spoke v1.1.0**

Manage alias and function in AWS Lambda from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- **AWS IAM Spoke** (sn_aws_iam_spoke)
Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version

This spoke was built for API version 2010-05-08, but may be compatible with later versions.

Note: If you use different API version, ensure that you change the API version in all spoke actions.

Spoke requirements

• User with full access to Lambda.
  
  Note: The AWSLambdaFullAccess IAM policy must be assigned to the user. See Identity-based IAM policies for AWS Lambda for more information about the IAM policy.

• Access Key ID and Secret Access Key of the user as obtained in the IAM Console. Record these values for later use.

For more information about creating user in IAM and providing the required access, see Understanding and Getting Your Security Credentials page on the AWS Documentation site.

Spoke actions

The AWS Lambda spoke provides actions to automate AWS Lambda tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alias Management</td>
<td>Create Function Alias</td>
<td>Creates an alias for the specified function.</td>
</tr>
<tr>
<td></td>
<td>Delete Function Alias</td>
<td>Deletes the specified alias of the function.</td>
</tr>
<tr>
<td></td>
<td>Get Function Alias Details</td>
<td>Retrieves the details of the specified function alias.</td>
</tr>
<tr>
<td></td>
<td>List Function Aliases</td>
<td>Retrieves the list of all aliases for the specified function.</td>
</tr>
<tr>
<td></td>
<td>Update Function Alias</td>
<td>Updates settings of the specified alias.</td>
</tr>
<tr>
<td>Function Management</td>
<td>Add Permission</td>
<td>Grants an AWS service or another account permission to use the specified AWS Lambda function.</td>
</tr>
<tr>
<td></td>
<td>Create Function</td>
<td>Creates a function in AWS Lambda.</td>
</tr>
<tr>
<td></td>
<td>Delete Function</td>
<td>Deletes the specified AWS Lambda function or function version.</td>
</tr>
<tr>
<td></td>
<td>Get Function Details</td>
<td>Retrieves details of the specified AWS Lambda function or function version.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Invoke Function</td>
<td>Invokes the specified AWS Lambda function.</td>
</tr>
<tr>
<td></td>
<td>List Functions</td>
<td>Retrieves list of all AWS Lambda functions in a region</td>
</tr>
<tr>
<td></td>
<td>Update Function Code</td>
<td>Updates code of the specified AWS Lambda function.</td>
</tr>
<tr>
<td></td>
<td>Update Function Configuration</td>
<td>Updates configuration of the specified AWS Lambda function.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

### Set up the AWS Lambda spoke

Integrate the ServiceNow instance and AWS Lambda using AWS credential to authenticate ServiceNow requests.

- Request an IntegrationHub subscription
- Activate the *AWS IAM spoke v1.0.2*
- Activate the AWS Lambda spoke
- Role required: admin

**Create Credential record for the AWS Lambda spoke**

Create Credential record for your AWS Lambda account. The AWS Lambda spoke connection and credential alias uses this credential to perform actions on AWS Lambda.

1. Navigate to *Connections & Credentials > Connection & Credential Aliases*.
2. Open for the record for *Amazon Lambda*.
3. From the *Credentials* tab, click *New*.

   The system displays the message *What type of Credentials would you like to create?*.

4. Select *AWS Credentials*.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Lambda Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to AWS Lambda.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to AWS Lambda.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Associated credential record.</td>
</tr>
</tbody>
</table>
### Field | Value required
--- | ---
Authentication Algorithm | Custom authentication algorithm for outbound signing requests. Select **AWS IAM Auth Algo**.

**Note:** Users are cautioned against directly modifying the default authentication algorithm.

6. Click **Submit**.

The credential record the AWS Lambda spoke is created.

**AWS OpsWorks spoke**

Manage elastic load balancers, instances, relational database services, and others in AWS OpsWorks account from the ServiceNow instance.

**Request apps on the Store**

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](#).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see [Request IntegrationHub](#).

**Supported versions**

This spoke was built for AWS OpsWorks API version 2013-02-18, but may be compatible with later versions.

**Spoke requirements**

- User with full access to AWS OpsWorks
- Access Key ID and Secret Access Key of the user. Record these values for later use.

For more information about creating user in IAM and providing the required access, see [Understanding and Getting Your Security Credentials](#) page on the [AWS Documentation](#) site.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
Spoke actions

The AWS OpsWorks spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic Load Balancer Management</td>
<td>Attach Elastic Load Balancer</td>
<td>Attaches an Elastic Load Balancer to a specified layer.</td>

</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

### Set up the AWS OpsWorks spoke

Integrate the ServiceNow instance and AWS OpsWorks account by using the AWS credentials to authenticate ServiceNow requests.

- Request an IntegrationHub subscription.
- Activate AWS OpsWorks spoke.
- Role required: admin

*Create a credential record for the AWS OpsWorks spoke*

Create a credential record for the AWS OpsWorks account. The AWS OpsWorks spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   
The system displays this message: *What type of Credentials would you like to create?*
3. Select **AWS Credentials**.
4. On the form, fill these values.

#### AWS Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, AWS OpsWork Credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Access Key ID</td>
<td>Access Key ID of the user with full access to AWS OpsWorks.</td>
</tr>
<tr>
<td>Secret Access Key</td>
<td>Secret Access Key of the user with full access to AWS OpsWorks.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select <strong>AmazonOpsWorkAuthAlgo</strong>. &lt;br&gt;<strong>Note:</strong> Users are cautioned against directly modifying the default authentication algorithm.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the AWS OpsWorks spoke.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.

**Azure DevOps Boards spoke v1.6.1**

Automate the process of managing work items in Azure DevOps Boards from your ServiceNow instance.

**Request apps on the Store**

Visit the [ServiceNow Store](https://store.snow.dev/search) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](https://store.snow.dev/search).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see [Request IntegrationHub](https://store.snow.dev/search).

**Supported versions**

This spoke was built for Azure DevOps Boards REST API version 4.1 and TFS 2018 Update 3, but may be compatible with later versions.

**Spoke requirements**

- Azure DevOps instance
- Personal access tokens (PATs) to authenticate Azure DevOps

See [Azure DevOps documentation](https://docs.microsoft.com/en-us/azure/devops/) for information about creating token.

**Spoke actions**

The Azure DevOps Boards spoke provides actions manage work items when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Core Process Management</td>
<td>Create Iteration</td>
<td>Creates an Azure DevOps iteration.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Iteration</td>
<td>Deletes an Azure DevOps iteration by path.</td>
</tr>
<tr>
<td></td>
<td>Post Iteration to Team</td>
<td>Adds an Azure DevOps iteration to an Azure DevOps team.</td>
</tr>
<tr>
<td></td>
<td>Reporting Work Items Revisions</td>
<td>Adds reporting work-item revisions for batch processing.</td>
</tr>
<tr>
<td></td>
<td>Reporting Work Items Links</td>
<td>Adds reporting work-item links for batch processing.</td>
</tr>
<tr>
<td></td>
<td>Update Iteration</td>
<td>Updates the name, start date, and end date for an Azure DevOps iteration.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Delink Iterations From A Team</td>
<td>Delinks Azure DevOps iterations from a team.</td>
</tr>
<tr>
<td></td>
<td>Get Creatable Fields</td>
<td>Retrieves the list of all fields in a required Azure DevOps project.</td>
</tr>
<tr>
<td></td>
<td>Get Area Paths of a Team</td>
<td>Retrieves the details of all area paths related to a team.</td>
</tr>
<tr>
<td></td>
<td>Get Areas Path</td>
<td>Retrieves the details of all area paths in a project.</td>
</tr>
<tr>
<td></td>
<td>Get Backlog and Default Iterations</td>
<td>Retrieves the details of all backlog and default iterations related to a team.</td>
</tr>
<tr>
<td></td>
<td>Get Iteration Paths</td>
<td>Retrieves the details of all iteration paths in a project.</td>
</tr>
<tr>
<td></td>
<td>Get Iteration by Path</td>
<td>Retrieves an Azure DevOps iteration with the specified path.</td>
</tr>
<tr>
<td></td>
<td>Get Iteration Paths of a Team</td>
<td>Retrieves the details of all iteration paths of a team.</td>
</tr>
<tr>
<td></td>
<td>Get Teams</td>
<td>Retrieves the details of all teams in a project.</td>
</tr>
<tr>
<td></td>
<td>Get Processes</td>
<td>Retrieves the details of all processes.</td>
</tr>
<tr>
<td></td>
<td>Get Work Item Data By ID</td>
<td>Retrieves details of the required work item.</td>
</tr>
<tr>
<td></td>
<td>Get Editable Fields</td>
<td>Retrieves the list of all fields in a required Work Item for editing.</td>
</tr>
<tr>
<td></td>
<td>Get Projects</td>
<td>Retrieves the list of all Azure DevOps projects.</td>
</tr>
<tr>
<td></td>
<td>Get Work Item Relations</td>
<td>Retrieves all relations of a required Work Item.</td>
</tr>
<tr>
<td></td>
<td>Get Work Item Type Fields By Process</td>
<td>Retrieves the list of all Work Item Type fields in a required Azure DevOps process.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Get Work Item Types By Process</td>
<td>Retrieves the list of all Work Item types in a required Azure DevOps process.</td>
<td></td>
</tr>
<tr>
<td>Get Work Item Types</td>
<td>Retrieves the list of all Work Item types in a required Azure DevOps project.</td>
<td></td>
</tr>
<tr>
<td>Work Item Management</td>
<td>Create Child Link</td>
<td>Creates parent-child relationships between the required Work Items.</td>
</tr>
<tr>
<td>Create Work Item</td>
<td>Creates a Work Item in your Azure DevOps instance.</td>
<td></td>
</tr>
<tr>
<td>Delete Work Item</td>
<td>Deletes the required Work Item in your Azure DevOps instance.</td>
<td></td>
</tr>
<tr>
<td>Delink Work Items</td>
<td>Delinks parent-child relationships between the required Work Items.</td>
<td></td>
</tr>
<tr>
<td>Update Work Item</td>
<td>Updates details of the required Work Item.</td>
<td></td>
</tr>
<tr>
<td>Add Attachment</td>
<td>Adds an attachment associated with a ServiceNow record to the required work item on the Azure DevOps instance.</td>
<td></td>
</tr>
<tr>
<td>Move To Project</td>
<td>Moves between projects in the same organization.</td>
<td></td>
</tr>
<tr>
<td>Register Service Hook</td>
<td>Registers webhooks for the required project.</td>
<td></td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up Azure DevOps Boards spoke**

Integrate the ServiceNow instance and Azure DevOps Boards using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Azure DevOps Boards spoke
- Role required: admin

*Create Credential records for the Azure DevOps Boards spoke*

Create Credential records for the Azure DevOps instance. The Azure DevOps Boards spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter <em>Azure DevOps Boards Credentials</em>.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your Azure DevOps instance.</td>
</tr>
<tr>
<td>Password</td>
<td>Personal access token to authenticate Azure DevOps.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

*Create Connection records for the Azure DevOps Boards spoke*

Create Connection records to your Azure DevOps instance. The Azure DevOps Boards spoke connection and credential alias uses these connections to perform actions in the Azure DevOps instance.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **Azure DevOps Boards**.
3. From the **Connections** tab, click **New**.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <em>Azure DevOps Boards Connection</em>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Azure DevOps Boards. For example, select <em>Azure DevOps Boards Credentials</em>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the Azure DevOps instance. For example, <a href="https://dev.azure.com/">https://dev.azure.com/</a>&lt;instance-name&gt;.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Azure Traffic Manager spoke**

Integrate ServiceNow instance with Azure Traffic Manager. Manage DNS-based traffic distribution and load balancing from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Azure Traffic Manager 2018-04-01, but may be compatible with later versions.

Spoke requirements

- Client ID and Client Secret of the Azure Traffic Manager registered in the Azure portal.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Microsoft Azure Resource Management Spoke 1.0.3 (sn_azure_rm_spoke)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Azure Traffic Manager Spoke provides actions to automate DNS-based traffic load balancing tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint Management</td>
<td>Create Endpoint</td>
<td>Creates a traffic manager endpoint.</td>
</tr>
<tr>
<td></td>
<td>Delete Endpoint</td>
<td>Deletes a traffic manager endpoint.</td>
</tr>
<tr>
<td></td>
<td>Get Endpoint</td>
<td>Retrieves the details of a traffic manager endpoint.</td>
</tr>
<tr>
<td></td>
<td>Update Endpoint</td>
<td>Updates the details of a traffic manager endpoint.</td>
</tr>
<tr>
<td>Profile Management</td>
<td>Check DNS Availability</td>
<td>Checks the availability of a traffic manager relative Domain Name System (DNS) name.</td>
</tr>
<tr>
<td></td>
<td>Create Profile</td>
<td>Creates a traffic manager profile.</td>
</tr>
<tr>
<td></td>
<td>Delete Profile</td>
<td>Deletes a traffic manager profile.</td>
</tr>
<tr>
<td></td>
<td>Get Profile</td>
<td>Retrieves the details of a traffic manager profile.</td>
</tr>
<tr>
<td></td>
<td>Look up Profiles By Resource Group</td>
<td>Retrieves all traffic manager profiles within a resource group.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Look up Profiles By Subscription</td>
<td>Retrieves a list of traffic manager profiles within a subscription.</td>
</tr>
<tr>
<td></td>
<td>Update Profile</td>
<td>Updates the details of a traffic manager profile.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

### Set up the Azure Traffic Manager spoke

Integrate the ServiceNow instance and Azure Traffic Manager by creating a custom OAuth application in Azure Traffic Manager to authenticate ServiceNow requests.

- Request an IntegrationHub subscription.
- Activate Azure Traffic Manager Spoke.
- Role required: admin

**Register Azure Traffic Manager as an OAuth provider**

Register Azure Traffic Manager as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

1. Navigate to [System OAuth > Application Registry](#).
3. On the form, fill these values.

**Application Registries form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during the Azure Traffic Manager application configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Key Value created during the Azure Traffic Manager application configuration.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: <code>https://login.microsoftonline.com/&lt;directory-id&gt;/oauth2/v2.0/token</code> and replace <code>&lt;directory-id&gt;</code> with the Directory ID of your Azure Traffic Manager account.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do and replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.

Create a credential record for the Azure Traffic Manager spoke

Create a credential record for the Azure Traffic Manager account. The Azure Traffic Manager connection and credential alias uses these credentials to authorize actions.

1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases.
2. Open the Azure_Traffic_Manager record.
3. In the Credentials tab, click New.
   - The system displays this message: What type of Credentials would you like to create?
4. Select OAuth 2.0 Credentials.
5. On the form, fill in these fields.

 OAuth 2.0 Credentials fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the credentials record. For example, enter Azure Traffic Manager.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make the credential active.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>The OAuth profile you created when you registered the custom Azure Traffic Manager application as an OAuth provider. Enter Azure Resource Management default_profile</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to assign the credential to all MID servers, or only specified MID servers.</td>
</tr>
<tr>
<td>Order</td>
<td>The order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>The credential alias of the dependant Azure Resource Management spoke. Click the lock icon and enter sn_azure_rm_spoke.Azure_Resource_Management</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click Save.
7. To generate the OAuth token, click the Get OAuth Token related link.

BigFix Inventory spoke

Manage hardware, software, and licenses in BigFix Inventory from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see *Request IntegrationHub*.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Streaming (com.glide.hub.action_type.datastream)

*Note:* Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

This spoke was built for BigFix Inventory version 9.2.16.0, but may be compatible with later versions.

Spoke requirements

- BigFix Inventory Management account

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The BigFix Inventory spoke provides actions to automate BigFix Inventory tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware</td>
<td>List Hardware Inventory</td>
<td>Retrieves the list of hardware records from the BigFix Inventory.</td>
</tr>
<tr>
<td></td>
<td>List Shared Disks</td>
<td>Retrieves the list of shared disks from the BigFix Inventory.</td>
</tr>
<tr>
<td></td>
<td>Look Up BIOS Details By Computer ID</td>
<td>Retrieves the Basic Input-Output System (BIOS) details of the specified computer ID.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Look Up Computer Hardware Fields By Computer ID</td>
<td>Retrieves the list of logical partitions of the specified computer ID.</td>
<td></td>
</tr>
<tr>
<td>Look Up IP Addresses By Computer ID</td>
<td>Retrieves the list of Internet Protocol addresses (IP addresses) of the specified computer ID.</td>
<td></td>
</tr>
<tr>
<td>Look Up Logical Partitions By Computer ID</td>
<td>Retrieves the list of logical partitions of the specified computer ID.</td>
<td></td>
</tr>
<tr>
<td>Look Up Memory Details By Computer ID</td>
<td>Retrieves the memory details of the specified computer ID.</td>
<td></td>
</tr>
<tr>
<td>Look Up Network Adapters By Computer ID</td>
<td>Retrieves the list of network adapters of the specified computer ID.</td>
<td></td>
</tr>
<tr>
<td>Look Up Operating System Details By Computer ID</td>
<td>Retrieves the operating system details of the specified computer ID.</td>
<td></td>
</tr>
<tr>
<td>Look Up Physical Partion Details By Computer ID</td>
<td>Retrieves the physical partitions of the specified computer ID.</td>
<td></td>
</tr>
<tr>
<td>Look Up Processor Details By Computer ID</td>
<td>Retrieves the processor details of the specified computer ID.</td>
<td></td>
</tr>
<tr>
<td>Look Up Storage Devices By Computer ID</td>
<td>Retrieves the list of storage devices of the specified computer ID.</td>
<td></td>
</tr>
<tr>
<td>Licensing</td>
<td>List License Metric Utilization</td>
<td>Retrieves the list of license usage data from the BigFix Inventory.</td>
</tr>
<tr>
<td>Software</td>
<td>List Cluster Information</td>
<td>Retrieves a list of clusters from the BigFix Inventory.</td>
</tr>
<tr>
<td></td>
<td>List IBM Software Products</td>
<td>Retrieves the summary of IBM softwares in the BigFix Inventory.</td>
</tr>
<tr>
<td></td>
<td>List License Usage</td>
<td>Retrieves the highest license usage for the last 90 days.</td>
</tr>
<tr>
<td></td>
<td>List Software Components</td>
<td>Retrieves the list of software components in the BigFix Inventory.</td>
</tr>
<tr>
<td></td>
<td>List Software Inventory</td>
<td>Retrieves the list of installed softwares in the Bigfix Inventory.</td>
</tr>
<tr>
<td></td>
<td>List VM Managers</td>
<td>Retrieves the list of Virtual Machine (VM) managers.</td>
</tr>
<tr>
<td></td>
<td>Look Up IBM Product Release By Product ID</td>
<td>Retrieves the list of releases associated with an IBM software.</td>
</tr>
<tr>
<td></td>
<td>Look Up IBM Product Release Instances By Release ID</td>
<td>Retrieves the list of instances associated with an IBM software release.</td>
</tr>
</tbody>
</table>

**Set up the BigFix Inventory spoke**

Integrate the ServiceNow instance and BigFix Inventory using an API key for authenticating ServiceNow requests.

- Request IntegrationHub subscription
• Activate the BigFix Inventory spoke
• Role required: admin

**Configure BigFix Inventory**
Create a BigFix Inventory instance to generate an access token for API key authentication.

BigFix Inventory Requirements:
• BigFix Inventory account
• BigFix Inventory administrator credentials

Complete these steps from your BigFix Inventory environment. For more information on installation and configuration, see [BigFix V9.5 Inventory Documentation](#).

1. Generate an access token to interact with BigFix Inventory APIs.
2. Record the access token to create Credential records on your ServiceNow instance.

**Create Credential records for the BigFix Inventory spoke**
Create Credential records for the BigFix Inventory spoke. The BigFix Inventory spoke connection and credential aliases use these credentials to authorize ServiceNow actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, BigFix Inventory Connection.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to enable the credential as active.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>API Key</td>
<td>API key obtained from the BigFix Inventory.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Option to select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**Create Connection records for the BigFix Inventory spoke**
Create Connection records to your BigFix Inventory account. The BigFix Inventory spoke connection and credential aliases use these connections to perform actions in the BigFix Inventory.

Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for BigFix_Inventory.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. On the form, fill these fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, BigFix Inventory Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record of BigFix Inventory. For example, BigFix Inventory Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection. Default value is sn_bigfix_in_spoke.BigFix_Inventory.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Do not change the default value for this field.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to enable the connection as active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Application scope of the connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Option to auto-generate the URL based on the inputs. Default is unchecked.</td>
</tr>
<tr>
<td></td>
<td>When this option is selected, the <strong>Connection URL</strong> is disabled. If selected, define the associated fields.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL for creating the connection. For example, <a href="https://bigfixtestsserver.eastus.cloudapp.server.com:9081/api">https://bigfixtestsserver.eastus.cloudapp.server.com:9081/api</a></td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server for this connection. If selected, define fields in the <strong>Advance MID Server Configuration</strong> section.</td>
</tr>
<tr>
<td>u_version</td>
<td>Version of the API. Default value is 2.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Blue Prism spoke v1.0.1**

Manage jobs and processes in Blue Prism environment from your ServiceNow instance.

**Request apps on the Store**

Visit the *ServiceNow Store* website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the *ServiceNow Store version history release notes*.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see *Request IntegrationHub*.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Complex Object (com.glide.object)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
• ServiceNow IntegrationHub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Supported Versions**

This spoke was built for Blue Prism Process Dispatch Framework version 2.6, but may be compatible with later versions.

**Spoke Requirements**

• Blue Prism account

**Spoke flows and subflows**

This spoke has no flows and subflows.

**Spoke actions**

The Blue Prism spoke provides actions to automate Blue Prism tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job Management</td>
<td>Get Job Status</td>
<td>Retrieves the status of the specified job.</td>
</tr>
<tr>
<td></td>
<td>List Job Outputs</td>
<td>Retrieves the list of outputs of a job associated with the specified session ID.</td>
</tr>
<tr>
<td></td>
<td>Start Job</td>
<td>Executes a job with the specified inputs on the Blue Prism environment.</td>
</tr>
<tr>
<td>Process Management</td>
<td>Get Process Parameters</td>
<td>Retrieves the list of parameters for the specified process on the Blue Prism environment.</td>
</tr>
<tr>
<td></td>
<td>List Processes</td>
<td>Retrieves the list of processes on the Blue Prism environment.</td>
</tr>
<tr>
<td>Utilities</td>
<td>Generate Collection Inputs</td>
<td>Creates a formatted string of the collection type. This formatted string is used as input for the Start Job action.</td>
</tr>
</tbody>
</table>
MID Server requirements

These actions use REST calls, which run on MID Server. Use the connection record that is associated with the Blue Prism Inventory alias to configure where actions run as well as to set MID Server selection attributes. For more information, see MID server.

Set up the Blue Prism spoke

Integrate the ServiceNow instance and Blue Prism environment to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin

Configure Blue Prism application

Configure the Dispatch Framework and Process info utilities in your Blue Prism environment to enable integration with ServiceNow.

Blue Prism Digital Exchange account

1. Log in to Blue Prism Digital Exchange.
2. Click Link to Asset of Dispatch Framework utility.
   - You are redirected to Dispatch Framework repository on GitHub.
4. Click Link to Asset of Process Info utility.
   - You are redirected to Process Info repository on GitHub.
5. Complete the steps mentioned in the Blue Prism Process Info VBO User Guide.
   - Your Blue Prism environment is ready for integration with your ServiceNow instance.

Create Connection and Credential Alias for Blue Prism ProcessInfo

Connection to Blue Prism ProcessInfo utility is required for integration.

1. Navigate to Connections & Credentials > Connection and Credential Aliases.
2. Open the record for BluePrismProcessInfo.
3. From Related Links section, Click Create New Connection & Credential.
   - The Create Connection and Credential modal appears.
4. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name of the connection. Default value is Blue Prism Process Info Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL used for creating connection to Blue Prism environment.</td>
</tr>
<tr>
<td>Database Credential Name</td>
<td>Credential name of the database. Default value is DB Read User.</td>
</tr>
<tr>
<td>Database Server Address</td>
<td>Database server address in Blue Prism environment.</td>
</tr>
<tr>
<td>Database Name</td>
<td>Name of the database. Default value is BluePrism.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Blue Prism Process Info Credentials.</td>
</tr>
<tr>
<td>User Name</td>
<td>User name.</td>
</tr>
<tr>
<td>Password</td>
<td>Password.</td>
</tr>
</tbody>
</table>

5. Click Create.
   - A new record is added in the Connections tab.
6. Open the new record and enable **Use MID server**.

**Note:** **Use MID server** value is disabled by default for a new record.

### Create Connection and Credential Alias for Blue Prism Process Dispatcher

Connection to Blue Prism Process Dispatcher utility is required for integration.

1. Navigate to **Connections & Credentials > Connection and Credential Aliases**.
2. Open the record for **BluePrismProcessDispatcher**.
3. From **Related Links** section, Click **Create New Connection & Credential**.
   The Create Connection and Credential modal appears.
4. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name of the connection. Default value is <strong>Blue Prism Process Dispatcher</strong></td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL used for creating connection to Blue Prism environment.</td>
</tr>
<tr>
<td>Runtime Credential Name</td>
<td>Credential with runtime access configured in Blue Prism environment.</td>
</tr>
<tr>
<td>Credential Name</td>
<td><strong>Blue Prism Process Dispatcher Credentials</strong>.</td>
</tr>
<tr>
<td>User Name</td>
<td>User name.</td>
</tr>
<tr>
<td>Password</td>
<td>Password.</td>
</tr>
</tbody>
</table>

5. Click **Create**.
   A new record is added in the Connections tab.
6. Open the new record and enable **Use MID server**.

**Note:** **Use MID server** value is disabled by default for a new record.

### BMC Remedy spoke

Manage change requests, incidents, problems, and other records in BMC Remedy from your ServiceNow instance.

### Request apps on the Store

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

### IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see **Request IntegrationHub**.
Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action.step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic.inputs)
- Complex Object (com.glide.cobject)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

This spoke was built for BMC Remedy AR server version 19.08, but may be compatible with later versions.

Spoke actions

The BMC Remedy spoke provides actions to perform BMC Remedy tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Management</td>
<td>Create Change</td>
<td>Creates a change request in BMC Remedy.</td>
</tr>
<tr>
<td></td>
<td>Create Incident</td>
<td>Creates an incident in BMC Remedy.</td>
</tr>
<tr>
<td>Incident Management</td>
<td>Get Incident By Number</td>
<td>Retrieves details of the specified incident.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get All Objects</td>
<td>Retrieves name and label of all objects in BMC Remedy.</td>
</tr>
<tr>
<td></td>
<td>Get Change Form Fields</td>
<td>Retrieves the list of fields in the Change Interface form table.</td>
</tr>
<tr>
<td></td>
<td>Get Change Status</td>
<td>Retrieves the list of all statuses in the BMC Remedy Change Management.</td>
</tr>
<tr>
<td></td>
<td>Get Change Timing</td>
<td>Retrieves the list of all change timings in BMC Remedy Change Management.</td>
</tr>
<tr>
<td></td>
<td>Get Creatable Fields</td>
<td>Retrieves the list of creatable fields in a required standard or custom BMC Remedy table.</td>
</tr>
<tr>
<td></td>
<td>Get Creatable Objects</td>
<td>Retrieves the list of creatable objects in BMC Remedy.</td>
</tr>
<tr>
<td></td>
<td>Get Impact</td>
<td>Retrieves the list of all impacts in the BMC Remedy.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Incident Form Fields</td>
<td>Retrieves the list of fields in the Incident Interface form table.</td>
</tr>
<tr>
<td></td>
<td>Get Incident Status</td>
<td>Retrieves the list of all statuses in BMC Remedy Incident Management.</td>
</tr>

</tbody>
</table>

**Spoke modules**

The BMC Remedy spoke adds a BMC Remedy application to your instance and includes these modules:
### Spoke user roles

The Remedy_Admin (sn_bmcremedy_spoke.Remedy_Admin) is available when the BMC Remedy spoke is installed. Users with role can view and create objects in the Objects module.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

Two aliases are available when you install the BMC Remedy spoke; one alias is of the **Connection and Credential** type and the other alias is of the **Credential** type.

### MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the BMC Remedy alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

### Set up the BMC Remedy spoke

Integrate the ServiceNow instance and BMC Remedy by using Remedy credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the BMC Remedy spoke.
- Role required: admin.

**Note:** Ensure that you perform these steps in the **BMC Remedy Spoke** application scope only.

*Create Credential record for the BMC Remedy spoke*

Create Credential records for your BMC Remedy application. The BMC Remedy spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record for the **BMC Remedy spoke** whose **Type** is **Credential**. For example, **BMCRemedy_Credential**.
3. From the **Credentials** tab, click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
4. Select **Remedy Credential**.

---

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credentials</td>
<td>Credential records for the BMC Remedy spoke can be accessed here.</td>
</tr>
<tr>
<td>Objects</td>
<td>Information about the objects in BMC Remedy can be accessed here. You can also create an object that can be used in your flows. See <a href="#">Create a BMC Remedy object in your ServiceNow instance</a> for information about creating an object.</td>
</tr>
</tbody>
</table>
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Remedy Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>User name</td>
<td>User name of the BMC Remedy user.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the BMC Remedy user's account.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias record associated with this record.</td>
</tr>
<tr>
<td>Token Status</td>
<td>Status of the BMC Remedy token. Select Active.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential record.</td>
</tr>
<tr>
<td>MID servers</td>
<td>Specific MID Servers that can use this credential record.</td>
</tr>
</tbody>
</table>

**Note:** Administrator user isn't necessary. However, ensure that the BMC Remedy user has permissions to perform the required change, incident, and problem management actions.

6. Right-click the form header and click **Save**.

The credential record the BMC Remedy spoke is created.

*Create Connection record for the BMC Remedy spoke*

Create Connection record for your BMC Remedy application. The BMC Remedy spoke connection and credential alias uses this connection to perform actions in BMC Remedy.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record of **BMC Remedy spoke** whose **Type** is **Connection and Credential**. For example, BMCRemedy.
3. From the **Connections** tab, click **New**.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter BMC Remedy Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for BMC Remedy. For example, select Remedy Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Connection alias associated with this record.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Option to manually enter the connection URL or use system to build the URL based on the inputs.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL to launch the BMC Remedy application. For example, http://&lt;bmc-remedy-localhost&gt;:8008/api</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server.</td>
</tr>
</tbody>
</table>

**Note:** This field appears only when Specific MID servers is selected from Applies to.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capabilities</td>
<td>Capability of the MID Server. This field appears only when the Use MID server option is selected.</td>
</tr>
<tr>
<td>MID Application</td>
<td>Option to use a MID Server. This field appears only when the Use MID server option is selected.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

5. Click Submit.

The connection record the BMC Remedy spoke is created.

**Create a BMC Remedy object in your ServiceNow instance**

Manage other objects in BMC Remedy from your ServiceNow instance by creating the required object.

Role required: admin or Remedy_Admin

By default, the BMC Remedy spoke supports the change request, incident, and problem objects. To manage other objects, such as Product Catalog, create an object in your ServiceNow instance.

1. Navigate to **BMC Remedy Spoke > Objects**.
2. Click **New**.
3. On the form, fill these fields.

<table>
<thead>
<tr>
<th>BMC Remedy Objects form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the required form. This value is unique to each object. For example, the form value for Product Catalog is PCT:Product Catalog.</td>
</tr>
<tr>
<td>Label</td>
<td>Label name to identify the record.</td>
</tr>
<tr>
<td>Creatable</td>
<td>Option to create records in the object. Select the option to create records and use the object in your flows.</td>
</tr>
</tbody>
</table>

4. Click Submit.

**Box spoke v2.0.2**

Move attachments to Box where they can be managed as shared documents.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.
Supported versions

API version v2.

Spoke flows

The Box spoke provides sample flows in the draft state to demonstrate automating Box tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move Attachment when created to Box</td>
<td>Moves attachment files from ServiceNow to Box when a new attachment record is added. Updates the trigger record with a shared link to the moved attachment file on Box.</td>
</tr>
<tr>
<td>On-boarding user</td>
<td>Creates a user in Box when you create a ServiceNow user in the Box User group.</td>
</tr>
</tbody>
</table>

Spoke actions

The Box spoke provides actions to automate Box tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Management</td>
<td>Add Metadata to File</td>
<td>Specifies custom data for a particular file or folder.</td>
</tr>
<tr>
<td></td>
<td>Copy File to ServiceNow Attachment</td>
<td>Copies a file from Box and attaches it to the specified ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Lookup File ID</td>
<td>Retrieves the ID of the specified file in Box.</td>
</tr>
<tr>
<td></td>
<td>Move Owned Item</td>
<td>Moves all items owned by the specified user in Box to the specified folder.</td>
</tr>
<tr>
<td></td>
<td>Remove File</td>
<td>Removes the specified file from Box.</td>
</tr>
<tr>
<td></td>
<td>Upload File</td>
<td>Uploads the specified file to Box.</td>
</tr>
</tbody>
</table>
| Document Sharing        | Add Collaborator                | Grants a user or group a specified level of access to a particular file or folder. Collaborators have one of these access levels. | • Co-Owner
• Editor
• Previewer
• Preview Uploader
• Uploader
• Viewer
• Viewer Uploader
<table>
<thead>

<td>Update Group</td>
<td>Updates the specified group in Box with the specified preferences.</td>
</tr>
<tr>
<td>User Management</td>
<td>Add User to Group</td>
<td>Adds the specified user to the specified group in Box.</td>
</tr>
<tr>
<td></td>
<td>Create App User</td>
<td>Creates an Enterprise App User in Box, which the spoke uses to act on behalf of other Box users. An Enterprise App User account cannot login directly to Box.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a new user account in Box.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified user in Box.</td>
</tr>
<tr>
<td></td>
<td>Disable User</td>
<td>Sets the status of the specified user in Box to inactive.</td>
</tr>
<tr>
<td></td>
<td>Enable User</td>
<td>Sets the status of the specified user in Box to active.</td>
</tr>
<tr>
<td></td>
<td>Lookup User ID</td>
<td>Retrieves the ID of the specified user in Box.</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates the specified user in Box with the specified role changes.</td>
</tr>
</tbody>
</table>
Box account requirements

The Box spoke requires creating a custom app on your Box account to generate OAuth 2.0 tokens. See Configure Box account.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses these alias records to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
</table>
| Box                           | Connection to the Box Collaboration and File Management APIs. | • Connection type: HTTP  
• Connection URL: https://api.box.com |
| Box Upload                    | Connection to the Box upload service. | • Connection type: HTTP  
• Connection URL: https://upload.box.com |

To use the spoke connection aliases, create an associated Connection record and an associated Credential record for each alias.

Set up Box spoke

Integrate the ServiceNow instance and Box by creating a custom OAuth application in Box to authenticate ServiceNow requests.

• Request IntegrationHub subscription
• Activate the Box spoke
• Role required: admin

Configure Box account

Create a custom OAuth application from your Box account to enable OAuth 2.0 authentication with the Box spoke.

Box requirements:
• Box account
• Box administrator credentials

Complete these steps from your Box account. See the Box Developer Portal documentation for instructions on creating and configuring custom applications.

1. From your Box account, create a custom OAuth application.
2. Select standard OAuth 2.0 user authentication as the application authentication method.
3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Enable the matching Box application scope permissions you want the app to support.
Box application scope permission | Required for
---|---
Read and write all files and folders stored in Box | Document management, document sharing, and folder management actions
Manage users | User management actions
Manage groups | Group management actions
Manage enterprise properties | Document sharing, group management, and user management actions

Register Box as OAuth provider
Use the information generated during Box account configuration to register Box as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Box OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Box account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the Box account configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   The system validates the OAuth credentials and populates the Redirect URL and the OAuth Entity Profiles related list.
6. Copy the value from Redirect URL.
7. Login to your Box account to edit the configuration of your custom Box application.
   See the Box Developer Documentation for instructions.
8. Paste the Redirect URL value into the OAuth 2.0 Redirect URI for your custom Box application.
   For example, paste https://instance.service-now.com/oauth_redirect.do.

   The instance can request OAuth 2.0 tokens for the spoke.

**Note:** The spoke generates OAuth tokens that expire after 30 days. An administrator can regenerate the spoke OAuth token every 30 days.
Create Credential records for the Box spoke
Create Credential records to the Box custom OAuth application you created during Box account configuration. The Box spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Box API Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Box application as an OAuth provider. For example, select Box OAuth default profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.
6. Click New.
   The system displays the message What type of Credentials would you like to create?.
7. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
8. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Box Upload Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Box application as an OAuth provider. For example, select Box OAuth default profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

9. Click Submit.

Create Connection records for the Box spoke
Create Connection records to your Box account and the Box APIs. The Box spoke connection and credential aliases use these connections to perform actions on Box.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Box.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Box API Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for the Box API. For example, select Box API Credentials.</td>
</tr>
</tbody>
</table>

5. Click Submit.
6. Open for the record for Box Upload.
7. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
8. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Box Upload Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Box upload. For example, select Box Upload Credentials.</td>
</tr>
</tbody>
</table>

9. Click Submit.

Regenerate Box OAuth token
Regenerate the Box OAuth token when it expires. The Box spoke OAuth token expires every thirty days.

1. Navigate to Connections & Credentials > Credentials.
2. Select the Box spoke OAuth Credential record.
   For example, select Box API Credentials.
3. From Related Links, click Get OAuth Token.

The Box spoke receives a new OAuth access token good for 30 days.

Cisco Webex Meetings spoke
Manage users of the Cisco Webex Meetings application. Get a list of all users, view user activity, and deactivate user accounts.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions

Webex Meetings XML API

Spoke actions

The Cisco Webex Meetings spoke provides actions to automate Webex tasks when events occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Get Users</td>
<td>Gets a list of all Webex user subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Get User Activity</td>
<td>Gets the date of the most recent meeting hosted by each Webex user.</td>
</tr>
<tr>
<td></td>
<td>Remove User</td>
<td>Deactivates a Webex user account.</td>
</tr>
</tbody>
</table>

Webex Meetings account requirements

The Cisco Webex Meetings spoke requires creating a custom app in Cisco DevNet to generate OAuth 2.0 tokens. See Create Webex OAuth app.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Webex alias record to authorize actions.

Set up Cisco Webex Meetings spoke

Integrate your ServiceNow instance and the Cisco Webex Meetings application by creating a custom OAuth application in Cisco DevNet to authenticate ServiceNow requests.

• Request IntegrationHub subscription
• Activate the Cisco Webex Meetings spoke
• Role required: admin

Create Webex OAuth app

Create a custom OAuth application in Cisco DevNet to enable OAuth 2.0 authentication with the Cisco Webex Meetings spoke.

Webex Meetings requirements:

• Webex Meetings account
• Webex Meetings administrator credentials

1. Navigate to Cisco DevNet WebEx Integration. Log in using the Login with Webex Meetings option.
2. On the My App Information page, click Add App Information.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integration name</td>
<td>Name of your choice. For example, ServiceNow integration.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td><a href="https://instance.service-now.com/oauth_redirect.do">https://instance.service-now.com/oauth_redirect.do</a>, where instance is the name of your ServiceNow instance</td>
</tr>
<tr>
<td>Scope</td>
<td>Webex Meetings application scope permissions you want the app to support.</td>
</tr>
</tbody>
</table>

**Note:** The read_all and modify_users scopes are required to use the actions provided with the spoke. The Get Users and Get User Activity actions require the read_all scope. The Remove User action requires the modify_users scope.

4. Record the client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.

*Register Webex Meetings as OAuth provider*

Use the information generated during OAuth app creation to register the Webex Meetings application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
3. Select Connect to a third party OAuth Provider.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Webex Meetings OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID you created during the Webex app configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you created during the Webex app configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Authorization Code.</td>
</tr>
<tr>
<td>Token URL</td>
<td><a href="https://api.webex.com/v1/oauth2/token">https://api.webex.com/v1/oauth2/token</a></td>
</tr>
</tbody>
</table>

5. Click Submit.

The system validates the OAuth credentials and populates the Redirect URL field and the OAuth Entity Profiles related list.
Create Credential record for the Webex Meetings spoke
Create a Credential record for the Webex custom OAuth application you created in Cisco DevNet. The Cisco Webex Meetings spoke connection and credential alias uses the credential to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Webex Meetings Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Selected.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile you created when you registered the custom Webex application as an OAuth provider. For example, Webex Meetings OAuth default profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Create Connection record for the Webex Meetings spoke
Create a Connection record for your Webex account. The Cisco Webex Meetings spoke connection and credential alias uses the connection to perform actions in Webex.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record for **Webex**.
3. From the Connections tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, Webex Meetings Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Webex Meetings. For example, Webex Meetings Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td><a href="https://site.webex.com/WBXService/XMLService">https://site.webex.com/WBXService/XMLService</a>, where site is the name of your Webex site.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Continuous Integration and Continuous Delivery (CICD) Spoke
Build a Continuous Integration and Continuation Delivery (CICD) pipeline for your ServiceNow instances. You can automate publishing and installing applications from an application repository, activating plugins, running ATF test suites, and running an instance HealthScan.
**CICD spoke application**

The CICD spoke application is installed by default with the Orlando upgrade.

**Supported versions**

Continuous Integration and Continuous Delivery (CICD) REST API version 1.0.0, which is a Now Platform feature active by default.

**Spoke flows**

This spoke has no sample flows.

**Spoke subflows**

The Continuous Integration and Continuous Delivery (CICD) Spoke provides sample subflows in the draft state to demonstrate automating CICD tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activate Plugin</td>
<td>Activate a plugin by ID on the specified instance URL.</td>
</tr>
<tr>
<td>Apply Changes From Source Control With ID</td>
<td>Apply remote changes from source control to an application by its Sys ID.</td>
</tr>
<tr>
<td>Apply Changes From Source Control With Scope</td>
<td>Apply remote changes from source control to an application by its scope name.</td>
</tr>
<tr>
<td>ATF Suite Start With ID</td>
<td>Start a test suite by its Sys ID on the specified instance URL. Return the test suite execution results.</td>
</tr>
<tr>
<td>ATF Suite Start With Name</td>
<td>Start a test suite by its name on the specified instance URL. Return the test suite execution results.</td>
</tr>
<tr>
<td>HealthScan Execute Full Scan</td>
<td>Start a full HealthScan on the specified instance URL.</td>
</tr>
<tr>
<td>HealthScan Execute Point Scan</td>
<td>Start a HealthScan on the specified instance starting from a particular table and record.</td>
</tr>
<tr>
<td>Install Application With ID</td>
<td>Install an application by its Sys ID from the application repository.</td>
</tr>
<tr>
<td>Install Application With Scope</td>
<td>Install an application by its scope name from the application repository.</td>
</tr>
<tr>
<td>Publish Application With ID</td>
<td>Publish an application by its Sys ID to the application repository.</td>
</tr>
<tr>
<td>Publish Application With Scope</td>
<td>Publish an application by its scope name to the application repository.</td>
</tr>
<tr>
<td>Rollback Application With ID</td>
<td>Rollback an application by its Sys ID. Confirm the rollback version number matches the specified version number or produce an error.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rollback Application With Scope</td>
<td>Rollback an application by its scope name. Confirm the rollback version number matches the specified version number or produce an error.</td>
</tr>
<tr>
<td>Rollback Plugin</td>
<td>Rollback a plugin by ID on the specified instance URL to the last installed version.</td>
</tr>
<tr>
<td>Wait Until Tracker Completes</td>
<td>Wait for a tracker to complete its progress on the specified instance URL and return the results.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Continuous Integration and Continuous Delivery (CICD) Spoke provides actions to automate CICD tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Repo</td>
<td>Install Application With ID</td>

</table>

### CICD account requirements

The Continuous Integration and Continuous Delivery (CICD) Spoke requires creating basic authorization credentials. The user credentials must have either the admin or sn_cicd.sys_ci_automation roles to authorize CICD actions and flows.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

This spoke uses the CICD alias record to authorize actions on local and remote instances.

### MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the CICD alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

### Set up Continuous Integration and Continuous Delivery (CICD) Spoke

Use basic authentication to authenticate CICD REST API calls on a ServiceNow instance.

- Request IntegrationHub subscription
- Activate Continuous Integration and Continuous Delivery (CICD) Spoke
- Role required: admin or sn_cicd.sys_ci_automation

_create Credential records for the Continuous Integration and Continuous Delivery (CICD) Spoke_

Create Credential records to the ServiceNow instance. The Continuous Integration and Continuous Delivery (CICD) Spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin

1. Navigate to [Connections & Credentials > Credentials](#).
2. Click New.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter <strong>CICD Credentials</strong>.</td>
</tr>
<tr>
<td>User name</td>
<td>The ServiceNow instance user name that authorizes and runs spoke actions and flows. This user must have either the admin or sn_cicd.sys_ci_automation roles.</td>
</tr>
<tr>
<td>Password</td>
<td>The password for the ServiceNow instance user.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

*Create Connection records for the Continuous Integration and Continuous Delivery (CICD) Spoke*

Create Connection records to your ServiceNow instance. The Continuous Integration and Continuous Delivery (CICD) spoke connection and credential alias uses these connections to perform actions on your ServiceNow instance.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **CICD**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP or HTTPS Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter <strong>CICD Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for CICD. For example, select <strong>CICD Credentials</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL of the ServiceNow instance on which the spoke runs actions and flows.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

*Cornerstone spoke v1.0.2*

Manage employee records, approvals, and employee learning in your Cornerstone instance from your ServiceNow instance.

*Request apps on the Store*

Visit the [ServiceNow Store](https://store.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](https://store.servicenow.com/).
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Cornerstone version v1, but may be compatible with later versions.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Spoke flows

The Cornerstone spoke provides a sample flow in the draft state to demonstrate automating the Cornerstone tasks. The sample flow, Cornerstone - Pull Todos Details, retrieves the list of Todos for the required user. Ensure that this user is added to your ServiceNow instance. The retrieved records can be accessed by navigating to the TO DO Lists module in the Cornerstone application of your instance.

To customize the sample flow, copy it to a new application scope.

Spoke subflows

The Cornerstone spoke provides sample subflows in the draft state to demonstrate automating Cornerstone tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cornerstone - Get Certificate Transcript Details</td>
<td>Retrieves the certificate information of the required employee.</td>
</tr>
<tr>
<td>Cornerstone - Get Transcripts</td>
<td>Retrieves the transcript information of the required employee.</td>
</tr>
<tr>
<td>Cornerstone - Remove Dangling To Do</td>
<td>Deletes the dangling Todo records. Some of the retrieved Certificate records may not have values set for the Status and Launch URL fields. The Cornerstone - Remove Dangling To Do action deletes such todo records.</td>
</tr>
</tbody>
</table>
Spoke actions

The Cornerstone spoke provides actions to automate Cornerstone tasks when events occurs in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Core Management</td>
<td>Look up Approval Details</td>
<td>Retrieves information about the pending approvals.</td>
</tr>
<tr>
<td></td>
<td>Look up Organizational Unit</td>
<td>Retrieves the list of organization units based on organization unit type.</td>
</tr>
<tr>
<td></td>
<td>Global Search</td>
<td>Searches for the required people, training, certification, and so on.</td>
</tr>
<tr>
<td>Employee Management</td>
<td>Create Employee</td>
<td>Creates an employee record and retrieves core employee data from Cornerstone.</td>
</tr>
<tr>
<td></td>
<td>Get Custom Fields For Employee</td>
<td>Retrieves custom fields for an employee from Cornerstone.</td>

<td>Look up Assigned Trainings</td>
<td>Retrieves details of the trainings assigned to a user.</td>
</tr>
<tr>
<td></td>
<td>Look up Catalog Search</td>
<td>Retrieves details of the required training.</td>
</tr>
<tr>
<td></td>
<td>Look up Certification Transcripts</td>
<td>Retrieves certification transcript information of the required user.</td>
</tr>
<tr>
<td></td>
<td>Look up Certifications From Reporting Data Stream</td>
<td>Retrieves the main view to get the certification data.</td>
</tr>
<tr>
<td></td>
<td>Look up Inbox Items</td>
<td>Retrieves all items in the required user’s inbox as shown on the welcome page.</td>
</tr>
<tr>
<td></td>
<td>Look up Learning Object</td>
<td>Retrieves the learning objects from Cornerstone. The supported learning object types are, Curriculum, Event, Session, Material, Test, Video, and Online Course.</td>
</tr>
<tr>
<td></td>
<td>Look up Sessions</td>
<td>Retrieves details of the upcoming sessions.</td>
</tr>
<tr>
<td></td>
<td>Look up Suggested Training</td>
<td>Retrieves details of the required and suggested learning objects that have been added to user’s transcripts.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>Look up Tasks</td>
<td>Retrieves all the incomplete tasks assigned to the user.</td>
<td></td>
</tr>
<tr>
<td>Look up Transcripts</td>
<td>Retrieves the transcript records of the required user.</td>
<td></td>
</tr>
<tr>
<td>Reporting on Learning Module Management</td>
<td>Look up Tasks From Reporting</td>
<td>Retrieves the main view to get training form user tasks.</td>
</tr>
<tr>
<td></td>
<td>Look up Trainings From Reporting</td>
<td>Retrieves the main view to get training data.</td>
</tr>
<tr>
<td></td>
<td>Look up Transcripts From Reporting</td>
<td>Retrieves the main view to get all user transcript related data.</td>
</tr>
</tbody>
</table>

**Spoke module**

The Cornerstone spoke adds a Cornerstone application to your ServiceNow instance. The Cornerstone application has the TO DO Lists module. List of Todos that the sample flow, Cornerstone - Pull Todos Details, retrieves for the specified user, can be accessed here.

**Cornerstone spoke account requirements**

The Cornerstone spoke requires registering an OAuth 2.0 application in your Cornerstone account to generate OAuth 2.0 tokens for the Cornerstone spoke. For more information about registering an application, see API Management in Cornerstone OnDemand Help. Record the generated Client ID and Client Secret for later use.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**Set up the Cornerstone spoke**

Integrate your Cornerstone application with your ServiceNow instance. Register an OAuth application in Cornerstone and authenticate requests from ServiceNow.

- Request IntegrationHub subscription
- Activate the Cornerstone spoke
- Role required: admin

*Register Cornerstone as an OAuth provider*

Use the information generated during the Cornerstone application creation and configuration to register Cornerstone as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to System OAuth > Application Registry.
2. Open the record for the Cornerstone spoke.
3. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Cornerstone OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the application configuration in Cornerstone.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the application configuration in Cornerstone.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Client Credentials.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Cornerstone Spoke.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry. Select the option.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. For example, https://{Cornerstone-Instance}.com/services/api/oauth2/token.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
5. In the OAuth Entity Profiles tab, click the default profile, Cornerstone default_profile.
6. Insert a record in the OAuth Entity Scope related list and select the default entity scope for the Cornerstone spoke. For example, all.

7. Click Update.

Create Credential record for the Cornerstone spoke
Authorize the Cornerstone spoke actions by creating credential records for the application registered in Cornerstone. The Cornerstone spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin
1. Navigate to Connections & Credentials > Credentials.
2. Click **New**.  
The system displays the message *What type of Credentials would you like to create?*.  
3. Select **OAuth 2.0 Credentials**.  
4. On the form, fill in the fields.  

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <em>Cornerstone Cred</em>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record. Select the option.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Default OAuth entity profile of the Cornerstone spoke. For example, select <em>Cornerstone default_profile</em>.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Save**.  
6. To generate the OAuth token, click the **Get OAuth Token** related link.

*Create Connection record for the Cornerstone spoke*  
Create Connection records to your Cornerstone application. The Cornerstone spoke connection and credential alias uses these connections to perform actions in Cornerstone.

Role required: admin

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.  
2. Open the record for the Cornerstone spoke.  
3. From the **Connections** tab, click **New**.  
4. On the form, fill these values.

**HTTP(s) Connection form**  

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <em>Cornerstone Conn</em>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Cornerstone. For example, select <em>Cornerstone Cred</em>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Do not select the check box.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection URL</td>
<td>URL of the Cornerstone instance.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>This field isn't applicable.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection. Select the option.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. In the **Attributes** tab, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>u_base_url</td>
<td>URL of the Cornerstone instance.</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>u_version</td>
<td>Cornerstone version of your instance. Enter v1.</td>
</tr>
</tbody>
</table>

6. Click Submit.

**Coupa spoke v2**

Manage business spend and automate approval, contract, inventory, purchase order, requisition, supplier, and user management in Coupa from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for Coupa version stable_025.6.0, but may be compatible with later versions.

**Spoke requirements**

Create an API key in your Coupa instance and record the API key for later use. See Coupa documentation for information about creating API key.

**Spoke actions**

The Coupa spoke provides actions to automate approval, contract, inventory, invoice, catalog item, purchase order, requisition, supplier, and user management when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Management</td>
<td>Approve Approval Request</td>
<td>Approves an approval request in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Get Approval Details</td>
<td>Retrieves the details of the required approval in Coupa.</td>
</tr>
<tr>
<td></td>
<td>Look Up Approval</td>
<td>Looks up an approval record in Coupa using the Coupa query.</td>
</tr>
<tr>
<td></td>
<td>Look Up Approval By Requisition ID</td>
<td>Looks up the required approval record in Coupa using its Requisition ID.</td>
</tr>
<tr>

</table>

**Note:** Remote tables are created when the Coupa spoke is activated. Users are cautioned against directly modifying schema or inserting data in these tables.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

### Set up Coupa spoke

Integrate the ServiceNow instance and your Coupa account using an API key to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Coupa spoke
Create Credential records for the Coupa spoke

Create Credential records to the Coupa application you created. The Coupa spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Coupa Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>API Key</td>
<td>API key generated in your Coupa instance.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Coupa spoke

Create a Connection record to the Coupa API. The Coupa spoke connection and credential alias uses these connections to perform actions in Coupa.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for Coupa.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Coupa Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Coupa. For example, select Coupa Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Coupa organization URL. For example, https://&lt;instance-name&gt;.coupacloud.com.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Docker spoke v1.0.3

Lookup Docker data from your ServiceNow instance. Automate changes in the Docker engine when an event occurs in ServiceNow.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

Community Edition version 18.09.0.

Spoke actions

The Docker spoke provides actions to automate Docker tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Images Management</td>
<td>Create An Image</td>
<td>Creates an image in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Images</td>
<td>Lists images from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Remove An Image</td>
<td>Removes an image from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Search Images</td>
<td>Searches for images on Docker Hub.</td>
</tr>
<tr>
<td>Services Management</td>
<td>Create A Service</td>
<td>Creates a service in the Docker instance. Services are tasks run on a swarm.</td>
</tr>
<tr>
<td></td>
<td>Delete A Service</td>
<td>Deletes a service from the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect A Service</td>
<td>Returns detailed information about a service in the Docker instance.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Update A Service</td>
<td>Updates a service to the swarm on the docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Services</td>
<td>Returns a list of services from the Docker instance.</td>
</tr>
<tr>
<td>Containers Management</td>
<td>Create A Container</td>
<td>Creates a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect A Container</td>
<td>Inspects a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Kill A Container</td>
<td>Kills a container in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>List Containers</td>
<td>Lists containers in the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Pause A Container</td>
<td>Suspends all processes in a container on the Docker instance.</td>
</tr>
<tr>
<td></td>
<td>Remove A Container</td>

</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

This spoke uses the Docker alias record to authorize actions. To use the spoke connection alias, create an associated Connection record. This spoke does not require a credential record.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Docker alias to configure where actions run as well as set MID Server selection attributes. For more information, see *MID server*.

**Create Connection records for the Docker spoke**

Create Connection records to the Docker engine. The Docker spoke connection and credential alias uses these connections to perform actions on Docker.

• Request IntegrationHub subscription
• Activate Docker spoke
• Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Docker.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Docker Connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The IP address and port of the host machine where Docker is installed.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**DocuSign spoke v1.2.2**

Automate the process of sending a document to an individual or list of recipients for digital signature using DocuSign. For example, automate employee onboarding and offboarding, or send non-disclosure agreements, legal agreements, and statements of work. Use ServiceNow data in document templates and enable users to upload documents for signature as needed.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
Compatible versions

This spoke was built for DocuSign API version v2 or v2.1, but may be compatible with later versions.

Key features

DocuSign spoke enables a flow designer to:

- Automate the process of sending a document from a ServiceNow attachment or DocuSign template to an individual or recipient list for digital signature.
- Discover and synchronize DocuSign accounts and templates in ServiceNow.
- Retrieve a list of accounts and associated templates from DocuSign and then insert or update them as records in the Accounts [sn_docusign_spoke_accounts] and Templates [sn_docusign_spoke_docusign_templates] tables using the Get Accounts subflow.
- Retrieve templates associated with a specified DocuSign account and then insert or update them as records in the Templates [sn_docusign_spoke_docusign_templates] table using the Get Templates Per Account subflow.
- Copy and customize sample flows for sending templates and on-demand document requests.
- Pause a flow until a document is signed. A scripted REST API webhook waits for the recipient to sign the document.
- Use values from a signed document in a flow.
- Attach a completed DocuSign document to a ServiceNow record for auditing purposes.
- Manage envelopes and users.

Spoke requirements

- DocuSign account
- DocuSign administrator credentials
- DocuSign application configured to integrate with ServiceNow
- DocuSign application details such as client ID, integrator key, secret keys, and RSA keypairs
- ServiceNow IntegrationHub subscription

<i>Note: Ensure that you have activated the Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer) plugin.</i>

See the <i>DocuSign Developer Center</i> documentation for instructions on creating and configuring custom applications.

Spoke flows

The DocuSign spoke provides sample flows to demonstrate automating DocuSign tasks. Use DocuSign spoke actions to automate any tasks desired by your organization. To customize a sample flow, copy it to a new application scope.

Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document to DocuSign for a digital signature when a Service Catalog request is created by the &lt;b&gt;Send a Document for Digital Signature&lt;/b&gt; item. Before using this flow, activate the &lt;b&gt;Send a Document for Digital Signature&lt;/b&gt; catalog item.</td>
</tr>
</tbody>
</table>
The DocuSign spoke adds catalog items for use with the DocuSign spoke sample flows. Before triggering a DocuSign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document for digital signature in DocuSign.</td>
</tr>
<tr>
<td>Demonstrate Template - Send Job Offer to Candidate</td>
<td>Sends a job offer using a DocuSign template.</td>
</tr>
</tbody>
</table>

**Spoke subflows**

The DocuSign spoke provides sample subflows to demonstrate automating DocuSign tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attach DocuSign Envelope To ServiceNow Record</td>
<td>Attaches all the documents in an envelope to a ServiceNow record.</td>
</tr>
<tr>
<td>Get &amp; Set DocuSign Field Data</td>
<td>Processes a list of catalog item variables and updates a draft envelope with each variable value.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The DocuSign spoke provides actions to automate DocuSign tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Get Accounts</td>
<td>Retrieves accounts associated with the spoke Connection and Credential alias record.</td>
</tr>
</tbody>
</table>
| Document Signature          | Get Embedded Signing URL | Creates a signing URL that is embedded into an application. User can sign the document without leaving the application.  
**Note:** Signing URL is active for 300 seconds and can be sent to one recipient at a time.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Management</td>
<td>Attach DocuSign Document to Record</td>
<td>Retrieves a signed DocuSign document and attaches it to a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Get Document ID by Name</td>
<td>Retrieves the document ID from an envelope using the specified document name.</td>
</tr>
<tr>
<td></td>
<td>Get Documents In An Envelope</td>
<td>Returns a list of documents with an ID and name in the given DocuSign envelope.</td>
</tr>
<tr>
<td>Envelope Management</td>
<td>Add Recipient to Envelope</td>
<td>Adds the specified recipient to the specified envelope.</td>
</tr>
<tr>
<td></td>
<td>Create Draft Envelope from Template</td>
<td>Creates a draft envelope from an existing DocuSign template.</td>
</tr>
<tr>
<td></td>
<td>Get Field ID</td>
<td>Retrieves the ID of the specified field from the specified draft envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Field Value</td>
<td>Retrieves the value of the specified field from the specified envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Recipient ID by Role Name</td>
<td>Retrieves the recipient ID of the specified role name from the specified envelope.</td>
</tr>
<tr>
<td></td>
<td>Get Recipients In An Envelope</td>
<td>Returns a list of recipients with a Recipient ID and Role Name in the given DocuSign envelope.</td>
</tr>
<tr>
<td></td>
<td>Send Adhoc Signature Request to User</td>
<td>Sends a DocuSign document associated with the specified ServiceNow record to the specified recipient for signature.</td>
</tr>
<tr>
<td></td>
<td>Send Adhoc Signature Request to Users</td>
<td>Sends a DocuSign document associated with the specified ServiceNow record to the specified multiple recipients for signatures at a time.</td>
</tr>
</tbody>
</table>

**Note:**
- Recipient ID used in this action is associated with the envelope and is different from the Recipient ID used in the Get All Template Fields action.
- Administrator enters a numeric value for this Recipient ID.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send Envelope</td>
<td>Sends an envelope to the specified recipients.</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> All recipient details must be provided before sending an envelope.</td>
<td></td>
</tr>
<tr>
<td>Set Field Value</td>
<td>Sets the value of the specified field in the specified draft envelope.</td>
<td></td>
</tr>
<tr>
<td>Wait for Signature from DocuSign</td>
<td>Pauses a flow until the specified document has been signed or rejected. Returns the status of the document to the flow for further processing.</td>
<td></td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get List Of Documents</td>
<td>Gets the list of all DocuSign documents in an envelope.</td>
</tr>
<tr>
<td>Template Management</td>
<td>Get Templates Per Account</td>
<td>Retrieves the templates associated with the specified DocuSign account.</td>
</tr>
<tr>
<td></td>
<td>Get Template Fields</td>
<td>Retrieves all fields in a template that is defined for a recipient.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
<td>- Recipient ID used in this action is associated with the template and is different from the Recipient ID used in the Add Recipient to Envelope action.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Value of the Recipient ID is a unique system-generated number.</td>
</tr>
<tr>
<td></td>
<td>Get Template Recipients</td>
<td>Retrieves all recipients defined for a template.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a DocuSign user with the specified user details.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified DocuSign user.</td>
</tr>
</tbody>
</table>

**Spoke module**

The DocuSign spoke adds a DocuSign module to your ServiceNow instance. The DocuSign spoke synchronizes and stores templates and envelopes in ServiceNow. The DocuSign spoke includes these tables and records.

<table>
<thead>
<tr>
<th>Table/Record</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Aliases</td>
<td>The DocuSign connection alias.</td>
</tr>
<tr>
<td>Table/Record</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Scheduled Job</td>
<td>The Get Accounts &amp; Templates scheduled job that synchronizes templates and envelopes with your DocuSign account.</td>
</tr>
<tr>
<td>Accounts</td>
<td>DocuSign accounts synchronized with your ServiceNow instance. To synchronize accounts, see <em>Synchronize DocuSign with ServiceNow</em>. The Get Accounts subflow retrieves a list of accounts and associated templates from DocuSign and then inserts or updates them as records in the Accounts [sn_docusign_spoke_accounts] and Templates [sn_docusign_spoke_docusignTemplates] tables.</td>
</tr>
<tr>
<td>Templates</td>
<td>DocuSign templates from synchronized DocuSign accounts. The Get Templates Per Account subflow retrieves templates associated with a specified DocuSign account and then inserts or updates them as records in the Templates [sn_docusign_spoke_docusignTemplates] table.</td>
</tr>
<tr>
<td>Envelopes</td>
<td>DocuSign envelopes from synchronized DocuSign accounts. Records in the Envelopes table are updated only when webhook is configured for the DocuSign account.</td>
</tr>
</tbody>
</table>

The DocuSign spoke tables include these fields.

<table>
<thead>
<tr>
<th>Table</th>
<th>Fields</th>
</tr>
</thead>
</table>
| Accounts [sn_docusign_spoke_accounts] | • Account ID  
• Account Name  
• Description  
• Email

• Embedded Signing  
• Signed Date Time Zone  
• Template |

**DocuSign account requirements**

The DocuSign spoke requires configuring your DocuSign account to generate an OAuth 2.0 JWT Bearer Grant token.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the DocuSign Connection & Credential Alias record to authorize actions.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the DocuSign alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Create connection aliases for additional DocuSign accounts

If your DocuSign implementation includes multiple DocuSign accounts, create a connection alias for each account.

Role required: admin

Your company may have a DocuSign account for each department that uses DocuSign. To use multiple accounts with this spoke, create an alias for each account. At runtime, the system identifies the alias associated with the account and sends the correct connection and credential information in the request.

If your company only has one account, you can use the default DocuSign alias provided with the spoke and proceed to Set up DocuSign spoke.

1. Navigate to DocuSign > Connection Aliases.
2. Select New.
3. In the Name field, add a descriptive name for the account. For example, DocuSign HR account.
4. Save the record.

Set up DocuSign spoke for each connection alias in your DocuSign implementation.

Set up DocuSign spoke

Integrate your DocuSign account with your ServiceNow instance. Create a custom OAuth application in DocuSign and authenticate requests from ServiceNow.

Role required: admin

- Request IntegrationHub subscription
- Activate DocuSign spoke

Configure DocuSign account

Create a custom OAuth application from your DocuSign account to enable OAuth 2.0 authentication with the DocuSign spoke.

DocuSign requirements:

- DocuSign account
- DocuSign administrator credentials
- DocuSign app configured to integrate with ServiceNow

Complete these steps from your DocuSign account. See the DocuSign Developer Center documentation for instructions on creating and configuring custom applications. DocuSign uses a scripted webhook to send signed
document data to x. This enables flow designers to pause a flow until a document is signed, and use document data in the flow.

1. From your DocuSign account, register your application.
   
   **Note:** Ensure that you select the **Authorization Code Grant** option for **User Application**.

2. Generate an integrator key.
3. Generate a secret key.
4. Record the integrator key and secret key to register the app as a third-party OAuth provider on your x instance.
5. Click **ADD RSA KEYPAIR** and record the **Keypair ID**, **Public Key**, and **Private Key**.
6. In **Redirect URIs**, add your x instance URL in this format: `https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook`.

**Generate the JKS certificate**

Generate a JKS certificate for the JWT authentication of the DocuSign spoke.

**Role required:** admin

1. Open the text editor for code such as, Sublime Text.
2. Create a new file.
3. Paste the **Private Key** you had earlier generated from your DocuSign integrator app. For more information, see *Configure DocuSign account*.
   
   **Note:** Ensure that you include both beginning and ending of the private key.

4. Save the file with the .key extension. For example, `privatekey.key`.
5. Open terminal and navigate to the directory where you saved the file with the .key extension.
6. Create a CA signed certificate using your private key by executing the command:
   
   ```
   openssl req -new -x509 -key <file-name>.key -out <certificate-name>.pem -days 1095
   ```

   System prompts you to provide required details such as Country Name, Province Name and so on.
7. Enter the required details.
8. Create PKCS 12 file using your private key and CA signed certificate by executing the command:
   
   ```
   openssl pkcs12 -export -in <certificate-name>.pem -inkey <file-name>.key -certfile <certificate-name>.pem -out <PKCS-12-file-name>.p12
   ```

   System prompts you to provide a password.
9. Provide the export password.
10. Create the JKS file by executing this command:
    
    ```
    keytool -importkeystore -srckeystore <PKCS-12-file-name>.p12 -srcstoretype pkcs12 -destkeystore <JKS-certificate-filename>.jks -deststoretype JKS
    ```

    System prompts you to provide a password.
11. Provide the destination and source keystore passwords.

**Attach a Java Key Store certificate to the DocuSign spoke**

Enable the JWT Bearer Grant token authentication by attaching a valid Java KeyStore (JKS) certificate to the DocuSign spoke.

- Ensure the availability of a valid Java KeyStore certificate
• Role required: admin

1. Navigate to **System Definition > Certificates**.
2. Click **New**.
3. Complete the form.

### X.509 Certificate form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the record. For example, <strong>DocuSign Certificate</strong>.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Define users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Enter the number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Type</td>
<td>Select <strong>Java Key Store</strong>.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Enter the number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Enter a password associated with the certificate.</td>
</tr>
<tr>
<td>Short description</td>
<td>Enter a summary about the certificate.</td>
</tr>
</tbody>
</table>

4. Click the attachments icon (_attach) and attach a JKS certificate.
5. Click **Validate Stores/Certificates**.

*Create a JWT signing key for the DocuSign spoke*

Create a JSON Web Token (JWT) signing key to assign to your Java KeyStore certificate.

1. Navigate to **System OAuth > JWT Keys**.
2. Click **New**.
3. Complete the form.

### JWT Keys form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the JWT signing key. For example, <strong>DocuSign JWT Keys</strong>.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Select the valid JKS certificate attached in the previous task. For example, <strong>DocuSign Certificate</strong>.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Enter a key Id to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Select an algorithm to sign with the JWT key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Enter a password associated with the signing key.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
Create a JWT provider for the DocuSign spoke
Add a JSON Web Token (JWT) provider to your ServiceNow instance.

1. Navigate to System OAuth > JWT Providers.
2. Click New.
3. On the JWT Provider form, fill the values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name to uniquely identify the JWT provider. For example, DocuSign JWT Provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Enter a number in seconds to set the lifespan of JWT provider tokens.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>Select a JWT signing key. For example, DocuSign JWT Keys.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save. The Standard Claims and Custom Claims related lists display.
5. Select the JWT provider created for the DocuSign spoke.
6. Enter values for iss, sub, and aud in the Standard Claims related list. See the DocuSign Developer Center for instructions.
7. Insert a record in the Custom Claims related list and complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Claim Name</td>
<td>scope</td>
</tr>
<tr>
<td>Claim Value Type</td>
<td>string</td>
</tr>
<tr>
<td>Claim Value</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

8. Click Update.

Register DocuSign as OAuth Provider
Use the information generated during DocuSign account configuration to register DocuSign as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter DocuSign OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the integrator key you generated during the DocuSign account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the client secret you generated during the DocuSign account configuration.</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Grant type</td>
<td>Select JWT Bearer.</td>
</tr>
</tbody>
</table>
| Authorization URL             | • For developer sandbox environment, enter https://account-d.docusign.com/oauth/auth.  
                                   • For live production system, enter https://account.docusign.com/oauth/auth.  
| Token URL                     | • For developer sandbox environment, enter https://account-d.docusign.com/oauth/token.  
                                   • For live production system, enter https://account.docusign.com/oauth/token. For more information see, Post Go-Live and User Info Endpoint Reference in the DocuSign Developer Center documentation. |

5. Right-click the form header, and click Save.
   - The system validates the OAuth credentials and populates the Redirect URL.
   - The system populates OAuth Entity Profile with Grant Type as JWT Bearer. For example, OAuth Entity Profile is created with default Name, DocuSign OAuth default_profile.

6. Insert a record in the OAuth Entity Scopes related list and fill the values.

   OAuth Entity Scopes related list fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>scope</td>
</tr>
<tr>
<td>OAuth Scope</td>
<td>signature impersonation</td>
</tr>
</tbody>
</table>

7. Copy the value from Redirect URL.
8. Click Update.
9. Login to your DocuSign account to edit the configuration of your custom DocuSign application. See the DocuSign Developer Center for instructions.

The instance can request OAuth 2.0 tokens for the spoke.

**Note:** When an OAuth token expires, the spoke automatically regenerates a new token in most cases. If a token expires and is not regenerated, an administrator can regenerate the spoke OAuth token.

**Obtain consent**

Obtain explicit consent for the ServiceNow application from DocuSign.

Role required: admin

**Obtain consent for individuals**

1. Navigate to System OAuth > Application Registry.
2. Open the record you had created for the DocuSign spoke.
3. Insert a record in the **OAuth Entity Profiles** related list and fill the values.

| **OAuth Entity Profiles related list fields** |
|-----------------|-----------------|
| **Field**       | **Value**       |
| Name            | DocuSign OAuth default_profile_Auth_Code |
| Is default      | true            |
| Grant type      | Authorization Code |

4. Click the created OAuth Entity Profile.
5. Insert a record in the **OAuth Entity Scopes** related list and fill the values.

| **OAuth Entity Scopes related list fields** |
|-----------------|-----------------|
| **Field**       | **Value**       |
| Name            | scope           |
| OAuth Scope     | signature impersonation |

6. Create credential record associated with the OAuth Entity profile whose **Grant type** is **Authorization Code**.
   a. Navigate to **Connections & Credentials > Credentials**.
   b. Click **New**. The system displays the message **What type of Credentials would you like to create?**.
   c. Select **OAuth 2.0 Credentials**.
   d. Fill these values.

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Value required</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter <strong>DocuSign Credentials Auth Code</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth Entity profile you created with <strong>Grant type</strong> as <strong>Authorization Code</strong>. For example, select <strong>DocuSign OAuth default_profile_Auth_Code</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select <strong>All MID Servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter <strong>100</strong>.</td>
</tr>
</tbody>
</table>

e. Save the record.
 f. Click the **Get OAuth Token** related link to generate the OAuth token.
 g. Enter your DocuSign user name and password to provide the consent.
7. Create another credential record associated with the OAuth Entity profile whose Grant type is JWT Bearer. See Create Credential records for the DocuSign spoke for the required information. After the credential record, click the Get OAuth Token related link to generate the OAuth token.

Obtain consent for an organization administrator

See DocuSign Developer documentation (Admin consent for internal applications) for instructions to obtain consent for an organization administrator.

Create Credential records for the DocuSign spoke
Create Credential records to the DocuSign custom OAuth application you created during DocuSign account configuration. The DocuSign spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter DocuSign Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom DocuSign application as an OAuth provider. For example, select DocuSign OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.
6. Click the Get OAuth Token related link to generate the OAuth token.

Create Connection records for the DocuSign spoke
Create Connection records to your DocuSign account. The DocuSign spoke connection and credential alias uses these connections to perform actions in DocuSign.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for DocuSign.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter DocuSign Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for DocuSign. For example, select DocuSign Credentials.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection URL</td>
<td>• For demo environment, enter <a href="https://demo.docusign.net">https://demo.docusign.net</a>.</td>
</tr>
<tr>
<td></td>
<td>• For live production system, enter the Base URI such as na2.docusign.net or</td>
</tr>
<tr>
<td></td>
<td>eu.docusign.net. For instructions on obtaining the base URI, see Post Go-Live</td>
</tr>
<tr>
<td></td>
<td>and User Info Endpoint Reference in the DocuSign Developer Center documentation.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke. See **Synchronize DocuSign with ServiceNow**.

**Configure DocuSign webhook**

Configure the webhook in your DocuSign account to enable DocuSign to send data to ServiceNow when a recipient signs a document.

Role required: admin

1. Connect a custom configuration to enable your DocuSign application to share events and data with your ServiceNow instance.
2. Add your ServiceNow instance URL in this format: https://{instance-name}.service-now.com/api/sn_docusign_spoke/docusign_webhook.
3. Include basic authorization in the header and add your x credentials.
4. Enable DocuSign to share envelope events with ServiceNow.
   - Envelope Sent
   - Envelope Delivered
   - Envelope Signed/Completed
   - Envelope Declined
   - Envelope Voided

**Synchronize DocuSign with ServiceNow**

Synchronize ServiceNow with DocuSign to access DocuSign accounts, templates, and envelopes from the DocuSign spoke.

Role required: admin

- Request IntegrationHub subscription
- Activate DocuSign spoke
- **Set up DocuSign spoke**

Schedule a job to synchronize DocuSign with your ServiceNow instance daily, or synchronize data as needed.

1. Required: Schedule a job to synchronize DocuSign data with your ServiceNow instance.
   a) Navigate to **DocuSign > Scheduled Job**.
      The Get Accounts & Templates scheduled job opens.
   b) Select **Active**.

   The DocuSign spoke synchronizes accounts, templates, and envelopes daily.

2. Required: Synchronize DocuSign data as needed with a UI action.
   a) Navigate to **DocuSign > Accounts**.
The Accounts [sn_docusign_spoke_accounts] table opens.

b) Click the Get Accounts related link.

The system synchronizes all accounts linked through an OAuth Credential record and populates the Templates and Envelopes tables with DocuSign data. Use template and envelope records when constructing flows.

**Activate DocuSign spoke catalog items**

Trigger events in DocuSign when an item is requested in the Service Catalog. For example, The Send a Document for Digital Signature catalog item triggers a sample flow that sends a DocuSign document to a designated recipient.

- Request IntegrationHub subscription
- Activate DocuSign spoke
- Activate the Flow Designer support for the Service Catalog (com.glideapp.servicecatalog.flow_designer) plugin
- Role required: admin

The DocuSign spoke adds catalog items for use with the DocuSign spoke sample flows. Before triggering a DocuSign spoke sample flow, activate these catalog items.

<table>
<thead>
<tr>
<th>Catalog item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send a Document for Digital Signature</td>
<td>Sends a document for digital signature in DocuSign.</td>
</tr>
<tr>
<td>Demonstrate Template - Send Job Offer to Candidate</td>
<td>Sends a job offer using a DocuSign template.</td>
</tr>
</tbody>
</table>

1. Navigate to Service Catalog > Maintain Items.
2. Search for and select Send a Document for Digital Signature.
3. Click Activate.
4. Open the record, Send a Document for Digital Signature.
5. In the Process Engine tab, select Send a Document for Digital Signature for Flow.
6. Search for and select Demonstrate Template - Send Job Offer to Candidate.
7. Click Activate.
8. Open the record, Demonstrate Template - Send Job Offer to Candidate.

When one of these items is requested in the Service Catalog, the associated DocuSign spoke sample flow triggers and performs actions in DocuSign.

**Change the DocuSign API version**

By default, the DocuSign spoke sends REST API requests to DocuSign API v2. For forward compatibility and to take advantage of DocuSign’s newer API, you can update a connection attribute to send API requests to DocuSign API v2.1.

Role required: admin

To understand the difference between the two APIs, see the DocuSign Developer site.

1. Navigate to DocuSign > Connection Aliases.
2. Open the connection alias that you want to update the version for.

Only requests sent using this alias use the new API version. For example, if you want to update the API version for all requests and your implementation uses multiple connection aliases, you must update each connection alias.
3. In the **Connection Attributes** related list, add or edit the **API Version** record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Label</td>
<td>API Version</td>
</tr>
<tr>
<td>Column name</td>
<td>api_version</td>
</tr>
<tr>
<td>Default value</td>
<td>v2.1</td>
</tr>
</tbody>
</table>

4. Save or submit the record.

When the DocuSign spoke makes an API request, it uses the API version designated in the connection attribute **Default value** field.

**How to automate on-demand signing requests**

Send DocuSign on-demand signing requests using information in your ServiceNow instance by creating flows in Flow Designer.

Role required: admin

- Request IntegrationHub subscription
- Activate DocuSign spoke
- **Set up DocuSign spoke**

**Note:** Customize flows in Flow Designer based on your requirements.

1. In Flow Designer, create a flow.
2. Specify **TRIGGER** to initiate the flow.
3. Specify the **ACTIONS** to be performed during the flow. The actions include one of the following:
   - **Send Adhoc Signature Request To User**
   - **Send Adhoc Signature Request To Users**
4. Optional: To pause the flow until the specified document is signed or rejected, select the **Wait for Signature from DocuSign** action.
5. Perform one of the following set of actions:
   - To send an embedded signing URL, select **Use Embedded Signing**, and **Embedded Signing Recipient [User]**.
   - To send a document for signing, provide details regarding DocuSign account, PDF document, recipient, email, and envelope expiry.
     - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
     - An envelope record is created in the **Envelopes** table. The Envelope status and other details are updated.

**How to automate signing requests using templates**

Send DocuSign signing requests using DocuSign templates and information in your ServiceNow instance by creating flows in Flow Designer. For example, **Send employee offer**.

Role required: admin

- Request IntegrationHub subscription
- Activate DocuSign spoke
Set up DocuSign spoke

**Note:** Customize flows based on your requirements.

1. In DocuSign, create document templates and specify recipient roles. For example, Candidate and Manager. The system retrieves other recipient details such as name and email, when the flow is triggered.
2. In Flow Designer, create a new flow.
3. Specify TRIGGER to initiate the flow.
4. Specify the ACTIONS to be performed during the flow and provide recipient details. The actions include:
   - Create Draft Envelope from Template
   - Get Recipient ID by Role Name
   - Add Recipient to Envelope
   - Get Recipient ID by Role Name
   - Add Recipient to Envelope
   - Get Field ID
   - Set Field Value
   - Send Envelope
   - Get Field Value
5. Optional: To pause the flow until the specified document is signed or rejected, select the **Wait for Signature from DocuSign** action.
   - The selected document or Embedded Signing URL is sent to the recipients for signing. While signing the document, the recipient details are auto-populated.
   - An envelope record is created in the **Envelopes table**. The Envelope status and other details are updated.

How to separate DocuSign account data

Restrict access to DocuSign data based on a user's role. For example, your company may have one DocuSign account used by the HR team and another used by the Legal team. To keep the data separate between these two accounts, you can create a role for each account and add it to the accounts record.

- Request IntegrationHub subscription
- Activate DocuSign spoke
- Create connection aliases for additional DocuSign accounts
- Set up DocuSign spoke

1. Create a role for each DocuSign account that you want to restrict access to.
   a) Navigate to **System Security > Users and Groups > Roles**.
   b) In the Roles [sys_user_role] table, select **New**.
   c) Check that the value of the Application field is DocuSign Spoke. If a different scope is listed, change the scope to DocuSign Spoke.
   d) In the Suffix field, add a name to indicate the account that the role is for. For example, Legal.
   e) Save the record.
   f) Note the name of the role you just created. For example, sn_docusign_spoke.legal.

2. Add the role to the associated account in the accounts table.
   a) Navigate to **DocuSign > Accounts**.
   b) Open the account record that you want to restrict access to.
c) In the **Role** field, add the associated role.

d) Click **Update**.

3. Grant the role to the desired users.
   a) Navigate to **System Security > Users and Groups > Users**.
   b) Open the record for the user you want to provide access.
   c) Add the role you created to the Roles related list.

Only users with the designated role have access to DocuSign data associated with the account.

**Dropbox Business spoke v1.0.2**

Use Dropbox Business as file storage in place of attachments in ServiceNow. This spoke adds Dropbox storage to your ServiceNow instance and enables users to reference Dropbox files in ServiceNow records.

**Request apps on the Store**

Visit the *ServiceNow Store* website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the *ServiceNow Store version history release notes*.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see *Request IntegrationHub*.

**Supported versions**

API version v2.

**Spoke subflows**

The Dropbox Business spoke provides sample subflows in the draft state to demonstrate automating Dropbox tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process File Changes</td>
<td>Subflow to process file changes in Dropbox.</td>
</tr>
<tr>
<td>Process Team Member Changes</td>
<td>Subflow to process team member changes in Dropbox.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Dropbox Business spoke provides actions to perform Dropbox tasks when events occur in ServiceNow. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>File and Folder Management</td>
<td>Copy Dropbox File To Attachment</td>
<td>Copies a Dropbox file and attaches it to a ServiceNow record. If a ServiceNow incident record is supplied as input, the specified record is attached to it.</td>
</tr>
<tr>
<td></td>
<td>Copy File or Folder</td>
<td>Creates a copy of the specified Dropbox file or folder in Dropbox.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a folder at the specified path in Dropbox.</td>
</tr>
<tr>
<td></td>
<td>Delete File Or Folder</td>
<td>Deletes a file or folder at the specified path in Dropbox.</td>
</tr>
<tr>
<td></td>
<td>Get File Changes - Webhook</td>
<td>Retrieves the file changes noticed in Dropbox.</td>
</tr>
<tr>
<td></td>
<td>Look up Folder</td>
<td>Looks up the contents of a Dropbox folder and returns an object containing information about the folder.</td>
</tr>
<tr>
<td></td>
<td>Update Latest Cursor</td>
<td>Updates the latest cursor value for the corresponding team in the Team Details table.</td>
</tr>
<tr>
<td></td>
<td>Upload Attachment to Dropbox</td>
<td>Copies a ServiceNow attachment to a Dropbox folder. It copies to the specified folder. To change the file name during the copy, use the optional file name.</td>
</tr>
<tr>
<td>User Management</td>
<td>Add Users To Group</td>
<td>Adds users to a specified group.</td>
</tr>
<tr>
<td></td>
<td>Add Users To Team</td>
<td>Adds users to a specified team.</td>
</tr>
<tr>
<td></td>
<td>Get Admin Details</td>
<td>Retrieves details of the administrator account used to generate the access token.</td>
</tr>
<tr>
<td></td>
<td>Get Current Account</td>
<td>Retrieves information about the current account.</td>
</tr>
<tr>
<td></td>
<td>Get Team Members Info</td>
<td>Retrieves information on specified team members. Returns profile and role details.</td>
</tr>
<tr>
<td></td>
<td>Look up Groups in Team</td>
<td>Lists all the groups in the team. Output includes group IDs, number of members, group name, and the role of users who manage the group.</td>
</tr>
<tr>
<td></td>
<td>Look up Users in Group</td>
<td>Lists all the members in the specific group. Returns user profile data and role in the group.</td>
</tr>
<tr>
<td></td>
<td>Look up Users in Team</td>
<td>List all the members in the team. Returns user profile data, membership type, and role.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Remove User From Team</td>
<td>Removes user from a team. Options include user retains files, and access to team shares, keeps email account and unrestricted team shares, and to delete relevant data.</td>
</tr>
<tr>
<td></td>
<td>Remove Users From Group</td>
<td>Removes one or more users from an existing group.</td>
</tr>
</tbody>
</table>

### Dropbox Business account requirements

The Dropbox Business spoke requires a custom app that you create in Dropbox Business.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

### MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Dropbox alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

### Set up Dropbox Business spoke

Integrate a ServiceNow instance and Dropbox Business spoke by using Dropbox credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Dropbox Business spoke.
- Role required: admin

Setting up the Dropbox Business spoke, includes actions in the Dropbox app console, in the Now Platform® user interface, and in the Flow Designer. Setup is easier if you keep each of these pages open in separate tabs.

**Configure Dropbox Business applications**

Create two custom OAuth applications from your Dropbox Professional account to enable OAuth 2.0 authentication with the Dropbox Business spoke.

Dropbox Business integration requirements:

- A Dropbox Business account and team admin credentials.

In this task, you create two apps using the Dropbox Business API (not the normal Dropbox API). The first is for **Team member file access** and the other is for **Team member management**. Complete these steps from your Dropbox Business account. See the Dropbox Business product documentation for instructions on creating and configuring custom applications.

2. Click **Create app**.
3. Choose **Dropbox Business API**.
4. Under Choose the type of access you need, select **Team member file access**.
5. Name the app and click **Create app**.
6. On the next screen, you see the **App key** and **App secret**. Show the App secret and copy both values. You use these values to connect Dropbox Business to ServiceNow.
7. Enter the **redirect URI**. The form of the redirect URI is `https://<your-instance>.service-now.com/oauth_redirect.do`.
8. Go back to the Create app screen and create a **Team member Management** app following the same steps. Make sure to note which App key and App secret belong to each application.

Create Connection and Credential records for the Dropbox Business Team Management alias

Create connection records to a Dropbox Business account. A connection alias resolves your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

The Dropbox Business spoke comes with three Connection and Credential aliases. Configure them in the following order:

1. **DropboxBusinessTeamManagement**
2. **DropboxBusinessFileAccess**
3. **DropboxBusinessContent**

You configure each alias with an App key and App secret that you generated in the Dropbox app console.

When you configure the DropboxBusinessTeamManagement alias, you navigate to the Flow Designer to get the `team_member_id`.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Select the DropboxBusinessTeamManagement alias.
3. Click the **Create New Connection and Credential** related link.
4. In the Create Connection and Credential pop-up, provide the following information. Some of the information displays automatically.

<table>
<thead>
<tr>
<th>Section</th>
<th>Information</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Information</td>
<td>Connection Name</td>
<td>A relevant connection name such as <strong>Dropbox Business Team Management Connection</strong>.</td>
</tr>
<tr>
<td></td>
<td>Connection URL</td>
<td><code>https://api.dropboxapi.com</code></td>
</tr>
<tr>
<td></td>
<td>API Version</td>
<td>2</td>
</tr>
<tr>
<td>Credential Information</td>
<td>Credential Name</td>
<td>Enter a relevant connection name such as <strong>Dropbox Business Team Management Credential</strong>.</td>
</tr>
<tr>
<td></td>
<td>OAuth Entity Name</td>
<td>A relevant entity name such as <strong>Dropbox Business Team Management OAuth</strong>.</td>
</tr>
<tr>
<td></td>
<td>OAuth Client ID</td>
<td>Enter the App key generated when you created the Team Member Management application in the Dropbox app console.</td>
</tr>
<tr>
<td>Section</td>
<td>Information</td>
<td>Input</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Enter the App secret generated when you created the Team Member Management application in the Dropbox app console.</td>
<td></td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>Enter the redirect URI. The form of the redirect URI is https://&lt;your-instance&gt;.service-now.com/oauth_redirect.do.</td>
<td></td>
</tr>
</tbody>
</table>

5. Click **Create and Get OAuth Token**.
6. Once you successfully acquire the OAuth token, get the team member ID for the connection.
   a) Navigate to **Flow Designer > Designer** and select **Actions**.
   b) Open the Get Admin Details action for the Dropbox Business spoke.
   c) In the Action Outline screen, click **Test**. After the test executes, click the link to view the result.
   d) On the **Execution Details** tab, click the link in the **Runtime Value** column to view the output of the action.
   e) Copy the value for `team_member_id` from the Viewing admin_details pop-up to a text file. You add this value to all three credential alias configurations.

8. On the Connections tab, select the **Dropbox Business File Access Connection**.
9. On the **Attributes** tab, paste the value of the `team_member_id` in the **Member ID** box and click **Update**.

**Create Connection and Credential records for the Dropbox Business File Access alias**

Create connection records to a Dropbox Business account for the DropboxBusinessFileAccess alias. Connection aliases resolve your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

The Dropbox Business spoke comes with three Connection and Credential aliases. You have already configured the Team Management alias.

You configure each one with an App Key and App Secret that you generated in the Dropbox app console.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
3. Click the **Create New Connection and Credential** related link.
4. In the Create Connection and Credential pop-up, provide the following information. Some of the information displays automatically.
5. Click **Create and Get OAuth Token**.
7. Paste the value of the `team_member_id` in the **Member ID** box and click **Update**.
   
   You generated the `team_member_id` when you configured the DropboxBusinessTeamManagement alias.

---

**Create Connection and Credential records for the Dropbox Business Content alias**

Create connection records to a Dropbox Business account for the DropboxBusinessContent alias. Connection aliases resolve your Dropbox connection and credential at runtime. Only one connection is active per Connection Alias at a time.

The Dropbox Business spoke comes with three Connection and Credential aliases. You have already configured the Team Management and File Access aliases.

You configure each one with an App Key and App Secret that you generated in the Dropbox app console.

When you configure the DropboxBusinessContent alias, you navigate to the Flow Designer to get the `root_namespace_id`. In the Connection configuration, you paste this value into the **Folder ID** field.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Select the DropboxBusinessContent alias.
3. Click the **Create New Connection and Credential** related link.
4. In the Create Connection and Credential pop-up, provide the following information. Some of the information displays automatically.

---

<table>
<thead>
<tr>
<th>Section</th>
<th>Information</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credential Information</td>
<td>Credential Name</td>
<td>Enter a relevant connection name such as Dropbox Business File Access Credential.</td>
</tr>
<tr>
<td></td>
<td>OAuth Entity Name</td>
<td>A relevant entity name such as Dropbox Business File Access OAuth.</td>
</tr>
<tr>
<td></td>
<td>OAuth Client ID</td>
<td>Enter the App key generated when you created the Team Member File Access application in the Dropbox app console.</td>
</tr>
<tr>
<td></td>
<td>OAuth Client Secret</td>
<td>Enter the App secret generated when you created the Team Member File Access application in the Dropbox app console.</td>
</tr>
<tr>
<td></td>
<td>OAuth Redirect URL</td>
<td>Enter the redirect URI. The form of the redirect URI is https://&lt;your-instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
<tr>
<td>Section</td>
<td>Information</td>
<td>Input</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential Information</td>
<td>Credential Name</td>
<td>Enter a relevant connection name such as Dropbox Business Content Credential.</td>
</tr>
<tr>
<td></td>
<td>OAuth Entity Name</td>
<td>A relevant entity name such as Dropbox Business Content OAuth.</td>
</tr>
<tr>
<td></td>
<td>OAuth Client ID</td>
<td>Enter the App key generated when you created the Team Member File Access application in the Dropbox app console.</td>
</tr>
<tr>
<td></td>
<td>OAuth Client Secret</td>
<td>Enter the App secret generated when you created the Team Member File Access application in the Dropbox app console.</td>
</tr>
<tr>
<td></td>
<td>OAuth Redirect URL</td>
<td>Enter the redirect URI. The form of the redirect URI is https://&lt;your-instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

5. Click **Create and Get OAuth Token**.
6. Once you successfully acquire the OAuth token, you acquire the root_namespace_id for the connection.
   a) In a different tab, navigate to **Flow Designer > Designer** and select **Actions**.
   b) Open the **Get Current Account** action for the Dropbox Business spoke.
   c) In the Action Outline screen, click **Test**. In the Test Action pop-up, click **Run Test**.
   d) On the Execution Details tab, click the link under **Runtime Value** to view the output of the action.
   e) Copy the value for root_namespace_id from the **Account Details** pop-up to a text file. You add this value to all three credential alias configurations.

7. Return to the **Connection & Credential Aliases** for the DropboxBusinessContent alias.
8. On the **Connections** tab, select the Dropbox Business Content Connection.
9. Paste the value of the root_namespace_id in the **Folder ID** box and click **Update**.

The Dropbox Business spoke is set up and integrated with the ServiceNow instance.

**F5 BIG-IP spoke**

Manage servers and pools in the F5 BIG-IP system.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.
IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version

BIG-IP 13.1.0.

Spoke flows

The F5 BIG-IP spoke provides sample flows in the draft state to demonstrate automating F5 tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Traffic Management Using F5 Big-IP</td>
<td>Creates a virtual server, associates it to a pool, and adds pool member in the BIG-IP system from a ServiceNow Service Catalog request.</td>
</tr>
</tbody>
</table>

Spoke subflows

The F5 BIG-IP spoke provides sample subflows to demonstrate automating F5 tasks. Available sample subflows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>F5 Server - Pool Management</td>
<td>Creates a pool in the BIG-IP system and manages it.</td>
</tr>
</tbody>
</table>

Spoke actions

The F5 BIG-IP spoke provides actions to automate F5 tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pool Management</td>
<td>Create Pool</td>
<td>Creates a pool in the BIG-IP system.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Add Pool Member</td>
<td>Creates a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Check Pool</td>
<td>Checks pool health in BIG-IP system. Returns whether the pool is available,</td>
</tr>
<tr>
<td></td>
<td>Delete Pool</td>
<td>Deletes a pool from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Disable Pool Member</td>
<td>Disables a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Enable Pool Member</td>
<td>Enables a pool member of a specified pool in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Get Pool Members</td>
<td>Retrieves the list of members of a specified pool from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Remove Pool Member</td>
<td>Deletes a pool member in the BIG-IP system.</td>
</tr>
<tr>
<td>Server Management</td>
<td>Add Profile to Virtual Server</td>
<td>Adds a profile to a virtual server in the BIG-IP system. Profiles enable you</td>
</tr>
<tr>
<td></td>
<td>Create Virtual Server</td>
<td>Creates a virtual server in the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Delete Virtual Server</td>
<td>Deletes a virtual server from the BIG-IP system.</td>
</tr>
<tr>
<td></td>
<td>Update Virtual Server</td>
<td>Updates virtual server attributes in the BIG-IP system.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

This spoke uses this alias record to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>F5_BIG_IP</td>
<td>Connection to the F5 BIG-IP system.</td>
<td>• Connection type: HTTP</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Connection URL: URL of the host machine where the F5 server is installed.</td>
</tr>
</tbody>
</table>

To use the spoke connection alias, create an associated Connection record and an associated Credential record.
MID Server requirements

These actions use REST calls, which can run on a MID Server. Use the connection record associated with the F5 BIG-IP alias to configure where actions run as well as set MID Server selection attributes. For more information, see *MID server*.

Set up F5 BIG-IP spoke

Integrate the ServiceNow instance and F5 using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate F5 BIG-IP spoke
- Role required: admin

Create Credential records for the F5 BIG-IP spoke

Create Credential records to the F5 BIG-IP server. The F5 BIG-IP spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
   A blank Basic Auth Credentials form displays.
4. Enter these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter F5 Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Your F5 BIG-IP user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Your F5 BIG-IP password.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>
5. Click Submit.

Create Connection records for the F5 BIG-IP spoke

Create Connection records to your F5 BIG-IP account. The F5 BIG-IP spoke connection and credential alias uses these connections to perform actions on the F5 BIG-IP server.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for F5_BIG_IP.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter F5 Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for F5. For example, select F5 Credentials.</td>
</tr>
</tbody>
</table>
First Advantage spoke v1.0.1

Manage and track the background verifications of candidates using First Advantage from your ServiceNow instance. Manage users, accounts, candidates, invites, and orders in First Advantage from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for First Advantage API version v1.1, but may be compatible with later versions.

Spoke requirements

- First Advantage account
- API key

  Note: Contact the First Advantage team to obtain the API key.

- Account ID

  Note: Contact the First Advantage team to obtain the Account ID.

Spoke flows

The First Advantage spoke provides sample flows to demonstrate automating the First Advantage tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
</table>
| First Advantage - Candidate Background Verification using Invite | Initiates background check of the candidate using invite. Sends a request to the candidate to complete an application. For information about creating a case, see Create a case in First Advantage from ServiceNow.
### Spoke subflows

The First Advantage spoke provides a sample subflow to demonstrate automating First Advantage tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflow is, Get Packages. The subflow retrieves packages in First Advantage and stores the details in the Packages table.

### Spoke actions

The First Advantage spoke provides actions manage accounts, candidates, invites, orders, and users when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Get Account Details</td>
<td>Retrieves details of the First Advantage account.</td>
</tr>
<tr>
<td></td>
<td>Get Account Packages</td>
<td>Retrieves the details of all the packages in an account.</td>
</tr>
<tr>
<td></td>
<td>Get Account Profiles</td>
<td>Retrieves the details of all profiles in an account.</td>
</tr>
<tr>
<td></td>
<td>Get Account Users</td>
<td>Retrieves the details of all users in an account.</td>
</tr>
<tr>
<td>Candidate Management</td>
<td>Create New Candidate</td>
<td>Creates a candidate profile for background verification.</td>
</tr>
<tr>
<td></td>
<td>Get Candidate By Candidate ID</td>
<td>Retrieves the details of the required candidate.</td>
</tr>
<tr>
<td></td>
<td>Get Documents For A Specific Candidate</td>
<td>Retrieves the documents associated with the required candidate.</td>
</tr>
<tr>
<td></td>
<td>Get Monitoring Product Details For A Specific Candidate</td>
<td>Retrieves the details of the monitoring product for the required candidate.</td>
</tr>
<tr>
<td></td>
<td>Update Candidate Details</td>
<td>Updates the details of a candidate profile.</td>
</tr>
<tr>
<td>Invite Management</td>
<td>Create Invite</td>
<td>Create an invite for the candidate to fill the application.</td>
</tr>
<tr>
<td></td>
<td>Get Invite Status By Applicant ID</td>
<td>Retrieves the latest status of the invite for the required applicant.</td>
</tr>
<tr>
<td></td>
<td>Get Invite View Link By Application ID</td>
<td>Retrieves a secure link to access the profile that the candidate must complete.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Order Management</td>
<td>Create Order</td>
<td>Creates a First Advantage screening order.</td>
</tr>
<tr>
<td></td>
<td>Get Order Report By Order ID</td>
<td>Retrieves the completed order report for the required order.</td>
</tr>
<tr>
<td></td>
<td>Get Order Status By Order ID</td>
<td>Retrieves the latest order status for the required order.</td>
</tr>
<tr>
<td>User Management</td>
<td>Activate User</td>
<td>Activates the required user.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a user profile.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the required user.</td>
</tr>
<tr>
<td></td>
<td>Update User Password</td>
<td>Updates the password of the required user.</td>
</tr>
<tr>
<td></td>
<td>Update User Profile</td>
<td>Updates information in the profile of the required user.</td>
</tr>
</tbody>
</table>

**Spoke module**

The First Advantage spoke adds a First Advantage spoke module to your ServiceNow instance. The First Advantage spoke synchronizes and stores information about First Advantage cases, tasks, employee tasks, order tasks, and packages.

The First Advantage spoke includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FADV Webhook Client Details</td>
<td>Enables you to set up First Advantage webhook by providing key for the First Advantage webhook client.</td>
</tr>
<tr>
<td>Create New First Advantage Case</td>
<td>Enables you to initiate the background check of the required candidate using invite or order from ServiceNow.</td>
</tr>
<tr>
<td>First Advantage Cases</td>
<td>Enables you to view list of all First Advantage cases created using invite and order.</td>
</tr>
<tr>
<td>Packages</td>
<td>Enables you to view the details of all packages available in First Advantage. To view the package details, you must set up the spoke and synchronise the packages.</td>
</tr>
<tr>
<td>Order Tasks</td>
<td>Enables you to view list of all First Advantage order records.</td>
</tr>
<tr>
<td>Employee Tasks</td>
<td>Enables you to view list of all First Advantage cases created using invite.</td>
</tr>
</tbody>
</table>

The First Advantage spoke includes these tables:

- First Advantage Task [sn_fadv_spoke_first_advantage_task]
- First Advantage Employee Task [sn_fadv_spoke_first_advantage_employee_task_table]
- Packages [sn_fadv_spoke_packages]
- FADV Webhook Client Details [sn_fadv_spoke_webhook_client_details]
<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Advantage Task</td>
<td>Details of all the First Advantage order records.</td>
</tr>
<tr>
<td>First Advantage Employee Task</td>
<td>Details of all the First Advantage invite records.</td>
</tr>
<tr>
<td>Packages</td>
<td>First Advantage packages that are synchronized with ServiceNow®.</td>
</tr>
<tr>
<td>FADV Webhook Client Details</td>
<td>Client details to set up the First Advantage webhook.</td>
</tr>
</tbody>
</table>

**Spoke user roles**

- First Advantage admin
- First Advantage user

Only users with the First Advantage admin role can view the **FADV Webhook Client Details** module.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the First Advantage spoke**

Integrate the ServiceNow instance with your First Advantage account using an API key to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the First Advantage spoke
- Role required: admin

*Create Credential record for the First Advantage spoke*

Create Credential records to the First Advantage spoke. The First Advantage spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to *Connections & Credentials > Credentials*.
2. Click **New**.
   The system displays the message *What type of Credentials would you like to create?*.
3. Select **API Key Credentials**.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter <em>FADV Credentials</em>.*</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>API Key</td>
<td>API key generated for your First Advantage instance.</td>
</tr>
</tbody>
</table>

**Note:** Contact the First Advantage team to obtain the API key.
5. Click **Submit**.

*Create Connection record for the First Advantage spoke*

Create a Connection record to the First Advantage API. The First Advantage spoke connection and credential alias uses these connections to perform actions in First Advantage.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record for **First Advantage**.
3. From the **Connections** tab, click **New**.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Order</strong></td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. In the **Attributes** tab, enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distribution Email</td>
<td>Distribution email of your organization.</td>
</tr>
<tr>
<td>Account ID</td>
<td>Account ID of your First Advantage account.</td>
</tr>
<tr>
<td>u_version</td>
<td>v1.1</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
7. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
8. Open for the record for **First Advantage**.
9. Click the **Connection Attributes** tab.
10. Modify the default values of the connection attributes records as per your requirement.
Create First Advantage states in your ServiceNow instance
Create First Advantage states to be displayed in the State list in your ServiceNow instance.

Role required: admin

Create the Draft, Ready, and In Progress states
Create the Draft, Ready, and In Progress states in the Task [task] table.

1. In the Filter navigator, enter sys_choice.list.
   The records in the Choice [sys_choice] table are displayed.
2. Click New.
3. On the form, fill these values and create three records for the Draft state.

<table>
<thead>
<tr>
<th>Record 1 - Draft state</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>Table</td>
</tr>
<tr>
<td>Label</td>
</tr>
<tr>
<td>Value</td>
</tr>
</tbody>
</table>

   Note:
   • Ensure that you provide the exact numbers in the Value field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.
   • Ensure that the record is created in the Global application.

4. Click Submit.
5. Similarly, create records for the Ready and In Progress states.

<table>
<thead>
<tr>
<th>Record 2 - Ready state</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>Table</td>
</tr>
<tr>
<td>Label</td>
</tr>
<tr>
<td>Value</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Record 3 - In Progress state</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>Table</td>
</tr>
<tr>
<td>Label</td>
</tr>
</tbody>
</table>
Create the Complete and Cancelled states

Create the Complete and Cancelled states in the First Advantage Task [sn_fadv_spoke_first_advantage_task] table.

1. Navigate to First Advantage Spoke > Order Tasks.
2. Click New.

Note: Ensure that the record is created in the First Advantage application.

3. Right-click State and click Configure Choices.
4. Perform these steps to create the Cancelled state:
   a) Enter Cancelled in New item text.
   b) Enter 149 in Numeric value.

   Note: Ensure that you provide the exact numbers in the Numeric value field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.
   c) Click Add.
   d) Click Save.

5. Perform these steps to create the Complete state:
   a) Enter Complete in New item text.
   b) Enter 127 in Numeric value.

   Note: Ensure that you provide the exact numbers in the Numeric value field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.
   c) Click Add.
   d) Click Save.

The Complete and Cancelled states are created in the First Advantage Task [sn_fadv_spoke_first_advantage_task] table.

Create the Complete - Success and Complete - Deal Broken states

Create the Complete - Success and Complete - Deal Broken states in the First Advantage Employee Task [sn_fadv_spoke_first_advantage_employee_task_table] table.

1. Navigate to First Advantage Spoke > Employee Task.
2. Click New.
3. Right-click **State** and click **Configure Choices**.
4. Perform these steps to create the Cancelled state:
   a) Enter **Complete - Success** in **New item text**.
   b) Enter **161** in **Numeric value**.

   ![Note:](image)

   **Note:** Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c) Click **Add**.
   d) Click **Save**.

5. Perform these steps to create the Complete state:
   a) Enter **Complete - Deal Broken** in **New item text**.
   b) Enter **117** in **Numeric value**.

   ![Note:](image)

   **Note:** Ensure that you provide the exact numbers in the **Numeric value** field as mentioned here. The spoke flows will not be triggered if there is any change in these numbers.

   c) Click **Add**.
   d) Click **Save**.

The **Complete - Success** and **Complete - Deal Broken** states are created in the First Advantage Employee Task table.

**Set up First Advantage webhooks**

Receive invite and order event updates at your ServiceNow instance by setting up the webhooks.

Role required: admin

Provide key in your ServiceNow instance

Set up the First Advantage webhook by providing key for the First Advantage webhook client.

• Generate a secure key as per your requirement and record the value. For example, a base64 encoded key.

• Role required: admin

1. Navigate to **First Advantage Spoke > FADV Webhook Client Details**.
2. Click **New**.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record.</td>
</tr>
<tr>
<td>Authorization Key</td>
<td>Key you had generated as per your requirement.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

Access API endpoints

Access the API endpoint for the invite and order events and share the required details with First Advantage to set up the webhooks.
Role required: admin

1. Navigate to **System Web Services > Scripted REST APIs**.
2. Open the record for the First Advantage spoke. For example, **First Advantage Webhook**.
3. In the **Resources** tab:
   a) Open the record for the invite event. For example, **Invite Status**.
   b) Copy and record the path provided in **Resource path**. For example, /api/sn_fadv_spoke/fadv/invite_status.
   c) Open the record for the order event. For example, **Order Status**.
   d) Copy and record the path provided in **Resource path**. For example, /api/sn_fadv_spoke/fadv/order_status.

Contact First Advantage to setup webhooks for your ServiceNow instance. For this, share these details with First Advantage:

- Custom header in this format: fadvKey <authorization-key>.
- **Note:**
  - Ensure that the custom header is in this format only. The spoke flows will not be triggered if there is any change.
  - Provide the same key you had earlier provided in **First Advantage Spoke > FADV Webhook Client Details**.
  - Use the same case as mentioned here: fadvKey.

- API endpoint for the invite events in this format: <ServiceNow-instance-URL>/api/sn_fadv_spoke/fadv/invite_status
- API endpoint for the order events in this format: <ServiceNow-instance-URL>/api/sn_fadv_spoke/fadv/order_status

**Synchronise First Advantage packages with ServiceNow**

Store the details of the First Advantage packages by synchronizing First Advantage packages with ServiceNow.

Role required: First Advantage admin

1. Navigate to **First Advantage Spoke > Packages**.
2. Click the **Get Packages** related link.

The First Advantage package details are retrieved and saved in the Packages table.

- **Note:** Only users with the FADV admin role can synchronize the package details. Users with FADV user role can only view the retrieved details.

**Create a case in First Advantage from ServiceNow**

Initiate the background check of the required candidate using invite or order from ServiceNow.

- **Set up the First Advantage spoke**
- **Synchronise First Advantage packages with ServiceNow**
- Create users in the User [sys_user] table. Background check can be performed only for these users.
- Role required: First Advantage admin or First Advantage user

1. Navigate to **First Advantage Spoke > Create New First Advantage Case**.
Form to provide the First Advantage case details is displayed.

2. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Distribution Email for getting invite email from First Advantage</td>
<td>Option to send invitation email to all users in the distribution email.</td>
</tr>
<tr>
<td>Select User</td>
<td>User in the User [sys_user] table.</td>
</tr>
<tr>
<td>First Name</td>
<td>First name of the selected user. The value is auto-populated based on the user selected in Select User.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the selected user. The value is auto-populated based on the user selected in Select User.</td>
</tr>
<tr>
<td>Email</td>
<td>Email address of the selected user. The value is auto-populated based on the user selected in Select User.</td>
</tr>
<tr>
<td>Select A Package</td>
<td>First Advantage package to perform the background check.</td>
</tr>
<tr>
<td>Short Description</td>
<td>Brief description about the background check.</td>
</tr>
<tr>
<td>Agent Name</td>
<td>Agent to perform the background check.</td>
</tr>
<tr>
<td>Send Invite link</td>
<td>Option to send an invite email. When selected, a request to complete an application is sent to the candidate through an invite email. If this option isn’t selected, an order email is sent to the user. An order record is created and request to provide essential details is sent to the candidate.</td>
</tr>
</tbody>
</table>

Note:
- When the Send Invite link option is selected, an order is created only after the candidate has filled the application form.
- When the Send Invite link option isn’t selected, an order is immediately created.

3. Click Submit.
A First Advantage task is created in your ServiceNow instance with State as Draft. The case can be accessed by navigating to First Advantage Spoke > First Advantage Cases.

Initiate background verification in First Advantage from ServiceNow using invite

Initiate background verification of the required candidate by sending a request to complete an application through an invite email.

- Create a case in First Advantage from ServiceNow

Note: Ensure that the Send Invite link option is selected.
• Role required: First Advantage admin or First Advantage user

1. Navigate to First Advantage Spoke > First Advantage Cases.
2. Search for the required task.
3. Ensure that the Send Invite link option is selected. Else, select the Send Invite link option if you want to initiate background verification using invite.
4. Change the State of the task from Draft to Ready.
   - The First Advantage - Candidate Background Verification using Invite flow is triggered.
   - State is changed to In Progress.
   - In the Employee Tasks tab, a record is created and its details such as Number, Invite ID and so on, are populated. Open the record to access details such as Invite URL, Candidate ID, and so on. Also, real-time updates are displayed here.

   **Note:** The Employee Tasks tab displays all the invite records created for the user.

   - In the Order History tab, a record is created and its details such as Number, Short Description and so on, are populated.

   **Note:** The Order History tab displays all the order records created for the user.

   - Real-time updates and System Administrator events are displayed in the Order Details tab.

   **Note:** Order ID is populated only after the invite is executed successfully. For example, Order ID isn't populated if the candidate has declined to complete the application form.

   - An invite email is sent to the candidate.

After accessing the invite email, candidate can either complete the application form or decline. If candidate fills and submits the application form, First Advantage approves, cancels, or rejects the task after performing the background verification.

- The status and all other details can be accessed in real-time by navigating to First Advantage Spoke > Employee Tasks.
- Guest events are displayed in the respective First Advantage Employee Task record.

**Note:**
- You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.
- If the candidate has declined the request for background verification, the Order record isn't created for the task.

**Initiate background verification in First Advantage from ServiceNow using order**

Initiate background verification of the required candidate by sending an email requesting for the essential information.

- Create a case in First Advantage from ServiceNow

  **Note:** Ensure that the Send Invite link option isn't selected.

- Role required: First Advantage admin or First Advantage user
An order is initiated when First Advantage has all basic information about the candidate and requires only some essential sensitive information.

1. Navigate to First Advantage Spoke > First Advantage Cases.
2. Search for the required task.
3. Ensure that the Send Invite link option isn't selected. Else, clear the Send Invite link option if you want to initiate background verification using order.
4. Change the State of the task from Draft to Ready.
   - The First Advantage - Candidate Background Verification using Order flow is triggered.
   - State is changed to In Progress.
   - In the Order History tab, a record is created and its details such as Order ID, Number, Short Description and so on, are populated.
   - Real-time updates and System Administrator events are displayed in the Order Details tab.

   **Note:** The Order History tab displays all the order records created for the user.

   • An order email is sent to the candidate.

A mail is sent to candidate requesting only the sensitive information. Real-time updates and guest events are displayed in the Order Details tab. First Advantage approves, cancels, or rejects the task after performing the background verification.

**Note:** You must set up the webhooks to receive the guest event updates. See Set up First Advantage webhooks for information on setting up the webhooks.

**GitHub spoke v1.0.2**

Manage distributed version control and source code in GitHub from your ServiceNow instance. Create flows in ServiceNow to manage collaborative features such as tracking bugs, feature requests, tasks and so on, for projects in GitHub.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for GitHub API version v3, but may be compatible with later versions.

**Spoke requirements**

• GitHub account
- User with admin credentials
- Token to authenticate the ServiceNow instance

See the GitHub documentation for instructions on creating GitHub account and generating token.

**GitHub Webhooks module**

Bi-directional webhooks can be setup to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in GitHub for which you wish to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the GitHub tasks.

The bi-directional webhooks requires separate setup and can be used independently without using the spoke actions. By default, the GitHub Webhooks application is available in the GitHub spoke and has the following modules:

- GitHub Webhook Registries
- GitHub Webhook Routing Policies

Use the GitHub Webhook Registries module to assign a token and provide the API path. You must generate Callback URL here and provide this URL in GitHub. A default routing policy is provided in the GitHub Webhook Routing Policies module. The default routing policy supports these GitHub fields:

<table>
<thead>
<tr>
<th>Supported GitHub fields</th>

<td>Organization Description</td>
<td>Pull Request Review Previous Body</td>
<td>Status Created At</td>
</tr>
<tr>
<td>Organization Login</td>
<td>Pull Request Review State</td>
<td>Status Description</td>
</tr>
<tr>
<td>Pre-Release</td>
<td>Pull Request State</td>
<td>Status Name</td>
</tr>
<tr>
<td>Project Body</td>
<td>Pull Request Title</td>
<td>Status State</td>
</tr>
<tr>
<td>Project Card Archived</td>
<td>Pull Request Updated At</td>
<td>Status Updated At</td>
</tr>
<tr>
<td>Project Card Created At</td>
<td>Pull Request User</td>
<td>Webhook Event</td>
</tr>
</tbody>
</table>

To use other conditions in the routing policy, create routing policy in the GitHub WebHook Routing Policies module and specify conditions as per your requirement. See [Set up bi-directional webhook for the GitHub spoke](#) for information regarding setting up and configuring the webhooks.
Spoke subflow

The GitHub spoke provides a sample subflow to handle various GitHub webhook events. Available sample subflows are:

### Spoke subflows

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
<th>Supported GitHub Event</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process GitHub Branch and Tag Webhook Events</td>
<td>Handles branch and tag webhook events.</td>
<td>Branch and Tag</td>
</tr>
<tr>
<td>Process GitHub Commit Webhook Events</td>
<td>Handles commit webhook events.</td>
<td>Commit</td>
</tr>
<tr>
<td>Process GitHub Issue Webhook Events</td>
<td>Handles issue webhook events.</td>
<td>Issue</td>
</tr>
<tr>
<td>Process GitHub Milestone Webhook Events</td>
<td>Handles milestone webhook events.</td>
<td>Milestone</td>
</tr>
<tr>
<td>Process GitHub Project Webhook Events</td>
<td>Handles project webhook events.</td>
<td>Project</td>
</tr>
<tr>
<td>Process GitHub Pull Request Webhook Events</td>
<td>Handles pull request webhook events.</td>
<td>Pull Request</td>
</tr>
<tr>
<td>Process GitHub Push Webhook Events</td>
<td>Handles push request webhook events.</td>
<td>Push Request</td>
</tr>
<tr>
<td>Process GitHub Release Webhook Events</td>
<td>Handles release webhook events.</td>
<td>Release</td>
</tr>
<tr>
<td>Process GitHub Repository Webhook Events</td>
<td>Handles repository webhook events.</td>
<td>Repository</td>
</tr>
<tr>
<td>Process GitHub Security Webhook Events</td>
<td>Handles security webhook events.</td>
<td>Security</td>
</tr>
<tr>
<td>Process GitHub Webhook Events</td>
<td>Handles all GitHub webhook events.</td>
<td></td>
</tr>
</tbody>
</table>

Note: This subflow handles all GitHub events. You can customize this subflow to handle other GitHub webhook events that are not supported by default.

To create subflows to handle other GitHub webhook events or handle the supported GitHub webhook events differently, customize the Process GitHub Webhook Events subflow. For this, you must create a copy of the subflow, parse the payload, and customize the subflow as per your requirement. Payload is one of the inputs to the subflow.

While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

Note:
- You must configure webhooks to use the spoke subflow. See Set up bi-directional webhook for the GitHub spoke for information regarding setting up and configuring the webhook.
- The sample subflows run as a user by default. It can be configured to run as system.
Spoke actions

The GitHub spoke provides actions manage branches, issues, repositories, and source code when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch Management</td>
<td>Create Branch</td>
<td>Creates a branch in GitHub based on a specific commit SHA.</td>
</tr>
<tr>
<td></td>
<td>Delete Branch</td>
<td>Deletes a branch from the GitHub repository.</td>
</tr>
<tr>
<td></td>
<td>Get Branch</td>
<td>Retrieves the details of a branch in the GitHub repository.</td>
</tr>
<tr>
<td></td>
<td>Get Branch Protection</td>
<td>Retrieves the restriction details of the required branch.</td>
</tr>
<tr>
<td></td>
<td>List Branches</td>
<td>Retrieves the list of all branches in a repository.</td>
</tr>
<tr>
<td></td>
<td>Remove Branch Protection</td>
<td>Removes protection on the required branch.</td>
</tr>
<tr>
<td></td>
<td>Update Branch Protection</td>
<td>Updates protection on the required branch.</td>
</tr>
<tr>
<td>Issue Management</td>
<td>Create Comment on Issue</td>
<td>Creates comment on a required issue.</td>
</tr>
<tr>
<td></td>
<td>Create Issue</td>
<td>Creates issue for the required repository.</td>
</tr>
<tr>
<td></td>
<td>Delete Comment on Issue</td>
<td>Deletes comment on a required issue.</td>
</tr>
<tr>
<td></td>
<td>Lock Issue</td>
<td>Locks the required issue. This limits the conversation to collaborators only.</td>
</tr>
<tr>
<td></td>
<td>Look Up Comments on Issue</td>
<td>Retrieves the list of comments on an issue.</td>
</tr>
<tr>
<td></td>
<td>Look Up Issues</td>
<td>Retrieves the list of issues for a repository.</td>
</tr>
<tr>
<td></td>
<td>Unlock Issue</td>
<td>Unlocks the required issue. This opens conversation to all users.</td>
</tr>
<tr>
<td></td>
<td>Update Comment on Issue</td>
<td>Updates a comment on an issue.</td>
</tr>
<tr>
<td></td>
<td>Update Issue</td>
<td>Updates the details of the required issue.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Fields by Action</td>
<td>Retrieves the list of fields for an action filter in the GitHub Fields table.</td>
</tr>
<tr>
<td>Repository Management</td>
<td>Add Collaborator</td>
<td>Adds collaborator to the required repository.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create Comment on Pull Request</td>
<td>Create review comments on a pull request.</td>
</tr>
<tr>
<td></td>
<td>Create Milestone</td>
<td>Creates milestone for the required repository.</td>
</tr>
<tr>
<td></td>
<td>Create Pull Request</td>
<td>Creates a pull request for a repository.</td>
</tr>
<tr>
<td></td>
<td>Create Reply on Pull Request Review Comment</td>
<td>Creates reply to a review comment for a pull request.</td>
</tr>
<tr>
<td></td>
<td>Create Repository</td>
<td>Creates a repository in GitHub.</td>
</tr>
<tr>
<td></td>
<td>Delete Comment on Pull Request</td>
<td>Deletes review comment on a pull request.</td>
</tr>
<tr>
<td></td>
<td>Delete Milestone</td>
<td>Deletes milestone from the required repository.</td>
</tr>
<tr>
<td></td>
<td>List Comments on Pull Request</td>
<td>Retrieves the list of all review comments on a pull request.</td>
</tr>
<tr>
<td></td>
<td>List Milestones</td>
<td>Retrieves the list of all milestones in a repository.</td>
</tr>
<tr>
<td></td>
<td>Look Up Pull Requests</td>
<td>Retrieves the details of pull requests for a repository.</td>
</tr>
<tr>
<td></td>
<td>Look Up Repositories</td>
<td>Retrieves the details of repositories based on a specific user or organization.</td>
</tr>
<tr>
<td></td>
<td>Merge Pull Request</td>
<td>Merges the pull request to a repository.</td>
</tr>
<tr>
<td></td>
<td>Remove Collaborator</td>
<td>Removes collaborator from a repository.</td>
</tr>
<tr>
<td></td>
<td>Update Comment on Pull Request</td>
<td>Updates review comment provided for a pull request.</td>
</tr>
<tr>
<td></td>
<td>Update Milestone</td>
<td>Updates the details of a milestone in a repository.</td>
</tr>
<tr>
<td></td>
<td>Update Pull Request</td>
<td>Updates the details of a pull request in a repository.</td>
</tr>
<tr>
<td></td>
<td>Update Repository</td>
<td>Updates the details of a repository in GitHub.</td>
</tr>
<tr>
<td>Source Code Management</td>
<td>Create Comment on Commit</td>
<td>Creates comment for the required commit using its SHA.</td>
</tr>
<tr>
<td></td>
<td>Create or update a file</td>
<td>Creates a file or updates an existing file in a repository.</td>
</tr>
<tr>
<td></td>
<td>Get Comments By Commit ID</td>
<td>Retrieves comments provided for a single commit.</td>
</tr>
<tr>
<td></td>
<td>Get Commit Information By ID</td>
<td>Retrieves the contents of the required commit reference.</td>
</tr>
</tbody>
</table>
### Category | Action | Description
--- | --- | ---
 | Get File Content | Retrieves the contents of a file in a repository. |

**Note:** This action supports files with file size up to 1 MB.

| Category | Action | Description |
--- | --- | ---
 | List Commits on a Repository | Retrieves the details of all commits made on a repository. |

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

### Set up GitHub spoke

- Request IntegrationHub subscription
- Activate GitHub spoke
- Generate token and record the value
- Role required: admin

*Create Credential record for the GitHub spoke*

Create Credential records for the GitHub spoke. The GitHub spoke connection and credential aliases use these credentials to authorize actions.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Click **New**.
   - The system displays the message *What type of Credentials would you like to create?*.
3. Select **API Key Credentials**.
   - A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter <em>GitHub Credentials</em>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>API Key</td>
<td>Token generated in GitHub. See the <em>GitHub documentation</em> for instructions on creating GitHub account and generating token.</td>
</tr>
<tr>
<td>Applies to</td>
<td><strong>Note:</strong> This option is not applicable to this spoke.</td>
</tr>
</tbody>
</table>
Create Connection records for the GitHub spoke

Create Connection records for your GitHub account. The GitHub spoke connection and credential aliases use these connections to perform actions in GitHub.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for GitHub.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter GitHub Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for GitHub. For example, select GitHub Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL. Enter <a href="https://api.github.com/">https://api.github.com/</a>.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Set up bi-directional webhook for the GitHub spoke

Configure webhook to subscribe to GitHub with a ServiceNow callback URL.
- Request IntegrationHub subscription
- Activate the GitHub spoke
- Role required: admin

Create secret for the GitHub spoke

Create secret to embedded in the GitHub webhook URL.

Role required: admin

1. Navigate to System Definition > Scripts - Background.
2. Enter this command in the Run script (JavaScript executed on server) text field:
   ```javascript
gs.info(GlideSecureRandomUtil.getSecureRandomString(16));
```
3. Click Run Script.
4. Copy and record the generated secret for later use.

Register GitHub webhook in ServiceNow

Role required: admin

1. Navigate to GitHub Webhooks > GitHub Webhook Registries.
2. Click New.
3. On the form, fill in the fields.
GitHub Webhook Registry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, GitHub webhook.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the record.</td>
</tr>
<tr>
<td>Secret</td>
<td>Secret you had generated using the Scripts - Background module.</td>
</tr>
<tr>
<td>Path</td>
<td>GitHub webhook path. By default, this is set to api/sn_github_spoke/ github_webhook_callbacks/wh_entry.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.
5. Click **Callback URL**.
   The system displays the Webhook Callback URL.
6. Copy and record the Webhook Callback URL.

The GitHub webhook is registered in your ServiceNow instance.

**Add Callback URL in GitHub**

Provide Webhook Callback URL in GitHub account to create webhook.

Role required: admin

1. Log in to your GitHub account.
2. Create a webhook in your Atlassian account.
3. Enter Webhook Callback URL in **Payload URL** and Secret in **Secret**. See the **GitHub Developer** documentation for instructions on creating and configuring a webhook.

   **Note**: GitHub spoke supports application/json payload. Configure the GitHub webhook accordingly. See the **GitHub Developer** documentation for instructions on creating and configuring a webhook.

The Callback URL is added in the GitHub account. You can create routing policies and subflows as per your requirement. See **Customize a bi-directional webhook** for information regarding creating new routing policies and subflows.

**Customize bi-directional webhook in the GitHub spoke**
Create webhook routing policy and subflow as per your requirement in the GitHub spoke.

Role required: admin

The default routing policy in the GitHub WebHook Routing Policies modules triggers the relevant GitHub subflow and notifies the ServiceNow app when certain events occur in GitHub. See **GitHub spoke v1.0.2** for information about the GitHub fields that the default routing policy supports and the GitHub events that the subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

1. Navigate to **Flow Designer > Designer**.
2. Click **Subflows**.
3. Create a copy of the required subflow.
4. Customize the required subflow as per your requirement and publish it. See **Subflows** for more information about creating and using subflows and **GitHub spoke v1.0.2** for information about the GitHub fields that the default routing policy supports and the GitHub events that the subflows support.
5. Navigate to **GitHub Webhooks > GitHub WebHook Routing Policies**.
6. Click **New**.

© 2020 ServiceNow, Inc. All rights reserved.
7. On the form, fill in the fields.

### Decision form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. Default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in GitHub. See GitHub spoke v1.0.2 for information about the supported fields.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that has to be triggered when the specified conditions are met.</td>
</tr>
</tbody>
</table>

1. Click the Lookup icon.
2. Select the required subflow from the Document list.

**Note:** Ensure that the Table name is Flow [sys_hub_flow].

8. Click Submit.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Routing policy and subflow are created.

### GitLab spoke v1.0.2

Manage the DevOps lifecycle in GitLab from your ServiceNow instance. Create flows in ServiceNow to manage branches, groups, issues, merge requests, projects, and source code in GitLab.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

### IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

### Compatible versions

This spoke was built for GitLab API version v4, but may be compatible with later versions.
Spoke requirements

- GitLab account
- An application in GitLab configured to integrate with ServiceNow
- **Application ID** and **Secret** of the GitLab application

See the *GitLab* documentation for instructions on creating and configuring applications.

Spoke actions

The GitLab spoke provides actions to automate GitLab tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch Management</td>
<td>Create Branch</td>
<td>Creates a branch in the required project.</td>
</tr>
<tr>
<td></td>
<td>Delete Branch</td>
<td>Deletes the required branch from a project.</td>
</tr>
<tr>
<td></td>
<td>Delete Merged Branches</td>
<td>Deletes the required merged branch from a project.</td>
</tr>
<tr>
<td></td>
<td>Get Branch</td>
<td>Retrieves the details of the required branch.</td>
</tr>
<tr>
<td></td>
<td>List Branches</td>
<td>Retrieves the list of branches in a required project.</td>
</tr>
<tr>
<td></td>
<td>Protect Branch</td>
<td>Protects a branch in a project with access levels.</td>
</tr>
<tr>
<td></td>
<td>Unprotect Branch</td>
<td>Unprotects a branch in a project with access levels.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To A Group</td>
<td>Adds user to a GitLab group.</td>
</tr>
<tr>
<td></td>
<td>Remove User From A Group</td>
<td>Removes user from a GitLab group.</td>
</tr>
<tr>
<td>Issue Management</td>
<td>Create Issue</td>
<td>Creates an issue in the required project.</td>
</tr>
<tr>
<td></td>
<td>Create Issue Note</td>
<td>Creates an issue note for the required issue.</td>
</tr>
<tr>
<td></td>
<td>Delete Issue Note</td>
<td>Deletes an issue note for the required issue.</td>
</tr>
<tr>
<td></td>
<td>List Issue Notes</td>
<td>Retrieves the list of all issue notes for the required issue.</td>
</tr>
<tr>
<td></td>
<td>List Issues</td>
<td>Retrieves the list of the issues based on the input criteria.</td>
</tr>
<tr>
<td></td>
<td>Update Issue</td>
<td>Updates details of the required issue.</td>
</tr>
<tr>
<td></td>
<td>Update Issue Note</td>
<td>Updates an issue note in a project.</td>
</tr>
<tr>
<td>Merge Request Management</td>
<td>Accept Merge Request</td>
<td>Approves a merge request in GitLab.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create Merge Request</td>
<td>Creates a merge request in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Create Merge Request Note</td>
<td>Creates a note for the required merge request.</td>
</tr>
<tr>
<td></td>
<td>Delete Merge Request Note</td>
<td>Deletes a note for the required merge request.</td>
</tr>
<tr>
<td></td>
<td>List All Merge Requests</td>
<td>Retrieves the list of merge requests in a project.</td>
</tr>
<tr>
<td></td>
<td>List Merge Request Notes</td>
<td>Retrieves the list of merge request notes in a project.</td>
</tr>
<tr>
<td></td>
<td>Update Merge Request</td>
<td>Updates details of the required merge request.</td>
</tr>
<tr>
<td></td>
<td>Update Merge Request Note</td>
<td>Updates details of the required merge request note.</td>
</tr>
<tr>
<td>Project Management</td>
<td>Add User To A Project</td>
<td>Adds user to a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Archive Project</td>
<td>Archives a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Create Milestone</td>
<td>Creates milestone in a GitLab project.</td>
</tr>
<tr>
<td></td>
<td>Create Project</td>
<td>Creates a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Delete Milestone</td>
<td>Deletes milestone in a GitLab project.</td>
</tr>
<tr>
<td></td>
<td>Delete Project</td>
<td>Deletes a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Get Project</td>
<td>Retrieves the details of the required project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>List Milestones</td>
<td>Retrieves a list of milestones, along with their details.</td>
</tr>
<tr>
<td></td>
<td>Look Up Projects</td>
<td>Retrieves a list of projects, along with their details.</td>
</tr>
<tr>
<td></td>
<td>Remove User From A Project</td>
<td>Removes user from a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Share Project With Group</td>
<td>Shares a project with a group in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Unarchive Project</td>
<td>Unarchives a project in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Unshare Project With Group</td>
<td>Unshares a project with a group in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Update Milestone</td>
<td>Updates details of a milestone in a project.</td>
</tr>
<tr>
<td></td>
<td>Update Project</td>
<td>Updates details of a project.</td>
</tr>
<tr>
<td>Source Code Management</td>
<td>Add New File To Repository</td>
<td>Adds a file to a repository in GitLab.</td>
</tr>
<tr>
<td></td>
<td>Get Commit</td>
<td>Retrieves a details of a commit in GitLab.</td>
</tr>
</tbody>
</table>
Spoke module

The GitLab spoke provides Gitlab Token Management application that includes the Gitlab Token Management module. You should record here to authenticate requests from your ServiceNow instance.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements

These actions use REST calls, which can run on a MID Server. Use the connection record associated with the GitLab alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up GitLab spoke

Integrate the ServiceNow instance and GitLab by creating a custom OAuth application in GitLab to authenticate ServiceNow requests.

• Request IntegrationHub subscription
• Activate the GitLab spoke
• Role required: admin

Create OAuth application in GitLab account

Create a custom OAuth application from your GitLab account to enable OAuth 2.0 authentication with the GitLab spoke.

• GitLab account
• GitLab admin credentials

Complete these steps from your GitLab account. See the GitLab documentation for instructions on creating and configuring applications.

1. From your GitLab account, create an application.
2. Enter ServiceNow instance URL in Redirect URI.
3. Copy and record the Application Id and Secret for later use. These details are required to register the application as a third-party OAuth provider on your ServiceNow instance.

The custom OAuth application from your GitLab account is created and can be integrated with the ServiceNow instance.

Register GitLab as OAuth provider

Use the information generated during GitLab application configuration to register GitLab as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

Role required: admin

1. Navigate to System OAuth > Application Registry.
2. Open for the record for GitLab.
3. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter GitLab OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during the GitLab application configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Secret created during the GitLab application configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select GitLab Spoke.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. For example, <a href="https://gitlab.com/oauth/token">https://gitlab.com/oauth/token</a>.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
</tbody>
</table>
**ServiceNow** Orlando  Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. System generates the URL upon saving the application registry. Replace <code>&lt;Instance-Name&gt;</code> with the name of your ServiceNow instance.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**. The system validates the OAuth credentials and populates the Redirect URL.

5. Copy and record the Redirect URL.

6. Login to your GitLab application and edit the configuration of your GitLab application. See the **GitLab** documentation for instructions on creating and configuring applications.

7. Paste the Redirect URL value into the Redirect URI for your GitLab application.

The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

**Add GitLab token**

Add GitLab token to authenticate requests from your ServiceNow instance.

1. Navigate to **GitLab Token Management > GitLab Token Managements**.
2. Click **New**.
3. On the form, fill these values.

**Gitlab Token Management form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Secret</td>
<td>Secret created during the GitLab application configuration.</td>
</tr>
<tr>
<td>Name</td>
<td>Name to identify the record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of GitLab spoke as an OAuth provider. For example, select <strong>GitLab OAuth profile</strong>.</td>
</tr>
</tbody>
</table>

4. Click **Save**.

**Create Credential records for the GitLab spoke**

Authorize the GitLab spoke actions by creating credential records for the application registered in GitLab. The GitLab spoke connection and credential alias uses these credentials to authorize actions.

**Role required: admin**

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>GitLab Credentials</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>
5. Right-click the form header and click **Save**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

The credential record for the GitLab spoke is created.

**Create Connection record for the GitLab spoke**

Create Connection records to your GitLab account. The GitLab spoke connection and credential alias uses these connections to perform actions in GitLab.

Role required: admin

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record for **GitLab**.
3. From the **Connections** tab, click **New**.
   
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter GitLab Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for GitLab. For example, select GitLab Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://gitlab.com/api">https://gitlab.com/api</a>. Note: If you have installed GitLab on an on-premise server, enter the URL in this format: https://&lt;gitlab-hosted-instance&gt;.com/api</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

The connection record is created for GitLab spoke.

**Gmail spoke**

Manage Gmail actions.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

© 2020 ServiceNow, Inc. All rights reserved.
IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v1.

Spoke subflows

The Gmail spoke provides sample subflows in the draft state to demonstrate automating Gmail tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to Gmail</td>
<td>Copies an attachment from ServiceNow to Gmail.</td>
</tr>
</tbody>
</table>

Spoke actions

The Gmail spoke provides actions to automate Gmail tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label Management</td>
<td>Add Label to Email</td>
<td>Add a label to an email.</td>
</tr>
<tr>
<td></td>
<td>Create New Label</td>
<td>Create a label in your Gmail account.</td>
</tr>
<tr>
<td></td>
<td>Lookup Label ID By Name</td>
<td>Retrieve details of a specified Label ID.</td>
</tr>
<tr>
<td></td>
<td>Remove Label From Email</td>
<td>Remove the specified label from an email.</td>
</tr>
<tr>
<td>Email Management</td>
<td>Add Attachment To ServiceNow Record</td>
<td>Add an attachment from an email in your Gmail account to a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Get Email Details</td>
<td>Retrieve details of a specified email.</td>
</tr>
<tr>
<td></td>
<td>Look Up Emails</td>
<td>Retrieve details of specified emails.</td>
</tr>
<tr>
<td></td>
<td>Reply To Email</td>
<td>Send a reply to an email.</td>
</tr>
<tr>
<td></td>
<td>Send Email</td>
<td>Send email from your Gmail account to specified recipients.</td>
</tr>
<tr>
<td></td>
<td>Delete Email</td>
<td>Delete the specified email.</td>
</tr>
<tr>
<td></td>
<td>Undelete Email</td>
<td>Retrieve the specified email from the Bin.</td>
</tr>
</tbody>
</table>
Gmail spoke account requirements

The Gmail spoke requires a custom app that you create in the Google Developers Console.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Gmail alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Gmail spoke

Integrate the ServiceNow instance and Gmail spoke by using Google credentials to authenticate ServiceNow requests.

• Install the Gmail spoke.
• Request IntegrationHub subscription.
• Activate the Gmail spoke.
• Role required: admin.

Configure Gmail application

Create a custom OAuth application from your Gmail account to enable OAuth 2.0 authentication with the Gmail spoke.

Google Tasks integration requirements:

• A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
• A Google G Suite or Gmail login created with the domain.

Complete these steps from the Google Developers Console. See the G Suite product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type Web application.
5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.

This redirect URI must match the Redirect URL you provide when you Register Gmail as an OAuth provider.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Gmail as an OAuth provider.

The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.
Register Gmail as an OAuth provider

Use the information generated during Gmail application configuration to register the Gmail application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Open the GMail spoke.
3. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Gmail application you created.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret of the Gmail application you created.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon, enter <code>https://&lt;instance&gt;.service-now.com/oauth_redirect.do</code>, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

4. In the OAuth Entity Scopes related list, add the scopes required by your application. The GMail spoke supports these scopes:

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>labels</td>
<td><code>https://www.googleapis.com/auth/gmail.labels</code></td>
</tr>
<tr>
<td>send</td>
<td><code>https://www.googleapis.com/auth/gmail.send</code></td>
</tr>
<tr>
<td>readonly</td>
<td><code>https://www.googleapis.com/auth/gmail.readonly</code></td>
</tr>
<tr>
<td>compose</td>
<td><code>https://www.googleapis.com/auth/gmail.compose</code></td>
</tr>
<tr>
<td>insert</td>
<td><code>https://www.googleapis.com/auth/gmail.insert</code></td>
</tr>
<tr>
<td>modify</td>
<td><code>https://www.googleapis.com/auth/gmail.modify</code></td>
</tr>
<tr>
<td>metadata</td>
<td><code>https://www.googleapis.com/auth/gmail.metadata</code></td>
</tr>
<tr>
<td>basic settings</td>
<td><code>https://www.googleapis.com/auth/gmail.settings.basic</code></td>
</tr>
<tr>
<td>sharing settings</td>
<td><code>https://www.googleapis.com/auth/gmail.settings.sharing</code></td>
</tr>
<tr>
<td>mail</td>
<td><code>https://mail.google.com</code></td>
</tr>
</tbody>
</table>

Note: The mail scope provides full access to the account including permanent deletion of threads and messages.
Click **Insert a new row** and enter the name and the OAuth scope

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>labels</td>
<td><a href="https://www.googleapis.com/auth/gmail.labels">https://www.googleapis.com/auth/gmail.labels</a>...</td>
</tr>
<tr>
<td>readonly</td>
<td><a href="https://www.googleapis.com/auth/gmail.readonly">https://www.googleapis.com/auth/gmail.readonly</a>...</td>
</tr>
<tr>
<td>send</td>
<td><a href="https://www.googleapis.com/auth/gmail.send">https://www.googleapis.com/auth/gmail.send</a></td>
</tr>
</tbody>
</table>

5. On the **OAuth Entity Profiles** tab, add at least one profile, set its **Is default** value to true, and select the **Grant type** Authorization Code. Click **Update**.

6. Open the form for this default profile, add the entity scopes to the profile, and click **Update**.

7. On the Application registries form, click **Update** again.

The system validates the OAuth credentials.

*Create Credential record for the Gmail spoke.*

*Create Credential record for the Gmail spoke*  
Create Credential records to Gmail. The Gmail spoke connection and credential alias uses these credentials to authorize actions.
• Role required: admin.

1. Navigate to IntegrationHub > Connections & Credentials > Credentials and click New.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, Gmail Spoke Credential.
4. Click the OAuth Entity Profile search icon and select the default Gmail profile.
5. Click Submit and reopen the credential.
7. Choose the Google account that the application is associated with and allow Google to access the spoke actions you specified.

Create Connection record for the Gmail spoke.
Create Connection record for the Gmail spoke
Create Connection records to your Gmail account. The Gmail spoke connection and credential alias uses these connections to perform actions on Gmail.

Role required: admin

1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases and select Gmail.
2. On the Connections related list, click New.
3. Select HTTP(s) Connection.
4. Provide this connection information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name gmail.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the name of the credential you created in Create Credential record for the Gmail spoke.</td>
</tr>
</tbody>
</table>

Note: Make sure that you don’t include spaces before or after this URL. If there are spaces, the connection fails.

5. Click Submit.

The Gmail spoke is set up and integrated with the ServiceNow instance.

Google Calendar spoke

Use ServiceNow to create and update events and attendees in Google Calendar.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v1.

Spoke actions

The Google Calendar spoke provides actions to perform Google Calendar tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attendees</td>
<td>Add Attendees To Event</td>
<td>Updates an event by adding to the list of attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td></td>
<td>Remove Attendees From Event</td>
<td>Updates an event by removing specified attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td>Event Management</td>
<td>Create Event</td>
<td>Creates an event on the specified calendar.</td>
</tr>
<tr>
<td></td>
<td>Update Event</td>
<td>Edit event information. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td></td>
<td>Get Event By ID</td>
<td>Returns the specified event.</td>
</tr>
<tr>
<td></td>
<td>Delete Event</td>
<td>Removes a specified event from a calendar.</td>
</tr>
<tr>
<td></td>
<td>Look Up Events</td>
<td>Returns events on a specified calendar based on start time, end time, or search terms.</td>
</tr>
</tbody>
</table>

Google Calendar Online account requirements

The Google Calendar spoke requires a custom app that you create in Google G Suite.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the
connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Calendar alias to configure where actions run as well as set MID Server selection attributes. For more information, see *MID server*.

**Set up Google Calendar spoke**

Integrate a ServiceNow instance and Google Calendar by using G Suite credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Google Calendar spoke.
- Role required: admin

**Configure Google Calendar application**

Create a custom OAuth application from your G Suite account to enable OAuth 2.0 authentication with the Google Calendar spoke.

Google Calendar integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or login created with the domain.

Complete these steps from your Google G Suite account. See the G Suite product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to [https://console.developers.google.com](https://console.developers.google.com), create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain service-now.com. Click **Save**.
3. Search for the Google Calendar API and enable it.
4. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.
5. Select the application type **Web application**.
6. Enter the following Authorized redirect URI: [https://<instance>.service-now.com/oauth_redirect.do](https://<instance>.service-now.com/oauth_redirect.do) and click **Create**.
   
   This redirect URI must match the **Redirect URL** you provide when you Register Google Calendar as an OAuth provider.
7. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Tasks as an OAuth provider.
   
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

**Register Google Calendar as an OAuth provider**

Use the information generated during Google Calendar account configuration to register the Google Calendar application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to **System OAuth > Application Registry**.
2. Click **New**.
3. On the screen titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example Google Calendar.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Calendar application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Click the search icon and select OAuthGoogleRefreshTokenUtil</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon, enter <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon, enter <a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon, enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. Optional: In the OAuth Entity Scopes related list, add any scopes required by your application. The Google Calendar spoke includes these scopes by default:
   - Calendar
   - Events

6. Right-click the form header, and click Save. The system validates the OAuth credentials.

Create Credential record for the Google Calendar spoke

Create Credential records to connect the Google Calendar custom OAuth application you created during account configuration. The Google Calendar spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to IntegrationHub > Connections & Credentials > Credentials and click New.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, gCal Cred.
4. Click the OAuth Entity Profile search icon and select the profile with the name of the OAuth application registry you created when you registered the Google Calendar service as an OAuth provider.

5. Click Get OAuth Token.

Create Connection record for the Google Calendar spoke

Create connection records to a Google Calendar account. A connection alias resolves your Google Calendar connection and credential at runtime. Only one connection is active per Connection Alias at a time.

You should provide a single Credential and Connection Alias for all G Suite service spokes.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Select the Google Calendar connection.
3. On the Connection Attributes related list, set the default value of the API version to v3.
   If there are no connection attributes, click New and create a connection attribute with this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>API version</td>
</tr>
<tr>
<td>Column name</td>
<td>u_api_version</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
<tr>
<td>Read only</td>
<td>False</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Reference</td>
<td>(empty)</td>
</tr>
<tr>
<td>Default value</td>
<td>v3</td>
</tr>
</tbody>
</table>

4. In the Connections related list, select the Google Calendar Connection.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name Google Calendar Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential name you specified when you created the Credential record. The value used in the preceding steps is gCal_Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the value sn_gcalendar_scope.Google_Calendar.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL <a href="https://www.googleapis.com/">https://www.googleapis.com/</a>.</td>
</tr>
</tbody>
</table>

5. Return to IntegrationHub > Connections & Credentials > Credentials and select googlecalendar_cred.
6. From Related Links, click Get OAuth Token.
   A confirmation message indicates that the OAuth token flow has completed successfully. Review the details if the flow is not successful.

Note: Ensure that you allow pop-up windows in your browser.

The Google Calendar spoke is set up and integrated with the ServiceNow instance.
Google Cloud Functions spoke

Manage functions that are attached to events, using your Google Cloud Functions account from ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for the Google Cloud Functions API version v1, but may be compatible with later versions.

Google Cloud Functions spoke requirements

The Google Cloud Functions spoke requires a custom app that you create in Google Cloud Platform.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Google Identity and Access spoke
- Google Cloud VPC Access spoke
- Google Cloud Storage spoke
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Cloud Functions spoke provides actions to automate Google Cloud Functions tasks when events occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function Management</td>
<td>Create Function For Event</td>
<td>Creates a function for an event.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create Function For HTTP</td>
<td>Create a function to process an HTTP request.</td>
</tr>
<tr>
<td></td>
<td>Delete Function</td>
<td>Deletes the specified function.</td>
</tr>
<tr>
<td></td>
<td>Generate Download URL</td>
<td>Retrieves details of a signed URL to download source code of the deployed function.</td>
</tr>
<tr>
<td></td>
<td>Generate Upload URL</td>
<td>Retrieves details of a signed URL for uploading source code of the deployed function.</td>
</tr>
<tr>
<td></td>
<td>Get Function</td>
<td>Retrieves information about the specified function.</td>
</tr>
<tr>
<td></td>
<td>Get IAM Policy</td>
<td>Retrieves details of IAM access control policy for a function.</td>
</tr>
<tr>
<td></td>
<td>Look up Functions</td>
<td>Retrieves a list of functions available in the specified location.</td>
</tr>
<tr>
<td></td>
<td>Set IAM Policy</td>
<td>Sets the IAM access control policy for the specified function.</td>
</tr>
<tr>
<td></td>
<td>Update Function</td>
<td>Updates details of the specified function.</td>
</tr>
<tr>
<td>Location Management</td>
<td>Look up Locations</td>
<td>Retrieves a list of locations available in the specified project.</td>
</tr>
<tr>
<td>Operation Management</td>
<td>Get Operation</td>
<td>Retrieves details of the specified operation.</td>
</tr>
<tr>
<td></td>
<td>Look up Operations</td>
<td>Retrieves the list of operations available in the specified project.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the Google Cloud Functions spoke**

Integrate the ServiceNow instance and Google Cloud Functions account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate Google Cloud Functions spoke.
- Role required: admin

*Configure the Google Cloud Functions application*

Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Functions spoke.
Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to https://console.cloud.google.com/, create a project with your administrator credentials, and open the project.

2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.

3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.

4. Select the application type OAuth client ID.

5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Cloud Functions as an OAuth provider.

Register Google Cloud Functions as an OAuth provider

Use the information generated during the Google Cloud Functions application configuration to register Google Cloud Functions as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.

2. Open for the record, Google Cloud Functions.

3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Cloud Functions application.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret of the Google Cloud Functions application.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.

Create a credential record for the Google Cloud Functions spoke

Create a credential record for the Google Cloud Functions application. The Google Cloud Functions spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Connections & Credential Aliases.

2. Open record for the Google Cloud Functions spoke. For example, GoogleCloudFunctions.

3. In the Credentials tab, click New.

4. Select OAuth 2.0 Credentials.

5. Enter a unique name for the credential, for example, GFunctions_Cred.

6. Click the OAuth Entity Profile search icon

   and select the profile with the name of the OAuth application registry you configured when you registered the Google Cloud Functions service as an OAuth provider. See Register Google Cloud Functions as an OAuth provider for more information.

7. Right-click the form header and click Save.
8. Click Get OAuth Token.

**Google Cloud Load Balancer Spoke**

Manage load balancing of your external or internal Virtual Private Cloud (VPC) network from ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for Google Cloud Load Balancer v1, but may be compatible with later versions.

**Spoke requirements**

- Google Cloud Platform (GCP) account with access to Google Compute Engine and Google Virtual Private Network

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- Google Compute Engine spoke (sn_gcompute_spoke)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke subflows**

The Google Cloud Load Balancer Spoke provides subflows to automate Google Cloud Load Balancer tasks when events occurs in your ServiceNow instance. Available subflows include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTPS Load Balancer Management</td>
<td>Create HTTPS Load Balancer For A New Backend Service</td>
<td>Creates a HTTPS load balancer for a new backend service in the specified project.</td>
</tr>
<tr>
<td></td>
<td>Create HTTPS Load Balancer For An Existing Backend Service</td>
<td>Creates a HTTPS load balancer for an existing backend service in the specified project.</td>
</tr>
<tr>
<td></td>
<td>Delete HTTPS Load Balancer</td>
<td>Deletes the components of the specified load balancer.</td>
</tr>
<tr>
<td></td>
<td>Look up Components Of HTTPS Load Balancer</td>
<td>Retrieves a list of names of all the components associated with a HTTPS load balancer.</td>
</tr>
<tr>
<td>HTTP Load Balancer Management</td>
<td>Create A HTTP Load Balancer For A New Backend Service</td>
<td>Creates a HTTP load balancer for a new backend service in the specified project.</td>
</tr>
<tr>
<td></td>
<td>Create HTTP Load Balancer For An Existing Backend service</td>
<td>Creates a HTTP load balancer for an existing backend service in the specified project.</td>
</tr>
<tr>
<td></td>
<td>Delete HTTP Load Balancer</td>
<td>Deletes the components of a HTTP load balancer.</td>
</tr>
<tr>
<td></td>
<td>Look up Components Of HTTP Load Balancer</td>
<td>Retrieves a list of names of all the components associated with a HTTP load balancer.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Google Cloud Load Balancer Spoke provides actions to automate Google Cloud Load Balancer tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backend Service Management</td>
<td>Create Backend Service</td>
<td>Creates a backend service.</td>
</tr>
<tr>
<td></td>
<td>Delete Backend Service</td>
<td>Deletes the specified backend service</td>
</tr>
<tr>
<td></td>
<td>Get Backend Service</td>
<td>Retrieves the details of the specified backend service.</td>
</tr>
<tr>
<td></td>
<td>Get Health Of Backend Service</td>
<td>Retrieves the health details of the specified backend service.</td>
</tr>
<tr>
<td></td>
<td>Look up Backend Services</td>
<td>Retrieves a list of all backend services.</td>
</tr>
<tr>
<td></td>
<td>Update Backend Service</td>
<td>Updates the details of the specified backend service.</td>
</tr>
<tr>
<td>Global Address Management</td>
<td>Create A Global Address</td>
<td>Creates a global address.</td>
</tr>
<tr>
<td></td>
<td>Delete A Global Address</td>
<td>Deletes the specified global address.</td>
</tr>
<tr>

<td>Create Instance In Instance Manager Group</td>
<td>Creates an instance in the specified instance group manager.</td>
</tr>
<tr>
<td></td>
<td>Delete An Instance Group Manager</td>
<td>Deletes the specified instance group manager.</td>
</tr>
<tr>
<td></td>
<td>Get Instance Group Manager</td>
<td>Retrieves the details of a specified instance group manager.</td>
</tr>
<tr>
<td></td>
<td>Look up Instance Group Managers</td>
<td>Retrieves a list of managed instance groups.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Look up Managed Instances In An Instance Group Manager</td>
<td>Retrieves a list of managed instances in a specified managed instance group.</td>
</tr>
<tr>
<td></td>
<td>Resize An Instance Group Manager</td>
<td>Resizes the number of instances in a specified instance group manager.</td>
</tr>
<tr>
<td></td>
<td>Update Instance Template Of An Instance Group Manager</td>
<td>Assigns the details of instance template to the specified instance group manager.</td>
</tr>
<tr>
<td>Target HTTP Proxy Management</td>
<td>Create Target HTTP Proxy</td>
<td>Creates a target HTTP proxy.</td>
</tr>
<tr>
<td></td>
<td>Delete Target HTTP Proxy</td>
<td>Deletes the specified target HTTP proxy.</td>
</tr>
<tr>
<td></td>
<td>Get Target HTTP Proxy</td>
<td>Retrieves the details of the specified target HTTP proxy.</td>
</tr>
<tr>
<td></td>
<td>Look up Target HTTP Proxies</td>
<td>Retrieves a list of all target HTTP proxies.</td>
</tr>
<tr>
<td></td>
<td>Update URL Map Of Target HTTP Proxy</td>
<td>Assigns the URL map information to the specified target HTTP proxy.</td>
</tr>
<tr>
<td>Target HTTPS Proxy Management</td>
<td>Create Target HTTPS Proxy</td>

</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials.*
Set up the Google Cloud Load Balancer Spoke

Integrate the ServiceNow instance and Google Cloud Load Balancer by creating a custom OAuth application in Google Cloud Storage to authenticate ServiceNow requests.

- Request an IntegrationHub subscription.
- Activate Google Cloud Load Balancer Spoke.
- Role required: admin

Register Google Cloud Load Balancer as an OAuth provider

Use the information generated during the Google Cloud Storage application configuration to register Google Cloud Load Balancer as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Open for the record for Google Cloud Load Balancer.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the Google Cloud Storage application configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during the Google Cloud Storage or application configuration.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code endpoint. Enter: <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a></td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: <a href="https://oauth2.googleapis.com/token">https://oauth2.googleapis.com/token</a></td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGoogleCloudLoadBalancerUtil.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.

Create a credential record for the Google Cloud Load Balancer Spoke

Create a credential record for the Google Cloud Storage custom application. The Google Cloud Load Balancer Spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases.
2. Open the Google_Cloud_Storage record.
3. In the Credentials section, click New.

   The system displays this message: What type of Credentials would you like to create?

4. Select OAuth 2.0 Credentials.
5. On the form, fill these values.
### OAuth 2.0 Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Google Cloud Load Balancer OAuth Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Google Cloud Storage as an OAuth provider. Find and select GCP Cloud Storage default_profile.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click **Submit**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

### Google Cloud Pub Sub Spoke

Manage Google Cloud Pub/Sub messaging service from your ServiceNow instance.

### Request apps on the Store

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](#).

### IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see [Request IntegrationHub](#).

### Supported versions

This spoke was built for Google Cloud Pub Sub v1, but may be compatible with later versions.

### Spoke requirements

- Google Cloud account

### Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
Complex Object (com.glide.object)
Google Identity And Access Spoke (sn_gcp_id_acc_spk)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows
The Google Cloud Pub Sub Spoke provides sample subflows to demonstrate automating Google Cloud Pub/Sub tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Google PubSub Messages</td>
<td>Receives messages from a sub topic and displays the messages in logs.</td>
</tr>
</tbody>
</table>

Spoke actions
The Google Cloud Pub Sub Spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Snapshot Management</td>
<td>Create Snapshot</td>
<td>Creates a snapshot from the requested subscription.</td>
</tr>
<tr>
<td></td>
<td>Delete Snapshot</td>
<td>Removes the specified existing snapshot.</td>
</tr>
<tr>
<td></td>
<td>Get Snapshot IAM Policy</td>
<td>Retrieves the IAM policy of the snapshot.</td>
</tr>
<tr>
<td></td>
<td>Look up Snapshots</td>
<td>Retrieves a list of existing snapshots.</td>
</tr>
<tr>
<td></td>
<td>Set Snapshot IAM Policy</td>
<td>Assigns the access control policy to the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Update Snapshot</td>
<td>Updates an existing snapshot.</td>
</tr>
<tr>
<td>Subscription Management</td>
<td>Acknowledge</td>
<td>Acknowledges the messages associated with the acknowledge IDs in the acknowledge request.</td>
</tr>
<tr>
<td></td>
<td>Acknowledge Deadline</td>
<td>Updates the acknowledge deadline in seconds for a specific message.</td>
</tr>
<tr>
<td></td>
<td>Create Pull Subscription</td>
<td>Creates a pull subscription to the specified topic.</td>
</tr>
<tr>
<td></td>
<td>Create Push Subscription</td>
<td>Creates a push subscription to the specified topic.</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>Get Subscription IAM Policy</td>
<td>Retrieves the access control policy for the specified subscription.</td>
</tr>
<tr>
<td></td>
<td>Look up Subscriptions</td>
<td>Retrieves a list of subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Pull Messages</td>
<td>Pulls message asynchronously for the specified project.</td>
</tr>
<tr>
<td></td>
<td>Seek Subscription</td>
<td>Seeks an existing subscription to a point in time or to a specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Set Subscription IAM Policy</td>
<td>Assigns the access control policy to the specified subscription.</td>
</tr>
<tr>
<td></td>
<td>Update Push Configuration</td>
<td>Updates the push configuration for the specified subscription.</td>
</tr>
<tr>
<td></td>
<td>Update Subscription</td>
<td>Updates the specified existing subscription.</td>
</tr>
<tr>
<td></td>
<td>Create Topic</td>
<td>Creates a topic with the specified name.</td>
</tr>
<tr>
<td></td>
<td>Delete Topic</td>
<td>Deletes the specified topic.</td>
</tr>
<tr>
<td></td>
<td>Get IAM Policy</td>
<td>Retrieves the specified access control policy of a resource.</td>
</tr>
<tr>
<td></td>
<td>Get Topic</td>
<td>Retrieves the configuration details of the specified topic.</td>
</tr>
<tr>
<td></td>
<td>Look up Topics</td>
<td>Retrieves a list of topics.</td>
</tr>
<tr>
<td></td>
<td>Publish Messages</td>
<td>Adds one or more messages to the specified topic.</td>
</tr>
<tr>
<td></td>
<td>Set IAM Policy</td>
<td>Assigns the access control policy to the specified resource.</td>
</tr>
<tr>
<td></td>
<td>Update Topic</td>
<td>Updates the specified topic.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**MID Server requirements**
Set up the Google Cloud Pub Sub Spoke

Integrate the ServiceNow instance and Google Cloud Pub Sub by creating a custom OAuth application in Google Cloud account to authenticate ServiceNow requests.

- Request an IntegrationHub subscription.
- Activate Google Cloud Pub Sub Spoke.
- Role required: admin

Register Google Cloud Pub Sub as an OAuth provider

Use the information generated during the Google Cloud Pub Sub application configuration to register Google Cloud as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays this message: What kind of OAuth application?.
3. Select Connect to a third party OAuth Provider.
4. On the form, fill these values.

### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter: Google Cloud Pub Sub OAuth</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the Google Cloud account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the Google Cloud account configuration.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code endpoint. Enter: <a href="https://oauth2.googleapis.com/o/oauth2/auth">https://oauth2.googleapis.com/o/oauth2/auth</a></td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: <a href="https://oauth2.googleapis.com/token">https://oauth2.googleapis.com/token</a></td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

**Note:** You can use only Authorization Code as the Default Grant type when PKCE is enabled.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

5. Add OAuth Entity Profile.
6. Add OAuth Entity Scope.
7. Right-click the form header, and click **Save**.

*Create a credential record for the Google Cloud Pub Sub Spoke*
Create a credential record for the Google Cloud account. The Google Cloud Pub Sub Spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **IntegrationHub** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays this message: **What type of Credentials would you like to create?**
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these values.
   **OAuth 2.0 Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Google Cloud Pub Sub Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Google Cloud Pub Sub as an OAuth provider. For example, Google Cloud Pub Sub OAuth Profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in your network, or to one or more <strong>Specific MID servers</strong>. Specify the MID Servers that should use this credential in the <strong>MID servers</strong> field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click **Submit**.
7. To generate the OAuth token, click the **Get OAuth Token** related link.

*Create a credential record for the Google Cloud Pub Sub Spoke*
Create a credential record for the Google Cloud account. The Google Cloud Pub Sub Spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **IntegrationHub** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the **GoogleCloudPubSub** record.
3. In the **Credentials** section, click **New**.
4. <TBD>.
5. Right-click the form header and click **Submit**.

6. To generate the OAuth token, click the **Get OAuth Token** related link.

---

**Google Cloud Storage spoke**

Manage storage and retrieval of data in Google Cloud from your ServiceNow instance.

**Request apps on the Store**

Visit the *ServiceNow Store* website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the *ServiceNow Store version history release notes*.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see *Request IntegrationHub*.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Google Cloud Storage account requirements**

The Google Cloud Storage spoke requires a custom app that you create in Google Cloud Platform.s

**Supported versions**

This spoke was built for API version v1, but may be compatible with later versions.

**Spoke subflows**

The Google Cloud Storage spoke provides sample subflows to demonstrate automating Google Cloud Storage tasks. To customize the sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move An Object</td>
<td>Moves an object from the source bucket to destination bucket.</td>
</tr>
</tbody>
</table>
### Spoke actions

The Google Cloud Storage spoke provides actions to automate Google Cloud Storage when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Permissions Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bucket Access Control Management</td>
<td>Create/Update Bucket Access</td>
<td>Creates or updates a bucket access control.</td>
<td>• storage.buckets.get&lt;br&gt;• storage.buckets.getIamPolicy&lt;br&gt;• storage.buckets.setIamPolicy&lt;br&gt;• storage.buckets.update</td>
</tr>
<tr>
<td></td>
<td>Control</td>
<td>Deletes the specified bucket access control.</td>
<td>• storage.buckets.get&lt;br&gt;• storage.buckets.getIamPolicy&lt;br&gt;• storage.buckets.setIamPolicy&lt;br&gt;• storage.buckets.update</td>
</tr>
<tr>
<td></td>
<td>List All Bucket Access Controls</td>

### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Permissions Required</th>
</tr>
</thead>
</table>
|          | Update Object Details In A Bucket | Updates details of the specified object in a bucket. | • storage.objects.update  
• storage.objects.setIamPolicy |
|          | Update Object Storage Class | Updates storage class of the specified object. | • storage.objects.update  
• storage.objects.setIamPolicy |
|          | Upload An Object | Uploads an object to the specified bucket. | • storage.objects.create  
• storage.objects.delete |

For more information about the required permissions, see *IAM permissions reference*.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

### Set up the Google Cloud Storage spoke

Integrate the ServiceNow instance and Google Cloud Storage spoke by using G Suite credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Google Cloud Storage spoke.
- Access to Google Cloud Platform.
- Role required: admin.

#### Configure the Google Cloud Storage application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud Storage spoke.

Complete these steps from the *Google Cloud Platform*. See the *Google Cloud Platform* product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to https://console.cloud.google.com/, create a project with your administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type Web application.
5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Cloud Storage as an OAuth provider.

   The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.
Register Google Cloud Storage as an OAuth provider
Use the information generated during Google Cloud Storage account configuration to register the Google Cloud Storage application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Open the record for Google Cloud Storage.
3. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Cloud Storage.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Cloud Storage application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGoogleCloudStorageUtils</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the ServiceNow instance in this format: https://&lt;instance&gt;.servicenow.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
   The system validates the OAuth credentials.

Create Credential record for the Google Cloud Storage spoke
Create Credential records to connect the Google Cloud Storage custom OAuth application you created during account configuration. The Google Cloud Storage spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to IntegrationHub > Connections & Credentials > Credentials and click New.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, GStorage Cred.
4. Click the OAuth Entity Profile search icon and select the profile with the name of the OAuth application registry you created when you registered the Google Cloud Storage service as an OAuth provider.
5. Click Get Oauth Token.

Google Cloud Translator Service spoke
Provides subflows and actions to dynamically translate the user-entered text, and to detect the language of the text using the Google translation service.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

Subscription

This spoke requires one of the following subscriptions:

- Any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.
- IntegrationHub Professional subscription package. For more information see, Request IntegrationHub.

Supported versions

Google Translate API version v3

Scope of the spoke in the Dynamic Translation framework

To use Google Cloud Translator Service spoke in the Dynamic Translation framework, ensure that the spoke is installed in ServiceNow Store and the Dynamic Translation plugin is active. For more information, see Dynamic Translation.

Spoke flows

This spoke has no sample flows.

Spoke subflows

The Google Cloud Translator Service spoke provides subflows in the Published state to integrate with the Google translation service. These subflows can be used as part of other subflows and flows.

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language</td>
<td>Contains a set of inputs, actions, and outputs to detect the language of the input text.</td>
</tr>
<tr>
<td>Translate Text To Multiple Languages</td>
<td>Contains a set of inputs, actions, and outputs to translate the input text to multiple languages.</td>
</tr>
</tbody>
</table>

Spoke actions

The Google Cloud Translator Service spoke provides actions to integrate with the Google translation service. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language</td>
<td>Detects the language of the input text.</td>
</tr>
</tbody>
</table>
### Google account requirements

The Google Cloud Translator Service spoke requires configuring your Google Cloud account to generate an OAuth 2.0 JWT Bearer Grant token.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

This spoke uses the GoogleTranslation alias record (sn_google_trans.GoogleTranslation) to authorize actions.

### Set up Google Cloud Translator Service spoke

Integrate your Google account with your ServiceNow instance.

- **Role required:** admin
- Create a service account on Google Cloud, generate a service account key of JSON type and download it. For information on creating the service account key, see the [Google documentation](#).
- Enable the Cloud Translation API service. For information on enabling a service, see the [Google documentation](#).

### Create a Java KeyStore certificate

Encrypt the security certificates obtained from Google by creating a Java KeyStore (JKS) file.

- **Role required:** admin
- Download a JSON file containing the service account key from Google. For information on downloading the JSON file, see the [Google documentation](#). Following is a sample JSON file:

```json
{
    "type": "service_account",

1. In the JSON file, perform the following for the `private_key` value.
   a) Unescape the \n characters.
   b) Store the private key in a file with .pem extension.

2. In the JSON file, perform the following for the `client_x509_cert_url` value.
   a) Open the link specified for `client_x509_cert_url`.
   b) Unescape the \n characters for the certificate associated with the `private_key_id` mentioned in the JSON file.
   c) Store the certificate value in a file with .pem extension.

3. Use the openssl command to create a PKCS 12 file using the recently created private key and certificate files.

   For example, if certificate.pem is the certificate and privatekey.pem is the private key:

   openssl pkcs12 -export -in certificate.pem -inkey privatekey.pem -certfile certificate.pem -out testkeystore.p12

   A PKCS 12 file, testkeystore.p12, is created.

4. Specify an export password or source keystore password.

   Note: You should specify this password when creating a JWT key for Google Cloud Translator Service spoke.

5. Use the keytool command to create a JKS file from the PKCS 12 file.

   keytool -importkeystore -srckeystore testkeystore.p12 -srcstoretype pkcs12 -destkeystore wso2carbon.jks -deststoretype JKS

   Note: testKeyStore.p12 is the PKCS 12 file and wso2carbon.jks is the JKS file.

6. Specify a destination keystore password.
**Attach a Java KeyStore certificate to Google Cloud Translator Service spoke**

Enable the JWT client authentication by attaching a valid Java KeyStore (JKS) certificate to Google Cloud Translator Service spoke.

- Role required: admin
- Valid Java KeyStore certificate

1. Navigate to **System Definition > Certificates**.
2. Click **New**.
3. On the form, fill in the fields.

**X.509 Certificate form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the certificate.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the certificate.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the certificate. Select <strong>Java Key Store</strong>.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Password to access the certificate. Use the destination keystore password specified when creating the JKS certificate. For more information on this password, see Create a Java KeyStore certificate.</td>
</tr>
<tr>
<td>Short description</td>
<td>Summary about the certificate.</td>
</tr>
</tbody>
</table>

4. Click the manage attachments icon (_attach-) and attach a JKS certificate.
5. To validate the JKS certificate, click **Validate Stores/Certificates**.
6. Click **Submit**.

**Create a JWT signing key for Google Cloud Translator Service spoke**

Assign a JSON Web Token (JWT) signing key to your Java KeyStore certificate.

Role required: admin

1. Navigate to **System OAuth > JWT Keys**.
2. Click **New**.
3. On the form, fill in the fields.

**JWT Keys form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the JWT signing key.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Valid JKS certificate for which you want to assign the key.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Key Id</td>
<td>Key ID to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Algorithm to sign with the key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Password associated with the key. Use the export password or the source keystore password specified when creating the JKS certificate. For more information on this password, see Create a Java KeyStore certificate.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the key.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Create a JWT provider for Google Cloud Translator Service spoke
Add a JSON Web Token (JWT) provider to Google Cloud Translator Service spoke.

Role required: admin

1. Navigate to System OAuth > JWT Providers.
2. Click New.
3. On the form, fill in the fields.

JWT Provider form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the JWT provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Number of seconds that indicate the lifespan of the JWT provider token. Specify 3600.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>JTW signing key.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
5. In the Standard Claims related list, enter the values for these claims.

Claim

<table>
<thead>
<tr>
<th>Claim name</th>
<th>Claim value</th>
</tr>
</thead>
<tbody>
<tr>
<td>aud</td>
<td><a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a></td>
</tr>
<tr>
<td>iss</td>
<td>client_email value from the JSON file.</td>
</tr>
</tbody>
</table>

6. In the Custom Claims related list, create the scope claim and enter its value as https://www.googleapis.com/auth/cloud-translation.
7. Click Update.

Configure the credential for the GoogleTranslation alias
Authorize actions of Google Cloud Translator Service spoke by configuring the Google OAuth 2.0 credential.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Select the Google OAuth 2.0 credential.
3. Open the record specified in the OAuth Entity Profile field.
4. In the JWT Provider field, specify the JWT provider that you want to use.
5. Click **Update**.
6. To verify if an OAuth Access token is generated to connect to Google's translation services, click the **Get OAuth Token** related link of the Google OAuth 2.0 credential.

Configure the connection attributes for the **GoogleTranslation alias**

Connect to the Google's translation service by configuring the Google connection. Provide information that is used by HTTP(s) actions or activities to connect to that service.

Role required: connection_admin

1. Navigate to **Connections & Credentials > Connections**.
2. Open for the record for **Google**.
3. In the Attributes related list of the HTTP(S) Connection form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Location of the customer. If the value is not specified when creating an account on Google Cloud, then specify <code>global</code>.</td>
</tr>
<tr>
<td>project_id</td>
<td>Identifier of a project. Specify the <code>project_id</code> value from the JSON file.</td>
</tr>
<tr>
<td>version</td>
<td>API version that the related spokes are built for. The default value is <code>v3beta1</code>. Because Google now supports the v3 version, you can override this value as <code>v3</code>.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.

**Google Cloud Virtual Network spoke**

Manage firewall, network, subnetwork, and IP address in Google Cloud Virtual Network from your ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see **Request IntegrationHub**.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Google Persistent Disk spoke (sn_gpdisk_spoke)
- Google Compute Engine spoke (sn_gcompute_spoke)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

### Google Cloud Virtual Network account requirements

The Google Cloud Virtual Network spoke requires a custom app that you create in the Google Cloud Platform.

### Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

### Spoke actions

The Google Cloud Virtual Network spoke provides actions to automate Google Cloud Virtual Network when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Permissions Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address Management</td>
<td>Create IP Address For Region</td>
<td>Creates an address resource in the specified project by using the data included in the request.</td>
<td>compute.addresses.create</td>
</tr>
<tr>
<td></td>
<td>Delete IP Address</td>
<td>Deletes the specified address resource.</td>
<td>compute.addresses.delete</td>
</tr>
<tr>
<td></td>
<td>Get IP Address</td>
<td>Retrieves details of the specified address resource.</td>
<td>compute.addresses.get</td>
</tr>
<tr>
<td>Firewall Management</td>
<td>Create Firewall For Egress</td>
<td>Creates a firewall for egress rule in the specified project.</td>
<td>compute.firewalls.create</td>
</tr>
<tr>
<td></td>
<td>Create Firewall For Ingress</td>
<td>Creates a firewall for ingress rule in the specified project.</td>
<td>compute.firewalls.create</td>
</tr>
<tr>
<td></td>
<td>Delete Firewall</td>
<td>Deletes the specified firewall.</td>
<td>compute.firewalls.delete</td>
</tr>
<tr>
<td></td>
<td>Get Firewall</td>
<td>Retrieves details of the specified firewall.</td>
<td>compute.firewalls.get</td>
</tr>
<tr>
<td></td>
<td>Update Firewall For Egress</td>
<td>Updates a firewall for the egress rule in the specified project.</td>
<td>compute.firewalls.update</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
<td>Permissions Required</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Update Firewall For Ingress</td>
<td>Updates a firewall for the ingress rule in the specified project.</td>
<td>compute.firewalls.update</td>
</tr>
<tr>
<td>Metadata Retrieval Management</td>
<td>List Addresses</td>
<td>Retrieves a list of addresses contained within the specified region.</td>
<td>compute.addresses.list</td>
</tr>
<tr>
<td></td>
<td>List Firewalls</td>
<td>Retrieves a list of firewalls available to the specified project.</td>
<td>compute.firewalls.list</td>
</tr>
<tr>
<td></td>
<td>List Networks</td>
<td>Retrieves a list of networks available to the specified project.</td>
<td>compute.networks.list</td>
</tr>
<tr>
<td></td>
<td>List Subnetworks</td>
<td>Retrieves a list of subnetworks available to the specified project.</td>
<td>compute.subnetworks.list</td>
</tr>
<tr>
<td>Network Management</td>
<td>Create Network</td>
<td>Creates a network in the specified project.</td>
<td>compute.networks.create</td>
</tr>
<tr>
<td></td>
<td>Delete Network</td>
<td>Deletes the specified network.</td>
<td>compute.networks.delete</td>
</tr>
<tr>
<td></td>
<td>Get Network</td>
<td>Retrieves details of the specified network.</td>
<td>compute.networks.get</td>
</tr>
<tr>
<td>Subnetwork Management</td>
<td>Create Subnetwork</td>
<td>Creates a subnetwork in the specified project.</td>
<td>compute.subnetworks.create</td>
</tr>
<tr>
<td></td>
<td>Delete Subnetwork</td>
<td>Deletes the specified subnetwork.</td>
<td>compute.subnetworks.delete</td>
</tr>
<tr>
<td></td>
<td>Expand IP CIDR Range</td>
<td>Expands the IP CIDR range of the subnetwork to a specified value.</td>
<td>compute.subnetworks.expandIpCidrRange</td>
</tr>
<tr>
<td></td>
<td>Get IAM Policy</td>
<td>Retrieves details of the access control policy for a resource.</td>
<td>compute.subnetworks.getIamPolicy</td>
</tr>
<tr>
<td></td>
<td>Get Subnetwork</td>
<td>Retrieves details of the specified subnetwork.</td>
<td>compute.subnetworks.get</td>
</tr>
<tr>
<td></td>
<td>Set IAM Policy</td>
<td>Sets the access control policy on the specified resource.</td>
<td>compute.subnetworks.setIamPolicy</td>
</tr>
</tbody>
</table>

For more information about the required permissions, see [IAM permissions reference](#).

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).
Set up the Google Cloud Virtual Network spoke

Integrate the ServiceNow instance and Google Cloud Virtual Network spoke by using OAuth 2.0 credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Google Cloud Virtual Network spoke.
- Activate and set up the Google Compute Engine spoke.
- Role required: admin.

1. Navigate to IntegrationHub > Connections & Credentials > Credentials.
2. Open record for the Google Compute Engine spoke. For example, Google Compute Cred.
3. For Credential alias, select the Connection and Credential alias record of the Google Cloud Virtual Network spoke.
4. Right-click the form header and click Save.
5. Click Get OAuth Token.

Google Compute Engine spoke

Launch and manage virtual machines in Google Compute Engine from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Google Persistent Disk spoke (sn_gpdisk_spoke)
- Google Cloud Virtual Network spoke (sn_gcp_vpc_spoke)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
Google Compute Engine account requirements

The Google Compute Engine spoke requires a custom app that you create in Google Cloud Platform.

Supported versions

This spoke was built for API version v1, but may be compatible with later versions.

Spoke actions

The Google Compute Engine spoke provides actions to automate Google Compute Engine when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>

For more information about the required permissions, see *IAM permissions reference*.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the Google Compute Engine spoke**

Integrate the ServiceNow instance and Google Compute Engine spoke by using OAuth 2.0 credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Google Compute Engine spoke.
- Access to Google Cloud Platform.
- Role required: admin.

**Note:** This procedure outlines steps to configure the custom app using OAuth. You can also configure the custom app using Service Account associated with JWT tokens. For more information about setting up the spoke using JWT tokens, see *Choosing an Authentication Method - Service accounts and Set up OAuth provider with JWT Bearer grant type*.
Configure the Google Compute Engine application
Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Compute Engine spoke.

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to https://console.cloud.google.com/, create a project with your administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type Web application.
5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Compute Engine as an OAuth provider.

The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Google Compute Engine as an OAuth provider
Use the information generated during Google Compute Engine account configuration to register the Google Compute Engine application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Open the record for Google Compute Engine.
3. Fill these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Compute Engine.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Compute Engine application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGoogleComputeUtil</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the ServiceNow instance in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
   The system validates the OAuth credentials.
Create Credential record for the Google Compute Engine spoke

Create Credential records to connect the Google Compute Engine custom OAuth application you created during account configuration. The Google Compute Engine spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to IntegrationHub > Connections & Credentials.
2. Open record for the Google Compute Engine spoke. For example, Google Compute.
3. In the Credentials tab, click New.
4. Select OAuth 2.0 Credentials.
5. Enter a unique name for the credential, for example, Google Compute Cred.
6. Click the OAuth Entity Profile search icon and select the profile with the name of the OAuth application registry you created when you registered the Google Compute Engine service as an OAuth provider.
7. Right-click the form header and click Save.
8. Click Get Oauth Token.

Google Cloud Datastore spoke

Manage the NoSQL database services in Google Cloud Datastore from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Google Cloud Datastore v1, but may be compatible with later versions.

Spoke requirements

- Google Cloud Datastore account

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- IntegrationHub (com.glide.hub.integrations)
Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Cloud Datastore spoke provides actions to automate Google Cloud Datastore tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entity Management</td>
<td>Entity Export</td>
<td>Exports a copy of all or a subset of entities from Google Cloud Datastore to another storage system.</td>
</tr>
<tr>
<td></td>
<td>Entity Import</td>
<td>Imports entities into Google Cloud Datastore.</td>
</tr>
<tr>
<td>Index Management</td>
<td>Create Index</td>
<td>Creates the specified index.</td>
</tr>
<tr>
<td></td>
<td>Delete Index</td>
<td>Deletes an existing index.</td>
</tr>
<tr>
<td></td>
<td>Get Index</td>
<td>Gets an index.</td>
</tr>
<tr>
<td></td>
<td>Look up Index</td>
<td>Retrieves the list of indexes that match the specified filters.</td>
</tr>
<tr>
<td>Operation Management</td>
<td>Cancel Operation</td>
<td>Starts asynchronous cancellation on a long-running operation.</td>
</tr>
<tr>
<td></td>
<td>Delete Operation</td>
<td>Deletes a long-running operation.</td>
</tr>
<tr>
<td></td>
<td>Get Operation</td>
<td>Gets the latest state of a long-running operation.</td>
</tr>
<tr>
<td></td>
<td>Look up Operation</td>
<td>Retrieves the list of operations that match the specified filter in the request.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Google Cloud Datastore spoke

Integrate the ServiceNow instance and Google Cloud Datastore spoke using Google Cloud Platform credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate Google Cloud Datastore spoke.
- Role required: admin
Register Google Cloud Datastore as an OAuth provider
Register G suite as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?.
3. Select Connect to a third party OAuth Provider.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Cloud Datastore.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Directory application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response to the external OAuth provider.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>The OAuth application logo URL.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>The default grant type used to establish the token. Select Authorisation Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Option to make the app accessible from all application scopes or from this scope only.</td>

<tr>
<td>Redirect URL</td>
<td>The OAuth callback endpoint. If left blank, the instance auto-generates the URL.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>The OAuth server token revocation endpoint.</td>
</tr>
</tbody>
</table>

5. Go to the related list on the record OAuth Entity Profiles to validate a system-generated default profile for the G Suite OAuth provider without any scope.
6. Go to the related list on the record OAuth Entity Scopes to define all available OAuth scopes for this OAuth provider.
7. Right-click the form header, and click Save.
   The system validates the OAuth credentials.

Create Credential record for the Google Cloud Datastore spoke
Create credential record for the Google Cloud Datastore application. The Google Cloud Datastore spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, Google Cloud Datastore credential.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to apply the credentials for all MID Servers, or specific MID servers.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make this credential active.</td>
</tr>
<tr>
<td>Order</td>
<td>Sequence in which the credential is applied to devices.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Enter Google Cloud Datastore default_profile. This OAuth profile is a combination of a grant type and at least one scope.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>The credential alias you want to map to the OAuth 2.0 credential.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Submit**.

**Google Cloud VPC Access spoke**

Manage connector and operations in your Google Cloud VPC Access account from ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see **Request IntegrationHub**.

**Supported versions**

This spoke was built for the Google Cloud VPC Access API version v1, but may be compatible with later versions.

**Google Cloud VPC Access spoke requirements**

The Google Cloud VPC Access spoke requires a custom app that you create in Google Cloud Platform.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- **Google Identity and Access spoke**
- **Google Cloud Virtual Network spoke**
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
Spoke actions

The Google Cloud VPC Access spoke provides actions to automate Google Cloud VPC Access tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connector Management</td>
<td>Create Connector</td>
<td>Creates a connector in the specified project.</td>
</tr>
<tr>
<td></td>
<td>Delete Connector</td>
<td>Deletes the specified VPC Access connector.</td>
</tr>
<tr>
<td></td>
<td>Get Connector</td>
<td>Retrieves the specified VPC Access connector.</td>
</tr>
<tr>
<td></td>
<td>Look up Connectors</td>
<td>Retrieves the list of VPC Access connectors available in the specified location.</td>
</tr>
<tr>
<td>Location Management</td>
<td>Look up Locations</td>
<td>Retrieves the list of locations available in the specified project.</td>
</tr>
<tr>
<td>Operation Management</td>
<td>Get Operation</td>
<td>Retrieves details of the specified operation.</td>
</tr>
<tr>
<td></td>
<td>Look up Operations</td>
<td>Retrieves a list of operations available with in the specified location.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Google Cloud VPC Access spoke

Integrate the ServiceNow instance and Google Cloud VPC Access account by creating a custom OAuth application in Google Cloud Platform to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate Google Cloud VPC Access spoke.
- Role required: admin
Configure the Google Cloud VPC Access application
Create a custom OAuth application in your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud VPC Access spoke.

Complete these steps from the Google Cloud Platform. See the Google Cloud Platform product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to https://console.cloud.google.com/, create a project with your administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type OAuth client ID.
5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Cloud VPC Access as an OAuth provider.

Register Google Cloud VPC Access as an OAuth provider
Use the information generated during the Google Cloud VPC Access application configuration to register Google Cloud VPC Access as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Open for the record, Google Cloud VPC Access.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Cloud VPC Access application.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.

Create a credential record for the Google Cloud VPC Access spoke
Create a credential record for the Google Cloud VPC Access application. The Google Cloud VPC Access spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Connections & Credential Aliases.
2. Open record for the Google Cloud VPC Access spoke. For example, GoogleCloudVPCAccess.
3. In the Credentials tab, click New.
4. Select OAuth 2.0 Credentials.
5. Enter a unique name for the credential, for example, GCloud_VPC_Cred.
6. Click the OAuth Entity Profile search icon and select the profile with the name of the OAuth application registry you configured when you registered the

Google Cloud VPC Access service as an OAuth provider. See Register Google Cloud VPC Access as an OAuth provider for more information.

7. Right-click the form header and click Save.
8. Click Get OAuth Token.

**Google Docs spoke**

Manage documents in Google Docs from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for Google Docs v1, but may be compatible with later versions.

**Spoke requirements**

Google Cloud account

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**

The Google Docs spoke provides actions to automate Google Docs tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Google Docs

Integrate the ServiceNow instance and Google Docs by creating a custom OAuth application in G Suite credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate Google Docs spoke.
- Role required: admin

Register Google Docs as an OAuth provider

Register G Suite as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill these values.

   **Applied Registries form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Docs.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Directory application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response to the external OAuth provider.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>The OAuth application logo URL.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>The default grant type used to establish the token. Select Authorisation Code.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,000 seconds.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Option to make the app accessible from all application scopes or from this scope only.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make the app active.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>The OAuth authorization code endpoint.</td>
</tr>
<tr>
<td>Token URL</td>
<td>The OAuth server token endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The OAuth callback endpoint. If left blank, the instance auto-generates the URL.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>The OAuth server token revocation endpoint.</td>
</tr>
</tbody>
</table>

5. Go to the related list on the record OAuth Entity Profiles to validate a system-generated default profile for the G Suite OAuth provider without any scope.

6. Go to the related list on the record OAuth Entity Scopes to define all available OAuth scopes for this OAuth provider.

7. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

Create Credential record for the Google Docs
Create credential record for the Google Docs custom application. The Google Docs connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials**>**Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**
4. Enter a unique name for the credential, for example **Google Docs Credential**.
5. Click the **OAuth Entity Profile** search icon (🔍) and select the profile with the name of the OAuth application registry you created when you registered the Google Docs service as an OAuth provider.
6. Click **Get Oauth Token**.

Google Cloud SQL spoke
Mange provisioning of MySQL and PostgreSQL in Google Cloud SQL from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
Supported versions

This spoke was built for Google Cloud SQL v1beta4, but may be compatible with later versions.

Spoke requirements

- Google Cloud Platform account
- Google Identity and Access spoke (sn_gcpcloudsql_spk)

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Google Cloud SQL provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Required Permission</th>
</tr>
</thead>
<tbody>
<tr>
<td>Back up Run Management</td>
<td>Create Backup</td>
<td>Creates a backup.</td>
<td>cloudsql.backupRuns.create</td>
</tr>
<tr>
<td></td>
<td>Delete Backup Run</td>
<td>Deletes a backup.</td>
<td>cloudsql.backupRuns.delete</td>
</tr>
<tr>
<td></td>
<td>Get Backup Run</td>
<td>Retrieves details of the backup.</td>
<td>cloudsql.backupRuns.get</td>
</tr>
<tr>
<td></td>
<td>Look up Backup Runs</td>
<td>Retrieves a list of the backup runs.</td>
<td>cloudsql.backupRuns.list</td>
</tr>
<tr>
<td>Database Management</td>
<td>Create Database</td>
<td>Creates a database.</td>
<td>cloudsql.databases.create</td>
</tr>
<tr>
<td></td>
<td>Delete Database</td>
<td>Deletes a database.</td>
<td>cloudsql.databases.delete</td>
</tr>
<tr>
<td></td>
<td>Get Database</td>
<td>Retrieves details of the instance.</td>
<td>cloudsql.databases.get</td>
</tr>
<tr>
<td></td>
<td>Look up Databases</td>
<td>Retrieves a list of the databases.</td>
<td>cloudsql.databases.list</td>
</tr>
<tr>
<td></td>
<td>Update Database</td>
<td>Updates a database.</td>
<td>cloudsql.databases.update</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Clone Instance</td>
<td>Clones an instance.</td>
<td>cloudsql.instances.clone</td>
</tr>
<tr>
<td></td>
<td>Create Instance</td>
<td>Creates an instance.</td>
<td>cloudsql.instances.create</td>
</tr>
</tbody>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Google Cloud SQL spoke

Integrate the ServiceNow instance and Google Cloud SQL spoke using Google Cloud Platform credentials to authenticate ServiceNow requests.

• Request IntegrationHub subscription.
• Activate Google Cloud SQL spoke.
• Role required: admin

Configure the Google Cloud SQL application

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Cloud SQL spoke.

Google Identity and Access integration requirements:

• Google Cloud SQL account

Complete these steps from the Google Cloud Platform.

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your Google Cloud Platform administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the **Create credentials** list.

4. Select the application type **Web application**.

5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Identity and Access as an OAuth provider.

   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

---

**Register Google Cloud SQL as an OAuth provider**

Use the information generated during Google Cloud SQL account configuration to register the Google Cloud SQL application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow instance, navigate to **System OAuth > Application Registry**.
2. Open the record for **Google Cloud SQL**.
3. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Cloud SQL.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Cloud SQL application.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you create the application.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGCPSQLUtil.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the ServiceNow instance in this format: <code>https://&lt;instance&gt;.service-now.com/oauth_redirect.do</code>.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

   The system validates the OAuth credentials.

---

**Create Credential record for the Google Cloud SQL spoke**

Create Credential records to connect the Google Cloud SQL custom OAuth application you created during account configuration. The GoogleCloud SQL spoke connection and credential aliases use these credentials to authorize actions.

Role required: admin

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, **GCSQL Cred**.
4. Click the **OAuth Entity Profile** search icon.
and select the profile with the name of the OAuth application registry you created when you registered the
Google Cloud SQL service as an OAuth provider.

5. Click **Get OAuth Token**.

**Google Directory spoke**

Manage groups, members, and users in Google Directory from your ServiceNow instance.

**Request apps on the Store**

Visit the [ServiceNow Store](#) website to view all the available apps and for information about submitting requests to the
store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](#).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see [Request IntegrationHub](#).

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Google Directory account requirements**

The Google Directory spoke requires a custom app that you create in the Google Developers Console.

**Supported versions**

This spoke was built for API version v1, but may be compatible with later versions.

**Spoke actions**

The Google Directory spoke provides actions to automate Google Directory when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Create Group</td>
<td>Creates a group.</td>

</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the Google Directory spoke**

Integrate the ServiceNow instance and Google Directory spoke by using G Suite credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Google Directory spoke.
- Role required: admin.
Configure the Google Directory application
Create a custom OAuth application from your Google G Suit account to enable OAuth 2.0 authentication with the Google Directory spoke.

Google Directory integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or login created with the domain.

Complete these steps from the Google Developers Console. See the G Suite product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
4. Select the application type Web application.
5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Directory as an OAuth provider.

The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Google Directory as an OAuth provider
Use the information generated during Google Directory account configuration to register the Google Directory application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Open the record for Google Directory.
3. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Directory.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Directory application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGoogleDirectoryUtils</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
</tbody>
</table>
4. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

---

### Create Credential record for the Google Directory spoke

Create Credential records to connect the Google Directory custom OAuth application you created during account configuration. The Google Directory spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, *GDirectory Cred*.
4. Click the **OAuth Entity Profile** search icon and select the profile with the name of the OAuth application registry you created when you registered the Google Directory service as an OAuth provider.
5. Click **Get OAuth Token**.

---

### Google Drive spoke v1.2

Use Google Drive as file storage in place of attachments in ServiceNow. Adds Google Drive storage to your ServiceNow instance and enables users to reference Google Drive files in ServiceNow records.

---

### Request apps on the Store

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

---

### IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see **Request IntegrationHub**.

---

### Supported versions

API version v1.

---

### Spoke subflows

The Google Drive spoke provides sample subflows in the draft state to demonstrate automating Google Drive tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:
## Spoke actions

The Google Drive spoke provides actions to perform Google Drive tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>File and Folder Management</strong></td>
<td>Copy Attachment to Drive</td>
<td>Copies a ServiceNow attachment to a Google Drive folder. It either copies to the root drive of the current account or to the specified folder. To change the file name during the copy, use the optional file name.</td>
</tr>
<tr>
<td></td>
<td>Copy Doc File To Attachment</td>
<td>Copies a file Google Drive and attaches it to a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Copy Drive File</td>
<td>Creates a copy of a Google Drive File and applies any metadata updates like a change in file name, file description, parent folder location, if file is starred, or shared by users with writer permissions.</td>
</tr>
<tr>
<td></td>
<td>Copy Drive File To Attachment</td>
<td>Copies a drive file to a ServiceNow attachment. If a ServiceNow record is supplied as input, the record should be attached to it.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a Google Drive folder that can be nested within other folders.</td>
</tr>
<tr>
<td></td>
<td>Delete Drive File Or Folder</td>
<td>Permanently deletes a drive file or folder owned by the Google Drive account user without moving it to the trash. To delete folders the user must be the owner of folder and its contents.</td>
</tr>
<tr>
<td></td>
<td>Look Up Folders</td>
<td>Returns a list of Google Drive folder IDs based on given search parameters.</td>
</tr>
<tr>
<td></td>
<td>Update Attachment To Drive</td>
<td>Updates the contents of a file, but maintains the previous versions and metadata. This action only updates the content of the Google Drive file. It does not update metadata.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Permission Management</td>
<td>Update File Or Folder Metadata</td>
<td>Updates the metadata on a file or folder. This can be a file name change, change to the file description, a move to a new parent folder, a change in starred status, or a change to sharing permissions.</td>
</tr>
<tr>
<td></td>
<td>Create File or Folder Permission</td>
<td>Adds a permission to a given user, group, domain, or anyone for a file or folder. If User or Group is selected, the email address is required for those users and groups. If Domain is selected, the domain name is required. If Anyone is selected, then anyone has permissions to the file or folder.</td>
</tr>
<tr>
<td></td>
<td>Delete File Or Folder Permission</td>
<td>Removes a permission to a given user, group, domain, or anyone for a file or folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up File Or Folder Permissions By ID</td>
<td>Returns the list of permissions associated with a particular file or folder.</td>
</tr>
<tr>
<td></td>
<td>Transfer Ownership Of All User Data</td>
<td>Transfers the ownership of data from one user to another within a domain. All previous permissions of old owner are removed and new owner permissions are created for new user.</td>
</tr>
<tr>
<td></td>
<td>Update File Or Folder Permission</td>
<td>Updates a given permission by updating the role.</td>
</tr>
</tbody>
</table>

**Google Drive Online account requirements**

The Google Drive spoke requires a custom app that you create in Google Drive Enterprise or Google G Suite.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Drive alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.
Set up Google Drive spoke

Integrate a ServiceNow instance and Google Drive spoke by using Google Drive credentials to authenticate ServiceNow requests.

• Request IntegrationHub subscription.
• Activate the Google Drive spoke.
• Role required: admin

Configure Google Drive application

Create a custom OAuth application from your Google Drive account to enable OAuth 2.0 authentication with the Google Drive spoke.

Google Drive integration requirements:

• A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in GSuite or Google Drive.
• A Google G Suite or Google Drive login created with the domain.
• A Google Drive account.

Complete these steps from your Google G Suite or Google Drive account. See the G Suite product documentation for instructions on creating and configuring custom applications.

2. Enter your business name, the number of employees, and your country, and click Next.
3. Enter the administrator contact name, email address and business phone number, and click Next.
4. Enter the domain associated with this spoke.
5. Provide the user name and password for your domain.
6. Add users to the G Suite account.
7. Verify your domain and email address.
   Users must create their own logins by navigating to the Google documentation.
9. Search for the Google Drive API and enable it.
10. Create a Credentials application and save the Client ID and Client secret.
    The Client Secret is only displayed in plain text for a short time. Copy the Client ID and the Client Secret to a text file so that you can use them when you Register Google Drive as an OAuth provider.

Register Google Drive as an OAuth provider

Use the information generated during Google Drive account configuration to register the Google Drive application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Click New.
3. On the screen titled What kind of OAuth application, select Connect to a third-party OAuth Provider.
4. Enter these values in the Application Registreries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example GoogleDrive.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Drive application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Click the search icon and select OAuthUtilGoogleDrive.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon, enter <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon, enter <a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon, enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. Optional: In the **OAuth Entity Scopes** related list, add any scopes required by your application. The Google Drive spoke includes these scopes by default:

- appdata
- drive
- drivereadonly
- file
- filetransfer
- metadata
- metadatereadonly
- photosreadonly
- scripts
- user
Click **Insert a new row** and enter the name and the OAuth scope of the permission. The name and the OAuth scope are often the same.

<table>
<thead>
<tr>
<th>OAuth Entity Profiles</th>
<th>OAuth Entity Scopes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Define all available OAuth scopes for this OAuth provider. The scopes defined here can be selected when you create/update a profile. Note: A unique name. OAuth Scope: Scopes you must get from the provider's specification, such as a read scope and a write scope. Define each scope separately.</td>
</tr>
</tbody>
</table>

### OAuth Entity Scopes

<table>
<thead>
<tr>
<th></th>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Calendars.ReadWrite</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Calendars.ReadWrite.Shared</td>
</tr>
<tr>
<td></td>
<td></td>
<td>email</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Files.Read</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Files.Read.All</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**. The system validates the OAuth credentials.

---

**Create Credential record for the Google Drive spoke**

Create Credential records to connect the Google Drive custom OAuth application you created during Google Drive account configuration. The Google Drive spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, `gDrive Cred`. 

---

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
4. Click the OAuth Entity Profile search icon

and select the profile with the name of the OAuth application registry you created when you registered the Google Drive service as an OAuth provider.

5. Click Get OAuth Token.

Create Connection record for the Google Drive spoke
Create connection records to a Google Drive account. A connection alias resolves your Google Drive connection and credential at runtime. Only one connection is active per Connection Alias at a time.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Select the Google Drive connection.
3. On the Connection Attributes related list, set the default value of the API version to v3.

If there are no connection attributes, click New and create a connection attribute with this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>API version</td>
</tr>
<tr>
<td>Column name</td>
<td>u_api_version</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
<tr>
<td>Read only</td>
<td>False</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Reference</td>
<td>(empty)</td>
</tr>
<tr>
<td>Default value</td>
<td>v3</td>
</tr>
</tbody>
</table>

4. In the Connections related list, select gDrive Connection.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name gDrive Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential name you specified when you created the Credential record. The value used in the steps above is gDrive Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the value sn_googledrive_spoke.Google_Drive</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL <a href="https://www.googleapis.com/">https://www.googleapis.com/</a></td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Client Credentials.</td>
</tr>
</tbody>
</table>

5. Return to IntegrationHub > Connections & Credentials > Credentials and select googledrive_cred.

6. From Related Links, click Get OAuth Token.

A confirmation message indicates that the OAuth token flow has completed successfully. Review the details if the flow is not successful.

Note: Ensure that you allow pop-up windows in your browser.

The Google Drive spoke is set up and integrated with the ServiceNow instance.
Google Hangouts spoke

Use ServiceNow to create and update events and attendees in Google Hangouts.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v1.

Spoke actions

The Google Hangouts spoke provides actions to perform Google Hangouts tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attendees</td>
<td>Add Attendees To Hangout</td>
<td>Updates a hangout by adding to the list of attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td></td>
<td>Remove Attendees From Hangout</td>
<td>Updates a hangout by removing specified attendees. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td>Event Management</td>
<td>Create Hangout</td>
<td>Creates a hangout on the specified calendar.</td>
</tr>
<tr>
<td></td>
<td>Update Hangout</td>
<td>Edit hangout information. Values you specify replace the existing values. Fields that you don’t specify in the request do not change.</td>
</tr>
<tr>
<td></td>
<td>Get Hangout By ID</td>
<td>Returns the specified hangout.</td>
</tr>
<tr>
<td></td>
<td>Delete Hangout</td>
<td>Removes a specified hangout from a calendar.</td>
</tr>
</tbody>
</table>
Google Hangouts Online account requirements

The Google Hangouts spoke requires a custom app that you create in Google G Suite.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Hangouts alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Google Hangouts spoke

Integrate a ServiceNow instance and Google Hangouts by using G Suite credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Google Hangouts spoke.
- Role required: admin

Configure Google Hangouts application

Create a custom OAuth application from your G Suite account to enable OAuth 2.0 authentication with the Google Hangouts spoke.

Google Hangouts integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or login created with the domain.

Complete these steps from your Google G Suite account. See the G Suite product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.
3. Search for the Google Hangouts API and enable it.
4. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.
5. Select the application type Web application.
6. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.
   This redirect URI must match the Redirect URL you provide when you Register Google Hangouts as an OAuth provider.
7. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Tasks as an OAuth provider.
The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

**Register Google Hangouts as an OAuth provider**

Use the information generated during Google Hangouts account configuration to register the Google Hangouts application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to **System OAuth > Application Registry**.
2. Click **New**.
3. On the screen titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example Google Hangouts.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Hangouts application you created in G Suite.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in G Suite.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Click the search icon and select OAuthHangoutsRefreshTokenUtil</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon, enter <a href="https://accounts.google.com/o/oauth2/auth">https://accounts.google.com/o/oauth2/auth</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon, enter <a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon, enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. Optional: In the **OAuth Entity Scopes** related list, add any scopes required by your application. The Google Hangouts spoke includes these scopes by default:

<table>
<thead>
<tr>
<th>Google Hangouts OAuth entity scopes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>Calendar</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>--------</td>
</tr>
<tr>
<td>Events</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

**Create Credential record for the Google Hangouts spoke**

Create Credential records to connect the Google Hangouts custom OAuth application you created during account configuration. The Google Hangouts spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, **Hangout Cred**.
4. Click the **OAuth Entity Profile** search icon and select the profile with the name of the OAuth application registry you created when you registered the Google Hangouts service as an OAuth provider.
5. Click **Get OAuth Token**.

**Create Connection record for the Google Hangouts spoke**

Create connection records to a Google Hangouts account. A connection alias resolves your Google Hangouts connection and credential at runtime. Only one connection is active per Connection Alias at a time.

You should provide a single Credential and Connection Alias for all G Suite service spokes.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Select the Google Hangouts connection.
3. On the Connection Attributes related list, set the default value of the API version to **v3**.
   If there are no connection attributes, click **New** and create a connection attribute with this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>API version</td>
</tr>
<tr>
<td>Column name</td>
<td>u_api_version</td>
</tr>
<tr>
<td>Mandatory</td>
<td>False</td>
</tr>
<tr>
<td>Read only</td>
<td>False</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
</tr>
<tr>
<td>Reference</td>
<td>(empty)</td>
</tr>
<tr>
<td>Default value</td>
<td>v3</td>
</tr>
</tbody>
</table>

4. In the Connections related list, select the Google Hangouts Connection.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name <strong>Google Hangouts Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential name you specified when you created the Credential record. The value used in the preceding steps is <strong>Hangouts Cred</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the value <strong>sn_ghangouts_scope.Google_Hangouts</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL <a href="https://www.googleapis.com/">https://www.googleapis.com/</a></td>
</tr>
</tbody>
</table>

5. Return to IntegrationHub > Connections & Credentials > Credentials and select googlehangouts_cred.

6. From Related Links, click Get OAuth Token.
   A confirmation message indicates that the OAuth token flow has completed successfully. Review the details if the flow is not successful.

   **Note:** Ensure that you allow pop-up windows in your browser.

The Google Hangouts spoke is set up and integrated with the ServiceNow instance.

**Google Identity and Access spoke**

Manage folders, projects, roles, and service accounts in Google Identity and Access Management and Google Resource Manager.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Supported Versions**

This spoke was built for API version v2 only Folder Management category and v1 for other categories, but may be compatible with later versions.
Spoke requirements

- Google Cloud Platform account

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Google Identity and Access spoke provides actions to automate Google Identity and Access Management and Google Resource Manager tasks when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available actions include:

### Spoke actions

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Required Permission</th>
</tr>
</thead>
<tbody>
<tr>
<td>Folder Management</td>
<td>Create Folder</td>
<td>Creates a folder.</td>
<td>resourcemanager.folders.create</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes a folder.</td>
<td>resourcemanager.folders.delete</td>
</tr>
<tr>
<td></td>
<td>Get Child Folder</td>
<td>Retrieves the information of a child folder.</td>
<td>resourcemanager.folders.get</td>
</tr>
<tr>
<td></td>
<td>List Folders</td>
<td>Retrieves the list of folders.</td>
<td>resourcemanager.folders.list</td>
</tr>
<tr>
<td></td>
<td>Rename Folder</td>
<td>Renames the specified folder.</td>
<td>resourcemanager.folders.update</td>
</tr>
<tr>
<td></td>
<td>Restore Folder</td>
<td>Restores the specified folder.</td>
<td>resourcemanager.folders.undelete</td>
</tr>
<tr>
<td>Organization Management</td>
<td>Get Organization</td>
<td>Retrieves details of the specified organization.</td>
<td>resourcemanager.organizations.get</td>
</tr>
<tr>
<td>Project Management</td>
<td>Create Project</td>
<td>Creates a project.</td>
<td>resourcemanager.projects.create</td>
</tr>
<tr>
<td></td>
<td>Delete Project</td>
<td>Deletes the specified project.</td>
<td>resourcemanager.projects.delete</td>
</tr>
<tr>
<td></td>
<td>Get Project</td>
<td>Retrieves details of the specified project.</td>
<td>resourcemanager.projects.get</td>
</tr>
<tr>
<td></td>
<td>List Projects</td>
<td>Retrieves the list of projects.</td>
<td>resourcemanager.projects.list</td>
</tr>
<tr>
<td></td>
<td>Rename Project</td>
<td>Renames the specified project.</td>
<td>resourcemanager.projects.update</td>
</tr>
<tr>
<td></td>
<td>Restore Project</td>
<td>Restores the specified project.</td>

<td>iam.serviceAccounts.list</td>
</tr>
</tbody>
</table>

For more information about the required permissions, see *IAM permissions reference*.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the Google Identity and Access Spoke**

Integrate the ServiceNow instance and Google Identity and Access spoke by using Google Cloud Platform credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Google Identity and Access spoke
- Role required: admin

*Configure the Google Identity and Access application*

Create a custom OAuth application from your Google Cloud Platform account to enable OAuth 2.0 authentication with the Google Identity and Access spoke.

Google Identity and Access integration requirements:

- Google Cloud Platform account
Complete these steps from the Google Cloud Platform.

1. Register a new custom application. Navigate to https://console.developers.google.com, create a project with your Google Cloud Platform administrator credentials, and open the project.

2. From the APIs & Services menu, select OAuth consent screen, enter the application name, and specify the Authorized domain service-now.com. Click Save.

3. From the APIs & Services menu, select Credentials, and select Create OAuth client ID from the Create credentials list.

4. Select the application type Web application.

5. Enter the following Authorized redirect URI: https://<instance>.service-now.com/oauth_redirect.do and click Create.

6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you Register Google Identity and Access as an OAuth provider.
   
   The client ID and secret can always be accessed in the Google APIs & Services interface. Click Credentials and select the OAuth 2.0 client ID name.

Register Google Identity and Access as an OAuth provider

Use the information generated during Google Identity and Access account configuration to register the Google Identity and Access application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow instance, navigate to System OAuth > Application Registry.
2. Open the record for Google Identity and Access.
3. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record, for example Google Identity and Access.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID of the Google Identity and Access application.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret you generated when you create the application.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select OAuthGoogleIAMUtil.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the ServiceNow instance in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
   The system validates the OAuth credentials.

Create Credential record for the Google Identity and Access spoke

Create Credential records to connect the Google Identity and Access custom OAuth application you created during account configuration. The Google Identity and Access spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to IntegrationHub > Connections & Credentials > Credentials and click New.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, GCPIAM Cred.
4. Click the OAuth Entity Profile search icon and select the profile with the name of the OAuth application registry you created when you registered the Google Identity and Access service as an OAuth provider.
5. Click Get OAuth Token.

**Google Persistent Disk spoke**

Manage disks, snapshots, and images in Google Persistent Disk from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- Google Cloud Virtual Network spoke (sn_gcp_vpc_spoke)
- Google Compute Engine spoke (sn_gcompute_spoke)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Google Persistent Disk account requirements**

The Google Persistent Disk spoke requires a custom app that you create in the Google Cloud Platform.

**Supported versions**

This spoke was built for API version v1, but may be compatible with later versions.
### Spoke actions

The Google Persistent Disk spoke provides actions to automate Google Persistent Disk when events occur in ServiceNow. For the spoke actions to be performed, you must ensure that your project or organization in Google Cloud Platform has the mentioned permissions. Available spoke actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
<th>Permissions Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disk Management</td>
<td>Create Disk</td>
<td>Creates a persistent disk in the specified project.</td>
<td>compute.disks.create</td>
</tr>
<tr>
<td></td>
<td>Delete Disk</td>
<td>Deletes the specified persistent disk.</td>
<td>compute.disks.delete</td>
</tr>
<tr>
<td></td>
<td>Get Disk</td>
<td>Retrieves details of the specified persistent disk.</td>
<td>compute.disks.get</td>
</tr>
<tr>
<td></td>
<td>Get Disk Type by Zone</td>
<td>Retrieves the details of the specified disk type by zone.</td>
<td>compute.diskTypes.get</td>
</tr>
<tr>
<td></td>
<td>Resize Disk</td>
<td>Resizes the specified persistent disk.</td>
<td>compute.disks.resize</td>
</tr>
<tr>
<td>Image Management</td>
<td>Create Image for Disk</td>
<td>Creates an image in the specified project.</td>
<td>compute.images.create</td>
</tr>
<tr>
<td></td>
<td>Create Image for Image</td>
<td>Creates an image in the specified project.</td>
<td>compute.images.create</td>
</tr>
<tr>
<td></td>
<td>Create Image for Snapshot</td>
<td>Creates an image in the specified project.</td>
<td>compute.images.create</td>
</tr>
<tr>
<td></td>
<td>Delete Image</td>
<td>Deletes the specified image.</td>
<td>compute.images.delete</td>
</tr>
<tr>
<td></td>
<td>Get Image</td>
<td>Retrieves details of the specified image.</td>
<td>compute.images.get</td>
</tr>
<tr>
<td>Metadata Retrieval Management</td>
<td>List Disk Types by Zone</td>
<td>Retrieves a list of disk types available to the specified project.</td>
<td>compute.diskTypes.list</td>
</tr>
<tr>
<td></td>
<td>List Disks</td>
<td>Retrieves a list of persistent disks contained within the specified zone.</td>
<td>compute.disks.list</td>
</tr>
<tr>
<td></td>
<td>List Images</td>
<td>Retrieves the list of images available to the specified project.</td>
<td>compute.images.list</td>
</tr>
<tr>
<td></td>
<td>List Snapshots</td>
<td>Retrieves the list of snapshot resources contained within the specified project.</td>
<td>compute.snapshots.list</td>
</tr>
<tr>
<td>Snapshot Management</td>
<td>Create Snapshot</td>
<td>Creates a snapshot of a specified persistent disk.</td>
<td>compute.snapshots.create</td>
</tr>
<tr>
<td></td>
<td>Delete Snapshot</td>
<td>Deletes the specified snapshot resource.</td>
<td>compute.snapshots.delete</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
<td>Permissions Required</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
<td>----------------------</td>
</tr>
<tr>
<td></td>
<td>Get Snapshot</td>
<td>Retrieves details of the specified snapshot.</td>
<td>compute.snapshots.get</td>
</tr>
</tbody>
</table>

For more information about the required permissions, see *IAM permissions reference*.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the Google Persistent Disk spoke**

Integrate the ServiceNow instance and Google Persistent Disk spoke by using G Suite credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Google Persistent Disk spoke.
- Activate and set up the *Google Compute Engine spoke*.
- Role required: admin.

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials**.
2. Open record for the Google Compute Engine spoke. For example, *Google Compute Cred*.
3. For **Credential alias**, select the Connection and Credential alias record of the Google Persistent Disk spoke.
4. Right-click the form header and click **Save**.
5. Click **Get Oauth Token**.

**Google Sheets spoke**

Manage spreadsheets in Google Sheets from your ServiceNow instance.

**Request apps on the Store**

Visit the *ServiceNow Store* website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the *ServiceNow Store version history release notes*.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see *Request IntegrationHub*.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• Complex Object (com.glide.cobject)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

This spoke was built for Google Sheets v4, but may be compatible with later versions.

Spoke requirements

• Google Cloud Platform account

Spoke actions

The Google Sheets spoke provides actions to automate Google Sheets tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sheet Management</td>
<td>Add Row</td>
<td>Adds a row with the specified values to a sheet.</td>
</tr>
<tr>
<td></td>
<td>Clear Cells</td>
<td>Clears the values in the sheet for the specified range.</td>
</tr>
<tr>
<td></td>
<td>Copy Sheet</td>
<td>Copies a sheet from a spreadsheet to another spreadsheet.</td>
</tr>
<tr>
<td></td>
<td>Create Sheet</td>
<td>Creates a sheet in the specified spreadsheet.</td>
</tr>
<tr>
<td></td>
<td>Delete Sheet</td>
<td>Deletes a sheet in the spreadsheet.</td>
</tr>
<tr>
<td></td>
<td>Get Cell Values</td>
<td>Retrieves the values in the sheet for the specified range.</td>
</tr>
<tr>
<td></td>
<td>Update Cells</td>
<td>Updates a range of cell values in a sheet.</td>
</tr>
<tr>
<td>Spreadsheet Management</td>
<td>Get Spreadsheet Details</td>
<td>Retrieves details about the specified spreadsheet.</td>
</tr>
</tbody>
</table>

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.
Set up the Google Sheets spoke

Integrate the ServiceNow instance and Google Sheets by creating a custom OAuth application in Google API Console to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate Google Sheets spoke.
- Role required: admin

Create a Connection and Credential Alias for Google Sheets spoke

Create Connection records to your Google Sheets account. The Google Sheets spoke connection and credential aliases use these connections to perform actions in the Google Sheets.

- Register your application using Google API Console and record the client ID and client secret. For more information, see Google Authorize Requests.
- Role required: admin

1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases.
2. Open the GoogleSheets record.
3. Under Related Links section, click Create New Connection & Credential record.
4. On the Create Connection and Credential, fill in these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name of the connection. This field is automatically set to Google Sheets Spoke Connection</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL used for connecting to Google Sheets APIs. This field is automatically set to <a href="https://sheets.googleapis.com/v4/spreadsheets">https://sheets.googleapis.com/v4/spreadsheets</a></td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name of the credential. This field is automatically set to Google Sheets Spoke Credential</td>
</tr>
<tr>
<td>OAuth Entity Name</td>
<td>Name of the OAuth entity profile. This field is automatically set to Google Sheets Spoke OAuth</td>
</tr>
<tr>
<td>OAuth Client ID</td>
<td>Client ID of the Google Sheets application you registered in G Suite.</td>
</tr>
<tr>
<td>OAuth Client Secret</td>
<td>Client Secret generated when you registered the application in Google API Console.</td>
</tr>
<tr>
<td>OAuth Redirect URL</td>
<td>The redirect URL. The format of the URL is https://&lt;your-instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
</tbody>
</table>

5. Click Create and Get OAuth Token.

Google Tasks spoke

Manage Google Task actions.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Supported versions

API version v1.

Spoke subflows

The Google Tasks spoke provides sample subflows in the draft state to demonstrate automating Google Tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to Google Tasks</td>
<td>Copies an attachment from ServiceNow to Google Tasks.</td>
</tr>
</tbody>
</table>

Spoke actions

The Google Tasks spoke provides actions to automate Google Tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task Management</td>
<td>Complete Task</td>
<td>Mark a task complete in a task list.</td>
</tr>
<tr>
<td></td>
<td>Create Task</td>
<td>Create a task in a task list.</td>
</tr>
<tr>
<td></td>
<td>Delete Task</td>
<td>Delete a task from a task list.</td>
</tr>
<tr>
<td></td>
<td>Get Task</td>
<td>Retrieve details of a specified task from a task list.</td>
</tr>
<tr>
<td></td>
<td>Look Up Tasks</td>
<td>Retrieve details of specified tasks from a task list.</td>
</tr>
<tr>
<td></td>
<td>Update Task</td>
<td>Update details of the specified task in a task list.</td>
</tr>
<tr>
<td>Task List Management</td>
<td>Create Task List</td>
<td>Create a task list in your Google Tasks account.</td>
</tr>
<tr>
<td></td>
<td>Delete Task List</td>
<td>Delete the specified task list.</td>
</tr>
<tr>
<td></td>
<td>Get All Task Lists</td>
<td>Retrieve the details of all task lists in your Google Tasks account.</td>
</tr>
<tr>
<td></td>
<td>Get Task List</td>
<td>Retrieve details of a specified task list.</td>
</tr>
</tbody>
</table>
### Google Tasks account requirements

The Google Tasks spoke requires a custom app that you create in the Google Developers Console.

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

### MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Google Tasks alias to configure where actions run as well as set MID Server selection attributes. For more information, see *MID server*.

### Set up Google Tasks spoke

Integrate the ServiceNow instance and Google Tasks spoke by using G Suite credentials to authenticate ServiceNow requests.

- Install the Google Tasks spoke.
- Request IntegrationHub subscription.
- Activate the Google Tasks spoke.
- Role required: admin.

**Configure Google Tasks application**

Create a custom OAuth application from your Gmail account to enable OAuth 2.0 authentication with the Google Tasks spoke.

Google Tasks integration requirements:

- A domain and an email address associated with the domain. For example, www.mydomain.com and jane-admin@mydomain.com. Note that you can only register one email address per domain in G Suite.
- A Google G Suite or Gmail login created with the domain.

Complete these steps from the *Google Developers Console*. See the G Suite product documentation for instructions on creating and configuring custom applications.

1. Register a new custom application. Navigate to [https://console.developers.google.com](https://console.developers.google.com), create a project with your G Suite administrator credentials, and open the project.
2. From the APIs & Services menu, select **OAuth consent screen**, enter the application name, and specify the Authorized domain `service-now.com`. Click **Save**.
3. From the APIs & Services menu, select **Credentials**, and select **Create OAuth client ID** from the Create credentials list.
4. Select the application type **Web application**.
5. Enter the following Authorized redirect URI: `https://<instance>.service-now.com/oauth_redirect.do` and click **Create**.
6. The OAuth client window shows your client ID and client secret. Copy these two values to a text file so that you can use them when you **Register Google Tasks as an OAuth provider**.

   The client ID and secret can always be accessed in the Google APIs & Services interface. Click **Credentials** and select the OAuth 2.0 client ID name.

**Register Google Tasks as an OAuth provider**

Use the information generated during Google Tasks application configuration to register the Google Tasks application as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. In ServiceNow, navigate to **System OAuth > Application Registry**.
2. Open the **Google Tasks** spoke.
3. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Enter the Client ID of the Google Tasks application you created.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret of the Google Tasks application you created.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon, enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

4. In the **OAuth Entity Scopes** related list, add the scopes required by your application. The Google Tasks spoke supports two scopes:

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>tasks</td>
<td><a href="https://www.googleapis.com/auth/tasks">https://www.googleapis.com/auth/tasks</a></td>
</tr>
<tr>
<td>readonly</td>
<td><a href="https://www.googleapis.com/auth/tasks.readonly">https://www.googleapis.com/auth/tasks.readonly</a></td>
</tr>
</tbody>
</table>
Click **Insert a new row** and enter a name for the scope and the OAuth scope

<table>
<thead>
<tr>
<th>OAuth Entity Profiles</th>
<th>OAuth Scope</th>
<th>URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task</td>
<td><a href="https://www.googleapis.com/auth/tasks">https://www.googleapis.com/auth/tasks</a></td>
<td></td>
</tr>
<tr>
<td>randomly</td>
<td><a href="https://www.googleapis.com/auth/tasks.readonly">https://www.googleapis.com/auth/tasks.readonly</a></td>
<td></td>
</tr>
</tbody>
</table>

5. On the **OAuth Entity Profiles** tab, add at least one profile, set its **Is default** value to true, and select the **Grant type** Authorization Code. Click **Update**.

6. Open the form for this default profile, add the entity scopes to the profile, and click **Update**.

7. On the Application registries form, click **Update** again.

The system validates the OAuth credentials.

---

**Create Credential record for the Google Tasks spoke.**

Create Credential records to Google. The Google Tasks spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin.

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.

2. Select **OAuth 2.0 Credentials**.

3. Enter a unique name for the credential, for example, **Google Tasks Spoke Credential**.

4. Click the **OAuth Entity Profile** search icon

( )

and select the default Google Task profile.
5. Click Submit and reopen the credential.
6. In Related Links, click Get OAuth Token. Choose the Google account that the application is associated with and allow Google to access the spoke actions you specified.

Create Connection record for the Google Tasks spoke.

Create Connection record for the Google Tasks spoke
Create Connection records to your Google account. The Google Tasks spoke connection and credential alias uses these connections to perform actions in Google tasks.

Role required: admin
1. Navigate to IntegrationHub > Connections & Credentials > Connection & Credential Aliases and select Google Tasks.
2. On the Connections related list, click New.
3. Select HTTP(s) Connection.
4. Provide this connection information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name GTask.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the name of the credential you created in Create Credential record for the Google Tasks spoke.</td>
</tr>
</tbody>
</table>

Note: Make sure that you don't include spaces before or after this URL. If there are spaces, the connection fails.

5. Click Submit.

The Google Tasks spoke is set up and integrated with the ServiceNow instance.

Gremlin spoke
Simulate outages and manage attacks using Gremlin instance from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Supported versions
This spoke was built for Gremlin version v1, but may be compatible with later versions.
**Spoke requirements**

- Set up clients as per your requirement.
- Admin access to the Gremlin dashboard.
- Team in your Gremlin account for integration with ServiceNow instance. For more information about creating teams, see *Teams*.
- Team ID and API Key of the team. Copy and record these values for later use. For more information about accessing these values, see the *Signature-based Authentication* section.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.object)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke actions**

The Gremlin spoke provides actions to automate Gremlin tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attack Management</td>
<td>Create Attack</td>
<td>Creates an attack on the Gremlin platform.</td>
</tr>
<tr>
<td></td>
<td>Get Attack Details</td>
<td>Retrieves details about an attack.</td>
</tr>
<tr>
<td></td>
<td>Get Attack Executions</td>
<td>Retrieves a list of executions associated with an attack.</td>
</tr>
<tr>
<td></td>
<td>Halt All Attacks</td>
<td>Idempotently halts all active attacks across the Gremlin platform.</td>
</tr>
<tr>
<td></td>
<td>Look up Attacks</td>
<td>Lists all attacks on the Gremlin platform.</td>
</tr>
<tr>
<td>Attack Schedule Management</td>
<td>Create Attack Schedule</td>
<td>Creates an attach schedule on the Gremlin platform.</td>
</tr>
<tr>
<td></td>
<td>Delete Attack Schedule</td>
<td>Deletes the specified attach schedule.</td>
</tr>
<tr>
<td></td>
<td>Get Attack Schedule Details</td>
<td>Retrieves details about the specified attach schedule.</td>
</tr>
<tr>
<td></td>
<td>Look up Active Attack Schedules</td>
<td>Lists all the attack schedules on the Gremlin platform.</td>
</tr>
</tbody>
</table>
Note:

- Time zone that is considered in the spoke actions, is same as the time zone of your ServiceNow instance.
- Based on your Gremlin license, if you don't have access to certain Gremlin functionality, you can't use the associated spoke actions in your ServiceNow instance as well.
- For some arguments that take True or False as input, the actual value that the Gremlin platform considers, might be different from the value you have provided.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Create Connection and Credential record for the Gremlin spoke

Authorize the Gremlin spoke actions by creating connection and credential record for the application registered in Gremlin. The Gremlin spoke connection and credential alias uses these connections and credentials to authorize actions.

Role required: admin

1. Navigate to Connection & Credentials > Connection & Credential Alias.
2. Open the record, Gremlin.
3. Click the Create New Connection & Credential related link.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name to identify the connection record. By default, this is Gremlin Connection. You may change it as per your requirement.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL to connect to Gremlin. By default, this is <a href="https://api.gremlin.com">https://api.gremlin.com</a>.</td>
</tr>
<tr>
<td>API Version</td>
<td>API version of the Gremlin platform. By default, this is v1.</td>
</tr>
<tr>
<td>Team ID</td>
<td>Team ID of your team.</td>
</tr>
<tr>
<td>API Key</td>
<td>API Key of your team.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name to identify the credential record. By default, this is Gremlin Credentials. You may change it as per your requirement.</td>
</tr>
</tbody>
</table>

5. Click Create.

HipChat spoke

The HipChat spoke provides actions which post messages and ServiceNow incident, problem, and change record details to a HipChat conversation.
IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

HipChat actions

The HipChat spoke is an available integration through IntegrationHub. You can specify the following HipChat actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a HipChat room. Specify the Room Notification URL, Auth Token, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a HipChat room. Specify the Room Notification URL, Auth Token, and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a HipChat room. Specify the Room Notification URL, Auth Token, and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a HipChat room. Specify the Room Notification URL, Auth Token, and Problem record to send.</td>
</tr>
</tbody>
</table>

HipChat Inputs

The following inputs are common to the HipChat actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Required] Room Notification URL</td>
<td>The HipChat notification REST API URL. Example: <a href="https://api.hipchat.com/v2/%7Broom">https://api.hipchat.com/v2/{room</a> name}/ah-test/notification</td>
</tr>
<tr>
<td>[Required] Auth Token</td>
<td>You need an access token to send notifications. Refer to the HipChat API access token guide for details.</td>
</tr>
<tr>
<td>[Optional] Additional Message</td>
<td>Add a message to the record details.</td>
</tr>
<tr>
<td>[Optional] Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
</tbody>
</table>

Example

You can add a HipChat Post Incident Details action to a flow which identifies high priority incidents and who they are assigned to.
Infoblox spoke v1.0.2

Automate network management tasks in Infoblox from your ServiceNow instance. For example, register or delete IP addresses on an Infoblox server.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Supported version

Infoblox versions 2.7 and 2.9.

Spoke flows

The Infoblox spoke provides sample flows in the draft state to automate allocating IP addresses in the Infoblox grid server. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infoblox Register or Reserve IP in IPAM</td>
<td>Registers or reserves an IP address in Infoblox based on a Service Catalog item request.</td>
</tr>
</tbody>
</table>
Spoke subflows

The Infoblox spoke provides sample subflows to register and reserve IP addresses.

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Register AName Record and Get Network Details</td>
<td>Registers an AName record type in the DNS server and retrieves network details such as network options and ID.</td>
</tr>
</tbody>
</table>

Spoke actions

The Infoblox spoke provides actions to manage IP addresses and networks in Infoblox from your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCP</td>
<td>Delete IP Reservation</td>
<td>Deletes IP address range from an Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>List IP Address Reservation</td>
<td>Lists IP address reservation in the DHCP server for a given Infoblox network view.</td>
</tr>
<tr>
<td></td>
<td>Reserve IP Address Range</td>
<td>Reserves an IP address range in the Infoblox server.</td>
</tr>
<tr>
<td>DNS</td>
<td>List CName Records</td>
<td>Lists CName records present in the Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>List DNS Records</td>
<td>Lists DNS records present in the Infoblox server.</td>
</tr>
<tr>
<td></td>
<td>Register AName Record</td>
<td>Registers an AName record type in DNS server. An AName record stores mapping between the fully qualified domain name and the IP address.</td>
</tr>
<tr>
<td></td>
<td>Register CName Record</td>
<td>Registers a CName record in the Infoblox DNS Server. A CName record is an alias to the fully qualified domain name.</td>
</tr>
<tr>
<td></td>
<td>Delete DNS Record</td>
<td>Deletes a DNS record in the Grid Server.</td>
</tr>
<tr>
<td>IPAM</td>
<td>Delete IPAM IP Address Reservation</td>
<td>Deletes an IPAM IP address Reservation in Infoblox.</td>
</tr>
<tr>
<td></td>
<td>List all the IPAM Reservations</td>
<td>Lists the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Register IPAM IP Address</td>
<td>Registers the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Reserve IPAM IP Addresses</td>
<td>Reserves the IP addresses within a given Infoblox Server.</td>
</tr>
<tr>
<td>Network</td>
<td>Create Network</td>
<td>Creates a network within a given Infoblox Server.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Delete Network</td>
<td>Deletes a network within a given Infoblox Server.</td>
</tr>
<tr>
<td></td>
<td>Get Network Details</td>
<td>Gets the network details within a given Infoblox Server.</td>
</tr>
</tbody>
</table>

#### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

This spoke uses the Infoblox alias record to authorize actions.

<table>
<thead>
<tr>
<th>Connection &amp; Credential alias</th>
<th>Description</th>
<th>Connection alias requirements</th>
</tr>
</thead>
</table>
| Infoblox                      | Connection to Infoblox server | • Connection type: HTTP  
• Connection URL: URL of the host machine where the Infoblox server is installed. |

To use the spoke connection alias, create an associated Connection record and an associated Credential record.

#### MID Server requirements

These actions use REST calls, which must run on a MID Server. Use the connection record associated with the Infoblox alias to configure where actions run as well as set MID Server selection attributes. For more information, see [MID server](#).

#### Set up Infoblox spoke

Integrate the ServiceNow instance and Infoblox using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Infoblox spoke.
- Role required: admin

*Create Credential records for the Infoblox spoke*

Create Credential records to the Infoblox server. The Infoblox spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   - The system displays the message *What type of Credentials would you like to create?*.
3. Select Basic Auth Credentials.
   - A blank Basic Auth Credentials form displays.
4. Enter these values.
**Note:** The user name and password must be for a user with permissions to perform the actions associated with the spoke, usually an administrator.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter <strong>Infoblox Credentials</strong>.</td>
</tr>
<tr>
<td>User name</td>
<td>Your Infoblox user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Your Infoblox password.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

*Create Connection records for the Infoblox spoke*

Create Connection records to your Infoblox account. The Infoblox spoke connection and credential alias uses these connections to perform actions on the Infoblox server.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record for **Infoblox**.
3. Optional: Select the **Connection Attributes** tab. If necessary, edit the **Default value** of the API.
   
   The default value of the API is associated with your Infoblox application version. For example, application version 13 uses v2.9 of the API.
4. On the **Connections** tab, click **New**.
   
   The system displays a blank HTTP(s) Connection form.
5. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter <strong>Infoblox Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Infoblox. For example, select <strong>Infoblox Credentials</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The URL of the host machine where the Infoblox server is installed.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

**Jenkins spoke v2**

Manage builds, users, settings, and jobs on the Jenkins server. Retrieve Jenkins data to use in a flow.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.
IntegrationHub subscription

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Spoke requirements

The Jenkins spoke v2 requires generating an API token. See Security Hardening: New API token system in Jenkins 2.129+ for more information about the API tokens.

Supported versions

All versions between 2.176.2 to 2.222.1.

Spoke modules

You can configure the Jenkins spoke v2 to receive updates from Jenkins at your ServiceNow instance. In the routing policies, conditions that must be met to receive updates at your ServiceNow instance are defined. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Jenkins tasks. This requires separate setup and can be used independently without using the spoke actions. See Set up a webhook for information regarding setting up and configuring the webhooks. To use other conditions in the routing policy or customize the default subflows, see Customize a webhook.

Routing policies and subflows support these fields:

- Keywords
- Build Number
- Job Name
- Job Path
- Show Related Fields

By default, the Jenkins v2 application is available in the Jenkins spoke and has these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Webhook Answer Subflows</td>
<td>Details of the webhook authorization key to authorise requests from Jenkins.</td>
</tr>
<tr>
<td>Webhook Client Detail</td>
<td>Details about the subflows in Jenkins spoke.</td>
</tr>
</tbody>
</table>
The Jenkins spoke v2 includes these tables:

- Jenkins v2 Webhook Answer Subflow [sn_jenkinsv2_spoke_webhook_answer_subflow]
- Jenkins Webhook Client Details [sn_jenkinsv2_spoke_webhook_client_details]

### Spoke subflows

The Jenkins spoke provides sample subflows to demonstrate automating Jenkins tasks. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Jenkins Job</td>
<td>Receives updates from Jenkins at the ServiceNow instance.</td>
</tr>
<tr>
<td>Jenkins Webhook Answer Subflow: Process build</td>
<td>Builds Jenkins Job and retrieves the information. To customize this subflow,</td>
</tr>
<tr>
<td>information</td>
<td>create a copy of the subflow and change it as per your requirement.</td>
</tr>
</tbody>
</table>

### Spoke actions

The Jenkins spoke provides actions to automate Jenkins tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Management</td>
<td>Delete Build</td>
<td>Deletes a build from a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Get Build ID</td>
<td>Retrieves the Build ID of an executed job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Timestamp</td>
<td>Retrieves build timestamp of a given job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Console Output</td>
<td>Retrieves build console output for a given job from Jenkins Server.</td>
</tr>
<tr>
<td></td>
<td>List Builds</td>
<td>Retrieves all the builds for a given job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Perform Build with</td>
<td>Executes a job with parameters on the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Parameters</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Get Build History</td>
<td>Retrieves a range of build history for a given job from Jenkins Server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Information</td>
<td>Retrieves the build timestamp, build status, and complete build information of a given job from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Build Number</td>
<td>Retrieves the build number for a Jenkins server job based on a pre-defined build filter, such as last successful build.</td>
</tr>
<tr>
<td></td>
<td>Perform Build</td>
<td>Executes a job on the Jenkins server.</td>
</tr>
<tr>
<td>Configuration Management</td>
<td>Create Node</td>
<td>Creates a node that you can launch with Java Web Start software. A node is a machine that is part of the Jenkins environment and capable of executing jobs.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Delete Node</td>
<td>Deletes a node from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Version</td>
<td>Retrieves the Jenkins server version.</td>
</tr>
<tr>
<td></td>
<td>Restart Jenkins</td>
<td>Restarts the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Test Connection</td>
<td>Tests the connection to the Jenkins server.</td>
</tr>
<tr>
<td>Job Management</td>
<td>Copy Job</td>
<td>Creates a job by copying an existing Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a Jenkins server folder to organize jobs.</td>
</tr>
<tr>
<td></td>
<td>Create Job</td>
<td>Creates a Jenkins server job from an XML file.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes an existing Jenkins server folder.</td>
</tr>
<tr>
<td></td>
<td>Delete Job</td>
<td>Deletes a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>List Jobs By Folder</td>
<td>Retrieves all the jobs for a given folder from the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Get Job Configuration</td>
<td>Retrieves the XML configuration for a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Reload Job</td>
<td>Reloads a Jenkins server job.</td>
</tr>
<tr>
<td></td>
<td>Rename Job</td>
<td>Renames a Jenkins server job.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates a Jenkins server user.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes an existing Jenkins server user.</td>
</tr>
<tr>
<td>View Management</td>
<td>Add Job To View</td>
<td>Adds a job to the Jenkins server view. Views are containers to organize jobs.</td>
</tr>
<tr>
<td></td>
<td>Create View</td>
<td>Creates a Jenkins server view.</td>
</tr>
<tr>
<td></td>
<td>Delete View</td>
<td>Deletes a Jenkins server view.</td>
</tr>
<tr>
<td></td>
<td>List Jobs By View</td>
<td>Retrieves all jobs from a view on the Jenkins server.</td>
</tr>
<tr>
<td></td>
<td>Remove Job From View</td>
<td>Removes a job from a Jenkins server view.</td>
</tr>
</tbody>
</table>

### Connection and credential requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the Jenkins v2 Connection & Credential Alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record.
MID Server requirements

These actions use REST calls, which run on a MID Server. Use the connection record associated with the Jenkins alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up the Jenkins spoke

Integrate the ServiceNow instance and Jenkins using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Jenkins spoke
- Role required: admin

Create Credential records for the Jenkins spoke

Create Credential records to the Jenkins server. The Jenkins spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
   A blank Basic Auth Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Jenkins Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>Jenkins user name.</td>
</tr>
<tr>
<td>Password</td>
<td>API token.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Jenkins spoke

Create Connection records to your Jenkins account. The Jenkins spoke connection and credential alias uses these connections to perform actions on Jenkins.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Jenkins v2.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Jenkins Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Jenkins. For example, select Jenkins Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the host machine where Jenkins is installed.</td>
</tr>
</tbody>
</table>
5. Click Submit.

**Set up a webhook**

Set up webhook application to receive the required updates from Jenkins at your ServiceNow instance.

Role required: admin

*Create authorization key for the Jenkins spoke*

Create a authorization key to authorise requests from Jenkins.

1. Navigate to **System Definition > Scripts - Background**.
2. Enter this command in the **Run script (JavaScript executed on server)** text field:
   
   ```javascript
   gs.info(GlideSecureRandomUtil.getSecureRandomString(32));
   ```
3. Click **Run Script**.
4. Copy and record the generated value for later use.

---

*Provide authorization key for webhook*

Authorise requests from Jenkins by providing authorization key for webhook in your ServiceNow instance.

1. Navigate to **Jenkins v2 > Webhook Client Details**.
2. Click **New**.
3. On the form, fill these values:

   **Jenkins Webhook Client Details form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authorization Key</td>
<td>Authorization key you had generated. See <em>Create authorization key for the Jenkins spoke</em> for more information.</td>
</tr>
<tr>
<td>Name</td>
<td>Name to identify the webhook client record.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

*Provide authorization key in Jenkins*

Receive updates from Jenkins by providing the authorization key in Jenkins.

1. Log in to your Jenkins account.
2. Click and open the job for which you want to configure your webhook.
3. Click **Configure**.
4. In the **Bindings** tab, click **Add** and select **Jenkins**. For more information about the using the plugin, see *Credentials Binding*. 

---

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
5. On the Jenkins Credential Provider form, fill these fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kind</td>
<td>Select Secret text.</td>
</tr>
<tr>
<td>Secret</td>
<td>Enter authorization key. See Create authorization key for the Jenkins spoke for more information.</td>
</tr>
<tr>
<td>ID</td>
<td>Provide unique identifier to identify the record.</td>
</tr>
</tbody>
</table>

6. Click Add.

7. In the Post-build Actions tab, configure task and specify script to receive updates at your ServiceNow instance.

Note: ID in the script is the ID you had provided in the Jenkins Credential Provider form.

For more information about the using the plugin, see *Post build task*.

8. Click **Apply**.

### Provide description to subflow

Provide user friendly descriptions to the subflows in the Jenkins spoke.

1. Navigate to **Jenkins v2 > Webhook Answer Subflows**.
2. Click **New**.
3. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description about the subflow.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Required subflow in the Jenkins spoke.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

### Provide answers to the decision table

Provide subflows as answers to the conditions mentioned in the decision table. When the specified conditions are met, the associated subflow is triggered.

1. Navigate to **System Definition > Decision Tables**.
2. Open the record for the **Jenkins v2 spoke**.
3. In the **Decisions** tab, click **New**.
4. On the form, fill these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Jenkins. See <strong>Jenkins spoke v2</strong> for information about the supported fields.</td>
</tr>
</tbody>
</table>
5. Click **Submit**.

**Customize a webhook**
Create a webhook routing policy and customize subflow as per your requirement.

1. Navigate to **Flow Designer > Designer**.
2. Click **Subflows**.
3. Create a copy of the required default subflow.
4. Customize the Jenkins Webhook Answer Subflow: Process build information subflow as per your requirement and publish it. See **Subflows** for more information about creating and using subflows and **Jenkins spoke v2** for information about the fields that the routing policies and subflows support.
5. Navigate to **Jenkins v2 > WebHook Answer Subflows**.
6. Click **New**.
7. On the form, fill in the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description about the subflow.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Required subflow in the Jenkins spoke.</td>
</tr>
</tbody>
</table>

8. Click **Submit**.

**Note**: These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

9. Navigate to **System Definition > Decision Tables**.
10. Open the record for the **Jenkins v2** spoke.
11. In the **Decisions** tab, click **New**.
12. On the form, fill these fields:

<table>
<thead>
<tr>
<th>Decision form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Jenkins. See Jenkins spoke v2 for information about the supported fields.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that must be triggered when the specified conditions are met.</td>
</tr>
<tr>
<td></td>
<td>1. Click the Lookup icon</td>
</tr>
<tr>
<td></td>
<td>2. Select the required subflow from the Document list.</td>
</tr>
</tbody>
</table>

Note: Ensure that the Table name is Jenkins v2 Webhook Answer Subflow [sn_jenkinsv2_spoke_webhook_answer_subflow].

13. Click Submit.

**Jira spoke v2.6.8**

Manage issues, users, stories, and groups in Jira. Retrieve Jira data to use in a flow. Use bi-directional webhooks and subscribe to Jira with a ServiceNow callback URL.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Integrations - External Authentication Framework (com.glide.external.app)
**ServiceNow Orlando Now Platform capabilities**

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Supported versions**

This spoke was built for API version v2, but may be compatible with later versions.

**Note:**
- If your Jira instance supports another API version, specify the API version in **API Version** under the Attributes related list. By default, the **API Version** is 2. See Create Connection records for the Jira spoke for information about creating a Connection record.
- Jira Service Desk is not supported by the spoke.

**Spoke requirements**

Activate the Integrations - External Authentication Framework (com.glide.external.app) plugin.

**Jira Webhooks module**

Bi-directional webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow app. These conditions are based on the events in Jira that you want to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Jira tasks.

The bi-directional webhooks require separate setup and can be used independently without using the spoke actions. By default, the Jira Webhooks application is available in the Jira spoke and has the following modules:

- Jira Webhook Registries
- Jira WebHook Routing Policies

Use the Jira Webhook Registries module to assign a token and provide the API path. You must generate a Callback URL here and provide this URL in Jira. A default routing policy is provided in the Jira WebHook Routing Policies module. The default routing policy supports these fields:
<table>
<thead>
<tr>
<th>Category</th>
<th>Field</th>
</tr>
</thead>
</table>
| Issue      | • Jira Instance URL  
              • Webhook Event  
              • Issue Description  
              • Created  
              • Updated  
              • Issue Resolution  
              • Previous Issue Resolution  
              • Issue Summary  
              • Issue Type  
              • Previous Issue Type  
              • Issue Priority  
              • Previous Issue Priority  
              • Issue Status  
              • Previous Issue Status  
              • Issue Status Category  
              • Previous Issue Status Category  
              • Project |
| Comment    | • Jira Instance URL  
              • Webhook Event  
              • Comment  
              • Created  
              • Updated  
              • Issue Summary  
              • Issue Type  
              • Issue Priority  
              • Issue Status  
              • Issue Status Category  
              • Project |
| Worklog    | • Jira Instance URL  
              • Webhook Event  
              • Worklog Time Spent  
              • Created  
              • Updated |
| Attachment | • Jira Instance URL  
              • Webhook Event  
              • Created  
              • Attachment File Name  
              • Attachment Size  
              • Attachment Mime Type |
| Project    | • Jira Instance URL  
              • Webhook Event  
              • Project |
To use other conditions in the routing policy, create routing policy in the Jira WebHook Routing Policies module and specify conditions as per your requirement. See Set up a bi-directional webhook for information regarding setting up and configuring the webhooks.

**Spoke subflow**

The Jira spoke provides a sample subflow to handle various Jira webhook events. The available sample subflow is Process Jira Webhooks. The Process Jira Webhooks subflow supports these fields:

<table>
<thead>
<tr>
<th>Category</th>
<th>Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issue</td>
<td>• User</td>
</tr>
<tr>
<td></td>
<td>• Issue</td>
</tr>
<tr>
<td></td>
<td>• Attachments</td>
</tr>
<tr>
<td></td>
<td>• Issue Change Log</td>
</tr>
<tr>
<td></td>
<td>• Project</td>
</tr>
<tr>
<td>Comment</td>
<td>• Issue</td>
</tr>
<tr>
<td></td>
<td>• Project</td>
</tr>
<tr>
<td></td>
<td>• Comment</td>
</tr>
<tr>
<td>Worklog</td>
<td>Worklog</td>
</tr>
<tr>
<td>Attachments</td>
<td>Attachment</td>
</tr>
<tr>
<td>Project</td>
<td>Project</td>
</tr>
<tr>
<td>Version</td>
<td>Version</td>
</tr>
<tr>
<td>Webhook Event</td>
<td></td>
</tr>
<tr>
<td>Timestamp</td>
<td></td>
</tr>
<tr>
<td>Payload</td>
<td>Note: This is the entire Jira payload.</td>
</tr>
</tbody>
</table>

To customize the default subflow, you must create a copy of the sample subflow, parse the payload, and customize the subflow as per your requirement. Payload is one of the inputs to the subflow.

While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

Note:
You must configure webhooks to use the spoke subflow. See *Set up a bi-directional webhook* for information regarding setting up and configuring the webhook.

The sample subflow runs as a user by default. The subflow can be configured to run as system.

## Spoke actions

Use actions in the Jira spoke in Flow Designer to automate Jira tasks when an event occurs in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issue Management</td>
<td>Copy Attachment</td>
<td>Copies the required attachment associated with the ServiceNow record to the required issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Delete Attachment</td>
<td>Deletes the required attachment in Jira.</td>
</tr>
<tr>
<td></td>
<td>Add Comment</td>
<td>Adds a comment to the specified issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Assign Issue</td>
<td>Assigns the issue in Jira to the user.</td>
</tr>
<tr>
<td></td>
<td>Create Issue</td>
<td>Creates an issue in Jira. Depending on how your organization is using Jira, an issue could represent a software bug, a project task, a help desk ticket, or more. An issue in Jira represents a task in the Now Platform.</td>
</tr>
<tr>
<td></td>
<td>Delete Issue</td>
<td>Deletes an issue in Jira.</td>
</tr>
<tr>
<td></td>
<td>Do Transition</td>
<td>Transitions an issue in Jira from one state to another.</td>
</tr>
<tr>
<td></td>
<td>Get Issue By ID</td>
<td>Retrieves the JSON object of the required issue.</td>
</tr>
<tr>
<td>Look Up Records By JQL</td>
<td></td>
<td>Retrieves the list of the required records by providing a JQL query.</td>
</tr>
<tr>
<td>Look Up Transitions</td>
<td></td>
<td>Retrieves information about all Transitions in JSON format for a given Issue ID.</td>
</tr>
<tr>
<td>Update Issue</td>
<td></td>
<td>Updates a set number of fields of an issue in Jira with values passed as input.</td>
</tr>
<tr>
<td>Get Issues</td>
<td></td>
<td>Gets a list of Jira issues.</td>
</tr>
<tr>
<td>Get Issues for Sprint</td>
<td></td>
<td>Retrieves the details of all issues for the given sprint.</td>
</tr>
<tr>
<td>Project Management</td>
<td>Get All Projects</td>
<td>Retrieves information in JSON format for all projects visible to the currently logged in user. A project in Jira is a collection of issues, and is defined according to your organization's requirements.</td>
</tr>
<tr>
<td>SDLC Management</td>
<td>Create Story</td>
<td>Creates a story in Jira, similar to a story in Now Platform Agile Development.</td>
</tr>
</tbody>
</table>

**Note:** Ensure that you construct JQL query to retrieve the required data only. Don't construct queries that retrieve the entire data. Avoid constructing queries such as, `project = NOW OR created < '2025-01-01'`.
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Look Up Stories</td>
<td>Retrieves information in JSON format for all stories within a specified date range.</td>
</tr>
<tr>
<td></td>
<td>Update Story</td>
<td>Updates a set number of fields of a story in Jira with values passed as input.</td>
</tr>
<tr>
<td>User Management</td>
<td>Look Up Users</td>
<td>Fetches a list in JSON format of all active Jira users.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a new user in Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove User</td>
<td>Removes a user from Jira.</td>
</tr>
<tr>
<td></td>
<td>Get Jira Users</td>
<td>Gets all Jira user subscriptions.</td>
</tr>
<tr>
<td></td>
<td>Get Jira User Activity</td>
<td>Retrieves the details of user activity in Jira.</td>
</tr>
<tr>
<td></td>
<td>Get Audit Log</td>
<td>Gets audit log activity for Jira user subscriptions.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User to Group</td>
<td>Adds given user to a group in Jira.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Jira.</td>
</tr>
<tr>
<td></td>
<td>Look Up Users By Group</td>
<td>Retrieves a list of users who are members of the specified group and its subgroups in Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove Group</td>
<td>Removes the given group from Jira.</td>
</tr>
<tr>
<td></td>
<td>Remove User from Group</td>
<td>Removes the given user from a group in Jira.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Creatable Fields</td>
<td>Retrieves the list of all fields in a required Jira project.</td>
</tr>
<tr>
<td></td>
<td>Get Editable Fields</td>
<td>Retrieves the list of all editable fields in a required Jira issue.</td>
</tr>
<tr>
<td></td>
<td>Get Issue Types</td>
<td>Retrieves the list of all issue types in a required Jira project.</td>
</tr>
<tr>
<td></td>
<td>Get Projects</td>
<td>Retrieves the list of all Jira projects.</td>
</tr>
<tr>
<td></td>
<td>Get All Boards</td>
<td>Retrieves the details of all boards in Jira.</td>
</tr>
<tr>
<td>Sprint Management</td>
<td>Create Sprint</td>
<td>Creates a sprint in Jira.</td>
</tr>
<tr>
<td></td>
<td>Delete Sprint</td>
<td>Deletes a sprint in Jira.</td>
</tr>
<tr>
<td></td>
<td>Get All Sprints By Board</td>
<td>Retrieves the details of all sprints in the required board.</td>
</tr>
<tr>
<td></td>
<td>Get Sprint By ID</td>
<td>Retrieves the details of the required sprint as a JSON object.</td>
</tr>
<tr>
<td></td>
<td>Update Sprint</td>
<td>Updates the details of a sprint in Jira.</td>
</tr>
</tbody>
</table>

**Jira account requirements**

The Jira spoke requires generating an API token for Jira using your Atlassian account.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the
connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

This spoke uses the Jira alias record. To use these actions, you must create a connection record and a credential record and associate them with the Jira alias record.

These actions use REST calls, which can run on an instance. Use the connection record associated with the Jira alias to configure the endpoint against which the actions run.

**Set up the Jira spoke v2.6.8**

Integrate the ServiceNow instance and Jira using an API key to authenticate ServiceNow requests.

- Request an IntegrationHub Standard subscription
- Activate the Jira spoke v2.6.8
- Role required: admin

You can integrate a ServiceNow instance with multiple Jira instances. For this integration, create a connection and credential alias record and a connection record for each Jira instance.

*Generate a Jira account API token*

**Jira requirements:**

- Atlassian account
- Atlassian administrator credentials

Complete these steps from your Atlassian account. See the *Atlassian Developer* portal documentation for instructions on generating your API token.

1. From your Atlassian account, generate an access token to interact with Jira APIs.
2. Copy and record the access token to create credential records on your ServiceNow instance.

*Create credential records for the Jira spoke*

Create a credential record for the Jira account. The Jira spoke connection and credential alias uses this credential to authorize actions.

1. Navigate to *Connections & Credentials > Credentials*.
2. Click *New*.
   - The system displays the message *What type of Credentials would you like to create?*
3. Select *Basic Auth Credentials*.
   - The pop-up window displays a blank Basic Auth Credentials form.
4. Enter these values, then click *Submit*.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter <em>Jira Credentials</em>.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the email address of the user.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the API token you generated for Jira.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Search for and select the Jira credential alias.</td>
</tr>
</tbody>
</table>

The credential record for the Jira spoke is created.
Create Connection records for the Jira spoke

Create a connection record for the Jira account. The Jira spoke connection and credential alias uses this connection to perform actions in Jira.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the alias record for Jira that shipped with the spoke.
3. On the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values and click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Jira Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record created for Jira. For example, select Jira Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Search for and select the Jira alias.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL of your Jira instance.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
</tbody>
</table>

5. Optional: If you create a credential record to integrate your ServiceNow instance with another Jira instance, ensure that api_version in the Attributes related list in the associated connection record is set to 2.

   Note: If your Jira instance supports another API version, specify the API version in API Version in the Attributes related list. By default, API Version is 2.

The Jira spoke is set up and integrated with the ServiceNow® instance.

Set up a bi-directional webhook

Configure a webhook to subscribe to Jira with a ServiceNow callback URL.

- Request an IntegrationHub Standard subscription
- Activate the Jira spoke v2.6.8
- Role required: admin

Create a token

Create a token to embed in the Jira webhook URL.

Role required: admin

1. In the navigation filter, enter token_verification.list.
   The system displays records in the Token Verifications table.
2. Click New.
3. On the form, fill the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the token. For example, Jira token.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the token.</td>
</tr>
</tbody>
</table>
The token is created to be embedded in the Jira webhook URL.

Register a Jira webhook in ServiceNow

Register a Jira webhook in ServiceNow to notify the ServiceNow app when certain events occur in Jira.

Role required: admin

1. Navigate to Jira Webhooks > Jira Webhook Registries.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, Jira webhook.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the record.</td>
</tr>
<tr>
<td>Token</td>
<td>Authentication token. This token is encrypted and embedded in the URL.</td>
</tr>
<tr>
<td>Path</td>
<td>Jira webhook path. By default, this path is set to api/sn_jira_spoke/</td>
</tr>
<tr>
<td></td>
<td>jira_webhook_callbacks/wh_entry.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click Save.
5. Click Callback URL.
   The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.

The Jira webhook is registered in your ServiceNow instance.

Add a callback URL in Jira

Provide a webhook callback URL in your Jira Atlassian account to create a webhook.

Role required: admin

1. Log in to your Jira Atlassian account.
2. Create a webhook in your Atlassian account.
3. Enter the webhook callback URL in the URL field. See the Atlassian Developer portal documentation for instructions on creating a webhook.

The callback URL is added in your Jira Atlassian account. You can create routing policies and subflows as per your requirement. See Customize a bi-directional webhook for information regarding the creation of new routing policies and subflows.

Customize a bi-directional webhook

Create a webhook routing policy and subflow as per your requirement.

Role required: admin

The default routing policy in the Jira WebHook Routing Policies module triggers the Process Jira Webhooks subflow and notifies the ServiceNow app when certain events occur in Jira. See Jira spoke v2.6.8 for information about the
fields that the default routing policy and subflows support. To use any other fields in your custom subflow and customize conditions in the routing policy, perform these steps.

1. Navigate to **Flow Designer > Designer**.
2. Click **Subflows**.
3. Create a copy of the default subflow, Process Jira Webhooks.
4. Customize the subflow as per your requirement and publish it. See **Subflows** for more information about creating and using subflows, and **Jira spoke v2.6.8** for information about the fields that the default routing policy and subflows support.
5. Navigate to **Jira Webhooks > Jira WebHook Routing Policies**.
6. Click **New**.
7. On the form, fill in the fields.

**Decision form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td></td>
<td>1. Click the lookup icon [ ]</td>
</tr>
<tr>
<td></td>
<td>2. Select the required subflow from the Document list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the Table name is Flow [sys_hub_flow].</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Jira. See <strong>Jira webhooks</strong> for information about the supported fields.</td>
</tr>
<tr>
<td>Answer</td>
<td>Subflow that must be triggered when the specified conditions are met.</td>
</tr>
</tbody>
</table>

8. Click **Submit**.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

The routing policy and subflow are created.

**Kronos spoke**

Manage time off requests in Kronos from your ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.
**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see *Request IntegrationHub*.

**Supported versions**

This spoke was built for Kronos version v1, but may be compatible with later versions.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

**Spoke flows**

The Kronos spoke provides sample flows to demonstrate automating the Kronos tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kronos - Create Manager Time Off Request</td>
<td>Creates the time of request for a manager or employee.</td>
</tr>
<tr>
<td>Kronos - Get New Refresh And Access Token</td>
<td>Retrieves access token for Kronos and generates a new refresh token periodically.</td>
</tr>
<tr>
<td>Kronos - Refresh The Access Token</td>
<td>Refreshes the access token for Kronos.</td>
</tr>
<tr>
<td>Kronos - Retrieve And Update Manager Time Off Request Status</td>
<td>Retrieves status of the time off request status and updates the details of the associated request item.</td>
</tr>
<tr>
<td>Kronos - Time Off Details House Keeping</td>
<td>Deletes the time off requests based on the provided criteria. By default, the flow deletes time off requests that have been approved 7 days ago.</td>
</tr>
</tbody>
</table>

Every flow triggers an associated subflow.

**Spoke subflows**

The Kronos spoke provides sample subflows to demonstrate automating Kronos tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:
<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kronos - Get Kronos Token</td>
<td>Uses the details provided during spoke setup to retrieve a valid refresh token from Kronos.</td>
</tr>
<tr>
<td>Kronos - Create Manager Time Off Request</td>
<td>Creates the time off request and saves the information in your ServiceNow instance.</td>
</tr>
<tr>
<td>Kronos - Manager Time Off Request</td>
<td>Creates the time off request for a manager or employee.</td>
</tr>
<tr>
<td>Kronos - Retrieve Manager Time Off Request Status Update</td>
<td>Retrieves status of the time off request status and updates the details of the associated request item.</td>
</tr>
<tr>
<td>Kronos - Time Off Request Housekeeping</td>
<td>Deletes the time off requests based on the provided criteria. By default, the subflow deletes time off requests that have been approved 7 days ago.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Kronos spoke provides actions to automate Kronos tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Management</td>
<td>Get Kronos Refresh Token</td>
<td>Retrieves the Refresh Token for Kronos.</td>
</tr>
<tr>
<td></td>
<td>Get Kronos Token</td>
<td>Retrieves the Token for Kronos.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Retrieve All Pay Codes</td>
<td>Retrieves all the pay code in Kronos.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Employee Request Subtype</td>
<td>Retrieves a list of request subtypes associated with the required Person Number.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Manager Request Subtype By Employee ID</td>
<td>Retrieves a list of request subtypes associated with the required Employee ID.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Manager Request Subtype By Person Number</td>
<td>Retrieves a list of request subtypes associated with the required Person Number. The action output is necessary for subsequent actions such as, the Retrieve Employee Accrual Balance action from manager’s perspective.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Manager Symbolic Amount Qualifiers By Employee ID</td>
<td>Retrieves different types of Retrieve Manager Symbolic Amount Qualifiers By Employee ID, such as half day, full day, and so on, based on Employee ID.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Manager Symbolic Amount Qualifiers By Person Number</td>
<td>Retrieves different types of Retrieve Manager Symbolic Amount Qualifiers By Employee ID, such as half day, full day, and so on, based on Person Number.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Symbolic Periods</td>
<td>Retrieves all the symbolic periods.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Scheduling Management</td>
<td>Create Employee Time Off Request</td>
<td>Creates a time off request based on the provided inputs.</td>
</tr>
<tr>
<td></td>
<td>Create Manager Time Off Requests</td>
<td>Creates a time off request based on the provided inputs.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Employee Accrual Balance</td>
<td>Retrieves details of the different types of employee accrual balance, such as PTO, sick days, and so on.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Employee Time Off Requests</td>
<td>Retrieves details of the time off requests based on the specified search criteria.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Manager Accrual Balance By Employee ID</td>
<td>Retrieves details of the different types of manager accrual balance using Employee ID.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Manager Accrual Balance By Person Number</td>
<td>Retrieves details of the different types of manager accrual balance using Person Number.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Manager Time Off Requests By Employee ID</td>
<td>Retrieves details of the time off requests based on the specified search criteria and Employee ID.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Manager Time Off Requests By Person Number</td>
<td>Retrieves details of the time off requests based on the specified search criteria and Person Number.</td>
</tr>
<tr>
<td></td>
<td>Update Employee Time Off Request</td>
<td>Updates the state of an employee time off request.</td>
</tr>
<tr>
<td></td>
<td>Update Manager Time Off Requests</td>
<td>Updates the state of a manager time off request.</td>
</tr>
</tbody>
</table>

**Spoke module**

The Kronos spoke adds a Kronos application to your ServiceNow instance. The Kronos application has these modules.

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credentials</td>
<td>Details of the Kronos users with permissions to perform the required actions.</td>
</tr>
<tr>
<td>Time Off Request Details</td>
<td>Details of the time off requests, along with the status.</td>
</tr>
<tr>
<td>Time Off Request Details Staging Tables</td>
<td></td>
</tr>
</tbody>
</table>

**Kronos spoke account requirements**

The Kronos spoke requires registering an OAuth 2.0 application in your Kronos account to generate OAuth 2.0 tokens for the Kronos spoke. Record the generated Client ID, Client Secret, and Application key for later use.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Kronos spoke

Integrate your Kronos application with your ServiceNow instance. Register an OAuth application in Kronos and authenticate requests from ServiceNow.

- Request IntegrationHub subscription
- Activate the Kronos spoke
- Kronos manager user or superuser credentials
- Role required: admin

Register Kronos as an OAuth provider

Use the information generated during the Kronos application creation and configuration to register Kronos as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Open the record for the Kronos spoke.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Kronos OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the application configuration in Kronos.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the application configuration in Kronos.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select Resource Owner Password Credentials.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select Kronos Spoke.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry. Select the option.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. For example, https://&lt;Kronos-Instance&gt;.com/api/authentication/access_token.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. For example, https://&lt;ServiceNow-Instance&gt;.com/oauth_redirect.do.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
5. In the OAuth Entity Scopes tab, insert a row and provide these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Kronos</td>
</tr>
</tbody>
</table>
Field | Value required
--- | ---
Name | Name to uniquely identify the record. For example, Kronos Cred.
Active | Option to actively use the credential record. Select the option.
OAuth Entity Profile | Default OAuth entity profile of the Kronos spoke. For example, select Kronos oAuth default_profile.
Order | Order that the credentials are used. For example, enter 100.

5. Right-click the form header and click Save.

Provide Kronos user credentials
Create a record to provide details and credentials of the required Kronos user. The Kronos spoke uses these user credentials to perform actions in Kronos.

Ensure that you provide credentials of a manager user or Kronos superuser. With these credentials, time off requests of both employee and manager can be managed.

1. Navigate to Kronos > Credentials.
2. Click New.
3. On the form, fill these values.

Kronos Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record.</td>
</tr>
<tr>
<td>Application Key</td>
<td>Application Key of the Kronos user.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to the user's account in Kronos.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the Kronos user account.</td>
</tr>
<tr>
<td>Connection &amp; Credential Alias</td>
<td>Default alias record associated with the Kronos spoke.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.
5. To generate the Kronos token, click the **Get Kronos Token** related link.

The Kronos - Get Kronos Token subflow is triggered. The subflow uses the details provided during spoke setup to retrieve a valid refresh token from Kronos. The subflow then, updates the value of **Refresh Token Expires**.

**Note:** To access more details about the Kronos refresh token, navigate to **System OAuth > Manage Tokens**. Here, a record is created for each refresh token.

---

### Create Connection record for the Kronos spoke

Create Connection records to your Kronos application. The Kronos spoke connection and credential alias uses these connections to perform actions in Kronos.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record for the Kronos spoke.
3. From the **Connections** tab, click **New**.
4. On the form, fill these values.

#### HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter <strong>Kronos Conn</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Kronos. For example, select <strong>Kronos Cred</strong>. See Create Credential record for the Kronos spoke for more information.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Note: Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the Kronos instance.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>This field isn't applicable.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection. Select the option.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. In the **Attributes** tab, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>u_app_key</td>
<td>Application Key of the Kronos user.</td>
</tr>
<tr>
<td>u_version</td>
<td>Kronos version of your instance. Enter v1.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
Create request as manager using the Kronos catalog item

Trigger events in Kronos when an item is requested in the Service Catalog.

- *Set up the Kronos spoke*
- Role required: admin

The Kronos spoke adds a catalog item for use with the Kronos spoke sample flows.

1. Navigate to **Self-Service > Service Catalog**.
2. Click **Kronos**.
3. Click **Kronos - Create Time Off Request As Manager (Super Access)**.
4. Provide details of the time off request.

   **Note**: After you have provided a valid **Employee ID** or **Person Number(Qualifier)**, the system may take some time to populate the values in the **Subtype Name using Employee ID** and **Symbolic Amount Qualifier By Employee ID**, or **Subtype Name using Person Number and Symbolic Amount Qualifier By Person Number** lists.

5. Click **Order Now**.
   A request item is generated and its generated number is displayed.
6. Click the request number and change the value of **Approval** to **Requested**, **Approved**, or **Rejected**.
7. Click **Update**.

   - The **Kronos - Create Manager Time Off Request** flow is triggered.
   - A record is created in the Time Off Request Details module. The status of the time off request is updated when the **Kronos - Retrieve And Update Manager Time Off Status** flow is triggered.

**Kubernetes spoke**

Automate changes in Kubernetes when an event occurs in ServiceNow.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see **Request IntegrationHub**.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

API version v1.

Spoke actions

The Kubernetes spoke provides actions to automate Kubernetes tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint Management</td>
<td>Create Endpoints</td>
<td>Creates an endpoint in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Endpoints</td>
<td>Deletes an endpoint from the Kubernetes instance.</td>
</tr>
<tr>
<td>Namespace Management</td>
<td>Create Namespace</td>
<td>Creates a namespace in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Namespace</td>
<td>Deletes a namespace from the Kubernetes instance.</td>
</tr>
<tr>
<td>Node Management</td>
<td>Create Node</td>
<td>Creates a node in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Node</td>
<td>Deletes a node in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Node</td>
<td>Inspects a specified node in the Kubernetes instance and returns node information and status.</td>
</tr>
<tr>
<td>Pod Management</td>
<td>Create Pod</td>
<td>Creates a Pod in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Pod</td>
<td>Deletes a pod from the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Inspect Pod</td>
<td>Inspects the specified pod in the Kubernetes instance and returns pod information and status.</td>
</tr>
<tr>
<td>Secret Management</td>
<td>Create Docker Hub Secret</td>
<td>Creates a secret in the Kubernetes instance.</td>
</tr>
<tr>
<td></td>
<td>Delete Docker Hub Secret</td>
<td>Deletes a Secret from the Kubernetes instance.</td>
</tr>
<tr>
<td>Service Management</td>
<td>Create Service</td>
<td>Creates a service on a Kubernetes server.</td>
</tr>
<tr>
<td></td>
<td>Delete Service</td>
<td>Deletes a service from the Kubernetes server.</td>
</tr>
</tbody>
</table>
## Kubernetes account requirements

The Kubernetes spoke requires generating and configuring your Kubernetes account to use a web API key.

## Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

This spoke uses the Kubernetes alias record to authorize actions. To use the spoke connection alias, create an associated Connection record and an associated Credential record.

## MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Kubernetes alias to configure where actions run as well as set MID Server selection attributes. For more information, see *MID server*.

### Set up Kubernetes spoke

Integrate the ServiceNow instance and Kubernetes using an API key and certificate to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Kubernetes spoke
- Role required: admin

*Generate Kubernetes API token and certificate*

Generate an access token and a certificate from your Kubernetes account for API key authentication.

Kubernetes requirements:
- Kubernetes account
- Administrator credentials on the host machine where Kubernetes is installed
Complete these steps from your Kubernetes host machine. See Kubernetes documentation for instructions on generating your API token and client certificate.

1. From your Kubernetes host machine, generate an access token to interact with Kubernetes APIs. This token does not expire.
2. Copy and record the access token to create Credential records on your ServiceNow instance.
3. Generate a client certificate to upload to your ServiceNow instance.

Upload Kubernetes client certificate
Upload the Kubernetes client certificate to your ServiceNow instance to authenticate API requests to the Kubernetes host machine.

1. Navigate to System LDAP > Certificates.
2. Click New.
3. Complete the form and enter the certificate in the PEM Certificate field.
   For more information about uploading certificates, see Upload a certificate to an instance.
4. Click Submit.

Create Credential records for the Kubernetes spoke
Create Credential records to your Kubernetes account. The Kubernetes spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Kubernetes Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter Bearer followed by the access token you obtained from Kubernetes. For example, Bearer {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Kubernetes spoke
Create Connection records to the Kubernetes engine. The Kubernetes spoke connection and credential alias uses these connections to perform actions in Kubernetes.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Kubernetes.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Kubernetes Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Kubernetes. For example, select Kubernetes Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>The IP address and port of the host machine where Kubernetes is installed.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**Turn off remote SSL host verification**

A system property prevents the Kubernetes spoke from processing Kubernetes responses. Set the `com.glide.communications.httpclient.verify_hostname` system property to false to enable the integration.

1. Enter `sys_properties.list` in the application navigator.
   The System Properties [sys_properties] table opens.
2. Search for the `com.glide.communications.httpclient.verify_hostname` system property.
3. Set the value to false.

**Microsoft AD spoke**

Create, delete, and manage objects in Microsoft Active Directory, such as users, groups, and computers.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Spoke requirements**

Ensure that Active Directory Web Services (ADWS) is deployed in the same server where Microsoft AD is installed. See Microsoft documentation for information about deploying ADWS.

**Spoke flows**

The Microsoft AD spoke provides sample flows in the draft state to demonstrate automating Active Directory tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Offboarding</td>
<td>Disables an AD user account and removes the user from any AD groups when a ServiceNow user record is deactivated.</td>
</tr>
<tr>
<td>User Onboarding</td>
<td>Creates and enables an AD user account when a ServiceNow user record is activated.</td>
</tr>
</tbody>
</table>
### Spoke subflows

This spoke has no sample subflows.

### Spoke actions

The Microsoft AD spoke provides actions to automate Microsoft Active Directory tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Delete Computer</td>
<td>Deletes a computer from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Disable Computer</td>
<td>Disables a computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Enable Computer</td>
<td>Enables a computer account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Get Computer OU</td>
<td>Gets the Organizational Unit (OU) of a Computer Account.</td>
</tr>
<tr>
<td></td>
<td>Is Computer Enabled</td>
<td>Checks the status of the specified computer account in Active Directory.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Move Computer to OU</td>
<td>Changes the Organizational Unit (OU) of a Computer Account in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Add User To Group</td>
<td>Adds an existing Active Directory user to an Active Directory group.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group from Active Directory.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Checks if an existing Active Directory user is a member of an Active Directory group.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group</td>
<td>Gets the details of a given group in Active Directory, including the group category, scope, and distinguished name.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes an existing user from a group in Active Directory.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Change User Password</td>
<td>Changes the user password in AD. The password input must comply with Active Directory password requirements.</td>
</tr>
<tr>
<td></td>
<td>Is User Account Locked</td>
<td>Checks the locked status of the specified user account in Active Directory.</td>
</tr>
</tbody>
</table>
### Category

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reset AD User Password</td>
<td>Resets a user’s password in Active Directory.</td>
</tr>
<tr>
<td>Create User</td>
<td>Creates a user with no password in Active Directory. To enable a user to set a password, log in to AD, create a default password for the user, and enable password reset.</td>
</tr>
<tr>
<td>Delete User</td>
<td>Deletes a user from Active Directory.</td>
</tr>
<tr>
<td>Disable User</td>
<td>Disables a user account in Active Directory.</td>
</tr>
<tr>
<td>Enable User</td>
<td>Enables a user account in Active Directory.</td>
</tr>
<tr>
<td>Is User Enabled</td>
<td>Checks the status of a user account in Active Directory.</td>
</tr>
<tr>
<td>Lookup User</td>
<td>Gets the details of a given user in Active Directory.</td>
</tr>
<tr>
<td>Unlock AD Account</td>
<td>Unlocks a user account in Active Directory.</td>
</tr>
<tr>
<td>Update User</td>
<td>Updates user attributes in Active Directory.</td>
</tr>
<tr>
<td>Update User Home Location</td>
<td>Updates the Home Directory for a User in Active Directory.</td>
</tr>
</tbody>
</table>

### Object Management

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create AD Object</td>
<td>Creates an object of any type supported in Active Directory.</td>
</tr>
<tr>
<td>Delete AD Object</td>
<td>Deletes an object of any type from Active Directory.</td>
</tr>
<tr>
<td>Query AD</td>
<td>Queries AD for objects specified by a search filter.</td>
</tr>
<tr>
<td>Update AD Object OU</td>
<td>Changes the Organizational Unit (OU) of an object in Active Directory.</td>
</tr>
<tr>
<td>Update AD Object Expiration</td>
<td>Update the account expiration date of an object in Active Directory.</td>
</tr>
</tbody>
</table>

### MID server requirements

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see Integration steps. For information, see MID Server.

**Note:** MID and Microsoft AD must be installed on different servers.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the AD alias record to authorize actions in Microsoft Active Directory.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>AD</td>
<td>Connection to Microsoft Active Directory.</td>
<td>The URL of the host machine where Microsoft Active Directory is installed.</td>
</tr>
</tbody>
</table>

Set up Microsoft AD spoke

Integrate the ServiceNow instance and your Microsoft AD account using Windows credentials to authenticate ServiceNow requests.

• Request IntegrationHub subscription
• Role required: admin

Create Credential record for the Microsoft AD spoke

Create a Credential record for the Microsoft Active Directory host. The Microsoft AD spoke connection and credential alias uses this credential to authorize actions.

• Request IntegrationHub subscription
• Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
   A blank Windows Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter AD Credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>User name</td>
<td>Enter a user name with access to the target Windows host.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection record for the Microsoft AD spoke

Create a Connection record to your Microsoft Active Directory host machine. The Microsoft AD spoke connection and credential alias uses this connection to perform actions in Microsoft Active Directory.
• Request IntegrationHub subscription
• Create Credential record for the Microsoft AD spoke
• Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for AD.
3. From the Connections tab, click New.
   The system displays a blank Basic Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter AD Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Windows Active Directory. For example, select AD Credential.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the fully qualified domain name of the target host where Microsoft Active Directory is installed. For example, &lt;host&gt;.&lt;domain&gt;.com.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Enable</td>
</tr>
<tr>
<td>Override default port</td>
<td>Enter the target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**Microsoft Azure AD spoke**

Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

**Spoke flows**

The Microsoft Azure AD spoke provides sample flows in the draft state to demonstrate automating Azure Active Directory tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Offboarding</td>
<td>Disables an Azure AD user account and removes the user from any Azure AD groups when a ServiceNow user record is deactivated.</td>
</tr>
<tr>
<td>User Onboarding</td>
<td>Creates and enables an Azure AD user account when a ServiceNow user record is activated.</td>
</tr>
</tbody>
</table>
**Spoke subflows**

The Microsoft Azure AD spoke provides sample subflows in the draft state to demonstrate automating Azure Active Directory tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Group</td>
<td>Looks up the groups that a ServiceNow User record belongs to, and adds the associated Azure AD user account to the same Azure AD groups.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Microsoft Azure AD spoke provides actions to automate Azure Active Directory tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Management</td>
<td>Add Owner To Group</td>
<td>Adds an owner to an existing group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Add User to Group</td>
<td>Adds an existing user to a group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Create Office 365 Group</td>
<td>Creates an Office 365 Group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Create Security Group</td>
<td>Create a Security Group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Look Up Group ID</td>
<td>Returns the first Group ID found based on provided search criteria.</td>
</tr>
<tr>
<td></td>
<td>Look Up Group Membership</td>
<td>Retrieves a list of groups for the given user as a JSON string.</td>
</tr>
<tr>
<td></td>
<td>Remove Owner From Group</td>
<td>Removes the owner from a group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes an existing user from a group in Azure AD.</td>
</tr>
<tr>
<td>License Management</td>
<td>Assign User License</td>
<td>Assigns a license to an existing user in Azure AD and defines access to Office 365 services. For example, if the license includes access to Microsoft Exchange, the user is provisioned a mailbox and login rights.</td>
</tr>
<tr>
<td></td>
<td>Remove User License</td>
<td>Removes a license from a user in Azure AD.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Reset User Password</td>
<td>Resets the password of the specified Azure AD user account.</td>
</tr>
<tr>
<td>User Management</td>
<td>Create User</td>
<td>Creates an Azure AD user account using the specified account details.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes a user from Azure AD.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------</td>
<td>------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Disable User</td>
<td>Disables a user in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Enable User</td>
<td>Enables a user in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Is User Enabled</td>
<td>Checks whether the specified user account is enabled in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Checks whether the specified user account is a member of the specified group in Azure AD.</td>
</tr>
<tr>
<td></td>
<td>Look Up User ID</td>
<td>Returns the first User ID found based on the provided search criteria.</td>
</tr>
<tr>
<td></td>
<td>Update User</td>
<td>Updates user properties in Azure AD with the provided details.</td>
</tr>
</tbody>
</table>

**Microsoft Azure AD account requirements**

The Microsoft Azure AD spoke requires creating a custom app on your Azure AD account to generate OAuth 2.0 tokens. See: [Create an Azure AD application](#).

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the AzureAD alias record to authorize actions on Microsoft Azure AD.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>AzureAD</td>
<td>Connection to Microsoft Azure AD.</td>
<td><a href="https://graph.microsoft.com">https://graph.microsoft.com</a></td>
</tr>
</tbody>
</table>

**Set up Microsoft Azure AD spoke**

Integrate the ServiceNow instance and your Microsoft Azure AD account by creating a custom OAuth application in Microsoft Azure AD to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin

*Create an Azure AD application*

Create a custom app using your Azure portal to enable OAuth 2.0 authentication with the Azure AD spoke.

- Request IntegrationHub subscription.
- Activate Azure AD spoke.
• Azure AD requirements:
  • Azure AD account
  • Azure AD administrator credentials

• Role required: admin

Complete these steps from your Azure portal. See the Azure Active Directory for developers documentation for instructions on creating and configuring custom applications.

1. From your Azure portal, access Azure Active Directory.
2. Create an Azure AD application.
   a) In Redirect URI, enter your ServiceNow instance URL in this format: https://<Instance-Name>.servicenow.com/oauth_redirect.do. See Create an Azure Active Directory application for instructions on registering and configuring an application.
   b) Record the Directory ID to register the app as a third-party OAuth provider on your ServiceNow instance.
   c) Create a Client Secret and record the value to register the app as a third-party OAuth provider on your ServiceNow instance.
   d) Add permissions to access the APIs. Ensure that you provide these permissions:

<table>
<thead>
<tr>
<th>Permission</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directory.AccessAsUser.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.Read.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.ReadWrite.All</td>
<td>Delegated</td>
</tr>
<tr>
<td>User.Read</td>
<td>Delegated</td>
</tr>
<tr>
<td>Directory.Read.All</td>
<td>Application</td>
</tr>
<tr>
<td>Directory.ReadWrite.All</td>
<td>Application</td>
</tr>
</tbody>
</table>

See Add permissions to access web APIs for more information.

e) Grant admin consent to your application. See Understanding API permissions and admin consent UI for more information.

Register Azure AD as OAuth provider

Use the information generated during Azure Active Directory account configuration to register Azure AD as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure AD OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Azure AD application registration.</td>
</tr>
</tbody>
</table>
5. In the **OAuth Entity Scopes** related list, create these entries

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth Scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter a unique name for the record, such as auth code.</td>
<td>Enter offline_access.</td>
</tr>
<tr>
<td>Enter a unique name for the record, such as openid</td>
<td>Enter openid.</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**.
The system validates the OAuth credentials and populates the **Redirect URL** and the **OAuth Entity Profiles** related list.

7. In the **OAuth Entity Profiles** related list, open the default profile record.

8. Verify that the openid entity scope record created in previous steps appears in the **OAuth Entity Profile Scopes** related list. If it does not appear, add the record.

---

**Create Credential records for the Azure AD spoke**
Create Credential records to the Azure AD custom app registration you created. The Azure AD spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure AD Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Azure AD application as an OAuth provider. For example, select Azure OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
</tbody>
</table>
Create Connection records for the Azure AD spoke
Create Connection records to your Azure AD account. The Azure AD spoke connection and credential aliases use these connections to perform actions in Azure AD.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the AzureAD record.
3. Click the New button in the Connections related list.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Azure AD Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Azure AD. For example, select Azure AD Credentials.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Regenerate Azure AD OAuth token
Regenerate the Azure AD OAuth token when it expires.

1. Navigate to Connections & Credentials > Credentials.
2. Select the Azure AD spoke OAuth Credential record. For example, select Azure AD Credentials.
3. From Related Links, click Get OAuth Token.

Microsoft Azure AD spoke action reference
Manage users, security groups, and office groups. Apply licenses and provision users in Office 365.

The Azure AD spoke is an available integration through IntegrationHub.

This spoke uses the Azure AD Connection & Credential Alias record. To use these actions, you must create a Connection record and a Credential record and associate them with the Azure AD Connection & Credential Alias record. To learn more about connections and credentials, see Introduction to credentials, connections, and aliases.

These actions use REST calls, which can run on an instance or MID Server. To determine when to run REST from the instance or a MID Server, see the design considerations in Integration steps. To learn more about the MID Server, see MID Server.

Add Owner To Group

Adds an owner to an existing group in Azure AD.
### Add User To Group

Adds an existing user to a group in Azure AD.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to add a user to. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to add to the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

#### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Create Office 365 Group

Creates an Office 365 Group in Azure AD.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Email Enable Distribution List</td>
<td>Group email address or distribution list associated with the group. By default set to true.</td>
</tr>
</tbody>
</table>
### Create Security Group

Create a Security Group in Azure AD.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>Description</td>
<td>Additional information about the group in Azure AD.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>ID of group created in Azure AD. Only populated if Status is Success.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Is User In Group

Check if an existing user is a member of a group in Azure Active Directory (Azure AD).

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>Group ID in which you wish to check the membership of the user.</td>
</tr>
<tr>
<td>User ID</td>
<td>User ID or User Principal Name of the Azure AD user.</td>
</tr>
</tbody>
</table>
### Look Up Group ID

Returns the first Group ID found based on provided search criteria.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Mail ID</td>
<td>Group email address or distribution list associated with the group.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the group.</td>
</tr>
<tr>
<td>Group Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Group ID</td>
<td>First group found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Look Up Group Membership

Retrieves a list of groups for the given user as a JSON string.

**Inputs**

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the users to retrieve the group for. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

**Outputs**

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
### Groups List

List of groups in JSON format. For example, `[{Group ID1, Group Name1}, {Group ID2, Group Name2}]`. If the user is not part of any group, an empty string is returned.

### Number of Groups Found

Total number of groups the user is a member of.

---

### Remove Owner From Group

Removes the owner from a group in Azure AD.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the owner from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to remove as owner of the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

#### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

### Remove User From Group

Removes an existing user from a group in Azure AD.

#### Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>ID of the group to remove the user from. If the Group ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>User ID</td>
<td>ID of the user to remove from the group. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

#### Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
Assign User License

Assigns a license to an existing user in Azure AD and defines access to Office 365 services. For example, if the license includes access to Microsoft Exchange, the user is provisioned a mailbox and login rights.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to assign a license to. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt; CompanyName &gt;:&lt; LicensingPlan &gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Remove User License

Removes a license from a user in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to remove the license from. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
<tr>
<td>SKU ID</td>
<td>Licensing plan for your organization using the syntax <code>&lt; CompanyName &gt;:&lt; LicensingPlan &gt;</code>. If the SKU ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Delete User

Deletes a user from Azure AD.
Disable User

Disables a user in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to disable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Enable User

Enables a user in Azure AD.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>ID of the user to enable. If the User ID does not exist in Azure AD, the Status output is set to Error.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>
Look Up User ID

Returns the first User ID found based on the provided search criteria.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Name displayed in the address book for the user.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>.</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
</tbody>
</table>

Outputs

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>User ID</td>
<td>First user found with matching criteria in Azure AD.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

Update User

Updates user properties in Azure AD with the provided details.

**Note:** Azure AD does not allow updating values to null. Null or empty values are discarded in Azure AD when passed as input.

Inputs

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Name</td>
<td>Name to display in the address book for the user.</td>
</tr>
<tr>
<td>Email Alias</td>
<td>Alias configured for an email account. A single email account can have more than one alias.</td>
</tr>
<tr>
<td>User Login ID</td>
<td>Login User ID is same as User Principal Name (UPN). For example, <a href="mailto:johndoe@snc.com">johndoe@snc.com</a>. This field is mandatory</td>
</tr>
<tr>
<td>First Name</td>
<td>First name of the user.</td>
</tr>
<tr>
<td>Last Name</td>
<td>Last name of the user.</td>
</tr>
<tr>
<td>City</td>
<td>City of the user.</td>
</tr>
<tr>
<td>Country</td>
<td>Country of the user.</td>
</tr>
<tr>
<td>Department</td>
<td>Name of the department the user belongs to.</td>
</tr>
<tr>
<td>Mobile</td>
<td>Mobile phone number for the user.</td>
</tr>
<tr>
<td>Job Title</td>
<td>User job title.</td>
</tr>
<tr>
<td><strong>Input</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>----------------------</td>
<td>------------------------------------------------------</td>
</tr>
<tr>
<td>Physical Delivery</td>
<td>Office location of the user.</td>
</tr>
<tr>
<td>Office Name</td>
<td></td>
</tr>
<tr>
<td>Postal Code</td>
<td>Postal code for the user.</td>
</tr>
<tr>
<td>Preferred Language</td>
<td>Preferred language for the user.</td>
</tr>
<tr>
<td>State</td>
<td>State for the user.</td>
</tr>
<tr>
<td>Street Address</td>
<td>Street address for the user.</td>
</tr>
<tr>
<td>Telephone Number</td>
<td>Telephone number for the user.</td>
</tr>
<tr>
<td>Usage Location</td>
<td>Some Microsoft services are not available in all locations. This property must be defined for the user in Azure AD before a license can be assigned to them.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Outputs</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>Set to Success if the request succeeds or Error if a failure in Azure AD occurs.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Reason for the error. Populated only when an error occurs.</td>
</tr>
</tbody>
</table>

**Microsoft Azure Blob Storage spoke v1.0.3**

Manage Azure blobs and containers from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

Microsoft Azure Resource Management spoke

**Supported versions**

This spoke was built for API version 2019-07-07, but may be compatible with later versions.

**Spoke requirements**

- Storage account in your Microsoft Azure portal for integration with your ServiceNow instance.
Note: Ensure that the user has the Storage Blob Data Owner role.

To assign the role:
1. Log in to your storage account and navigate to Access Control(IAM).
2. Click the Add a role assignment and select Storage Blob Data Owner role.
3. Assign access to the required Azure AD user, group, or service principle option. For this, select the email address of the Azure account and save the changes.

For more information, see [Use the Azure portal to assign an Azure role for access to blob and queue data](#).

- Record and save the access keys and Directory ID for later use.

**Spoke subflows**

The Azure Blob Storage spoke provides sample subflows to demonstrate automating the Azure Blob Storage tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:
### Spoke actions

The Azure Blob Storage spoke provides actions to automate Azure Blob Storage tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blob Management</td>
<td>Attach Blob To ServiceNow Record</td>
<td>Attaches a blob to ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Copy Blob</td>
<td>Copies a blob from one container to another container.</td>
</tr>
<tr>
<td></td>
<td>Delete Blob</td>
<td>Deletes the specified blob.</td>
</tr>
<tr>
<td></td>
<td>Get Blob Details</td>
<td>Retrieves details of the specified blob.</td>
</tr>
<tr>
<td></td>
<td>Lease Blob</td>
<td>Creates a lock on a blob for write and delete operations.</td>
</tr>
<tr>
<td></td>
<td>Look up Blob</td>
<td>Retrieves details of all blobs in a container.</td>
</tr>
<tr>
<td></td>
<td>Release Lease On Blob</td>
<td>Releases a lock on a blob.</td>
</tr>
<tr>
<td></td>
<td>Snapshot Blob</td>
<td>Creates a snapshot for the specified blob.</td>
</tr>
<tr>
<td></td>
<td>Upload ServiceNow Attachment To Container</td>
<td>Uploads a blob to the specified container.</td>
</tr>
<tr>
<td>Container Management</td>
<td>Create Container</td>
<td>Creates a container.</td>
</tr>
<tr>
<td></td>
<td>Delete Container</td>
<td>Deletes the specified container.</td>
</tr>
<tr>
<td></td>
<td>Get Container Details</td>
<td>Retrieves details of the specified container.</td>
</tr>
<tr>
<td></td>
<td>Lease Container</td>
<td>Creates a lock on the container for delete operations.</td>
</tr>
<tr>
<td></td>
<td>Look up Container</td>
<td>Retrieves details of all containers.</td>
</tr>
<tr>
<td></td>
<td>Release Lease On Container</td>
<td>Releases a lock on a container.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Note:** Two Credential aliases are available for the Azure Blob Storage spoke.
Set up the Azure Blob Storage spoke

Integrate the ServiceNow instance and your Azure Blob Storage account by creating a custom OAuth application in Azure to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Azure Blob Storage spoke.
- User with the Storage Blob Data Owner role.

Note:
To assign the role:
1. Log in to your storage account and navigate to Access Control (IAM).
2. Click the Add a role assignment and select Storage Blob Data Owner role.
3. Assign access to the required Azure AD user, group, or service principle option. For this, select the email address of the Azure account and save the changes.

For more information, see Use the Azure portal to assign an Azure role for access to blob and queue data.

- Role required: admin
Register Azure Blob Storage as OAuth provider

Use the information generated during Azure Blob Storage account configuration to register your Azure Blob Storage as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to **System OAuth > Application Registry**.
2. Open the record, **Azure Blob Storage Spoke**.
   The system displays the Application Registries form.
3. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID you created during the Azure Blob Storage account registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Key value you created during the Azure Blob Storage account registration.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Authorization URL in this format: <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a></td>
</tr>
<tr>
<td></td>
<td>&lt;directory-id&gt;/oauth2/v2.0/authorize. Replace &lt;directory-id&gt; with the Directory ID of your Azure Blob Storage account.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Token URL in this format: <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a></td>
</tr>
<tr>
<td></td>
<td>&lt;directory-id&gt;/oauth2/v2.0/token. Replace &lt;directory-id&gt; with the Directory ID of your Azure Blob Storage account.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Redirect URI in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td></td>
<td>Replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

Create Credential records for the Azure Blob Storage spoke

Create two Credential records for your Azure Blob Storage account. The Azure Blob Storage spoke connection and credential alias uses these credential records to perform actions in your Azure Blob Storage account.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open for the record, **Azure_Blob_Storage**.
3. From the **Credentials** tab, click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Azure Blob Storage Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Default OAuth Entity Profile. For example, Azure Blob Storage Spoke default_profile.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential record associated with Azure_Blob_Storage.</td>
</tr>
</tbody>
</table>
6. Click Submit.
8. Open for the record, Azure_Blob_Storage_SAS.
9. From the Credentials tab, click New.
   The system displays the message What type of Credentials would you like to create?.
10. Select Azure Shared Access Signature.
11. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Azure Blob Storage SAS Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Shared Access Key Name</td>
<td>Name to identify the Shared Access Key record.</td>
</tr>
<tr>
<td>Shared Access Key</td>
<td>Shared Access Key of your Azure Blob Storage account.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential record associated with Azure_Blob_Storage_SAS.</td>
</tr>
<tr>
<td>Authentication For</td>
<td>Azure product for which this credential record is used. Select Blob Storage.</td>
</tr>
<tr>
<td>Authentication Algorithm</td>
<td>Custom authentication algorithm for outbound signing requests. Select AzureSASAlgo.</td>
</tr>
</tbody>
</table>

12. Click Submit.

Microsoft Azure Cosmos DB spoke

Manage Microsoft Azure Cosmos DB from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Microsoft Azure Cosmos DB v1, but may be compatible with later versions.
Spoke requirements

- Microsoft Azure Portal account

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- Microsoft Azure Resource Management spoke (com.sn.ms.azure.resource.mgmt.spoke)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Microsoft Azure Cosmos DB Spoke provides actions to automate Microsoft Azure Cosmos DB tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cassandra Database Management</td>
<td>Create Cassandra Keyspace</td>
<td>Creates a Cassandra keyspace.</td>
</tr>
<tr>
<td></td>
<td>Delete Cassandra Keyspace</td>
<td>Deletes the specified Cassandra keyspace.</td>
</tr>
<tr>
<td></td>
<td>Get Cassandra Keyspace Information</td>
<td>Retrieves information about the specified Cassandra keyspace information in a specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look up Cassandra Keyspaces</td>
<td>Retrieves a list of Cassandra keyspaces in the specified Subscription ID.</td>
</tr>
<tr>
<td></td>
<td>Update Cassandra Keyspace Throughput</td>
<td>Updates Request Units (RUs) per second of a Cassandra keyspace.</td>
</tr>
<tr>
<td>Core SQL Database Management</td>
<td>Create Database</td>
<td>Creates a database in the specified database account.</td>
</tr>
<tr>
<td></td>
<td>Create Permission</td>
<td>Creates a permission in the specified database.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates a user in the specified database.</td>
</tr>
<tr>
<td></td>
<td>Delete Database</td>
<td>Deletes the specified database.</td>
</tr>
<tr>
<td></td>
<td>Delete Permission</td>
<td>Deletes the specified permission in a database.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified user.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Database Information</td>
<td>Retrieves the specified database information in a specified database account.</td>
</tr>
<tr>
<td></td>
<td>Get Permission Information</td>
<td>Retrieves the specified permission information of a user.</td>
</tr>
<tr>
<td></td>
<td>Get User Information</td>
<td>Retrieves the specified user information in the specified database.</td>
</tr>
<tr>
<td></td>
<td>Look up Databases</td>
<td>Retrieves a list of databases in the specified database account.</td>
</tr>
<tr>
<td></td>
<td>Look up Permissions</td>
<td>Retrieves a list of permissions of the specified database.</td>
</tr>
<tr>
<td></td>
<td>Look up Users</td>
<td>Retrieves a list of all the users in the database.</td>
</tr>
<tr>
<td></td>
<td>Replace Permission</td>
<td>Replaces the specified permission for the specified user.</td>
</tr>
<tr>
<td></td>
<td>Replace User</td>
<td>Replaces the specified user name in the specified database.</td>
</tr>
<tr>
<td>Database Account Management</td>
<td>Create DB Account</td>
<td>Creates an account in Azure Cosmos DB.</td>
</tr>
<tr>
<td></td>
<td>Delete DB Account</td>
<td>Deletes the specified Cosmos DB account.</td>
</tr>
<tr>
<td></td>
<td>Enable/Disable Options On DB Account</td>
<td>Enables or disables options of the specified database account.</td>
</tr>
<tr>
<td></td>
<td>Get DB Account Information</td>
<td>Retrieves information about the specified account in the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look up Connection Strings</td>
<td>Retrieves a list of all connections strings in the specified Azure Cosmos DB account.</td>
</tr>
<tr>
<td></td>
<td>Look up DB Account By Resource Group</td>
<td>Retrieves a list of all Azure Cosmos DB database accounts in the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look up DB Account By Subscription ID</td>
<td>Retrieves a list of Azure Cosmos DB accounts in the specified subscription ID.</td>
</tr>
<tr>
<td></td>
<td>Look up Keys</td>
<td>Retrieves a list of all access keys in the specified Azure Cosmos DB database account.</td>
</tr>
<tr>
<td></td>
<td>Look up Usages</td>
<td>Retrieves the most recent data in the specified database account.</td>
</tr>
<tr>
<td></td>
<td>Regenerate Key</td>
<td>Regenerates an access key for the specified Azure Cosmos DB account.</td>
</tr>
</tbody>
</table>
## Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

## Set up the Microsoft Azure Cosmos DB spoke

Integrate the ServiceNow instance and Microsoft Azure Cosmos DB by creating a custom OAuth application in Microsoft Azure Portal to authenticate ServiceNow requests.

- Request an IntegrationHub subscription.
- Activate Microsoft Azure Cosmos DB Spoke.
- Role required: admin

*Register Microsoft Azure Cosmos DB as an OAuth provider*

Use the information generated during the Azure Portal account configuration to register Microsoft Azure Cosmos DB as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

1. Navigate to **System OAuth > Application Registry**.
2. Open for the record for Azure Resource Management.
3. On the form, fill these values.

### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the Azure Portal account configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the Azure Portal account configuration.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Script to customize the request and response. Select .</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select .</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

**Note:** You can use only Authorization Code as the Default Grant type when PKCE is enabled.

Application scope that contains this record.

Application scope that this registry is accessible from.

Option to actively use the application registry.

Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.

4. Right-click the form header, and click **Save**.

*Create a credential record for the Microsoft Azure Cosmos DB spoke*

Create a credential record for the Microsoft Azure Cosmos DB account. The Microsoft Azure Cosmos DB Spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials**.
2. Click **New**.
   
The system displays this message: *What type of Credentials would you like to create?*
3.  
4. Select **OAuth 2.0 Credentials**.
5. On the form, fill these values.
OAuth 2.0 Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Azure Cosomos DB OAuth Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Microsoft Azure Cosmos DB Spoke as an OAuth provider. For example, Azure Cosmos DB OAuth Profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to specify if the credential applies to all MID Servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use this credential in the MID servers field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click Submit.
7. To generate the OAuth token, click the Get OAuth Token related link.

Microsoft Azure Managed Storage spoke v1.0.4
Manage Microsoft Azure managed disks from your ServiceNow instance.

Request apps on the Store
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription
This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies
If you're having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Microsoft Azure Resource Management spoke (com.sn.ms.azure.resource.mgmt.spoke)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
Supported Versions

This spoke was built for API version 2019-07-01, but may be compatible with later versions.

Spoke requirements

- User account with full access to Microsoft Azure managed disks.
- Microsoft Azure Resource Management spoke

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Microsoft Azure Managed Storage spoke provides actions to automate Microsoft Azure disks and disk snapshots when events occur in ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disk Management</td>
<td>Create Managed Disk</td>
<td>Creates a disk with the specified disk size in giga bytes (GB).</td>
</tr>
<tr>
<td></td>
<td>Create Managed Disk From Snapshot</td>
<td>Creates a disk using a snapshot.</td>
</tr>
<tr>
<td></td>
<td>Create Managed Upload Disk</td>
<td>Creates a disk with the specified upload size.</td>
</tr>
<tr>
<td></td>
<td>Delete Disk</td>
<td>Deletes the specified disk.</td>
</tr>
<tr>
<td></td>
<td>Get Disk Information</td>
<td>Retrieves the specified disk information in a specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Grant Access To Disk Data</td>
<td>Grants access to the specified disk.</td>
</tr>
<tr>
<td></td>
<td>Look up Disks By Resource Group</td>
<td>Retrieves a list of disks for the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look up Disks By Subscription</td>
<td>Retrieves a list of disks in a subscription.</td>
</tr>
<tr>
<td></td>
<td>Revoke Access From Disk Data</td>
<td>Revokes access to the specified disk.</td>
</tr>
<tr>
<td></td>
<td>Set Disk Tags</td>
<td>Assigns tags to the specified disk.</td>
</tr>
<tr>
<td></td>
<td>Update Disk Size</td>
<td>Updates the size of the specified disk.</td>
</tr>
<tr>
<td></td>
<td>Update Disk Storage Account</td>
<td>Updates the details of the storage account associated with the specified disk.</td>
</tr>
<tr>
<td>Disk Snapshot Management</td>
<td>Create Snapshot</td>
<td>Creates a snapshot of the disk.</td>
</tr>
<tr>
<td></td>
<td>Delete Snapshot</td>
<td>Deletes the specified snapshot.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>---------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Snapshot Information</td>
<td>Retrieves information about the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Grant Access to Disk Snapshot</td>
<td>Grants access to the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Look up Snapshot By Resource Group</td>
<td>Retrieves a list of snapshots in a resource group.</td>
</tr>
<tr>
<td></td>
<td>Look up Snapshot By Subscription</td>
<td>Retrieves a list of snapshots in a subscription.</td>
</tr>
<tr>
<td></td>
<td>Revoke Access From Snapshot</td>
<td>Revokes access to the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Set Snapshot Tags</td>
<td>Assigns tags of the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Update Snapshot Size</td>
<td>Updates the disk size of the specified snapshot.</td>
</tr>
<tr>
<td></td>
<td>Update Snapshot Storage Account</td>
<td>Updates the details of the storage account associated with the specified snapshot.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

### Set up Microsoft Azure Managed Storage spoke

Integrate the ServiceNow instance and Azure Managed Storage using OAuth credentials to authenticate ServiceNow requests.

- Request an IntegrationHub Enterprise subscription
- Activate the Microsoft Azure Managed Storage spoke
- Role required: admin

**Configure app registration for Microsoft Azure Managed Storage spoke**

Configure app registration from your Azure account to add redirect URIs, credentials, and permissions to access web APIs for your application. For more information, see *Quickstart: Configure a client application to access web APIs*

- Azure account with admin privileges

1. Sign into *Azure portal*.
2. Register your app with the following platform settings.

#### Registration Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Web app/API</td>
</tr>
<tr>
<td>Supported account types</td>
<td>Specify the account types who can use the application.</td>
</tr>
</tbody>
</table>
3. Record the client ID and client secret of the app which are used for authentication.

Register Azure Managed Storage as OAuth provider
Use the authentication information from Azure account configuration to register Azure Managed Storage as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to **System OAuth > Application Registry**.
2. Open the Azure Resource Management application registry record.
3. On the form, fill the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during Azure virtual account registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Key value created during Azure virtual account registration.</td>
</tr>
<tr>
<td>Token URL</td>
<td>The URL used for OAuth tokens. The format of the URL is <code>https://login.microsoftonline.com/</code> <code>&lt;Directory ID&gt;/oauth2/v2.0/token</code>. Replace <code>&lt;Directory ID&gt;</code> with the directory ID in your Azure configuration properties.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The URL of the instance used for redirection. The format of the URL is <code>https://</code> <code>&lt;instance&gt;.service-now.com/</code> oauth_redirect.do. Replace <code>&lt;instance&gt;</code> with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

Create Credential records for the Microsoft Azure Managed Storage spoke
Create Credential records to the Azure Managed Storage app registration you created. The Microsoft Azure Managed Storage spoke connection and credential aliases uses these credentials to authorise actions.

Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the credentials record. For example, enter Azure Managed Storage.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>The OAuth profile you created when you registered the custom Azure Managed Storage application as an OAuth provider. Enter Azure Resource Management default profile.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>The credential alias you created when you registered the custom Azure Managed Storage application. Click the lock icon and enter, sn_azure_ms_spoke.Azure_Managed_Storage, sn_azure_rm_spoke.Azure_Resource_Management, sn_azure_vm_spoke.Azure_Virtual_Machine, sn_azure_vn_spoke.Azure_Virtual_Network.</td>
</tr>
</tbody>
</table>

5. Click Submit.

*Regenerate OAuth token for Microsoft Azure Managed Storage spoke*

Regenerate an OAuth token when it expires.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Select the Azure Managed Storage OAuth Credential record.
   For example, select Azure Managed Storage credentials.
3. From Related Links section, click Get OAuth Token.

**Microsoft Azure Resource Management spoke v1.0.4**

Azure Resource Management enables you to create, update, and delete resources in your Azure subscription from within ServiceNow. This spoke is installed automatically when you install the MicrosoftAzure SQL spoke.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

### Spoke actions

The Azure Resource Management spoke provides actions to automate resource management tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resource Management</td>
<td>Get Databases</td>
<td>Retrieves a list of databases in a server.</td>
</tr>
<tr>
<td></td>
<td>Get Elasticpools</td>
<td>Retrieves a list of elastic pools in Azure.</td>
</tr>
<tr>
<td></td>
<td>Get Resources</td>
<td>Retrieves a list of resource groups.</td>
</tr>
<tr>
<td></td>
<td>Get SQL Servers</td>
<td>Retrieves a list of servers in a resource group.</td>
</tr>
<tr>
<td></td>
<td>Get Location</td>
<td>Retrieves a list of locations.</td>
</tr>
<tr>
<td></td>
<td>Get Operational Status of Resource</td>
<td>Generates the operational status of the resource (Virtual Machine, Network, Disk, and so on) that is created or updated.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

### Set up the Microsoft Azure Resource Management spoke

Integrate the ServiceNow instance and your Azure Resource Management account by creating a custom OAuth application in Azure to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate the Microsoft Azure Resource Management spoke.
- Role required: admin

*Register Azure Resource Management as an OAuth provider*

Use the information generated during application configuration in Azure portal to register Azure Resource Management as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to **System OAuth > Application Registry**.
2. Open the record, **Azure Resource Management**.
   - The system displays the Application Registries form.
3. Enter these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Azure Resource Management application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Key value you created during the Azure Resource Management application registration.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The format of the Redirect URI is https://〈instance〉.service-now.com/oauth_redirect.do. Replace 〈instance〉 with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.

Create Credential record for the Azure Resource Management spoke

Create Credential record to the Azure Resource Management custom app registration you created. The Azure Resource Management spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record, Azure_Resource_Management.
3. From the Credentials tab, click New.

   The system displays the message What type of Credentials would you like to create?.

4. Select OAuth 2.0 Credentials.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Azure RM Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Default OAuth Entity Profile. For example, Azure Resource Management default_profile.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential record associated with Azure_Resource_Management.</td>
</tr>
</tbody>
</table>

6. Click Submit.

**Microsoft Azure SQL spoke**

Configure and manage Microsoft Azure SQL databases from within ServiceNow. When you install the Azure SQL spoke, you also get the Microsoft Azure Resource Management spoke v1.0.4. Azure Resource Manager provides a management layer that enables you to create, update, and delete resources in your Azure subscription.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported version**

This spoke is built for Azure SQL v12, but may be compatible with later versions.

**Spoke requirements**

- User with full access to Microsoft Azure Cloud Computing.

**Spoke actions**

The Azure SQL spoke provides actions to automate Microsoft Azure SQL tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Database</td>
<td>Create Database - Generic</td>
<td>Creates a generic database in Azure.</td>
</tr>
<tr>
<td></td>
<td>Create Database - Hyperscale</td>
<td>Creates a Hyperscale database in Azure.</td>
</tr>
<tr>
<td></td>
<td>Create Database - vCore</td>
<td>Creates a vCore database in Azure.</td>
</tr>
<tr>
<td>Database Management</td>
<td>Delete Database</td>
<td>Deletes the specified database from a server.</td>
</tr>
<tr>
<td></td>
<td>Get Database</td>
<td>Retrieves details of a database.</td>
</tr>
</tbody>
</table>
## Set up Microsoft Azure SQL spoke

Integrate the ServiceNow instance and your Microsoft Azure SQL databases by creating a custom OAuth application in Azure to authenticate ServiceNow requests.

- Role required: admin
- Request IntegrationHub subscription.
- Activate Azure SQL spoke.

**Configure an app registration for Azure SQL**

Create a custom app from your Azure account to enable OAuth 2.0 authentication with the Azure SQL spoke.

**Azure SQL requirements:**
- Azure SQL account
- Azure SQL administrator credentials

Complete these steps from your Azure account. See the [Azure SQL Database documentation](https://docs.microsoft.com/en-us/sql/database-services/sql-database/azure-sql-database-integrate-service-now) for instructions on creating and configuring custom applications.

1. From your Azure account, navigate to **Home > App registrations > Register an application.**
2. Create an app registration in your Azure Active Directory.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter <code>Web app/API</code>.</td>
</tr>
<tr>
<td>Supported account types</td>
<td>Specify who can use the application.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td>The format of the Redirect URI is <code>https://&lt;instance&gt;.service-now.com/oauth_redirect.do</code>. Replace <code>&lt;instance&gt;</code> with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

3. Click **Register**.
4. Copy the Application (client) ID.
   You use this ID when you **Register Azure SQL as an OAuth provider.**
5. Select **Manage > Certificates & secrets** and click **New client secret.**
6. Give the client secret a description, select when it expires, and click **Add.**
   Copy the client secret value for use when you **Register Azure SQL as an OAuth provider.** It will not be available after you leave the Certificates & secrets page.

**Register Azure SQL as an OAuth provider.**
**Register Azure SQL as an OAuth provider**

Use the information generated during Azure account configuration to register Azure SQL as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to **System OAuth > Application Registry**.
2. Click **New**.  
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third-party OAuth Provider**.  
   The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure SQL OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Azure SQL application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Key value you created during the Azure SQL application registration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td></td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
</tbody>
</table>
   On the Azure page for the app registration, click Endpoints. The Authorization URL is labeled **OAuth 2.0 authorization endpoint (v2)**. You can copy the URL there. |
   On the Azure page for the app registration, click Endpoints. The Authorization URL is labeled **OAuth 2.0 token endpoint (v2)**. You can copy the URL there. |
| Redirect URL         | The format of the Redirect URI is https://<instance>.service-now.com/oauth_redirect.do. Replace <instance> with the name of your ServiceNow instance. |

5. Right-click the form header, and click **Save**.  
   The system validates the OAuth credentials and populates the **Redirect URL** and the **OAuth Entity Profiles** related list.
6. In the **OAuth Entity Profiles** related list, open the default profile record.
7. Verify that the openid entity scope record created in previous steps appears in the **OAuth Entity Profile Scopes** related list. If it does not appear, add the record.
Create Credential records for the Azure SQL spoke
Create Credential records to the Azure SQL custom app registration you created. The Microsoft Azure SQL spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
The system displays the message What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials.
The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Azure SQL Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Azure SQL application as an OAUTH provider. For example, select Azure OAuth default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Click the lock icon, enter sn_azure_sql_spoke.Azure_database, and click the lock icon again.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Microsoft Azure SQL spoke
Create Connection records to your Azure account. The Azure SQL spoke connection and credential aliases use these connections to perform actions in Azure SQL.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the Azure_database record.
3. Select the Type Connection and Credential
4. In the Connections related list, click New.
5. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Azure SQL Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Azure SQL. For example, select Azure SQL Credentials.</td>
</tr>
</tbody>
</table>

6. Click Submit.

Regenerate Azure SQL OAuth token
Regenerate the Azure SQL OAuth token when it expires.
1. Navigate to Connections & Credentials > Credentials. 
2. Select the Azure SQL spoke OAuth Credential record. For example, select Azure SQL Credentials. 
3. From Related Links, click Get OAuth Token.

Microsoft Azure Virtual Machine spoke v1.0.2

Manage Microsoft Azure Virtual Machine (VM) from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported Versions

This spoke was built for API version 2019-07-01, but may be compatible with later versions.

Spoke requirements

- Microsoft Azure Resource Management spoke (com.sn.ms.azure.resource.mgmt.spoke)
- Microsoft Azure Virtual Network spoke (com.sn.ms.azure.virtual.network.spoke)
- Microsoft Azure Managed Storage spoke (com.sn.ms.azure.managed.storage.spoke)

Spoke flows and subflows

This spoke has no flows and subflows.
Spoke actions

The Microsoft Azure Virtual Machine spoke provides actions to automate Microsoft Azure Virtual Machine tasks when events occur in ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image Management</td>
<td>Create Image From Instance</td>
<td>Creates an image from an existing instance.</td>
</tr>
<tr>
<td>Image Management</td>
<td>Delete Image</td>
<td>Deletes an image.</td>
</tr>
<tr>
<td>Image Management</td>
<td>Get Image Information</td>
<td>Retrieves information of an image from a specified resource group.</td>
</tr>
<tr>
<td>Image Resource Management</td>
<td>Look Up Images By Resource Group</td>
<td>Retrieves the list of images from a specified resource group.</td>
</tr>
<tr>
<td>Image Resource Management</td>
<td>Look Up Images By Subscription ID</td>
<td>Retrieves the list of images with the specified subscription ID.</td>
</tr>
<tr>
<td>Image Resource Management</td>
<td>Set Tags On Image</td>
<td>Assigns tags to an image.</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Get VM Instance Details</td>
<td>Retrieves the instance view or model view of a virtual machine.</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Attach Disk</td>
<td>Attaches the data disk to an instance.</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Create Virtual Machine</td>
<td>Creates a virtual machine.</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Create Virtual Machine From Image</td>
<td>Creates a virtual machine from an image.</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Deallocate Instance</td>
<td>Shuts down the virtual machine and releases the related resources.</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Delete Instance</td>
<td>Deletes a virtual machine.</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Detach Disk</td>
<td>Detaches the data disk from an instance.</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Generalize Instance</td>
<td>Assigns the generalised OS state to the virtual machine for an instance.</td>
</tr>
<tr>
<td>Instance Management</td>
<td>Get VM Instance Details</td>
<td>Retrieves the instance view or model view of a virtual machine.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get VM Runtime Details</td>
<td>Retrieves the VM runtime state of an instance.</td>
</tr>
<tr>
<td></td>
<td>Look Up Disks By Instance</td>
<td>Retrieves a list of disks in the specified virtual machine.</td>
</tr>
<tr>
<td></td>
<td>Look Up Instances By Resource Group</td>
<td>Retrieves a list of virtual machines in the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Instances By Subscription ID</td>
<td>Retrieves a list of virtual machines in the specified subscription ID.</td>
</tr>
<tr>
<td></td>
<td>Power Off Instance</td>
<td>Shuts down the specified virtual machine.</td>
</tr>
<tr>
<td></td>
<td>Redeploy Instance</td>
<td>Shuts down the virtual machine, moves it to a new node, and powers it back on.</td>
</tr>
<tr>
<td></td>
<td>Resize Instance</td>
<td>Resizes the specified virtual machine. This process requires some time to complete.</td>
</tr>
<tr>
<td></td>
<td>Restart Instance</td>
<td>Restarts a virtual machine.</td>
</tr>
<tr>
<td></td>
<td>Start Instance</td>
<td>Starts a virtual machine.</td>
</tr>
<tr>
<td>VM Size Management</td>
<td>Look Up Sizes By Availability Set</td>
<td>Retrieves a list of virtual machine sizes for the specified availability set.</td>
</tr>
<tr>
<td></td>
<td>Look Up Sizes By Instance</td>
<td>Retrieves the list of virtual machine sizes for the specified virtual machine.</td>
</tr>
<tr>
<td></td>
<td>Look Up Sizes By Location</td>
<td>Retrieves a list of virtual machine sizes for the specified Azure location.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

**Set up Microsoft Azure Virtual Machine spoke**

Integrate the ServiceNow instance and Azure Virtual Machine using OAuth credentials to authenticate ServiceNow requests.

- Request an IntegrationHub Enterprise subscription
- Activate the Microsoft Azure Virtual Machine spoke
- Role required: admin

*Configure app registration for Microsoft Azure Virtual Machine spoke*

Configure app registration from your Azure account to add redirect URIs, credentials, and permissions to access web APIs for your application. For more information, see [Quickstart: Configure a client application to access web APIs](#).
• Azure account with admin privileges

1. Sign into Azure portal.
2. Register your app with the following platform settings.

   **Registration Settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Web app/API</td>
</tr>
<tr>
<td>Supported account types</td>
<td>Specify the account types who can use the application.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td>Specify the URI in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do. Replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

3. Record the client ID and client secret of the app which are used for authentication.

   **Register Azure Virtual Machine as OAuth provider**

   Use the authentication information from Azure account configuration to register Azure Virtual Machine as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Open the Azure Resource Management application registry record.
3. On the form, fill the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during Azure virtual account registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Key value created during Azure virtual account registration.</td>
</tr>
<tr>
<td>Token URL</td>
<td>The URL used for OAuth tokens. The format of the URL is <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a>&lt;Directory ID&gt;/oauth2/v2.0/token. Replace &lt;Directory ID&gt; with the directory ID in your Azure configuration properties.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The URL of the instance used for redirection. The format of the URL is https://&lt;instance&gt;.service-now.com/oauth_redirect.do. Replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
Create Credential records for the Microsoft Azure Virtual Machine spoke

Create Credential records to the Azure Virtual Machine app registration you created. The Microsoft Azure Virtual Machine spoke connection and credential aliases uses these credentials to authorise actions.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials.
4. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the credentials record. For example, enter Azure Virtual Machine.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>The OAuth profile you created when you registered the custom Azure Virtual Machine application as an OAuth provider. Enter Azure Resource Management default_profile</td>
</tr>
<tr>
<td>Credential alias</td>
<td>The credential alias you created when you registered the custom Azure Virtual Machine application. Click the lock icon and enter, sn_azure_ms_spoke.Azure_Managed_Storage, sn_azure_rm_spoke.Azure_Resource_Management, sn_azure_vm_spoke.Azure_Virtual_Machine, sn_azure_vn_spoke.Azure_Virtual_Network</td>
</tr>
</tbody>
</table>

5. Click Submit.

Regenerate OAuth token for Microsoft Azure Virtual Machine spoke

Regenerate an OAuth token when it expires.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Select the Azure Virtual Machine OAuth Credential record.
   For example, select Azure Virtual Machine credentials.
3. From Related Links section, click Get OAuth Token.

Microsoft Azure Notification Hub spoke

Integrate ServiceNow instance with Microsoft Azure Notification Hub. Manage Azure notification hubs from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Azure Notification Hub version 2016-03-01, but may be compatible with later versions.

Spoke requirements

- Storage account in your Microsoft Azure portal for integration with your ServiceNow instance.
- Register the application in Microsoft Azure portal and record the access keys and directory IDs.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The Microsoft Azure Notification Hub Spoke provides actions to automate Azure Notification Hub tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Installation Management</td>
<td>Delete Installation</td>
<td>Deletes an installation</td>
</tr>
<tr>
<td></td>
<td>Get Installation</td>
<td>Retrieves an installation for the specified installation ID</td>
</tr>
<tr>
<td></td>
<td>Update Installation</td>
<td>Updates the installation partially using the JSON patch.</td>
</tr>
<tr>
<td></td>
<td>Upsert Installation</td>
<td>Creates a new installation or updates an existing installation.</td>
</tr>
<tr>
<td>Namespace Management</td>
<td>Delete Namespace</td>
<td>Deletes an existing namespace and all the associated notification hubs under the namespace.</td>
</tr>
<tr>
<td></td>
<td>Get Namespace</td>
<td>Retrieves the description of the specified namespace.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look up Namespaces By Resource Group</td>
<td>Retrieves a list of available namespaces within a resource group.</td>
</tr>
<tr>
<td></td>
<td>Look up Namespaces By Subscription ID</td>
<td>Retrieves a list of available namespaces within the specified subscription.</td>
</tr>
<tr>
<td></td>
<td>Update Namespace</td>
<td>Updates an existing namespace.</td>
</tr>
<tr>
<td></td>
<td>Upsert Namespace</td>
<td>Creates a new namespace or updates an existing namespace.</td>
</tr>
<tr>
<td>Notification Hub Management</td>
<td>Delete Notification Hub</td>
<td>Deletes a notification hub associated with a namespace.</td>
</tr>
<tr>
<td></td>
<td>Get Notification Hub</td>
<td>Retrieves a notification hub associated with a namespace.</td>
</tr>
<tr>
<td></td>
<td>Look up Notification Hubs</td>
<td>Retrieves a list of notification hubs associated with a namespace.</td>
</tr>
<tr>
<td></td>
<td>Send APNS Native Notification</td>
<td>Sends an Apple Push Notification Service (APNS) native notification through a notification hub.</td>
</tr>
<tr>
<td></td>
<td>Send GCM Native Notification</td>
<td>Sends a Google Cloud Messaging (GCM) native notification through a notification hub.</td>
</tr>
<tr>
<td></td>
<td>Send Notification to Device Handle</td>
<td>Sends a notification directly to a device handle in the form a token.</td>
</tr>
<tr>
<td></td>
<td>Upsert Notification Hub</td>
<td>Creates a new notification hub or updates an existing notification hub in a namespace.</td>
</tr>
<tr>
<td>Registration Management</td>
<td>Create APNS Registration</td>
<td>Creates a registration for an Apple Push Notification Service (APNS) device.</td>
</tr>
<tr>
<td></td>
<td>Create GCM Registration</td>
<td>Creates a registration for a Google Cloud Messaging (GCM) device.</td>
</tr>
<tr>
<td></td>
<td>Create Registration ID</td>
<td>Retrieves a registration ID without creating a registration.</td>
</tr>
<tr>
<td></td>
<td>Delete Registration</td>
<td>Deletes a registration.</td>
</tr>
<tr>
<td></td>
<td>Get Registration</td>
<td>Retrieves the description and other information for the specified registration ID.</td>
</tr>
<tr>
<td></td>
<td>Look up Registrations</td>
<td>Retrieves a list of registrations.</td>
</tr>
<tr>
<td></td>
<td>Update APNS Registration</td>
<td>Updates an existing Apple Push Notification Service (APNS) registration.</td>
</tr>
<tr>
<td></td>
<td>Update GCM Registration</td>
<td>Updates an existing Google Cloud Messaging (GCM) registration.</td>
</tr>
</tbody>
</table>
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Microsoft Azure Notification Hub spoke

Integrate the ServiceNow instance and Microsoft Azure Notification Hub by creating a custom OAuth application in Microsoft Azure Notification Hub to authenticate ServiceNow requests.

- Request an IntegrationHub subscription.
- Activate Microsoft Azure Notification Hub Spoke.
- Role required: admin

Register Microsoft Azure Notification Hub as an OAuth provider

Use the information generated during the Microsoft Azure Notification Hub account configuration to register Microsoft Azure Notification Hub as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays this message: What kind of OAuth application?.
3. Select Connect to a third party OAuth Provider.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter: Microsoft Azure Notification Hub OAuth</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the Microsoft Azure Notification Hub application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the Microsoft Azure Notification Hub application registration.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. Enter: //login.microsoftonline.com/ &lt;directory-id&gt;/oauth2/v2.0/token Replace &lt;directory-id&gt; with the directory ID of your Azure Notification Hub account.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https:// &lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.

Create a credential record for the Microsoft Azure Notification Hub spoke
Create a credential record for the Microsoft Azure Notification Hub account. The Microsoft Azure Notification Hub Spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to IntegrationHub > Connections & Credentials > Credentials & Credential Aliases.
2. Open the Azure_Resource_Mangement record.
3. From the Credentials tab, click New.

   The system displays this message: What type of Credentials would you like to create?

4. Select OAuth 2.0 Credentials.
5. On the form, fill these values.

   **OAuth 2.0 Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Azure Notification Hub OAuth</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click Submit.
7. Navigate to IntegrationHub > Connections & Credentials > Credentials & Credential Aliases
8. Open the Azure_Resource_Mangement record.
9. From the Credentials tab, click New.

   The system displays this message: What type of Credentials would you like to create?

10. Select Azure Shared Access Signature.
11. On the form, fill these values.

   **Azure Shared Access Signature form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Microsoft Azure Notification Hub Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Shared Access Key Name | Name to identify the Shared Access Key record.
Shared Access Key | Shared Access Key of your Azure Notification Hub account.
Credential alias | Credential alias associated with the spoke. NotificationHub_SAS
Authentication For | Azure product for which this credential record is used. Select Notification Hub
Authentication For | Custom authentication algorithm for outbound signing requests. Select AzureSASAlgo.

**Note:** Do not modify the authentication algorithm directly.

12. Click Submit.

### Microsoft Azure Virtual Network spoke v1.0.3

Manage Microsoft Azure Virtual Network (VNet) from your ServiceNow instance.

#### Request apps on the Store

Visit the *ServiceNow Store* website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the *ServiceNow Store version history release notes*.

#### IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see *Request IntegrationHub*.

#### Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.
Supported Versions

This spoke was built for API version 2019-07-01 for List Network Interface Names by ResourceGroup and Look Up Network Interfaces By Resource Group, 2019-11-01 for other actions but may be compatible with later versions.

Spoke requirements

- Microsoft Azure Resource Management spoke (com.sn.ms.azure.resource.mgmt.spoke)
- Microsoft Azure subscription with access to Azure Virtual Network service

Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Microsoft Azure Virtual Network spoke provides actions to automate Microsoft Azure Virtual Network tasks when events occur in ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Interface Management</td>
<td>Create Network Interface</td>
<td>Creates a network interface.</td>
</tr>
<tr>
<td></td>
<td>Delete Network Interface</td>
<td>Deletes the specified network interface.</td>
</tr>
<tr>
<td></td>
<td>Get Network Interface Information</td>
<td>Retrieves the specified network interface information in a specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Network Interfaces By Resource Group</td>
<td>Retrieves a list of network interfaces in the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Network Interfaces By Subscription ID</td>
<td>Retrieves a list of network interfaces in the specified subscription ID.</td>
</tr>
<tr>
<td></td>
<td>Set Network Interface Tags</td>
<td>Assigns tags to the specified network interface.</td>
</tr>
<tr>
<td>Public IP Address Management</td>
<td>Create Public IP Address</td>
<td>Creates a public IP address.</td>
</tr>
<tr>
<td></td>
<td>Delete Public IP Address</td>
<td>Deletes a specified public IP address.</td>
</tr>
<tr>
<td></td>
<td>Get Public IP Address Information</td>
<td>Retrieves the specified public IP address information in a specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Public IPs By Resource Group</td>
<td>Retrieves a list of public IP addresses in the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Public IPs By Subscription ID</td>
<td>Retrieves a list of public IP addresses in the specified subscription ID.</td>
</tr>
<tr>
<td></td>
<td>Set Public IP Tags</td>
<td>Assigns tags on public IP addresses.</td>
</tr>
</tbody>
</table>
## ServiceNow Orlando Now Platform capabilities

<table>

<td>Look Up Virtual Networks By Resource Group</td>
<td>Retrieves a list of virtual networks in the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Look Up Virtual Networks By Subscription ID</td>
<td>Retrieves a list of virtual network in the specified resource group.</td>
</tr>
<tr>
<td></td>
<td>Set Virtual Network Tags</td>
<td>Assigns tags on virtual network.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see [Connections and Credentials](#).

### Set up Microsoft Azure Virtual Network spoke

Integrate the ServiceNow instance and Azure Virtual Network using OAuth credentials to authenticate ServiceNow requests.

- Request an IntegrationHub Enterprise subscription
- Activate the Microsoft Azure Virtual Network
- Role required: admin

*Configure app registration for Microsoft Azure Virtual Network spoke*

Configure app registration from your Azure account to add redirect URIs, credentials, and permissions to access web APIs for your application. For more information, see [Quickstart: Configure a client application to access web APIs](#)

Azure account with admin privileges

1. Sign into [Azure portal](#).
2. Register your app with the following platform settings.

**Registration Settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter Web app/API.</td>
</tr>
<tr>
<td>Supported account types</td>
<td>Specify the account types who can use the application.</td>
</tr>
<tr>
<td>Redirect URI</td>
<td>Specify the URI in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do Replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

3. Record the client ID and client secret of the app which are used for authentication.

**Register Azure Virtual Network as OAuth provider**

Use the authentication information from Azure account configuration to register Azure Virtual Network as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to **System OAuth > Application Registry**.
2. Open the Azure Resource Management application registry record.
3. On the form, fill the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created during Azure virtual account registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Key value created during Azure virtual account registration.</td>
</tr>
<tr>
<td>Token URL</td>
<td>The URL used for OAuth tokens. The format of the URL is <a href="https://login.microsoftonline.com/">https://login.microsoftonline.com/</a>&lt;Directory ID&gt;/oauth2/v2.0/token. Replace &lt;Directory ID&gt; with the directory ID in your Azure configuration properties.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The URL of the instance used for redirection. The format of the URL is https://&lt;instance&gt;.service-now.com/oauth_redirect.do. Replace &lt;instance&gt; with the name of your ServiceNow instance.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click **Save**.

**Create Credential records for the Microsoft Azure Virtual Network spoke**

Create Credential records to the Azure Managed Storage app registration you created. The Microsoft Azure Virtual Network spoke connection and credential aliases uses these credentials to authorise actions.

Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Click New.
The system displays the message **What type of Credentials would you like to create?**
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the credentials record. For example, enter <strong>Azure Virtual Network</strong>.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>The OAuth profile you created when you registered the custom Azure Virtual Network application as an OAuth provider. Enter <strong>Azure Resource Management default_profile</strong></td>
</tr>
<tr>
<td>Credential alias</td>
<td>The credential alias you created when you registered the custom Azure Virtual Network application. Click the lock icon and enter, <strong>sn_azure_ms_spoke.Azure_Managed_Storage</strong>, <strong>sn_azure_rm_spoke.Azure_Resource_Mangement</strong>, <strong>sn_azure_vm_spoke.Azure_Virtual_Machine</strong>, <strong>sn_azure_vn_spoke.Azure_Virtual_Network</strong></td>
</tr>
</tbody>
</table>

5. Click **Submit**.

*Regenerate OAuth token for Microsoft Azure Virtual Network spoke*

Regenerate an OAuth token when it expires.

Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Azure Virtual Network OAuth Credential record. For example, select Azure Virtual Network credentials.
3. From Related Links section, click **Get OAuth Token**.
4. Right-click the form header, and click **Save**.

**Microsoft Dynamics CRM spoke v1.0.1**

Provide the baseline actions to interact with Microsoft Dynamic Entities through introspection.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see *Request IntegrationHub*.

**Spoke flows & subflows**

This spoke ships with one subflow, Process Dynamics CRM Webhook. See *Configure Microsoft Dynamics CRM webhook details*.
**Spoke actions**

The Microsoft Dynamics CRM spoke provides the baseline actions to interact with Microsoft Dynamic Entities through introspection.

**Available Microsoft Dynamics CRM spoke actions**

<table>
<thead>
<tr>

<td>Retrieve records based on the search query and specific entity.</td>
</tr>
<tr>
<td></td>
<td>Update Record</td>
<td>Update a record in Microsoft Dynamics CRM.</td>
</tr>
</tbody>
</table>

### Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

This spoke uses the Microsoft_Dynamics_CRM alias record to authorize actions.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft_Dynamics_CRM</td>
<td>Connection to Microsoft Dynamics CRM</td>
<td>URL configured when you create your application in Azure. This URL ends with dynamics.com.</td>
</tr>
</tbody>
</table>

### Set up Microsoft Dynamics CRM spoke

Integrate the ServiceNow instance and Microsoft Dynamics CRM by using the Windows credentials to authenticate ServiceNow requests.

- Install Microsoft AD
- Request IntegrationHub subscription.
- Activate the Microsoft Dynamics CRM spoke.
- Role required: admin.

- Perform these steps to use all Microsoft Dynamics CRM spoke actions.

*Configure Microsoft Dynamics CRM application*

Create a custom OAuth application from your Microsoft Dynamics CRM account to enable OAuth 2.0 authentication with the Microsoft Dynamics CRM.

Microsoft Dynamics CRM requirements:

- Microsoft Dynamics CRM account
- **Microsoft Azure** account
- Microsoft Dynamics CRM credentials
Complete these steps from your Azure Developer account. See the Azure product documentation for instructions on creating and configuring custom applications.

1. Log in to the Microsoft Azure App registration portal with your organization credentials.
2. Register a new custom application. Fill in the application name, the supported account type, and the redirect URI, and then click Register.
   An overview of the application's basic information is shown.
3. Copy the application ID to a text file.
   You will use this ID and the client secret generated in the next step to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to ServiceNow.
4. Add a client secret.
   a) In Microsoft Azure, navigate to Manage > Certificates & secrets.
   b) Provide a description and an expiration date and click Add.

   **Note:** The client secret is only displayed in plain text for a short time. You use the client secret when you connect the application to ServiceNow.

5. Enable the permissions you want the application to support. For more information, see the Microsoft Graph permissions reference.
   a) In Microsoft Azure, navigate to Manage > API permissions.
   b) Click the Microsoft Graph tile.
   c) Select the Delegated or Application permissions that the application supports.
      Delegated permissions enable the application to access the API as a signed-in user. Application permissions enable the application to run as a background service or daemon without a signed-in user.
   d) Click Add permissions.

Register Microsoft Dynamics CRM as OAuth provider.

Use the information generated during Microsoft Dynamics CRM account configuration to register Microsoft Dynamics CRM as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

- Request IntegrationHub subscription.
- Activate Microsoft Dynamics CRM.
- Create a Microsoft Dynamics CRM application.

Role required: admin.

1. In ServiceNow, navigate to System OAuth > Application Registry.
2. Click New.
3. On the screen titled What kind of OAuth application, select Connect to a third-party OAuth Provider.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example Dynamics CRM OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Application ID of the Microsoft Dynamics CRM application you created in Azure.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in Azure.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon</td>
</tr>
<tr>
<td></td>
<td>(enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/authorize">https://login.microsoftonline.com/common/oauth2/v2.0/authorize</a> followed by a question mark and the resource attribute of your instance, and then click the lock icon again. The resource attribute of the URL. For example, ?resource=<a href="https://mycompany.crm.dynamics.com">https://mycompany.crm.dynamics.com</a>. This attribute is the URL of your Microsoft application.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon</td>
</tr>
<tr>
<td></td>
<td>(enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/token">https://login.microsoftonline.com/common/oauth2/v2.0/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon</td>
</tr>
<tr>
<td></td>
<td>(enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. In the **OAuth Entity Scopes** related list, edit the provided entity scope to include the URL of your Microsoft Dynamics CRM application. The name and the OAuth scope are often the same string.
6. Right-click the form header, and click Save. The system validates the OAuth credentials.

Create credential record for Microsoft Dynamics CRM.

Create Credential records for the Microsoft Dynamics CRM spoke
Create Credential records for the Microsoft Dynamics CRM custom OAuth application you created during Microsoft Dynamics CRM account configuration. The Microsoft Dynamics CRM spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
   The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Dynamics Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Microsoft Dynamics CRM application as an OAuth provider. For example, select Dynamics OAuth profile.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>
5. Save the record.
6. From Related Links, click **Get OAuth Token**.
   The system displays a confirmation message that the OAuth token flow is completed successfully. Review the details if the flow is not completed successfully.

   **Note:** Ensure that you allow pop-up windows in your browser.

---

**Create Connection records for the Microsoft Dynamics CRM spoke**

Create Connection records to your Microsoft Azure account. The Microsoft Dynamics CRM spoke connection and credential alias uses these connections to perform actions on Microsoft Dynamics CRM.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the connection and credential alias for the Microsoft Dynamics CRM application.
3. On the **Connections** tab, click **New**.
   The system displays a blank **HTTP(s) Connection** form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter <strong>MS Dynamics CRM Connection</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Microsoft Dynamics CRM. For example, select <strong>MS Dynamics Credentials</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the Connection alias record you created for Microsoft Dynamics CRM.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the root Dynamics URL. For example, https://&lt;SiteName&gt;.dynamics.com.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

---

**Configure Microsoft Dynamics CRM webhook details**

Register Microsoft Dynamics CRM webhook in ServiceNow to notify the ServiceNow application when certain events occur in Microsoft Dynamics CRM.

Role required: admin

- Microsoft Dynamics CRM requires registration through the Windows Plugin Registration Tool. To install the Windows Plugin Registration Tool, see the Microsoft document [Download tools from NuGet](https://download.microsoft.com/download/A/1/5/A15E9C90-0E96-4B11-869C-9C9F819C9F16/DynamicsCRMVersion3WindowsPluginSetup32.sdr).  
- The Endpoint URL is the ServiceNow instance URL to which event information is posted. For example, https://<instance-name>.service-now.com/api/sn_ms_crm_spoke/dynamics_webhook_callbacks.  
- The key-value pair you use to register the webhook in the Plugin Registration Tool is the same as the Name and Authorization Key in Dynamics CRM Webhook Details.

1. Navigate to **Dynamics CRM Webhook Details > Client Details**.
2. Click **New**.
3. In the **Name** field, enter the webhook's plugin key. In the **Authorization Key** field, enter the value from the webhook's key-value pair.
Create webhook routing policy and subflow according to your requirements.

1. Navigate to **Flow Designer > Designer**
2. Click **Subflows**.
3. Create a copy of the default subflow, Process Dynamics CRM Webhook.
4. Customize the subflow according to your requirement and publish it. See [Subflows](#) for more information about creating and using subflows.
5. Navigate to **Dynamics CRM Webhook Details > Decision Policy**.
6. On the **Decisions** tab, click **New**.
7. On the form, fill in the fields.

### Decision form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
</tbody>
</table>
| Answer      | Option to specify if this answer is the default answer. Default answer is applicable when the conditions are not met.  
1. Click the Lookup icon.  
2. Select the required subflow from the Document: list. |
| Condition   | Conditions to be met when the required events occur in Microsoft Dynamics CRM. |

8. Click **Submit**.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

Decision policy and subflow are created.

### Microsoft Exchange Online spoke

The Microsoft Exchange Online spoke creates and manages calendar and mail in Microsoft Exchange Online. To create, manage, or delete users and groups, use the Microsoft Azure AD spoke.

**Note:** User and group management can be done using Microsoft Azure AD only and not Microsoft Exchange Online spoke.

### Request apps on the Store

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](#).
IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version

Microsoft Graph REST API v1.0

Spoke actions

The Microsoft Exchange Online spoke provides actions to automate calendar and mail tasks when an incident is created in the ServiceNow instance.

**Microsoft Exchange Online spoke actions**

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendar Management</td>
<td>Copy Attachment To Calendar Event</td>
<td>Copies a ServiceNow attachment to an Exchange calendar event.</td>
</tr>
<tr>
<td></td>
<td>Create Calendar Event</td>
<td>Creates an event in the user's default calendar and specifies the time zone for the start and end times of the event.</td>
</tr>
<tr>
<td></td>
<td>Create Recurring Calendar Events</td>
<td>Creates a recurring event in the user's default calendar and specifies the time zone for the start and end times of the event.</td>
</tr>
<tr>
<td></td>
<td>Delete Calendar Event</td>
<td>Deletes a calendar event.</td>
</tr>
<tr>
<td></td>
<td>Get Events by User ID</td>
<td>Retrieves the list of event objects in the user's mailbox.</td>
</tr>
<tr>
<td></td>
<td>Update Calendar Event</td>
<td>Updates the properties of an event object.</td>
</tr>
<tr>
<td>Mail Management</td>
<td>Delete Message</td>
<td>Deletes the message in user's inbox or from a custom folder.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Look Up Mail Folders By User ID</td>
<td>Retrieves all the mail folders for a specified User ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Messages By Mail Folder ID</td>
<td>Retrieves all the messages in a mail folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up Messages By User ID</td>
<td>Retrieves all the messages in the inbox folder of the user.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Time Zones</td>
<td>Retrieves the list of all available time zones.</td>
</tr>
</tbody>
</table>

**Microsoft account requirements**

The Microsoft Exchange Online spoke requires registering an application using the Microsoft Azure portal to generate OAuth 2.0 tokens.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up Microsoft Exchange Online spoke**

Integrate the ServiceNow instance and Microsoft Exchange Online account by creating a custom OAuth application in Microsoft Exchange Online to authenticate ServiceNow requests.

- Request IntegrationHub Professional subscription
- Activate the Microsoft Exchange Online spoke
- Role required: admin

*Register an application using the Microsoft Azure portal*

Provide authorization to the ServiceNow instance by registering an application with Azure AD.

Role required: Azure Active Directory admin

Complete these steps from the Microsoft Azure portal. For instructions on registering an application, see the *Microsoft Azure documentation*.

1. In the Microsoft Azure portal, add the *Redirect URIs* in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`
2. For the *Required Permissions*, select *Microsoft Graph*.
3. Record the *Client Secret* for use in later configurations.

The ServiceNow application is created with Microsoft Azure AD.

*Register Microsoft Exchange Online as the OAuth provider*

Register Microsoft Exchange Online as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Use the information generated during the registration of the application in the Microsoft Azure portal.

1. Navigate to *System OAuth > Application Registry*.
2. Click *New*. 
The system displays the message, What kind of OAuth application?

3. Select **Connect to a third party OAuth Provider.**
4. On the form, fill in the fields.

### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Microsoft Exchange Online.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

**Note:** You can use only Authorization Code as the Default Grant type when PKCE is enabled.

5. Right-click the form header, and click Save.

A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, Microsoft Exchange Online default_profile.
Create Credential records for the Microsoft Exchange Online spoke
Authorize the Microsoft Exchange Online spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Exchange Online connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New. The system displays the message, What type of Credentials would you like to create?
3. Select OAuth 2.0 Credentials.
4. On the form, fill in the fields.

OAuth 2.0 Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Exchange_Ohline_Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Microsoft Exchange Online spoke as an OAuth provider. For example, Microsoft Exchange Online.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Save.
6. To generate the OAuth token, click the Get OAuth Token related link.

The credential record for the Microsoft Exchange Online spoke is created.

Create connection records for the Microsoft Exchange Online spoke
Perform actions in Microsoft Exchange Online by creating connection records for your Microsoft Exchange Online account. The Microsoft Exchange Online spoke connection and credential alias uses these connections to perform actions.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the Microsoft Exchange Online spoke record.
3. In the Connections related list, click New.
4. On the form, fill in the fields.

HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Exchange_Ohline_Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Exchange Online. For example, Exchange_Ohline_Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note:</strong> Do not select the check box.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click Update.

The Microsoft Exchange Online spoke is set up and integrated with the ServiceNow instance.

Regenerate the Microsoft Exchange Online OAuth token

Authorize the Microsoft Exchange Online spoke by regenerating the Microsoft Exchange Online OAuth token after it expires.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Select the Microsoft Exchange Online spoke OAuth Credential record.
3. To regenerate the OAuth token, click the Get OAuth Token related link.

The Microsoft Exchange Online spoke receives a new OAuth access token.

Microsoft Exchange Server spoke

The Microsoft Exchange Server spoke creates and manages address list, mailbox, and calendar events in Microsoft Exchange mail system.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

The Microsoft Exchange Server spoke requires an IntegrationHub subscription.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Speakedependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - PowerShell (com.glide.hub.action_step.powershell)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

- Exchange Server 2016 installed on Windows Server 2016
  
  Note: The Create Calendar Event For User action is supported only on Exchange Server 2013.

- Exchange Server 2013 installed on Windows Server 2012 R2

This spoke may be compatible with the earlier versions of Microsoft Exchange Server.

Spoke requirements

Powershell remoting must be enabled on the target Exchange Server.

Spoke actions

The Microsoft Exchange Server spoke provides actions to automate address list, mailbox, and calendar event tasks.

Microsoft Exchange Server spoke actions

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address List Management</td>
<td>Create Address List Using Included Recipients</td>
<td>Creates a new address list in Exchange Server using the Included Recipients field.</td>
</tr>
<tr>
<td></td>
<td>Create Address List Using Recipient Filter</td>
<td>Creates a new address list in Exchange Server using the Recipient field.</td>
</tr>
<tr>
<td></td>
<td>Delete Address List</td>
<td>Deletes the required address list on a required Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Get Address List Details</td>
<td>Retrieves the details of a required address list on a required Exchange Server.</td>

<td>Retrieves the properties of a mailbox in Exchange Server.</td>
</tr>
<tr>
<td></td>
<td>Set Mailbox</td>
<td>Modifies the properties of a mailbox in Exchange Server.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

Two connection and credential aliases are created when the Microsoft Exchange Server spoke is activated, Exchange and Exchange_https.

**Note:**

• The Exchange_https alias is supported only on Exchange Server 2013.
• The Exchange_https alias is required to use the Create Calendar Event For User action.
MID Server requirements

Your instance must have a MID Server set up and configured to run PowerShell 2.0. Use the connection record associated with the Microsoft Exchange alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Microsoft Exchange Server spoke

Integrate the ServiceNow instance and Exchange Server by using the Windows credentials to authenticate ServiceNow requests.

- Install Microsoft AD
- Request IntegrationHub subscription
- Activate the Microsoft Exchange Server spoke
- Role required: admin

- Perform these steps to use all Microsoft Exchange Server spoke actions except the Create Calendar Event For User action.
- To use the Create Calendar Event For User action, perform the same steps again for the Exchange_https connection and credential alias. MID Server is not necessary to perform this action.

Note: The Create Calendar Event For User action is supported only on Exchange Server 2013.

Create Credential record for Microsoft Exchange Server spoke

Authorize the Microsoft Exchange Server spoke actions by creating Windows credential record for the Exchange Server host. The Microsoft Exchange Server spoke connection and credential alias uses these credentials to authorize actions.

Create two credential records, one for each connection and credential alias.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message, What type of Credentials would you like to create?
4. On the form, fill in the fields.

Windows Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSExchangeCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>User name</td>
<td>User name with access to the target Windows host. For more information about Windows permissions, see Windows credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Advanced selection criteria for the credential.</td>
</tr>
</tbody>
</table>
5. Click **Submit**.

The Windows credential record for the Microsoft Exchange Server spoke is created.

*Create Connection record for Microsoft Exchange Server spoke*

Perform actions in Microsoft Exchange Server spoke by creating connection records. The Microsoft Exchange Server spoke connection and credential alias uses these connections to perform actions.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the Microsoft Exchange Server spoke record.
3. In the Connections related list, click **New**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Exchange Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for the Microsoft Exchange Server spoke. For example, MSExchangeCredentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Host</td>
<td>Fully qualified domain name or IP address of the target host where Exchange Server is installed.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Target port that the connection uses.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
</tbody>
</table>

Note: MID Server is necessary for all the Microsoft Exchange Server spoke actions except the Create Calendar Event For User action.

5. Click **Submit**.

The Microsoft Exchange Server spoke is set up and integrated with the ServiceNow instance.

**Microsoft OneDrive spoke v1.5.2**

Automate file and folder management and collaboration in Microsoft OneDrive. Adds Microsoft OneDrive data to your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

**Note:** Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

API version v1.

Spoke subflows

The Microsoft OneDrive spoke provides sample subflows in the draft state to demonstrate automating Microsoft OneDrive tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Move a ServiceNow attachment to OneDrive</td>
<td>Copies an attachment from ServiceNow to OneDrive, records the new location of the attachment, and deletes the attachment from the ServiceNow attachment table.</td>
</tr>
</tbody>
</table>

Spoke actions

The Microsoft OneDrive spoke provides actions to automate Microsoft OneDrive tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drive Management</td>
<td>Get Drive Info</td>
<td>Gets the metadata of a specific Microsoft OneDrive drive</td>
</tr>
<tr>
<td></td>
<td>List Drives</td>
<td>Retrieves all the available drives associated with a target User, Group, or Site. If you don’t provide a User, Group, or Site, then a list of root drives associated with the authenticated user is returned.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Move File Or Folder Item</td>
<td>Moves a file or folder in Microsoft OneDrive to the target location.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Create Folder</td>
<td>Creates a folder in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Update File Or Folder Name</td>
<td>Updates the name for a file or folder item by ID.</td>
</tr>
<tr>
<td></td>
<td>Delete File Or Folder Item</td>
<td>Deletes a file or folder from Microsoft OneDrive.</td>
</tr>
<tr>
<td>File Management</td>
<td>Copy OneDrive File to Attachment</td>
<td>Copies a file in Microsoft OneDrive to an attachment in a record in a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment to OneDrive</td>
<td>Copies an attachment record in ServiceNow to Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Copy File Or Folder Item</td>
<td>Asynchronously creates a copy of a Microsoft OneDrive item (including children), under a new parent item or with a new name.</td>
</tr>
<tr>
<td></td>
<td>List Items</td>
<td>Retrieves a list of drive items from either a path or the source and source ID of a drive item.</td>
</tr>
<tr>
<td></td>
<td>Get File Or Folder Item Info By ID</td>
<td>Gets file metadata information from the file or folder ID in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Get File Or Folder Item Info By Path</td>
<td>Gets file metadata information from the file path in Microsoft OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment To OneDrive Using Path</td>
<td>Copies an attachment record in ServiceNow to OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Copy OneDrive File To Attachment Using File Path</td>
<td>Copies a file using its path in OneDrive to an attachment in a record in ServiceNow.</td>
</tr>
<tr>
<td></td>
<td>Copy OneDrive File Version To Attachment</td>
<td>Copies a file in OneDrive to an attachment in a record in ServiceNow.</td>
</tr>
<tr>
<td></td>
<td>Delete Version of a File</td>
<td>Deletes the specified version of a file from OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Get All Versions of A File</td>
<td>Retrieves all the versions a file in OneDrive.</td>
</tr>
<tr>
<td></td>
<td>Restore File Version</td>
<td>Restores the specified file version and make this version the latest.</td>
</tr>
<tr>
<td>Search Documents</td>
<td>Search Files or Folder Items</td>
<td>Searches the drive items (files or folders) based on metadata attributes such as the item name.</td>
</tr>
<tr>
<td>Document Sharing</td>
<td>Add Collaborator</td>
<td>Adds a collaborator and their permissions to a file or a folder. You can identify the collaborator by their Azure AD Alias or an Object ID.</td>
</tr>
</tbody>
</table>
OneDrive Online account requirements

The Microsoft OneDrive spoke requires a custom app that you create in Microsoft Azure.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Single tenant

The OneDrive spoke includes the OneDrive alias record to authorize actions on Microsoft OneDrive. Select this alias in the Tenant record to authorize changes in Microsoft OneDrive for a single tenant.

Multiple tenants

The OneDrive spoke includes the OneDrive alias record to authorize actions on Microsoft OneDrive. Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint. See Create aliases for multiple tenants.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the MicrosoftSharepointOnline alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Microsoft OneDrive spoke

Integrate the ServiceNow instance and Microsoft OneDrive spoke by using Windows credentials to authenticate ServiceNow requests.

• Install Microsoft AD.
• Install the Microsoft OneDrive spoke.
• Request IntegrationHub subscription.
• Activate the Microsoft OneDrive spoke.
• Role required: admin

Configure Microsoft OneDrive application

Create a custom OAuth application from your Microsoft OneDrive account to enable OAuth 2.0 authentication with the Microsoft OneDrive spoke.

Microsoft OneDrive requirements:

• Microsoft OneDrive account
• *Microsoft Azure* account
• Microsoft OneDrive tenant administrator credentials

Complete these steps from your Azure Developer account. See the *Azure* product documentation for instructions on creating and configuring custom applications.

1. Log in to the *Microsoft Azure App registration portal* with your organization credentials.
2. Register a new custom application. Fill in the application name, the supported account type, and the redirect URL, and then click **Register**.
   An overview of the application's basic information is shown.
3. Copy the application ID to a text file.
   You will use this ID and the client secret generated in the next step to register the app as a third-party OAuth provider on your ServiceNow instance. You use the application ID as the client ID when you connect the application to ServiceNow.
4. Add a client secret.
   a) In Microsoft Azure, navigate to **Manage > Certificates & secrets**.
   b) Provide a description and an expiration date and click **Add**.

   **Note:** The client secret is only displayed in plain text for a short time. You use the client secret when you connect the application to ServiceNow.

5. Enable the permissions you want the application to support. For more information, see the *Microsoft Graph permissions reference*.
   a) In Microsoft Azure, navigate to **Manage > API permissions**.
   b) Click the Microsoft Graph tile.
   c) Select the Delegated or Application permissions that the application supports.
      Delegated permissions enable the application to access the API as a signed-in user. Application permissions enable the application to run as a background service or daemon without a signed-in user.
   d) Click **Add permissions**.

*Register Microsoft OneDrive as OAuth provider.*

Use the information generated during Microsoft OneDrive account configuration to register Microsoft OneDrive as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

• Request IntegrationHub subscription.
• Activate Microsoft OneDrive spoke.
• Create Microsoft OneDrive application.

Role required: admin

1. In ServiceNow, navigate to **System OAuth > Application Registry**.
2. Click **New**.
3. On the screen titled **What kind of OAuth application**, select **Connect to a third-party OAuth Provider**.
4. Enter these values in the Application Registries form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record, for example OneDrive OAuth profile.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Application ID of the OneDrive application you created in Azure.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you generated when you created the application in Azure.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Click the lock icon, enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/authorize">https://login.microsoftonline.com/common/oauth2/v2.0/authorize</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Click the lock icon, enter <a href="https://login.microsoftonline.com/common/oauth2/v2.0/token">https://login.microsoftonline.com/common/oauth2/v2.0/token</a>, and then click the lock icon again.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>Click the lock icon, enter https://&lt;instance&gt;.service-now.com/oauth_redirect.do, and then click the lock icon again.</td>
</tr>
</tbody>
</table>

5. In the **OAuth Entity Scopes** related list, add scopes to match the permissions you defined when you configured the Microsoft OneDrive application.
Click **Insert a new row** and enter the name and the OAuth scope of the permission. The name and the OAuth scope are often the same.

<table>
<thead>
<tr>
<th>OAuth Entity Profiles</th>
<th>OAuth Entity Scopes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td><strong>OAuth scope</strong></td>
</tr>
<tr>
<td>Calendars.ReadWrite</td>
<td>Calendars.ReadWrite</td>
</tr>
<tr>
<td>Calendars.ReadWrite.Shared</td>
<td>Calendars.ReadWrite.Shared</td>
</tr>
<tr>
<td>email</td>
<td>email</td>
</tr>
<tr>
<td>Files.Read</td>
<td>Files.Read</td>
</tr>
<tr>
<td>Files.Read.All</td>
<td>Files.Read.All</td>
</tr>
</tbody>
</table>

**Define all available OAuth scopes for this OAuth provider. The scopes defined here can be selected when you create/update a profile.**

**Name:** A unique name.

**OAuth Scope:** Scopes you must get from the provider's specification, such as a read scope and a write scope. Define each scope separately.

6. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials.

*Create Credential record for the Microsoft OneDrive spoke.*

Create Credential records to the Microsoft OneDrive custom OAuth application you created during Microsoft OneDrive account configuration. The Microsoft OneDrive spoke connection and credential aliases use these credentials to authorize actions.

- Microsoft role required: User management administrator, Global administrator
- ServiceNow role required: admin

1. Navigate to **IntegrationHub > Connections & Credentials > Credentials** and click **New**.
2. Select OAuth 2.0 Credentials.
3. Enter a unique name for the credential, for example, OneDrive Spoke OAuth Cred.
4. Click the OAuth Entity Profile search icon and select the default OneDrive OAuth profile.
5. Click Submit.

Create Connection record for the Microsoft OneDrive spoke.

A connection alias resolves your connection and credential at runtime. Only one connection is active per Connection Alias at a time.

Role required: admin

1. Navigate to IntegrationHub > Connections & Credentials > Connections and click New.
2. Select HTTP(s) Connection.
3. Provide this connection information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name onedrive_con.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the value OneDrive Spoke OAuth Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the value sn_onedrive_spoke.OneDrive</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the URL <a href="https://graph.microsoft.com">https://graph.microsoft.com</a>.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Client Credentials.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Enter <a href="https://accounts.accesscontrol.windows.net/">https://accounts.accesscontrol.windows.net/</a>&lt;TenantID&gt;/tokens/OAuth/2. Replace &lt;TenantID&gt; with your Tenant ID.</td>
</tr>
</tbody>
</table>

4. Return to IntegrationHub > Connections & Credentials > Credentials and select onedrive_cred.
5. From Related Links, click Get OAuth Token.

A confirmation message indicates that the OAuth token flow has completed successfully. Review the details if the flow is not successful.

Note: Ensure that you allow pop-up windows in your browser.

The Microsoft OneDrive spoke is set up and integrated with the ServiceNow instance.

Microsoft SCCM spoke

Automate management of user collections, device collections, and application deployments on a Microsoft System Center Configuration Management (SCCM) server.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.
Spoke flows & subflows

This spoke has no sample flows or subflows.

Spoke actions

The Microsoft System Center Configuration Management (SCCM) spoke provides actions to automate SCCM tasks when events occur in the Now Platform. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Management</td>
<td>Get Applications</td>
<td>Retrieves the application data from the SCCM server.</td>
</tr>
<tr>
<td>Deployment Management</td>
<td>Get Deployments</td>
<td>Retrieves deployment data from the SCCM server.</td>
</tr>
<tr>
<td></td>
<td>Add to Device Collection</td>
<td>Adds a device to a collection in SCCM.</td>
</tr>
<tr>
<td></td>
<td>Get Device Collections</td>
<td>Retrieves device collection data from the SCCM server.</td>
</tr>
<tr>
<td></td>
<td>Is Device In Collection</td>
<td>Checks if a specified device exists in a device collection.</td>
</tr>
<tr>
<td></td>
<td>Remove From Device Collection</td>
<td>Removes a device from an existing device collection.</td>
</tr>
<tr>
<td>User Management</td>
<td>Add to User Collection</td>
<td>Adds a user to a collection in SCCM.</td>
</tr>
<tr>
<td></td>
<td>Get User Collections</td>
<td>Retrieves user collection data from the SCCM Server.</td>
</tr>
<tr>
<td></td>
<td>Is User In Collection</td>
<td>Checks if a specified user exists in a user collection.</td>
</tr>
<tr>
<td></td>
<td>Remove From User Collection</td>
<td>Removes a user from a user collection.</td>
</tr>
</tbody>
</table>

To see inputs and outputs for these activities, see *SCCM activity pack*.

MID server requirements

To use these actions, your instance must have a MID Server set up and configured to use PowerShell. For more information about running actions on the MID Server, see *Integration steps*. For information, see *MID Server*.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the SCCM alias record to authorize actions on a Microsoft System Center Configuration Management (SCCM) server.
Set up SCCM spoke

Integrate the ServiceNow instance and SCCM using Windows credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin
- Configure the MID Server for SCCM activities

Create Credential record for the SCCM spoke

Create a Credential record to the SCCM server. The SCCM spoke connection and credential alias uses this credential to authorize actions.

- Request IntegrationHub subscription
- Role required: admin
- Configure the MID Server for SCCM activities

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
   A blank Windows Credentials form displays.
4. Enter these values, then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SCCM Credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>User name</td>
<td>Enter a user name with access to the target Windows host. For more information about Windows permissions, see Windows credentials.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password for the account.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

Create Connection record for the SCCM spoke

Create a Connection record to your SCCM host machine. The SCCM spoke connection and credential alias uses this connection to perform actions in SCCM.

- Request IntegrationHub subscription
- Create Credential record for the SCCM spoke
- Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the record for SCCM.
3. From the Connections tab, click New.
The system displays a blank Basic Connection form.

4. Enter these values, then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter SCCM Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Windows. For example, select SCCM Credential.</td>
</tr>
<tr>
<td>Host</td>
<td>Enter the fully qualified domain name of the target host where the SCCM server is installed. For example, &lt;host&gt;.&lt;domain&gt;.com.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Enable</td>
</tr>
<tr>
<td>Override default port</td>
<td>Enter the target port used by the connection. If blank, the system uses the default port.</td>
</tr>
</tbody>
</table>

*Configure MID Server as WinRM trusted host*

**Microsoft SCCM Usage Metering spoke**

Manage the process of fetching software usage data from a Microsoft System Center Configuration Management (SCCM) Usage Metering server. Get data about software usage metering and when the software was last used using this spoke.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported Versions**

This spoke was built for Microsoft SCCM version 1602, but may be compatible with later versions.

**Spoke Requirements**

- Microsoft System Center Configuration Management Usage Metering Server version 2012 R2 with software metering enabled. For more information about software metering, see Software metering in Configuration Manager

  **Note:** Ensure that metering rules are configured in SCCM for the required software.

- Microsoft SQL Server 2014
Spoke flows and subflows

This spoke has no flows and subflows.

Spoke actions

The Microsoft SCCM Usage Metering spoke provides actions to retrieve software usage data from a Microsoft System Center Configuration Management Usage Metering server. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Software Last Used Data</td>
<td>Retrieves the last usage data of the required software from the SCCM server.</td>
</tr>
<tr>
<td>Get Software Usage Data</td>
<td>Retrieves usage metering of the required software from the SCCM server.</td>
</tr>
</tbody>
</table>

Note:
The spoke actions support a maximum payload of 10 MB from the SCCM server for the JDBC step.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record that is associated with the Microsoft SCCM Usage Metering alias to configure where actions run as well as to set MID Server selection attributes. For more information, see MID server.

Set up the Microsoft SCCM Usage Metering spoke

Integrate the ServiceNow instance and SCCM using Java Database Connectivity (JDBC) credentials to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Microsoft SCCM Usage Metering spoke
- Role required: admin

Create Connection records for the Microsoft SCCM Usage Metering spoke

Create Connection records to the SCCM server. The SCCM Usage Metering spoke connection and credential aliases use these connections to perform actions in SCCM.

1. Navigate to Credentials & Connections > Connections.
2. Click New and select JDBC Connection.
3. On the form, fill in the fields.
The database selection in the **Format** field determines which fields are available.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the JDBC connection. For example, JDBC MySQLProd.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential for the JDBC provider. Enter the user name and password of the database.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with the connection.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>Maximum elapsed time the JDBC query allowed to run without a response.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to make the connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain for the table. By default, the JDBC Connection [jdbc_connection] table runs in the global domain.</td>
</tr>
<tr>
<td>Format</td>
<td>Database type for the connection. The choices are:</td>
</tr>
<tr>
<td></td>
<td>• MySQL</td>
</tr>
<tr>
<td></td>
<td>• Oracle</td>
</tr>
<tr>
<td></td>
<td>• SQLServer</td>
</tr>
<tr>
<td></td>
<td>• None</td>
</tr>
<tr>
<td>Host</td>
<td>Host name or IP address of the database server.</td>
</tr>
<tr>
<td>Oracle port</td>
<td>Port that the Oracle database is using. The default value is 1521.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when Oracle is selected from the Format list.</td>
</tr>
<tr>
<td>Oracle sid</td>
<td>Oracle database site identifier. The default value is orcl.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when Oracle is selected from the Format list.</td>
</tr>
<tr>
<td>Database name</td>
<td>Name of the database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when MySQL or SQLServer is selected from the Format list.</td>
</tr>
<tr>
<td>Override default port</td>
<td>Port that the selected database is using.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when MySQL or SQLServer is selected from the Format list.</td>
</tr>
<tr>
<td>Instance name</td>
<td>Instance name for the selected SQLServer.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available when SQLServer is selected from the Format list.</td>
</tr>
</tbody>
</table>
Create Credential records for the Microsoft SCCM Usage Metering spoke

Create Credential records to the SCCM server. The Microsoft SCCM Usage Metering spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
3. Select JDBC Credentials.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to use the credentials.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Option to verify if the credentials apply to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to access the database.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to access the database.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Microsoft SharePoint spoke

Manages sites, folders, files, groups, lists, and users in Microsoft SharePoint. Adds Microsoft SharePoint data to your ServiceNow instance.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

API version v1.

Spoke flows

The Microsoft SharePoint spoke provides sample flows in the draft state to demonstrate automating Microsoft SharePoint tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Attachment on Record creates folder, and copies attachment</td>
<td>Creates a Microsoft SharePoint folder with an attachment when the attachment is added to a Knowledge article in ServiceNow.</td>
</tr>
<tr>
<td>Create Site For Knowledge Base</td>
<td>Creates a Microsoft SharePoint site when a Knowledge Base is created in ServiceNow.</td>
</tr>
</tbody>
</table>

Spoke subflows

The Microsoft SharePoint spoke provides sample subflows in the draft state to demonstrate automating Microsoft SharePoint tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:
### Spoke actions

The Microsoft SharePoint spoke provides actions to automate Microsoft SharePoint tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Site Management</td>
<td>Create Site</td>
<td>Creates a site or subsite in Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Delete Site</td>
<td>Removes a site or subsite from Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Look Up Site Collection ID</td>
<td>Looks up a specific site ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up Sites</td>
<td>Looks up the sites in a given Microsoft SharePoint site.</td>
</tr>
<tr>
<td></td>
<td>Look Up Subsite Details</td>
<td>Looks up information about a subsite.</td>
</tr>
<tr>
<td></td>
<td>Update Site Information</td>
<td>Updates a Microsoft SharePoint site.</td>
</tr>
<tr>
<td>Folder Management</td>
<td>Create Folder</td>
<td>Creates a folder in a document library on a Microsoft SharePoint site.</td>
</tr>
<tr>
<td></td>
<td>Delete Folder</td>
<td>Deletes a folder in Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>List Files In A Folder</td>
<td>Gets a list of files in a folder.</td>
</tr>
<tr>
<td></td>
<td>List Folders In A Folder</td>
<td>Gets a list of folders in a folder.</td>
</tr>
<tr>
<td></td>
<td>Look Up Folder</td>
<td>Looks up a folder in Microsoft SharePoint and returns folder properties. For example, use this action to return the relative URL to enter as input in the Rename A Folder action.</td>
</tr>
<tr>
<td></td>
<td>Rename A Folder</td>
<td>Renames a folder in Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Share Folder With Group</td>
<td>Shares a folder with a group in Microsoft SharePoint. The group must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Share Folder With User</td>
<td>Shares a folder with a user in Microsoft SharePoint. The user must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare Folder With Group</td>
<td>Unshares a folder with a group. The group must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>File Management</strong></td>
<td>Unshare Folder With User</td>
<td>Unshares a folder with a user. The user must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Attach Sharepoint File To A Record</td>
<td>Attaches a Microsoft SharePoint file to a ServiceNow record.</td>
</tr>
<tr>
<td></td>
<td>Check-in File</td>
<td>Checks in a file to Microsoft SharePoint using the Application Service user.</td>
</tr>
<tr>
<td></td>
<td>Check-out File</td>
<td>Checks a file out of Microsoft SharePoint using the Application Service user.</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment To Folder</td>
<td>Copies a ServiceNow attachment to a Microsoft SharePoint folder.</td>
</tr>
<tr>
<td></td>
<td>Copy File</td>
<td>Copies a file with a new name.</td>
</tr>
<tr>
<td></td>
<td>Create A Text File</td>
<td>Uploads a text file to Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Delete File</td>
<td>Deletes a file in Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Look Up File Details</td>
<td>Looks up file details in Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Move File</td>
<td>Moves a file to another location in Microsoft SharePoint.</td>
</tr>
<tr>
<td></td>
<td>Share File With Group</td>
<td>Shares a file with a group in Microsoft SharePoint. The group must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Share File With User</td>
<td>Shares a file with a Microsoft SharePoint user. The user must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare File With Group</td>
<td>Unshares a file with a Microsoft SharePoint group. The group must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td></td>
<td>Unshare File With User</td>
<td>Unshares a file with a Microsoft SharePoint user. The user must belong to the Microsoft SharePoint tenant account.</td>
</tr>
<tr>
<td><strong>User Management</strong></td>
<td>Look Up User Information By Login Name</td>
<td>Searches the Microsoft SharePoint site for a given user and returns information about the user account.</td>
</tr>
<tr>
<td></td>
<td>Look Up User's Sharepoint Groups</td>
<td>Searches the Microsoft SharePoint site for a given user and returns the user's Microsoft SharePoint groups regardless of which site or subsite the group is a part of.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add Role To Site</td>
<td>Adds a role to a Microsoft SharePoint site.</td>
</tr>
<tr>
<td></td>
<td>Add User To Group</td>
<td>Adds a User to a Microsoft SharePoint site group.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates a group in a Microsoft SharePoint site.</td>
</tr>
<tr>
<td></td>
<td>Delete Group</td>
<td>Deletes a group on a Microsoft SharePoint site.</td>
</tr>
<tr>
<td></td>
<td>Look Up Group By Name</td>
<td>Looks up a group by name in the specified site location.</td>
</tr>
<tr>
<td></td>
<td>Remove Role From Site</td>
<td>Removes permissions from a group or user.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes a user from a Microsoft SharePoint site group.</td>
</tr>
<tr>
<td></td>
<td>Update Group Owner (User)</td>
<td>Updates a group owner.</td>
</tr>
<tr>
<td>List Management</td>
<td>Create List</td>
<td>Creates a list in a Microsoft SharePoint site.</td>
</tr>
<tr>
<td></td>
<td>Delete List By ID</td>
<td>Deletes a list in a Microsoft SharePoint site.</td>
</tr>
<tr>
<td></td>
<td>Look Up List Details By ID</td>
<td>Looks up a list in a Microsoft SharePoint site by ID.</td>
</tr>
<tr>
<td></td>
<td>Look Up List ID By Title</td>
<td>Looks up a list in a Microsoft SharePoint site by title.</td>
</tr>
<tr>
<td></td>
<td>Update List Details</td>
<td>Updates a list in a Microsoft SharePoint site.</td>
</tr>
<tr>
<td>List Item Management</td>
<td>Create List Item</td>
<td>Creates a list item inside a list.</td>
</tr>
<tr>
<td></td>
<td>Delete List Item By ID</td>
<td>Deletes a list item.</td>
</tr>
<tr>
<td></td>
<td>Look Up List Item By ID</td>
<td>Looks up a list item.</td>
</tr>
<tr>
<td></td>
<td>Look Up List Items In A List</td>
<td>Looks up items in a specified list in various useful formats.</td>
</tr>
<tr>
<td></td>
<td>Update List Item By ID</td>
<td>Updates a list item title with the ID.</td>
</tr>
</tbody>
</table>

**Sharepoint Online account requirements**

The Microsoft SharePoint spoke requires creating a custom app on your SharePoint Online account to generate OAuth 2.0 tokens. See [Configure Microsoft SharePoint account](#).
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Single tenant

This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft Sharepoint Online. Select this alias in the Tenant record to authorize changes in Microsoft SharePoint for a single tenant.

Multiple tenants

This spoke includes the MicrosoftSharepointOnline alias record to authorize actions on Microsoft Sharepoint Online. Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint. See Create aliases for multiple tenants.

MID Server requirements

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the MicrosoftSharepointOnline alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Microsoft SharePoint spoke

Integrate the ServiceNow instance and Microsoft SharePoint by creating a custom OAuth application in Microsoft SharePoint to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Microsoft SharePoint spoke
- Role required: admin

Configure Microsoft SharePoint account

Create a custom OAuth application from your Microsoft SharePoint account to enable OAuth 2.0 authentication with the Microsoft SharePoint spoke.

Microsoft SharePoint requirements:

- Microsoft SharePoint Online account and Microsoft SharePoint Onprem account
- Microsoft SharePoint tenant administrator credentials

Complete these steps from your Microsoft SharePoint account. See the SharePoint development documentation for instructions on creating and configuring custom applications.

1. Select Microsoft SharePoint Online account or Microsoft SharePoint Onprem account.
   - For SharePoint Online account, work with your Azure AD administrator to retrieve the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint tenant you want to connect to. Record the Directory ID to use as the Tenant ID when creating a Tenant record in your ServiceNow instance.
   - For SharePoint Onprem account, download and run the Hybrid Configuration wizard from the Admin Center. For more information, see Hybrid Configuration wizard.

2. In your SharePoint site, create a custom application.

3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.

4. Enable the matching SharePoint application scope permissions you want the app to support.
For example, to provide full control, enter the following XML.

```xml
<AppPermissionRequests AllowAppOnlyPolicy="true">
  <AppPermissionRequest
    Scope="http://sharepoint/content/tenant"
    Right="FullControl" />
</AppPermissionRequests>
```

Create aliases for multiple tenants
Create a connection and credential alias record for each additional tenant site you wish to support. Select the correct alias in the Tenant record to authorize changes in Microsoft SharePoint. If configuring an integration for a single tenant, use the existing MicrosoftSharepointOnline alias record.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Click New.
   A blank Connection & Credential Alias record opens
3. On the Connection & Credential Aliases form, fill the following values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>&lt;unique-name&gt;</td>
</tr>
<tr>
<td>Type</td>
<td>Connection and Credential</td>
</tr>
<tr>
<td>Connection type</td>
<td>HTTP</td>
</tr>
</tbody>
</table>

4. Click Submit.

Associate a Credential record and a Connection record with the alias to authorize actions on the SharePoint tenant site. Create an alias record and associated connection and credential records for each tenant you want to support.

Define Microsoft SharePoint tenants
Define a profile for your Microsoft SharePoint tenant site. The Microsoft SharePoint spoke uses the tenant record and associated Connection and Credential alias to perform actions on Microsoft SharePoint.

1. Navigate to Sharepoint Online > Tenants.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for the tenant.</td>
</tr>
<tr>
<td>Alias</td>
<td>Select a connection and credential alias. If configuring the integration for a single tenant, select the MicrosoftSharepointOnline alias. If configuring the integration for multiple tenants, select the desired alias.</td>
</tr>
</tbody>
</table>
   | Sharepoint Root URL | Enter the root SharePoint URL without the https:// prefix.  
   |                   | For example, <SiteName>.sharepoint.com                                    |
   | Tenant Id         | Enter the Tenant ID. This is the Directory ID for the Azure AD Directory that is supporting the Microsoft SharePoint tenant you want to connect to. See Configure Microsoft SharePoint account. |
4. Click Submit.

If configuring an integration with multiple Microsoft SharePoint tenants, create additional tenant profiles as needed.

Register Microsoft SharePoint as OAuth provider

Use the information generated during Microsoft SharePoint account configuration to register Microsoft SharePoint as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays the message What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
   The system displays a blank Application Registries form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record.</td>
</tr>
<tr>
<td></td>
<td>For example, enter SharePoint OAuth profile.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the value, &lt;ClientID&gt;@&lt;TenantID&gt;.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the</td>
</tr>
<tr>
<td></td>
<td>Microsoft SharePoint account configuration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Select OAuthUtilSPOnline.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Client Credentials.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Enter <a href="https://accounts.accesscontrol.windows.net/">https://accounts.accesscontrol.windows.net/</a></td>
</tr>
<tr>
<td></td>
<td>&lt;TenantID&gt;/tokens/OAuth/2. Replace &lt;TenantID&gt; with your</td>
</tr>
<tr>
<td></td>
<td>Tenant ID.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
   The system validates the OAuth credentials and populates the Redirect URL and the OAuth Entity Profiles related list.

6. Copy the value from Redirect URL.
7. Login to your Microsoft SharePoint account to edit the configuration of your custom SharePoint application.
   See the SharePoint development site for instructions.
8. Paste the Redirect URL value into the OAuth 2.0 Redirect URI for your custom Microsoft SharePoint application.
   For example, paste https://instance.service-now.com/oauth_redirect.do.

The instance can request OAuth 2.0 tokens for the spoke.

Create Credential records for the Microsoft SharePoint spoke

Create Credential records to the Microsoft SharePoint custom OAuth application you created during Microsoft SharePoint account configuration. The Microsoft SharePoint spoke connection and credential aliases use these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
The pop-up window displays a blank OAuth 2.0 Credentials form.

4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter SharePoint Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Microsoft SharePoint application as an OAuth provider. For example, select SharePoint OAuth profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Save the record.

6. From Related Links, click Get OAuth Token.

The system displays a confirmation message that the OAuth token flow is completed successfully. Review the details if the flow is not completed successfully.

**Note:** Ensure that you allow pop-up windows in your browser.

*Create Connection records for the Microsoft SharePoint spoke*

Create Connection records to your Microsoft SharePoint account. The Microsoft SharePoint spoke connection and credential alias uses these connections to perform actions on Microsoft SharePoint.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open the connection and credential alias used in the Tenant record. See Define Microsoft SharePoint tenants and Create aliases for multiple tenants.
3. From the Connections tab, click New.
   
The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter SharePoint Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Microsoft SharePoint. For example, select SharePoint Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the Connection alias record you created for Microsoft SharePoint.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter the root SharePoint URL. For example, https://&lt;SiteName&gt;.sharepoint.com.</td>
</tr>
</tbody>
</table>

5. Click Submit.
**Microsoft Teams spoke**

The Microsoft Teams spoke provides actions which post messages and ServiceNow incident, problem, and change record details to Microsoft Teams channels.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

**Microsoft Teams actions**

The Microsoft Teams spoke is an available integration through IntegrationHub. You can specify the following Microsoft Teams actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL, Title, and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Microsoft Teams channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>

**Microsoft Teams Inputs**

The following inputs are common to the Microsoft Teams actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Required] Webhook URL</td>
<td>The Microsoft Teams webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Microsoft Teams documentation.</td>
</tr>
<tr>
<td>[Optional] Title</td>
<td>Title of the message.</td>
</tr>
<tr>
<td>[Optional] Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td>[Optional] Override Default Fields</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
</tbody>
</table>
### Input

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Optional] Theme Color (Hex)</td>
<td>Hex code value of color to highlight the message.</td>
</tr>
</tbody>
</table>

### Example

You can add a Microsoft Teams Post Incident Details action to a flow which identifies newly created high priority incidents and a specified theme color.

![Diagram of Microsoft Teams Post Incident Details action](image)

### Microsoft Teams Graph spoke v3.2

The Microsoft Teams Graph spoke creates and manages teams and channels in Microsoft Teams. To create, manage, or delete users and groups, use the Microsoft Azure AD spoke.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

### Note:
- Teams in the Microsoft Teams Graph spoke are created from the groups in Microsoft Azure AD. To create a team using the Microsoft Teams Graph spoke, the associated group must be present in Microsoft Azure AD.
- User and group management can be done using Microsoft Azure AD only and not Microsoft Teams Graph spoke.
- Teams can be created from the Microsoft Office 365 group only.
- The team ID in Microsoft Teams is the same as the group ID of the associated group in Microsoft Azure AD.
## IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

## Supported version

Microsoft Graph REST API v1.0 and Beta API

**Note:** The Notification Management actions use Beta API.

## Spoke actions

The Microsoft Teams Graph spoke provides actions to automate team and channel tasks when an incident is created in the ServiceNow instance.

### Microsoft Teams Graph spoke actions

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Team Management</td>
<td>Create Team</td>
<td>Creates a team from an existing Microsoft Office 365 group. &lt;br&gt; <strong>Note:</strong> The team ID is the same as the group ID.</td>
</tr>
<tr>
<td></td>
<td>Update Team</td>
<td>Updates the properties of a team.</td>
</tr>
<tr>
<td></td>
<td>Get Team</td>
<td>Retrieves the properties and relationships of a team.</td>
</tr>
<tr>
<td></td>
<td>Archive Team</td>
<td>Archives a team. Members cannot send messages on the channels of the team. However, members can be added to the group and can search the team content.</td>
</tr>
<tr>
<td></td>
<td>List Teams</td>
<td>Lists teams the specified user is part of.</td>
</tr>
<tr>
<td></td>
<td>Unarchive Team</td>
<td>Restores an archived team. Members can send messages on the channels of the team.</td>
</tr>
<tr>
<td>Channel Management</td>
<td>Create Channel in a Team</td>
<td>Creates a channel in a team.</td>
</tr>
<tr>
<td></td>
<td>Get Channel Metadata</td>
<td>Retrieves the properties and relationships of a channel.</td>
</tr>
<tr>
<td></td>
<td>Get Messages From Channel</td>
<td>Retrieves the list of messages in a channel of a team.</td>
</tr>
<tr>
<td></td>
<td>Get Channel ID by Name</td>
<td>Retrieves the channel ID and properties.</td>
</tr>
<tr>
<td></td>
<td>Delete Channel</td>
<td>Removes the channel from a team and deletes all conversations.</td>
</tr>
</tbody>
</table>
## ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Management</td>
<td>Look Up Channels</td>
<td>Retrieves the list of channels in the specified team.</td>
</tr>
<tr>
<td></td>
<td>Get Messages From Chat</td>
<td>Retrieves the list of messages in a chat.</td>
</tr>
<tr>
<td></td>
<td>Look up Chats</td>
<td>Retrieves the list of chats of a user.</td>
</tr>
<tr>
<td>Notification Management</td>
<td>Post Change Details</td>
<td>Posts details of the required change to a channel.</td>
</tr>
<tr>
<td></td>
<td>Post Incident Details</td>
<td>Posts details of the required incident to a channel.</td>
</tr>
<tr>
<td></td>
<td>Post Message</td>
<td>Posts message to a channel.</td>
</tr>
<tr>
<td></td>
<td>Post Problem Details</td>
<td>Posts details of the required problem to a channel.</td>
</tr>
</tbody>
</table>

**Note:** Currently, these actions use Beta API. Hence, when you create the connection record, `api_version` in the Attributes tab is set to `beta` by default.

When Microsoft Teams supports these actions in another API version, you must update `api_version` in the Attributes tab and specify the new API version to use these actions.

**Note:** Some of the spoke actions require the channel ID, group ID, or team ID as one of the inputs. To learn these details, log in to Microsoft Teams, navigate to **Teams**, and click **Get link to channel** for the required channel. The channel link contains the required details.

For example, if the channel link is `https://teams.microsoft.com/l/channel/19%3a1aa3730712e245a0af31e4095d66d613%40thread.skype/New%2520channel%2520in%2520team?groupId=7fb91938-5e8c-4968-bf7d-3987df7716f3&tenantId=a46df9b7-2c9b-49d5-8c9f-d1b3de4ba59f`, the group ID and team ID are `7fb91938-5e8c-4968-bf7d-3987df7716f3`, and the channel ID is `19:1aa3730712e245a0af31e4095d66d613@thread.skype` or `1aa3730712e245a0af31e4095d66d613`.

For more information about accessing the channel ID and group ID through Microsoft Teams, see [Microsoft Teams documentation](https://docs.microsoft.com/en-us/microsoftteams/platform/teams/teams-api).

### Microsoft Teams Graph spoke action permissions

The Microsoft Teams Graph spoke should have the following permissions to perform the relevant actions.

<table>
<thead>
<tr>
<th>Action</th>
<th>Permission type</th>
<th>Permissions (from least to most privileged)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Action</td>
<td>Permission type</td>
<td>Permissions (from least to most privileged)</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------</td>
<td>---------------------------------------------</td>
</tr>
<tr>
<td>Update Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Get Team</td>
<td>Delegated (work or school account)</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Archive Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Unarchive Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Create Channel in a Team</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td>Get Channel Metadata</td>
<td>Delegated (work or school account)</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Get Channel ID by Name</td>
<td>Delegated (work or school account)</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>

<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.Read.All, Group.ReadWrite.All</td>
</tr>
<tr>
<td>Delete Channel</td>
<td>Delegated (work or school account)</td>
<td>Group.ReadWrite.All</td>
</tr>
<tr>
<td></td>
<td>Delegated (personal Microsoft account)</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Application</td>
<td>Group.ReadWrite.All</td>
</tr>
</tbody>
</table>

For more information about the required permissions, see *Microsoft Teams documentation*. 
Microsoft account requirements

The Microsoft Teams Graph spoke requires registering an application using the Microsoft Azure portal to generate OAuth 2.0 tokens.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

MID Server requirements

The Microsoft Teams Graph spoke actions use REST calls, which can run on an instance or a MID Server. Use the connection record associated with the Microsoft alias to configure where actions run as well as set MID Server selection attributes. For more information, see MID server.

Set up Microsoft Teams Graph spoke

Integrate the ServiceNow instance and Microsoft Teams account by creating a custom OAuth application in Microsoft Teams to authenticate ServiceNow requests.

• Request IntegrationHub subscription
• Activate the Microsoft Teams Graph spoke
• Role required: admin

Register an application using the Microsoft Azure portal

Provide authorization to the ServiceNow instance by registering an application with Azure AD.

Role required: Azure Active Directory admin

Complete these steps from the Microsoft Azure portal. For instructions on registering an application, see the Microsoft Azure documentation.

1. In the Microsoft Azure portal, copy and record the Directory ID for later use.
2. Register your application by providing the ServiceNow instance URL for the Home page.
3. Copy and record the Application ID for later use.
4. Add the Reply URLs in this format: https://<instance-name>.service-now.com/oauth_redirect.do
5. For the Required Permissions, select Microsoft Graph.
6. Record the Client Secret for use in later configurations.

The ServiceNow application is created with Microsoft Azure AD.

Register Microsoft Teams as the OAuth provider

Register Microsoft Teams as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

Use the information generated during the registration of the application in the Microsoft Azure portal.

1. Navigate to System OAuth > Application Registry.
2. Click New. The system displays the message, What kind of OAuth application?
3. Select Connect to a third party OAuth Provider.
4. On the form, fill in the fields.
### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MS Teams.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Application ID created during application registration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret created during application registration.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

**Note:** You can use only Authorization Code as the Default Grant type when PKCE is enabled.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope that contains this record.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. Enter https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Use mutual authentication</td>
<td>Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.</td>
</tr>
<tr>
<td>Send Credentials</td>
<td>Client credentials in the request.</td>
</tr>
</tbody>
</table>

5. Insert the following records in the OAuth Entity Scopes related list.

**Record 1 in the OAuth Entity Scopes related list**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>auth_code</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>OAuth scope</td>
<td>offline_access</td>
</tr>
</tbody>
</table>

**Record 2 in the OAuth Entity Scopes related list**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>openid</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>openid</td>
</tr>
</tbody>
</table>

6. Right-click the form header, and click **Save**.
A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, MS Teams default_profile.

*Create Credential records for the Microsoft Teams Graph spoke*
Authorize the Microsoft Teams Graph spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Teams Graph spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
The system displays the message, *What type of Credentials would you like to create?*
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

**OAuth 2.0 Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSTeamsCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of Microsoft Teams Graph spoke as an OAuth provider. For example, MS Teams default_profile.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Save**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

The credential record for the Microsoft Teams Graph spoke is created.

*Create Connection records for the Microsoft Teams Graph spoke*
Perform actions in Microsoft Teams by creating connection records for your Microsoft Teams account. The Microsoft Teams Graph spoke connection and credential alias uses these connections to perform actions.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the Microsoft Teams Graph spoke record.
3. In the Connections related list, click **New**.
4. On the form, fill in the fields.
### HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, MSTeamsConnection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Microsoft Teams. For example, MSTeamsCredentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note</strong>: Do not select the check box.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

**Note:**
Currently, the Notification Management actions use Beta API. Hence, api_version in the Attributes tab is set to beta by default.

When Microsoft Teams supports the Notification Management actions in another API version, you must update api_version in the Attributes tab and specify the new API version.

5. Click **Update**.

The Microsoft Teams Graph spoke is set up and integrated with the ServiceNow instance.

### Regenerate the Microsoft Teams OAuth token

Authorize the Microsoft Teams Graph spoke by regenerating the Microsoft Teams OAuth token after it expires.

Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Select the Microsoft Teams Graph spoke OAuth Credential record.
3. To regenerate the OAuth token, click the Get OAuth Token related link.

The Microsoft Teams Graph spoke receives a new OAuth access token.

### Okta spoke v1.1.1

Use Okta to manage users, passwords, and groups.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Professional subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported versions

API version v1.

Spoke flows

The Okta spoke provides sample flows in the draft state to demonstrate automating user and group management tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add User to Okta Group</td>
<td>When a user is created, adds the user to the specified group.</td>
</tr>
<tr>
<td>Onboard User in Okta</td>
<td>When a user is created in ServiceNow, creates and activates the user in Okta.</td>
</tr>
<tr>
<td>Remove Okta Group Membership on Deactivation</td>
<td>When a user is deactivated, removes the user from all Okta groups.</td>
</tr>
</tbody>
</table>

Note: Okta has the ServiceNow_UD application to provision users in ServiceNow. ServiceNow can also be configured to provision users in Okta. Hence, ServiceNow administrators must ensure that circular user creation does not occur.

Spoke actions

The Okta spoke provides actions to authenticate and manage users and groups. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Management</td>
<td>Activate User</td>
<td>Starts the process of activating a user in Okta by enabling new or returning users to configure their Okta account from an activation URL. This action can either have Okta send the activation URL to the user as an email, or it can return the activation URL as a data pill for use in a later action to send an email or notification.</td>
</tr>
<tr>
<td></td>
<td>Clear User Session</td>
<td>Clears all active sessions the specified user has with Okta, which forces the user to log back in the next time they use Okta.</td>
</tr>
<tr>
<td></td>
<td>Create User</td>
<td>Creates the specified user in Okta with the specified standard, optional, and mandatory field values.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the specified user in Okta, which removes the user's groups and application assignments, and changes the user status to DEACTIVATED. This action is commonly used when a user departs the company indefinitely.</td>
</tr>
<tr>
<td></td>
<td>Delete User</td>
<td>Deletes the specified user within Okta, which completely removes the user. This action is commonly used to clean up your user base after compliance regulations have been met.</td>
</tr>
<tr>
<td></td>
<td>Is Account Locked</td>
<td>Determines if a user account is locked.</td>
</tr>
<tr>
<td></td>
<td>Lookup Okta User ID</td>
<td>Retrieves the Okta user ID for the specified Okta login ID or login short name.</td>
</tr>
<tr>
<td></td>
<td>Lookup User Account Details</td>
<td>Retrieves user details for the specified Okta user ID.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Lookup User Profile Information</td>
<td>Restart User Activation</td>
<td>Restarts the specified user's activation within Okta. Use this action if the user did not complete their activation with the activation code or link provided by the Activate User Action.</td>
</tr>
<tr>
<td></td>
<td>Suspend User</td>
<td>Suspends the specified user within Okta by changing the user status from ACTIVE to SUSPENDED. For example, use this action to suspend access for users who are on temporary leave. To reactivate a suspended user, use the Unsuspend action.</td>
</tr>
<tr>
<td></td>
<td>Unsuspend User</td>
<td>Unsuspends the specified user in Okta.</td>
</tr>
<tr>
<td></td>
<td>Update User Profile</td>
<td>Updates the user profile details for the specified user in Okta.</td>
</tr>
<tr>
<td>Password Management</td>
<td>Change User's Password</td>
<td>Changes the specified user's password after validating the user's current password.</td>
</tr>
<tr>
<td></td>
<td>Expire User Password</td>
<td>Expires the specified user's password within Okta. This action is commonly used as a reaction to stop breaching attempts.</td>
</tr>
<tr>
<td></td>
<td>Reset to Temporary Password</td>
<td>Resets the specified user's password within Okta to a temporary password. This action is commonly used to get a user logged in who has forgotten their password.</td>
</tr>
<tr>
<td></td>
<td>Reset User Factors</td>
<td>Resets all of the multi-factor access devices for the specified user within Okta. This action is commonly used when a user loses their multi-factor authentication device or method.</td>
</tr>
<tr>
<td></td>
<td>Set User Password</td>
<td>Sets the specified user's password in Okta.</td>
</tr>
<tr>
<td></td>
<td>Unlock User</td>
<td>Unlocks the specified user in Okta.</td>
</tr>
<tr>
<td>Group Management</td>
<td>Add User To Group</td>
<td>Adds the specified user to the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Create Group</td>
<td>Creates the specified group in Okta.</td>
</tr>
<tr>
<td></td>
<td>Get Groups</td>
<td>Retrieves all new and updated groups in Okta.</td>
</tr>
<tr>
<td></td>
<td>Is User In Group</td>
<td>Determines if the specified user is a member of the specified group in Okta.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Lookup Group Details</td>
<td>Retrieves group details for the specified Okta group ID.</td>
</tr>
<tr>
<td></td>
<td>Lookup Group ID By Name</td>
<td>Retrieves group details and group ID for the specified Okta group name.</td>
</tr>
<tr>
<td></td>
<td>Remove User From Group</td>
<td>Removes the specified user from the specified Okta group ID.</td>
</tr>
<tr>
<td></td>
<td>Update Group</td>
<td>Updates the group details for the specified Okta group ID.</td>
</tr>
</tbody>
</table>

**Okta account requirements**

The Okta spoke requires generating and configuring your Okta account to use a web API key.

**Credential and connection alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

This spoke uses the Okta Connection & Credential Alias record to authorize actions.

**MID Server requirements**

These actions use REST calls, which can run on an instance or MID Server. Use the connection record associated with the Okta alias to configure where actions run as well as set MID Server selection attributes. For more information, see *MID server*.

**Set up Okta spoke v1.1.1**

Integrate the ServiceNow instance and your Okta account using an API key to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the Okta spoke
- Role required: admin

*Generate Okta account API token*

Configure your Okta account to generate an access token for API key authentication.

Okta requirements:

- Okta organization or developer account
- Okta administrator credentials

Complete these steps from your Okta organization or developer account. See the *Okta for developers* documentation for instructions on creating and configuring your account.

1. Generate an access token to interact with Okta APIs.
2. Record the access token to create Credential records on your ServiceNow instance.
Create Credential records for the Okta spoke v1.1.1
Create Credential records to the Okta application you created. The Okta spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select API Key Credentials.
   A blank API Key Credentials form displays.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Okta Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter SSWS followed by the access token you obtained from Okta. For example, SSWS {access token}.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select All MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create Connection records for the Okta spoke v1.1.1
Create a Connection record to the Okta API. The Okta spoke connection and credential alias uses these connections to perform actions in Okta.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Okta.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Okta Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for Okta. For example, select Okta Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter your Okta organization URL. For example, <a href="https://dev-418994.oktapreview.com">https://dev-418994.oktapreview.com</a>.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Fetch Okta groups
Fetch Okta groups into your instance so that you can assign them to different users. You can fetch the groups on an as-needed or scheduled basis.

Role required: okta.admin

1. To fetch Okta groups on an as-needed basis.
a) Navigate to **Okta spoke > Okta groups**.

b) Click **Fetch Okta groups**.

c) From the Okta groups list, you can review the following:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the Okta group.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the Okta group.</td>
</tr>
<tr>
<td>Group ID</td>
<td>Group ID of the Okta group.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the Okta group.</td>
</tr>
<tr>
<td>Group creation date</td>
<td>Date when Okta group was created.</td>
</tr>
<tr>
<td>Group last updated date</td>
<td>Date when Okta group was last updated.</td>
</tr>
<tr>
<td>Created</td>
<td>Date when Okta group was first synchronized with your ServiceNow instance.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date when Okta group was last synchronized with your ServiceNow instance.</td>
</tr>
</tbody>
</table>

2. To fetch Okta groups on a scheduled basis.
   a) Navigate to **System Definition > Scheduled Jobs**.
   b) Open the **Fetch Okta Groups** record.
   c) Update the fields, as needed.
   
   **Note:** Make sure that the **Active** option is selected so that the scheduled job is activated for use.
   d) Click **Update**.

**Oracle Financial Cloud spoke**

Manage invoices, ledger, and records in Oracle Financial Cloud instance from your ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see **Request IntegrationHub**.

**Supported versions**

This spoke was built for Oracle Financial Cloud API version 11.13.18.05, but may be compatible with later versions.
Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- *Utility Actions spoke*
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke flows

The Oracle Financial Cloud spoke provides sample flows to demonstrate automating the Oracle Financial Cloud tasks. To customize a sample flow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Accounted AP Invoices</td>
<td>Retrieves information about the accounted AP invoices.</td>
</tr>
<tr>
<td></td>
<td>This flow triggers the Get Accounted AP Invoice subflow and includes the Look up Record Details action.</td>
</tr>
<tr>
<td>Import Journals</td>
<td>Imports the journal records from your ServiceNow instance to Oracle Financial Cloud system.</td>
</tr>
<tr>
<td></td>
<td>To import the journal records, you must create the required records in the GL Interface module.</td>
</tr>
<tr>
<td>Import AP Invoices</td>
<td>Imports accounts payable invoice line and accounts payable invoice records from your ServiceNow instance to Oracle Financial Cloud system.</td>
</tr>
<tr>
<td></td>
<td>To import the accounts payable invoice line and accounts payable invoice records, you must create the required records in the AP Invoices Interface and AP Invoices Lines Interface modules respectively.</td>
</tr>
</tbody>
</table>

**Note:** The success message displayed after flow executions during the data imports from ServiceNow instance to Oracle Financial Cloud system, only indicates that data has been successfully pushed to Oracle Financial Cloud system. You must verify that the data import is successfully completed by accessing the Oracle Financial Cloud system.
Spoke subflows

The Oracle Financial Cloud spoke provides sample subflow, Get Accounted AP Invoice, to demonstrate automating Oracle Financial Cloud tasks. The subflow retrieves the accounted AP invoice records and is used in the Get Accounted AP Invoices flow. To customize the sample subflow, copy it to a new application scope.

Spoke actions

The Oracle Financial Cloud spoke provides actions to automate Oracle Financial Cloud tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Record Management</td>
<td>Create Record</td>
<td>Creates an object.</td>
</tr>
<tr>
<td></td>
<td>Look up Record Details</td>
<td>Retrieves record details in an object.</td>
</tr>
<tr>
<td></td>
<td>Look up Record Details By ID</td>
<td>Retrieves details of the specified record in an object.</td>
</tr>
<tr>
<td>AP Invoice Management</td>
<td>Import AP Invoices</td>
<td>Imports the actionable payment invoices.</td>
</tr>
<tr>
<td></td>
<td>Look up AP Invoice Lines</td>
<td>Retrieves information about the accounts payable invoice lines.</td>
</tr>
<tr>
<td></td>
<td>Look up AP Invoices</td>
<td>Retrieves information about the actionable payment invoices.</td>
</tr>
<tr>
<td>Currency Conversion</td>
<td>Look up Currency Rates</td>
<td>Retrieves information about the currency rates.</td>
</tr>
<tr>
<td>General Ledger</td>
<td>Get Code Combinations Details</td>
<td>Retrieves information about the code combinations.</td>
</tr>
<tr>
<td></td>
<td>Get Subledger Balances</td>
<td>Retrieves information about the subledger balances.</td>
</tr>
<tr>
<td></td>
<td>Import Journals</td>
<td>Imports details about the journals.</td>
</tr>
<tr>
<td></td>
<td>Look up Ledger Balance</td>
<td>Retrieves information about the ledger balances.</td>
</tr>
<tr>
<td>Supplier Record Management</td>
<td>Look up Suppliers</td>
<td>Retrieves information about the suppliers.</td>
</tr>
</tbody>
</table>

Spoke modules

The Oracle Financial Cloud spoke adds the Oracle Financial Cloud application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounted AP Invoices</td>
<td>Displays information about the accounted AP invoices. This information is retrieved when the Get Accounted AP Invoices flow is triggered.</td>
</tr>
<tr>
<td>Module</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>AP Invoices Interface</td>
<td>Displays the accounts payable invoice records. Admin must create these records in the ServiceNow instance in this module. The Import AP Invoices flow imports these invoices from your ServiceNow instance to Oracle Financial Cloud system.</td>
</tr>
<tr>
<td>AP Invoices Lines Interface</td>
<td>Displays the accounts payable invoice line records. Admin must create these records in the ServiceNow instance in this module. The Import AP Invoices flow imports these invoices from your ServiceNow instance to Oracle Financial Cloud system.</td>
</tr>
<tr>
<td>BI Report Paths</td>
<td>Displays information about the folder path where the required report is saved. The Get Subledger Balances and Get Code Combinations Details actions retrieve the subledger balances from these folder paths. Admin must create two records for the two actions and specify the folder path in this module.</td>
</tr>
<tr>
<td>Get Currency Rates</td>
<td>Displays information about the currency rates. The currency rates are retrieved from the remote table, Get Currency Rates [sn_ofc_spoke_st_get_currency_rates]. You can use the remote table as reference and create another remote table for currency rates as per your requirement.</td>
</tr>
<tr>
<td>GL Interface</td>
<td>Displays the journal records. The Import Journals flow imports these records from your ServiceNow instance to Oracle Financial Cloud system. Admin must create the required journal records in this module.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the
connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

Two connection and credential records are available along with the spoke. You must configure these alias record to use the spoke. See *Set up the Oracle Financial Cloud spoke* for more information.

**Note:** Depending on the Oracle Financial Cloud policies and account settings, you may have to change or refresh the credentials in your credential record periodically.

### Set up the Oracle Financial Cloud spoke

Integrate the ServiceNow instance and Oracle Financial Cloud instance by using the basic auth credentials to authenticate ServiceNow requests.

- Request an IntegrationHub subscription.
- Activate Oracle Financial Cloud spoke.
- Role required: admin

*Create a credential record for the Oracle Financial Cloud spoke*

Create a credential record for your Oracle Financial Cloud server. The Oracle Financial Cloud spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to *Connections & Credentials > Credentials*.
2. Click New.

   The system displays this message: What type of Credentials would you like to create?

3. Select Basic Auth Credentials.
4. On the form, fill these values.

#### Basic Auth Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, OFC Cred.</td>
</tr>
<tr>
<td>User name</td>
<td>User name to log in to your Oracle Financial Cloud server.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to authenticate and log in to your Oracle Financial Cloud server.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, 100.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias associated with the spoke.</td>
</tr>
</tbody>
</table>

**Note:** Depending on the Oracle Financial Cloud policies and account settings, you may have to change or refresh the credentials in your credential record periodically.

5. Click Submit.

*Create a connection record for the Oracle Financial Cloud spoke*

Create a connection record for your Oracle Financial Cloud server. The Oracle Financial Cloud spoke connection and credential aliases use these connections to perform actions in Oracle Financial Cloud.

1. Navigate to *Connections & Credentials > Connections & Credentials Aliases*.
2. Open the alias record, OracleCloudFinancials.
3. From the **Connections** tab, click **New**.
4. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <code>OFC Connection</code>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Oracle Financial Cloud spoke. For example, <code>OFC Cred</code>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to the server on which Oracle Financial Cloud is installed.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
6. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.
7. Open the alias record, **OracleCloudFinancialsReport**.
8. From the **Connections** tab, click **New**. This connection record is required to generate and import custom reports using the public report service.
9. On the form, fill these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <code>OFC Reports Conn</code>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record is not required for this connection.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to the Oracle Financial Cloud public report service. Enter the URL in this format, <code>https://&lt;oracle-financial-cloud-host&gt;/xmlpserver/services/PublicReportService</code></td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action runs in.</td>
</tr>
</tbody>
</table>

10. In the **Attributes** tab, provide these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password</td>
<td>Password to authenticate and log in to your Oracle Financial Cloud account.</td>
</tr>
<tr>
<td>User Name</td>
<td>User name with permission to access the public report service, to log in to</td>
</tr>
</tbody>
</table>

11. Click **Submit**.

Create the required records in these spoke modules:
ServiceNow Orlando Now Platform capabilities

- AP Invoices Interface
- AP Invoices Lines Interface
- BI Report Paths
- GL Interface

### Plivo spoke

Enable communications with your customers using the Plivo platform from your ServiceNow instance.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

### IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

### Supported versions

This spoke was built for Plivo API version v1, but may be compatible with later versions.

### Spoke requirements

- Admin access to the Plivo console.
- **AUTH ID** and **AUTH TOKEN**. You can find these values in the dashboard of your Plivo account. For more information, see Authentication in the Plivo documentation.

### Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)

ℹ️ **Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

### Spoke subflows

The Plivo spoke provides sample subflows to demonstrate automating the Plivo tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:
While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.

**Note:**
- You must configure webhooks to use the spoke subflow. See *Set up a webhook for the Plivo spoke* for information regarding setting up and configuring the webhook.
- The sample subflow runs as a user by default. The subflow can be configured to run as system.

**Spoke actions**

The Plivo spoke provides actions to automate the Plivo tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Management</td>
<td>Create Application</td>
<td>Creates an application.</td>
</tr>
<tr>
<td></td>
<td>Delete Application</td>
<td>Deletes an application.</td>
</tr>
<tr>
<td></td>
<td>Get Application</td>
<td>Retrieves details of an application.</td>
</tr>
<tr>
<td></td>
<td>Look up Applications</td>
<td>Retrieves list of all application IDs.</td>
</tr>
<tr>
<td></td>
<td>Update Application</td>
<td>Updates details of an application.</td>
</tr>
<tr>
<td>Call Management</td>
<td>Get Call</td>
<td>Retrieves Call Detail Record(CDR) of the call.</td>
</tr>
<tr>
<td></td>
<td>Hang Up Call</td>
<td>Ends an ongoing call or cancel a queued outbound call.</td>
</tr>
<tr>
<td></td>
<td>Look up Call</td>
<td>Retrieves details of the specified call.</td>
</tr>
<tr>
<td></td>
<td>Make Call</td>
<td>Initiates an outbound call.</td>
</tr>
<tr>
<td></td>
<td>Start Recording Call</td>
<td>Starts recording an ongoing outbound call.</td>
</tr>
<tr>
<td></td>
<td>Stop Recording Call</td>
<td>Stops all the ongoing recordings for the specified call UUID.</td>
</tr>
<tr>
<td>Conference Management</td>
<td>Get Conference</td>
<td>Gets details of a conference.</td>
</tr>
<tr>
<td></td>
<td>Hang Up Conference</td>
<td>Hangs up all ongoing conferences in your account.</td>
</tr>
<tr>
<td></td>
<td>Hang Up Member</td>
<td>Hangs up a member in a conference.</td>
</tr>
<tr>
<td></td>
<td>Kick Member</td>
<td>Disconnects a member in a conference.</td>
</tr>
<tr>
<td></td>
<td>Look up Conferences</td>
<td>Retrieves a list of all conferences that are ongoing on your account.</td>
</tr>
<tr>
<td></td>
<td>Mute Member</td>
<td>Mutes members in a conference.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>SMS Management</td>
<td>Unmute Member</td>
<td>Unmutes members in a conference.</td>
</tr>
<tr>
<td></td>
<td>Get Message</td>
<td>Retrieves the details of the specified message.</td>
</tr>
<tr>
<td></td>
<td>Look up Message</td>
<td>Retrieves the details of the messages.</td>
</tr>
<tr>
<td></td>
<td>Send Bulk SMS</td>
<td>Sends SMS to the multiple numbers.</td>
</tr>
<tr>
<td></td>
<td>Send SMS</td>
<td>Sends the SMS to the specified number.</td>
</tr>
</tbody>
</table>

**Spoke module**

Webhooks can be set up to be notified about the required events. Routing policy defines conditions that must be met to notify the ServiceNow instance. These conditions are based on the events in Plivo that you want to be notified about. When the conditions are met, routing policy triggers the associated subflow, which in turn automates the Plivo tasks.

Webhooks require separate setup and can be used independently without using the spoke actions. The Plivo spoke adds the Plivo Spoke application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plivo Webhook Registries</td>
<td>Create and view the Plivo webhooks in ServiceNow.</td>
</tr>
<tr>
<td>Plivo Webhook Routing Policy</td>
<td>Create and view the routing policies for the Plivo webhooks in ServiceNow. You can also customise the conditions in the routing policies as per your requirement.</td>
</tr>
</tbody>
</table>

Use the Plivo Webhook Registries module to register a Plivo webhook. You must generate a Callback URL and provide this URL in your Plivo account.

Routing policies and subflows support these Plivo fields:

- Keywords
- Call Event
- Caller Name
- Event Type
- SMS Text
- To Number
- Show Related Fields

Create routing policy in the Plivo WebHook Routing Policies module and specify conditions as per your requirement. See *Set up a webhook for the Plivo spoke* for information regarding setting up and configuring the webhooks.

**Spoke user roles**

The Plivo spoke provides a Plivo Admin (sn_plivo_spoke.Plivo_Admin) role.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Set up the Plivo spoke

Integrate the ServiceNow instance and Plivo account by using the basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription.
- Activate Plivo spoke.
- Role required: admin

Create Credential record for the Plivo spoke

Create credential record for the Plivo account. The Plivo spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   - The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
4. On the Basic Auth Credentials form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Plivo Credential.</td>
</tr>
<tr>
<td>User name</td>
<td>Auth ID of your Plivo account.</td>
</tr>
<tr>
<td>Password</td>
<td>Auth token of your Plivo account.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Submit.

Create Connection record for the Plivo spoke

Create connection record for your Plivo account. The Plivo spoke connection and credential aliases use these connections to perform actions in Plivo.

1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record, Plivo.
3. From the Connections tab, click New.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Plivo Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Plivo. For example, select Plivo Credential.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to Plivo. Enter <a href="https://api.plivo.com">https://api.plivo.com</a>.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>This field isn't applicable.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. In the **Attributes** tab, enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auth ID</td>
<td>Auth ID of your Plivo account.</td>
</tr>
<tr>
<td>API version</td>
<td>API version of your Plivo account. Enter v1.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

**Set up a webhook for the Plivo spoke**

Configure a webhook to subscribe to your Plivo account with a ServiceNow callback URL.

- Request IntegrationHub subscription
- Activate the Plivo spoke
- Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin

**Register a Plivo webhook in ServiceNow**

Register a Plivo webhook in your ServiceNow instance to notify the ServiceNow app when certain events occur in Plivo.

Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin

1. Navigate to **Plivo Spoke > Plivo Webhook Registries**.
2. Click **New**.
3. On the form, fill in the fields.

**Plivo Webhook Registry form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name to identify the record. For example, Plivo webhook.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the record.</td>
</tr>
<tr>
<td>Path</td>
<td>Plivo webhook path. By default, this path is set to api/sn_plivo_spoke/plivo_webhook_handler/wh_entry.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.
5. Click **Callback URL**.

The system displays the webhook callback URL.
6. Copy and record the webhook callback URL.

The Plivo webhook is registered in your ServiceNow instance.

**Add a callback URL in Plivo**

Provide a webhook callback URL in your Plivo account to create a webhook.
Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin

1. Log in to your Plivo console.
2. Create an application in the Plivo console as per your requirement.
   For more information about creating an application in the Plivo console, see the Create an Application section in the Make your first Outbound Call page of the Plivo documentation. You can also refer to the Plivo Application documentation for more information about creating and updating an application using Plivo APIs.
3. Enter the webhook callback URL in MESSAGE URL and ANSWER URL, and configure the application as per your requirement.

The callback URL is added in your Plivo account. You can create routing policies and subflows as per your requirement. See Create routing policy and customize webhook for information regarding the creation of new routing policies and subflows.

Create routing policy and customize webhook
Create a webhook routing policy and subflow as per your requirement.

Role required: sn_plivo_spoke.Plivo_Admin and decision_table_admin

Routing policy in the Plivo WebHook Routing Policy module triggers the subflows and notifies the ServiceNow instance when certain events occur in your Plivo account. See Plivo spoke for information about the fields that the routing policy and subflows support.

1. Navigate to Flow Designer > Designer.
2. Click Subflows.
3. Create a copy of the default subflow.
   Two subflows are available along with Plivo spoke; Plivo Call Handler and Plivo SMS Handler. You can create a copy of either of these subflows as per your requirement.
4. Customize the subflow as per your requirement and publish it. See Subflows for more information about creating and using subflows, and Plivo spoke for information about the supported fields.
6. Click New.
7. On the form, fill in the fields.

Decision form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label to identify the routing policy.</td>
</tr>
<tr>
<td>Default answer</td>
<td>Option to specify if this is the default answer. The default answer is applicable when the conditions are not met.</td>
</tr>
<tr>
<td></td>
<td>1. Click the lookup icon</td>
</tr>
<tr>
<td></td>
<td>2. Select the required subflow from the Document list.</td>
</tr>
<tr>
<td>Note:</td>
<td>Ensure that the Table name is Flow [sys_hub_flow].</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions to be met when the required events occur in Plivo.</td>
</tr>
</tbody>
</table>
Routing policies and subflows support these Plivo fields:

- Keywords
- Call Event
- Caller Name
- Event Type
- SMS Text
- To Number
- Show Related Fields

8. Click Submit.

**Note:** These routing policies are saved in the Decision tables. Users are cautioned against directly updating or modifying data in these tables.

The routing policy and subflow are created.

**SAP SuccessFactors spoke v2**

Manage data and entities in SAP SuccessFactors from your ServiceNow instance.

**Request apps on the Store**

Visit the [ServiceNow Store](https://store.service-now.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](https://store.service-now.com).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see [Request IntegrationHub](https://store.service-now.com).

**Spoke dependencies**

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- Complex Object (com.glide.cobject)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- ServiceNow IntegrationHub Action Step - XML Parser (com.glide.hub.action_step.xmlparser)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Remote Tables (com.glide.script.vtable)
Spoke flows

The SAP SuccessFactors spoke provides sample flows in the draft state to demonstrate automating the SAP SuccessFactors tasks. To customize a sample flow, create a copy of it. Available sample flows include:

<table>
<thead>
<tr>
<th>Flow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Todo</td>
<td>Creates a todo record in SAP SuccessFactors.</td>
</tr>
<tr>
<td>Update Todo</td>
<td>Updates details of the specified todo record in SAP SuccessFactors.</td>
</tr>
</tbody>
</table>
| Run SuccessFactors Integration Flow       | Retrieves entire data or only updates made after the last refresh, for the selected entities, from SAP SuccessFactors to your ServiceNow instance. By default, you can retrieves data from these entities in SAP SuccessFactors:  
  • Department  
  • Location  
  • Job Profile  
  • Workers Profile  
  • Effective Workers Profile  
  • Job History Including Secondary Assignments  
  • Todo |

Note: The Create Todo and Update Todo flows demonstrate the todo record management when events occur in ServiceNow. You can customize these flows as per your requirement to manage records of other entities from your ServiceNow instance.

Spoke subflows

The SAP SuccessFactors spoke provides sample subflows in the draft state to demonstrate automating the SAP SuccessFactors tasks. To customize a sample subflow, copy it to a new application scope. Available sample flows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retrieve Departments</td>
<td>Retrieves the department data from SAP SuccessFactors and stores it in SuccessFactors Departments Staging Table.</td>
</tr>
<tr>
<td>Retrieve Effective Worker Profiles</td>
<td>Retrieves the Effective Worker Profiles data from SAP SuccessFactors and stores it in SuccessFactors Worker Profiles Staging Table.</td>
</tr>
<tr>
<td>Retrieve Job History Including Secondary Assignments</td>
<td>Retrieves the job history data, including secondary assignments, from SAP SuccessFactors and stores it in the SuccessFactors Employee Job information And History Staging Table.</td>
</tr>
<tr>
<td>Subflow</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Retrieve Job Profiles</td>
<td>Retrieves the job profile data from SAP SuccessFactors and stores it in SuccessFactors Job Profile Staging Table.</td>
</tr>
<tr>
<td>Retrieve Locations</td>
<td>Retrieves the location data from SAP SuccessFactors and stores it in SuccessFactors Locations Staging Table.</td>
</tr>
<tr>
<td>Retrieve Todos</td>
<td>Retrieves the todo data from SAP SuccessFactors and stores it in SuccessFactors Inbound Todos Staging Table.</td>
</tr>
<tr>
<td>Retrieve Worker Profiles</td>
<td>Retrieves the Worker Profiles data from SAP SuccessFactors and stores it in SuccessFactors Worker Profiles Staging Table.</td>
</tr>
<tr>
<td>Run SuccessFactors Service</td>
<td>Retrieves entire data or only updates made from the last successful runtime, for the selected entities.</td>
</tr>
<tr>
<td>Process SuccessFactors Webhooks</td>
<td>Processes the SAP SuccessFactors webhook event. For more information about setting up the webhooks, see Set up webhook for the SAP SuccessFactors spoke.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The SAP SuccessFactors spoke provides actions to automate SAP SuccessFactors tasks when events occurs in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employee Management</td>
<td>Employee Address Information</td>
<td>Retrieves the address information of the specified employee.</td>
</tr>
<tr>
<td></td>
<td>Employee Annual Compensation</td>
<td>Retrieves the annual compensation details of the specified employee.</td>
</tr>
<tr>
<td></td>
<td>Employee Compensation Details</td>
<td>Retrieves compensation details of the specified employee.</td>
</tr>
<tr>
<td></td>
<td>Employee Documents</td>
<td>Retrieves all the viewable documents of the specified employee.</td>
</tr>
<tr>
<td></td>
<td>Employee Payment Method Details</td>
<td>Retrieves the details about payment method of the specified employee.</td>
</tr>
<tr>
<td></td>
<td>Employee Time Off</td>
<td>Retrieves the time offs taken by the specified employee.</td>
</tr>
<tr>
<td></td>
<td>Employee Time Off Balances</td>
<td>Retrieves the time off balance details of the specified employee.</td>
</tr>
<tr>
<td></td>
<td>My TimeCard Details</td>
<td>Retrieves the time sheet details of the specified employee.</td>
</tr>
<tr>
<td></td>
<td>Change User Roles</td>
<td>Adds user to the given permission group.</td>
</tr>
<tr>
<td></td>
<td>Employee All Payment Methods Details</td>
<td>Retrieves details of all the payment methods of the specified employee.</td>
</tr>
<tr>
<td></td>
<td>Employee Recurring Compensations</td>
<td>Manages the recurring component of a specified employee's compensation.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Get Employee Benefit Enrollments</td>
<td>Retrieves details of the benefit enrollments of the specified employee during a specific time period.</td>
<td></td>
</tr>
<tr>
<td>Offboard an Employee</td>
<td>Triggers the termination process of the specified employee.</td>
<td></td>
</tr>
<tr>
<td>Org Change</td>
<td>Changes the organisation related information of the specified employee.</td>
<td></td>
</tr>
<tr>
<td>Report No Shows</td>
<td>Reports no show for the specified employee.</td>
<td></td>
</tr>
<tr>
<td>Reporting Structure</td>
<td>Retrieves the reporting structure of the specified employee.</td>
<td></td>
</tr>
<tr>
<td>Request Time Off</td>
<td>Applies a time off request for the specified employee.</td>
<td></td>
</tr>
<tr>
<td>Update Employee Address</td>
<td>Updates the address of the specified employee.</td>
<td></td>
</tr>
<tr>
<td>Update Employee Personal Information</td>
<td>Updates the personal information of the specified employee.</td>
<td></td>
</tr>
<tr>
<td>Update Employee Personal Information - Global</td>
<td>Updates the global information of the specified employee.</td>
<td></td>
</tr>
<tr>
<td>Update Employee Start Dates</td>
<td>Updates the start date of employment of the specified employee.</td>
<td></td>
</tr>
<tr>
<td>Login into SuccessFactors</td>
<td>Logs in to SAP SuccessFactors and retrieves the Session ID.</td>
<td></td>
</tr>
<tr>
<td>Retrieve Current Employment Information</td>
<td>Retrieves the current employment information from SAP SuccessFactors.</td>
<td></td>
</tr>
<tr>
<td>Retrieve Departments</td>
<td>Retrieves the department data from SAP SuccessFactors.</td>
<td></td>
</tr>
<tr>
<td>Retrieve Effective Worker Profiles</td>
<td>Retrieves the Effective Worker Profiles data from SAP SuccessFactors.</td>
<td></td>
</tr>
<tr>
<td>Retrieve Job History Including Secondary Assignments</td>
<td>Retrieves the job history data including secondary assignments from SAP SuccessFactors.</td>
<td></td>
</tr>
<tr>
<td>Retrieve Job Profiles</td>
<td>Retrieves the job profile data from SAP SuccessFactors.</td>
<td></td>
</tr>
<tr>
<td>Retrieve Locations</td>
<td>Retrieves the location data from SAP SuccessFactors.</td>
<td></td>
</tr>
<tr>
<td>Retrieve Worker Profiles</td>
<td>Retrieves the Worker Profiles data from SAP SuccessFactors.</td>
<td></td>
</tr>
<tr>
<td>Get Holiday Calendar</td>
<td>Retrieves holiday calendar for a country.</td>
<td></td>

<tr>
<td></td>
<td>Get Pick List Options</td>
<td>Retrieves all the available pick list options for the specified pick list ID.</td>
</tr>
<tr>
<td></td>
<td>Get Pick List Options By Country</td>
<td>Retrieves the pick list options of the specified country.</td>
</tr>
<tr>
<td></td>
<td>Get Recurring Pay Components Defined for Employee</td>
<td>Retrieves recurring pay components and relevant information for the specified employee.</td>
</tr>
<tr>
<td></td>
<td>Get Required Fields - Creatable</td>
<td>Retrieves all the required insertable fields in the specified entity.</td>
</tr>
<tr>
<td></td>
<td>Get Time Types By User ID</td>
<td>Retrieves all the available time types of the specified employee in SAP SuccessFactors.</td>
</tr>
<tr>
<td></td>
<td>Get Updatable Todo Fields</td>
<td>Retrieves the list of updatable fields in the SuccessFactors Outbound Todos Staging table.</td>
</tr>
<tr>
<td>Record Management</td>
<td>Create Record</td>
<td>Creates a record in SAP SuccessFactors.</td>
</tr>
<tr>
<td></td>
<td>Delete Record</td>
<td>Deletes the specified record in SAP SuccessFactors.</td>
</tr>
<tr>
<td></td>
<td>Execute Entity By URL</td>
<td>Takes navigation URL as input and provides the response for that navigation URL.</td>
</tr>
<tr>
<td></td>
<td>Get Record</td>
<td>Retrieves the record for the selected entity and for the given key fields.</td>
</tr>
<tr>
<td></td>
<td>Update Record</td>
<td>Updates details of the specified record.</td>
</tr>
<tr>
<td>Todos</td>
<td>Create Todo</td>
<td>Create a todo record in SAP SuccessFactors.</td>
</tr>
<tr>
<td></td>
<td>Get Todo By ID</td>
<td>Get details of a todo from SAP SuccessFactors.</td>
</tr>
<tr>
<td></td>
<td>Retrieve Todos</td>
<td>Retrieves the todo data from SAP SuccessFactors, except those with Category ID as 57.</td>
</tr>
<tr>
<td></td>
<td>Update Todo</td>
<td>Updates details of the specified todo record.</td>
</tr>
<tr>
<td>Utility Category</td>
<td>Call A SuccessFactors Subflow</td>
<td>Executes the specified SAP SuccessFactors spoke subflow synchronously.</td>
</tr>
<tr>
<td></td>
<td>Call Run SuccessFactors Service Subflow</td>
<td>Executes the Run SuccessFactors Service subflow asynchronously.</td>
</tr>
<tr>
<td></td>
<td>Check Flow Status</td>
<td>Checks if the context of flow is currently running.</td>
</tr>
<tr>
<td></td>
<td>Get Last Run Date</td>
<td>Retrieves the last run date and time of the flow.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>Update Record In Outbound Todos Staging Table</td>
<td>Updates details of the specified todo record in SuccessFactors Outbound Todos Staging Table.</td>
</tr>
</tbody>
</table>

**Note:** If a spoke action requires date or time as an input, ensure that you provide the value in GMT time zone only.

**Spoke modules**

The SAP SuccessFactors spoke adds a SuccessFactors application to your ServiceNow instance. The SuccessFactors application has these modules.

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department Staging Table</td>
<td>Displays the department data retrieved from SAP SuccessFactors.</td>
</tr>
<tr>
<td>Locations Staging Table</td>
<td>Displays the location data retrieved from SAP SuccessFactors.</td>
</tr>
<tr>
<td>Job Profile Staging Table</td>
<td>Displays the job profile data retrieved from SAP SuccessFactors.</td>
</tr>
<tr>
<td>Worker Profiles Staging Table</td>
<td>Displays the worker profile data retrieved from SAP SuccessFactors.</td>
</tr>
<tr>
<td>Inbound Todos Staging Table</td>
<td>Displays the todo records retrieved from SAP SuccessFactors.</td>
</tr>
<tr>
<td>Outbound Todos Staging Table</td>
<td>Displays the todo records created in ServiceNow. When a todo record is</td>
</tr>
<tr>
<td></td>
<td>created or updated in ServiceNow, the Create Todo or Update Todo flow</td>
</tr>
<tr>
<td></td>
<td>is triggered and the same record is created or updated in SAP SuccessFactors.</td>
</tr>
<tr>
<td></td>
<td>All the associated record details, are retrieved from SAP SuccessFactors.</td>
</tr>
<tr>
<td></td>
<td>and saved in this staging table. If the flow fails to create or update</td>
</tr>
<tr>
<td></td>
<td>record in SAP SuccessFactors, the associated record or updates in ServiceNow</td>
</tr>
<tr>
<td></td>
<td>is also deleted.</td>
</tr>
<tr>
<td>Employee Job Information And History</td>
<td>Displays the job information and job history of all users.</td>
</tr>
<tr>
<td>View My Time Off Balance</td>
<td>Displays the time off balance of the logged in user.</td>
</tr>
<tr>
<td>View My Time Off Details</td>
<td>Displays details of the time off requests of the logged in user.</td>
</tr>
<tr>
<td>Webhook Registry</td>
<td>Displays the list of webhook registries. Admin must create webhook registry</td>
</tr>
<tr>
<td></td>
<td>here. For more information, see <a href="#">Set up webhook for the SAP SuccessFactors spoke</a>.</td>
</tr>
<tr>
<td>View My Time Card Details For Past 1 Month</td>
<td>Displays time card details of the previous one month for the logged in user.</td>
</tr>
<tr>
<td>View My Worker Profile</td>
<td>Displays the worker profile details of the logged in user.</td>
</tr>
<tr>
<td>View My Holiday Calendar</td>
<td>Displays the holiday calendar applicable to the logged in user.</td>
</tr>
<tr>
<td>Module</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td>View My Reporting Structure</td>
<td>Displays the reporting structure details of the logged in user.</td>
</tr>
<tr>
<td>View My Direct Deposit Information</td>
<td>Displays the direct deposit details of the logged in user.</td>
</tr>
<tr>
<td>View My Total Rewards</td>
<td>Displays the total rewards of the logged in user.</td>
</tr>
</tbody>
</table>

To retrieve the data, run Run SuccessFactors Integration Flow. The data in the staging tables is available for 7 days. During this time period, you must use transform maps to save this data in the required target ServiceNow tables as per your requirement.

**Spoke transform maps**

The SAP SuccessFactors spoke provides sample transform maps in inactive state and associated sample target tables to demonstrate using transform maps to save SAP SuccessFactors data in your ServiceNow tables. You can use these sample transform maps and target tables as reference to create transform maps as per your requirement.

For more information, see *Transform maps*.

**Spoke user roles**

These user roles are available along with the spoke:

- **SuccessFactors Admin (sn_successfactors.SuccessFactors Admin)**: Users with this role have access all spoke modules and tables.
- **SuccessFactors Private Data (sn_successfactors.SuccessFactors Private Data)**: Users with this role have access to data in these spoke modules:
  - View My Direct Deposit Information
  - View My Total Rewards
- **SuccessFactors Public Data (sn_successfactors.SuccessFactors Public Data)**: Users with this role have access to data in these spoke modules:
  - View My Time Off Balance
  - View My Time Off Details
  - View My Time Card Details For Past 1 Month
  - View My Worker Profile
  - View My Holiday Calendar
  - View My Reporting Structure

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

Two connection and credential aliases are available with the SAP SuccessFactors spoke; one for the SOAP API and other for the OData API.
Set up the SAP SuccessFactors spoke

Integrate the ServiceNow instance with your SAP SuccessFactors instance using basic credentials.

- Request IntegrationHub subscription
- Activate the SAP SuccessFactors spoke
- Enable these system properties:
  - glide.pf.rest.response_payload_max_size
  - com.snc.process_flow.reporting.serialized.val_size_limit
  - com.glide.transform.json.max-partial-length

- Ensure that you create user records for all SAP SuccessFactors users in the Users [sys_user] table of your ServiceNow instance.

**Note:** User ID of these users is the ServiceNow user ID.

- Role required: admin

Create Credential record for the OData API

Create Credential record for the OData APIs in SAP SuccessFactors. The SAP SuccessFactors spoke connection and credential alias uses these credentials to authorize actions using the OData API.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **Basic Auth Credentials**.
   A blank Basic Auth Credentials form displays.
4. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter SAPSF OData Credentials.</td>
</tr>
<tr>
<td>User name</td>
<td>User name with the OData API permission in this format: &lt;username&gt;@&lt;SAP-SuccessFactors-CompanyID&gt;.</td>
</tr>
<tr>
<td>Password</td>
<td>Associated password.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

The credential record to authorize actions using the OData API is created.

Create Credential record for the SOAP API

Create Credential record for the SOAP APIs in SAP SuccessFactors. The SAP SuccessFactors spoke connection and credential alias uses these credentials to authorize actions using the SOAP APIs.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **SuccessFactors SOAP Credentials**.
   A blank SuccessFactors SOAP Credentials form displays.
4. On the form, fill these values.
### Field | Value required
---|---
Name | Name to uniquely identify the record. For example, SAPSF Comp Emp Credentials.
User name | User name with the SOAP API permission.
Password | Associated password.
Active | Option to actively use the credential record.
Order | Order to apply this credential. For example, enter 100.

5. Click **Submit**.

The credential record to authorize actions using the SOAP API is created.

#### Create Connection record for the OData API
Create a Connection record for the OData API in SAP SuccessFactors. The SAP SuccessFactors spoke connection and credential alias uses these connections to perform actions in SAP SuccessFactors.

1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **SuccessFactors OData API**. For example, **SuccessFactors_Odata**.
3. From the **Connections** tab, click **New**.
   
   The system displays a blank HTTP(s) Connection form.
4. On the form, fill these values.

#### HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, SF_REST.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for the OData API. For example, SAPSF OData Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

The connection record for the OData API in SAP SuccessFactors is created.

#### Create Connection record for the SOAP API
Create a Connection record for the SOAP API in SAP SuccessFactors. The SAP SuccessFactors spoke connection and credential alias uses these connections to perform actions in SAP SuccessFactors.

1. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open for the record for **SuccessFactors SOAP API**. For example, **SuccessFactors_Comp_Emp**.
3. From the **Connections** tab, click **New**.
   
   The system displays a blank HTTP(s) Connection form.
4. On the form, fill these values.
HTTP(s) Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, SF_REST.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for the SOAP API. For example, SAPSF Comp Emp Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>SAP SuccessFactors connection URL. For example, <a href="https://salesdemo4.successfactors.com/sfapi/v1/soap">https://salesdemo4.successfactors.com/sfapi/v1/soap</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
</tbody>
</table>

5. In the Attributes tab, provide these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Company Id</td>
<td>Immutable Company ID of your SAP SuccessFactors instance.</td>
</tr>
<tr>
<td>Flow Timeout (seconds)</td>
<td>Maximum time in seconds up to which data can be received from SAP SuccessFactors during the flow execution. If the time taken to retrieve data from SuccessFactors exceeds the timeout duration, the flow or subflow is cancelled. Default value is, 30.</td>
</tr>
</tbody>
</table>

6. Click Submit.

The connection record for the SOAP API in SAP SuccessFactors is created.

Synchronise data between SAP SuccessFactors and ServiceNow

Customise the sample flows as per your requirement to synchronise data between your SAP SuccessFactors and ServiceNow instances.

Todo entity

The SAP SuccessFactors spoke provides sample flows to synchronise data bi-directionally for the todo entity. The sample flow, Run SuccessFactors Integration Flow can customised to retrieve data from SAP SuccessFactors, while the Create Todo and Update Todo flows creates or updates the todo records in SAP SuccessFactors when events occur in ServiceNow. While customising the sample flows, ensure that you provide appropriate triggers to retrieve and save future updates using transform maps.

Other default entities

For these entities, the sample flow, Run SuccessFactors Integration Flow, can be customised to retrieve data from SAP SuccessFactors:

- Department
- Location
- Job Profile
- Workers Profile
- Effective Workers Profile
- Job History Including Secondary Assignments
To create or update records in SAP SuccessFactors for these entities when events occur in ServiceNow:

- Create flows or subflows as per your choice or customise the sample flows and subflows.
- Use Metadata Retrieval and Record Management actions in your flows.
- Ensure that you provide appropriate triggers to retrieve and save future updates using transform maps.

**Other SAP SuccessFactors entities**

Depending on the SAP SuccessFactors permissions and configurations, you can also synchronise data of other entities as per your requirement.

**Set up webhook for the SAP SuccessFactors spoke**

Configure a webhook to subscribe to your SAP SuccessFactors account with a ServiceNow callback URL.

- **Set up the SAP SuccessFactors spoke**
- Role required: admin

1. Configure the default decision table.
   a) Navigate to System Definition > Decision Tables.
   b) Search for the record, SuccessFactors Webhook and open it.
   c) In the Decision Inputs tab, open the Webhook Event record.
   d) In the Choices tab, create record for the event for which you want to subscribe. For example, enter Employee Time Off in Label and Name to subscribe to the Employee Time Off events.
   e) Navigate back to the SuccessFactors Webhook record.
   f) In the Decisions tab, open the Default Decision record.
   g) Select the required webhook event in Condition and select the subflow in Answer.

   When the specified webhook event occurs, the associated subflow is triggered.

   **Note:** You can customise the default subflow or create a subflow as per your requirement.

2. Create a webhook registry.
   a) Navigate to SuccessFactors Spoke > Webhook Registry.
   b) Click New.
   c) On the form, enter SuccessFactors Webhook Authentication for Name and provide Description.

   **Note:** The Name of the webhook registry must be SuccessFactors Webhook Authentication.

   d) Click Generate Username and Password.

   Username and Password are generated and the values are displayed.

   e) Copy and record the values of the generated values for later use.

3. Copy and record the value of Resource path.
   a) Navigate to System Web Services > Scripted REST APIs.
   b) Search for the record, SuccessFactorsWebhook and open it.
   c) In the Resources tab, click the processWebhook record.
d) Copy and record the value provided in Resource path.

4. Configure events in your SAP SuccessFactors instance.
   a) Log in to your SAP SuccessFactors instance and navigate to Admin Center > Event Notification Subscription.
   b) In the External Event tab, provide these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint URL</td>
<td>ServiceNow instance endpoint URL in this format: https://&lt;servicenow-</td>
</tr>
<tr>
<td></td>
<td>instance&gt;.com/&lt;resource-path&gt;</td>
</tr>
<tr>
<td>Authentication</td>
<td>Select Basic.</td>
</tr>
<tr>
<td>User</td>
<td>User name generated when the webhook registry is created.</td>
</tr>
<tr>
<td>Password</td>
<td>Password when the webhook registry is created.</td>
</tr>
</tbody>
</table>

c) Configure the subscriber in the Subscriber tab as per your requirement.

d) Select the required Service Event Bus Topic in the SEB External Event tab as per your requirement and select the events for which you want to receive notifications. For example, Employee Time Off.

ServiceNow eBonding spoke

The ServiceNow eBonding spoke demonstrates some common integration design patterns through a common use case of synchronizing incidents across ServiceNow instances.

Note: The ServiceNow eBonding spoke is included by default in your instance and doesn’t require an IntegrationHub or Orchestration subscription.

Base system eBonding actions

If you have multiple production instances in your environment, you might have a need to synchronize data across these instances. For example, one instance might manage internal applications (your source system) and another manages external customer facing applications (your target system). A common use case is an incident which initially opens on the source system, but it requires a correlated incident to be created and tracked on the target instance. The ServiceNow eBonding integration contains the following OOB actions to assist in creating the synchronization:

Create Remote Incident action

This action uses the source system incident details to create a new incident on the target instance. It passes the source incident number as the Correlation ID on the target system. It takes the target system incident number and updates the Correlation ID of the source system.

Source
- Incident #
- Correlation ID
- Incident Details

Target
- Incident #
- Correlation ID
- Incident Details

Lookup Remote Incident action
This action takes the remote incident number as input and retrieves more details about that incident, such as: short description, description, priority, etc.

**Update Remote Incident action**

This action uses the source incident details to update the remote incident with details from source instance. Look up of remote incident is performed using Correlation ID in source instance’s incident.

**Credential and Connection information for eBonding**

When building actions, you must decouple the connection and credential information from the action so there is a seamless transition from distinct production environments. This also makes it easier to share content and create content through the ServiceNow store.

As part of eBonding example, you can associate an OOB connection alias (sn_ebonding_ah.ServiceNow). Create an HTTP connection record and associate it with this alias. For credentials, ServiceNow web services supports a multitude of authentication mechanisms. Create a BasicAuth credential to start with, however, that login ID must have permissions to create, read, and update an incident on your remote system. An example HTTP connection:

![HTTP connection](image)

**Additional eBonding Script**

The Payloadbuilder script is included with this example. It builds a payload by reading a set of fields from an incident table used in the REST steps for these actions.

**Slack spoke**

Use Slack to post messages and manage access to channels.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

**Spoke flows**

This spoke has no sample flows.

**Spoke subflows**

This spoke has no sample subflows.
## Spoke actions

The Slack spoke provides actions to automate Slack workspace tasks when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Channel Management</strong></td>
<td>Add User to Channel</td>
<td>Adds an existing user to the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Archive Channel</td>
<td>Archives the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Create Channel</td>
<td>Creates the specified channel in a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Remove User from Channel</td>
<td>Removes a user from the specified channel in the Slack workspace.</td>
</tr>
<tr>
<td><strong>Notification Management</strong></td>
<td>Post a Message</td>
<td>Posts a message in the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Post Change Details</td>
<td>Posts Change record details to the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Post Incident Details</td>
<td>Posts Incident record details to the specified channel.</td>
</tr>
<tr>
<td></td>
<td>Post Problem Details</td>
<td>Posts Problem record details to the specified channel.</td>
</tr>
<tr>
<td><strong>User Management</strong></td>
<td>Create User</td>
<td>Creates a user in the specified Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Deactivate User</td>
<td>Deactivates the specified user from a Slack workspace.</td>
</tr>
<tr>
<td></td>
<td>Lookup User</td>
<td>Returns information about the specified user such as name, time zone, workspace admin rights, and team ownership.</td>
</tr>
</tbody>
</table>

**Note:** To perform the channel management actions, enable these Slack application scope permissions:
- channels:write
- groups:write

For more information, see *Configure Slack workspace*.

**Note:** To perform the notification management actions, enable the chat:write Slack application scope permission. For more information, see *Configure Slack workspace*.

**Note:** To perform the user management actions, enable these Slack application scope permissions:
- users:read.email
- users:read
- admin

For more information, see *Configure Slack workspace*.

## Slack account requirements

The Slack spoke requires creating a custom app on your Slack account to generate OAuth 2.0 tokens for the Slack spoke. See *Configure Slack workspace*.
Connection and credential alias requirements

IntegrationHub uses aliases to manage connection information and OAuth credentials. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection.

This spoke uses the Slack alias record to authorize actions on Slack.

<table>
<thead>
<tr>
<th>Connection alias</th>
<th>Description</th>
<th>Connection URL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slack</td>
<td>Connection to Slack.</td>
<td><a href="https://slack.com">https://slack.com</a></td>
</tr>
</tbody>
</table>

Set up Slack spoke

Integrate the ServiceNow instance and your Slack account by creating a custom OAuth application in Slack to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Role required: admin

Configure Slack workspace

Create a custom OAuth application on your Slack workspace to enable OAuth 2.0 authentication with the Slack spoke.

Slack requirements:
- Slack account
- Slack workspace owner credentials for admin scope permissions

Complete these steps from your Slack account. See the Slack API documentation for instructions on creating and configuring custom applications.

1. From your Slack account, create a custom OAuth application.
2. Select standard OAuth 2.0 user authentication as the application authentication method.
3. Record the application client ID and client secret to register the app as a third-party OAuth provider on your ServiceNow instance.
4. Enable the matching Slack application scope permissions you want the app to support.

<table>
<thead>
<tr>
<th>Slack application scope permission</th>
<th>Required for</th>
</tr>
</thead>
<tbody>
<tr>
<td>chat:write</td>
<td>Post Message, Post Incident Details, Post Change Details, Post Problem Details actions, and Send messages as your Slack app</td>
</tr>
<tr>
<td>channels:write</td>
<td>Create Channel, Achieve Channel, Add User to Channel, and Remove User from Channel actions</td>
</tr>
<tr>
<td>groups:write</td>
<td></td>
</tr>
<tr>
<td>im:write</td>
<td></td>
</tr>
<tr>
<td>mpim:write</td>
<td></td>
</tr>
<tr>
<td>users:read.email</td>
<td>Lookup User action</td>
</tr>
<tr>
<td>users:read</td>
<td></td>
</tr>
<tr>
<td>admin (Only available to Slack workspace owners)</td>
<td>Create User and Deactivate User actions.</td>
</tr>
</tbody>
</table>
**Register Slack as OAuth provider**
Use the information generated during Slack workspace configuration to register Slack as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

- Request IntegrationHub subscription
- **Configure Slack workspace**
- Role required: admin

1. **Navigate to System OAuth > Application Registry.**
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
   The system displays a blank Application Registries form.
4. **Enter these values.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter Slack OAuth.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Enter the Client ID you created during the Slack workspace configuration.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Enter the Client Secret you created during the Slack workspace configuration.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Select Authorization Code.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Enter <a href="https://slack.com/api/oauth.v2.access">https://slack.com/api/oauth.v2.access</a>.</td>
</tr>
<tr>
<td>Access Token Lifespan</td>
<td>Enter a value in seconds for the access token expiration. After expiration, you must generate a new token. The maximum value is 2,144,448,000.</td>
</tr>
<tr>
<td>(Requires configuring form layout to display field)</td>
<td></td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click **Save**.
   The system validates the OAuth credentials and populates the **OAuth Entity Profiles** related list and **Redirect URL**.

6. In the **OAuth Entity Scopes** related list, create entries for the same scopes you had configured in your Slack workspace in this format.

<table>
<thead>
<tr>
<th>Name</th>
<th>OAuth scope</th>
</tr>
</thead>
<tbody>
<tr>
<td>chat:write</td>
<td>chat:write</td>
</tr>
<tr>
<td>chat:write:bot</td>
<td>chat:write:bot</td>
</tr>
<tr>
<td>chat:write:user</td>
<td>chat:write:user</td>
</tr>
<tr>
<td>channels:write</td>
<td>channels:write</td>
</tr>
<tr>
<td>groups:write</td>
<td>groups:write</td>
</tr>
<tr>
<td>im:write</td>
<td>im:write</td>
</tr>
<tr>
<td>mpim:write</td>
<td>mpim:write</td>
</tr>
<tr>
<td>users:read.email</td>
<td>users:read.email</td>
</tr>
<tr>
<td>users:read</td>
<td>users:read</td>
</tr>
</tbody>
</table>
7. Open the default record in the **OAuth Entity Profiles** related list. In the **OAuth Entity Profile Scopes** related list, specify the same scopes you had earlier specified in the **OAuth Entity Scopes** related list.

8. Copy the value from **Redirect URL**.

9. Login to your Slack workspace to edit the configuration of your custom Slack application. See the **Slack API** for instructions.

10. Paste the **Redirect URL** value into the OAuth 2.0 Redirect URI for your custom Slack application. For example, paste `https://instance.service-now.com/oauth_redirect.do`.

The instance can request OAuth 2.0 tokens for the spoke.

**Note:** The spoke generates OAuth tokens that expire after 24 days. An administrator can regenerate the spoke OAuth token every 24 days.

---

### Create Credential record for the Slack spoke
Create a Credential record for the Slack custom OAuth application you created during Slack workspace configuration. The Slack spoke connection and credential alias uses this credential to authorize actions.

- Request IntegrationHub subscription
- Configure Slack workspace
- Role required: admin

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**. The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**. The pop-up window displays a blank OAuth 2.0 Credentials form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the record. For example, enter <strong>Slack Credential</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>Select the OAuth profile you created when you registered the custom Slack application as an OAuth provider. For example, select <strong>Slack OAuth default profile</strong>.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Servers that can use this credential. For example, select <strong>All MID Servers</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Select the order to apply this credential. For example, enter <strong>100</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.
Create Connection record for the Slack spoke
Create a Connection record to your Slack workspace. The Slack spoke connection and credential alias uses this connection to perform actions on your Slack workspace.

- Request IntegrationHub subscription
- Configure Slack workspace
- Create Credential record for the Slack spoke
- Role required: admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open for the record for Slack.
3. From the Connections tab, click New.
   The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter Slack Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for the Slack workspace. For example, select Slack Credential.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Regenerate Slack OAuth token
Regenerate the Slack OAuth token when it expires. The Box spoke OAuth token expires every twenty four days.

- Request IntegrationHub subscription
- Create Credential record for the Slack spoke
- Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Select the Slack spoke OAuth Credential record.
   For example, select Slack Credential.
3. From Related Links, click Get OAuth Token.

The Slack spoke receives a new OAuth access token good for 24 days.

Slack webhooks spoke
Use Slack webhooks to post messages and record details for ServiceNow incidents, problems, and changes to Slack channels.

IntegrationHub subscription
This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.
Spoke actions

The Slack webhooks spoke is an available integration through IntegrationHub. You can specify the following Slack actions within a flow:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post a Message</td>
<td>Send a message to a Slack channel using an Incoming Webhook. Specify the Webhook URL and Message to send.</td>
</tr>
<tr>
<td>Post Change Details</td>
<td>Send details about a ServiceNow change record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Change record to send.</td>
</tr>
<tr>
<td>Post Incident Details</td>
<td>Send details about a ServiceNow incident record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Incident record to send.</td>
</tr>
<tr>
<td>Post Problem Details</td>
<td>Send details about a ServiceNow problem record to a Slack channel using a Webhook Connector. Specify the Webhook URL and Problem record to send.</td>
</tr>
</tbody>
</table>

Slack Inputs

The following inputs are common to Slack webhooks spoke actions:

<table>
<thead>
<tr>
<th>Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Required] Webhook URL</td>
<td>The Slack webhook for sending a message. Set up the webhook before configuring this action. Refer to the custom incoming webhook for Slack documentation.</td>
</tr>
<tr>
<td>[Optional] Additional Message</td>
<td>Add a message before the record details.</td>
</tr>
<tr>
<td>[Optional] Channel</td>
<td>Specify the Slack channel to post information.</td>
</tr>
<tr>
<td>Username</td>
<td>Specify a username to include in your post.</td>
</tr>
<tr>
<td>[Optional] Override Default Field</td>
<td>You can provide a comma-separated list of field names to send instead of the default fields. Default fields are Short Description, Category, State, Priority, and Assignment Group.</td>
</tr>
<tr>
<td>[Optional] Icon</td>
<td>Add an icon to the communication.</td>
</tr>
</tbody>
</table>

Note: If you do not specify a Username, Channel, or Icon, it will post the message using the defaults as configured in your webhook. If you specify them here, they will override those defaults.
Example

You can add a Slack Post Incident Details action to a flow which identifies newly created high priority incidents, a username, and a specific slack channel.

ServiceNow Remote Instance spoke

Integrate your local and remote ServiceNow instances to export, import, and manage records from your local instance.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for the Orlando version and later.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke actions

The ServiceNow Remote Instance spoke provides actions to export, import, and manage records when events occurs in your local ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change request Management</td>
<td>Export Change Request Record</td>
<td>Exports a change request record to a remote instance from the local instance.</td>
</tr>
<tr>
<td></td>
<td>Import Change Request Record</td>
<td>Imports a record from the Change Request table of the remote instance to the local instance.</td>
</tr>
<tr>
<td>Incident Management</td>
<td>Export Incident Record</td>
<td>Exports an Incident record to a remote instance from the local instance.</td>
</tr>
<tr>
<td></td>
<td>Import Incident Record</td>
<td>Imports a record from Incident table of the remote instance to the local instance.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Problem Management</td>
<td>Export Problem Record</td>
<td>Exports a Problem record to a remote instance from the local instance.</td>
</tr>
<tr>
<td></td>
<td>Import Problem Record</td>
<td>Imports a record from Problem table of the remote instance to the local instance.</td>
</tr>
<tr>
<td>Record Management</td>
<td>Create or Update Remote Record Using Import Set</td>
<td>Creates a record in a remote import set. This, in turn, either creates a record or updates an existing record.</td>
</tr>
<tr>
<td></td>
<td>Export Record Using Import Set</td>
<td>Exports a record from selected local table to a remote instance.</td>
</tr>
<tr>
<td></td>
<td>Import Record Using Import Set</td>
<td>Imports a record from table in the remote instance to the local instance.</td>
</tr>
<tr>
<td>Table Management</td>
<td>Look Up Fields By Remote Table</td>
<td>Retrieves all the fields from the given remote table.</td>
</tr>
<tr>
<td></td>
<td>Look Up Local Import Set Tables</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Look Up Remote Import Set Tables</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Look Up Remote Tables</td>
<td></td>
</tr>
</tbody>
</table>

**Spoke transform maps**

The ServiceNow Remote Instance spoke provides sample transform maps in active state and associated sample target tables to demonstrate using transform maps to save the remote ServiceNow instance data in your local ServiceNow tables. You can use these sample transform maps and target tables as reference to create transform maps as per your requirement.

For more information, see *Transform maps*.

**Note:**
- By default, the sample transform maps uses `sys_id` as the coalesce field. You can customise the transform map script as per your requirement to change the coalesce field.
- By default, the export and import actions use the spoke tables. You can change this to use different import sets.
- The time zones may be different in your ServiceNow instances. Ensure that you customise flows accordingly.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

Two connection and credential aliases are required for this spoke; one for the local instance and other for the remote instance.
Set up the ServiceNow Remote Instance spoke

Integrate the local and remote ServiceNow instances by creating an OAuth API endpoint in the remote ServiceNow instance to authenticate requests.

- Request IntegrationHub subscription.
- Activate ServiceNow Remote Instance spoke in remote and local ServiceNow instances.
- Role required: admin

Register remote ServiceNow instance as an OAuth provider

Register remote ServiceNow instance as an OAuth provider so that the local ServiceNow instance can request OAuth 2.0 tokens.

- In the remote ServiceNow instance:
  - Create an OAuth API endpoint for external clients. In Redirect URL, specify the URL of the local ServiceNow instance in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`. For more information, see Create an endpoint for clients to access the instance.
  - Copy and record the values of Client ID and Client Secret.

- Role required: admin

1. Navigate to System OAuth > Application Registry.
2. Open for the record, RemoteSpoke.
3. On the form, fill these values.

### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client ID</td>
<td>Client ID created in the remote ServiceNow instance.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created in the remote ServiceNow instance.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>URL of the remote ServiceNow instance in this format: <code>https://&lt;instance-name&gt;.service-now.com/oauth_auth.do</code>.</td>
</tr>
<tr>
<td>Token URL</td>
<td>URL of the remote ServiceNow instance in this format: <code>https://&lt;instance-name&gt;.service-now.com/oauth_token.do</code>.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>URL of the remote ServiceNow instance in this format: <code>https://&lt;instance-name&gt;.service-now.com/oauth_redirect.do</code>.</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
</tbody>
</table>
PKCE required | Option to enable public clients to require PKCE for an authorization.
---|---

Application | Application scope that contains this record.
Accessible from | Application scope that this registry is accessible from.
Active | Option to actively use the application registry.

4. Right-click the form header, and click **Save**.

Create Credential record for the remote ServiceNow instance

Create credential record for the remote ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to **Connections & Credentials > Credentials**.
2. Click **New**.
   
   The system displays the message *What type of Credentials would you like to create?*.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Remote Credentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth profile created during the registration of the remote ServiceNow instance as an OAuth provider. For example, select RemoteSpoke default_profile.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the credentials are used. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click **Submit**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

Create Connection record for the remote ServiceNow instance

Create Connection record for your remote ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential aliases use these connections to perform actions.

1. Navigate to **Connections & Credentials > Connections & Credentials Aliases**.
2. Open the alias record, **ServiceNowRemoteInstance**.
3. From the **Connections** tab, click **New**.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Name</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Remote Connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for remote ServiceNow instance. For example, Remote Credentials.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note:</strong> Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the remote ServiceNow instance. For example, https://&lt;remote-instance-name&gt;service-now.com/.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click Submit.

*Create Credential record for the local ServiceNow instance*

Create credential record for the local ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.

   The system displays the message **What type of Credentials would you like to create?**.
3. Select Basic Auth Credentials.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Local Credentials.</td>
</tr>
<tr>
<td>Username</td>
<td>Username to log in to the local ServiceNow instance.</td>
</tr>
<tr>
<td>Password</td>
<td>Password to log in to the local ServiceNow instance.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
</tbody>
</table>

5. Right-click the form header and click Submit.

*Create Connection record for the local ServiceNow instance*

Create Connection record for your local ServiceNow instance. The ServiceNow Remote Instance spoke connection and credential aliases use these connections to perform actions.

1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record, ServiceNowRemoteInstanceLocalAlias.
3. From the Connections tab, click New.
4. On the form, fill in the fields.

   **HTTP(s) Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Local Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for local ServiceNow instance. For example, Local Credentials.</td>
</tr>
<tr>
<td>Field</td>
<td>Value required</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL of the local ServiceNow instance. For example, https://&lt;local-instance-name&gt;service-now.com/.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**Twilio spoke v1.1.2**

Use the Twilio spoke to send SMS, make voice calls, create conference calls, manage calls, manage short codes, notify services, and messaging services.

**Request apps on the Store**

Visit the [ServiceNow Store](https://servicenow.com/appcenter) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](https://servicenow.com/appcenter).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Starter subscription package. For more information, see [Request IntegrationHub](https://servicenow.com/appcenter).

**Supported versions**

This spoke was built for Twilio Base version 2010-04-01, Twilio Messaging version v1, and Twilio Notify version v1, but may be compatible with later versions.

**Spoke requirements**

- Twilio account.
- `AccountSid` and `AuthToken` of the account to create a Basic Auth credential.
- Activate these plugins:
  - ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
  - ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
  - ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)

See [Twilio documentation](https://www.twilio.com/docs) for instructions on creating an account.

**Spoke actions**

The Twilio spoke provides actions to automate sending SMS, making voice calls, and creating conference calls when events occur in ServiceNow. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Create Application</td>
<td>Creates an application resource in a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Delete Application</td>
<td>Deletes an application resource from a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Get Application</td>
<td>Retrieves the required application resource.</td>
</tr>
<tr>
<td></td>
<td>Look Up Accounts</td>
<td>Retrieves the account resources in a Twilio account. The list includes the account and its sub-account resources.</td>
</tr>
<tr>
<td></td>
<td>Look Up Applications</td>
<td>Retrieves the application resources in a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Update Application</td>
<td>Updates properties of an application resource in a Twilio account.</td>
</tr>
<tr>
<td>Call Management</td>
<td>Dequeue Call</td>
<td>Removes a call from a queue.</td>
</tr>
<tr>
<td></td>
<td>Get Call</td>
<td>Retrieves the required call resource.</td>
</tr>
<tr>
<td></td>
<td>Get Incoming Phone Number</td>
<td>Retrieves the incoming phone number resource.</td>
</tr>
<tr>
<td></td>
<td>Hang Up Call</td>
<td>Ends a call in progress.</td>
</tr>
<tr>
<td></td>
<td>Look Up Incoming Phone Numbers</td>
<td>Retrieves the incoming phone number resources in a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Make a Call With Recording</td>
<td>Places a call to a phone number and records the call.</td>
</tr>
<tr>
<td></td>
<td>Make a Call Without Recording</td>
<td>Places a call to a phone number and doesn't record the call.</td>
</tr>
<tr>
<td></td>
<td>Modify Call</td>
<td>Modifies a call in progress.</td>
</tr>
<tr>
<td></td>
<td>Mute Or Unmute Participant</td>
<td>Mutes or unmutes a participant resource in a conference call.</td>
</tr>
<tr>
<td></td>
<td>Remove Participant From Conference Call</td>
<td>Removes a participant resource from a conference call.</td>
</tr>
<tr>
<td></td>
<td>Update Incoming Phone Number</td>
<td>Updates properties of an incoming phone number resource in a Twilio account.</td>
</tr>
<tr>
<td>Messaging Service Management</td>
<td>Add Phone Number To Messaging Service</td>
<td>Adds a phone number resource to the messaging service.</td>
</tr>
<tr>
<td></td>
<td>Add Short Code To Messaging Service</td>
<td>Adds a short code resource to the messaging service.</td>
</tr>
<tr>
<td></td>
<td>Create Messaging Service</td>
<td>Creates a new messaging service resource in a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Delete Messaging Service</td>
<td>Deletes a messaging service resource from a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Look Up Messaging Service Phone Numbers</td>
<td>Retrieves the phone number resources in a messaging service.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-----------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Look Up Messaging Service Short Codes</td>
<td></td>
<td>Retrieves the short code resources associated with a messaging service.</td>
</tr>
<tr>
<td>Look Up Messaging Services</td>
<td></td>
<td>Retrieves the messaging service resources in a Twilio account.</td>
</tr>
<tr>
<td>Remove Phone Number From Messaging Service</td>
<td></td>
<td>Removes a phone number resource from a messaging service.</td>
</tr>
<tr>
<td>Remove Short Code From Messaging Service</td>
<td></td>
<td>Removes a short code resource from a messaging service.</td>
</tr>
<tr>
<td>Notification Service Management</td>
<td>Create Notify Service</td>
<td>Creates a new notify service resource in a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Delete Notify Service</td>
<td>Deletes a notify service resource from Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Look Up Notify Services</td>
<td>Retrieves the notify service resources in a Twilio account.</td>
</tr>
<tr>
<td>Short Code Management</td>
<td>Get Short Code</td>
<td>Retrieves a short code resource.</td>
</tr>
<tr>
<td></td>
<td>Look Up Short Codes</td>
<td>Retrieves the short code resources of a Twilio account.</td>
</tr>
<tr>
<td></td>
<td>Reset Short Code</td>
<td>Resets the short code resource.</td>
</tr>
<tr>
<td></td>
<td>Update Short Code</td>
<td>Updates properties of a short code resource in a Twilio account.</td>
</tr>
<tr>
<td>Text Messaging</td>
<td>Send Bulk SMS</td>
<td>Sends an SMS to multiple phone numbers.</td>
</tr>
<tr>
<td></td>
<td>Send SMS</td>
<td>Sends an SMS to a phone number.</td>
</tr>
</tbody>
</table>

**Note:** To receive information about Status Callbacks, you must configure webhooks in Twilio. See *Twilio documentation* for instructions on creating and configuring webhooks.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Note:** Three connection and credential alias records are needed for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each alias should be associated with the respective Twilio API.

**Set up Twilio spoke**

Integrate the ServiceNow instance and Twilio using basic authentication to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate Twilio spoke
• Role required: admin

Create Credential records for the Twilio spoke
Create Credential records to the Twilio server. The Twilio spoke connection and credential alias uses these credentials to authorize actions.

Create three credential records for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each credential should be associated with the respective Twilio API.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select Basic Auth Credentials.
4. On the form, fill these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter Twilio Base, Twilio Notify, or Twilio Messaging.</td>
</tr>
<tr>
<td>User name</td>
<td>Twilio Account SID.</td>
</tr>
<tr>
<td>Password</td>
<td>Twilio AuthToken.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order to apply this credential. For example, enter 100.</td>
</tr>
</tbody>
</table>

5. Click Submit.

The three required credential records are created for Twilio Base, Twilio Notify, and Twilio Messaging.

Create Connection records for the Twilio spoke
Create Connection records to your Twilio account. The Twilio spoke connection and credential alias uses these connections to perform actions on Twilio.

Create three connection records for the Twilio spoke; one each for Twilio Base, Twilio Notify, and Twilio Messaging. Each connection record should be associated with the respective Twilio API.

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Open record of the Twilio spoke.
3. From the Connections tab, click New.
4. On the form, fill these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the connection record. For example, enter Twilio Base Connection, Twilio Notify Connection, or Twilio Messaging Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record you created for Twilio. For example, select Twilio Base for Twilio Base Connection.</td>
</tr>
</tbody>
</table>
### Field | Value required
--- | ---
Connection URL | Connection URL.

- If the connection record is for Twilio Base, enter https://api.twilio.com/.
- If the connection record is for Twilio Notify, enter https://notify.twilio.com/.
- If the connection record is for Twilio Messaging, enter https://messaging.twilio.com/.

5. In the Attributes related list:
   - For the connection record of Twilio Base, enter **Account SID**.
   - Enter **Page size**.
   - Don't modify the default value of the **Version**.

6. Click **Submit**.

The three connection records are created. The ServiceNow instance and Twilio are integrated.

**Twitter spoke**

Use the Twitter spoke to automatically tweet messages or media in your Twitter account from your ServiceNow instance.

**Request apps on the Store**

Visit the *ServiceNow Store* website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the *ServiceNow Store version history release notes*.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Standard subscription package. For more information, see *Request IntegrationHub*.

**Supported versions**

API version v1.1.

**Spoke requirements**

- Twitter developer account
- Twitter developer app to access the Twitter APIs
- Access token and secret of your Twitter developer app
- Consumer key and secret from your Twitter developer app

See the *Twitter Developers* documentation for instructions on creating the developer application and gathering the required details.
Spoke actions

The Twitter spoke provides actions to automate tweeting when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tweet</td>
<td>Tweets a message or media. Messages and media are tweeted as per Twitter limits.</td>
</tr>
</tbody>
</table>

**Note:** If you wish to tweet media, use the Look Up Attachment Records action before this action in your custom flow to retrieve the required media.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

**Note:** Two connection and credential alias records are needed for the Twitter spoke; one for tweeting messages and other for tweeting media. Each alias should be associated with the respective Twitter API.

Create Credential records for the Twitter spoke

Authorize the Twitter spoke actions by creating credential records for the application registered in the Twitter developer account. The Twitter spoke connection and credential alias uses these credentials to authorize actions.

You must create two credential records; one for tweeting messages and other for tweeting media.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message, What type of Credentials would you like to create?
3. Select Twitter Credentials.
4. On the form, fill in the fields.

**Twitter Credentials form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, TwitterCredentials.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>Consumer Key</td>
<td>Consumer key of your Twitter developer app.</td>
</tr>
<tr>
<td>Consumer Secret</td>
<td>Consumer secret of your Twitter developer app.</td>
</tr>
<tr>
<td>Access Token</td>
<td>Access token of your Twitter developer app.</td>
</tr>
<tr>
<td>Access Token Secret</td>
<td>Access token secret of your Twitter developer app.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Credential alias record associated with this credential.</td>
</tr>
</tbody>
</table>

**Note:**
- If the credential record is created for tweeting messages, select the credential alias that is associated with the Twitter messaging API.
- If the credential record is created for tweeting media, select the credential alias that is associated with the Twitter media API.

5. Right-click the form header and click **Save**.

The credential record for the Twitter spoke is created.

**Create Connection records for the Twitter spoke**

Perform actions in Twitter by creating connection records for your Twitter account. The Twitter spoke connection and credential alias uses these connections to perform actions.

Two connection and credential alias records are available by default; one for tweeting messages and other for tweeting media. Perform these steps to associate each alias with the respective Twitter API.

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the required Twitter spoke record.

**Note:** There are two connection and credential records; **Twitter** and **Twitter_Media**. The **Twitter** record is for tweeting messages and **Twitter_Media** is for tweeting media.

3. In the Connections related list of the required record, click **New**.
4. On the form, fill in the fields.

**HTTP(s) Connection form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, <strong>Twitter Base</strong> or <strong>Twitter Media</strong>.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Twitter spoke. For example, <strong>Twitter</strong>.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>URL builder</td>
<td><strong>Note:</strong> Do not select the check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL.</td>
</tr>
<tr>
<td></td>
<td>• If the connection record is for tweeting messages, enter <a href="https://api.twitter.com">https://api.twitter.com</a>.</td>
</tr>
<tr>
<td></td>
<td>• If the connection record is for tweeting media, enter <a href="https://upload.twitter.com">https://upload.twitter.com</a>.</td>
</tr>
</tbody>
</table>
Use MID server | Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.
---|---
Active | Option to actively use the connection.
Domain | Domain that the action or activity runs in.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain that the action or activity runs in.</td>
</tr>
</tbody>
</table>

5. Click **Update**.

The Twitter spoke is set up and integrated with the ServiceNow instance.

**UiPath spoke v1.0.3**

Automate business processes in UiPath from your ServiceNow® instance.

**Request apps on the Store**

Visit the [ServiceNow Store](https://www.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](https://www.servicenow.com).

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see [Request IntegrationHub](https://www.servicenow.com).

**Supported version**

This spoke was built for these UiPath versions, but may be compatible with later versions.

- Platform version 2019.4.3
- Cloud Platform version 2020.1.219

**Note:** This version of the UiPath spoke doesn't support the on-premise UiPath solution.

**Spoke requirements**

Ensure that you have UiPath account information before you **Set up the UiPath spoke**.

- If you are using the UiPath Cloud Platform:
  - Token URL
  - Client Id
  - Account Logical Name
  - Tenant Logical Name
  - User Key
- If you are using the UiPath Platform installed on private or public cloud:
  - Tenant Name
• Credentials to authenticate the UiPath Orchestrator API

See the *UiPath documentation* for more information about obtaining the required details.

### Spoke actions

The UiPath spoke provides actions to manage environments, jobs, machines, processes, robots, and so on, when events occur in ServiceNow. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Environment Management</td>
<td>Get Environment By ID</td>
<td>Retrieves the details of the required environment.</td>
</tr>
<tr>
<td></td>
<td>Lookup Environments</td>
<td>Retrieves the details of the required environments. The environments are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Job Management</td>
<td>Get Job By ID</td>
<td>Retrieves the details of the required job.</td>
</tr>
<tr>
<td></td>
<td>Lookup Jobs</td>
<td>Retrieves the details of the required jobs. The jobs are retrieved based on the filter query.</td>
</tr>
<tr>
<td></td>
<td>Start Jobs</td>
<td>Starts the jobs to execute the required process.</td>
</tr>
<tr>
<td>Machine Management</td>
<td>Get Machine By ID</td>
<td>Retrieves the details of the required machine.</td>
</tr>
<tr>
<td></td>
<td>Lookup Machines</td>
<td>Retrieves the details of the required machines. The machines are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Process Management</td>
<td>Lookup Processes</td>
<td>Retrieves the details of the required processes. The processes are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Queue Management</td>
<td>Lookup Queues</td>
<td>Retrieves the details of the required queue definition records. The queues are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Release Management</td>
<td>Get Release By ID</td>
<td>Retrieves the details of the required release.</td>
</tr>
<tr>
<td></td>
<td>Lookup Releases</td>
<td>Retrieves the details of the required releases. The releases are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Robot Management</td>
<td>Create Robot</td>
<td>Creates a robot in UiPath.</td>
</tr>
<tr>
<td></td>
<td>Delete Robot</td>
<td>Deletes a robot in UiPath.</td>
</tr>
<tr>
<td></td>
<td>Get Robot By ID</td>
<td>Retrieves the details of the required robot.</td>
</tr>
<tr>
<td></td>
<td>Lookup Robots</td>
<td>Retrieves the details of the required robots. The robots are retrieved based on the filter query.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Session Management</td>
<td>Lookup Sessions</td>
<td>Retrieves the details of the required sessions. The sessions are retrieved</td>
</tr>
<tr>
<td></td>
<td></td>
<td>based on the filter query.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the UiPath spoke**

Integrate the ServiceNow instance with your UiPath account using to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the UiPath spoke
- Role required: admin

1. Navigate to *Connections & Credentials > Connection & Credential Aliases*.
2. Open the record for *UiPath*.
3. Select *Configuration Template* as per your requirement.
4. Click the *Create New Connection & Credential* related link.
5. On the form, fill these fields.

   - If you have selected *UiPath Configuration Template - UiPath Cloud* for *Configuration Template*, fill these fields.

**Create Connection and Credential form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name to identify the connection record. For example, <em>UiPath Connection</em>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Connection URL in this format: <a href="https://platform.uipath.com/">https://platform.uipath.com/</a></td>
</tr>
<tr>
<td></td>
<td>&lt;account-logical-name&gt;/ &lt;instance-logical-name&gt;</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name to identify the credential record. For example, <em>UiPath Credential</em>.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Location of the token endpoint that the instance uses to retrieve and refresh tokens. For example, <a href="https://account.uipath.com/oauth/token">https://account.uipath.com/oauth/token</a>.</td>
</tr>
<tr>
<td>Client Id</td>
<td>Client ID specific to the UiPath Orchestrator application.</td>
</tr>
<tr>
<td>Account Logical Name</td>
<td>Unique URL of the UiPath site.</td>
</tr>
<tr>
<td>Tenant Logical Name</td>
<td>Logical name of the service.</td>
</tr>
<tr>
<td>User Key</td>
<td>Unique login key you had generated.</td>
</tr>
</tbody>
</table>
If you have selected **UiPath Configuration Template - Private/Public Cloud** for **Configuration Template**, fill these fields.

### Create Connection and Credential form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Name</td>
<td>Name to identify the connection record. For example, <strong>UiPath Connection</strong>.</td>
</tr>
<tr>
<td>Connection URL</td>
<td><strong>UiPath</strong> instance URL.</td>
</tr>
<tr>
<td>Credential Name</td>
<td>Name to identify the credential record. For example, <strong>UiPath Credential</strong>.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Location of the token endpoint that the instance uses to retrieve and refresh tokens in this format: http://&lt;instance-URL&gt;/api/account/authenticate</td>
</tr>
<tr>
<td>Tenant Name</td>
<td>Tenant logical name.</td>
</tr>
<tr>
<td>Username or email</td>
<td>Username or email address to authenticate the <strong>UiPath Orchestrator API</strong>.</td>
</tr>
<tr>
<td>Password</td>
<td>Associated password.</td>
</tr>
</tbody>
</table>

6. Click **Create**.
7. Click **Submit**.

The Connection and Credential alias is configured and the **UiPath** spoke is set up.

### Utility Actions spoke

Create file attachments and zip attachments in your ServiceNow instance.

### Request apps on the Store

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.

### IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see **Request IntegrationHub**.

### Supported versions

This spoke is compatible with ServiceNow instance of Orlando and later versions.

### Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

### Spoke actions

The Utility Actions spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add File to Zip</td>
<td>Adds the file to list of files to be zipped.</td>
</tr>
<tr>
<td>Append to Delimited File</td>
<td>Creates a file line record, corresponding to a row in the delimited file.</td>
</tr>
<tr>
<td>Append to File</td>
<td>Creates a file line record, corresponding to a line in the file to be created.</td>
</tr>
<tr>
<td>Begin File</td>
<td>Creates a file record, to which the actual file would be attached.</td>
</tr>
<tr>
<td>Begin Zip</td>
<td>Creates a file set record, to which the zip file would be attached.</td>
</tr>
<tr>
<td>Build File</td>
<td>Generates the file and attaches it to the file record specified.</td>
</tr>
<tr>
<td>Build Zip</td>
<td>Generates the zip file and attaches it to the file set record specified.</td>
</tr>
</tbody>
</table>

**Note:** This action requires at least one MID Server with the IntegrationHub Utilities capability.

### Spoke module and tables

The Utility Actions spoke includes these tables:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>File [sn_utility_spoke_file]</td>
<td>Information about every file that has been created. The associated file is attached to the record.</td>
<td>File Name, File Type, Schema</td>
</tr>
</tbody>
</table>

**Note:** You must specify Schema if you specify Delimited File for File Type.
### Table

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>File Line [sn_utility_spoke_file_line]</td>
<td>Information about each row in delimited file.</td>
<td>• File</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Line Content</td>
</tr>
<tr>
<td>File Mapping [sn_utility_spoke_file_mapping]</td>
<td>Information about files mapped to a ZIP file. For example, if four files are zipped to a ZIP file, four records are created in this table for each file.</td>
<td>• File</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• File Set</td>
</tr>
<tr>
<td>File Schema [sn_utility_spoke_file_schema]</td>
<td>Information regarding the delimited files.</td>
<td>• Schema Name</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Columns</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Delimiter</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Has Header</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Quoted</td>
</tr>
<tr>
<td>File Set [sn_utility_spoke_file_set]</td>
<td>Information about the zip files. The associated ZIP file is attached to the record.</td>
<td>Zip File Name</td>
</tr>
</tbody>
</table>

The Utility Actions spoke adds the IntegrationHub Utilities application to your instance and includes the File Schemas module. The module displays records from the File Schema table.

Auto Flush data retention policies are available for the File and File Set tables. By default, the system retains data in the spoke tables, except the File Schema table, up to 7 days.

**Note:**
- Auto Flush data retention policies don't apply to records in the File Schema table.
- When the file records in the File table are deleted, the corresponding file line records in the File Line table are also deleted.
- When the file set records in the File Set table are deleted, the corresponding file mapping records in the File Mapping table are also deleted.

To modify the data retention policy, change the value of **Age in seconds** in the Auto Flush form of the required table. For more information, see *Auto Flush form*.

### Connection and credential alias requirements

This spoke doesn't require configuration of connection and credential alias.

### MID Server requirements

These actions use REST calls, which can run on a MID Server. For more information, see *MID server*.

**Note:**
- The Build Zip action in the spoke requires at least one MID Server with the capability IntegrationHub Utilities or ALL. To set up and configure the MID Server, user must have the role `sn_utility_spoke.utility_actions_admin` role.
Create a MID Server property with Value as *.service-now.com.

Create schema

Create schema to create delimited files in your ServiceNow instance.
Role required: sn_utility_spoke.utility_actions_admin

1. Navigate to IntegrationHub Utilities > File Builder > File Schemas.
2. Click New.
3. On the form, fill these values.

File Schema form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schema Name</td>
<td>Name to identify the schema record. For example, Incident Schema.</td>
</tr>
<tr>
<td>Delimiter</td>
<td>Delimiter in the file. For example, , and \t. The default value is comma.</td>
</tr>
<tr>
<td>Has Header</td>
<td>Option to specify if the schema has header.</td>
</tr>
<tr>
<td>Quoted</td>
<td>Option to escape the delimiters and surround all values with quotation marks.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Columns</td>
<td>Columns of the schema as a JSON array. For each column, specify column name and data type. For example,</td>
</tr>
<tr>
<td></td>
<td>[</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;: &quot;Number&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;type&quot;: &quot;string&quot; }</td>
</tr>
<tr>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;: &quot;Caller First Name&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;type&quot;: &quot;string&quot; }</td>
</tr>
<tr>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;: &quot;Caller Last Name&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;type&quot;: &quot;string&quot; }</td>
</tr>
<tr>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;: &quot;Short Description&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;type&quot;: &quot;string&quot; }</td>
</tr>
<tr>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;: &quot;State&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;type&quot;: &quot;choice&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;choices&quot;: [</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;label&quot;: &quot;New&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;value&quot;: &quot;New&quot; }</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;label&quot;: &quot;In Progress&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;value&quot;: &quot;In Progress&quot; }</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;label&quot;: &quot;On Hold&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;value&quot;: &quot;On Hold&quot; }</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;label&quot;: &quot;Resolved&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;value&quot;: &quot;resolved&quot; }</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;label&quot;: &quot;Closed&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;value&quot;: &quot;closed&quot; }</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;: &quot;Active&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;type&quot;: &quot;boolean&quot; }</td>
</tr>
</tbody>
</table>
4. Click **Submit**.

**Build a flow using the Utility Actions spoke actions**

Create a flow in Flow Designer using the Utility Actions spoke actions to create two files; one for incident records and other for user records, and zip these two files.

This sample flow demonstrates using the Utility Actions spoke actions to create files. You can configure the flow as per your requirement.

1. Navigate to **Flow Designer > Designer**.
2. Create a flow. See **Flows** for more information about creating flows.
3. In the flow, add these spoke actions or flow logics:
   a) Look Up Incident Records action to retrieve the incident records.
   b) Begin File action to create a file that will contain the incident records.
   c) For Each flow logic to apply the Append to Delimited File action to the list of incident records.
## 3.1 Append to Delimited File

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Append to Delimited File</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>2 + File</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Incident Schema</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Number</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Caller First Name</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Caller Last Name</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Short Description</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>State</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Active</td>
<td>✔️</td>
<td>✔️</td>
<td>✔️</td>
</tr>
</tbody>
</table>

+ Add Field Value
d) Build File action to add rows. Each incident record is added as a row in the file.
e) Perform similar steps to retrieve records from the User [sys_user] table.

f) Begin Zip action to build the ZIP file for the incident and user records.

g) Add File To Zip action to add file containing the incident records to the ZIP file.
h) Add File To Zip action to add file containing the user records to the ZIP file.
i) Build Zip action to create the ZIP file containing the incident and user records.
4. Save, test, and publish the flow to use it.
1. Look Up Incident Records
2. Begin File
3. For Each Item in Incident Records
   3.1. Append to Delimited File
4. Build File
5. Look Up User Records
6. Begin File
7. For Each Item in User Records
   7.1. Append to Delimited File
8. Build File
Unified Compliance Framework (UCF) spoke

Manage processes to collect and coordinate the compliance requirements applicable to your organization from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

• ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream)
• ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
• ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
• ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
• Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate license, if used outside the spoke implementation.

Supported version

This spoke was built for UCF v2.0, but may be compatible with later versions.

Spoke requirements

• Common Control Hub (CCH) account
• CCH administrator credentials

Spoke actions

The UCF spoke provides actions to automate UCF tasks when events occur in ServiceNow. Available actions include:
<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Record Management</td>
<td>Get Authority Documents</td>
<td>Retrieves authority documents that are downloaded from the UCF Common Controls Hub.</td>
</tr>
<tr>
<td></td>
<td>Get Citation Control Objective Mapping</td>
<td>Retrieves the Citation and Control objective mapping information.</td>
</tr>
<tr>
<td></td>
<td>Get Citation Documents</td>
<td>Retrieves the citations that are downloaded from the UCF Common Controls Hub.</td>
</tr>
<tr>
<td></td>
<td>Get Control Objective Documents</td>
<td>Retrieves the citation to controls that are downloaded from the UCF Common Controls Hub.</td>
</tr>
<tr>
<td>Metadata Retrieval</td>
<td>Get Authority Document List</td>
<td>Retrieves the current user's authority document lists.</td>
</tr>
</tbody>
</table>

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the UCF spoke**

Integrate the ServiceNow instance and UCF by creating a custom OAuth application in UCF to authenticate ServiceNow requests.

- Request IntegrationHub subscription
- Activate the UCF spoke
- Role required: admin

*Create application in UCF*

Create application in Common Controls Hub (CCH) to enable OAuth 2.0 authentication with the UCF spoke.

Role required: CCH administrator

1. Create application in UCF. For information about creating an application using your CCH account, see the *CCH Support* documentation.
2. While creating the application, ensure that you provide this information:
   - **Redirect URL**: ServiceNow instance URL in the format, `https://<Instance-Name>.service-now.com/oauth_redirect.do`
   - **Authorization URL**: Location on your website to which CCH redirects the interested users.
3. Copy and record the **Client ID** and **Client Secret** for later use.

The application is created in CCH to enable OAuth 2.0 authentication with the UCF spoke.

*Register UCF as OAuth provider*

Use the information generated during the application configuration in CCH, to register UCF as an OAuth provider and allow the ServiceNow instance to request OAuth 2.0 tokens.
Role required: admin

1. Navigate to **System OAuth > Application Registry**.
2. Open for the record for **UCF**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter <strong>UCF OAuth profile</strong>.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID created during the application configuration in CCH.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client Secret created during the application configuration in CCH.</td>
</tr>
<tr>
<td>OAuth API Script</td>
<td>Optional script to customize the request and response.</td>
</tr>
<tr>
<td>Logo URL</td>
<td>URL that contains an image to use as the application logo.</td>
</tr>
<tr>
<td>Default Grant type</td>
<td>Grant type used to establish the token. Select <strong>Authorization Code</strong>.</td>
</tr>
<tr>
<td>Refresh Token Lifespan</td>
<td>Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.</td>
</tr>
<tr>
<td>PKCE required</td>
<td>Option to enable public clients to require PKCE for an authorization.</td>
</tr>
</tbody>
</table>

**Note:** You can use only **Authorization Code** as the Default Grant type when PKCE is enabled.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Application scope that contains this record. Select <strong>UCF Spoke</strong>.</td>
</tr>
</tbody>
</table>

**Note:** You must ensure that the application scope is **UCF Spoke**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessible from</td>
<td>Application scope that this registry is accessible from.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>OAuth authorization code endpoint. For example, <a href="https://auth.unifiedcompliance.com/authorize">https://auth.unifiedcompliance.com/authorize</a>.</td>
</tr>
<tr>
<td>Token URL</td>
<td>OAuth server token endpoint. For example, <a href="https://auth.unifiedcompliance.com/token">https://auth.unifiedcompliance.com/token</a>.</td>
</tr>
<tr>
<td>Token Revocation URL</td>
<td>OAuth server token revocation endpoint.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint. System generates the URL upon saving the application registry. This is the URL of the ServiceNow instance in this format: https://&lt;Instance-Name&gt;/service-now.com/oauth_redirect.do</td>
</tr>
</tbody>
</table>
4. Right-click the form header, and click Save.
   The system validates the OAuth credentials and populates the Redirect URL.
5. Insert a row in the OAuth Entity Profiles tab and provide these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>UCF OAuth</td>
</tr>
<tr>
<td>Is default</td>
<td>true</td>
</tr>
<tr>
<td>Grant type</td>
<td>Authorization Code</td>
</tr>
</tbody>
</table>

**Note:** This is name to identify the record. You can provide any other name as per your requirement.

6. Insert a row in the OAuth Entity Scopes tab and provide these values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>read</td>
</tr>
<tr>
<td>OAuth scope</td>
<td>read</td>
</tr>
<tr>
<td>Application</td>
<td>UCF Spoke</td>
</tr>
<tr>
<td>In default profile</td>
<td>true</td>
</tr>
</tbody>
</table>

7. Right-click the form header, and click Save.
8. Open the record in the OAuth Entity Scopes tab. For example, open the UCF OAuth record.
   Details of the OAuth Entity Profile record is displayed.
9. In the OAuth Entity Scopes tab, select the OAuth Entity Scope you had earlier created. For example, select read.
10. Right-click the form header, and click Save.

The instance can request OAuth 2.0 tokens for the spoke and a refresh token is created to regenerate tokens.

**Create Credential records for the UCF spoke**

Authorize the UCF spoke actions by creating credential records for the application registered in UCF. The UCF spoke connection and credential alias uses these credentials to authorize actions.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
   The system displays the message What type of Credentials would you like to create?.
3. Select OAuth 2.0 Credentials.
4. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, UCF Credentials.</td>
</tr>
</tbody>
</table>
Field | Value required
--- | ---
Active | Option to actively use the credential record.

OAuth Entity Profile | OAuth profile created during the registration of UCF spoke as an OAuth provider. For example, select UCF OAuth profile.

Applies to | MID Servers that can use this credential. For example, select All MID Servers.

Order | Order that the credentials are used. For example, enter 100.

5. Right-click the form header and click **Save**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.

The credential record for the UCF spoke is created.

*Create Connection record for the UCF spoke*

Create Connection records to your UCF account. The UCF spoke connection and credential alias uses these connections to perform actions in UCF.

Role required: admin

1. Navigate to **Connections & Credentials > Connection & Credential Aliases**.
2. Open the record for UCF.
3. From the **Connections** tab, click **New**. The system displays a blank HTTP(s) Connection form.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter any name to uniquely identify the connection record. For example, enter UCF Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the Credential record you created for UCF. For example, select UCF Credentials.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Enter <a href="https://api.unifiedcompliance.com/">https://api.unifiedcompliance.com/</a>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

The connection record is created for UCF spoke.

**Workday Financials spoke**

The Workday HR spoke is built by Bristelcone, Inc. Manage resources, business units, journals, cost centers, and so on, in Workday Financials application from your ServiceNow instance.

**Request apps on the Store**

Visit the **ServiceNow Store** website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the **ServiceNow Store version history release notes**.
IntegrationHub subscription

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Workday Financials SOAP API version v33.2, but may be compatible with later versions.

Spoke requirements

To set up the integration, perform these:

1. Register Integration System User.
   
   ![Note: While filling account information details, ensure that you select the Do Not Allow UI Sessions check box.]

2. Create a security group and assign it to the integration system user.
   
   a. In Action, navigate to Security Group > Maintain Domain Permissions for Security Group and provide these permissions:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Get Only</td>
<td>Set Up: Worktags - Business Units</td>
<td></td>
<td>Common Financial Management Worktags</td>
</tr>
<tr>
<td>Get Only</td>
<td>Set Up: Ledger and Book</td>
<td></td>
<td>Common Financial Management</td>
</tr>
<tr>
<td>Get and Put</td>
<td>Process: Journals - Core</td>
<td></td>
<td>Financial Accounting</td>
</tr>
<tr>
<td>Get Only</td>
<td>Process: Journals - View</td>
<td></td>
<td>Financial Accounting</td>
</tr>
<tr>
<td>Get and Put</td>
<td>Process: Purchase Order - Cancel</td>
<td></td>
<td>Procurement</td>
</tr>
<tr>
<td>Get Only</td>
<td>Process: Advance Ship Notice - View</td>
<td></td>
<td>Procurement</td>
</tr>
<tr>
<td>Get Only</td>
<td>Process: Supplier Invoice - New</td>
<td></td>
<td>Supplier Accounts</td>
</tr>
<tr>
<td>Get Only</td>
<td>Process: Request for Quotes - View</td>

<td></td>
<td>Integration</td>
</tr>
<tr>
<td>View Only</td>
<td>Integration Security</td>
<td></td>
<td>Integration</td>
</tr>
</tbody>
</table>

**Note:** Ensure that the domain security policies are activated for the security group.

b. Configure the business process policies of your security group and provide these permissions:

**Business process security policy permissions**

<table>
<thead>
<tr>
<th>Operation</th>
<th>Business Process Type</th>
<th>Functional Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initiate (Register Asset (Web Service))</td>
<td>Asset Registration Event</td>
<td>• Business Asset Accounting</td>

<tr>
<td>Initiate (Submit Receipt (Web Service))</td>
<td>Receipt</td>
<td>Procurement</td>
</tr>
<tr>
<td>Initiate (Submit Supplier (Web Service))</td>
<td>Supplier Event</td>
<td>Supplier</td>
</tr>
<tr>
<td>Initiate (Submit Supplier Invoice (Web Service))</td>
<td>Supplier Invoice Event</td>
<td>Supplier Accounts</td>
</tr>
</tbody>
</table>
Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Complex Object (com.glide.cobject)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Authentication

Workday provides an open SOAP API for programmatic access to on-demand business management services. Workday SOAP APIs require basic authentication; that is, user name and password are required.

Note: This spokes doesn't require you to set up the connection and credential alias.

Spoke subflows

The Workday Financials spoke provides sample subflows to demonstrate automating Workday Financials tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create PO</td>
<td>Creates a purchase order record in the Purchase Order table. To use the subflow, set up webhook for your Workday Financials spoke.</td>
</tr>
<tr>
<td>Get Supplier Invoice Details</td>
<td>Retrieves details of the specified supplier invoice.</td>
</tr>
</tbody>
</table>

Spoke actions

The Workday Financials spoke provides actions to automate tasks when events occurs in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Financial Management</td>
<td>Get Account Set By ID</td>
<td>Retrieves details of the specified account set.</td>
</tr>
<tr>
<td></td>
<td>Get Business Unit By ID</td>
<td>Retrieves details of the specified business unit.</td>
</tr>
<tr>
<td>Category</td>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>--------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Get Cost Center By ID</td>
<td>Retrieves details of the specified cost center.</td>
</tr>
<tr>
<td></td>
<td>Get Ledger By ID</td>
<td>Retrieves details of the specified ledger record.</td>
</tr>
<tr>
<td></td>
<td>Look up Account Sets</td>
<td>Retrieves details of the required account sets, based on the provided filter criteria.</td>
</tr>
<tr>
<td></td>
<td>Look up Business Units</td>
<td>Retrieves details of the required business units, based on the provided filter criteria.</td>
</tr>
<tr>
<td></td>
<td>Look up Cost Centers</td>
<td>Retrieves details of the required cost centers, based on the provided filter criteria.</td>
</tr>
<tr>
<td></td>
<td>Look up Fx Rates</td>
<td>Retrieves details of the required Fx rates, based on the provided filter criteria.</td>
</tr>
<tr>
<td></td>
<td>Create Accounting Journal</td>
<td>Creates an accounting journal.</td>
</tr>
<tr>

**Spoke module**

The Workday Financials spoke adds the Workday Finance application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Details</td>
<td>Contains information about the base URL of the Workday instance or tenant, and API version.</td>
</tr>
<tr>
<td>Get Business Units</td>
<td>Displays information about the business units. Admin should configure the sample remote table as per their requirement.</td>
</tr>
<tr>
<td>Purchase Orders</td>
<td>Displays information about the purchase orders whenever they are created in the Workday application. To retrieve this information to the ServiceNow instance, you must Set up webhook for your Workday Financials spoke.</td>
</tr>
<tr>
<td>Webhook Registries</td>
<td>Contains records of webhooks registries. Admin should create record here Set up webhook for your Workday Financials spoke for the required Workday event.</td>
</tr>
</tbody>
</table>

**Set up the Workday Financials spoke**

Integrate the ServiceNow instance Workday instance by using the WS-Security Username Profile to authenticate ServiceNow requests.
- Request an IntegrationHub subscription.
- Activate Workday Financials spoke.
- Role required: admin

**Provide the Workday Financials base URL**
Provide the base URL of your Workday Financials instance in the Connection Details [connection_details] table. Spoke actions based on the SOAP API, use these details for the action execution.

1. Navigate to **System Definition > Tables**.
2. Filter and search for the Connection Details table.
3. Click the **Show List** related list.
4. Click **New**.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base URL</td>
<td>Base URL of the Workday instance or tenant name.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the API. For example, enter \texttt{v33.2}.</td>
</tr>
</tbody>
</table>

6. Click **Save**.

**Create a WS-Security Username Profile for the Workday Financials spoke**
Create a WS-Security Username Profile to provide your Workday credentials to authenticate requests from ServiceNow.

1. Navigate to **IntegrationHub > SOAP Integrations > WS-Security Username Profiles**.
2. Click **New**.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify this credential. For example, enter \texttt{WorkdayFinancials User}.</td>
</tr>
<tr>
<td>Application</td>
<td>Application in which the record is applicable. Select <strong>Workday Financials Spoke</strong>.</td>
</tr>
<tr>
<td>Username</td>
<td>Workday user who has integration rights using Workday Web Services.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the Workday user.</td>
</tr>
</tbody>
</table>

4. Click **Save**.

**Configure the SOAP security policy for the Workday Financials spoke**
Configure the SOAP security profile by adding the security user name profile you had created to authenticate requests from ServiceNow.

1. Navigate to **IntegrationHub > SOAP Integrations > SOAP Security Policies**.
2. Open the record, **WorkdayFinancials**.
3. For **WS-Security Username Profile**, select the security username profile you had created for the Workday Financials spoke. See **Create a WS-Security Username Profile for the Workday Financials spoke** for more information.
4. Do not provide value in **WS-Security X.509 Profile**.
5. Right-click the form header and click **Save**.

Set up webhook for your Workday Financials spoke

Retrieve details of an on-boarded employee in the Workday application to your ServiceNow instance by setting up the webhooks.

- **Set up the Workday Financials spoke**
- Role required: admin

*Generate user name and password in your ServiceNow instance*

Generate user name and password in your ServiceNow instance to authenticate requests and retrieve the required data from the Workday application.

1. Navigate to **System Definition > Table**.
2. Filter and search for the Workday Financials spoke webhook registry table. For example, **WorkdayFin Webhook Registry**.
3. Click the **Show List** related list.
4. Click **New**.
5. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description of the webhook registry record. Enter Workday event and authentication for Create PO.</td>
</tr>
<tr>
<td>UserName</td>
<td>Workday user who has integration rights using Workday Web Services.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the Workday user.</td>
</tr>
<tr>
<td>Workday Event</td>
<td>Event for which the webhook is set up. Enter CreatePO.</td>
</tr>
<tr>
<td>Workday Instance</td>
<td>Base URL of the Workday instance or tenant name.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click **Save**.
7. Click **Generate UserName And Password**.
   Copy and record the values of user name and password. These values must be specified in the Workday instance to authenticate the webhook requests.

*Retrieve the resource path from your ServiceNow instance*

Retrieve the resource path from your ServiceNow instance for later use to authenticate requests and retrieve the required data from the Workday application.

1. Navigate to **System Web Services > Scripted Web Services > Scripted REST APIs**.
2. Open the record for the Workday Financials spoke.
3. In the **Resources** tab, click the **Callback** record.
4. Record and save the value of **Resource path** for later use.

*Import CLAR file to your Workday instance*

Import CLAR file available at ServiceNow Store to set up webhooks and authenticate requests from ServiceNow instance.

- Workday Studio should be installed.
- Access to custom report creation policy.
  - Create custom report in Workday based on the Purchase_order_report structure and share the report with ISU user.
  - Ensure that you select all companies in company prompt in report.
### Prompt Instructions

Instructions: (empty)

Display Prompt Values in Subtitle: Yes

#### Prompt Defaults

<table>
<thead>
<tr>
<th>Field</th>
<th>Prompt Qualifier</th>

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Company</td>
<td></td>
<td>Company</td>
<td>Specify default value</td>
<td>ABC Company</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>ABC Consolidated</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>ABCD</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>ABC Limited</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Back</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- Access to edit business process definition.
- Access to create and edit integration system.
- Role required: admin
Note: Except integration name, report field XPath (if required), and Workday instance header, users are cautioned against modifying the values of fields or properties in the CLAR file.

1. From the Workday Financials spoke page on ServiceNow Store, download the Workday-Finance-Webhook-Studio-Sample file from Supporting Links and Docs.
2. Unzip the sample file to obtain the CLAR file.
3. Import the CLAR file to Workday Studio.
4. In the Properties tab of the StartHere component, navigate to Services and select the RAAS report created for this webhook.
5. Choose the environment where your report exists such as, implementation or sandbox, and configure the report as per your requirement.

6. Provide a report name and select the required report.

7. Provide the alias name of the report.
8. After the report alias is added, add the selected path of report in **Extra Path** that is used to run the report based on prompt.
9. In the **Set Headers** component, provide your Workday instance for the **WorkdayInstance** header.
10. In the properties of **HttpOut**, fill in these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint</td>
<td>REST endpoint</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>See Retrieve the resource path from your ServiceNow instance for more information.</td>
</tr>
<tr>
<td>Http Method</td>
<td>POST</td>
</tr>
</tbody>
</table>
11. Save the changes.
12. In the project explorer, select the integration and deploy it in your Workday system.
13. Log in to your Workday instance and navigate to Integration > Integration System > Configure Integration Attributes.
14. Provide user name and password in Configure Integration Attributes that you have generated in Generate user name and password in your ServiceNow instance.
15. Modify a business process and add this integration in your business process.
   a) Edit definition of the business process.
   b) Search for Purchase Order business process in Workday. If within one customer environment there are more than one purchase order business processes, all the business processes should be configured to enable this webhook for all purchase orders.
c) Select the effective date and click **Ok**.
d) Click the + sign and add a new business process step in BP.
e) Select an order, which is after the completion step of business process.
f) Select **Type** as **Integration**.
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Notes</td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Drop</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- **g)** Provide ISU username in **Run as User** and click **Ok**.

- **h)** Click **Configure Integration** on the newly added business process step in hire BP.
i) On the Configuration Integration Step page, click Ok.

j) In integration criteria, select value type as **Determine value at runtime** and select value as **PO Number**.
Selected **PO Number** should be as shown below.
k) Click Ok.

l) Create a report for the webhook with these details:

Purchase Order report definition:
Column labels:

<table>
<thead>
<tr>
<th>Business Object</th>

</tr>
</tbody>
</table>

Condition as Text: PO Number equal to from user input

Prompt default:
**Workday HR spoke v1.1**

The Workday HR spoke is built by Bristelcone, Inc. Manage staffing, resources, payroll, benefits and so on, in Workday HR system from your ServiceNow instance.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**IntegrationHub subscription**

This spoke requires the IntegrationHub Enterprise subscription package. For more information, see Request IntegrationHub.

**Supported versions**

This spoke was built for Workday HR SOAP API version v33.2 and REST API version v1, but may be compatible with later versions.

**Spoke requirements**

To set up the integration, perform these:

1. Register an Integration System User.
   
   **Note:** While filling account information details, ensure that you select the Do Not Allow UI Sessions check box.

2. Create a security group and assign it to the integration system user.
a. In **Action**, navigate to **Security Group > Maintain Domain Permissions for Security Group** and provide these permissions:

**Domain security policy permissions**

</table>

**Note:** Ensure that the business process security policies are activated for the security group.

**Note:** If you have installed Workday HR spoke v1, uninstall it and install the Workday HR spoke v1.1.

Workday REST and Report-as-a-Service (RAAS) API works with OAuth 2.0 to authorize access to resources in your Workday tenant. To use OAuth 2.0, you must register your client in the tenant, using the Register API Client task.

Record and save these values while registering your client:

- Client ID
- Client Secret
- Workday REST API Endpoint
- Token Endpoint
- Authorization Endpoint

**Spoke dependencies**

If you're having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - SOAP (com.glide.hub.action_step.soap)
- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)
- ServiceNow Flow Designer - Dynamic Outputs (com.glide.hub.dynamic_outputs)
- Complex Object (com.glide.cobject)
- System Import Data Source (glide.system_import_data_source)

**Note:** Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

**Spoke flows**

The Workday HR spoke provides a sample flow, Verify User Sample Flow that demonstrates automating the Workday HR tasks. This flow calls the subflow with the same name to verify if the user who raised request is a valid user in Workday system. To customize a sample flow, copy it to a new application scope.
Spoke subflows

The Workday HR spoke provides sample subflows to demonstrate automating Workday HR tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify User Subflow</td>
<td>Verifies if the user who raised request is a valid user in Workday system.</td>
</tr>
<tr>
<td>Get WID For Worker</td>
<td>Retrieves WID details of the employee using the Look up Worker Profile action.</td>
</tr>
<tr>
<td>Create User</td>
<td>Creates a user in the ServiceNow when the user is onboarded in the Workday system. To use this subflow, you should set up webhook for your Workday HR spoke.</td>
</tr>
</tbody>
</table>

Spoke actions

The Workday HR spoke provides actions to automate tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Absence Management</td>
<td>Get Time off Balances By Employee ID</td>

**Spoke module**

The Workday HR spoke adds the Workday application to your instance and includes these modules:

<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connection Details</td>
<td>Contains information about the base URL of the Workday instance or tenant, and API version.</td>
</tr>
<tr>
<td>Custom Objects</td>
<td>To use the custom actions, create a record in the Custom Objects module and provide these details:</td>
</tr>
<tr>
<td></td>
<td>• Parent Object WS Alias</td>
</tr>
<tr>
<td></td>
<td>• Extension Object WS Alias</td>
</tr>
<tr>
<td></td>
<td>• Extension Object Fields</td>
</tr>
<tr>
<td></td>
<td>• Extension Object Field Data Type</td>
</tr>
<tr>
<td></td>
<td>• Field Type</td>
</tr>
<tr>
<td>Get My Holiday Calendar</td>
<td>Sample remote table that you should customise to retrieve details of the holiday calendar for the logged in employee. From the Get My Holiday Calendar remote table definition, the Get My Holiday Calendar action is called to retrieve the data.</td>
</tr>
<tr>
<td>Get Payroll Results</td>
<td>Sample remote table that you should customise to retrieve the payroll information. From the Get Payroll Results remote table definition, the Look up Payroll Results action is called to retrieve the data.</td>
</tr>
</tbody>
</table>
**Module** | **Description**
--- | ---
RAAS Report Access Details | To use actions based on Workday Report as a Service API, create a record in the RAAS Report Access Details module and provide details of the ServiceNow user along with the Workday report owner name and Workday report name. Ensure that the user is entitled to access these reports.
Create a record and fill in these values:
- **User ID**: User ID of the ServiceNow user, who is entitled to access the required reports.
- **Report Name**: Name of the RAAS API while configuring it in Workday system.
- **Report Owner Username**: Username of the RAAS owner.

Remote Table Configurations | An entry of column and table name that consists of Workday employee ID of the logged in user should be made into this table. For example, Employee Number column of the User Table. That is, **Table Name** is `sys_user` and **Field Name** is `employee_number`.

*Note: Ensure that you provide the internal name of the table and field.*

View My Direct Deposit Information | Sample remote table that you should customise to retrieve the direct deposit information. From the View My Direct Deposit Information remote table definition, the Look up Direct Deposit Information Details action is called to retrieve the data.

View My Total Rewards | Sample remote table that you should customise to retrieve the total rewards for a logged in employee. From the View My Total Rewards remote table definition, the Look up Total Rewards action is called to retrieve the data.

View Time Off Balance | Sample remote table that you should customise to retrieve the time off balance for a logged in employee. From the View Time Off Balance remote table definition, the Look up Time Off Balance action is called to retrieve the data.

Webhook Registry | Contains records of webhooks registries. Admin should create record here to *Set up webhook for your Workday HR spoke* for the required Workday HR event.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don’t need to update any actions that use the connection. For more information, see *Connections and Credentials*.

**Set up the Workday HR spoke**

Integrate the ServiceNow instance Workday instance by using the OAuth 2.0 to authenticate ServiceNow requests.
- Request an IntegrationHub subscription.
- Activate Workday HR spoke.
- Role required: admin
Provide the Workday HR base URL
Provide the base URL of your Workday HR instance in the Connection Details [connection_details] table. Spoke actions based on the SOAP API, use these details for the action execution.

1. Navigate to System Definition > Tables.
2. Filter and search for the Connection Details table.
3. Click the Show List related list.
4. Click New.
5. On the form, fill these values.

### Connection Details form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base URL</td>
<td>Base URL of the Workday instance or tenant name.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the API. For example, enter v33.2.</td>
</tr>
<tr>
<td>Webservice Type</td>
<td>Type of web service. Select SOAP.</td>
</tr>
</tbody>
</table>

6. Click Save.

Register Workday HR as an OAuth provider
Register the Workday HR instance as the OAuth provider so that the ServiceNow instance can request OAuth 2.0 tokens.

1. Navigate to System OAuth > Application Registry.
2. Click New.
   The system displays this message: What kind of OAuth application?.
3. Select Connect to a third party OAuth Provider.
4. On the form, fill these values.

### Application Registries form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, enter: Workday HR OAuth</td>
</tr>
<tr>
<td>Application</td>
<td>Application in which the record is applicable. Select Workday HR Spoke.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Client ID generated while registering your client.</td>
</tr>
<tr>
<td>Client Secret</td>
<td>Client secret generated while registering your client.</td>
</tr>
<tr>
<td>Authorization URL</td>
<td>Authorization endpoint generated while registering your client.</td>
</tr>
<tr>
<td>Token URL</td>
<td>Token endpoint generated while registering your client.</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>OAuth callback endpoint in this format: https://&lt;instance&gt;.service-now.com/oauth_redirect.do</td>
</tr>
<tr>
<td>Default Grant Type</td>
<td>Grant type used to establish the token. Select Authorization Code.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the application registry.</td>
</tr>
</tbody>
</table>

5. Right-click the form header, and click Save.
An OAuth entity profile is created.

Create a WS-Security Username Profile for the Workday HR spoke
Create a WS-Security Username Profile to provide your Workday credentials to authenticate requests from ServiceNow.

1. Navigate to IntegrationHub > SOAP Integrations > WS-Security Username Profiles.
2. Click New.
3. On the form, fill these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify this credential. For example, enter WorkdayHR User.</td>
</tr>
<tr>
<td>Application</td>
<td>Application in which the record is applicable. Select Workday HR Spoke.</td>
</tr>
<tr>
<td>Username</td>
<td>Workday user who has integration rights using Workday Web Services.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the Workday user.</td>
</tr>
</tbody>
</table>

4. Click Save.

Configure the SOAP security policy for the Workday HR spoke
Configure the SOAP security profile by adding the security user name profile you had created to authenticate requests from ServiceNow.

1. Navigate to IntegrationHub > SOAP Integrations > SOAP Security Policies.
2. Open the record for the Workday HR spoke. For example, Workday.
3. For WS-Security Username Profile, select the security username profile you had created for the Workday HR spoke. See Create a WS-Security Username Profile for the Workday HR spoke for more information.
4. Do not provide value in WS-Security X.509 Profile.
5. Right-click the form header and click Save.

Create a credential record for the Workday HR spoke
Create a credential record for the Workday HR instance. The Workday HR spoke connection and credential alias uses these credentials to authorize actions.

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
3. The system displays this message: What type of Credentials would you like to create?
4. Select OAuth 2.0 Credentials.
5. On the form, fill these values.

OAuth 2.0 Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Workday HR Cred.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the credential record.</td>
</tr>
<tr>
<td>OAuth Entity Profile</td>
<td>OAuth entity profile created during the registration of Workday HR as an OAuth provider. For example, OAuth Profile.</td>
</tr>
</tbody>
</table>
5. Right-click the form header and click Submit.
6. To generate the OAuth token, click the Get OAuth Token related link.

Create a connection record for the Workday HR spoke
Create a connection record for your Workday HR instance. The Workday HR spoke connection and credential aliases use these connections to perform actions in Workday HR.

1. Navigate to Connections & Credentials > Connections & Credentials Aliases.
2. Open the alias record, WorkdayConnection.
3. From the Connections tab, click New.
4. On the form, fill these fields.

Note: Ensure that you create the connection record in the Workday HR Spoke application.

Connection form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name to uniquely identify the record. For example, Workday HR Connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record created for Workday HR spoke. For example, Workday HR Cred.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record associated with this connection.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>URL to connect to your Workday HR instance.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to actively use the connection record.</td>
</tr>
</tbody>
</table>

5. In the Attributes tab, fill in these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tenant Name</td>
<td>Tenant name of your Workday application.</td>
</tr>
<tr>
<td>Version</td>
<td>v1</td>
</tr>
</tbody>
</table>

6. Click Submit.

Set up webhook for your Workday HR spoke
Retrieve details the required employees in the Workday HR application to your ServiceNow instance by setting up the webhooks.

• Set up the Workday HR spoke
• Role required: admin

Generate user name and password in your ServiceNow instance
Generate user name and password in your ServiceNow instance to authenticate requests and retrieve the required data from the Workday application.

1. Navigate to System Definition > Table.
2. Filter and search for the Workday HR spoke webhook registry table. For example, Workday Webhook Registry.
3. Click the Show List related list.
4. Click New.
5. On the form, fill these values.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description of the webhook registry record. Enter Workday event and authentication for Create User.</td>
</tr>
<tr>
<td>UserName</td>
<td>Workday user who has integration rights using Workday Web Services.</td>
</tr>
<tr>
<td>Password</td>
<td>Password of the Workday user.</td>
</tr>
<tr>
<td>Workday Event</td>
<td>Event for which the webhook is set up. Enter CreateUser.</td>
</tr>
<tr>
<td>Workday Instance</td>
<td>Base URL of the Workday instance or tenant name.</td>
</tr>
</tbody>
</table>

6. Right-click the form header and click **Save**.
7. Click **Generate UserName And Password**.
   Copy and record the values of username and password. These values must be specified in the Workday instance to authenticate the webhook requests.

*Retrieve the resource path from your ServiceNow instance*
Retrieve the resource path from your ServiceNow instance for later use to authenticate requests and retrieve the required data from the Workday application

1. Navigate to **System Web Services > Scripted Web Services > Scripted REST APIs**.
2. Open the record for the Workday HR spoke.
3. In the **Resources** tab, click the **Callback** record.
4. Record and save the value of **Resource path** for later use.

*Import CLAR file to your Workday instance*
Import CLAR file available at ServiceNow Store to set up webhooks and authenticate requests from ServiceNow instance.

- Workday Studio should be installed.
- Access to custom report creation policy.
  Create custom report in workday based on the New_Hire_record report structure and share the report with ISU user.
- Access to edit business process definition.
- Access to create and edit integration system.
- Role required: admin

**Note:** Except integration name, report field XPath (if required), and Workday instance header, users are cautioned against modifying the values of fields or properties in the CLAR file.

1. From the **Workday HR spoke** page on **ServiceNow Store**, download the **Workday-HR-Webhook-Studio-Sample** file from **Supporting Links and Docs**.
2. Unzip the sample file to obtain the CLAR file.
3. Import the CLAR file to Workday Studio.
4. In the **Properties** tab of the **StartHere** component, navigate to **Services** and select the RAAS report created for this webhook.
5. Choose the environment where your report exists such as, implementation or sandbox and configure the report as per your requirement.

6. Provide a report name and select the required report.
7. Provide the alias name of the report.
8. After the report alias is added, add the selected path of report in **Extra Path** that is used to run the report based on prompt.
9. In the Set Headers component, provide your Workday instance for the WorkdayInstance header.
10. In the properties of **HttpOut**, fill in these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint</td>
<td>REST endpoint</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>See <em>Retrieve the resource path from your ServiceNow instance</em> for more information.</td>
</tr>
<tr>
<td>Http Method</td>
<td>POST</td>
</tr>
</tbody>
</table>
11. Save the changes.

12. In the project explorer, select the integration and deploy it in your Workday system.

13. Log in to your Workday instance and navigate to Integration > Integration System > Configure Integration Attributes.
14. Provide user name and password in **Configure Integration Attributes** that you have generated in Generate user name and password in your ServiceNow instance.
15. Modify a business process and add this integration in your business process.
a) Edit definition of the business process.

b) Select the effective date and click Ok.

c) Click the + sign and add a new business process step in BP.
d) Select an order, which is after the completion step of business process.

e) Add the business process and select **Type as Integration**.

f) Provide ISU username in **Run as User** and click **Ok**.

g) Click **Configure Integration** on the newly added business process step in Hire BP.
<table>
<thead>
<tr>
<th>Step</th>
<th>Order</th>
<th>If</th>
<th>Type</th>
<th>Specify</th>
<th>Step Label Override</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

Filter and prompt details:
Vonage spoke

Manage communications through calls, SMS, and WhatsApp by using the Vonage account from your ServiceNow instance.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
IntegrationHub subscription

This spoke requires the IntegrationHub Starter subscription package. For more information, see Request IntegrationHub.

Supported versions

This spoke was built for Vonage for these versions, but may be compatible with later versions:

- Messages API version v0.1
- Voice API version v1

Spoke requirements

- Admin access to Vonage account and Vonage API Dashboard.
- Record the values of API key and API Secret. You can access these values from the Vonage API Dashboard. For more information, see the Authentication page in the Vonage API Developer documentation site.
- Record and save the value of the Signature Secret. You can access this value in the Account Settings in Vonage API Dashboard. For more information, see the Authentication page in the Vonage API Developer documentation site.

Spoke dependencies

If you’re having trouble installing the app, ensure that these dependent plugins are installed:

- ServiceNow IntegrationHub Action Step - REST (com.glide.hub.action_step.rest)
- ServiceNow IntegrationHub Runtime (com.glide.hub.integration.runtime)
- Complex Object (com.glide.cobject)
- ServiceNow Flow Designer - Dynamic Inputs (com.glide.hub.dynamic_inputs)

Note: Some of these plugins are licensable features and require appropriate licenses, if used outside the spoke implementation.

Spoke subflows

The Vonage spoke provides sample subflows to demonstrate automating Vonage tasks. To customize a sample subflow, copy it to a new application scope. Available sample subflows include:

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vonage SMS Webhook</td>
<td>Processes the SMS requests from Vonage.</td>
</tr>
<tr>
<td>Vonage Voice Webhook</td>
<td>Processes the voice requests from Vonage.</td>
</tr>
<tr>
<td>Vonage WhatsApp Webhook</td>
<td>Processes the WhatsApp requests from Vonage.</td>
</tr>
</tbody>
</table>

To customize the default subflow, you must a create a copy of the sample subflow and customize the subflow as per your requirement. While customizing subflows, you must ensure that the subflows are configured to avoid infinite loops.
Spoke actions

The Vonage spoke provides actions to automate Vonage tasks when events occur in your ServiceNow instance. Available actions include:

<table>
<thead>
<tr>
<th>Category</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Management</td>
<td>Get Account Balance</td>
<td>Retrieves the current balance of the Vonage account.</td>
</tr>
<tr>
<td>Call Management</td>
<td>Play DTMF tone into Call</td>
<td>Plays DTMF (Dual-tone multi-frequency) tones into an active call</td>
</tr>
<tr>
<td>Call Management</td>
<td>Attach Recording To ServiceNow</td>
<td>Attaches a call recording to the target ServiceNow record.</td>
</tr>
<tr>
<td>Call Management</td>
