<td><strong>Note</strong>: The <strong>GET</strong> operation is only supported for the Queue destination type.</td>
</tr>
<tr>
<td>Destination Name</td>
<td>Name of the queue or topic destination that is configured on the JMS provider.</td>
</tr>
<tr>
<td>Message Type</td>
<td>The JMS message type value. Only the <strong>Text Message</strong> type is supported. The queue or topic destination must be configured to receive or send only Text Message. Other message types are dropped, since the JMS Activity cannot process them.</td>
</tr>
<tr>
<td>Operation</td>
<td>The programmatic operation to perform on the destination. The choices are <strong>PUT</strong> or <strong>GET</strong>.</td>
</tr>
<tr>
<td>Timeout (Secs)</td>
<td>Allowed time to wait for a message in the message queue before it times out, in seconds. The default is <strong>30</strong>.</td>
</tr>
<tr>
<td>Custom message headers</td>
<td>The custom header values in a name/value pair format, that is available on the JMS destination.</td>
</tr>
<tr>
<td>Message payload</td>
<td>Actual message content or payload that is sent to the JMS destination.</td>
</tr>
<tr>
<td>Credential tag</td>
<td>A tag for an individual credential for a JMS activity in an Orchestration workflow.</td>
</tr>
<tr>
<td>Required MID Server capabilities</td>
<td>MID Server to use, by capabilities.</td>
</tr>
</tbody>
</table>
Create a JMS connection for an Orchestration activity

Configure your system to use Java Messaging Service (JMS) with a custom Orchestration JMS activity.

Role required: admin

The MID Server must have the correct JMS connection factories for your organization. Configure those values in the `mid.property.jms.command.allowed_factory_names` property, found in MID Server > Properties. The default values for this property can be changed to any value or comma-separated list of values that the third-party JMS provider advertises.

1. Navigate to MID Server > JAR Files.
2. Click New and add:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>A version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Location of the JAR file for reference purposes. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

3. Click the paper clip icon in the banner and attach the JMS driver jar file.

The JMS driver jar file should be available as part of JMS provider installation. Few JMS vendors make them available as a separate product. Refer to the JMS provider documentation to determine which JMS client driver jar files require the client applications to connect to the JMS provider. For example, if you are trying to connect to ActiveMQ V5.10 (JMS provider), you need the `activemq-all-5.10.1.jar` file.

5. Click New, add the following, and click Submit:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this connection factory.</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext.</td>
</tr>
</tbody>
</table>

    Note: For example, to connect to ActiveMQ V5.10 (JMS Provider), the value is `org.apache.activemq.jndi.ActiveMQInitialContextFactory`.

<table>
<thead>
<tr>
<th>Provider URL</th>
<th>Location of the running JMS provider installation.</th>
</tr>
</thead>
</table>

    Note: For example, to connect to ActiveMQ V5.1:tcp://ipAddressOrHostName:61616.

6. Navigate to Orchestration > Credentials.
7. Click New, select JMS Credentials, and provide the user name and password the MID should use to communicate with the JMS provider.

For more information, see JMS credentials.

8. Click Submit.

You are ready to create a custom JMS activity.
**JMS template execution parameters**

You use execution parameters to create the input process script in the **Preprocessing** form.

You must use the `executionParam` prefix with all variables in this table.

### JDBC execution parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jms ds</td>
<td>jms_ds</td>
<td>Reference</td>
<td>Selected JMS data source.</td>
</tr>
<tr>
<td>Destination type</td>
<td>destination_type</td>
<td>Enumerated</td>
<td></td>
</tr>
<tr>
<td>Destination name</td>
<td>destination_name</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Message type</td>
<td>message_type</td>
<td>Enumerated</td>
<td></td>
</tr>
<tr>
<td>Operation</td>
<td>operation</td>
<td>Enumerated</td>
<td></td>
</tr>
<tr>
<td>Time out</td>
<td>time_out</td>
<td>Integer</td>
<td>Length of time to wait for the query to return results.</td>
</tr>
<tr>
<td>Custom headers</td>
<td>custom_headers</td>
<td>Array of JavaScript objects</td>
<td></td>
</tr>
<tr>
<td>Message payload</td>
<td>message_payload</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>Credential tag</td>
<td>credential_tag</td>
<td>String</td>
<td>List of required MID Server capabilities.</td>
</tr>
<tr>
<td>MidCapabilities</td>
<td>midCapabilities</td>
<td>String (comma separated)</td>
<td></td>
</tr>
<tr>
<td>ValueCapabilities</td>
<td>valueCapabilities</td>
<td>Array of hashmap</td>
<td>Capability values used to select the MID Server. For more information, see <strong>MID Server capabilities</strong>. If there are additional capabilities that are assigned by value, use this example to customize the MID Server selection:</td>
</tr>
</tbody>
</table>

```javascript
var valueCapability = {'NEW_MID_CAPABILITY': 'NEW_MID_CAPABILITY_VALUE'};
executionParam.valueCapabilities.push(valueCapability);
```

---

**JMS template post-processing parameters**

Use these parameters to create a post-processing script.
JMS post-processing parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Variable</th>
<th>Type</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>status</td>
<td>String</td>
<td>Status of the operation (Put or Get) on the JMS destination.</td>
</tr>
<tr>
<td>StandardHeaders</td>
<td>standardHeaders</td>
<td>String</td>
<td>All the standard headers, as specified by JMS, that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>CustomHeaders</td>
<td>customHeaders</td>
<td>String</td>
<td>All custom headers added by a producer or publisher application that are obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>MessagePayload</td>
<td>messagePayload</td>
<td>String</td>
<td>Message payload that is obtained as part of the JMS message during a Get operation. This field is applicable only for Get operations.</td>
</tr>
<tr>
<td>EccSysID</td>
<td>eccSysID</td>
<td>String</td>
<td>Contains the reference ID associated with the ECC Queue input message returned by the activity.</td>
</tr>
<tr>
<td>ErrorMessages</td>
<td>errorMessage</td>
<td>String</td>
<td>Contains any error messages retrieved from the JMS command. This value is null if there are no error messages.</td>
</tr>
</tbody>
</table>

Activity scoping

Custom activities run in their own scope, even if it is different from that of the workflow.

Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.
You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

**Note:** Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

### Publish a custom activity

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is visible only to the user who created it.

Roles required: admin, activity_admin, activity_creator

1. When you finish configuring the activity, click **Publish**.
   - This makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

2. To edit a published activity, click **Checkout**.
   - When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users.

3. When you are finished editing the checked out activity, publish it again.
   - The system adds a new version of this activity to the Custom tab in the Workflow Editor palette.

   **Note:** Activities you create and publish are visible in the Packs tab only if they were created in the current application scope.

### Return a locked activity to a published state

Problems can arise if an activity version is checked out by a user and not checked back in. An activity in this state cannot be checked out for update.

**Role required:** admin, activity_admin, activity_creator

An administrator can return a locked activity to a published state.

1. Open the Workflow Editor.
2. From the Custom tab, open the activity that is locked.
3. Click the menu icon in the title bar and select **Versions** from the context menu.
   - A list of all the versions of that activity appears. The locked version displays the user who checked it out.
4. Select the checked out version.
   The system opens the record in the activity designer.
5. Click the menu icon again and select **Force Checkout** from the context menu.
   The activity fields become editable.
6. Click **Publish**.
   The activity becomes available to users with the appropriate roles.

**Copy a custom activity**

You can copy activities for reuse from the Custom tab in the global scope.

Role required: admin, activity_admin, activity_creator

**Note:** You cannot copy an activity in a private scope.

1. To reuse an activity in the global scope, expand the parent category to display the activities.
2. Right-click the activity you want to copy and select one of these options:
   - **Copy into global scope as new activity:** Copies the activity with the new name you provide, uses the same version number as the original activity, and moves it to the global scope in the Custom tab.
Naming an activity copy

- **Copy into global scope as new version**: Copies the activity using the same name, increments the version number, and moves it to the global scope in the Custom tab. The system automatically adds the parent category to the Custom tab if it does not already exist. This action will overwrite another activity with the same name and version number.

Creating a new activity version

**Note**: If the activity is in any other scope but global, the system displays this message: Cannot copy privately scoped activity.

**Orchestration databus**

The databus allows workflow designers to track the flow of data through an Orchestration workflow and provides access to output data that can be consumed by other custom activities.

Data is made available in a workflow when you use activities created with the Orchestration activity designer. The activity designer provides the ability to specify well defined inputs and outputs for your activities. When you use those activities on the workflow canvas, the outputs appear in the Data tab and are available for use as inputs in subsequent activities.

**Note**: Orchestration does not filter the data you are given for reuse in the Data tab. You must make sure an activity in the workflow canvas has executed before you consume its output data.

When you drop a custom activity onto the workflow canvas, the system assigns it an index. If you delete an activity from the canvas and add a new one, the indexes are not reused. This ensures that you don’t accidentally start subscribing to data you did not intend to use. If you update an activity in the activity designer, the system automatically updates the activity on the canvas to ensure the data you are subscribing to downstream is not affected.
Reuse data in the activity designer

The **Data** tab in the Workflow Editor lists all custom activities used in the current workflow that produce data and displays that data for reuse in other custom activities.

Roles required: workflow_creator

Activities are categorized by application in this tab and are available for use as data sources for other activities. The **Data** tab is a graphical representation of the workflow Databus, which manages all the temporary data used by the current workflow.

1. Drag output variables from an activity in this tab into the inputs of another activity on the workflow canvas to link the activities together.

   You can use any of the outputs in the structure, regardless of the the application to which they belong. An index number in parenthesis after the activity name provides a unique identifier for the parameters that you use as input data in other activities. If you do not name a custom activity, the only identifier for that activity in the **Data** tab is the index number. Index numbers indicate the sequence in which custom activities were added to the workflow and are not reused. When you drag a custom activity onto the workflow canvas, the system adds that activity and its output data to the structure. Conversely, if you remove a custom activity from the canvas, that activity and its outputs disappear from the data list.

2. Point to an activity to display information about it in a pop-up window.

   Any output data reused by the activity is listed in the **Databus Output** field of the the pop-up window.
MID Servers for Orchestration

Orchestration automatically selects an appropriate MID Server based on the capabilities that you configure in activities, the IP addresses of target devices, and the application that the MID Server is allowed to use.

To allow a MID Server to work with Orchestration, it must have the Orchestration application or the ALL application assigned to it. See Configure a default MID Server for each application for instructions.

You can have MID Servers focus on different capabilities and separate sections of your network. See:
- MID Server capabilities
- Map an IP address to a DNS name

You can also specify a default MID Server to use if no MID Servers meet the capability and IP range criteria for an activity. See Select the default MID Server for Orchestration.

MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range.

Nmap capability

The Nmap capability is only assigned to MID Servers for which the Network Mapper (Nmap) scanner has been installed for credential-less Discovery. This capability cannot be added to or removed from any MID Server manually. For instructions on installing or uninstalling Nmap, see Install and uninstall Nmap on a MID Server.

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
MID Server capability values

Capabilities provided in the base system do not have a defined value string. A MID Server configured to use a capability that has no value can locate any device using that capability’s protocol. If a capability has a defined value, the MID Server using that capability finds only those devices using that protocol that match the value string exactly. The exception to this is the Resolve DNS capability, which is configured to resolve any DNS name into an IP address using a partial string match.

Starting with the madrid release, the (capability name):(value) combination appears in the slushbucket when you add a capability to a MID Server. This combination allows you to see all the capabilities that have different values, even if the capability name is the same. For example, if you are using the Cloud Management capability, and you use the value field to specify the us-west logical datacenter on one of the capability records, you can see the combination in the Collection list.

Scripted MID Server capability value matching

You can use value tests to create capabilities that find devices using values without requiring exact string matching. Action on these values is controlled by a user-defined script.

The Resolve DNS capability is provided in the base system and is configured to resolve DNS names into IP addresses for devices whose names end with a specified domain name. The capability Value entered is automatically prefaced with a dot during processing to match domain syntax. This value can contain one or more sub-domains, but must include the end of the domain string. Matching devices must end with the identical syntax. The script for the Resolve DNS capability determines if a device name matches the criteria defined by Value. If a match exists, the platform performs the address resolution automatically. For example, if the value for the Resolve DNS capability is service-now.com, the MID Server with this capability finds lnxlab01.sandiego.service-now.com and dbsrv101.san jose.service-now.com. If the value is changed to sandiego.service-now.com, then the MID Server finds only lnxlab01.

Note: If Value in the Resolve DNS capability is blank, then all domains match.

To view the script for evaluating this capability, navigate to MID Server > Capability Value Tests and select Resolve DNS from the list.
Configure MID Server capabilities

MID Server capabilities define the specific functions of a MID Server within an IP address range, allowing an application to select the most appropriate MID Server. Configure capabilities on MID Servers for applications like Orchestration, Cloud Management, and Service Mapping.

Role required: admin or sm_admin
Several applications use capabilities, IP ranges, and MID Server selection to narrow the pool of MID Servers the applications need.

**Note:** At least one capability is required for each MID Server used by Orchestration. See MID Servers for Orchestration for more information.

The following capabilities are available by default with Discovery:

<table>
<thead>
<tr>
<th>All</th>
<th>IBM</th>
<th>Resolve DNS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ansible</td>
<td>JDBC</td>
<td>REST</td>
</tr>
<tr>
<td>AWS</td>
<td>NetApp</td>
<td>SNMP</td>
</tr>
<tr>
<td>Azure</td>
<td>Nmap</td>
<td>SOAP</td>
</tr>
<tr>
<td>Chef</td>
<td>OpenStack</td>
<td>SSH</td>
</tr>
<tr>
<td>Cloud Management</td>
<td>PowerShell</td>
<td>VMware</td>
</tr>
<tr>
<td>Google</td>
<td>RCA</td>
<td>WMI</td>
</tr>
</tbody>
</table>

1. Navigate to **MID Server > Capabilities**.
2. Select an existing capability. You can also select **ALL** to include all capabilities.

**Note:** Ensure that each IP address range has MID Servers with the necessary capabilities to complete the Orchestration activities on that network segment.

3. Create a new capability:
   a) Click **New**.
   
   b) Configure the value for a custom capability. An example is a capability for **DOMAIN**, with a value of **service-now**.
   
   c) Click **Submit**.

4. Click **Edit** in the MID Servers related list to add MID Servers to the capability.
5. Select one or more MID Servers for this capability from the Available list.
6. Click Save.

The capability defined here also appears in the primary record for this MID Server.

Select the default MID Server for Orchestration

Orchestration uses the default MID Server if it cannot find a MID Server with the correct IP range and capability.

Specify the default MID Server in either of these locations:

- The Default MID Server field on the Orchestration application record. See Configure a default MID Server for each application for instructions.
- The Default MID Server to use for Orchestration Activities property. Navigate to Orchestration > MID Server Properties to set this value.

These two values are automatically kept in synch. You can change the default MID Server in either location.

PowerShell probe version 2 system property

View detailed PowerShell credential information and view extended logging information.

Starting with the madrid release, there is a new system property for the PowerShell probe which enables the version 2 of the probe. This new version enables you to view detailed credential information on why PowerShell credentials fail or succeed. You can also view logging information for an ECC Queue payload and Workflow Context log.

mid.server.rba_powershell_v2

Enables the PowerShell probe version 2 for use with all PowerShell activities. The default value is true. If you choose false, the legacy PowerShell probe is used. Unless there are issues, use version 2, as the legacy version is going to be deprecated.

You can access the property by selecting the MID Server Properties link in the navigation pane:

![PowerShell log property](image)

PowerShell log property

Enable debug messages to display from PowerShell.
This property enables control of when and where to display debug messages generated by debug statements embedded in the PowerShell scripts.

### `mid.property.powershell.log_info`

The new MID Server PowerShell log property:

- Displays logging information.

**Note:** Once logging is enabled, OOB PowerShell scripts log information.

- Adds logging information to your developed PowerShell scripts and PowerShell activities.

**Note:** Logging information is only available when property is enabled.

- Logging is not enabled by default.

If the property is set to true, debug messages display from the workflow context or from the Response popup after you test inputs. The ecc_queue entry payload for each of the PowerShell activities is going to show all the debug messages that were logged.

Enable the PowerShell log property for each MID Server. If the MID Server field is empty, the property applies to all MID Servers. There are separate credential debug messages that always come back regardless of this setting. The credential debug messages show which credentials have been used and other related information.

**Note:** All the debug messages that come back to the instance are also saved to the MID Server log file. The log file might have additional debug messages generated from Java code, which might help the debug process.

### Use the Orchestration Usage dashboard

This dashboard shows an overview of Orchestration usage metrics to show customers how their organization uses Orchestration and to support license compliance.

Role required: orchestration_manager

1. To view the dashboard, navigate to **Orchestration > Operations & Troubleshooting > Orchestration Usage Dashboard**.
   
   The Orchestration Usage dashboard displays. The tabs on the dashboard include Licensable Usage and Orchestration Usage. Reports on these tabs include:
<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
</table>
| Transaction Summary Last 12 months | A running transaction count of all Orchestration transactions over the last 12 months. Includes:  
  - The count of orchestration transactions associated with the HR Application  
  - The count of Orchestration transactions associated with the Security Operations Application |
| Transaction Summary YTD | Cumulative count of all transactions since the time the Orchestration plugin was activated or the customer upgraded to Geneva. |
| 365 day Running Average of Server | The running average over the last 365 days for cmdb_ci_computer - cmdb_ci_server. This includes all physical and virtual client nodes and excludes server nodes from the count. |
| 365 day Running Average of Client | The running average over the last 365 days for cmdb_ci_server. This includes all physical and virtual server nodes. |
| Orchestration Transactions by Month for Last 12 Months |  |
| Average Client Nodes Orchestrated Last 365 Days |  |
| Average Server Nodes Orchestrated Last 365 Days |  |
| Number of Orchestration Activities Developed Last 365 Days | The aggregate number of activity definitions you have developed and OOB activity definitions you have modified. This number includes activity elements (Activities build with the Activity Designer) you have developed and OOB activity definitions you have modified.  
  **Note:** This number excludes activity elements that are shipped with ServiceNow Applications that use the Orchestration Runtime e.g. ServiceNow Security Operations and Human Resources Apps. |
| Cumulative Client Nodes Orchestrated by Month |  |
| Cumulative Server Nodes Orchestrated by Month |  |
| Usage by Provider Last 12 Months | Breaks down emphasis by provider, such as PowerShell, JDBC, SSH, etc. |
| Top 10 Orchestration Activities |  |
2. Optional: You can add more widgets to the dashboard by clicking the Add Content icon
(+) in the upper right corner of the dashboard.

Note: You should not modify the first tab in this Dashboard. If you want a different dashboard experience, add a tab and customize that with your usage reports.

Password Reset application

The ServiceNow® Password Reset application enables an end user to use a self-service process to reset or change the password. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Password Reset setup guide

A simple version of the Password Reset application is active by default. You can install a plugin to extend functionality.

Requirements

Role required: admin

Note: The Password Reset application is not available during upgrade.
Active and available plugins

- A simple version of the Password Reset application is active by default and includes example verifications. The base system enables connections only to the Local ServiceNow Instance credential store type. For details, see Credential stores for Password Reset.
- To enable connections to Active Directory (AD) and Remote (SOAP) ServiceNow Instance credential store types, you must activate the Password Reset - Orchestration Add-on plugin. The plugin also activates the Password Reset Windows Application (com.glideapp.password_reset_desktop). No other components are installed. Orchestration is available as a separate subscription. See Request the Password Reset - Orchestration Add-on plugin.

Next steps

Plan and configure the Password Reset processes for your organization. See the Password Reset admin guide.

Request the Password Reset - Orchestration Add-on plugin

The Password Reset - Orchestration Add-on plugin activates the Password Reset Windows Application (com.glideapp.password_reset_desktop) and enables connections to the Active Directory (AD) and ‘Remote (SOAP) ServiceNow instance’ credential store types. No other components are installed.

Role required: admin

There are two ways to request a plugin:

- Access the HI Service Catalog directly by clicking Service Catalog > Activate Plugin on HI.
- Access the HI Service Catalog through the All Applications page on your instance by following these steps.

1. From your instance, navigate to System Definition > Plugins.
2. On the All Applications page, click Request Plugin to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Installed with Password Reset**

Tables, roles, business rules, scripts, and workflows are installed with the Password Reset application.

**Password Reset tables**

<table>
<thead>
<tr>
<th>Table name</th>

<tr>
<td>$pwd_verify_questions_ui</td>
<td>UI for verifying questions.</td>
</tr>
<tr>
<td>$pwd_verify_simple_ui</td>
<td>Input section for a simple verification method. This field is a single input field.</td>
</tr>
</tbody>
</table>

**UI scripts installed with Password Reset**

You can create a UI script and reference the script from a UI macro or UI page by using a <g:include_script> Jelly tag. The following example shows how the $pwd_enroll_questions_ui UI macro can reference the $pwd_enroll_questions_ui script. In the example, [UI Script Name]+".jsdbx" is the name of the script:

```
<g:include_script src="$pwd_enroll_questions_ui.jsdbx" />
```

By referencing an external script, you can maintain separation between client JavaScript code and Jelly code, which simplifies maintenance. You can use the following installed scripts with Password Reset UI macros:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$pwd_csrf_common_ui_script</td>
<td>Common UI script for handling a Cross-site Request Forgery (CSRF).</td>
</tr>
<tr>
<td>$pwd_enroll_email_ui</td>
<td>JavaScript code for the $pwd_enroll_questions_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_google_auth_ui</td>
<td>JavaScript code for the $pwd_enroll_google_auth_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_questions_ui</td>
<td>JavaScript code for the $pwd_enroll_questions_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sample_ui</td>
<td>Included sample client JavaScript for the $pwd_enroll_sample_ui UI macro.</td>
</tr>
<tr>
<td>$pwd_enroll_sms_ui</td>
<td>SMS enrollment UI script.</td>
</tr>
<tr>
<td>$pwd_enrollment_submit_event</td>
<td>UI script for an enrollment submission event.</td>
</tr>
<tr>
<td>$pwd_utils</td>
<td>Utilities for password reset UI pages and UI macros.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>$pwdWfManager</td>
<td>Helper class to handle workflow activities and post-processing.</td>

<tr>
<td>Pwd Get Lock State - Master</td>
<td>Master workflow to get a user account lock state.</td>
</tr>
<tr>
<td>Pwd Get Lock State - Remote SN</td>
<td>Gets a user account lock state for the remote(SOAP) ServiceNow instance.</td>
</tr>
</tbody>
</table>

**Workflows that unlock a user account**

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Unlock Account – AD</td>
<td>Unlocks a user account for a local instance.</td>
</tr>
<tr>
<td>Pwd Unlock Account - Local SN</td>
<td>Workflow to unlock a user account for a local instance.</td>
</tr>
<tr>
<td>Pwd Unlock Account - Master</td>
<td>Master workflow to unlock a user account.</td>
</tr>
<tr>
<td>Pwd Unlock Account – Remote SN</td>
<td>Unlocks a user account for a remote(SOAP) ServiceNow instance.</td>
</tr>
</tbody>
</table>

**Workflows that change a password**

<table>
<thead>
<tr>
<th>Workflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pwd Change - Master</td>
<td>Password change master workflow.</td>
</tr>
<tr>
<td>Pwd Change – Local ServiceNow</td>
<td>Connects to a local instance to change a password.</td>
</tr>
<tr>
<td>Pwd Change – AD</td>
<td>Connects to an AD server to change a password.</td>
</tr>
<tr>
<td>Pwd Change – Remote ServiceNow</td>
<td>Connects to a remote(SOAP) ServiceNow instance to change a password.</td>
</tr>
</tbody>
</table>

**Password Reset notifications**

<table>
<thead>
<tr>
<th>Name</th>
<th>Fired by event name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Reset – Send SMS Code</td>
<td>pwd.send_sms_code.trigger</td>
<td>Sends out SMS authentication code for verification.</td>
</tr>
<tr>
<td>(K) Password Reset – Send Email Code</td>
<td>pwd.send_email_code.trigger</td>
<td>Sends out authentication code via Email for verification.</td>
</tr>
<tr>
<td>Password Reset - Enrollment Reminder</td>
<td>pwd.enrollment_reminder.trigger</td>
<td>Sends emails to remind users to enroll in the required verifications.</td>
</tr>
<tr>
<td>Password Reset - New Password Confirmation</td>
<td>pwd.email.trigger</td>
<td>For the Email Password process, sends an email that includes the new password.</td>
</tr>
<tr>
<td>Name</td>
<td>Fired by event name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>---------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Password Reset - Send Verify Code</td>
<td>pwd.send_verify_code.trigger</td>
<td>Sends authentication code to users using email or SMS for password reset or enrollment.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> If the Notify plugin is active, SMS code is sent via Twilio instead of ServiceNow Notification.</td>
</tr>
<tr>
<td>Password Reset URL</td>
<td>password.reset.url</td>
<td>For the Email Password Reset URL process: Sends email that includes a link to the password reset URL.</td>
</tr>
</tbody>
</table>
|                                                |                           | **Note:** Check the following items if the instance does not send the email notification to the user:  
  - Check the System Event (sys_event) table to see if the email was sent.  
  - Verify that the user is subscribed to the notification.  
  - Verify that the Default Self Service password reset process and password reset properties are configured correctly.                                                                                                                     |

Domain separation in the Password Reset application

A password reset process that you define in any domain is isolated from a process that you create in any other domain. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes Basic level
- Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another.

Business logic:

Overview

Each password reset process follows these steps:

1. The end user asks to reset the password.
2. The user provides identifying information (typically username or email address).
3. The user verifies the identity — proves that they are who they say they are (typically by answering questions or submitting a code number that was delivered securely).
4. The instance connects to the credential store to confirm the user credentials.
5. The instance generates the new password and displays it to the user.

How domain separation works in Password Reset

Domain separation for Password Reset is applied at the process level. The admin configures the following elements to define a password reset process: A connection to a credential store, user groups that can use the process, method of identification, and verifications to use during the process.

- A connection to the credential store where user credentials (like username/password) are securely stored. Each connection inherits the domain setting from a template called a connection type. Each connection type is tied to a domain (the connection type record has a domain field). There are uniqueness constraints on connection names within a domain.
- One or more user groups on the ServiceNow instance that can use the password reset process. User accounts are members of one or more domains — they use the standard ServiceNow domain separation. When a user enrolls to use one of the password reset processes that is configured for the organization, the user is allowed to choose only from the processes in the user’s domain.
- The identification — the method that the end user employs to claim identity for the public password reset or password change process. Each identification inherits the domain setting from a template called an identification type. Each identification type is tied to a domain.
ServiceNow Orlando Now Platform capabilities

The identification type record has a domain field. There are uniqueness constraints on identification names within a domain.

- One or more verifications — methods to verify the identity of the person who is attempting to reset the password. Each verification inherits the domain setting from a template called a verification type. Each verification type is tied to a domain (the verification type record has a domain field). There are uniqueness constraints on verification names within a domain.
- All Password Reset tables have a domain column.
- Password Reset process tables include a sys-overrides column on business rules, UI actions, and so on.
- The Password Reset application is built using Orchestration. Orchestration supports "Data only" domain separation — the data security model of separating visibility of data from one domain to another.

Self-service and Service Desk-assisted processes

In addition to configuring the connections, user groups, identifications, and verifications that are used in each process, the admin specifies one of the following operational methods for the organization:

- Self-service process: End users reset passwords over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user’s domain (or child domain of an end user’s domain).
- Service desk-assisted process: End users do not reset passwords. An end user requests the assistance of a service desk agent, over the phone or in person. The agent processes the request. Each service desk agent has the Password Reset Admin service desk role. The "reset request" form that the agent works in presents a User field and a Process field. On the form, the agent can view all processes in the end user’s domain, even if the agent is not a member of one or more of the domains.

Password Change process

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. A service desk-assisted process is not supported. An admin must publish the URL for the self-service password change form.

The Password Change application enables an end user to change a password over the Internet using a browser on any supported interface, including mobile devices. The end user can select from any configured process in the end user’s domain (or child domain of an end user’s domain).

A password change process uses the same elements as a password reset process (connections, user groups, identifications, and verifications), with the same domain-separation features.

Password Reset Windows Application

The Password Reset Windows Application enables a user, who forgets the password or is locked out of a Windows computer, to reset the password directly from the Windows login screen.

Installer and documentation

Download the installer and installation instructions from KB0542328 in the ServiceNow Knowledge Base. The installer uninstalls any earlier version of the Password Reset Windows Application.

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
How the Password Reset Windows Application works

Administrators download and run an EXE or MSI file to install or distribute the application to user computers. The application installs a link on the Windows login screen. The user clicks the link (Forgot Password? as depicted in the examples on various Windows versions) and is then guided through the process of resetting the password.
By default, when a user requests a reset, the instance sends the user a URL with a user-specific token. After the user opens the URL, the instance prompts the user to enter and confirm the new password. The instance does not send a temporary password.

Restrictions on the Password Reset Windows Application

- The Password Reset Windows Application does not support custom verifications.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA with the web interface. See the section titled "Settings on the Details tab of the Password Reset Processes form" in https://docs.servicenow.com.
- The Password strength indicator is not supported. See the topic titled "Configure your Password Reset process" in https://docs.servicenow.com.
- For some verification types, you can use only one verification. Custom verifications are not supported. See the topic titled "Password Reset verifications" in https://docs.servicenow.com.
- Custom UI macros configured on the Process > Advanced page are not supported (for example, entry, success, or failure macros). The system displays only the default success and failure messages.
- The Password Reset Windows Application supports newline characters in the Password rule hint text. Other formatting is not supported (bold, underline, hyperlink, and so on). See the topic titled "Configure the connection to a credential store for the Password Reset processes" in https://docs.servicenow.com.

Password Reset Windows Application installation requirements

Activate the Password Reset Orchestration Add-on plugin to use the Password Reset Windows Application.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required ServiceNow release</td>
<td>Password Reset Windows Application version 4.0 is supported on Kingston,</td>
</tr>
<tr>
<td></td>
<td>London, and Madrid releases. Jakarta and earlier releases are not supported.</td>
</tr>
</tbody>
</table>
## Requirement Description

**Required hardware**
- 1 GHz or faster processor
- 512 MB of RAM
- 10 MB of available hard disk space (x86)
- 10 MB of available hard disk space (x64)

**Required software**

<table>
<thead>
<tr>
<th>Version of Password Reset Windows Application</th>
<th>Microsoft .NET Framework</th>
<th>Microsoft Visual C++</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0</td>
<td>4.7.1 and newer</td>
<td>Redistributable Visual Studio 2017</td>
</tr>
</tbody>
</table>

**Supported operating systems**
- Windows 7
- Windows 8.1
- Windows 10 Enterprise
- Windows 10 Pro

**Supported processor architecture**
- X86
- X64

**Supported network architecture**
- Password Reset Windows Application clients must have direct access to both the Internet and the ServiceNow instance where the Password Reset Windows Application is configured
- For Password Reset Windows Application versions that use an SHA certificate, the corporate network must not block the SHA certificate.
- To reset an AD password, the client must be on the corporate network.

---

**Password Reset admin guide**

The Password Reset application enables an end user to reset or change a password using a self-service process. Alternatively, your organization can implement a process that requires a service desk agent to reset passwords for end users.

Watch the video: *Introducing Password Reset (Video)*

**Password Reset processes**

Users with the password_reset_admin role configure how the process of resetting a password works for an end user.

- **Self-service process:** Users reset passwords over the Internet using a browser on any supported interface, including mobile devices.
- **Service desk-assisted process:** A user requests the assistance of a service desk agent, over the phone or in person. Users do not reset passwords.
End-user experience of the self-service process

The following example is typical:

1. On the login page, the user clicks the **Forgot Password?** link to start the process.

![Login page](image)

2. The Identify page opens and the user enters their identifying information (typically username or email address). The example includes the default Google reCAPTCHA security feature:

![Identify page](image)
3. On the Verify page, the user verifies their identity by providing information that proves that they are who they say they are. You, the admin, configure the method of verification and you can require multiple verifications. In the example, the admin has configured the Security Question verification. The user must answer a question to prove identity. (Earlier, the user selected the question and provided a secure private answer while enrolling for the password reset process.) Other possible verifications require the user to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.

4. The system checks the credential store to verify identity and then displays the new password on the Reset page.
Elements of a password reset process

You configure the following elements of the process for your organization:

- A connection to the credential store for your organization where user credentials (like username/password) are securely stored.
- One or more user groups on the ServiceNow instance that can use the password reset process.
- The type of identification that users must enter to identify themselves (typically username or email address).
- One or more verifications — methods to verify the identity of the user. Examples:
  - Answer a question that only the user knows how to answer — the QA Verification (based on the Security Question verification type).
  - Enter a code number that was emailed to the user — the Email verification.
  - Enter a code number that was texted to a mobile device — the SMS verification.
  - Enter a code number that appears on the Google Authenticator app on a mobile device — the Google Authenticator verification.
How you implement a password reset process

1. Plan your implementation: Ensure that all applicable organizational guidelines, security policies, and areas of the organization are considered.

2. Set up the elements of the password reset and password change processes according to the plan:
   - Connection to the credential store.
   - User groups that will use the password reset process.
   - Identification type to use.
   - Verifications to use.

3. In the service desk-assisted model, assign service desk agents to monitor and reset passwords as needed.

4. Monitor password reset activity to identify security threats and to ensure compliance with the password policy requirements of your organization.

Password Reset Windows Application

If a user forgets the password or gets locked out of a Windows computer, the user can reset the password directly from the Windows login screen. The user clicks the Forgot Password? link and is then guided through the process of resetting the password. To learn more, see Password Reset Windows Application.

Password Change application

The Password Change application extends the Password Reset application by letting admins define how users change their passwords. Only a self-service process is supported and an admin must publish the URL to the password change form.

1. The user logs in to the instance and then selects the Change Password module or link from the user profile record. Password change is supported on mobile devices.

2. On the Change Password page, the user selects the credential store where the password resides.

3. The user enters the old password and then enters and confirms a new password.

4. Workflows validate the old password and then implement the new password.

5. The system notifies the user that the password was changed.

What to do next

Plan your Password Reset processes

Example: The default self-service Password Reset process

The default self-service Password Reset process enables a user to reset the password without assistance from service desk agents.
The default self-service password reset flow

1. If a user does not remember the password, the user can click the **Forgot Password?** link on the login screen.

   ![Forgot Password Login](image)

2. The Password Reset application starts. On the **Identity** page, the user identifies himself or herself by entering a **Username**.

   ![Identity Page](image)

3. On the **Verify** page, the user proves that they are the person who is associated with the username. In this example, the user enters the email address that is associated with the user profile. The admin can configure a different verification method or can require additional verifications, for example, a personal question that only the user can answer.

   ![Verify Page](image)

4. The **Reset** page tells the user to check email for instructions.

   ![Reset Page](image)
5. The user opens the email and clicks the here link to reset the password. The link is valid for a period that you specify (use the **password_reset.request.expiry** property).

   ![Email preview](image)

   **Hello**
   
   A password reset was requested for your user account on the ServiceNow instance https://demonightlyplatformsecurity.service-now.com/. 
   
   Click here to reset your password. If you do not want to reset your password, please disregard this email.
   
   The link will expire in 12 hours.
   
   If you did not request this password reset, please notify your company's ServiceNow administrator.

6. The **Reset Password** page guides the user to reset the password.

   ![Reset Password page](image)

   The default self-service Password Reset process (**com.glideapp.password_reset**) defines:

   - The URI that specifies where users are redirected when they click **Forgot Password?**. By default this value is **/pwd_reset.do?sysparm_url=ss_default**, which is the same value used in the **glide.security.password_reset.uri** property. In previous releases, this value was set to **/reset_password.do**.
   - The **Enable Password Reset URL** option, which specifies that the user should receive an email with a link to reset their password after they click **Forgot Password?**.
   - The **Personal Data - Enter Email Address** verification flow that specifies the three-step password reset flow.

   See **Configure your Password Reset process** for instructions on accessing this form and configuring the fields.

   ![Note](image)

   **Note:**

   - This feature works for locally authenticated users who enter the username and password specified in their user record. Users logging in to the instance via an SSO solution or an LDAP integration cannot reset passwords using the example self-service Password Reset process.
Plan your Password Reset processes

To ensure security and efficiency, take the time to plan your Password Reset implementation.

Role required: password_reset_admin or admin

1. Decide on the password reset process:
   - **Self-service process:** Users reset their password over the Internet using a browser on any supported interface, including mobile devices. To make the Password Reset application with Orchestration available to all users publicly, create a new Password Reset process only for this purpose and make it accessible to all users by setting the **Public access** property. See Example: The default self-service Password Reset process.
   - **Service desk-assisted process:** Users reset passwords by requesting the assistance of a service desk agent, over the phone or in person. Only service desk agents with the password_reset_service_desk role can reset user passwords. Watch the videos: Resetting User Passwords (Video) and How to Set Up a Service Desk-Assisted Password Reset Process (Video).

2. Decide how groups and roles differ in access and security needs.
   - Analyze and assess how members of each group in your organization access the system. For example, if members of the sales group primarily access the system remotely, consider using a stronger method or multiple methods to verify the identity of each user.
   - Identify user roles that have access to critical information and resources. For example, stronger verifications might be required for roles that have access to employee data, accounting information, or network configurations.
   - Based on your analysis of groups and roles, determine the number and variety of verifications needed for the different Password Reset processes.

3. Decide how to manage credentials.
   - Determine whether single sign-on is enabled with the type of directory service or other credential store used. If the directory service is configured for single sign-on, consider increasing the level of security by using multiple methods to verify identity of a user. A compromised user name and password can easily allow access to associated systems in a single sign-on environment.

4. Decide how to implement enrollment in the Password Reset program.
   - For example, will enrollment be optional or required? Will users be auto-enrolled? How will users be notified to enroll in the program? The answers to these questions will help you determine the appropriate verification types to use.

5. Decide which Password Reset options to offer to users.
   - If your organization uses single sign-on, how will users reset their password if they are unable to log on?
   - What options are available to users working off-site?
Configure your Password Reset process

To implement the process, you configure credentials, verification methods and settings, and enrollment settings. You also specify which users the process applies to.

Role required: password_reset_admin or admin

1. Be sure to Plan your Password Reset processes.
2. Create the credential store record for usernames and passwords that are managed.

Note: For LDAP integrations: If the Active Directory settings require users to reset the password when logging in, the results depend on the Password Reset plugin that is installed.
- The Password Reset plugin cannot change an AD password. End users will not be able to log in to the instance.
- The Self Service Password Reset plugin depends on the Password Reset Basic plugin. Self service is intended for password reset only on the local ServiceNow instance and cannot change an AD password.
- The Password Reset Orchestration Add-on plugin is built on top of Orchestration AD activities. The plugin supports changing the AD password.

3. Define the verifications that the process will use.
4. Configure Password Reset to auto-enroll users or to enable users to enroll for the program. See Configure your Password Reset process to auto-enroll users and Enable users to enroll for Password Reset.

A Password Reset process consists of the following elements:
- The credential store that contains user login credentials.
- Optionally, the user groups that are authorized to use the Password Reset process.
- The verifications that verify the identity of the requesting user and that enable the service desk agents to authorize reset of the password. (Verifications are implemented by script includes.)

1. Navigate to Password Reset > Processes.
2. Click New and then specify a meaningful Name and Description for the process.
3. Select the Credential store that contains the user credentials that the process applies to.
4. Specify the process that you are defining: Select the Password Reset check box, the Password change check box or both check boxes.
5. Specify the Apply to all users setting.

<table>
<thead>
<tr>
<th>Setting of the Apply to all users check box</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>All users use the process that you are defining. This setting is useful only if all users have access to the authentication methods that are defined in this process.</td>
</tr>
<tr>
<td>Not selected</td>
<td>Only the users in the groups that you specify use the process. You specify the groups in the Groups related list.</td>
</tr>
</tbody>
</table>

6. For Password Reset, configure settings on the Password Reset Details tab.
## Settings on the Details tab

<table>

</tr>
<tr>
<td></td>
<td>Select the check box to display a CAPTCHA on the user identification page.</td>
</tr>
<tr>
<td></td>
<td>The Password Reset application uses Google reCAPTCHA as the default CAPTCHA service. See <a href="#">Configure Google reCAPTCHA for the password reset process</a>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.</td>
</tr>
<tr>
<td></td>
<td>Because on-premises instances do not have access to the Internet, the instances cannot use the Google reCAPTCHA service. Set the <code>password_reset.captcha.google.enabled</code> system property to <code>false</code> for on-premises instances.</td>
</tr>
<tr>
<td></td>
<td>To use the base system CAPTCHA, change the <code>password_reset.captcha.google.enabled</code> system property to <code>false</code>.</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Identification type  | Method that the user employs to claim identity for the public Password Reset or Password Change process. Any selection overrides the default identification that is associated with the process.  

The base system includes the Email and Username Identification identification types. You can create a custom identification type (some knowledge of JavaScript is recommended).  

See Personal data identification types and confirmation type verifications. |
| Post-reset URL       | URL to go to after a successfully resetting a password — typically, the URL of the original login page.  

Enter a complete path, including the protocol (for example, https://myDomain.myURL.com). If the path is under the same domain as the Public URL, then start the path with the / character.  

**Note:** If the Auto-generate password check box is selected, then the instance displays the new password. The user must click Done to go to the URL. |
| Minimum verifications| Number of verifications that a user must successfully submit to reset the password.  

If the number exceeds the number of mandatory verifications, then the user must submit enough additional optional verifications to meet the number specified for Minimum verifications.  

**Note:** Each user must submit all mandatory verifications regardless of the number specified.  

By default, during the password reset process, the system presents optional verifications to the user based on the Order values for the verifications. If you selected Allow user to choose from optional verifications, then the Verification page presents all optional verifications to the user. The user then selects the appropriate number of verifications. In this example, the Minimum verifications value is 1. Because no mandatory verifications are configured, the user can choose an optional verification.  

Also, see Allow user to choose from optional verifications. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>

8. For **Password Reset**, fill in any fields of interest on the **Enrollment Reminder** tab.

10. From the **Password Reset Process Verifications** related list, select one or more verifications. See **Password Reset verifications**.

11. Optional: From the **Password Reset Process Groups** related list, select the user groups that will use the process that you are defining.

   The **Password Reset Process Groups** related list appears only if the **Apply to all users** check box is not selected.

12. Save the record and then select the **Active** check box to enable the Password Reset process that you configured. The check box is available only after the record has been saved.

13. Click **Update**.

14. Navigate to **Password Reset > Properties** to set the properties that configure the Password Reset experience for end users.

---

**Credential stores for Password Reset**

Credential stores hold user information such as user names and passwords that can be used as login credentials. Examples include the User table (sys_user) or an Active Directory server.

Users with the password_reset_admin or password_reset_credential_manager role can create and modify connections to credential stores.
Credential store types installed with the base system

A credential store type is a set of workflows that specify how to connect to a credential store. Navigate to Password Reset > Credential Stores to view the list of example credential stores that are based on the base-system types. The base system includes the following credential store types:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local ServiceNow Instance</td>
<td>Represents the current (local) ServiceNow instance.</td>
</tr>
<tr>
<td>AD Credential Store</td>
<td>Represents an Active Directory credential store. Installed with the Password Reset - Orchestration Add-on plugin.</td>
</tr>
</tbody>
</table>

Connection workflows for credential store types

A credential store type workflow requires a subflow that defines how to connect to the store, and can include an optional subflow that defines how to test the connection. Use the Pwd reset – AD and Pwd Reset - Local subflows as models for your custom connection workflows.
Pwd Reset Local sub workflow
Creating a custom credential store type

You can use a credential store type as a model to create a custom type. See Create a credential store type for Password Reset.

Configure the connection to a credential store for the Password Reset processes

You create a Password Reset credential store record to configure access to your credential store server while a user is changing or resetting a password. In addition to host connection information, you can specify the password hints that users should see, restrictions on password reuse, the allowed number of failed reset attempts, and other settings.

For an AD credential store, skip this procedure and instead follow the instructions in Integrate Password Reset with your Active Directory service. The Password Reset Windows Application supports only AD credential stores.

1. Navigate to Password Reset > Credential Stores.
2. Select one of the following sample credential stores:
   - Local ServiceNow Instance credential store.
   - Remote (SOAP) ServiceNow credential store (installed with the Orchestration Add-on).
3. Enter a unique and meaningful Name and Description, and then fill in the form.
<table>
<thead>
<tr>
<th>Type</th>
<th>Explanation</th>
<th>Note: For an AD credential store, skip this procedure and see Integrate Password Reset with your Active Directory service. The Password Reset Windows Application supports only AD credential stores.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-generate password</td>
<td>Script include that generates a temporary password for use during the reset process. If you select the Enforce history policy check box, then you must specify a value for Auto-generate password.</td>
<td></td>
</tr>
</tbody>
</table>
| Enforce history policy | Appears only if you select a credential store Type of AD Credential Store or Local ServiceNow Instance. For information on configuring the setting for an AD credential store, see Configure the connection to an AD credential store.  
Select the Enforce history policy check box to ensure that users do not reuse passwords. For example, you might configure the history policy to not allow the user to reuse any of the previous 10 passwords. Follow this procedure:  
1. Select the Enforce history policy check box.  
2. In the Password Reset Credential Store Parameters related list, create a password_history_limit parameter.  
3. Set the value of the parameter to the number of previous passwords that cannot be used (maximum 10). The default value of 0 (zero) enables use of any previous password. |                                                                                                                                 |
| Hostname              | URL or IP address of the credential store.                                  |                                                                                                                                 |
| User account lookup   | Script include that maps the user ServiceNow platform ID to the user credential store ID. A default script, PwdDefaultUserAccountLookup, returns the user ServiceNow platform user name. |                                                                                                                                 |
| Password rule hint    | Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The Password rule script enforces the requirements.  
Note: The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on). |                                                                                                                                 |
| Password rule         | Specify the client script that validates the new password that the user enters. The script is invoked when the user enters a new password and clicks Password Reset. You can use the script to enforce password strength/complexity requirements. |                                                                                                                                 |
Enable Password Strength
Select the check box to:

- Display the text box for the **Strength rule** script so you can update the script.
- Display the graphical **Password Strength** bar to the user while the user changes or resets the password.

**Note:** The Password Reset Windows Application does not support Password Strength.

Strength rule
This text box appears only if you select **Enable Password Strength**.
Specify the client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process.

Default settings:

- Selected for local ServiceNow credential stores
- Not selected for other credential stores

**Note:** To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.

**Note:** The Password Reset Windows Application does not support Password Strength.

---

4. Click **Submit**.

5. If you use the Local ServiceNow Instance credential store and you selected the **Enforce history policy** check box, then follow these steps:

   a) Open the Password Reset process that is associated with the credential store: **Password Reset > Processes**.

   b) On the **Password Reset Details** tab of the Password Reset Process form, clear the **Auto-generate password** check box and then save the process definition.

6. **Test the connection to the credential store.**

**Integrate Password Reset with your Active Directory service**
When the Orchestration Add-on plugin is activated, the Password Reset application can change passwords on an Active Directory credential store. The application changes passwords by referencing an Active Directory user role with the appropriate password change privileges.

Role required: admin

Active Directory must have a user role with the following privileges:
Descendent User objects:
- Reset password
- Read/Write pwdlastset
- Read/Write UserAccountcontrol
- Write Account Restrictions
- Read/Write lockouttime
- Read MemberOf

Descendent Group objects:
- Read Members
- Read MemberOf

1. Install a MID Server on a Windows computer that can connect to Active Directory.
2. Configure the MID Server.
3. In the ServiceNow instance, navigate to Orchestration > Credentials.
4. Click New, complete the form with the following values for the AD credential, and then click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select Windows.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter your Active Directory domain user. For example, domain \admin.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter your Active Directory domain user password.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select the MID Server that is used to access the Active Directory server.</td>
</tr>
</tbody>
</table>

Create a connection to the credential store as described in Configure the connection to an AD credential store.

Configure the connection to an AD credential store
You create a Password Reset credential store record to configure access to your Active Directory server while a user is changing or resetting a password. In addition to host connection information, you can specify the password hints that users should see, restrictions on password reuse, the allowed number of failed reset attempts, and other settings.

The Orchestration add-on installs the AD Credential Store type. The Password Reset Windows Application supports only AD Credential Store.

1. Navigate to Password Reset > Credential Stores and select Sample AD Credential Store to use as a template.
2. Enter a unique and meaningful Name and Description and then fill in the form.

<table>
<thead>
<tr>
<th>Type</th>
<th>Select AD Credential Store. A ServiceNow credential store type is a template that provides the required set of capabilities for a particular type of credential store. Credential stores inherit the functionality of the credential store type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-generate password</td>
<td>Specify a script include that generates a temporary password for use during the reset process.</td>
</tr>
</tbody>
</table>

Note: If you select the Enforce history policy check box, then you must specify a value for Auto-generate password.
### Enforce history policy

Appears only if you select a credential store **Type of AD Credential Store** or **Local ServiceNow Instance**. For information on configuring the setting for credential store types other than AD, see **Configure the connection to a credential store for the Password Reset processes**.

Select the **Enforce history policy** check box to enforce both of the following password reset policies:

- **History policy (password reuse)**: Active Directory domains can be configured to include a history policy that ensures that users do not reuse passwords. For example, the history policy might be configured to not allow the user to reuse any of the previous 10 passwords when resetting a password.
- **Maximum number of reset attempts**: You can configure the maximum number of attempts to reset a password. A user who fails to reset the password (by failing password policies or the history policy) the specified number of times is blocked.

Follow this procedure to enforce the history policy that is configured for the AD credential store and to enforce the password policy:

1. Select the **Enforce history policy** check box.
2. In the Password Reset Credential Store Parameters related list, set the value of the `max_reset_attempts` parameter to the number of allowed attempts to change or reset the password. Attempts fail when password policies which are set up on the remote AD server. The `max_reset_attempts` setting applies only to Password Reset processes that use AD credential stores. The default value of 0 (zero) enables an unlimited number of reset attempts.

<table>
<thead>
<tr>
<th><strong>Hostname</strong></th>
<th>Specify the URL or IP address of the credential store.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>User account lookup</strong></td>
<td>Specify the script include that maps the user ServiceNow platform ID to the user credential store ID.</td>
</tr>
<tr>
<td>The default script, <code>PwdDefaultUserAccountLookup</code>, returns the user ServiceNow platform user name.</td>
<td></td>
</tr>
<tr>
<td><strong>Password rule hint</strong></td>
<td>Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The <strong>Password rule</strong> script enforces the requirements.</td>
</tr>
<tr>
<td><strong>Note</strong>: The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
<td></td>
</tr>
<tr>
<td><strong>Password rule</strong></td>
<td>Specify the client script that validates the new password that the user enters. The script is invoked when the user enters a new password and clicks <strong>Password Reset</strong>. You can use the script to enforce password strength/complexity requirements.</td>
</tr>
<tr>
<td><strong>Enable Password Strength</strong></td>
<td>Select the check box to:</td>
</tr>
<tr>
<td>• Display the text box for the <strong>Strength rule</strong> script so you can update the script.</td>
<td></td>
</tr>
<tr>
<td>• Display the graphical <strong>Password Strength</strong> bar to the user while the user changes or resets the password.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong>: The Password Reset Windows Application does not support Password Strength.</td>
<td></td>
</tr>
</tbody>
</table>
This text box appears only if you select **Enable Password Strength**.

Specify the client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process.

**Default settings:**
- Selected for local ServiceNow credential stores
- Not selected for other credential stores

**Note:**
To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.

**Note:**
The Password Reset Windows Application does not support Password Strength.

---

3. **Click Submit.**

4. On the domain controller, set **Password Aging** (MIN_PASSWORD_AGE) to zero.

5. To enforce the history policy that is configured for the AD credential store, follow these steps:
   a) Open the Password Reset process that is associated with the credential store: Password Reset > Processes.
   b) On the **Password Reset Details** tab of the Password Reset Process form, clear the **Auto-generate password** check box and then save the process definition.
   c) On the domain controller, set the history policy to twice the desired number of passwords. For example, to enforce that the last 11 passwords are not repeated, set the history policy to 22.

   **Note:**
   To enforce the history policy that is configured for the AD credential store, the system auto-generates a new temporary password for each reset cycle. The system auto-generates the temporary password even though you cleared the **Auto-generate password** check box on the Password Reset Process form. Because the user immediately replaces the temporary password with a new password, two passwords are created for each reset cycle.

6. To enforce the maximum number of attempts to reset the password: In the Password Reset Credential Store Parameters related list, set the value of the **max_reset_attempts** parameter to the number of allowed failed attempts. The default value of 0 (zero) enables an unlimited number of reset attempts.
Note: The max_reset_attempts setting applies only to Password Reset processes that use AD credential stores.

7. Click **Submit**.
8. **Test the connection to the credential store.**

**Test the connection to a credential store**
You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

Role required: admin

1. Navigate to **Password Reset > Credential Stores** and then open the credential store record.
2. In the header bar, click **Save and Test Connection**.
   A progress page displays the result of the test.

**Set up SOAP credentials for Password Reset**
When the Orchestration Add-on plugin is activated, the Now Platform can use the SOAP protocol to interact with remote credential stores such as a remote ServiceNow instance.

Role required: admin or web_service_admin

1. Navigate to **System Web Services > Outbound > SOAP Message**.
2. Click **Password Reset Request**.
3. From the **Soap Message Functions** related list, configure both the password_reset and sys_user_get_record functions by completing the following steps.
   a) In **Basic auth user ID**, enter the user ID for the remote system user who has privileges to update records on the User [sys_user] table.
   b) In **Basic auth user password**, enter the password for the remote system user who has privileges to update records on the User [sys_user] table.
   c) Select **Use basic auth**.
   d) Click **Update**.

You do not need to enter a value in the **SOAP endpoint** field. The field shows the name of the ServiceNow instance used for Password Reset.

**Delete a connection to a credential store for Password Reset**
Important: Before you delete the connection to a credential store, check all Password Reset processes to ensure that the credential store is not in use. If the credential store is being used by a process, update the process before deleting the credential store.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to **Password Reset > Credential Stores** and then select the check box for the credential store.
2. In the **Actions** choice list, select **Delete**.

**Password Reset verifications**
Each verification specifies the method and process for verifying the identity of the user that is requesting password reset.
Verifications included with Password Reset

The Password Reset application includes the following verifications in the base system. You can create a verification based on either a base-system verification or a verification type (a template).

**Note:** The Password Reset Windows Application does not support custom verifications.

### Password Reset verifications

<table>
<thead>
<tr>
<th>Verification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QA verification</td>
<td>Implements a self-service Password Reset model with questions that are included with the base system or custom questions that the admin defines. While enrolling for the process, the user decides which questions to provide answers for. Questions are presented in the language that the user requested during login. When a user requests password reset, the system poses a specified number of the questions that the user selected during enrollment. The user must answer all questions correctly to verify identity.</td>
</tr>
<tr>
<td>Email verification</td>
<td>This verification relies on auto-generated code numbers. You typically implement Email verification as a self-service Password Reset model. When a user requests password reset, the system sends a verification code to an email address that the user authorized during enrollment. To verify identity, the user then submits the code on the Password Reset Verify page. For information on the user enrollment experience, see Users: Enroll in the Password Reset program using emailed codes. The Password Reset Windows Application supports Email verification. This verification is based on the Email Code verification type.</td>
</tr>
</tbody>
</table>

For information on the user enrollment experience, see Users: Enroll in the Password Reset program using questions and answers.

This verification is based on the **Security Questions** verification type.
SMS verification

- Implements a self-service or service desk-assisted Password Reset model that relies on auto-generated code numbers.

  When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then submits the code on the Password Reset Verify page.

  You can use the ServiceNow Notify feature to send the codes.

  For information on the user enrollment experience, see Users: Enroll in the Password Reset program using SMS codes.

  This verification is based on the SMS Code verification type.

Google Authenticator verification

- Password Reset model that relies on auto-generated code numbers.

  You typically implement Google Authenticator verification as a self-service Password Reset model.

  When a user requests password reset, the user reads a code from the Google Authenticator app on a device that the user has paired. To verify identity, the user then submits the code on the Password Reset Verify page.

  For information on the user enrollment experience, see Users: Enroll in the Password Reset program using Google Authenticator.

  The Password Reset Windows Application supports Google Authenticator verification.

  This verification is based on the Google Authenticator verification type.

Personal Data — Confirm Email Address

- Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance.

  This verification is based on the Personal Data Confirmation verification type.

Personal Data — Enter User Name

- Implements a self-service Password Reset model that relies on user information that is available in the user profile on the instance.

  This verification is based on the Personal Data verification type.

Verifications included with the demo data

The following demo data is based on the Mock verification type:

- Sample Mock verification #1
- #2

Personal data identification types and confirmation type verifications

Personal data verifications allow users to verify their identity by providing answers to questions that are generated from personal information stored in the User table [sys_user].

User experience

For an example of how a user might enroll for Personal data verification, see Users: Enroll in the Password Reset program using questions and answers.
Personal data identification types

The Password Reset application provides the email and username identification types. You can use either type as provided or as a model to create a custom identification type.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Identification</td>
<td>Identifies users by their email addresses.</td>
</tr>
<tr>
<td>Username Identification</td>
<td>Identifies users by their user names.</td>
</tr>
</tbody>
</table>

Personal data confirmation verifications

- **Personal data verification**: If users are associated with a Password Reset process that uses a personal data verification, the users are typically not required to enroll for Password Reset.
- **Personal data confirmation verifications** allow employees with the password_reset_service_desk role to access personal data from the sys_user table when assisting a user with a password reset request.

To configure personal data and personal data confirmation verifications, you specify parameters as name/value pairs that correspond to a particular piece of user information. For example, to verify users by their email address:

1. Set the **label** parameter (the text that the end user should see) to **Email** (that is, `label=Email`).
2. Set the **column** parameter (the column in the table that holds the verification data) to **email** (that is, `column=email`).

**Note**: You can use only one set of name/value pair parameters per verification. Additional parameters are ignored.

To use multiple pieces of personal information for user verification, create more personal data or personal data confirmation verifications and add the verifications to the related Password Reset process.

Personal data and personal data confirmation type verifications

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Text to display as a label for the field that the user fills in during the password reset request. Data Type: string Default Value: n/a</td>
</tr>
<tr>
<td>column</td>
<td>Column of the sys_user table that provides the data that is used to verify the identity of the user. Data Type: string Default Value: n/a</td>
</tr>
</tbody>
</table>
**SMS Code Verification type for Password Reset**

Using the Simple Message Service (SMS) Code Verification type, a user can verify identity with the help of any SMS-enabled device, like a cell phone that accepts text messages. When a user requests password reset, the system sends a numerical code to the device and the user then enters the code on the Password Reset Verification page.

You can change the default behavior of an SMS code verification using either of the following methods:

- Set parameter values, as shown in the table.
- Update property settings for the Password Reset application.

**Note:** The system allows only one instance of each SMS code parameter.

### SMS Code Verification type parameters

<table>
<thead>
<tr>
<th>Parameter name</th>
<th>Description</th>
<th>Data Type</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>expiry</td>
<td>Number of minutes the verification code is valid.</td>
<td>integer (any positive integer)</td>
<td>5</td>
</tr>
<tr>
<td>complexity</td>
<td>Number of digits in the numerical verification code.</td>
<td>integer (any positive integer)</td>
<td>4</td>
</tr>
<tr>
<td>pause_window</td>
<td>Number of minutes before the user can request another SMS code for verification.</td>
<td>integer (any positive integer)</td>
<td>2</td>
</tr>
<tr>
<td>max_per_day</td>
<td>Maximum number of codes sent for verification in one day.</td>
<td>integer (any positive integer)</td>
<td>10</td>
</tr>
</tbody>
</table>

**User experience**

For information on how users enroll for SMS verification, see [Users: Enroll in the Password Reset program using SMS codes](#).

Use NotifyNow to send SMS codes for enrollment and verification

You can configure the Password Reset application to send SMS codes for enrollment and verification using the ServiceNow NotifyNow application (via the Twilio SMS Messaging system). NotifyNow is tightly integrated with the workflow engine and business rules and delivers a highly configurable and trusted way to deliver SMS messages.

**Role required:** admin

NotifyNow requires a separate contract with Twilio.

1. Enroll for a Twilio account and telephone number at [https://www.twilio.com/](https://www.twilio.com/)
2. Activate the Notify plugin.
3. Associate the Twilio account with Notify.

No other configuration is required. Users who request password change or password reset receive SMS codes through NotifyNow.

Specify the number of required security questions

When designing a Security Questions verification for Password Reset, you can specify the number of questions to display when users enroll. You can also specify the number to display when a user is verifying identity while resetting the password.

Role required: password_reset_admin or admin

1. Navigate to Password Reset > Verifications and then open a verification that uses the Security Questions Verification Type.
2. Configure the parameters in the Password Reset Verification Parameters related list.

### Parameters for Security Questions Verification

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_enroll</td>
<td>Number of questions that a user must provide answers to while enrolling for the Password Reset process. The value that you specify here overrides the setting of the Number of security questions required during enrollment property. See Configure Password Reset properties. Data Type: Positive integer that does not exceed the number of questions in the security questions list (Password Reset &gt; Security Questions). Default Value: 5</td>
</tr>
<tr>
<td>num_reset</td>
<td>Number of security questions that are displayed on the Verify page while a user is attempting to reset the password. The user must answer all questions correctly to verify identity. The questions are selected at random and are presented in random order. The value that you specify here overrides the setting of the Number of security questions required during the password reset request property. See Configure Password Reset properties. Data Type: Positive integer that does not exceed the value of the num_enroll parameter Default Value: 3</td>
</tr>
</tbody>
</table>

3. Click Update.

**Configure your Password Reset process to auto-enroll users**

To simplify management, many organizations auto-enroll users in the Password Reset program. Every base-system verification type enables you to specify automatic enrollment for your process.

Role required: password_reset_admin or admin
To enable automatic enrollment, you configure settings for the verification type that your Password Reset process is based on.

1. Navigate to **Password Reset > Extensions > Verification Types**.
2. Click the verification type for the verification that your Password Reset process uses. The verification type for each base-system verification is identified in **Password Reset verifications**.
3. On the **Verification Types** page, specify the following settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Script that determines whether a user is enrolled for verification.</td>
</tr>
<tr>
<td><strong>Note:</strong> For automatic enrollment to work, the Enrollment check script must return true. This may require additional setup by the admin to ensure that the preconditions are met. For example, for the SMS Code verification type, records must be populated in particular tables.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>If no script is specified when <strong>Automatic Enrollment</strong> is selected, a default script is provided.</td>
</tr>
<tr>
<td>Automatic enrollment</td>
<td>Select the check box to auto-enroll users.</td>
</tr>
<tr>
<td><strong>Note:</strong> If Automatic enrollment is not selected, then you must provide an enrollment UI macro and enrollment processor script as described in Create a custom Password Reset verification type.</td>
<td></td>
</tr>
</tbody>
</table>

4. Repeat the procedure for all verifications that your Password Reset process uses.

### Enable users to enroll for Password Reset

To enable users to enroll for the Password Reset program, you specify a UI macro that takes the user through the enrollment process and a script that processes the enrollment data that the user entered. The base system includes a functioning macro and script.

**Role required:** password_reset_admin or admin

To enable users to enroll, you configure settings for the verification type that your Password Reset process is based on.

1. Navigate to **Password Reset > Extensions > Verification Types**.
2. Click the verification type for the verification that your Password Reset process uses. The verification type for each base-system verification is identified in **Password Reset verifications**.
3. On the **Verification Types** page, specify the following settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic enrollment</td>
<td>Clear the check box to disable automatic enrollment.</td>
</tr>
<tr>
<td>Enrollment UI</td>
<td>Enrollment UI macro that takes the user through the enrollment process.</td>
</tr>
<tr>
<td>Enrollment processor</td>
<td>Enrollment processor script that processes enrollment data.</td>
</tr>
</tbody>
</table>

4. Repeat the procedure for all verifications that your Password Reset process uses.
Enabling user enrollment

This example verification type uses the `pwd_enroll_sms_ui` enrollment UI macro and the `PwdEnrollSMSProcessor` enrollment processor script.

Verification type

A verification type must also define a verification UI macro and a corresponding verification processor script. The example uses the `pwd_verify_sms_ui` verification UI macro and the `PwdVerifySMSProcessor` verification processor script.
Verification UI macro

```xml
<?xml version="1.0" encoding="utf-8"?>
<j:java tsim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
<script language="javascript">
    function getVerificationInfo() {
        var ga = new GlideAjax('PvdAjaxPublicEnrollSMS');
        ga.addParam('sysparm_name', 'getEnrollVerificationInfo');
        ga.addParam('sysparm_user_id', '7f(sysparm_sys_user_id)');
        // add CSRF token for AJAX handling.
        ga.addParam('sysparm_pvd.csrf_token', findCERFElement(null).value);
        ga.getXML(handleGetVerificationInfoResponse, null);
    }

    function handleGetVerificationInfoResponse(response, args) {
```
Verification processor script

Configure Password Reset properties

You can specify properties that configure the Password Reset experience for end users.

Role required: password_reset_admin
While there are no range limits for the values you can enter for properties, consider using only positive integer values starting at 1. When you determine the limit for the upper range of a property, consider the task that the user is performing.

For example, you would not want to allow 100 attempts for users to verify their identity. A more common value is 3 attempts. Similarly, you may not want to force users who are completing the enrollment process to spend time selecting and answering 30 security questions. The more commonly used number of security questions is between 5 and 7.

1. Navigate to **Password Reset > Properties**.
2. Update settings as needed and then click **Save**.

### Password Reset properties

<table>
<thead>
<tr>
<th>Property Label</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email template for reminders to users who need to enroll for the password reset process</td>
<td>password_reset.enrollment_reminder.email_template</td>
<td>Template to use for the email messages that remind users to enroll for the password reset process. See <a href="#">Send email to remind users to enroll for Password Reset</a>.</td>
</tr>
<tr>
<td>Workflow polling frequency</td>
<td>password_reset.wf.refresh_rate</td>
<td>Time period in milliseconds between checks on status of the Password Reset workflow.</td>
</tr>
<tr>
<td>Workflow expiration</td>
<td>password_reset.wf.timeout</td>
<td>Maximum wait time in milliseconds for the workflow to complete. The workflow is triggered during the password reset request when the user clicks <strong>Submit</strong>.</td>
</tr>
<tr>
<td>Disable CAPTCHA validation functionality</td>
<td>password_reset.captcha.ignore</td>
<td>Enables or disables CAPTCHA functionality.</td>
</tr>
</tbody>
</table>

The Password Reset application uses Google re-CAPTCHA as the default CAPTCHA service. To use the base system CAPTCHA, change the `password_reset.captcha.google.enabled` system property to **false**. See [Configure Google reCAPTCHA](#).
<table>
<thead>
<tr>
<th>Property Label</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of unsuccessful attempts allowed to reset/change password | `password_reset.request.max_attempt` | Number of password reset attempts a user is allowed before they are locked out for a period determined by the value in `max_attempt_window`.  
- Type: integer  
- Default value: 3 (attempts) |
| Number of minutes a user must wait to reset/change password after exceeding the maximum allowed unsuccessful attempts | `password_reset.request.max_attempt_window` | Time period that users are blocked or prevented from changing their passwords after trying the maximum number of times.  
- Type: integer  
- Default value: 1440 (minutes) |
| Number of minutes a user must wait to reset/change password after the last successful reset/change | `password_reset.request.success_window` | Time period that a user must wait after successfully resetting the password to reset the password again.  
- Type: integer  
- Default value: 1440 (minutes) |
| Number of minutes a user must wait to start a reset request after the last successful unlock account | `password_reset.request.unlock_window` | Time period that a user must wait after a successful unlock operation before starting a new request.  
- Type: integer  
- Default value: 1440 (minutes) |
| Number of minutes before a password reset request expires | `password_reset.request.expiry` | Time period during which a user must perform the Password Reset process.  
- Type: integer  
- Default value: 10 (minutes) |

**Note:** This setting takes precedence over the `glide.pwd_reset.onetime.token.validity` property (that has a 12-hour default).
<table>
<thead>
<tr>
<th>Property Label</th>
<th>Property Name</th>
<th>Description</th>

</tr>
</tbody>
</table>
| Number of security questions required during the password reset request | password_reset.qa.num_reset | Number of security questions that are displayed on the Verify page while a user is attempting to reset the password. The user must answer all questions correctly to verify identity. The questions are selected at random and are presented in random order.  
- Type: integer  
- Default value: 3 (questions)  
- Possible values: Integers that are less than the number specified for the Number of security questions required during enrollment property (the num_enroll parameter).  

**Note:** You can override this property setting for a Password Reset process by configuring the num_reset parameter. See Specify the number of required security questions.

Password Reset SMS Code properties
<table>
<thead>
<tr>
<th>Property Label</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of SMS codes sent for verification per day     | password_reset.sms.max_per_day                    | Maximum number of SMS codes that are sent to a user within one 24-hour period. The 24-hour period begins when a user clicks **Send Code**.  
- Type: integer  
- Default value: 10 (per day)  

**Note:** You can override this SMS code property by adding the `max_per_day` parameter in the SMS code verification. |
| Number of minutes before the user can attempt to send another SMS code for verification | password_reset.sms.pause_window                   | Time that must pass before another SMS code can be sent to a user.  
- Type: integer  
- Default value: 2 (minutes)  

**Note:** You can override this SMS code property by adding the `pause_window` parameter in the SMS code verification. |
| Number of digits in the SMS code sent to the user             | password_reset.sms.default_complexity             | Number of characters required for a user to reset their password.  
- Type: integer  
- Default value: 4 (digits)  

You can override this SMS code property by adding the `complexity` parameter in the SMS code verification. |
<table>
<thead>
<tr>
<th>Property Label</th>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of minutes before the SMS code expires | password_reset.sms.expiry | Time, in minutes, until the SMS code sent to the user expires.  
- Type: integer  
- Default value: 5 (minutes) |

**Note:** You can override this SMS code property by the **expiry** parameter in the SMS code verification.

### Password Reset Monitoring and Reporting properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| password_reset.activity_monitor.incident_window | Time window to count the number of blocked users.  
- Type: integer  
- Default value: 60 (minutes) |
| password_reset.activity_monitor.incident_threshold | Number of blocked (or locked) users, within the specified time window, that triggers a system log event.  
- Type: integer  
- Default value: 10 (blocked users) |

### Password Reset Style Sheet

<table>
<thead>
<tr>
<th>Property Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| password_reset.stylesheet | Name of a custom CSS style sheet in the Style Sheet (content_css) table. You can use the default style sheet as a template for the custom style sheet. You cannot add element definitions to the style sheet.  
- Type: string  
- Default value: `css_pwd_reset_default` |
### Property Label | Property Name | Description
--- | --- | ---
Email template for reminder emails | password_reset.email_template_default | Template to use to specify the subject and body of the email messages to remind users to enroll for the Password Reset process. For example:
- (Subject) Reminder: Enroll in the Password Reset program
- (Body) Click here to enroll for the password reset service.

**Note:** You must create an email template in the password_reset table to use it as a reminder.

- Type: string
- Default value: email_template_default

**Note:** Several components in the Self Service Password Reset (com.snc.password_reset) plugin and the Password Reset (com.glideapp.password_reset) plugin control the password reset flow. The following properties affect Password Reset, but do not appear on the Password Reset > Properties page:

- You can add the `glide.pwd_reset.onetime.token.validity` property to the System Properties (sys_properties) table to specify the number of hours that the Password Reset token should be valid. Default: 12.

**Note:** The setting for the `password_reset.request.expiry` property (time period during which a user must perform the Password Reset process) takes precedence over the setting for `glide.pwd_reset.onetime.token.validity`.

Properties accessible from the System Properties (sys_properties) table:

- For Password Reset on mobile devices, you can specify the URL that the user is taken to when user taps the Forgot password? button. See the `glide.security.password_reset.uri` property in High Security Settings. Default: `/$pwd_reset.do?sysparm_url=ss_default`
- If `glide.security.forgot_password.display.link` is set to true, displays the Forgot Password? link on the login page.
Send email to remind users to enroll for Password Reset

You can automatically send messages that remind users to enrolled in the Password Reset process. You specify the text of the message and can configure the messages to repeat at intervals.

Role required: password_reset_admin

The default email content is:

- **Subject:** Reminder: Enroll in the Password Reset program
- **Body:** Click here to enroll in the Password Reset program.

To customize the email, see [Customize the Password Reset enrollment reminder email](#).

1. Navigate to [Password Reset > Processes](#) and select your process.
2. Click the [Enrollment Reminder](#) tab, configure the following settings, and then click **Update**. (The tab appears only when the **Password reset** check box is selected.)

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Send reminder</td>
<td>Select the check box to send reminder emails to users (either all users or users in the specified groups, as you configured). Clear the check box to send no reminders.</td>
</tr>
</tbody>
</table>
| Sender alias   | Enter a non-functional email alias that should appear in both the **To** and **From** fields of the message. For example, do-not-reply@myCompany.com. Users will not be able to respond to the alias.  

   The alias is required by the email system to use the **bcc** field for all of the users who receive the message. The intent is that the users should not see the other addressees.  

   Default: do-not-reply@ServiceNow.com |
| Send, Day, and Time | Specify a schedule of one message each month or one message each week.  

   - If you set **Send** to **Monthly**, then enter the day of the month and optionally the time of day when the message should be sent.  

   - If you set **Send** to **Weekly**, then enter the day of the week and optionally the time of day when the message should be sent.  

   Default: Weekly message at 00:00 on Monday |
| Starting      | Date and time to send the first message. Click the calendar button to specify the setting.  

   Default: (Now) |

[Customize the Password Reset enrollment reminder email](#)

The email message that reminds users to enroll for the Password Reset process is based on an email template. To customize the message, you can modify the default template or create a custom template.
Role required: password_reset_admin

The default email content is:

- **Subject:** Reminder: Enroll in the Password Reset program
- **Body:** Click here to enroll in the Password Reset program.

1. To modify the email subject text:
   a) Navigate to **System Policy > Email > Templates**.
   b) Open the **Password reset enrollment reminder** template.
   c) Update the **Subject** field as needed.
   d) In the **Message HTML** text box, you can add code as needed, but do not modify the default text.

2. To modify the email body content:
   a) Navigate to **System Notifications > Email > Notification Email Scripts**.
   b) Open the **pwd.enrollment_reminder** script.
   c) Modify only the indicated portion of the script.
3. To create a custom email template:
   a) Make a copy of the Password reset enrollment reminder template and edit as described above.
b) Navigate to **Password Reset > Properties** and enter the template name in the **Email template for enrollment reminder emails** field.

### Configure the required strength for passwords

The password that a user defines must meet certain requirements — for example, it must contain at least 12 characters, it must include a numeral, and so on. You can configure the requirements as needed for your organization.

**Role required:** password_reset_admin

The base system includes example credential stores with various password requirements. You can modify password requirements and provide users with hints for creating a password. The default requirements are:

- At least eight characters
- At least one uppercase and one lower case letter
- At least one numeral

**Note:** In addition to configuring password strength requirements, you can configure several other settings for the credential store, as described in **Configure the connection to a credential store for the Password Reset processes**.

1. Navigate to **Password Reset > Credential Stores**.
2. Select the credential store in the list and then configure the following settings:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password rule hint</td>
<td>Specify the text that appears on the password reset page to help the user to create a password that meets all requirements. The <strong>Password rule</strong> script enforces the requirements.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application supports newline characters in the hint. Other formatting is not supported (bold, underline, hyperlink, and so on).</td>
</tr>
<tr>
<td>Password rule</td>
<td>Specify the client script that validates the new password that the user enters. The script is invoked when the user enters a new password and clicks <strong>Password Reset</strong>. You can use the script to enforce password strength/complexity requirements.</td>
</tr>
<tr>
<td>Enable Password Strength</td>
<td>Select the check box to:</td>
</tr>
<tr>
<td></td>
<td>· Display the text box for the <strong>Strength rule</strong> script so you can update the script.</td>
</tr>
<tr>
<td></td>
<td>· Display the graphical <strong>Password Strength</strong> bar to the user while the user changes or resets the password.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The Password Reset Windows Application does not support Password Strength.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Strength rule  | This text box appears only if you select **Enable Password Strength**. Specify the client script that calculates the strength/complexity of the password that the user enters. The script is invoked when the user begins to enter a new password during the reset process. Default settings:  
  - Selected for local ServiceNow credential stores  
  - Not selected for other credential stores |

**Note:**
To guide the user during the reset process, the system displays a graphical bar labeled **Password Strength** under the **New password** field.

**Note:** The Password Reset Windows Application does not support Password Strength.

---

3. Click **Submit**.
   
   You should test the connection to a credential store after you configure a new credential store or when users experience problems that might involve the connection.

4. Navigate to **Password Reset > Credential Stores** and then open the credential store.

5. In the header bar, click **Save and Test Connection**. A progress page displays the result of the test.

---

**Specify lockout for failed login attempts**

The system provides inactive script actions that enable you to specify the number of failed login attempts before a user account is locked and to reset the count after a successful login.

Role required: admin

Navigate to **System Policy > Script Actions** to view or activate the scripts.

**Note:** Starting with the Kingston release, following a zBoot, the script actions **SNC User Lockout Check with Auto Unlock** and **SNC User Clear** are activated.

To learn more about properties that affect failed login attempts, see **Manage failed login attempts** in the Instance Security Hardening Settings.
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Script action</th>
<th>Description</th>
</tr>
</thead>
</table>
| SNC User Lockout Check with Auto Unlock | - Uses the value of the `glide.user.max_unlock_attempts` property to set the limit for failed login attempts.  
- Unlocks the user account after the time period that is specified for the `glide.user.unlock_timeout_in_mins` property. If no value is specified, then the system unlocks the user account after the default period of 15 minutes. |
| SNC User Lockout Check | Tracks the number of failed login attempts and locks the user account after a specified number of failed login attempts (default: 5). |
| SNC User Clear | Updates the user record after a successful login: Resets the number of failed login attempts and updates the date of the last login. |

Each time a user attempts to log in, the action is recorded in an event log. You can view a log of failed login attempts.

1. Navigate to **System Policy > Event Logs**.
2. Filter for `login.failed` in the Name field. You can view the attempted login name, date, and IP address logged for the attempt.

#### Configure Google reCAPTCHA for the password reset process

To use the Google reCAPTCHA service, instances that are running on a domain other than `service-now.com` require an API key pair from Google.

Role required: admin

- The procedure described in this topic is optional for instances that are running on the `service-now.com` domain.
- Because on-premises instances do not have access to the Internet, they cannot use the Google reCAPTCHA service. Do not follow the procedure described in this topic. Instead, set the `password_reset.captcha.google.enabled` system property to `false`. This setting enables the CAPTCHA service that is provided with the base system.
- The Password Reset Windows Application uses the base-system CAPTCHA service even if the Password Reset application is configured to use Google reCAPTCHA.

1. Request an API key pair (a site key and a secret) from Google at [https://www.google.com/recaptcha](https://www.google.com/recaptcha).
2. Set the following system properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>password_reset.captcha.google.enabled</code></td>
<td></td>
</tr>
</tbody>
</table>
Set to `true`.  
Type: string  
Default: true |
<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>google.captcha.site_key</td>
<td>Set to the site key that Google provided. Type: string Default: A site key that Google provided to ServiceNow</td>
</tr>
<tr>
<td>google.captcha.secret</td>
<td>Set to the secret that Google provided. Type: password2 Default: An encrypted secret that Google provided to ServiceNow</td>
</tr>
</tbody>
</table>

**Settings on the Advanced tab of the Password Reset Processes form**

UI macros and script includes can extend the basic functionality of a Password Reset process. The Advanced tab appears when you are configuring a Password Reset process (Password Reset > Processes).

**Advanced tab**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entry UI macro</td>
<td>UI macro that displays a customized message to users when they access the initial Password Reset screen.</td>
</tr>
<tr>
<td>Success UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password is successfully reset.</td>
</tr>
<tr>
<td>Failure UI macro</td>
<td>UI macro that displays a customized message to users on the final Password Reset screen when their password reset fails.</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Script include that performs actions after the Password Reset process completes whether the outcome is success or failure. For more information on customizing post processor scripts, see the Post reset script category as described in Password Reset extension script categories.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Header UI macro / Footer UI macro</td>
<td>Macros that add a header or footer to customize the appearance of the pages that end users work in while resetting a password (the Identify, Verify, and Reset pages. See Add a custom header or footer to the user pages for Password Reset.</td>
</tr>
</tbody>
</table>

### Customizing Password Reset processes

Password Reset scripts enable you to customize Password Reset by creating your own credential store, verification, and identification types, and extend them by defining extension scripts. You can also create a custom credential store type, custom verification type, or verification.

### Legacy

Password Reset scripting is available to users with the password_reset_admin role. The easiest way to customize Password Reset is:

1. Create custom types and scripts as described in Password Reset extension script categories.
   - Extension scripts are example script includes that enable you to extend functionality in a password reset process. The extension script category refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).
2. Follow the configuration steps described in Configure your Password Reset process.
3. Select the new types that you created. You can customize the following components:
• Credential store types: Define new types for how to connect to your credential stores by creating custom workflows for connection and testing. See *Create a credential store type for Password Reset.*

• Verification types: Define new types for how users are verified. See *Create a custom Password Reset verification type.*

• Identification types: Define new types for how users can identify themselves. See *Create a custom identification type for Password Reset.*

**Advanced password reset configuration**

You can customize the Password Reset and Password Change applications to meet your organization’s needs. See *Password Reset and Password Change applications* for more information. Also see *Configure Password Reset properties* for a list of properties that control several aspects of password reset.

**Customize password reset processes and integrate third-party credential services**

To customize password reset processes or to integrate them with third-party credential services such as Okta or Microsoft Azure AD, use IntegrationHub capabilities. Use Action Designer to create or modify actions like user unlock, change password, and get user status. Use Flow Designer to create or modify subflows that perform the actions.

Role required: admin, password_reset_admin, or password_reset_credential_manager

- The base system provides actions, subflows, and credential store types for the "Local ServiceNow Instance" identity provider.
- For Microsoft Active Directory, the subflows are available when you activate the Password Reset - Orchestration Add-on plugin.
- To use any other identity provider such as Okta or Microsoft Azure AD, you must use IntegrationHub to create the required actions, subflows, and custom credential store types.

1. Use Action Designer to create password reset actions like user unlock, change password, and get user status. See *Action Designer* for more information.

2. Use Flow Designer to create the following subflows. Use the specified names, inputs, and outputs for the subflows. See *Subflows* for more information.

<table>
<thead>
<tr>
<th>Subflow name</th>
<th>Input</th>
<th>Input type</th>
<th>Output</th>
<th>Output type</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Provider Name&gt; Password Unlock</td>
<td>Password Reset Request</td>
<td>Record.Password Reset Request</td>
<td>Error Message</td>
<td>String</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

3. For third party providers, **create a credential store type**.
   a) Select the **Use Flow** check box.
   b) Select the password reset subflows that you created for the provider.

   See **Password Reset application** for more information.

4. **Create password reset credential store**. Select the credential store type created for the provider.

5. **Create a password reset process**. Select the credential store created for the provider.

The password reset mechanism for the required third-party application is set up.

### Add a custom question to the Security Questions verification

To enroll for the 'Security Questions' verification, the user selects several questions and supplies confidential answers that only the user knows. You can add a custom question to the set of questions that are included with the base system.

**Role required:** password_reset_admin or admin

The base system provides a large set of default questions in all supported languages. Questions are presented to each user in the language that the user requested during login. Creating a custom English language question is a one-step process. To create a custom question in a non-English language, you can use either of the following options:
- Create a custom question in the non-English language.
- Create a custom English language question plus one or more translations of the question into other languages.

1. Navigate to **Password Reset > Security Questions**.

   **Note:** Each question in the list is presented to users when they enroll for the Password Reset process. The user selects each question to use by providing a confidential answer to the question.

2. Follow this procedure to create a custom question in a single language.

   **Note:** To enter non-English question text, you must request the language when logging in.

   a) On the Password Reset Questions page, click **New**.
   b) Enter the text in the **Question (Translated field)** field and then click **Submit**.

   The question is added to the list of questions that is presented to users when they enroll. No additional steps are needed and you can skip the remaining steps.

3. Follow this procedure to create a custom question in English and the same question in one or more other languages:
   a) Click **New**, enter English language text in the **Question (Translated field)** field, and then click **Submit**.
   b) Create a record in the **sys_translated** table for the non-English language question. Details appear at **Translated Name / Field table** and **Languages table**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label (translate)</td>
<td>Non-English equivalent of the English text in the Value field.</td>
</tr>
<tr>
<td>Element</td>
<td>Name of the field in the Password Reset Question (pwd_question) table: question_translated</td>
</tr>
<tr>
<td>ID</td>
<td>Two-character ISO 639.2 code for the language.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that you are adding the translated question to: the Password Reset Question (pwd_question) table.</td>
</tr>
<tr>
<td>Language</td>
<td>Language name.</td>
</tr>
<tr>
<td>Value</td>
<td>English-language question that you added in the Security Questions table.</td>
</tr>
</tbody>
</table>

   c) Repeat the process for each language that users might request.

**Add a custom header or footer to the user pages for Password Reset**

You can specify UI macros that add a header or footer to the pages that end users work in while resetting a password (the Identify, Verify, and Reset pages).

Role required: password_reset_admin
1. Configure a UI macro for the header or footer: Navigate to System UI > UI Macros, click New, and then enter a meaningful Name and Description.

2. In the XML text box, enter the macro text. The example macro adds the text "Trust Acme to Deliver!" to the footer of the page that users work in while resetting a password.
3. Select the **Active** check box and then click **Submit**.

4. Navigate to **Password Reset > Processes** and select the process to update.

5. On the **Advanced** tab, click

   for the **Header UI macro** or **Footer UI macro** and select the macro that you created.

6. Click **Save**.

7. Verify the appearance of the end-user pages.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If the reset pages are Public Access</td>
<td>On the <strong>Password Reset Details</strong> tab, click the <strong>Public URL</strong>.</td>
</tr>
<tr>
<td>If the reset pages are not Public Access</td>
<td>Log in as an end user and request password reset.</td>
</tr>
</tbody>
</table>

**Create a Password Reset verification from an existing verification**

The Password Reset application includes several example verifications that you can use as they are or as the basis for a custom verification. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Role required: **password_reset_admin**
i **Note:** The Password Reset Windows Application does not support custom verifications.

1. Navigate to **Password Reset > Verifications** and select a verification.
2. If needed, modify the parameters on the **Password Reset Verification Parameters** tab. The parameters are described in the instructions for the type of verification that you are working on.
3. Click **Submit**.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

**Create a custom Password Reset verification type**

Each verification in Password Reset is based on the settings for a verification type. If the verification types in the base system do not meet your needs, you can create a custom verification type.

Role required: password_reset_admin or admin

Review the verification types that are provided in the base system to determine whether to create a custom verification type. Then review the verification type components to develop.

1. Navigate to **Password Reset > Extensions > Verification Types**.
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Script that determines whether a user is enrolled for verification. Automatic enrollment requires an enrollment check. If no script is specified when <strong>Automatic Enrollment</strong> is selected, a default script is provided.</td>
</tr>
<tr>
<td>Automatic enrollment</td>
<td>Select the check box to auto-enroll users. If <strong>Automatic enrollment</strong> is not selected, then you must provide an enrollment UI macro and enrollment processor script.</td>
</tr>
<tr>
<td>Enrollment UI</td>
<td>Enrollment UI macro that provides the UI for the enrollment.</td>
</tr>
<tr>
<td>Enrollment processor</td>
<td>Enrollment processor script that processes the enrollment.</td>
</tr>
<tr>
<td>Verification UI</td>
<td>Verification UI macro that provides the UI for the verification.</td>
</tr>
<tr>
<td>Verification processor</td>
<td>Verification processor script (extension scripts) that processes the verification.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

**Create a custom Password Reset verification**

Use a verification type in the base system as a template to design a custom verification. The Password Reset Windows Application does not support custom verifications.

Role required: password_reset_admin
## Verification types in the base system

<table>
<thead>
<tr>
<th>Verification type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Personal Data</td>
<td>Verifies user identity using data from the User (sys_user) table. The user data is displayed to a service desk agent. The agent verifies the data. Enrollment is not required for this type. Recommended for service desk-assisted processes.</td>
</tr>
<tr>
<td>Personal Data</td>
<td>Verifies user identity using data from the User (sys_user) table. The user is required to answer questions. Enrollment is not required for this type.</td>
</tr>
<tr>
<td>Email Code</td>
<td>When a user requests password reset, the system sends a verification code to the email address in the user profile or to an email address that the user authorized during enrollment. To verify identity, the user then submits the code on the Password Reset Verify page.</td>
</tr>
<tr>
<td>Google Authenticator</td>
<td>While requesting password reset, the user reads a code from the Google Authenticator app on a device that the user has paired. To verify identity, the user then submits the code on the Password Reset Verify page.</td>
</tr>
<tr>
<td>Security Questions</td>
<td>Verifies user identity by presenting personal security questions that the user must answer correctly.</td>
</tr>
<tr>
<td>Verification type</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| SMS Code          | When a user requests password reset, the system sends a code to an SMS-capable device that the user has authorized. To verify identity, the user then enters the code on the Password Reset web page.  

**Note:** The Password Reset and Password Reset Windows Application support only a single verification of the SMS Code type.  
See [SMS Code Verification type for Password Reset](#). |
| Mock              | Not a functional identity verification. Demonstrates how to add a verification type in a Password Reset process.  

**Note:** The Password Reset Windows Application does not support the Mock verification type.  
- The enrollment UI macro for this verification gets the user input and returns the entered value in the enrollment processor.  
- The Password Reset UI macro for this verification gets input from the user and returns the entered value through the verification processor. |

1. Navigate to **Password Reset > Extensions > Verification Types**.  
2. Click **New**, enter a unique and meaningful **Name** and **Description**, and then fill in the form.  

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Type                                 | Create verifications based on one of the verification types in the base system.  
Password Reset supports the following types. You can create multiple instances of any type.  
- Personal Data Confirmation Verification  
- Personal Data Verification  
- Security Question Verification  
- SMS Code Verification  
The Password Reset Windows Application supports the following types:  
- Personal Data Verification. You can create only a single instance.  
- Security Question Verification. You can create multiple instances.  
- SMS Code Verification. You can create only a single instance. |
| Order                                | Position of the verification as it appears on the Enrollment form and Password Reset form. |
| Password Reset Verification Parameters | Parameters used by a verification to configure specific behaviors, like number of questions required to enroll, request expiration time, and columns used. Set parameters for any behavior that should be different from the value that is specified in the Password Reset properties.  
The available parameters are described separately for each verification type. |

3. Click **Submit**.
4. Each verification type has properties that control the user experience. Review the property settings and update as needed.

Create a custom identification type for Password Reset

A custom identification type enables the user to enter alternative verification information such as an employee ID while resetting the password.

Role required: password_reset_admin or admin

1. Navigate to Password Reset > Extensions > Identification Types.
2. Click New, enter a unique and meaningful Name and Description, and then fill in the form.

<table>
<thead>
<tr>
<th>Identification field label</th>
<th>Text to display as a label for the Identification field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification processor</td>
<td>Identification processor script. Choose an existing script or create your own using the Identification form processor category (extension script).</td>
</tr>
</tbody>
</table>

3. Click Submit.

Create a credential store type for Password Reset

You can create a custom credential store type if the base-system types do not meet your needs.

Role required: password_reset_admin or password_reset_credential_manager

1. Navigate to Password Reset > Extensions > Credential Store Types.
2. Click New, enter a unique and meaningful Name and Description.
3. To use password reset subflows in IntegrationHub, leave the Use Flow selected.
   Select the subflows created for the third-party application.

   **Note:** See Customize password reset processes and integrate third-party credential services for information on creating provider-specific subflows.

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unlock user flow</td>
<td>Defines process to unlock a user.</td>
</tr>
<tr>
<td>Password reset flow</td>
<td>Unlocks the specified user account. Expires the current password and changes the password to the provided new password if it conforms to the password format and history policies.</td>
</tr>
<tr>
<td>Password change flow</td>
<td>Changes the password of an authenticated and unlocked user account to the provided new password. Verifies the new password conforms to the password format and history policies. Displays an error if the user is not authenticated or is locked out. Use the Password Reset flow to unlock a locked user account and require a password change.</td>
</tr>
<tr>
<td>Get user lock state flow</td>
<td>Retrieves the lock status of a local ServiceNow user account.</td>
</tr>
<tr>
<td>Connection test flow</td>
<td>Defines how to test the connection.</td>
</tr>
</tbody>
</table>
4. To use the password reset workflows in Orchestration, clear the **Use Flow** check box.

   **Note:** You may need to configure the form to see the **Get user lock state** workflow and the **Unlock user** workflow.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Reset workflow</td>
<td>Subflow that defines the credential store processing. Password Reset workflows are available to use as a model. Provide scripts for each of the activities defined for the subflow. For more information about how to create a workflow, see <em>Create a workflow</em>. For installed workflows, see <em>Installed with Password Reset</em>.</td>
</tr>
<tr>
<td>Connection test workflow</td>
<td>Subflow that defines how to test the connection. Connection test workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For more on how to create a workflow, see <em>Create a workflow</em>. For installed workflows, see <em>Installed with Password Reset</em>.</td>
</tr>
<tr>
<td>Get user lock state workflow</td>
<td>Subflow that defines how to get the user lock state. Get user lock state workflows are available to use as a model. Provide scripts for each of the activities defined for the subflow. </tr>
<tr>
<td>Unlock user workflow</td>
<td>Subflow that defines how to unlock a user. Unlock user workflows are available to use as a model. If you create a connection test subflow, provide scripts for each of the activities defined for the subflow. For installed workflows, see <em>Installed with Password Reset</em>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Password Reset script includes**

The Password Reset plugin installs script includes that implement password reset processes. To enable you to extend functionality, each base-system script include provides extension points that you can use to invoke “extension scripts” that you customized.

The *extension script category* refers to the specific types of behavior for an extension script (for example, credential store, verification, identification type, or as a post-processor).

**'Enrollment check' script includes**

All enrollment check script includes take the following parameters and return a boolean indicating whether the user is enrolled for Password Reset.

- `params.userId`: The sys_id of the user being checked (table: (sys_user)).
- `params.verificationId`: The sys_id of the verification being checked (table: (pwd_verification)).
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdAlwaysEnrolled</td>
<td>Default check of whether a user is enrolled that always returns true.</td>
</tr>
<tr>
<td>PwdMockIsEnrolled</td>
<td>Default check of whether a user is enrolled that always returns true.</td>
</tr>
<tr>
<td>PwdQuestionsEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using security question verification.</td>
</tr>
<tr>
<td>PwdSMSEnrollmentCheck</td>
<td>Determines whether a user has enrolled for Password Reset using SMS verification.</td>
</tr>
</tbody>
</table>

**'Identification form processor' script includes**

Identification form processor script includes provide functionality for extending identification processing.

All identification form processor script includes take the following parameters, and return the sys_id of the user that corresponds to the requested input. If the user was not identified, it returns null.

- params.processId: The sys_id of the calling Password Reset process (table: pwd_process).
- param request: The form request object. Fields in the form can be accessed with request.getParameter('<element-id>'). The supported request parameter is sysparm_user_id, the user identifier value entered in the form.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdIdentifyViaEmail</td>
<td>Verifies a user's identity by checking the email address.</td>
</tr>
<tr>
<td>PwdIdentifyViaUsername</td>
<td>Verifies a user's identity by checking the user name.</td>
</tr>
</tbody>
</table>

**'Enrollment form processor' script includes**

Enrollment form processor script includes provide functionality for extending enrollment form processing.

All enrollment form processor script includes take the following parameters, and return a boolean indicating whether the user was successfully enrolled.

- params.userId: The sys_id of the user trying to enroll (table: sys_user).
- params.verificationId: The sys_id of the verification used to enroll (table: pwd_verification).
- params.enrollmentId: The sys_id of this enrollment process.
- request: The form request object. Fields in the form can be accessed with request.getParameter('<element-id>').

You should add the following information to the state of the enrollment process:

- gs.getSession().putProperty("result.status",status): Whether the user was successfully enrolled.
- `gs.getSession().putProperty("result.message",message)`: An associated message to be returned to the UI, such as a detailed error message.
- `gs.getSession().putProperty("result.value",value)`: A custom value associated with the enrollment.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdEnrollQuestionsProcessor</td>
<td>Handles questions and answers for verification.</td>
</tr>
<tr>
<td>PwdEnrollSampleProcessor</td>
<td>Provides an enrollment processor for sample verification.</td>
</tr>
<tr>
<td>PwdEnrollSMSProcessor</td>
<td>Provides an enrollment processor for SMS verification.</td>
</tr>
</tbody>
</table>

**User account lookup' script includes**

User account lookup script includes return the credential store account_id for a given user. The following parameter returns the credential store account_id for a given user.
- `params.userId`: The sys_id of the user being checked (table: 
  (sys_user)).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultUserAccountLookup</td>
<td>Provides a default script for user account lookup from a user_id to the account in a credential store. The default mapping is to use the user name as the account name.</td>
</tr>
</tbody>
</table>

**Password generator' script includes**

Password generator script includes take the following parameter, and return an auto-generated string password.
- `params.credentialStoreId`: The sys_id of the calling Password Reset process (table: (pwd_process)).

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdDefaultAutoGenPassword</td>
<td>Generates a password from a random word and 4 digits.</td>
</tr>
</tbody>
</table>

**Verification processor' script includes**

If the user identity is verified, the verification processor script includes return `true`. Verification processor script includes take the following parameters:
- `params.resetRequestId`: The sys_id of the current Password Reset request (table: (pwd_reset_request)).
- `params.userId`: The sys_id of the user to be verified (table: (sys_user)).
- `params.verificationId`: The sys_id of the verification (table: (pwd_verification)).
- **request**: The form request object. Access the fields in the form with `request.getParameter('<element-id>')`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdVerifyPersonalDataConfirmationProcess</td>
<td>Verifies that the user accepts the answer.</td>
</tr>
<tr>
<td>PwdVerifyPersonalDataProcessor</td>
<td>Verifies that the user’s answers match the expected data in the system.</td>
</tr>
<tr>
<td>PwdVerifyQuestionsProcessor</td>
<td>Provides question and answer verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySimpleProcessor</td>
<td>Provides simple verification of user input on the second page of the verification form.</td>
</tr>
<tr>
<td>PwdVerifySMSProcessor</td>
<td>Provides SMS verification of user input on the second page of the verification form.</td>
</tr>
</tbody>
</table>

**Post processor** script includes

Post processor script includes execute custom actions after the Password Reset process has completed.

All post processor script includes take the following parameters.

- **params-resetRequestId**: The sys_id of the current Password Reset request (table: [pwd_reset_request]).
- **params-wfSuccess**: A flag indicating whether the workflow completed successfully: True if, and only if, successful.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PwdPostProcessor</td>
<td>Executes actions after the process completes for success, failure, or both conditions.</td>
</tr>
</tbody>
</table>

**Example custom scripts for Password Reset**

The example scripts perform a user account lookup and processes an identification form, define a credential store, and create an identification type.

**Perform a user account lookup and process an identification form**

The main script calls two extension scripts, one to perform the user account lookup, and the other to process the identification form.

```javascript
// User account lookup
var lookupExtensionSysId =
  getExtensionScriptSysId('SampleUserAccountLookupExtension', 'user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';
```
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId =
getExtensionScriptSysId('SampleIdentificationProcessorExtension',
'identification_form_processor');
var identificationExtension = new
SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the indentification processor
var request = new SNC.PwdExtensionPointParameter(); // A real life case
    will inject it's own request object
    request.setParameter('sysparm_user_id', 'joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);

// Simple helper to return the sys-id for a given extension script
function getExtensionScriptSysId(scriptName, category) {
    var result;
    var gr = new GlideRecord('sys_script_include');
    gr.addQuery('name', scriptName);
    gr.addQuery('script', 'CONTAINS', 'category: \"password_reset.extension.' + category + '\\"');
    gr.query();
    if (gr.next() ) {
        result = gr.getValue('sys_id');
    }
    return result;
}

Define a credential store

The following is an example of an extended process function in the User Account Lookup category used to define a credential store. To create this extension script, go to Password Reset > Extensions > New extension script and create a new script as described in Create an Extension Script. To configure the User Lookup in a Password Reset process, see Credential Stores.

```xml
<record_update table="sys_script_include">
    <sys_script_include action="INSERT_OR_UPDATE">
        <active>true</active>
        <client_callable>false</client_callable>
        <description>Simple account lookup that returns the supplied user id</description>
        <name>SampleUserAccountLookupExtension</name>
        <script><![CDATA[
            var SampleUserAccountLookupExtension = Class.create();
            SampleUserAccountLookupExtension.prototype = {
                category: 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!
                
                /* Returns the credential-store account id for a given user
```
Create an identification type

The following is an example of an extended processForm function in the Identification Form Processor category that can be used to create an identification type. To create this extension script, go to Password Reset > Extensions > New extension script and create a new script as described in Create an Extension Script.

```xml
<record_update table="sys_script_include">
  <sys_script_include action="INSERT_OR_UPDATE">
    <active>true</active>
    <client_callable>false</client_callable>
    <description>Script that processes an identification form.&amp;#13;</description>
  </sys_script_include>
</record_update>
```
Returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.

```javascript
var SampleIdentificationProcessorExtension = Class.create();
SampleIdentificationProcessorExtension.prototype = {
    category: 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!

    processForm: function(params, request) {
        return request.getParameter('sysparm_user_id') + '_' + params.processId;
    },

    type: 'SampleIdentificationProcessorExtension'
};
```
Use the `process` and `processForm` extensions

This example shows a script that uses two sample extensions, one `process` extension and one `processForm` extension.

```javascript
// User account lookup
var lookupExtensionSysId = getExtensionScriptSysId('SampleUserAccountLookupExtension', 'user_account_lookup');
var lookupExtension = new SNC.PwdExtensionPoint(lookupExtensionSysId);

// Setup parameters required for this extension type - userId
var params = new SNC.PwdExtensionPointParameter();
params.userId = 'joe.employee';

// Invoke the extension
var answer = lookupExtension.process(params);
gs.print('user: ' + answer);

// Form processor sample - Identification form processor
var identExtensionSysId = getExtensionScriptSysId('SampleIdentificationProcessorExtension', 'identification_form_processor');
var identificationExtension = new SNC.PwdExtensionPoint(identExtensionSysId);

// Setup parameters required for this extension type - processId
var params = new SNC.PwdExtensionPointParameter();
params.processId = 'pwdreq1234';

// Simulate the posted form parameter for the identification processor
var request = new SNC.PwdExtensionPointParameter(); // A real life case will inject its own request object
request.setParameter('sysparm_user_id', 'joe.employee');

var userIdentity = identificationExtension.processForm(params, request);
gs.print('identity: ' + userIdentity);

function getExtensionScriptSysId(scriptName, category) {
    var result;
    var gr = new GlideRecord('sys_script_include');
    gr.addQuery('name', scriptName);
    gr.addQuery('script', 'CONTAINS', 'category: ' + category +']+"');
    gr.query();
    if (gr.next()) {
        result = gr.getValue('sys_id');
    }
    return result;
}
```

**process function:**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<record_update
    table="sys_script_include">
    <sys_script_include
        action="INSERT_OR_UPDATE"><active>true</active><client_callable>false</client_callable><description>Simple account lookup that returns the supplied user id</description>
    <name>SampleUserAccountLookupExtension</name>
    <script><![CDATA[var SampleUserAccountLookupExtension = Class.create();
        SampleUserAccountLookupExtension.prototype={
            category: 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!
            
            /**
             * Returns the credential-store account id for a given user
             *
             * @param params.userId The sys-id of the user being checked (table: sys_user)
             */
        }]]>
</sys_script_include>
</record_update>
```
* @return The credential-store account-id (string) for a given user

**********

process:function(params){return params.userId;},

type:'SampleUserAccountLookupExtension'

/**

Customer process:

<?xml version="1.0" encoding="UTF-8"?><record_update

table="sys_script_include"><sys_script_include

action="INSERT_OR_UPDATE"><active>true</active><client_callable>false</client_callable><description>Script that processes an identification form.&amp;13;

Returns the sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.&amp;13;</description><name>SampleIdentificationProcessorExtension</name><script><![CDATA[

var SampleIdentificationProcessorExtension = Class.create();

SampleIdentificationProcessorExtension.prototype={

category:'password_reset.extension.identification_form_processor',// DO NOT REMOVE THIS LINE!

processForm:function(params, request){

  return request.getParameter('sysparm_user_id')+'_'+params.processId;

}
]]>

*/

**

Process the identification form request, and returns the user's sys_id. If user was not identified return null.

* @param params.processId The sys-id of the calling password-reset process (table: pwd_process)
* @param request The form request object. fields in the form can be accessed using: request.getParameter('element-id')

Supported request parameters:

  * sysparm_user_id - the user identifier

value entered in the form.

* @return The sys-id of the user that corresponds to the requested input; if no user was found, null should be returned.

**********

processForm:function(params, request){

  return request.getParameter('sysparm_user_id')+'_'+params.processId;

},

Password Reset extension script categories

You can use a custom extension script to extend Password Reset functionality for credential store, verification, or identification types.

Note: To use a script include as an extension script, you must set it to Active status.

Password Reset extension script categories

Extension scripts must specify a category that indicates which script include is being extended, for example, category: 'password_reset.extension.enrollment_check'. The Now Platform installs several scripts in each category. A script in the Enrollment check category can perform the enrollment check for a verification. Detailed information on each extension script appears in Password Reset extension scripts.

<table>
<thead>
<tr>
<th>Extension script category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment check</td>
<td>Defines how to check that a user is enrolled in the Password Reset process. Scripts of this category are available in the Enrollment check field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Enrollment form processor</td>
<td>Defines how an enrollment form is processed (if automatic enrollment is not configured). Scripts of this category are available in the Enrollment form processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
<tr>
<td>Extension script category</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Identification form processor</td>
<td>Defines how a user identification is processed. Scripts of this category are available in the Identification processor field when you define a verification type (Password Reset Identification Type form).</td>
</tr>
<tr>
<td>Password generator</td>
<td>Defines how to generate a password. Scripts of this category are available in the Auto generate password field when you configure a credential store (Password Reset Credential Store Type form).</td>
</tr>
<tr>
<td>Post reset script</td>
<td>Executes at the end of a Password Reset process. Scripts of this category are available in the Post reset script field when you configure a process (Password Reset Process form).</td>
</tr>
<tr>
<td>User account lookup</td>
<td>Defines how to look up a user account. Scripts of this category are available in the User account lookup field when you configure a credential store (Password Reset Credential Store form).</td>
</tr>
<tr>
<td>Verification form processor</td>
<td>Defines how a verification form is processed. Scripts of this category are available in the Verification processor field when you define a verification type (Password Reset Verification Type form).</td>
</tr>
</tbody>
</table>

**Password Reset extension scripts**

Extension scripts allow you to extend Password Reset functionality in credential store, verification, or identification types.

**Password Reset extension script includes**

Each script include is associated with a specific category, which is available in the appropriate field of a Password Reset form.

**Note:** Create extension scripts only from the Password Reset Extension Script form (Password Reset > Extensions > New extension script). Extension scripts are special purpose script includes that are not created in the System Definition > Script Includes interface. To use a script include as an extension script, you must set it to Active status.
### ‘Enrollment Check’ script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Check</td>
<td>Checks whether a user is enrolled for a given verification.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (boolean)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- params.userId - The sys_id of the user to check (table: sys_user).</td>
<td>true, if the user is enrolled in the specified verification; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- params.verificationId - The sys_id of the verification to check (table: pwd_verification).</td>
<td></td>
</tr>
</tbody>
</table>

This Enrollment Check example signals that the user is enrolled if both expected parameters are supplied. The code would be contained in the `Script` field of an extension script named `SampleEnrollmentCheck`:

```javascript
var SampleEnrollmentCheck = Class.create(
    function (params) {
        return (params.userId && params.verificationId) ? true : false;
    },
    {category: 'password_reset.extension.enrollment_check'}); // DO NOT REMOVE THIS LINE!

/*******
* Returns boolean telling whether the user is enrolled.
* This sample returns true if both parameters are supplied, false otherwise
*
* @param params.userId The sys-id of the user being checked (table: sys_user)
* @param params.verificationId The sys-id of the verification being checked (table: pwd_verification)
* @return Boolean indicating whether the user is enrolled into the specified verification
*******

type: 'SampleEnrollmentCheck';
```
## 'Enrollment Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enrollment Form Processor</td>
<td>Checks whether all necessary information has been collected from the user. Stores the information so it can be used for verification when the user resets their password.</td>
<td><code>process(params)</code></td>
<td>Parameters:</td>
<td>Returns: (boolean) true, if the user is enrolled in the specified verification; otherwise, false.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>params.resetRequestId</code> - The sys_id of the current Password Reset request (table: pwd_reset_request).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>params.userId</code> - The sys_id of the user to be verified (table: sys_user).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>params.verificationId</code> - The sys_id of the verification to be processed (table: pwd_verification).</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- <code>request</code> - The form request object. Fields in the form can be accessed with <code>request.getParameter('element-id')</code>.</td>
<td></td>
</tr>
</tbody>
</table>

The following information should be added to the state of the enrollment process:

- `gs.getSession().putProperty('result.status',status)` - Whether the user was successfully enrolled.
- `gs.getSession().putProperty('result.message',message)` - An associated message to be returned to the UI, such as a detailed error message.
- `gs.getSession().putProperty('result.value',value)` - A custom value associated with the enrollment.
This example processes an enrollment form submission successfully if the user-submitted response was success. The code would be contained in the `Script` field of an extension script named `SampleEnrollmentProcessor`:

```javascript
var SampleEnrollmentProcessor = Class.create();
SampleEnrollmentProcessor.prototype = {
    category : 'password_reset.extension.enrollment_form_processor', // DO NOT REMOVE THIS LINE!

    processForm : function (params , request) {
        var verificationId = params.verificationId;
        var sampleInput = request.getParameter('sample_input');
        if (gs.nil(verificationId) || (sampleInput != 'success')) { return false; }
        var gr = new GlideRecord('sys_user');
        gr.get(params.userId);
        gs.print('User: ' + gr.getValue('user_name') + ' successfully enrolled');
        return true;
    }
};
```
### Identification Form Processor script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification Form Processor</td>
<td>Processes an identification form request.</td>
<td>processForm(params, request)</td>
<td>- params.processId - The sys_id of the calling Password Reset process (table: pwd_process). - request - The form request object. Fields in the form can be accessed with request.getParameter('&lt;element-id&gt;'). Use request.getParameter('sysparm_user_id') to get the user ID that was entered into the form.</td>
<td>Returns: the sys_id of the user that corresponds to the requested input. Returns null, if no user was found.</td>
</tr>
</tbody>
</table>

This example attempts to identify the user within the sys_user table given a user name submitted from the identification form. The code would be contained in the **Script** field of an extension script named `PwdIdentifyViaUsername`:

```javascript
var PwdIdentifyViaUsername = Class.create();
PwdIdentifyViaUsername.prototype = {
    category : 'password_reset.extension.identification_form_processor', // DO NOT REMOVE THIS LINE!
    initialize : function () { },

    //**********
    // Process the identification form request, and returns the user's sys_id.
    // If user was not identified return null.
    //**********
    processForm : function (params , request ) { var processId = params.processId ; var sysparm_user_id = request.getParameter ('sysparm_user_id' ) ;
        gr = new GlideRecord ('sys_user' ) ;
```
gr. addQuery ( 'user_name', sysparm_user_id )
    gr. query () ; if (!gr. next ()) { return null ; } return gr.
sys_id ; }

    type : 'PwdIdentifyViaUsername' }

'Password Generator' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Generator</td>
<td>Returns an auto-generated password.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (String) an auto-generated password.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- params.processId</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- The sys_id of the calling Password Reset process (table: pwd_process).</td>
<td></td>
</tr>
</tbody>
</table>

This example randomly generates a password from a base word and numbers. The base word is selected depending on the credential store. The code would be contained in the Script field of an extension script named SamplePasswordGenerator:

```javascript
var SamplePasswordGenerator = Class.create ( ) ;
SamplePasswordGenerator. prototype = { 
    category : 'password_reset.extension.password_generator', // DO NOT REMOVE THIS LINE!

    process : function (params) { var basePassword ;
        var gr = new GlideRecord ( 'pwd_cred_store' ) ; 
gr. addQuery ( 'name', 'Local ServiceNow Instance' ) ;
gr. query () ; if (gr. next ()) { if (params. credentialStoreId == gr. getValue ( 'sys_id' )) 
            basePassword = "Password" ; else
            basePassword = "Dorwssap" ; } return this. generateSimple
            (basePassword ) ; },

    generateSimple : function (base) { var pwd = base ; var numbers = '0123456789' ; var length = 4 ;
        for ( var i = 0 , n = numbers. length ; i < length ; i ++ ) {
            pwd += numbers. charAt (Math. floor (Math. random ( ) * n ) + 1 ) ; } return pwd ; },

    type : 'SamplePasswordGenerator' } ;
```
### 'Post Reset' script include category

<table>
<thead>
<tr>
<th>Script Include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Post Reset</td>
<td>Performs additional operations after the completion of the Password Reset process.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: void</td>
</tr>
</tbody>
</table>

- `params.resetRequestId` - The sys_id of the calling Password Reset process (table: pwd_process).
- `params.wfSuccess` - A flag indicating whether the workflow completed successfully. True if, and only if, successful.

This example adds failed reset requests to the system log. The code would be contained in the **Script** field for an extension script named *PwdPostProcessor*:

```javascript
var PwdPostProcessor = Class.create();

PwdPostProcessor.prototype = {
    category : 'password_reset.extension.post_reset_script', // DO NOT REMOVE THIS LINE!
    initialize : function () {},

    // Execute custom actions after the Password Reset process has
    // completed.
    process : function (params) {
        if (!params.wfSuccess) {
            gs.log('[PwdPostProcessor.process] failure post processing for request [' + params.resetRequestId + ']');
        }

        // We could place actions here that we always want executed
        return;
    },

    type : 'PwdPostProcessor'
};
```

© 2020 ServiceNow, Inc. All rights reserved. ### 'User Account Lookup' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Account Lookup</td>
<td>Gets the credential store account ID for a given user.</td>
<td>process(params)</td>
<td>Parameters:</td>
<td>Returns: (String) the credential store account ID for the given user.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>- params.userId - The sys_id of the user being checked (table: sys_user).</td>
<td></td>
</tr>
</tbody>
</table>

This example gets the credential store account for a user. This code would be contained in the script field of an extension script named `SampleUserAccountLookupExtension`:

```javascript
var SampleUserAccountLookupExtension = Class.create();
SampleUserAccountLookupExtension.prototype = {
    category: 'password_reset.extension.user_account_lookup', // DO NOT REMOVE THIS LINE!
    process: function (params) { return params.userId; },
    type: 'SampleUserAccountLookupExtension'
};
```
### 'Verification Form Processor' script include category

<table>
<thead>
<tr>
<th>Script include category</th>
<th>Description</th>
<th>Method signature</th>
<th>Input fields</th>
<th>Output fields</th>
</tr>
</thead>
</table>
| Verification Form Processor | Processes a verification form request and indicates whether the user was verified or not. | processForm(params, request)                          | • params.resetRequestId - The sys_id of the current Password Reset request (table: pwd_reset_request).  
  • params.userId - The sys_id of the user to be verified (table: sys_user).  
  • params.verificationId - The sys_id of the verification to be processed (table: pwd_verification).  
  • request - The form request object. Fields in the form can be accessed with request.getParameter('element-id'). | Returns: (boolean) true, if the user is verified; otherwise, false. |

This example shows a verification processor that returns true only if the user sent ok in the input field; otherwise, it returns false. The code would be contained in the Script field of an extension script named SampleVerificationFormProcessor:

```javascript
var SampleVerificationFormProcessor = Class.create();
SampleVerificationFormProcessor.prototype = {
    category: 'password_reset.extension.verification_form_processor', // DO NOT REMOVE THIS LINE!

    processForm: function(params, request) {
        // Process the verification form request, and return whether the user was successfully verified.
        // This is a sample verification processor returns true only if the user sent "ok" in the input field;
        // otherwise, it returns false.

        // @param params.resetRequestId The sys_id of the current Password Reset request (table: pwd_reset_request)
        // @param params.userId - The sys_id of the user trying to be verified (table: sys_user)
        // @param params.verificationId - The sys_id of the verification to be processed (table: pwd_verification)
```
Create a Password Reset extension script

Create extension scripts only from the Password Reset Extension Script form. Do not create extension scripts in the System Definition > Script Includes interface.

Role required: password_reset_admin or admin

Note: To use a script include as an extension script, you must set it to Active status.

1. Navigate to Password Reset > Extensions > New extension script.
2. Enter a name in the Extension script name field.
   Use CamelCase to construct a name without spaces, for example, PwdEnrollmentCustom.
3. Select an Extension script category.
   - Enrollment check
   - Enrollment form processor
   - Identification form processor
   - Password generator
   - User account lookup
   - Verification form processor
4. Click Submit.
   A new instance of the script include for the selected category opens.
5. Edit the script by providing an implementation in the body of the process or processForm function, depending on the script category. You can add additional functions as long as the process or processForm function accepts the defined parameters and returns the expected results.

Note: Do not edit or delete the Category declaration.
6. Click Update.

Service desk: Reset a password or unlock a user account

In a service desk-assisted Password Reset process, service desk agents with the password_reset_service_desk role reset user passwords—users cannot reset passwords.

Role required: password_reset_admin or password_reset_service_desk

Watch a video example of service desk agents resetting passwords: Resetting User Passwords (Video).

Note:
- You must set the Public access property to enable the service desk-assisted process. See Configure your Password Reset process.
- You can perform this activity on a mobile device.

1. Navigate to Password Reset > Service Desk.
2. Select a user and the Password Reset process to use.
3. Click Verify Identity.
4. On the Verify Identity form, enter the answers that the user provides and then click Continue. If the user identity is verified, the Reset Password form displays identity verification and status of the account lock.
5. Perform one of the following actions.
   - If the user is not locked, the form displays the **Reset password** button. Enter the new password and click **Reset password**.
   - If the user is locked, the form displays the **Reset password** and **Unlock account** buttons. You can enter a new password and click **Reset password** to reset the password and unlock the account. If the **Enable account unlock** check box is selected for the password process, you can unlock the account without resetting the password by clicking **Unlock account**.

6. To reset the password for a different user, you must first navigate out of the **Service Desk** and then navigate to **Password Reset > Service Desk**.

**View user requests for password reset**

The **Reset Requests** module displays the status of each password reset request from the Password Reset Request table (pwd_reset_request).

Role required: password_reset_admin or password_reset_service_desk

Navigate to **Password Reset > Reset Requests**.

<table>
<thead>
<tr>

<tr>
<td>Status</td>
<td>Result of the Password Reset request:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Completed With Failure</strong>: User completed all steps in the Password Reset process, but the password was not reset in the credential store.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Completed With Success</strong>: User completed all steps in the Password Reset process and the password was reset in the credential store.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Expired</strong>: User did not complete all steps in the Password Reset process in the time allowed.</td>
</tr>
<tr>
<td></td>
<td>- <strong>In Progress</strong>: User is working through the steps to reset the password.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Max Number of Attempts</strong>: User failed to answer the security questions correctly during the identity verification step and has exceeded the maximum number of attempts allowed.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Verified</strong>: User has completed the identity verification step and is verified. The user can move to the Password Reset step.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the request is open or closed.</td>
</tr>
<tr>
<td>Retry</td>
<td>Total number of times the user has attempted to complete a password reset request.</td>
</tr>
</tbody>
</table>

### Unblock a Password Reset user

If a user is manually banned or is flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). You can unblock a blocked user.

Role required: password_reset_admin or password_reset_service_desk

Blocking events include:

- The user exceeded the limit for the number of failed password attempts.
- The most recent password reset occurred before the wait time required until the next reset.
- The user failed to provide the correct information while attempting to reset the password.

If the number of blocked or locked users exceeds the limit within a defined time interval, it triggers a system log event. You can configure the number of blocked or locked users and the time interval required to generate the log event by setting the `password_reset.activity_monitor.incident_threshold` and `password_reset.activity_monitor.incident_window` properties.

1. To view the list of blocked users, navigate to **Password Reset > Blocked Users**.
2. To unblock a self-service user:
   a) Navigate to **Password Reset > Blocked Users**.
   b) Select a user from the list.
   c) Select **Delete** on the **Actions on selected rows** list.
3. To unblock a user whose password was reset by a service desk agent:
If a user is manually banned or flagged as exceeding max attempts, the user can be blocked (not allowed to use the Password Reset application). When the password reset request is made through self-service, the user is unblocked when the password is successfully reset.

In contrast, service desk agents are allowed any number of retries. The `max_attempt_reached` limit does not apply and the Blocked status for the user is not reset after the password is reset. As a result, after you successfully reset a user password, you must unblock the user manually.

If the user is not unblocked manually, then the system resets the blocked state only when the `max_attempt_window` time period elapses and the user tries to reset the password using self-service.

a) After you successfully reset a user password, navigate to Password Reset > Blocked Users.

b) Change the Blocked setting for the user from true to false.

### Integrate Password Reset with a Service Portal widget

You can enable a Password Reset process in a Service Portal page by adding a widget that opens the password reset pages inside the portal.

Role required: admin or sp_admin

1. On the Service Portal Designer for the portal, create a new page — the page where the user will perform the password reset process.
2. On the Widget tab, under Layouts, select the 12-column layout and drop it onto the page.
3. Drop the Pwd reset widget into the 12-column layout and then save the page. The three tabs of the password reset process appear in the layout.
4. In the “Reset my password” link on the login page for the portal, specify the URL of the new password reset page. The URL must include one required parameter and may contain one optional parameter:
   - Required: `sysparm_show_custom_header_footer=false`. This parameter disables the native header and footer feature of the password reset page.
   - Optional: `sysparm_redirect_url=<portalName>?id=<pageName>`. This parameter specifies the page to go to after a successful reset — typically the login page for the portal.

   For example, https://server.acme.com/acme_community?id=password_reset_page&sysparm_show_custom_header_footer=false&sysparm_redirect_url=acme_community?id=communities_login

### Integrate Password Reset with a CMS integration

You can configure a site in the ServiceNow content management (CMS) application to define a single-site access point that includes the Password Reset service. For example, you can create an employee self-service site that provides Password Reset service.

Role required: content_admin

Each Password Reset process requires a separate CMS page.

1. Navigate to Content Management > Specialty Content > iFrames and create an iFrame record.
2. Go to Content Management > Sites and create a site that has no login page.
3. Go to **Content Management > Pages** and create a password reset page.

4. Enter the name of the site that you created in the **Content site** field (**Password Reset self-service** in the example).

5. Right-click the form header and click **Save**.

6. Click the **Edit Page** related link and then click **Add content**.

7. In the **Content Blocks** section, select the iFrame that you created. Add more content as needed.

8. Click **Update**.

**Password Reset and Password Change reports and logs**

The Password Reset application provides several tools for monitoring and troubleshooting password reset activities.

Users with the password_reset_credential_manager or password_reset_admin role can view the status of password reset activities, identify potential security threats, and monitor for compliance with password security policies.
The Reset Requests, Activity Log, and Blocked Users modules are useful for monitoring password reset activities and for troubleshooting password reset issues. They also provide access to more detailed information than is provided on the Overview module.

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting.

Password Reset Overview module

The Password Reset > Overview module displays reports on password reset and password change activities. Users with the password_reset_admin role can customize the layout of the reports that appear in the Overview module.

Password Reset reports

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Requests (last 7 days)</td>
<td>Number of password reset requests by type during the last 7 days.</td>
</tr>
<tr>
<td>Blocked Users (last 7 days)</td>
<td>Number of users blocked over the last 7 days.</td>
</tr>
<tr>
<td>Password Reset Request Status (last 7 days)</td>
<td>Status of all password reset requests by process.</td>
</tr>
<tr>
<td>Password Reset Request by Action (last 30 days)</td>
<td>Number of password reset requests by action type: Reset Password, Unlock Account, or Reset and Unlock.</td>
</tr>
<tr>
<td>Password Reset Top Users (last 30 days)</td>
<td>Number of password reset requests per user. Many password reset requests from a single user could indicate a security issue.</td>
</tr>
<tr>
<td>Password Reset Failed Verifications (last 7 days)</td>
<td>Number of failed verification attempts, by verification instance. A failed verification occurs when a user attempts to reset the password, but fails for one reason or another, during the identity verification step. Many failed verification attempts for a specific type of verification could indicate that the process is too complicated or unclear.</td>
</tr>
<tr>
<td>Password Reset Enrollment By Verification</td>
<td>Number of users by verification type who enrolled and did not enroll in the password reset program. A large number for users who did not enrolled could indicate a compliance or communication issue within the organization.</td>
</tr>
<tr>
<td>Password Change Top Users (last 30 days)</td>
<td>Number of password change requests per user. Many password change requests from a single user could indicate a security issue.</td>
</tr>
</tbody>
</table>

Password Reset activity log

The activity log (Password Reset > Activity Log) provides detailed information that you can use to troubleshoot and to generate reports on password reset metrics. Information contained in the activity log is stored in the Password Reset activity log (pwd_reset_activity) table.
You must have the password_reset_credential_manager or password_reset_admin role to view the log.

**Password Reset event log**

The event log is a valuable resource for troubleshooting. On the **Start** menu, click **Programs (or All Programs)** > **Administrative Tools** > **Event Viewer**.

If the log does not appear, then, on the **Windows Logs** menu, click **Applications** > **Service Logs**.

You must have the admin role to view the log.

**To write to the Password Reset event log**

Edit the **DebugFlag** registry key entry at: **Computer** > **HKEY_LOCAL_MACHINE** > **SOFTWARE** > **Microsoft** > **Windows** > **CurrentVersion** > **Authentication** > **Credential Providers** > **{B6EFF27D-C1C4-481F-B81B-F3547C47D58A}**

By default, the key is set to 0. Set the key to 1 to write log entries to the **ServiceNowPwdReset** event log.

You must have the password_reset_credential_manager or password_reset_admin role to write to the log.

**Password Reset blocked user notification**

You can receive email notifications when the number of users that are blocked or locked exceeds the password blocked threshold. Notifications can alert you to suspicious activities. The default threshold is 10.

To subscribe: Add an email notification device or modify an existing device and then subscribe to the **Password Reset-Activity Monitor Lockout** notification.

You must have the password_reset_credential_manager or password_reset_admin role to subscribe.

**Schedule for purging Password Reset data**

To make room for new data, the system periodically purges the data that is used for password reset monitoring and reporting. Information contained in reports and monitoring tools could change dramatically immediately after a data purge.

Users with the password_reset_credential_manager or password_reset_admin role can follow this procedure to modify the purge interval:

1. On a non-production instance: Navigate to **Automated Test Framework** > **Administration** > **Table Cleanup**.
2. Modify the designated tables.
3. Test all changes on the non-production instance.
4. Modify the tables on your production instance and test.

Alternatively, contact ServiceNow Technical Support to modify the purge interval.
### Purge intervals for Password Reset tables

<table>
<thead>
<tr>
<th>Table name</th>
<th>Purge interval</th>
</tr>
</thead>
</table>
| (pwd_reset_request)                | 90 days (7,776,000 seconds). Depending on your organizational data monitoring requirements, you could configure the rule to:  
  - Purge successful requests after 90 days  
  - Keep failed requests for 120 days |
| (pwd_user_lockout)                 | 90 days (7,776,000 seconds). Depending on your organizational data monitoring requirements, you could configure the rule to:  
  - Purge successful requests after 90 days  
  - Keep failed requests for 120 days |
| (pwd_reset_activity)               | 90 days (7,776,000 seconds).                       |
| (pwd_activity_monitor)             | 90 days (7,776,000 seconds).                       |
| (pwd_dvc_enrollment_code)         | 1 day (86,400 seconds).                             |
| (pwd_sms_code)                     | 1 day (86,400 seconds).                             |

### User guide: Resetting your password

Your experience might differ, but the self-service process is a typical process that you might follow to reset your password.

### Example experience of the self-service process

Your experience might differ, but here:

1. On the login page, you click the **Forgot Password?** link to start the process.
2. The Identify page opens and you enter your identifying information (typically username or email address). The example includes the default Google reCAPTCHA security feature:

3. On the Verify page, you verify your identity by providing information that proves that you are who you say you are. The admin configured the method of verification and can require multiple verifications. In the example, the admin has configured the Security Question verification. You must answer a question to prove your identity. (Earlier, while enrolling for the
password reset process, you selected the question and provided a secure private answer.) Other possible verifications require you to enter a code number that was sent to a mobile device by SMS text, through the Google Authenticator app, or by email.

4. The system checks the credential store to verify your identity and then displays, on the Reset page, the new password.
Enroll in the Password Reset program

Some organizations auto-enroll users in a Password Reset program. Your organization could offer end users the option to enroll for one or more methods of verifying identity when resetting the password. End users can enroll for most Password Reset programs on a mobile device.

End users might enroll for any combination of the following methods:

**Verify your identity using security questions (QA verification)**
- To enroll, you choose multiple questions that only you can answer (like the name of your first pet) and then supply answers. The system stores your answers securely.
- Later, when you want to reset your password, the system presents one or more of the questions. You answer the questions to verify your identity. See

**Verify your identity using an SMS code (SMS verification)**
- To enroll, you authorize a device like a cellular phone for SMS verification.
Later, when you want to reset your password, you get a code number on the device and enter the code on the web page to verify your identity.

Verify your identity using an Emailed code

- To enroll, you authorize one or more email addresses.
- Later, when you want to reset your password, the system sends a code number to the email address. You then enter the code on the web page to verify your identity.

Verify your identity using the Google Authenticator app

- You enroll on a computer that you normally use to access the instance (you use Google Authenticator to reset your password, but cannot use Google Authenticator to enroll for Password Reset Windows Application.). After you have enrolled, you load the Google Authenticator app on one or more devices and then authorize the devices for Google Authenticator verification.
- Later, when you want to reset your password, read the Google Authenticator code on your device and then enter the code on the web page to verify your identity.

Users: Enroll in the Password Reset program using questions and answers

Your organization might ask you to select the questions to use when resetting your password. You select the questions and provide answers that only you know. At another time, when you reset your password, your answers verify your identity. You can enroll on a mobile device.

Role required: none

The list of questions is presented in the language that you requested while logging in.

1. Navigate to Password Reset > Enroll and then click the QA Verification tab.
   If you are required to enroll for the QA verification method, then the tab is marked with an asterisk (*).
2. For each Question field, select a question from the list and then enter the answer in the Answer field. Repeat the process until the required number of Question and Answer fields are filled in.
3. Click Submit.
4. Optional: Enroll for an extra identity verification using any of the other methods that your organization offers. See:
   - Users: Enroll in the Password Reset program using SMS codes
   - Users: Enroll in the Password Reset program using Google Authenticator
   - Users: Enroll in the Password Reset program using emailed codes

Users: Enroll in the Password Reset program using SMS codes

To prove that you are who you say you are (verify your identity) while resetting your password, you can use a code number (the SMS code) that was delivered to your mobile phone or device. You can enroll on a mobile device.

Role required: none

1. Navigate to Password Reset > Enroll and then click the SMS Verification tab.
   If your organization requires you to enroll for the SMS verification method, then the tab is marked with an asterisk (*).
2. If you had previously added an SMS-enabled device to your Password Reset profile, the device is listed. To add and verify a device, click Add Device and then follow the instructions. Provide a meaningful Name for each device. Repeat the process for as many devices as you need.

3. After you verify each device, select the Authorized check box for each device that you expect to use to change or reset your password.

   Note: You can deauthorize a device at any time by clearing the Authorized check box.

4. Click Submit.

5. Optional: Enroll for an additional identity verification using any of the other methods that your organization offers. See:

   - Users: Enroll in the Password Reset program using questions and answers
   - Users: Enroll in the Password Reset program using Google Authenticator
   - Users: Enroll in the Password Reset program using emailed codes

Users: Enroll in the Password Reset program using emailed codes

To prove that you are who you say you are (verify your identity) while resetting your password, you enter a code that was sent to your email address. You can enroll for this program on a mobile device.

Role required: none

During this enrollment process, you add the email address, the system sends you a code so you can verify the address, and then you authorize the address to be used for the Password Reset process. By default, the system sends the code to the email address that is associated with your ServiceNow profile. You can send the code to additional email addresses.

1. Navigate to Password Reset > Enroll and then click the Email Verification tab.
   If your organization requires you to enroll for the Email verification method, then the tab is marked with an asterisk (*). Email addresses that were added previously are listed on the tab.

2. Click Add Email, enter the Email address and a meaningful Email name to associate with the address and then click Add Email. Repeat the process for as many email addresses as you need.

3. On the Email Verification tab, for each email that should receive Password Reset codes, click Verify.
   The system sends an email message with a code and then displays the Verify the Email Address pop-up.

4. On the Verify the Email Address pop-up, enter the code and click Verify. If this process fails, click Send a New Code to send a different code and try again.

5. After you verify each email address, select the Authorized check box for each address that you expect to use to change or reset your password.

   Note: To deauthorize an email address so that it does not receive Password Reset codes, clear the Authorized check box.

6. Click Submit.

7. Optional: Enroll for an additional identity verification using any of the other methods that your organization offers. See:

   - Users: Enroll in the Password Reset program using questions and answers
   - Users: Enroll in the Password Reset program using SMS codes
Users: Enroll in the Password Reset program using Google Authenticator

To prove that you are who you say you are (verify your identity) while resetting your password, you get a code number from Google Authenticator on your cell phone or mobile device and then enter the code on the Password Reset web page. If you already paired a device (for example, to log in to the ServiceNow instance), you can skip this enrollment process.

Role required: none

You cannot enroll for the Password Reset program on a mobile device.

1. Navigate to Password Reset > Enroll and then click the Google Authenticator Verification tab.

   Note: If your organization requires you to enroll for the Google Authenticator verification method, then the tab is marked with an asterisk (*).

2. Download the Google Authenticator app to your device.
3. Open the app and then use the device to scan the QR code on the tab.
4. When the device generates a code, enter the code in the text box and then click Pair Device.
5. Click Submit.
6. Optional: If the system displays a success message, click Submit. If the system displays a failure message, enter the code again, click Pair Device, and then click Submit.

When you submit the enrollment, the tab displays the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate New QR Code</td>
<td>Enables you to pair a device with a new code. This option is useful if you have a new device. Existing multi-factor authentication data is replaced with the new data.</td>
</tr>
<tr>
<td>Disable Multi-factor Authentication</td>
<td>Deletes existing multi-factor authentication data. The Google Authenticator verification is no longer available.</td>
</tr>
</tbody>
</table>

7. Optional: Enroll for an additional identity verification using any of the other methods that your organization offers. See:
   - Users: Enroll in the Password Reset program using questions and answers
   - Users: Enroll in the Password Reset program using SMS codes
   - Users: Enroll in the Password Reset program using emailed codes

Users: Reset your password on Windows systems

If your organization uses the Password Reset Windows Application, you can reset your password directly from your Windows login screen.

Role required: none

1. Start your computer or press Ctrl+Alt+Delete to go to the Windows login screen.
2. Click the **Forgot Password?** link. (Your administrator may configure different text for the link.)
3. On the **Identify** page, enter the requested information and then click **Next**.
4. On the **Verify** page, enter the requested information, and then click **Next**.

   **Note:** You might be given the option to choose the method used to verify your identity.

   If your identity is verified, the **Reset** page displays whether you were successfully verified and the state of your account (either locked or unlocked).

5. Based on your locked/unlocked state, perform one of the following actions:
   - If your account is not locked, the page displays the **Reset Password** button. Enter and reenter the new password and then click **Reset Password**.
   - If your account is locked, the page displays the **Reset Password** and **Unlock Account** buttons.
     - You can enter a new password and click **Reset password** to reset the password and unlock the account.
     - If your administrator has selected **Enable account unlock** for the password process, you can unlock the account without resetting the password by clicking **Unlock account**.

---

**Retrieving external data using remote tables and scripts**

Connect the Now Platform to third-party sources, or to another instance, so that you can retrieve external data and optionally cache it in the memory. You can view external data in lists or forms and process it with standard Glide scripts. You can also group, sort, aggregate, and filter the data just like you would for standard internal tables.

**Remote table components**

Use the following components to build an external data framework:

**Remote tables**
You create remote tables to describe the schema for the data that you want to retrieve from an external source.

The table definition is in the Now Platform, but its rows, or external records, live in the memory. You create a remote table the same way that you would create a standard internal table. You define columns and controls and designate application access for it just like you would do for an internal table. Unlike an internal table, a remote table does not get its records from the Now Platform database. It gets its records from running an associated script against an external data source.

To learn more about creating remote tables, see Create a remote table.

**Script definitions**

You create and associate a script definition with a remote table. The external data that you’ve retrieved using the script can be cached in the memory. You can also designate how this data is cached and how long the data is cached in the memory. Every time that you refresh a list that contains the external data from a remote table, the associated script runs again.

To learn more about script definitions and how to associate them with a remote table, see Create a script definition for a remote table.

**How remote tables work**

By using a remote table, you can retrieve the data from external sources or from another instance with REST or SOAP services. The external data lives in the memory in read-only mode, which makes the data temporary, or transient, within the Now Platform. You can then view and manipulate the external data without importing or storing it.

You view the external data in lists or forms in the same way that you view internally stored data. You can manipulate this data by using standard Glide records, business rules, remote APIs, scripting, table reference fields, services, and development tools in the Now Platform.

**Important:** All data that is retrieved from the external source lives in the memory, so make sure that your data set is small. To minimize query times, don’t add more than 1000 rows to a remote table.

**External data life cycle within the Now Platform**

The data that you retrieve from an external source has a finite duration, or life cycle, within the Now Platform.

- When you run a script that is associated with a remote table, the retrieved data lives in the memory for as long as the list or form appears. After you close the list or form, that external data is purged from the memory. The next time that you use or view the external data in this remote table, the memory is repopulated from the external system.
- However, if you have defined caching parameters for the script, the external data remains cached in the memory for the specified caching duration.

For example, if you designate that the external data should be cached for 300 seconds, it remains cached in the memory for 5 minutes. After that time expires, the cached data is purged from the memory. The next time that you use or view the external data in this remote table, the cache is refreshed from the external system.
Practical applications for remote tables

Set up and use remote tables in your enterprise when:

- You want to fetch external data for temporary use without storing it in the Now Platform. For example, you can create a remote table that fetches weather-related data that appears on a homepage when a user logs in. You would then create an associated script definition that retrieves this data from a third-party weather source that is based on the user's location.
- You want to retrieve customer details that are stored in an external Customer Relationship Management (CRM) application for viewing in Customer Service Management functions such as Agent Workspace.

Note: To learn more about data retrieval for Customer Service Management, see Third-party data integration for CSM.

- You want to retrieve and view personnel data from Human Capital Management (HCM) applications such as Workday or SAP SuccessFactors for use in HR Service Delivery functions.

Post-filtering and sorting

When you run a remote table script, it applies post-filtering and sorting query conditions after it adds rows to a table. These applied conditions support any other required queries that the script does not handle. When you apply post-filtering and sorting, the remote table queries work like standard internal table queries.

When you create remote table scripts, you generally handle the most frequent and expansive queries in the script. Post-filtering queries and sorting can take a long time and may adversely affect how your instance performs. Use a small data set instead so that it doesn't take much time to do post-filtering and sorting.

Based on your use cases, determine if you should try a narrower query in the external call or a more expansive query. Because the internal filtering and sorting can be expensive to run on large result sets, use a narrower query when the data doesn't require extra filtering. Use a more expansive query when a more general query would return a small result set and would require extra filtering and sorting.

Differences between remote tables or IntegrationHub

Choose whether to use a remote table or IntegrationHub to process external data.

- Use a remote table when you simply want to use temporary external data.
- Use the IntegrationHub if you want more advanced importing and transformation options, including Flow Designer, or if you want to develop custom integrations.

Note: If you create a remote table that uses the data from an external source that is outside of the Now Platform, you must have an IntegrationHub subscription entitlement. To learn more about the IntegrationHub, see IntegrationHub.

Activate the remote tables plugin

If you have the admin role, you can activate the Remote Tables plugin (com.glide.script.vtable). This plugin includes demo data and activates related plugins if they are not already active.
Role required: admin
Remote Tables activates these related plugins if they are not already active.

### Plugins for Remote Tables

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Tables</td>
<td>Supports remote tables and associated script definitions that can be used to retrieve and optionally cache data from external sources.</td>
</tr>
<tr>
<td>(com.glide.script.vtable)</td>
<td></td>
</tr>
<tr>
<td>Transformation Service</td>
<td>Supports use of Transform APIs that are associated with the remote tables.</td>
</tr>
<tr>
<td>(com.glide.transform)</td>
<td></td>
</tr>
</tbody>
</table>

1. Navigate to **System Definition > Plugins**.
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   ![Banner](image)
   **Note:** To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in *Request a plugin*.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
• To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the **Activate/Update** related link.
  3. In the dialog box, review the dependent plugins.
     If your plugin requires dependent plugins, they're activated automatically when you
     activate your plugin if they're not active already.
  4. If demo data is available and you want to install it, click **Load demo data**.
     Some plugins include demo data, which are sample records that describe plugin
     features for common use cases. Load demo data when you first activate the plugin
     on a development or test instance. You can always load demo data later by clicking
     **Load demo data only** on the plugin form.
  5. Click **Activate**.

**Create a remote table**

Create a remote table so that you can see the data that you retrieved from an external source.

Role required: admin

When you designate a table as a remote table, keep the following points in mind:

• You can create a remote table using this form, or by using the standard Create Tables form that
  you access from **System Definition > Tables**.

  **Note:** To learn more about creating tables in an instance, see **Create a table**.

• Before you create a remote table, you must have a good understanding of external data
  sources.

  For example, if you want to retrieve CRM data for use in Customer Service Management, you
  must understand how the data is structured in the external CRM source.

• Unlike standard internal tables, you can't extend a remote table from another table.

• A remote table needs an external primary key to relate its temporary data to the data that is
  stored in the external source. When you designate a table as remote, only a sys_id field is auto-
  generated and appears in the Columns section, which it uses as its primary key for use in Glide
  records. All external table primary key values are converted to string values. CRUD (Create,
  Read, Update, Delete) fields are not generated for a remote table, as they are for standard
  internal tables.

1. Navigate to **System Definition > Remote Tables > Tables**.
2. Click **New**.
3. On the form, fill in the fields.

  **Note:** You create a remote table in the same manner as a normal table, but designate it as a remote table. The following controls differ in how they operate and what you enter into them when you create a remote table:
<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Table name, which is automatically populated based on the table label and a prefix as follows:</td>
</tr>
<tr>
<td></td>
<td>• For a remote table in a scoped application, the name is prefixed with a namespace identifier and the string st_ to indicate that it is remote and part of an application.</td>
</tr>
<tr>
<td></td>
<td>• For a remote table in the global application, the name is prefixed with the string u_st_.</td>
</tr>
<tr>
<td></td>
<td>You can’t modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_).</td>
</tr>
<tr>
<td>Extends Table</td>
<td>Option that is not available if you select the Remote Table option to designate that this table is remote. It no longer appears because you can’t extend remote tables from other tables.</td>
</tr>
<tr>
<td>Remote Table</td>
<td>Option to designate this table as a remote table. A remote table is a table to which you can associate a script definition for retrieval of data from an external data source. Unlike a standard internal table, the data does not come from records in the current instance.</td>
</tr>
</tbody>
</table>

4. In the Columns section, use the Table Columns embedded list to add columns to the remote table like you do when you create columns for a standard internal table.

5. In the Controls section, define additional remote table options like you do when you define additional table options for a normal table.

6. In the Application Access section, define the scope protection for the remote table like you do when you define additional table options for a normal table. For more information, see Application access settings.

7. Click Submit.

A remote table is created in the instance.

**Create a script definition for a remote table**

Define and associate a script with a remote table so that you can retrieve data from an external source with it. The Now Platform retrieves and caches the data for the remote table by running the script against an external data source so you can view or modify it. You can also designate
how this external data is cached and how long the data is cached in the memory until the script must run again.

Role required: admin

You create script definitions for remote tables like you do for other scripts. To learn more about entering, modifying, and debugging scripts, see JavaScript syntax editor.

1. Navigate to **System Definition > Remote Tables > Definition**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the script that you are creating to associate with the selected remote table.</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the remote table that you want to associate the script that you are creating.</td>
</tr>
<tr>
<td></td>
<td>• For a remote table in a scoped application, the name is prefixed with a namespace identifier and the string <code>st_</code> to indicate that it is remote and part of an application.</td>
</tr>
<tr>
<td></td>
<td>• For a remote table in the global application, the name is prefixed with the string <code>u_st_</code>.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that is associated with this remote table. If you are working on an application or are creating a remote table from an application record, the field defaults to that application. Otherwise, the field defaults to <strong>Global</strong>. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for activating the script that you are associating with the remote table. You can have multiple inactive script definitions for a remote table, but can only have one active script definition.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Option to access the Caching section to designate how the memory caching should operate in the Now Platform for this remote table.</td>
</tr>
</tbody>
</table>

4. In the Script section, add your JavaScript syntax to the skeleton template:
5. In the Caching section, designate how this data is cached and how long the data is cached in the memory of the Now Platform:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cache TTL</td>
<td>Time to live, expressed in seconds, that external data is cached in memory</td>
</tr>
<tr>
<td></td>
<td>for this remote table script definition. For example, enter 300 to cache</td>
</tr>
<tr>
<td></td>
<td>the data in the memory for 5 minutes.</td>
</tr>
</tbody>
</table>

**Note:** By default, the external data is cached in the memory by user.

6. Click Submit.

When you activate a script definition, you associate it with the remote table so that you can retrieve and cache the external data.

**Example 1: Retrieving all incident records from an external source**

These are examples of script definitions you might create for retrieval and caching of data from sources external to your current instance. In this first example, we create a script to load all incident records from an external source.

```javascript
/**
 * Using `v_query`, add the rows to `v_table`
*/
(function executeQuery(v_table, v_query) {
  // Main API:
  // v_table.addRow({ ... }) — adds a row to the result set
  // There are also query helper methods
  // v_query.getEncodedQuery() — returns encoded querystring
  // v_query.getCondition(field) — returns encoded querystring (and value)
  // v_query.getParameter(field) — returns parameter for the given condition
  // v_query.isGet() — returns whether the query is a single get
  // v_query.getSysId() — returns parameter for sys_id field
  // v_query.isTextSearch() — returns whether the query contains a text search
  // v_query.getTextSearch() — returns text search query parameters
  // v_query.getFirstRowWanted() — returns the first row to include
  // v_query.getLastRowWanted() — returns the last row to include

  // Your code goes here
  // v_table.addRow({...})

})(v_table, v_query);
```
/**
 * function executeQuery(v_table, v_query) {

 fetchAllIncidents(v_table, v_query);

 /**
 * fetch all incidents records from the remote instance
 */
 function fetchAllIncidents(v_table, v_query) {
 // Uses RestMessage with name 'Remote Instance Incidents' and function 'All Incidents'
 // Create a RestMessage first which calls an external REST service
 try {
     var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'All Incidents');
     var response = restMessage.execute();
     var responseBody = response.getBody();

     // if REST call ends up in an error, set the last error message which shows up
     // at the bottom of the list view
     if (response.haveError()) {
         v_query.setLastErrorMessage(response.getErrorMessage());
     // can use gs.error() or gs.addErrorMessage() while debugging
     // gs.debug() messages visible in session debugger
     // gs.debug(response.getErrorMessage());
         return;
     }
     catch (ex) {
         v_query.setLastErrorMessage(ex.message);
     // gs.debug(ex.message);
         return;
     }

     var transformerDefinition = getTransformerDefinition();
     var transformer = new sn_tfrm.Transformer(transformerDefinition, responseBody);
     // transformer parses the responseBody and extracts rows
     while (transformer.transform()) {
         // row is field-value map e.g. { active:"true", number: "INC0000001"}
         var row = transformer.getRow();
     // you may do any additional transformations to the row like GlideDuration, GlideDataTime etc. For example,
     // row.duration = new GlideDuration(row.duration);

     // finally add the row to the remote table
     v_table.addRow(row);
     }
 }

 /**
 * returns a sn_tfrm.TransformerDefinition, which defines the mapping of the table fields and elements in the response body
 */
 function getTransformerDefinition() {
 // create a rule list to map a field to its element path
 var ruleList = new sn_tfrm.TransformerRuleList()
     .fromJSON() // the response body is a JSON
     // 'active' field maps to path '$.active'
     .addRule("active", "$.active")
     .addRule("caller_id", "$.caller_id.value")
     .addRule("number", "$.number")
     .addRule("short_description", "$.short_description")
     .addRule("sys_id", "$.sys_id")
These code snippets are of note in this script:

```javascript
function fetchAllIncidents(v_table, v_query) {
  try {
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'All Incidents');
    var response = restMessage.execute();
    var responseBody = response.getBody(); // if REST call ends up in an error, set the last error message which shows up
    if (response.haveError()) {
      v_query.setLastErrorMessage(response.getErrorMessage());
    // can use gs.error() or gs.addErrorMessage() while debugging
    // gs.debug() messages visible in session debugger
    // gs.debug(response.getErrorMessage());
    return;
    }
    catch (ex) {
      v_query.setLastErrorMessage(ex.message);
      // gs.debug(ex.message);
      return;
    }
    } catch (ex) {
      v_query.setLastErrorMessage(ex.message);
      // gs.debug(ex.message);
      return;
    }
  }
```

You can create a RestMessage and directly use it in the script. In this example, it uses a RESTMessageV2 API with the name of Remote Instance Incidents, and the function All Incidents, which gets all incident data. Once a response is returned from the server, an error message appears if problems are encountered in the data retrieval.

**Note:** To learn more about use of RESTMessageV2 and how to define a direct message, see [RESTMessageV2 - Scoped, Global and Direct RESTMessageV2 example](#).

If no problems are encountered in the data retrieval, it gets the data body for the records.

```javascript
var transformerDefinition = getTransformerDefinition();
var transformer = new sn_tfrm.Transformer(transformerDefinition, responseBody);
// transformer parses the responseBody and extracts rows
while (transformer.transform()) {
  // row is field-value map e.g. { active:"true", number: "INC0000001"}
  var row = transformer.getRow();
  // you may do any additional transformations to the row like GlideDuration, GlideDataTime etc. For example,
  // row.duration = new GlideDuration(row.duration);

  // finally add the row to the remote table
  v_table.addRow(row);
```
It then uses the Transformer API to perform any required data transformations, extracts rows, and then adds a row for each record to the remote table.

```javascript
/**
 * returns a sn_tfrm.TransformerDefinition, which defines the mapping of
 * the table fields and elements in the response body
 */
function getTransformerDefinition() {
  // create a rule list to map a field to its element path
  var ruleList = new sn_tfrm.TransformerRuleList()
    .fromJSON() // the response body is a JSON
    // 'active' field maps to path '$.active'
    .addRule("active", "$.active")
    .addRule("caller_id", "$.caller_id.value")
    .addRule("number", "$.number")
    .addRule("short_description", "$.short_description")
    .addRule("sys_id", "$.sys_id")
    .addRule("updates", "$.sys_mod_count");

  var recordPath = "$\.result";
  return new sn_tfrm.TransformerDefinition(ruleList, recordPath);
}
})(v_table, v_query);
```

getTransformerDefinition defines the schema of the record in the external API response body. It maps each of the fields in the table script to an element in the external record. Any external data elements outside of this mapping are not supported or retrieved.

**Note:** You must map a sys_id in the transformer definition to an element in the external data. In this case, the sys_id is mapped to the external incident sys_id. The maximum length of the sys_id is 32 characters. You do this sys_id mapping so forms that use the external data can operate properly.

### Example 2: Retrieving specific records from a third-party source

In this example, we create a script to retrieve specific types of incident records from a third-party source.

```javascript
/**
 * Using 'v_query', add the rows to 'v_table'
 */
(function executeQuery(v_table, v_query) {
  if (v_query.isGet()) {
    bySysId(v_table, v_query, v_query.getSysId());
  }
  else if (v_query.getParameter("caller_id")) {
    byCallerId(v_table, v_query, v_query.getParameter("caller_id"));
  }
  else {
    fetchAllIncidents(v_table, v_query);
  }

  /**
   * fetch all incidents records from the remote instance
   */
  function fetchAllIncidents(v_table, v_query) {
    // Uses RestMessage with name 'Remote Instance Incidents' and function
    'All Incidents'
    // Create a RestMessage first which calls an external REST service
```
var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'All Incidents');
loadData(v_table, v_query, restMessage);

/**
 * fetches a specific record from the remote instance with Sys Id being `sys_id`
 */
function bySysId(v_table, v_query, sys_id) {
    // Uses RestMessage with name 'Remote Instance Incidents' and function 'By SysId'
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'By SysId');
    // sets variable 'sys_id'
    restMessage.setStringParameterNoEscape("sys_id", sys_id);
    loadData(v_table, v_query, restMessage);
}

/**
 * fetches records from the remote instance with Caller (caller_id) being `caller_id`
 */
function byCallerId(v_table, v_query, caller_id) {
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'By CallerId');
    restMessage.setStringParameterNoEscape("caller_id", caller_id);
    loadData(v_table, v_query, restMessage);
}

/**
 * Adds rows to `v_table` using `restMessage`
 */
function loadData(v_table, v_query, restMessage) {
    try {
        var response = restMessage.execute();
        var responseBody = response.getBody(); // if REST call ends up in an error, set the last error message which shows up
        if (response.haveError()) {
            v_query.setLastErrorMessage(response.getErrorMessage()); // at the bottom of the list view
            if (response.getErrorMessage()) {
                v_query.setLastErrorMessageMessage(response.getErrorMessage()); // can use gs.error() or gs.addErrorMessage() while debugging
                // gs.debug() messages visible in session debugger
                // gs.debug(response.getErrorMessage());
                return;
            }
        }
    } catch (ex) {
        v_query.setLastErrorMessage(ex.message);
        // gs.debug(ex.message);
        return;
    }

    var transformerDefinition = getTransformerDefinition();
    var transformer = new sn_tfrm.Transformer(transformerDefinition, responseBody); // transformer parses the responseBody and extracts rows
    while (transformer.transform()) {
        var row = transformer.getRow(); // row is field-value map e.g. { active:"true", number: "INC0000001"}
        var row = transformer.getRow(); // you may do any additional transformations to the row like GlideDuration, GlideDateTime etc. For example,
        // row.duration = new GlideDuration(row.duration);
// finally add the row to the remote table
v_table.addRow(row);
}

/**
 * returns a sn_tfrm.TransformerDefinition, which defines the mapping of
 * the table fields and elements in the response body
 */
function getTransformerDefinition() {
    // create a rule list to map a field to its element path
    var ruleList = new sn_tfrm.TransformerRuleList()
        .fromJson() // the response body is a JSON
        .addRule("active", ".active")
        .addRule("caller_id", ".caller_id.value")
        .addRule("number", ".number")
        .addRule("short_description", ".short_description")
        .addRule("sys_id", ".sys_id")
        .addRule("updates", ".sys_mod_count");

    var recordPath = ".result";
    return new sn_tfrm.TransformerDefinition(ruleList, recordPath);
}
})(v_table, v_query);

These code snippets are of note in this script:

function fetchAllIncidents(v_table, v_query) {
    // Uses RestMessage with name 'Remote Instance Incidents' and function
    // 'All Incidents'
    // Create a RestMessage first which calls an external REST service
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents',
        'All Incidents');
    loadData(v_table, v_query, restMessage);
}

You can create a RestMessage and directly use it in the script. In this example, it uses a
RESTMessageV2 API with the name of Remote Instance Incidents, and the function All
Incidents, which gets all incident data. Once a response is returned from the server, an error
message appears if problems are encountered in the data retrieval.

function bySysId(v_table, v_query, sys_id) {
    // Uses RestMessage with name 'Remote Instance Incidents' and function 'By
    // SysId'
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'By
    SysId');
    // sets variable 'sys_id'
    restMessage.setStringParameterNoEscape("sys_id", sys_id);
    loadData(v_table, v_query, restMessage);
}

When you query a specific record using GlideRecord.get("<sys_id>"), then
v_query.isGet() is `true`. It fetches the specific record from the external service.

function byCallerId(v_table, v_query, caller_id) {
    var restMessage = new sn_ws.RESTMessageV2('Remote Instance Incidents', 'By
    CallerId');
    restMessage.setStringParameterNoEscape("caller_id", caller_id);
    loadData(v_table, v_query, restMessage);
You can also handle any other specific query conditions in the script, such as using `caller_id` in the preceding code snippet. The remainder of this script operates in a manner similar to Example 1.

```javascript
function getTransformerDefinition() {
  // create a rule list to map a field to its element path
  var ruleList = new sn_tfrm.TransformerRuleList()
    .fromJson() // the response body is a JSON
    // 'active' field maps to path '$.active'
    .addRule("active", "$.active")
    .addRule("caller_id", "$.caller_id.value")
    .addRule("number", "$.number")
    .addRule("short_description", "$.short_description")
    .addRule("sys_id", "$.sys_id")
    .addRule("updates", "$.sys_mod_count");

  var recordPath = "$\.result";
  return new sn_tfrm.TransformerDefinition(ruleList, recordPath);
}
}

getTransformerDefinition defines the schema of the record in the external API response body. It maps each of the fields in the table script to an element in the external record. Any external data elements outside of this mapping are not available in the remote table.

### Debugging remote table script definitions

You can enable session debugging for remote table script definitions. To enable script definition logging in a session debug log, set the `glide.script.vtable.log.debug` property to `true`.

When you create remote table script definitions, you can use the `gs.debug()` command to add debug logs that are visible in the session debugger. The session debugger also contains debug logs with `{RemoteTable}` tags, each with the following information:

- Query definition
- Number of rows loaded in the remote table
- Number of aggregate rows (if GlideAggregate)

Prolonged use of the `glide.script.vtable.log.debug` property can affect performance, so it is best to set its value to `false` when you finish a debugging session.

**Note:** If you are not on the application node that processed your remote table script, you may not see the resulting log statements. In this case, contact Technical Support.

Use the `v_query.setLastErrorMessage(message)` API to set the last error message that appears at the bottom of the list view. In script, you can retrieve this message using the `glideRecord.getLastErrorMessage()` API. To learn more about these APIs, see GlideRecord.
**Domain separation and remote tables**

This is an overview of domain separation and remote tables. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**No support**

- The domain field may exist on data tables, but no logic exists to manage data.
- This level is not considered domain-separated.

**Overview**

Domain separation provides complete data isolation for domain-specific users.

**How domain separation works with remote tables**

When you create standard internal tables, you can add a sys_domain field, which results in domain separation of the data that is stored in the table. This functionality is not supported when you natively create remote tables, which results in lack of domain separation for rows that are added to a remote table.

However, script definitions that you create and associate with a remote table can be domain (data) separated. When you create the script, you can include DomainSupport APIs that provide domain separation support. If the script definition is domain separated, only users that belong to the designated domain can view the data in the remote table.

**Response templates**

Resolve cases or support issues faster and more efficiently with response templates. Response templates (formerly known as templated snippets) are reusable messages that can be copied to case or task forms to provide quick and consistent messages to users, or to display standard chat response messages to requesters in Agent Chat.

**Assign response template roles**

The following roles are installed when you activate the response templates plugin.

<table>
<thead>
<tr>
<th>Response template role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response template administrator (sn_templated_snip.template_snippet_admin)</td>
<td>Grants access to scoped administration of the response templates feature.</td>
</tr>
<tr>
<td>Response template writer (sn_templated_snip.template_snippet_writer)</td>
<td>Grants access to create, read, update, and delete (CRUD) response template content.</td>
</tr>
<tr>
<td>Response template reader (sn_templated_snip.template_snippet_reader)</td>
<td>Grants access to read response template content.</td>
</tr>
<tr>
<td>Response template role</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>System Administrator</td>
<td>Response template administrator</td>
</tr>
<tr>
<td>(admin)</td>
<td>(sn_templated_snip.template_snippet_admin)</td>
</tr>
</tbody>
</table>

**Note:** Admin inherits this role by default. When the Templated Responses (com.sn_templated_snip) plugin is activated without activating related HR applications, you can still use response templates.

- Admin can reassign this role to other users.
- Admin can also remove the Contained Role (sys_user_role_contains) table so Admin users do not inherit this role by default. Or:

1. Enter `sys_store_app_list.do` in the Filter navigator search bar of an instance, or `https://YOUR_INSTANCE/sys_store_app_list.do` from a web browser.
2. Search for and select Templated Snippets.
4. Click Remove from the role contained by admin.

Before you begin using response templates, you must assign these roles to the appropriate roles, groups, or users in your application.

- To assign a role to another role, see Add a role to an existing role.
- To assign a role to a group, see Assign a role to a group.
- To assign a role to a user, see Assign a role to a user.

For example,

- In the HR Service Delivery application, users with the HR administrator role are assigned the response template administrator role, users with the HR manager role are assigned the response template writer role, and users with the HR case writer role are assigned the response template reader role.
- In the Customer Service Management application, users with the customer service manager role (sn_customerservice_manager) inherit the response template writer role. Users with the customer service agent role (sn_customerservice_agent) inherit the response template reader role and can access response templates assigned to all groups to which they belong.
How to use response templates

Users with the response template writer (sn_templated_snip.template_snippet_writer) role can create response templates. Each template is associated with a table that is an extension of the Task (task) or Interaction (interaction) table. Response templates include a short name for specifying a shortcut that can be used to identify the message. For chat response templates used in Agent Workspace, agents use the slash command with a short name to present the standard message during a chat. You can also configure the template to

- Include variables pulled from a table
- Specify a condition builder to specify the conditions that must be met for the template to be available for use, such as for a specific HR service

- Create or modify a response template

Users with the response template reader (sn_templated_snip.template_snippet_reader) role can then copy response template content and use it in their responses to users when working on case or task forms that meet the specified conditions. For example, a response template for payroll discrepancy cases enables HR agents to use a standardized message when responding to that case type. See Copy a response template to an HR case for an HR-specific example.

Response template to escalate payroll discrepancy cases

You are part of an enterprise HR organization using the HR Service Delivery application. You want your HR agents to respond to and, when necessary, escalate payroll discrepancy cases quickly and consistently. Create a response template so that HR agents have a reusable message to use when responding to employees about that case type.

One of your HR managers with the response template writer role is responsible for creating the template to escalate payroll discrepancy cases. The template is associated with the HR Payroll Case (sn_hr_core_case_payroll) table, and a condition filters on cases that match the appropriate HR service called Payroll Discrepancy. In the template body, the response text appears with variables, such as the subject person name in the salutation.

HR case writers with the response template reader role can copy the response template content and use it in their responses to employees when working on cases. Response templates provide a faster and efficient way to resolve cases.

Activation information

To use response templates in your application, you must activate response templates. For information on what components are installed with the feature, see Components installed with response templates.

Activate response templates

You can activate response templates (formerly known as templated snippets) (com.sn_templated_snip) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin
Note: If you are using Agent Chat, the Agent Chat (com.glide.interaction.awa) plugin automatically activates response templates.

Response templates activate these related plugins if they are not already active.

### Plugins for response templates

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scoped Application Restricted Caller Access (com.glide.scope.access.restricted_caller)</td>
<td>Allows scoped applications to restrict access to public tables and script includes.</td>
</tr>
</tbody>
</table>

1. **Navigate to System Definition > Plugins.**

A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   - **Note:** To redirect to the legacy list view for plugins, click the link.

2. **Find the plugin using the filter criteria and search bar.**

You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in [Request a plugin](#).

3. **Activate the plugin.**

You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.

   - To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

**Components installed with response templates**

Several types of components are installed with activation of the response templates (formerly known as templated snippets) plugin, including tables and user roles.

ℹ️ **Note:** The Application Files table lists the components installed with this application. For instructions on how to access this table, see *Find components installed with an application*.

Demo data is available for this feature.

**Roles installed**

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response templates administrator</td>
<td>Grants access to scoped administration of the response templates feature.</td>
<td>• sn_templated_snip.template_snippet_writer</td>
</tr>
<tr>
<td>(sn_templated_snip.template_snippet_admin)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Response templates writer</td>
<td>Grants access to create, read, update, and delete (CRUD) response template content.</td>
<td>• sn_templated_snip.template_snippet_reader</td>
</tr>
<tr>
<td>(sn_templated_snip.template_snippet_writer)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Response templates reader</td>
<td>Grants access to read response template content.</td>
<td>• None</td>
</tr>
<tr>
<td>(sn_templated_snip.template_snippet_reader)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

You can assign these roles to the appropriate roles, groups, or users in your application.

- To assign a role to another role, see *Add a role to an existing role*.
- To assign a role to a group, see *Assign a role to a group*.
- To assign a role to a user, see *Assign a role to a user*.

For further information on user administration and how to manage users, see *User administration*.

Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note Template (sn_templated_snip_note_template)</td>
<td>Table for templated snippets.</td>
</tr>
</tbody>
</table>

For further information on table administration and how to manage data, see Table administration.

Create or modify a response template

Create or modify a response template (formerly known as a templated snippet) to define a reusable message that can be copied to case or task forms or used in Agent Chat sessions to provide quick and consistent messages to users.

Role required: sn_templated_snip.template_snippet_writer

Each response template is associated with a table that is an extension of the Task (task) table or, if using Agent Workspace, the Interaction (interaction) table. The template can be configured to include variables pulled from that table. You can also use a condition builder to specify the conditions that a case must meet for the template to be available for use, such as for a specific HR service or for chat. For chat response templates, you specify a short name (shortcut) that is used with the slash command as a quick way to present the response message to a user.

1. Navigate to System Definition > Response template configuration.
2. Click New or open a record.
3. Fill in the fields on the form.

Response template form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the response template.</td>
</tr>
<tr>
<td>Short Name</td>
<td>Short description that identifies the response template when using chat in Agent Workspace. The short name is used with a quick command () to show the text from the template body of the response template while in chat. This feature provides a fast and consistent way to populate text while in chat. For example, the short name gm identifies the chat response template for a Good Morning greeting. Enter /gm in a chat window to show the text from this response template.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the table that the response template is associated with.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you are creating a response template for Agent Workspace chat, the associated table is the Interaction (interaction) table. For other response templates, the table must be an extension of the Task (task) table.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions under which the response template is made available for use.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The conditions available depend on the table you select. For chat response templates, specify the condition: <em>(Type) (is) (Chat)</em></td>
</tr>
<tr>
<td>Application</td>
<td>The application that created the response template.</td>
</tr>
<tr>
<td>Group visibility</td>
<td>Indicates what groups have access to the response template. Adding groups filters who can view the response template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Leaving this field blank makes the response template available to all groups.</td>
</tr>
<tr>
<td>Template body</td>
<td>Text of the response template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Rich text is not supported with response templates.</td>
</tr>
<tr>
<td>Select variables</td>
<td>Variables that can be added to the template body.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The variables available depend on the table you select.</td>
</tr>
</tbody>
</table>

The following GIF shows an example of an HR manager in the HR Service Delivery application creating a response template to escalate payroll discrepancy cases. The template is associated with the HR Payroll Case (sn_hr_core_case_payroll) table, and a condition is set to filter on cases that match the Payroll Discrepancy HR service. The template text is pasted into the body, and then a variable for the subject person is added to the salutation.
4. Click **Submit** or **Update**.

You can copy response template content to any field on a form that meets the specified conditions.
The following GIF shows an example of an HR case writer in the HR Service Delivery application opening a payroll discrepancy case and copying a payroll discrepancy escalation template to the comments field in the HR case form for the employee to read.
<table>
<thead>
<tr>

</tbody>
</table>
Self-service

The Self-Service application gives supported end users a clean, simple front end to their IT support organization.

By default, the Self-Service application provides access to common actions, such as viewing your homepage, accessing the Service Catalog, viewing knowledge articles, working with incidents, and taking surveys.

Service catalog requests

This page contains links to content on service catalog requests.

Add new request items

Use ServiceNow’s web-based interface to add new items to a request.

Roles required: Only an administrator or a user with the catalog_admin role can add a new item to a submitted request.

Modifying a request does not resubmit it to the approval process.

1. Navigate to Service Catalog > Open Records > Requests and open an existing request.
2. Click Add New Item.
3. In the dialog box that appears, choose an item and a quantity to add.
4. Click OK.

Amazon EC2 instance request from the Service Catalog

Users can request the provisioning and deletion of virtual computers (Linux or Windows) in the Amazon EC2 virtual computing environment through the ServiceNow Service Catalog.

The Amazon EC2 offering requires the purchase and activation of ServiceNow Orchestration Automaton.

Request an instance

Request the provisioning of a new Amazon EC2 instance through the service catalog.

1. Navigate to Self-Service > Service Catalog.
2. Select Amazon EC2 Instance from the Request Application Infrastructure category.
3. Select the operating system, the type of instance (Large or Small), and the number of instances requested.
   See the specifications for Large and Small instances in Amazon EC2 Instance Types.
4. Type a reason for the request.
EC2 Service Catalog

5. Click **Order Now** to order the instance.

The Order Status form appears, summarizing the request. A status bar tracks the progress of the approval and provisioning of the EC2 instance.
Upon successful creation of the instance, you receive an email containing the instance ID, IP address, and the public DNS for the instances created.

**Terminate an instance**

Shut down an Amazon EC2 instance through the service catalog.

1. Navigate to **Service Catalog > Routine Changes > Terminate Amazon EC2 Instance**.
   
   A list appears displaying the instances that are assigned to you.

2. Select an instance from the list and click **Order**.

   This list does not support multi-line selection, and there is no **undo** feature.

**Check-out redirect property**

A property called One-step checkout redirect (glide.vm.checkout_redirect) controls the view presented to virtual machine requesters in the service catalog.

By default, this property is set to **false**, which redirects the view to the Order Status form when the requester clicks **Order Now**. When this property is set to **true**, ServiceNow redirects the requester to his or her My Virtual Assets portal. This property is located in **Cloud Management > Administration > Properties**.

**Delete request items**

Use ServiceNow's web-based interface to delete items from a request.

All users can delete items from their own requests any time prior to delivery. Modifying a request does not resubmit it to the approval process.

1. Navigate to **Service Catalog > Open Records > Requests** and open an existing request.

2. In the **Requested Items** related list, select the check box beside the item to delete.
3. In the **Actions** choice list, select **Delete**.
   ServiceNow recalculates the price and delivery date for the order.

**Place a request**

Use ServiceNow’s web-based interface for ordering predefined goods and services.

1. **Navigate to** **Self-Service > Service Catalog**.
   The default catalog view organizes items in categories and subcategories.

   Default catalog view

2. **Select an item to order.**

   **Note:** Some items are order guides, which combine related items for easier ordering. For example, an order guide called New Employee Hire presents a list of items that new employees typically receive (desk, phone, computer, email account). After you select the items you want to order, the order guide requests the information required and shows a separate time to delivery for each item ordered.

   The order screen requests any additional information that’s needed, such as the requester’s name or location and the date the item is needed. It also displays the item’s delivery time after approval.
Delivery time

3. Enter complete and accurate information to expedite your order.
4. Order any other items required.
5. Click **Order Now** when the order is complete.

ServiceNow displays a confirmation screen for your order:
Order submitted

You can view the order's progress in the Stage column.

Note: It may be useful to note the order number for future reference.

ServiceNow automatically notifies the approvers if approval is required and creates work orders to fulfill the order according to your organization's process. For example, if you order a new notebook computer, the purchasing group might receive a work order to order the computer, and the desktop services group might receive a work order to configure the new computer and deliver it to your office after it arrives.

Create incidents and change requests from a requested item

You can quickly open an incident or a change request from a requested item. It also maintains a relationship between the requested item, and its associated incidents or change requests.

The administrator must enable the Create Change and Create Incident UI actions for the Requested Item (sc_req_item) table. The administrator must set the Active field to true when editing these UI actions.
Role required: itil

1. Navigate to **Self-Service > Requested Items.**
2. Open a requested item.
3. Click the Additional actions menu icon and select **Create Change** or **Create Incident**

**View request status**

View the status of a request to see its progress, and determine when it may be fulfilled.

1. Navigate to **Self-Service > Requested Items.**
2. Click your order number to view details.
3. View the order's progress in the **Stage** field.
4. Check the **Backordered** field, and if the item is backordered, review comments for information about its return to stock.

**Customize homepages**

If you are assigned at least one role in the system, you can create a customized homepage that you can see when you log in.

The content on your homepage comes from a variety of sources, such as graphs and charts generated from a report, application modules, a service catalog category, the scrolling news widget, which is the News knowledge category.

1. Navigate to **Self-Service > Homepage**.
2. Add any item to the homepage by clicking the add content icon ( ) or the Add content link at the top.

A window will open that lets you select from a number of different homepage items you can add. Some items pertain to specific features and applications, such as CMS content blocks and the Work Management dispatch map. So the list of items varies depending on what is active on your system.

3. Reposition elements on your homepage by dragging and dropping them to a new location.

4. To remove a homepage item, click the (X) on the right side of the item’s header.

Delete custom homepages

You can delete any of your custom homepages if you no longer need them.

1. Click the Delete page link at the bottom of the homepage.

2. Click OK to confirm the deletion.

How Help the Help Desk identifies devices

Help the Help Desk uses a predefined series of queries to identify and update existing CIs in the CMDB or to create a new CI if no match is found.

These queries attempt to match devices using the three criteria listed here, in this order. Updates to an existing CI require only a single match as the list is evaluated. For example, if a device’s name has changed, but the MAC address is the same, the CI with the matching MAC address is updated.

- Serial number in the `cmdb_ci_computer` table
- MAC address in the `cmdb_ci_network_adapter` table
- Computer name in the `cmdb_ci_computer` table
**Note:** Discovery Identifiers are incompatible with Help the Help Desk queries.

**Script Include**

The script include `CIIdentifierForHelpDesk` provides the logic for updating existing CIs or creating a new CI if no matching device exists in the CMDB. *Do not* modify this script. Errors introduced into this script can result in update failures or in new CIs being created for every device found.

**Running Help the Help Desk**

Help the Help Desk is a tool that enables users to populate the CMDB automatically with information about their Windows computer. Help the Help Desk is a small Web application that downloads and runs locally, using a login script to gather information such as serial number, computer name, disk configuration, network configuration, installed software, memory, and much more.

To detect all system software successfully on a 64-bit machine, make sure to run the Help the Help Desk script from a 64-bit browser. A 64-bit browser can detect both 64-bit and 32-bit software, but a 32-bit browser cannot detect 64-bit software.

1. On your instance, navigate to **Self Service > Help the Help Desk**.
2. Click **Start the Scan to Help the Help Desk**.
   You are prompted to run or save the `discovery.hta` script.
3. If your browser is Internet Explorer, run the script. If you are using any other browser, click **Save** and save the script to the local machine.
4. To execute the saved script, double click the file.
   The script runs a series of WMI queries to gather information about the Windows machine. When it is done, the data is sent back to your ServiceNow instance and used to populate the configuration database (CMDB).

**Service Delegation**

Service delegation is the ability to designate other users to view and interact with approvals sent or tasks assigned to you, and to receive copies of all email notifications sent to you.

**Note:** Users to whom you delegate responsibility see all pending tasks and approvals regardless of the delegation period.

**Note:** Delegation does not cascade. When a user acts as a delegate for another user, the delegate cannot in turn delegate to a third party. The original delegate is the only user who receives assignments and notifications. Delegation does not grant the delegate access to tasks where the caller or requester is the user for whom the delegate was created.

**Add the Delegates related list to a user profile**

To delegate approvals and tasks to another user, configure your user profile form to display the Delegates related list.

Role required: personalize_form or admin.

1. Navigate to **Self-Service > My Profile**.
2. On the form context menu, navigate to **Configure > Related Lists**, and then add the **Delegate->User** related list.

The Delegates related list displays at the bottom of the user profile form.

**Delegate approvals and tasks to another user**

If a user is out of the office, that user can delegate responsibilities to other users for a period of time.

1. Navigate to **Self Service > My Profile**.
2. In the **Delegates** related list, click **New**.

---

**Delegates related list**

If the list is not visible, configure the form to add the **Delegate->User** related list.
3. Select the Delegate (User).
4. Set the period of time.
5. Specify the responsibilities the delegate will assume using the following check boxes. You can delegate:

- **Approvals**: The delegate can approve items on your behalf.
- **Assignments**: The delegate can view and work on tasks assigned to you.
- **CC notifications**: The delegate receives a copy of email notifications sent to you, except those marked as Meeting Invitation.

**Note:** If the **Approvals** check box is selected but **CC notifications** is not, the delegate does not receive approvals.

- **Meeting invitations**: The delegate receives a copy of email notifications sent of the type Meeting Invitation.

**Note:** You must select an active user as your delegate. The instance only delegates to active users.

A sample delegation looks like this:

![Delegation options](image)

**Delegation options**

**Note:** If your delegate gets email notifications, they will be the same email notifications sent to you. The delegate may be confused to
Service administration

Configure settings for services that support business applications or the platform.

Assessments

Use assessments to evaluate, score, and rank records from any table in the system.

You can assess projects that executives want to evaluate for effective management, or rate and compare a vendor's goods and services. Use assessments to send custom questionnaires to selected users or write scripts that query the database directly. You can then compare assessment results for the records using unique graphical views designed to highlight key performance information. Share an assessment between ServiceNow instances by using update sets, which is the recommended way to move assessment data from one instance to another.

The Assessments plugin is enabled by default.

You can only edit an assessment that has the same application scope as that of your current session.

Installed with Assessments

Several types of components are installed with activation of Assessments.

- Demo data is available for assessments and surveys.
- Vendor Performance offers an additional set of vendor assessment demo data.

</tr>
<tr>
<td>Auto stakeholder creation</td>
<td>Assessment Category User</td>
<td>Assigns new category users as stakeholders automatically for assessable records if the associated category has the Create stakeholders check box selected.</td>
</tr>
<tr>
<td>Auto stakeholder creation</td>
<td>Category Assessable Records</td>
<td>Creates stakeholders from all of a category’s category users automatically for new assessable records if:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· The Create stakeholders check box is selected for the metric category.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>· The same metric category is associated to the new assessable record.</td>
</tr>
<tr>
<td>Auto stakeholder creation</td>
<td>Metric Category</td>
<td>Assigns all of a category’s category users as stakeholders for each assessable record associated to the category when the Create stakeholders check box is selected for the category.</td>
</tr>
<tr>
<td>Calculate category max weight</td>
<td>Assessment Metric</td>
<td>Calculates the sum of all metric weights in a category.</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>--------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cancel notification workflow</td>
<td>Assessment Instance (asmt_assessment_instance)</td>
<td>Cancels the workflow that generates assessment email notifications when an assessment instance is deleted or changes state to Complete or Canceled.</td>
</tr>
<tr>
<td>Category domain matches type</td>
<td>Metric Category (asmt_metric_category)</td>
<td>Ensures that all new categories are in the same domain as the metric type. This is a special requirement of assessment domain separation, that all records must be in the same domain.</td>
</tr>
<tr>
<td>Check Live Feed Groups</td>
<td>Assessable Record (asmt_assessable_record)</td>
<td>Selects the Live feed check box if a live feed group is associated with the source record. If the Live feed check box is selected and no live feed group is associated with the source record, this business rule clears the check box.</td>
</tr>
<tr>
<td>Check only one default</td>
<td>Bubble Chart (asmt_bubble_chart)</td>
<td>Ensures there is only one default bubble chart for a metric type.</td>
</tr>
<tr>
<td>Check only one default</td>
<td>Decision Matrix (asmt_decision_matrix)</td>
<td>Ensures there is only one default decision matrix for a metric type.</td>
</tr>
<tr>
<td>Create actual results</td>
<td>Assessment Instance (asmt_assessment_instance)</td>
<td>Generates assessment and category results from the user responses if a user completes an assessment.</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>--------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create Business Rule on Remote table</td>
<td>Assessment Metric Type (asmt_metric_type)</td>
<td>Generates the following business rules if an assessment administrator creates or updates a metric type:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Business rule called Auto business rule for Assessments, which monitors the Table selected for the metric type. When someone adds a record that meets the metric type conditions, this business rule generates an assessable record. If someone changes the metric type's Table or conditions, the Create Business Rule on Remote table business rule updates the automatic business rule script to reflect the changes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Business rule called Auto deletion rule for Assessments, which prevents users from deleting a record on the metric type's Table if the record is associated to metric or category results. If the record has no associated results and a user deletes it, this business rule deletes any associated assessable records.</td>
</tr>
</tbody>
</table>

The Create Business Rule on Remote table business rule generates automatic business rules only for metric types with Evaluation method set to Assessment.
<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
</table>
| Create Scheduled Job               | Assessment Metric Type        | Assessments: Generates a scheduled job for the creation of assessment components if either of these conditions is met:  
- Someone creates a new metric type with the schedule type set to Scheduled.  
- The schedule type changes from On demand to Scheduled.  
Surveys: Generates a scheduled job for the creation of survey components if the schedule period for a survey definition is set to Daily, Weekly, Monthly, or Yearly. |
<p>| Create Survey Records              | Assessment Metric Type        | Generates various records and populates certain fields on those records when someone creates a new survey definition, which is a metric type with Evaluation method set to Survey. More specifically, this business rule generates a survey category and assessable record, both associated to the survey definition. |
| Create UI Action on Remote table   | Assessment Metric Type        | Reserved for future use.                                                                                                                                                                                   |
| decision_matrix_axis               | Global                        | Limits available categories for X- and Y-axes to those that belong to the type if there is a metric type specified on the Decision Matrix form.                                                                |
| Delete Live Feed Group             | Assessable Record             | Deletes the assessable record's live feed group, if there is one, when an assessment administrator deletes an assessable record.                                                                           |
| delete related users               | Category Assessable Records   | Deletes any stakeholders for the assessable record and category when an assessment administrator disassociates a category from an assessable record.                                                        |</p>

**Assessment administrator tasks**

Before you create assessments, assign the assessment_admin role to the appropriate users in your organization and determine your objectives for the assessment.

Decide which sets of records in the system to assess, which themes you are interested in, and which traits to measure. Consider your organization's options for obtaining the data to compare. If you intend to use assessment questionnaires, consider which people can answer the questions.

**Assessment terminology**

Assessment admins use several terms when working with assessments.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric type</td>
<td>A metric type defines a set of records to evaluate, such as vendors, projects, or employees.</td>
</tr>
<tr>
<td>Assessable record</td>
<td>An assessable record links a record to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees. You define sets of assessable records when you create metric types.</td>
</tr>
<tr>
<td>Metric category</td>
<td>A metric category represents a theme for evaluating assessable records. Categories contain one or more individual metrics, which define specific traits or values that comprise the theme. Examples of categories include overall vendor performance or quality of delivery services. You can also set filter conditions that control which assessable records to evaluate for the metrics in a category.</td>
</tr>
<tr>
<td>Term</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Metric</td>
<td>A metric is a trait or value used to evaluate assessable records. A metric can measure subjective values in an assessment questionnaire, or gather objective values in a database query run by a script. Examples of metrics include perceived courtesy of sales representatives or number of incidents per vendor.</td>
</tr>
<tr>
<td>Category user</td>
<td>A category user is a person who knows about a specific category. One person can be a category user for multiple categories. Examples of category users include a vendor manager who oversees all purchasing operations or a supervisor of a sales team.</td>
</tr>
<tr>
<td>Stakeholder</td>
<td>A stakeholder is a category user who knows about a specific assessable record. Examples of stakeholders include a vendor manager who coordinates purchases from Amazon or a supervisor of a sales team who manages a specific employee.</td>
</tr>
</tbody>
</table>
| Assessment instance  | An assessment instance represents one assessment questionnaire assigned to one user. The system generates a new assessment instance for each assigned user when:  
  - The assessment generation scheduled job runs.  
  - An assessment administrator creates an on-demand assessment. |
| Scorecard            | A scorecard provides a visual illustration of an assessable record's performance, based on assessment results. Use scorecards to view a variety of data summaries for one assessable record and to compare the ratings with other assessable records. |
| Decision matrix      | A decision matrix is a graph with two axes that plots the assessment results for multiple assessable records. Use decision matrixes to determine the relative standing of assessable records in selected categories. |
| Bubble chart         | A bubble chart is a graph with three axes that plots the assessment results for multiple assessable records. Use bubble charts to determine the relative standing of assessable records in selected categories, with an emphasis on one category. |
Assessment roles

The Assessments application requires certain roles to perform assessment tasks. No role is required to take assessment questionnaires that are assigned to you.

<table>
<thead>
<tr>
<th>Role Title</th>
<th>Role Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment administrator</td>
<td>assessment_admin</td>
<td>Assessment administrators set up assessments. They know which records to evaluate, the criteria on which to evaluate the records, and who to assign assessments to.</td>
</tr>
<tr>
<td>ITIL user</td>
<td>itil</td>
<td>ITIL users perform basic technician operations in the system. In the Assessments application, they have read access to the Assessable Record table.</td>
</tr>
<tr>
<td>Administrator</td>
<td>admin</td>
<td>Administrators have access to all aspects of the assessment process. Only administrators can set up assessment schedules.</td>
</tr>
</tbody>
</table>

Note: By default, users with the assessment_admin role have limited system rights and might not have access to all source records to assess. When planning assessments, grant additional roles to assessment administrators as needed. For example, to create and manage vendor assessments, the assessment administrator must also have the vendor_manager role, which grants access to the Company table and other relevant tables.

Assessment methods

The available methods are Assessment, for non-scripted metrics, and Script, for scripted metrics. Each method serves a different function and can be used with certain data types.
Use the **Method** field to specify how to use the metric.

**Assessment method**

Metrics with the Method set to Assessment are called non-scripted metrics. Use each non-scripted metric to define a question for assessment questionnaires. Non-scripted metrics are useful if you want to obtain subjective data like personal opinions.

You can use the Assessment method with these **Data type** values:
- Attachment
- Checkbox
- Choice
- Date
- Date/Time
- Likert Scale
- Number
- Percentage
- String
- Template
- Yes/No

**Script method**

Metrics with the Method set to Script are called scripted metrics. Use each scripted metric to define a custom script for database queries. Scripted metrics are useful if your system contains reliable data for the traits you want to evaluate.

You can use the Script method with these **Data type** values:
- Duration
- Number
- Percentage

Use the Script field to write JavaScript code. By default, the field contains information about available variables and an example, which you can use as the basis of your script or replace entirely:
Metric form script field

You must use the following variables in your script:

- **primary**: Input variable used to access the sys_id of the record being assessed.
- **actual_result**: Output variable that contains the actual value for this metric. The system uses this variable to populate the Actual value field on the Metric Result form. For each actual_result, you must specify a corresponding **scaled_result** value.
- **scaled_result**: Output variable that contains a numerical scaled value to represent an actual value. The system uses this variable to populate the Scaled value field on the Metric Result form. Ensure the scaled values you specify are between or equal to the **Min** and **Max** values for the metric. The **Scale definition** field determines how the system uses the scaled value. A scale definition of **Low** means smaller numbers are better, such as for a metric that measures the number of incidents for a vendor. **High** means larger numbers are better, such as for a metric that measures user satisfaction on a scale of one to five.

**Script example**

The metric Number of active devices uses the script pictured below. The **primary** variable is used to find CIs that are associated to the vendor record being assessed. The script retrieves the actual_result, the number of CIs associated to the vendor, then calculates the correct scaled_result. The script uses a series of scaled values, from the **Min** to the **Max** value, to represent actual values. Because the **Scale definition** is set to **High**, the greatest scaled values are best, meaning a vendor associated to the most CIs scores highest. The system stores the actual and scaled values in a metric result record for the vendor.
Scripted metric example

Data types for assessments
Metric data types have functions that depend on the method that you select.

Assessment data types

### Assessors

| User field | User field from the table specified in the **Conditions** tab. The assessment will be assigned to all users of this user field in the table. When you save the assessment and click **Generate Assessable Records**, an assessable record is created for each unique user of the user field. This is applicable for Scheduled and On-demand assessments. For an on-demand assessment, each assessor assesses all assessable records. For a scheduled assessment, each assessor assesses only the corresponding assessable record. |

### Assessment generation

In the Assessments application, administrators or assessment administrators can trigger the system to generate scheduled assessments or on-demand assessments when all the prerequisite steps are completed.

An assessment administrator must publish the metric type to enable assessment generation.

The system performs these tasks when it generates assessments:

- Creates assessment questionnaires from non-scripted metrics and assigns the questionnaires to users. When users complete their assigned questionnaires, the system uses their responses to calculate assessment results.
- Runs scripted metrics from each category to query the database and calculate assessment results.

Each time the system generates assessments, it creates some or all of the following components. Consider having an administrator set a schedule for recurring data cleanup, as the system can potentially generate a considerable amount of assessment data.

- Assessment group
- Assessment instances
- Assessment results
Assessment groups

An assessment group is a container for assessment instances and assessment results generated in a single occurrence.

The system generates an assessment group every time the scheduled job runs or the API is called, when there is at least one assessable record associated to a category in the type. You can find assessment group records in Assessments > Assessment Groups.

The Assessment Group form displays the group Number, the associated Metric type, and these related lists:

- **Assessment Instances**: Lists all assessment instances within this group. There may be no records in this related list. The system does not generate assessment instances if there are only scripted metrics for the type.
- **Metric Results**: Lists all metric results for this group. There may be no records in this related list initially. The system generates metric results immediately for scripted metrics, but not for non-scripted metrics, which appear as questions on assessments and require user response. The system dynamically updates the records in this list as users complete assessment questionnaires.
- **Assessment Category Results**: Lists all category results for this group. There may be no records in this related list initially. The system generates category results immediately if there are only scripted metrics in a category. Otherwise, the system does not calculate category results until a user completes an assessment questionnaire that contains questions from the category.

**Note**: To prevent the loss of important assessment data, you cannot delete an assessment group if it contains any assessment instances, metric results, or category results.

View an assessment metric category

View assessment metric categories that are used with assessment metric types and assessment metrics in generating the bubble charts on the Demand Workbench. The bubble charts help the demand managers to visually assess the demands.

Role required: it_pps_admin

The Demand Management application comes with an assessment metric type named Demand, five default assessment metric categories, and assessment metrics.

1. Navigate to Project Administration > Settings > Assessments Metric Categories.
2. Open an assessment metric category to review it.

The following default assessment metric categories are available with the Demand Management.

<table>
<thead>
<tr>
<th>Demand assessment metric categories</th>

</tbody>
</table>
Assessment metric categories
In the Assessments application, a metric category represents a theme for evaluating assessable records in a given metric type.

Each category has a numeric weight value to indicate its importance relative to other categories. Within a category, records called metrics are the traits or values used to evaluate assessable records. For example, there are many categories within the Vendor metric type, including Support Rating, which contains metrics that measure the quality of vendors’ customer support services. Assessable records must be associated to categories to be eligible for evaluation. Assessment administrators create categories and manage which assessable records each category is associated to.

Weight categories and metrics

When you create a metric category or metric, you must specify a weight, a numeric value that indicates the importance of the category or metric relative to other categories and metrics.

The greater the weight value, the more important the item is. The system uses weight values in assessment result calculations. Consider these recommendations when choosing weight values.

- Determine a weighting scale and use it consistently. In general, use a scale with a small numeric range. A standard 1-10 scale is usually appropriate, where 1 is least and 10 most important. Understand that increasing the maximum value of a weighting scale impacts all related result calculations.
- Use the same weighting scale for metric categories and metrics. Though there is no limitation, consider using the same or very similar weighting scales for both categories and metrics to make it easier to remember which values to use. A scale of 1-10 is an effective and simple weighting system, but may not be suitable for all organizations.

Note: If you do not want to use weighting, set the same weight value for all categories and metrics. The default weight value is 10.

Create a category for assessable records
After you create a metric type and generate assessable records, create categories for the themes you are interested in using to evaluate the assessable records.

Role required: none

1. Navigate to Assessments > Metric Definition > Categories.
2. Click New to create a new metric category and then complete the Metric Category form:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>(Required) Metric type this category is used for. Metrics in this category can be used to evaluate assessable records for the type you select. This field becomes read-only after you save the record.</td>
</tr>
<tr>
<td>Create stakeholders</td>
<td>Check box that enables (selected) or disables (cleared) automatic stakeholder creation for this category. When the check box is selected, the system makes all associated category users stakeholders for each assessable record associated to this category. This saves the time required to manually create stakeholders. For more information, see Create Stakeholders Automatically. Existing stakeholders are not impacted if you clear the check box.</td>
</tr>
<tr>
<td>Table</td>
<td>(Read-Only) Table that contains the records to evaluate with metrics in this category. The system automatically populates this field with the same table as the metric type selected. The table does not appear in the field until you save the form. This field is visible depending on whether a Type is selected.</td>
</tr>
<tr>
<td>Weight</td>
<td>(Required) Numerical value that represents the importance of this category relative to other categories. A greater value indicates greater importance. For more information, see weight categories and metrics. The default value is 10.</td>
</tr>
</tbody>
</table>
| Scoring type          | Scoring method for an attestation category. This field appears only when the metric type is an attestation with a Scoring type of Percent. Use this field to configure different scoring types for specific attestation categories. Possible selections are:  
  * Percent: Attestation score as a weighted percentage of correct answers for scored questions.  
  * All or nothing: All answers for attestation type questions must be correct or the score is zero for the entire category. |
<p>| Total metrics         | (Read-Only) Number of metrics associated to this category. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter</td>
<td>Filter conditions that assessable records must meet to be evaluated using metrics in this category. The filter operates on fields on the selected table. If you specify a filter condition, the system automatically associates matching assessable records to the category when you save the record. If you change the filter conditions, the system removes and creates assessable record associations as needed. The system also deletes stakeholders for assessable records it disassociates. The system does not remove assessable record associations created by users, even if the assessable records do not match the filter conditions. This field is visible only when a Type is selected.</td>
</tr>
<tr>
<td>Description</td>
<td>Descriptive information about the category that appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Roles</td>
<td>Only those users with the specified roles can perform the assessment for this category. If no role is specified, then users with any role can perform the assessment for this category. Note: If the Roles property does not appear on the form, ask your admin to add the property.</td>
</tr>
<tr>
<td>Details</td>
<td>Text field containing an HTML editor. Use this field to present important details about this category to assessment recipients. Details can include formatted lists, images, videos, or links to external websites. You may need to configure the form to see this field.</td>
</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>Assessment Metrics</td>
<td>All metrics associated to this category. There must be at least one metric associated to the category to use any assessments with the category.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assessable records</td>
<td>All assessable records associated to this category. There must be at least one assessable record associated to the category to use any assessments with the category. This related list is hidden if the Evaluation method is Attestation. Note: Category users are automatically generated based on the user field is specified in the Assessors tab of the assessment after publishing the assessment.</td>
</tr>
<tr>
<td>Users</td>
<td>All users associated to this category. There must be at least one category user to create scheduled assessments using metrics in this category. If any user field is specified in the Assessors tab of the assessment, the corresponding users are automatically generated after publishing the assignment. This related list is available only when the associated metric type has schedule type set to Scheduled. Category users are not a part of the on-demand assessment process.</td>
</tr>
</tbody>
</table>

Assessable record associations
Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

Only the assessable records associated to a category can be evaluated using metrics in that category. Manage which assessable records you evaluate for each category by creating and removing the associations.

Note: You can also manage which categories an assessable record is associated to using the Assessable Record form.

Manage an assessable record automatically
You must define at least one filter condition in the Metric Category form to automatically associate assessable records with the category.

Role required: assessment_admin or admin

1. Navigate to Assessments > Metric Definition > Categories.
2. Open a category.
3. In the Filter field, create a condition statement that defines the records you want to associate to this category. The available fields are from the table defined for the metric type.
   For example, for a category in the Vendor type, you might create the condition (Country) (is) (Germany). Metrics in the category will be used only to evaluate vendors that meet this condition.
4. Save the record.
   The system associates this category to all assessable records that match the filter condition. As the system generates new assessable records that match the condition, it associates them to
the filter condition, the system removes and creates assessable record associations, as appropriate. Note the following:

- The system does not remove assessable record associations created manually, even if the assessable records do not match the filter conditions.
- The system deletes any related stakeholders, if applicable, when it disassociates assessable records from a category.
- The system does not create or remove assessable record associations if the related source records change. For example, consider the previous example in which all assessable records for vendors based in Germany were associated to a particular category. Assume that a user changes the Country of one of the vendor records from Germany to Canada. The system does not disassociate the related assessable record from the category, even though it no longer matches the filter condition.

Note: To configure the system to automatically associate all assessable records from a metric type to a category, use the same category condition as the metric type condition. For example, if the Vendor metric type has the condition (Vendor) (is) (true), create the same condition for the category. If the metric type does not have a condition specified, you can use the category condition (Sys ID) (is not empty), which includes all records from any table.

Manage an assessable record manually

You can manually create and remove assessable record associations for a category using a related list on the Metric Category form.

Role required: assessment_admin or admin

Keep in mind that when you disassociate an assessable record from a category, the system deletes any related stakeholders, if applicable, and you can no longer evaluate the assessable record using metrics in that category.

1. Navigate to Assessments > Metric Definition > Categories.
2. Open a category.
3. In the Assessable records related list, click Edit and use the slushbucket to add or remove one or more assessable records.

Only assessable records associated to this category's metric type are available for selection.

Delete a category

When you delete a category, the system also deletes the associated category users and stakeholders.

Role required: assessment_admin or admin

1. Navigate to Assessments > Metric Definition > Categories.
2. Alternatively, navigate to a record that contains a related list for categories.
3. On the Metric Category form, click Delete.
4. Click OK when asked to confirm the action.

The system displays messages at the top of the form describing the actions taken.

Assessment metrics

In the Assessments application, a metric is a trait or value used to evaluate assessable records. Depending on the metric method, a metric can be used as either of the following:
ServiceNow Orlando Now Platform capabilities

- A question on assessment questionnaires, to obtain a subjective value such as how much people enjoy using each cell phone offered in the service catalog.
- A script that queries the database, to obtain an objective value such as the number of incidents related to each cell phone.

Each metric is associated to one **metric category** and can be used to evaluate assessable records for that category only. For example, the Support Rating category contains metrics that measure the quality of vendors’ customer support services. One metric addresses the quality of product documentation. Others address the strength of the user community, self-service options, online training, and other support services. Each metric has a numeric weight value to indicate its importance relative to other metrics in the same category.

Assessment administrators can create and administer metrics and **metric templates**, which define reusable sets of answer options for metrics used as assessment questions. If you decide to use metric templates, you may want to create them before you create metrics.

**Note:** Changes to assessment metrics and metric templates are reflected in assessment questionnaires and results, even if users have saved responses already. If possible, avoid changing the original meaning of a metric question, the data type, or any metric templates in use by existing assessments.

### Create a metric for a category

After you create a category, create metrics you can use to evaluate the assessable records for that category.

**Role required:** assessment_admin or admin

When you create metrics, consider the focus of the category and what characteristics you want to measure for the items you will assess.

1. **Navigate in one of the following ways:**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessments &gt; Metric Definition &gt; Categories</td>
<td>Open a category, and locate the Assessment Metrics related list. This is the suggested navigation path, as the system links metrics to the category from which they are created.</td>
</tr>
<tr>
<td>Assessments &gt; Metric Definition &gt; Metrics</td>
<td></td>
</tr>
</tbody>
</table>

2. **Click New.**

3. **Fill in the fields, as appropriate.**

   **Assessment Metric form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric.</td>
</tr>
<tr>
<td>Category</td>
<td>Metric category that the metric belongs to. The system automatically populates this category if you create a new metric from the Metric Category form. <strong>Note:</strong> You cannot change the category if the <strong>Depends on</strong> field is set or if another metric depends on this metric</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Method</td>
<td>Determines how to use the metric.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Assessment</strong>: Non-scripted metric. Make the metric available as a question on an assessment questionnaire. The <strong>Assessment</strong> method is compatible with all data types except <strong>Duration</strong>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Script</strong>: Scripted metric. Obtain values by writing a custom script. The <strong>Script</strong> method is compatible with the <strong>Duration</strong>, <strong>Number</strong>, and <strong>Percentage</strong> data types.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default answer from field</strong>: This option appears only if you have selected an <strong>Assessment Metric Type</strong> that contains a table. The <strong>General</strong> tab adds two fields:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default answer</strong>: Select the default answer for the question. The list comes from the selected table.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Ask question</strong>: Specifies when to ask the question: always or only if the default answer is empty.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Default answer from script</strong>: The <strong>General</strong> tab adds a field:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Ask question</strong>: Specifies when to ask the question: always or only if the script does not contain a default answer. The script is defined on the <strong>Field Type</strong> tab.</td>
</tr>
</tbody>
</table>

**Note**: If you select a **Data type** that is incompatible with the selected **Method**, the system automatically changes the **Method** to the correct value.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight</td>
<td>Numeric value that represents the importance of this metric relative to other metrics in the same category. By default, the weight is 10. For weighting suggestions, see <strong>Weight Metrics and Metric Categories</strong>.</td>
</tr>
<tr>
<td></td>
<td>This field is visible and required unless the <strong>Data type</strong> is <strong>Date</strong>, <strong>Date/Time</strong>, or <strong>String</strong>. These data types are not included in results calculations.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Order</td>
<td>Numeric value that determines the order of the metric question on assessment questionnaires, relative to other metric questions in the same category. The metric with the smallest order value appears as the first question in the category section. By default, the order is 100. For more information about questionnaire layout, see <a href="#">Complete Assessment Questionnaires</a>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> It does not matter which order value you use for metrics with the Script method, as they do not appear on questionnaires.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this metric is used to gather assessment results. If a non-scripted metric (Assessment method) is inactive, the question does not appear on assessment questionnaires generated after the metric becomes inactive. If a scripted metric (Script method) is inactive, the script does not run.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the metric question mandatory (selected) or optional (cleared) on assessment questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which display a red field status indicator.</td>
</tr>
<tr>
<td></td>
<td>This field is visible only if the Method is Assessment, the Depends on field is empty, and the data type is not Checkbox.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a <strong>Not Applicable</strong> answer option for this metric question on assessment questionnaires. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question or if a question does not apply to a particular assessable record. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is visible only if the <strong>Method</strong> is <strong>Assessment</strong> and certain data types are selected.</td>
</tr>
</tbody>
</table>

Additional fields you can add by customizing the form

<table>
<thead>
<tr>
<th>Details</th>
<th>Text field containing an HTML editor. Use this field to present important details about this metric to assessment recipients. Details can include formatted lists, images, videos, or links to external websites.</th>
</tr>
</thead>
</table>

General Section
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Question</td>
<td>Text to use as the question on assessment questionnaires. Enter a clear, straightforward question that is easy to answer, such as <strong>How likely are you to recommend this vendor for the purchase of office supplies?</strong></td>
</tr>
<tr>
<td>Description</td>
<td>Information about the metric and what it evaluates. If the <strong>Method</strong> is <strong>Assessment</strong>, include details that help users understand how to answer the question. This text appears as a hint when a user points to the question text on the questionnaire.</td>
</tr>
<tr>
<td>Depends on</td>
<td>Setting used to make this metric a conditional question. Select an existing metric question from the list, which displays <strong>Checkbox</strong>, <strong>Choice</strong>, <strong>Likert Scale</strong>, <strong>Template</strong>, and <strong>Yes/No</strong> metrics of the same category as this metric. Then, use the <strong>Displayed when</strong> field to set the conditions that display this metric question on questionnaires. The system prevents the creation of recursive dependencies between metrics. For example, if Metric A depends on Metric B, Metric B cannot depend on Metric A. This field is visible only if the Method is <strong>Assessment</strong>.</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected <strong>Depends on</strong> metric question that, when chosen on questionnaires, display this metric question. This field is visible and required only if the <strong>Depends on</strong> field is set.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Data type</td>
<td>(Required) Format of the expected response data. The function of the data type depends on the selected <code>Method</code>. If the method is <code>Assessment</code>, the data type determines how users answer the corresponding question on questionnaires. If the method is <code>Script</code>, the data type determines how the system calculates assessment results.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If another metric depends on this metric, you cannot change the data type.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this metric question in a random order. The order of answer options can influence users, which creates biased results. Randomizing answer options can help prevent this bias.</td>
</tr>
<tr>
<td></td>
<td>This field is visible only if a data type that requires metric definitions is selected.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Randomizing answer options for certain questions can make those questions confusing for the person answering. In general, only randomize answer options that do not follow a logical order. For example, the following question is confusing when randomization is enabled:</td>
</tr>
<tr>
<td></td>
<td><img src="template.png" alt="This vendor is one of my top choices when I need to purchase office supplies." /> Strongly agree Disagree Agree Neither agree nor disagree Strongly disagree</td>
</tr>
<tr>
<td>Template</td>
<td>Metric template to use for the metric question. A metric template is a set of predefined answer options. This field is visible and required only if the <code>Data type</code> is <code>Template</code>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If another metric depends on this metric, you cannot change the template.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Dependent plugin</td>
<td>Plugin that contains the tables queried in the script. The system executes the metric script only if the plugin is active. The default available values are Asset Management, CMDB, Core, Cost Management, Procurement, and Software Asset Management. If the Method is Script, select a plugin. This field is visible only if the Method is Script.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in assessment result calculations. Select Low if lesser numerical values are better, such as for a metric that measures the number of incidents for a vendor. Select High if greater numerical values are better, such as for a metric that measures user satisfaction on a scale of one to five. The default value is High. This field is visible and required unless the Data type is Date, Date/Time, or String. The results for these data types are not included in results calculations.</td>
</tr>
<tr>
<td>Note: An administrator may need to add more choices of plugins to the field.</td>
<td></td>
</tr>
<tr>
<td>Min</td>
<td>Lowest numerical value to be used as an answer option on assessments or as a scaled value in a scripted metric. This field is visible and required only if certain data types are selected. If the data type is Choice or Likert Scale, this field is read-only and is set automatically based on the smallest metric definition Value.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest numerical value to be used as an answer option or scaled value. This field is visible and required only if certain data types are selected. If the data type is Choice or Likert Scale, this field is read-only and is set automatically based on the largest metric definition Value.</td>
</tr>
<tr>
<td>Script</td>
<td>Script that obtains the desired system information. This field is visible and required only if the Method is Script.</td>
</tr>
</tbody>
</table>
4. Save the record.
When you create a **Choice** or **Likert Scale** question, reopen the Assessment Metric form after you submit it to create a metric definition. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.

### Create a metric definition

Metrics with Choice or Likert Scale data types must have metric definitions defined to represent answer options on questionnaires.

**Role required:** assessment_admin or admin

Each metric definition appears as one answer option for a question on an assessment questionnaire. For example, a metric for the question "How satisfied are you with the quality of this vendor?" has three metric definitions to create these answer options: **Very satisfied**, **Somewhat satisfied**, and **Not at all satisfied**.

1. Open the metric record you want to edit.
2. In the **Assessment Metric Definitions** related list, click **New** to create a new metric definition.
3. Fill in the fields:
   - **Display**: Enter the text you want to appear as the answer option.
   - **Value**: Enter the numeric value, greater than or equal to zero, to which the answer option equates. Values are used to calculate metric results. When you view assessment questions, metric definitions appear in order from least to greatest value.
     - The system sets the minimum and maximum values according to the metric definition values.
     - To prevent reporting confusion, no two metric definitions for a given metric should have the same Value.
4. Click **Submit**.

### Change the order of an answer

By default, the order of answer options is established when a question is created with a data type of **Choice** or **Likert Scale**.

**Role required:** assessment_admin or admin

The system creates an Order value for each choice based on where it appears in the original list when you submit it. This order corresponds to the **Value** setting you give the answer. The choice with the lowest order number appears first, and the choice with the highest order number appears last. If you want to reconfigure the order of the answer options, you must do so by editing the **Order** field and not the **Value** field.
The **Order** column is hidden in the base system.

To edit these records, configure the **Assessment Metric Definitions** related list in the question record to show the **Order** column, and then edit the order number in the list. The **Value** setting remain the same for each answer option after reorganization.

---

**Metric types and assessable records**

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see **Assessment administrator tasks**.

---

**Assessable records**

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the **On demand** schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This set up provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See **Define a new smartphone table title** for more information.

**Create metric types and generate assessable records**

Each metric type sets a table and filter conditions that define a set of records to evaluate.
Role required: assessment_admin or admin

For example, the Vendor Performance application provides the Vendor metric type, which defines an assessable record for each source record in the Company (core_company) table that has the Vendor field selected. Create a metric type for each set of records you want to evaluate, such as vendors, users within an organization, or projects.

In addition to defining assessable records, metric types also determine how to filter decision matrix data and set the schedule type, which determines whether assessments are on-demand or scheduled.

1. Navigate to Assessments > Metric Definition > Types.
2. Click New.
3. Fill in the fields, as appropriate (see table).
4. When you are satisfied with the type settings, click Generate Assessable Records to save the record and create assessable records. The page redirects to the list of assessable records created.

You must click Generate Assessable Records to create the initial set of assessable records based on the table and conditions specified on the type record. After that, the system creates an assessable record each time a new matching record is created. Generate Assessable Records is located under Related Links.

Note: Clicking Generate Assessable Records can trigger the deletion of existing assessable records under certain circumstances. For more information, see Enforce a condition to delete an assessable record.

### Metric types

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Name of the type. It may be practical to give the type a name that indicates which records it defines.</td>
</tr>
<tr>
<td>Assessment duration</td>
<td>Amount of time assessors have to complete their assigned questionnaires, starting from the time the assessment is generated. The assessment duration sets the Due date that appears on assessment instances. Changes made to the duration of an attestation in the GRC Control Test Definition form are updated dynamically in this field. The default duration is 14 days.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that determines whether to enable (selected) or disable (cleared) the Live Feed view in scorecards for all assessable records created from this type.</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
<td>Check box that determines whether to send (selected) email notifications a user's manager when that user fails to submit an assigned questionnaire on time.</td>
</tr>
<tr>
<td>Assessment manager</td>
<td>Manager for this assessment metric type. These users are responsible only for managing the assessment process and not the results. The system notifies the assessment manager when an assessment for this metric type is past due.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Scoring type                              | Scoring method to use for questions with a data type of attestation. The possible selections are:  
  - **Percent**: Attestation score as a weighted percentage of correct answers for scored questions. When you select this scoring type, categories can be scored as **Percent** or **All or nothing**.  
  - **All or nothing**: Requires all answers for attestation type questions to be correct, or the score is zero for the entire attestation. When you select this scoring type, all categories are scored automatically as **All or nothing**.                                                                                                                                                                                                                                                                                                                                                           |                                                                     |
| Scale factor                              | (Required) Number to represent the best possible score for assessment results. All results for assessments of this type are scaled to this number. 10 is generally a good scale factor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Note: This field becomes read-only when it contains a value and you save the metric type. Choose a scale factor you are satisfied with before you save the metric type. |
| Pagination setting for Service Portal view | Specify how the user will see pages on the desktop or tablet view in Service Portal.  
  - **Category**: Display each category on a separate page. The categories appear in the following order:  
    - Each category appears in sequence on a separate page for the first assessable record  
    - Then each category appears in sequence on a separate page for the next assessable record  
    - and so on  
  - **Question**: Display each question on a separate page. Questions appear on separate pages for mobile devices regardless of this setting. Each question appears for each category as described for the Category setting.  
  - **None**: All items on a single page—no pagination  
  Default: **Category**                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Note: This field appears only when Service Portal is installed.      |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roles</td>
<td>Additional user roles that can view the results and access records associated with this type. Users with the specified roles have read access to this type record as well as to associated categories, metrics, assessable records and scorecards, category users, stakeholders, and decision matrixes.</td>
</tr>
<tr>
<td>Note:</td>
<td>Users with these roles do not have access to Assessments modules unless they are also assessment administrators. Users with these roles can navigate to the records by other means, such as from reference fields on assessment instances. This field provides the option to easily grant certain users access to specific assessment data in special cases. For example, the Vendor metric type provides access to users with the vendor_manager role so they can view results and compare assessable records when they open scorecards or decision matrixes in the Vendor Performance application.</td>
</tr>
<tr>
<td>Signature</td>
<td>(Optional) Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to an assessment. For more information, see Create an assessment signature.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit an assessment for this metric type. When a return URL is configured, the end note content does not appear.</td>
</tr>
<tr>
<td>State</td>
<td>(Read-Only) Status of the assessment: Draft or Published.</td>
</tr>
<tr>
<td>Business rule</td>
<td>(Admin only) Business rule the system creates to monitor the specified table. When a new record is added to the table that meets the metric type conditions, the business rule generates a corresponding assessable record. If someone changes the table or conditions of the metric type, the system updates the business rule to reflect the changes. Existing assessable records associated with the metric type are not affected.</td>
</tr>
<tr>
<td>Schedule type</td>
<td>Setting that determines which assessment process to use. Select On demand or Scheduled.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Scheduled job</td>
<td>(Admin only) Scheduled job the system creates to generate assessments for this metric type. This field is populated the first time you save the record. The scheduled job name follows the format &lt;type name&gt; Assessment Creation. Administrators can configure a recurring assessment generation schedule for the metric type. This field is visible only when the schedule type is Scheduled. Note: If you change the schedule type from Scheduled to On demand, the system deletes the scheduled job. If you change the schedule type back to Scheduled, the system creates a new scheduled job. The previous assessment generation schedule is not saved, but can be reconfigured if desired.</td>
</tr>
<tr>
<td>Evaluation method</td>
<td>(Admin only) Indicates the evaluation method for this metric type. The system sets this field based on how the metric type is created. The possible evaluation methods are: • <strong>Assessment</strong>: Default filter value for metric types. Only this evaluation method uses assessable records, conditions, and stakeholders. • <strong>Attestation</strong>: For details, see . • <strong>Survey</strong>: For details, see Survey definitions.</td>
</tr>
<tr>
<td>Scale factor</td>
<td>(Required) Number to represent the best possible score for assessment results. All results for assessments of this type are scaled to this number. 10 is generally a good scale factor. Note: This field becomes read-only when it contains a value and you save the metric type. Choose a scale factor that you are satisfied with before you save the metric type.</td>
</tr>
<tr>
<td>Allow retake</td>
<td>Check box that allows users to modify their answers to a completed assessment, quiz, survey, or attestation. After the due date, the system removes the assessment from the user's My Assessments and Surveys page.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether the metric type is active. When the metric type is inactive (cleared), assessment generation is disabled and users cannot take existing assessments.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about this type. Enter a clear description of the type and its purpose.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on assessment questionnaires. Consider adding a company logo, a welcome message, background information about the survey, or instructions. You may need to configure the form to see this field.</td>
</tr>
<tr>
<td>End note</td>
<td>Content to display on the screen that appears when someone submits an assessment questionnaire. Consider adding a thank you message, followup instructions, or other applicable information. You may need to configure the form to see this field. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Send notifications</td>
<td>Select the check box to send notifications for this assessment, survey, or attestation. You may need to configure the form to see this field.</td>
</tr>
<tr>
<td>Condition section</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>(Required) Table that contains the records you want to evaluate. The system creates assessable records for records on this table that meet the conditions you specify, if any. The number of matching records appears as a link by the Condition field. The link dynamically updates if you change the table selection. Click the link to open the list of matching records in a new tab or window. Note: Additional roles are required to view the records on certain tables. If you select a table that you do not have access to, a warning message appears by the Condition field where the number of matching records would be. You cannot generate assessable records for tables you do not have sufficient roles for.</td>
</tr>
<tr>
<td>Enforce condition</td>
<td>Check box that determines what happens to assessable records when you change the selected table or conditions.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder that defines specific records to assess from the selected table. If you do not specify any conditions, the system creates assessable records for all records on the selected table. Click the refresh icon to update the adjacent record count.</td>
</tr>
</tbody>
</table>

**Note:** If you change the table or conditions, you must click Generate Assessable Records to create new assessable records.

**Decision Matrix section**

<table>
<thead>
<tr>
<th>Filter field</th>
<th>(Required) Field on the selected table that can be used to filter results on decision matrices and scorecards. For example, if the selected table is Company [core_company] and you choose Vendor type as the filter field:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• When you view decision matrices for this type, the decision matrix menu to filter plotted items lists vendor types: Applications, Hardware, Services, and Software.</td>
</tr>
<tr>
<td></td>
<td>• On scorecards for this type, the Averages view displays ratings by vendor type.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Condition builder that defines which records from the table are available as choices on the filter menu. For example, if the filter field is Vendor type and you create the filter condition (Name) (does not contain) (Hardware), only records with vendor types of Applications, Services, and Software are possible choices as decision matrix filters.</td>
</tr>
<tr>
<td>Default matrix filter</td>
<td>Record to use as the default filter choice on decision matrices and scorecards. The selected Filter field and Filter condition control the available record choices. To see the records, if any, click the refresh icon next to the field. Consider the case that the filter field is Vendor type and you select Applications as the default matrix filter. The filter choice on decision matrices for this type is set to Applications by default. If you change the value of the Table or Filter condition field, you must click the refresh icon to view the updated Default matrix filter choices. If you do not, the system selects the first available choice from the updated field choices when you save the record.</td>
</tr>
</tbody>
</table>

**Related Lists**

<table>
<thead>
<tr>
<th>Metric Categories</th>
<th>All metric categories associated with the type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessable Records</td>
<td>All assessable records associated with the type. This related list is hidden in the Attestation view of this form.</td>
</tr>
</tbody>
</table>

**Note:** The Generate Assessments button is visible to administrators in certain cases for scheduled assessments. Do not click the button until after completing the prerequisite tasks.

**Delete a metric type**

Deleting a metric type entails deleting many related records.

**Role required:** assessment_admin or admin

You must delete some of these records manually before deleting the type, while the system deletes others automatically with the type.

1. Delete the records associated with the type to delete:
   - Assessment results (metric and category results)
   - Assessment instance (questions and assessment instances, in that order)
   - Assessment groups

2. Delete the type.

   A confirmation dialog box appears and alerts you that certain records associated with the type will also be deleted.

3. Click OK to delete the type and these related records:
Export an assessment
You can share assessments between ServiceNow instances by exporting an assessment and then importing the assessment on another instance.

Role required: assessment_admin or admin

**Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

**Note:** The system exports a single XML file that does not contain result data.

The XML file contains a metric type `[asmt_metric_type]` and the following records that are associated with the type:

- Assessable records `[asmt_assessable_record]`
- Metric categories `[asmt_metric_category]`
- Metrics `[asmt_metric]`
- Metric definitions `[asmt_metric_definition]`
- Category users `[asmt_m2m_category_user]`
- Stakeholders `[asmt_m2m_stakeholder]`
- Decision matrixes `[asmt_decision_matrix]`, `[asmt_m2m_xcategory_matrix]`, and `[asmt_m2m_ycategory_matrix]`

1. Navigate to Assessments > Metric Definition > Types.
2. Right-click the record and select Export Assessment.
3. Save the XML file.

Import an assessment
Share assessments between ServiceNow instances by importing a previously exported assessment.

Role required: admin

**Note:** Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

1. Ensure that the target instance has assessments enabled.
2. Follow the procedure detailed in Import a Record as XML Data.

Use update sets for surveys and assessments
Use an update set to capture changes to surveys and assessments.

Role required: admin or survey_admin
When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates (asmt_template)
- Assessment Template Definitions (asmt_template_definition)
- Assessment Metric Definitions (asmt_metric_definition): survey question answer options
- Schedule (sys_trigger): scheduled jobs associated with the survey
- Assessment Metric Categories (asmt_metric_category): survey categories
- Assessment Metrics (asmt_metric): survey questions
- Assessment Category Users (asmt_m2m_category_user): survey users
- Trigger Conditions (asmt_condition)

Create an assessment signature

A signature on an assessment questionnaire contains assertions that can communicate directions, a legal statement, or any text that you want the recipient to consider.

Role required: assessment_admin or admin

You can require the recipient to select a check box or provide a full signature to acknowledge acceptance of the assertion before submitting the form. You can display assertions without requiring a signature. An assessment property called Require authentication for user signature allows you to require users to provide their user name and password when an assessment asks for a full name signature.

1. Navigate to Assessments > Metric Definition > Signatures.
   All signatures in the system appear in this list.
2. Click New.
3. Complete and submit the form using the fields in the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for this signature</td>
</tr>
<tr>
<td>Signature type</td>
<td>Type of signature required. The selections are Checkbox, Full name, or Assertion only. If Assertion only is selected, no signature is required to submit the questionnaire. By default, the system requires user authentication for a full name entry.</td>
</tr>
<tr>
<td>Assertion</td>
<td>Text to present to recipients that requires acknowledgement.</td>
</tr>
</tbody>
</table>

Assessable records

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the On demand schedule type, you can generate on-
**Demand assessments** from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See *Define a new smartphone table title* for more information.

**View an assessable record**

View the Assessable Record form to edit preferences and perform various actions.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Assessable Records**.
2. Open a record from the list.
   By default, the list displays only assessable records with **Active** metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).

<table>

**Enforce a condition to delete an assessable record**

By default, the system does not delete assessable records, even if you change the table or conditions for the type and the existing assessable records no longer match.

Role required: assessment_admin or admin

The system can be configured so you can trigger the deletion of assessable records that do not match the type table and conditions.

1. On the Assessment Metric Type form, select the **Enforce condition** check box to enable deletion of existing assessable records of this type that do not match the table or conditions specified.

   When the check box is cleared, the system retains existing assessable records of this type, even if they do not match the table and conditions specified.

2. Click **Generate Assessable Records** to delete all assessable records associated with the type that do not match the current table and conditions.
The system does not automatically delete assessable records, even if the Enforce condition check box is selected. You must click Generate Assessable Records with the check box selected every time you want the system to delete non-matching assessable records.

Delete an assessable record
When you delete an assessable record, the system deletes any stakeholders for the record.
Role required: assessment_admin or admin

Note: If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:
- To delete a single record, open the record and click Delete.
- To delete multiple records, use the Assessable Records list.

Add a metric category and metric in the question bank for assessments
Reuse the question categories (metric categories) and questions (metrics) added in the question bank for assessments. You can add metric categories or metrics from the question bank to an assessment, or from the assessment to a question bank.
Role required: admin or assessment_admin

1. Navigate to Assessments > Question Bank.
2. Click New.
3. In the Metric Category form, fill the fields.

Metric Category fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the metric category.</td>
</tr>
<tr>
<td>Total metrics</td>
<td>Total number of metrics in the metric category. This number is automatically updated when you add or delete metrics from the category.</td>
</tr>
</tbody>
</table>

4. Right-click on the title bar and click Save.
5. In the Assessment Metrics related list, click New.
6. In the Assessment Metric form, fill the fields. For more information on assessment metric fields, refer to Create a metric for a category.
7. Click Submit.

Configure metric categories or metrics for an assessment using the question bank
Reuse question categories (metric categories) and questions (metrics) from the Question Bank module while creating or updating an assessment.
Role required: admin or assessment_admin

1. Navigate to Assessments > Metric Definitions > Types.
2. Open an assessment definition.
3. Optional: To add metric categories to an assessment from the question bank in Platform, perform the following steps.
   a) In the Metric Categories related list, click **New Category from Bank**.
      The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.
   b) Select the required categories and click **Add Selected**.
      A copy of the metric category and the corresponding metrics is created in the Metric Categories related list.

4. Optional: To add metrics to an assessment from the question bank in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) In the Assessment Metrics related list, click **New Metric from Bank**.
      The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.
   c) Select the required metrics and click **Add Selected**.
      A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.

5. Optional: To add a metric category to the question bank from an assessment in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) Click **Add to Question Bank**.
      A copy of the category is created along with its metrics and metric definitions in the question bank.

6. Optional: To add a metric to the question bank from an assessment in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) In the Assessment Metrics related list, open the required metric definition.
   c) Click **Add to Question Bank**.
      The Add to Question Bank dialog box is displayed.
   d) In the **Choose a question bank to add this question/metric** field, select a metric category that you want to add this metric to, and click **OK**.
      A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

**Copy an assessment**

Create a copy of an assessment with at least one category to reduce the effort of creating another assessment with similar data.

Role required: assessment_admin or admin

All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

1. Navigate to **Assessments > Metric Definition > Types**.
2. Select an assessment metric type.
Create a metric template

Create a metric template to define reusable rating scales for evaluating non-scripted metrics.

Role required: assessment_admin or admin

1. Navigate to Assessments > Metric Definition > Templates.
2. Click New.
3. Fill in the Name field on the Assessment Metric Template form.
4. To use images for template choices, such as for image scale questions, select Allow Image.
5. Click Submit.
6. Under the Assessment Template Definitions related list, click New.

Create a template definition for each answer option you want to appear on an assessment question.

7. Fill in the following fields:
   - Display: Enter the text to appear as the answer option.
   - Value: Enter a numeric value, equal to or greater than zero, that you want the answer option to equate to. Values are used in results calculations.
   - Selected Image: Click to add the image to use for selected state.
   - Unselected Image: Click to add the image to use for unselected state.

When you view assessment questions that use templates, answer options appear in order from least to greatest Value.

Tip: To prevent reporting confusion, no two template definitions for a given template should have the same Value.

8. Click Update.

Metric templates

Metric templates define reusable rating scales for evaluating non-scripted metrics.

Each answer option on the scale is defined as a template definition, much like a metric definition. For example, the metric template named Satisfaction contains the template definitions: Very Satisfied, Satisfied, Neutral, Dissatisfied, and Very Dissatisfied.

Metric templates are available for metrics that have Template as the Data type. The following metric templates are available by default.

<table>
<thead>
<tr>
<th>Name</th>
<th>Assessment template definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

### Name | Assessment template definition
---|---
Quality | Very Poor, Poor, Average, Good, Very Good
Complexity | Very Complex, Complex, Moderate, Simple, Very Simple

**Update a metric minimum and maximum value to match a template**

For assessment results to be properly calculated, the Min and Max values of a metric that uses a template must be equal to the smallest and largest template definition Value, respectively.

Role required: assessment_admin or admin

The system sets the **Min** and **Max** fields automatically when you create a metric of the Template data type, based on the template definition values. However, the system does not update these fields for existing metrics if you add a new template definition to a template or if you update the Value of an existing template definition. If the new Value is less than the minimum value of any metrics that use the template or greater than the maximum value, update the metrics accordingly.

To edit the minimum and maximum values for a question that has the Template data type:

1. Navigate to **Assessments > Metric Definition > Metrics**.
2. Configure the **list** to show the **Min** and **Max** columns.
3. Run the following list filter condition: `[Template] [is] [<select the template you updated>]`
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template, respectively.

   If the values do not match, edit the Min and Max directly from the list.

   **Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

### Category users and stakeholders

Users who take assessments are individuals in your organization who have specific knowledge of the assessment categories and the records being assessed. A person who is qualified to answer assessment questions from metrics in a specific category becomes a category user when associated to that category. A category user then becomes a stakeholder when associated to a specific assessable record.

The system determines which assessable records and questions a user receives by looking at the metric categories and assessable records for which those users are stakeholders. Assessment administrators can create and manage category users and stakeholders.

**Note:** Category users and stakeholders are used only for scheduled assessments.

### Category users

Category users are users who can potentially answer assessment questions about a particular metric category for scheduled assessments. Category users should have special knowledge of the categories and the metrics those categories contain. A category user becomes a stakeholder when associated to an assessable record. Create at least one category user for each category you want to use for assessment questionnaires. There is no need for category users if the category contains only scripted **metrics**.
Stakeholders

A stakeholder is a category user with specific product or service knowledge, who is associated to an assessable record. A stakeholder is familiar with the assessable record and all the metrics within a specific category. The same category user can be associated to multiple assessable records, in which case the system creates a stakeholder record for each association.

There are multiple ways to create stakeholders:

- Configure the system to create stakeholders automatically.
- Associate multiple category users to multiple assessable records.
- Associate multiple category users to one assessable record.
- Associate one category user to one assessable record.

**Note:** Ensure you establish the desired user and assessable record associations to categories before attempting to creating stakeholders.

Create a category user

Create category users by associating users in the system to metric categories.

Role required: assessment_admin or admin

When you create category users, choose users who are knowledgeable and can answer questions from that category. For example, a purchasing agent is a good category user for metrics that evaluate a vendor’s discount practices.

1. Navigate to **Assessments > Metric Definitions > Categories**.
2. Open a category record.
3. In the **Users** related list, click **Edit**.
4. Select the appropriate users for this category.

Create stakeholders automatically

You can configure the system to create stakeholders automatically from all category users and assessable records associated with a category using the **Create stakeholders** check box on the Metric Category form.

Role required: assessment_admin or admin

If you associate a user to the category, the system makes the resulting category user a stakeholder for all the assessable records associated to the category. Similarly, if you associate a new assessable record to the category, the system makes all category users stakeholders for that record if they are not already stakeholders.

**Note:** Use the **Create stakeholders** check box with caution. You can end up with more stakeholders than you want and a large amount of unnecessary assessment data. Automatic stakeholder creation is best suited to assessment implementations in which category users are knowledgeable about all or most of the assessable records associated to each category.

1. Navigate to **Assessments > Metric Definition > Categories**.
2. Select a category.
3. Associate category users and assessable records to the category.
4. Select the **Create stakeholders** check box.
5. Click **Update**.
   All the category users are associated to all the assessable records as stakeholders.

6. In the **Assessable Records** related list, click **Edit**.

7. Using the slushbucket, associate an assessable record to the category.

8. Click **Save**.
   The system makes all category users stakeholders for the new assessable record.
9. Delete stakeholders as needed.

Associate multiple category users to multiple assessable records
The stakeholder list helper in the create stakeholders module is the most efficient way to associate multiple category users to multiple assessable records in a single interface.

Role required: assessment_admin or admin

You can select category users from one category at a time.

Note: You cannot edit or delete stakeholders using the list helper.

1. Navigate to Assessments > Advanced > Create Stakeholders.
The stakeholder list helper appears.

2. Select a metric type from the list of available types.

   Note: Only metric types for scheduled assessments are available. On-demand assessments do not use category users or stakeholders.

3. Select a category from the list of available categories.

   Note: Only categories within the selected metric type are available.

The system populates the Category User and Assessable Records lists with category users and assessable records associated to the selected category.

4. Select one or more category users from the Category Users list.
5. Select one or more assessable records from the Assessable Records list.
6. Click the Associate arrow between the lists to complete the association.
A message above the list helper advises you that the selected category users are now stakeholders for the selected assessable records.

Delete a stakeholder for multiple assessable records
You can delete stakeholders for multiple assessable records.
Role required: assessment_admin or admin

1. Navigate to Assessments > Advanced > Assessment Stakeholders.
2. Sort the list by Assessable Record or Category User depending on the perspective you want.
3. Select the check box for each stakeholder you want to delete.
4. Select Delete in the Actions choice list.
5. Click OK to confirm the action.
The system deletes the stakeholders.

Associate one category user to one assessable record
You can create a single stakeholder using the list in the Assessment Stakeholders module.
Role required: assessment_admin or admin

1. Navigate to Assessments > Advanced > Assessment Stakeholders.
2. Click New. On the Assessment Stakeholders form, fill in these fields:
   • Category user: Select a category user.
   • Assessable record: Select an assessable record.
3. Click Submit.
The selected category user becomes a stakeholder for the selected assessable record. To verify the association, navigate to the assessable record and note that the selected category user is on the Category users related list.

Note: Do not create stakeholders from category users and assessable records of different metric types.

Associate multiple category users to one assessable record
You can create many stakeholders for a single assessable record from the Assessable Record form.
Role required: assessment_admin or admin
You can also edit or delete stakeholders from the form.

1. Navigate to Assessments > Assessable Records.
2. Open a record from the list.
3. In the Category users related list, click Edit.
These category users are the stakeholders for this assessable record.

4. Use the slushbucket to edit the category users associated to this assessable record. Add category users to create stakeholders. Remove category users to delete stakeholders. The system only shows category users for categories associated to the assessable record. For example, if an assessable record is only associated to the Compliance Score and Support Rating categories, you do not see User Satisfaction category users.

Delete a stakeholder for one assessable record
You can delete stakeholders for one assessable record.
Role required: assessment_admin or admin

1. Navigate to Assessments > Assessable Records.
2. Open an assessable record.
3. In the **Category Users** related list, select the check box for each stakeholder you want to delete.
4. Select **Delete** in the **Actions** choice list.
5. Click **OK** to confirm the action.
   The system deletes the stakeholders.

**Generate an on-demand assessment**

Use on-demand assessments to familiarize yourself with the basic assessment process and test your questionnaires using minimal configuration.

Role required: assessment_admin or admin

Select the **assessable records** to evaluate, create the categories and questions, and then assign an assessment to a user in the system. Pre-configured **stakeholders** are not used for on-demand assessments.

1. Create a **metric type** and set the **Schedule type** to **On demand** to allow for testing of your assessment configuration.
2. Generate the **assessable records** for the metric type you created.
3. Create the **metric categories** required to evaluate the assessable records selected.
4. Create one or more assessment questions, or **metrics**, for each category.
5. **Publish the assessment.**
6. Perform an **on-demand assessment** to test your categories and metrics.
7. Analyze the assessment ratings in an **assessment scorecard** or **decision matrix**.

**On-demand assessments**

On-demand assessments can be generated for metric types with the **Schedule type** field set to **On demand**.

For the system to properly generate on-demand assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:

- Assessable record
- Metric

By default, an assessment administrator can generate an on-demand assessment for one assessable record or multiple assessable records.

**Generate an on-demand assessment for one assessable record**

When you generate an on-demand assessment from the Assessable Record form, the resulting assessment contains questions from the categories associated to the assessable record.

Role required: assessment_admin or admin

Publish the assessment.

1. Navigate to **Assessments > Assessable Records**.
2. Open an assessable record associated to a metric type that has the **On demand** schedule type.
3. To assign the assessment to users configured in the **Assessors** tab of the assessment, and other specified users, perform these steps.
   a) On the Assessment Metric Type form, click **Assign Assessment**.
   b) Select a user from the Recent Assessors list or select a different user.
c) Click **OK**.

4. To assign the assessment to users configured in the **Assessors** tab of the assessment, click **Assign to Assessors**.

The system generates an assessment instance assigned to the selected users.

### Generate an on-demand assessment for multiple assessable records

When you generate an on-demand assessment from the Assessment Metric Type form, the resulting assessment contains questions from all categories associated to any assessable records for the metric type.

Role required: assessment_admin or admin

Publish the assessment.

For example, if there are 15 assessable records associated to at least one category with assessment metrics, the assessment contains questions for all 15 assessable records.

1. Navigate to **Assessments > Metric Definition > Types**.
2. Open a metric type that has the **On demand** schedule type.
3. To assign the assessment to users configured in the **Assessors** tab of the assessment, and other specified users, perform these steps.
   a) On the Assessment Metric Type form, click **Assign Assessment**.
   b) Select a user from the Recent Assessors list or select a different user.
   c) Click **OK**.

4. To assign the assessment to users configured in the **Assessors** tab of the assessment, click **Assign to Assessors**.

The system generates an assessment instance assigned to the selected users.

### Generate an assessment with the on-demand API

The Assign Assessment buttons call an API to generate on-demand assessments.

Role required: assessment_admin or admin

1. To generate an assessment, call the from any script in the system, such as a business rule or client script.
2. Use the sys_ids of these items:
   - An assessable record to evaluate. The assessable record must be associated with an on-demand type and at least one category that contains non-scripted metrics.
   - One or more users who should perform the assessment. The API generates a questionnaire about the specified assessable record for each user.

### Schedule an assessment

After you have evaluated your questionnaires using on-demand assessments, edit your categories and metrics as needed, reset your metric type record, and select the users who are qualified to evaluate the assessable records.

Role required: assessment_admin or admin

1. Open the metric type you created for the **on-demand assessment** and set the **Schedule type** to **Scheduled**.
2. Make sure the categories and metrics you created for the on-demand assessment are correct.
3. Create category users who have special knowledge of your categories.
4. Create stakeholders by associating category users to specific assessable records.
5. Set a schedule for automatic assessment generation or generate the assessment manually. This procedure must be done by a system administrator.
6. Configure email notifications to remind users of their assigned assessments and to report to managers when an employee misses an assessment deadline.
7. Analyze the assessment ratings in an assessment scorecard or decision matrix.

Schedule types
You can schedule assessments for preconfigured users or send them to any user on demand.

On-demand assessments require less setup. Scheduled assessments define users, or stakeholders, who have specific knowledge of the records being evaluated, and automatically send out assessment questionnaires to those users at scheduled intervals. The best practice is to configure an on-demand assessment first to familiarize yourself with the process and test your questionnaires. When you are satisfied with your categories and questions, reconfigure for a scheduled assessment. These configuration paths are the easiest for both assessment types. Refer to Key Terms for definitions of the terms used in these procedures.

Set an assessment generation schedule
You can set assessment generation schedules. You must set a schedule for each metric type individually.

Role required: assessment_admin or admin
1. Navigate to Assessments > Metric Definition > Types.
2. Open the appropriate metric type record.
3. Click the reference icon next to the Scheduled job field to open the Schedule Item record.
4. Locate the Trigger type field and set a recurring schedule for the scheduled job.

   For example, if you want to generate assessment components each month, select the Interval or Repeat trigger type and specify a Repeat value of 30 days. Alternatively, select Day in Month and specify a Run time and Run day of month.

   The optimal frequency of assessment generation is subjective. When you set the schedule, keep in mind the number of records to evaluate, how often your organization requires updated assessment results, the time and effort required of users to complete assessments, and other relevant factors.

Publish a metric type
Before it is possible to generate assessments, an assessment administrator must publish the associated metric type.

Role required: assessment_admin or admin
1. Navigate to Assessments > Metric Definition > Types.
2. Open a metric type record, and click Publish.

   The Publish button is available only if the state is Draft and there is at least one metric associated with the type.

   Note: A metric type cannot be moved back to the Draft state after it has been published.
Scheduled assessments
The system generates a unique scheduled job for each metric type with the Schedule type field set to Scheduled.

The system generates a unique scheduled job for each metric type with the Schedule type field set to Scheduled. Each scheduled job generates assessment components for the related metric type. By default, the scheduled job runs when an administrator executes it manually, but administrators can set a schedule to generate assessments automatically on a recurring basis.

For the system to properly generate scheduled assessments, the metric type must be active and published. The metric type must also be associated to at least one metric category. That metric category must be associated to one or more of each of the following items:
- Assessable record
- Stakeholder associated to one of the assessable records
- Metric

Generate a scheduled assessment manually
Administrators can generate scheduled assessments manually.
Role required: assessment_admin or admin
Use this option, for example, if you have set a schedule but want to generate assessments before the next scheduled run date.

1. Navigate to Assessments > Metric Definition > Types.
2. Open the appropriate metric type record.
3. Click Generate Assessments to trigger the scheduled job immediately.

Note: Be careful to click Generate Assessments, not Generate Assessable Records.

Generate a vendor type assessment manually
The Vendor Performance feature provides a direct method of generating assessments for the Vendor metric type.
Role required: admin

1. Navigate to Vendor Performance > Admin > Generate Assessments.
2. Click Generate Assessments to execute the scheduled job for the Vendor type.

Clean up assessment data
The assessment process generates a considerable amount of data, some of which is not useful after a short time.
Role required: assessment_admin or admin

The assessment process generates a considerable amount of data, some of which is not useful after a short time. Assessments include a scheduled job called Remove Old Assessment Data that is available to administrators only. The scheduled job removes these items if they are more than a year old:
- Assessment instance questions
- Assessment instances
- Metric results

By default, the scheduled job is executed manually. Administrators can configure the scheduled job to run automatically on a recurring schedule.
1. Navigate to System Scheduler > Scheduled Jobs > Scheduled Jobs.
2. Open the **Remove Old Assessment Data** record.

3. On the Schedule Item form, set the **Trigger type** field to run the scheduled job on a recurring schedule.

   It is recommended to set the scheduled job to run on a weekly or monthly basis.

4. Optional: Click **Execute Now** to run the scheduled job.

**Assessment instances**

An assessment instance represents one occurrence of a questionnaire assigned to one user.

The system generates assessment instances only when the required conditions are met, as described in **Scheduled assessments** and **On-demand assessments**, and there are non-scripted metrics in at least one category.

When the system generates scheduled assessments for a metric type, each assessment instance contains questions about assessable records and categories related to the stakeholder to which it is assigned.

Example:

Recall that there can be multiple stakeholder records associated with one user record. Minh Leclaire is a stakeholder for these items related to the **Vendor** metric type:

<table>
<thead>
<tr>
<th>Assessable record</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>User Satisfaction</td>
</tr>
<tr>
<td>Acme</td>
<td>Reliability</td>
</tr>
<tr>
<td>Cisco</td>
<td>Reliability</td>
</tr>
</tbody>
</table>

When the system generates a scheduled assessment, Minh is assigned one assessment instance. Minh must evaluate Amazon, Acme, and Cisco by answering questions from the categories for which she is a stakeholder. Assuming that there are three questions in the User Satisfaction category and six questions in Reliability, Minh's questionnaire contains three questions about Amazon, nine questions about Acme, and six questions about Cisco.

When the system generates an on-demand assessment *for a specific assesseable record*, the assessment instance contains questions about that assessable record and all its associated categories. When the system generates an on-demand assessment *for a metric type*, the assessment instance contains questions about all that metric type's assessable records and their associated categories.

**View an assessment instance**

An assessment instance represents one occurrence of a questionnaire assigned to one user.

Role required: admin, survey_admin, or assessment_admin

1. Navigate to **Assessments > Assessment Instances**. The following sub-modules are available based on the state of the instances:

   - **Ready to take**: Displays assessment instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the **Number** field.
   - **In progress**: Displays assessment instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.
   - **Completed**: Displays assessment instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.
• **Cancelled**: Displays assessment instances that are cancelled. By default, these instances are sorted in ascending order by the **Number** field.
• **All**: Displays assessment instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. Click an assessment instance number to open the record from the required sub-module. By default, the following fields are displayed in the Assessment Instance form for all sub-modules other than **Completed**.

   **Note**: When you open an instance in the **Completed** sub-module, you are redirected to the User's Response page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Auto-generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Metric type of this assessment.</td>
</tr>
<tr>
<td>Assessment group</td>
<td>Assessment group to which this assessment belongs.</td>
</tr>
<tr>
<td>Due date</td>
<td>Date by which the assessment instance must be completed. The system populates the due date from the value in the metric type <strong>Assessment duration</strong> field. The system generates email notifications related to the due date.</td>
</tr>
<tr>
<td>State</td>
<td>State of the assessment.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain associated with the instance.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User this assessment is assigned to. This field becomes read-only when the state is <strong>In progress</strong>, <strong>Complete</strong>, or <strong>Canceled</strong>.</td>
</tr>
<tr>
<td>Signature</td>
<td>Name of the signature record attached to this assessment. A signature requires that assessment recipients acknowledge that they have read any assertions attached to a questionnaire.</td>
</tr>
<tr>
<td>Signature result</td>
<td>Verification provided by the recipient when a signature is required. This value is either the recipient's full name from the User (sys_user) table or <strong>checked</strong>, indicating that the recipient acknowledged reading the assertion by selecting a check box.</td>
</tr>
</tbody>
</table>

3. Click **Take assessment** to open the questionnaire.

   This button is available if all the following conditions are true for the assessment instance:
   • It is **Assigned to** you.
   • The **State** is **Ready to take** or **In progress**.
- The associated metric type is **Active**.

**Configure trigger conditions for an assessment**

Trigger conditions specify when to send a particular assessment and who to send the assessment to.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Admin > Trigger Conditions**.
2. Complete the fields as described in the table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>(Required) Metric type to generate assessment instances for. Triggered assessments only work if the metric type is set to the <strong>On demand</strong> schedule type.</td>
</tr>
<tr>
<td>Table</td>
<td>(Required) Table to run the trigger condition on. You can select only tables in the current application scope. The table must have a connection to the assessable records for the selected <strong>Assessment</strong>. For example, you might want to send a vendor assessment when incidents close that are related to vendors you assess. In this case, select the incident (incident) table. After you select a table, ensure there is at least one option for the <strong>Assessable Record Field</strong>. If there is not, select a different table.</td>
</tr>
<tr>
<td>User field</td>
<td>(Required) Field that stores the users you want to send the assessment. You can select any field, on the selected <strong>Table</strong> or on a related table, that references the User (sys_user) table. Use the tree picker to select a field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>Minimum period that must pass before the trigger condition can resend the assessment to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user is eligible for multiple assessments from this trigger condition, the system can only send the user one assessment every 30 days.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>(Admin only) Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the assessment to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the assessment to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected), as specified in the Probability (%) field.</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Probability out of 100 that the assessment will be sent each time the condition is met. For example, if the probability is set to 50, the system sends the assessment approximately 50% of the time the conditions are met, assuming there are no repeat interval restrictions. This field is visible and required only when the Trigger randomly check box is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assessable Record Field</td>
<td>(Required) Field on the selected Table that determines which assessable record will be the subject of the assessment. Only appropriate reference fields on the selected Table are available to select. If there are no Assessable Record Field options available, you must select a different Table. If the selected Assessment evaluates records on the Company [core_company] table and the selected Table is Incident, the only Assessable Record Field options are fields on the Incident table that reference the Company table. For example, Company or, if vendor ticketing is enabled, Vendor. If you select Vendor, the trigger condition sends an assessment about the Vendor for the incident, assuming there is an assessable record for the associated company. The assessment contains questions from all metric categories associated with the assessable record.</td>
</tr>
<tr>
<td>Related Field 1 – Related Field 4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected Table. When the trigger condition generates an assessment instance, the system stores the value from the triggering record. Select up to four fields. For example, if you select the Incident table, you might select Caller and Vendor as related fields. That stores the caller and vendor associated with the incident as Related record 1 and Related record 2 in the assessment instance record. To view these fields, configure the Assessment Instance form.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>(Required) Condition builder that defines the criteria that must be true to send the assessment. For example, if you want to send an assessment whenever an incident closes, create the condition (State) (is) (Closed).</td>
</tr>
</tbody>
</table>
With trigger conditions, assessment administrators can configure the system to generate assessments each time a specific action occurs, such as when an incident or change request closes. The trigger condition sends the assessment to specified users who are related to the triggering record, such as incident callers or change request assignees. You can choose to send the assessment every time the condition is met, or set a probability for the system to send the assessment at random when the condition is met.

### Trigger condition configuration

<table>
<thead>
<tr>
<th>Assessment</th>
<th>Vendor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>User field</td>
<td>Assigned to</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>30 days</td>
</tr>
<tr>
<td>Active</td>
<td>true</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>false</td>
</tr>
<tr>
<td>Assessable Record Field</td>
<td>Vendor</td>
</tr>
<tr>
<td>Related Field 1</td>
<td>Caller</td>
</tr>
<tr>
<td>Related Field 2</td>
<td>Vendor</td>
</tr>
<tr>
<td>Condition</td>
<td>(State) (is) (Closed) and (Vendor) (is not empty)</td>
</tr>
</tbody>
</table>

### Trigger condition example

Modesto Scroggie is the caller on an incident that is assigned to Boris Catino, a service desk technician. Boris contacts a vendor to resolve Modesto’s issue and sets the Vendor field to **Microsoft**. When the incident closes, the system creates an assessment instance assigned to Boris so he can evaluate Microsoft as a vendor.

Because two related fields were selected as part of the trigger condition, the assessment instance stores the following information from the incident:

- **Related record 1**: User: Modesto Scroggie
- **Related record 2**: Company: Microsoft

**Note**: Even though the trigger condition is set to be triggered every time the conditions are met, the **Repeat Interval** setting ensures that Boris does not receive another assessment if another vendor incident assigned to him closes within 30 days of the first one.

### Enable manager notifications

Users with the assessment_admin role can enable the Notify manager assessment is overdue email notification.

Role required: assessment_admin or admin

This notification sends emails to assessors’ managers when assessors do not complete their assigned assessments on time. For more information, see the table of assessment notifications. You must enable or disable this email notification separately for each metric type.

1. Navigate to **Assessments > Metric Definition > Types**.
2. Open a metric type.
3. Select the **Notify if overdue** check box.

   ![Assessment Metric Type](image)

   To disable manager notifications, clear the check box.

4. Save the record.

   **Note:** The assessor’s user record must have a manager specified in the **Manager** field to use this notification. You might need to configure the form to use this field.

**Assessment notifications**

You can configure the system to send email notifications for assessments.

You can configure any of the following types of notification during the process of generating assessable records:

- **Notify assessment user:** This message notifies you of an assigned assessment and includes the **type**, the due date, and basic instructions. The message also contains a link to the record where you take the assessment.

  **Note:** If a user has a pending assessment, then the system will not generate another instance of the same assessment.

- **Remind assessment user:** This message reminds you of the due date if half the time passes and you have not completed the assessment. The message content is the same as the first notification.

- **Notify manager assessment is overdue:** If you do not complete an assessment by the due date, the system may send a notification to your manager, depending on configuration.

  **Note:** By default, the system runs a script every 30 days to cancel expired assessment and survey instances that are in the **Work in progress** or **Ready to take** states.

**Assessment notification workflow**

The system sends assessment notifications according to the Notify assessment user workflow. Users with the **workflow_admin**, **workflow_creator**, or **workflow_publisher** roles can view workflows.

1. To open the graphical Workflow Editor, navigate to **Workflow** > **Workflow Editor**.
2. In the activity menu, click the link to choose an existing workflow.
3. Select **Notify assessment user** from the Workflow Versions list.

The workflow appears.
View a metric result

Metric results contain values that represent an evaluated record’s performance for a specific metric, based on a single evaluation from one user or from the execution of a script. Metric results contain actual values as well as calculated values. The system uses values from metric results to calculate category results.

Role required: assessment_admin or admin

If there is an active scripted metric when the assessment is generated, the system automatically produces a metric result for each associated assessable record. The system produces an additional metric result for each question a user answers on a completed assessment questionnaire. If multiple users complete questionnaires with the same questions on the same assessable records, the system produces metric results for each user’s responses. For example, three users complete questionnaires that contain the same four questions about the Acme Corporation record. The system produces 12 metric results: one per user for each question.

1. Navigate to Assessments > Results > Metric Results.
2. Open the metric result record you want to view.
All fields on the form except **Updated** and **String value** are read-only.

**Metric Result form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result is associated.</td>
</tr>
<tr>
<td>Metric</td>
<td>Name of the metric to which these metric result values apply.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the metric.</td>
</tr>
<tr>
<td>Method</td>
<td>Method of the metric.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Source record of the assessable record evaluated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the assessment questionnaire. This field is blank when the method is <strong>Script</strong>.</td>
</tr>
<tr>
<td>Instance</td>
<td>Assessment instance completed by the <strong>Assigned to</strong> user. This field is blank when the method is <strong>Script</strong>.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Unscaled value from a user response or script, depending on the method:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Assessment</strong>: Value obtained from the user response to the assessment instance question. The actual value is determined by the metric data type:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Checkbox</strong>: The actual value is 0 if the check box is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Choice</strong> or <strong>Likert Scale</strong>: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Date</strong>, <strong>Date/Time</strong>, or <strong>String</strong>: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Template</strong>: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Yes/No</strong>: The actual value is 0 if the response is <strong>No</strong> and 1 if it is <strong>Yes</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Script</strong>: Value the script placed in the actual_result variable.</td>
</tr>
</tbody>
</table>

This field is hidden and left blank when the data type is **Duration**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duration value</td>
<td>Specific kind of actual value that is only applicable if the data type is <strong>Duration</strong>. The duration value is the value obtained by the script query from the <strong>actual_result</strong> parameter, such as the average duration of outages for a vendor.</td>
</tr>
</tbody>
</table>
| Scaled value     | Appropriate value from the **scaled_result** variable in the associated metric script. The code in a scripted metric defines a scaling scheme for the actual values it obtains. For example, a scripted metric queries the CMDB to return the number of configuration items (CIs) for a vendor. The code includes this scaling scheme, where **actual_result** is the number of CIs, and **scaled_result** is a representation of the quantity of CIs:  
```java
if (actual_result < 1)  
scaled_result = 0;
else if (actual_result < 1000)  
scaled_result = 1;
else if (actual_result < 10000)  
scaled_result = 2;
else if (actual_result < 25000)  
scaled_result = 3;
else if (actual_result < 100000)  
scaled_result = 4;
else  
scaled_result = 5;
```
If the script detects 315 CIs for the vendor, the **Actual value** is 315 and the **Scaled value** is 1 for this metric result.  

**Note:** Although this field is visible only when the method is **Script**, the system populates the field with the **Actual value** when the method is **Assessment**, as the scaled value is used in the **Normalized value** calculation.  

| Normalized value | Adjusted value that accounts for weights, scale definition, minimum and maximum values, and other factors that impact the metric (like the survey responses or the input value—the actual value given by the user). See the example for **Normalized value** in View an assessment category result. |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the metric data type is Percentage. The string value is N/A for unanswered questions of certain data types. For the Attachment data type, the names of the attached files are displayed as comma-separated values.</td>
</tr>
</tbody>
</table>

**Assessment results**

In the Assessments application, when the system processes completed questionnaires or gathers values returned from scripted metric queries, it generates assessment result records called metric and category results.

Assessment administrators can view assessment results.

The system calculates **metric results** first, normalizes the scores, and then calculates **category results**. Each metric and category result record stores data from one assessment group, for a particular category and source record evaluated. Specifically:

- Metric results: store data calculated from one evaluation of one metric.
- Category results: store data calculated from a weighted average of all metrics in the category.

**Note:** Although results data is available to view in the form of metric and category result records, the most meaningful way to view results is in scorecards and decision matrixes. These tools display only the most pertinent data in graphical, comparative formats.

**Excluded Responses**

The system creates metric results for responses but does not include them in category result calculations if any of the following are true:

- The user selects the **Not Applicable** answer option on a questionnaire.
- The user does not answer the question and the data type is not **Checkbox**.
- The question data type is one of the following: **Date, Date/Time,** or **String**.
- The metric result **Actual value**, **Scaled value**, and **Normalized value** fields are set to -1.

**Metric Attachments**

After a survey or assessment is submitted, any attachments that have been added by a user are moved to the metric result record. The names of the attached files are added to the **String value** field on the Metric Result form.

**Note:** You cannot add or remove attachments from a metric result.

**Assessments overview module**

The assessment overview module is a type of homepage that displays various assessment reports, such as results by category and assessments by state.
Prerequisites

You can view the overview page and refresh, add, delete, and rearrange report widgets.
Role required: assessment_admin
To use the Assessments Overview module, navigate to **Assessments > Overview** and click elements within the reports to obtain more information.

The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessable Records by Type</td>
<td>Assessable Record</td>
</tr>
<tr>
<td>Assessment Instances by Assessment Group</td>
<td>Assessment Instance</td>

</tr>
<tr>
<td>Total Metrics by Metric Type</td>
<td>Assessment Metric</td>
</tr>
<tr>
<td>Unanswered Questions by Assigned User</td>
<td>Assessment Instance Question</td>
</tr>
</tbody>
</table>

**Assessment results calculation**

For every assessment group, there are assessment results.

Data calculated from an evaluation of one metric is classified as a metric result. Data calculated from the weighted average of all metric results in a category is classified as a category result. The system calculates some assessment results when the assessment is generated, and others when users complete questionnaires.

**View a bubble chart for assessments**

Assessment administrators can view bubble charts to compare the relative standing of assessable records in three metric categories.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Admin > Bubble Charts**.
2. Click a **Name** to open the bubble chart record.
3. Under **Related Links**, click **View Bubble Chart**.

**Note:** Demand managers and vendor managers can view bubble charts through the Demand Management and Vendor Performance applications. See *Project Portfolio Management* for more information.

**Bubble charts for assessments**

A bubble chart is a dynamically updated graph that plots assessment results for multiple assessable records.

Assessment administrators can create and use bubble charts to compare the relative standing of assessable records in three metric categories. The X- and Y-axes each represent a different category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.
Create a bubble chart

Assessment administrators can create bubble charts to compare the relative standing of assessable records in three metric categories.

To create a bubble chart, navigate to **Assessments > Admin > Bubble Charts** and create a record (see table for field descriptions).

**Note:** For color fields, either HTML color names or hexadecimal (hex) values are acceptable. For hex values, the # character is optional. Values are not case-sensitive. For example, all of the following values are valid: LightGray, lightgray, #D3D3D3, d3d3d3.

![Bubble Chart form](image)
## Bubble Chart form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for the bubble chart. <strong>Bubble Chart</strong> is appended to the name when you view the bubble chart.</td>
</tr>
<tr>
<td>Top left label</td>
<td>Label text for the top left, top right, bottom left, and bottom right quadrants, respectively. Choose labels that help interpret results. For example, a bubble chart that displays vendor assessment results might have the following quadrant labels, where vendors in the top right quadrant have the best scores: Top left label: Resource Top right label: Essential Partner Bottom left label: Poor Performer Bottom right label: Reevaluate</td>
</tr>
<tr>
<td>Bubble Chart</td>
<td>X-Axis label</td>
</tr>
<tr>
<td>X-Axis label</td>
<td>Label text for the X-, Y-, and Z-axis categories of the bubble chart. These labels appear along the X- and Y-axes, if applicable, and in bubble score summary windows. The metric category name is usually a good label. If these fields are left empty, the bubble chart automatically displays the selected category names as the labels.</td>
</tr>
<tr>
<td>Y-Axis label</td>
<td>Metric category each axis represents. Results for the Z-axis category determine the size of each bubble. The Z-axis should generally represent the most important category out of the three.</td>
</tr>
<tr>
<td>Z-Axis label</td>
<td>Color of the label text for the quadrant borders. Check box that enables (selected) or disables (cleared) the bubble chart as the default. There can be only one default bubble chart per metric type.</td>
</tr>
<tr>
<td>Metric X category</td>
<td>Default</td>
</tr>
<tr>
<td>Metric Y category</td>
<td>X- and Y-axes: Each axis represents a metric category.</td>
</tr>
<tr>
<td>Metric Z category</td>
<td>X- and Y-axes: Each axis represents a metric category.</td>
</tr>
</tbody>
</table>

## Bubble chart components

The X- and Y-axes each represent a different metric category. Assessable records are plotted on the chart as circular markers, or bubbles, which vary in size according to scores for the third category.

The bubble chart page has these components:

- **Bubble Chart**
- **X- and Y-axes**: Each axis represents a metric category.
- **Bubbles**: Each labeled bubble represents an average of category result data for an assessable record. Point to a bubble to view an assessable record score summary. Click a bubble or bubble label to view the scorecard for the assessable record.

- **Source record list**: List of all records defined by the Table and Condition fields for the associated metric type. Note that the bubble chart only plots records for which there are assessment results. The assessment results are actually associated with the assessable records for each of the listed source records.
### Vendor Quality Bubble Chart

The chart illustrates the relationship between company alignment and reliability, distinguishing between resources and essential partners. The bubble size represents the source record list with companies such as Dell Inc., among others. Companies are categorized into poor performers, revaluated, and reevaluated categories based on their alignment and reliability.

Assessable record score summaries

Point to a bubble to display a score summary for the assessable record the bubble represents. The summary displays the assessable record’s average score for each category in the following order: X-axis category, Y-axis category, Z-axis category. The scores are based on data from the last 12 months.

Bubble chart score summary

View an assessment scorecard

The Assessments application prepares printable scorecards. A scorecard displays easy-to-interpret assessment results, in which the current calculated ratings for an assessable record are compared to previous ratings or to the ratings of other records.

Role required: assessment_admin or admin

Users can examine ratings over time, compare ratings for one assessable record with all assessable records in a table, or compare the ratings of two assessable records. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed assessments and scripted metrics.

Administrators can display a scorecard for any table by creating a Related Link on assessable records. The system provides this link on the Company form by default when Vendor Performance is active.

The Vendor Performance application provides an enhanced scorecard view for vendors. See Vendor Performance in Project Portfolio Suite.

1. Navigate to Assessments > Assessable Records.
2. Open a record.

Create a link to a scorecard

Users with the admin role can create UI actions that allow users to view scorecards from tables.
Role required: assessment_admin or admin

1. Generate **assessable records** you want to evaluate.
   For example, you might create a metric type called **Project** to assess project management records.

2. Navigate to **System Definition > UI Actions**.

3. Open the View Scorecard record.

4. Right-click the header bar and select **Insert and Stay** from the context menu to create a duplicate record.

5. Change the **Table** name to the table on which you want the UI action to appear.
   For example, you might select Project (pm_project).

6. Do not edit the **Action name** field or the **Condition** script.

7. Save the record.

8. Navigate to the table on which you created the UI action and open an assessable record.
   a) In this example, navigate to **Project > Projects > All**.
   b) Open any record in the list.
   c) Click **View Scorecard** under **Related Links** to open the scorecard for that assessable record.
The scorecard appears with the title in the form of `<table display name> Scorecard`. For example, a scorecard for an assessable record in the Project `[pm_project]` table is named `Project Scorecard`.

**Note:** Content does not appear in the scorecard unless the associated assessable record has assessment results or related live feed conversations.

9. Insert a new View Scorecard UI action record for each table where you want the related link to appear.

**Export a quiz scorecard as an image**

You can export scorecards as images.

*Role required: assessment_admin or admin*

1. Click the menu icon and select **Save as PNG** or **Save as JPEG** as the download format.
2. When the export is complete, select **Download** to save the scorecard image to a storage location.

---

**Assessment scorecard averages**

The Averages view compares the current ratings for an assessable record in each metric category with the average, minimum, and maximum values from all assessable records in the filter. All ratings are from assessments generated over the trailing twelve months (TTM).
Select a filter option to compare the current record against all assessable records in that filter. An assessment administrator configures these options in the Filter field field in the Assessment Metric Type form.

Rating variances are highlighted as follows:

- **Red**: Ratings are below average in this category. The Diff value displays a negative number.
- **Green**: Ratings are above average in this category. The Diff value displays a positive number.
- **White**: Ratings are average in this category. The Diff value is 0.0.

In the following example, the ratings of the current group are compared against other groups for which Don Goodliffe is the manager.

![Group scorecard with ratings filter](image)

**Assessment scorecard categories**

The Categories view displays a bar chart showing the average ratings for each category in the selected time interval.

Select from these reporting periods:

- All History
- Last 3 Months
- Last 12 Months
Scorecard categories

Assessment scorecard category metrics
The Category Metrics view displays the weighted average results for each metric within a category. Use this view to learn how individual metrics affect the overall rating for the category.
Select a metric category from the choice list to display the chart.
Scorecard category metrics

Assessment scorecard head-to-head compare view
The Head to Head Compare view allows you to compare the ratings of two assessable records of the same type. Select an assessable record from the choice list to compare against the current record's trailing twelve month (TTM) ratings.

Head to head compare
The Diff column displays the difference between each assessable record's most recent TTM ratings. By default, the system selects the first assessable record in the list when you open this view. The scorecard displays three years of ratings for the comparison record. All ratings are expressed as averages.
Scorecard head to head compare

Overall Rating
The Overall Rating is calculated as:

\[
\frac{\text{sum of normalized values in category result}}{\text{number of assessment groups}}
\]

In the following example, the calculation is

\[
\frac{2.13 + 2.86 + 3.79 + 1.43 + 2.39 + 3.7}{2} = 8.15
\]
Normalized values

<table>
<thead>
<tr>
<th>Category</th>
<th>Weight</th>
<th>Source</th>
<th>Rating</th>
<th>Normalized value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Politeness</td>
<td>5</td>

</tr>
</tbody>
</table>

Overall Rating on the group scorecard
Assessment scorecard history
The History view compares the current ratings for each category with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current assessment against the previous assessment.

- **3 Years**: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.

- **4 Quarters**: Quarterly assessments compare the average rating for each category in the current quarter against the average ratings from the previous four quarters. The Diff column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd (2013), 1st (2013), 4th (2012), and 3rd (2012). All four of the previous quarters appear, whether or not there was any data for those quarters.
**Scorecard history - 4 quarters**

*Live feed view of assessable records*

The live feed view displays live feed conversations that apply to the assessable record. Users can view the group feed, including tagged comments, and add comments of their own.

To configure a live feed view, an assessment administrator selects the **Live feed** check box on the **Assessable Record** form. Live feed is available on the scorecard even if there are no category results for the other views.

The live feed view provides these viewing options:

- **My Feed**: Displays the user's My Feed preferences.
- **Company**: Displays the user's company feed.
- **Groups**: Displays all available groups and gives the logged in user the option to leave or join a group. Select a group to display that group's conversations.
- **Tags**: Displays all the tags found in live feed comments. Click a tag to display the conversations containing that tag.

Live Feed group scorecard
Assessment scorecard ratings
The scorecard ratings section displays various ratings for the assessable record.

Select one of several views that present different ratings:

- Averages
- Categories
- Category Metrics
- Head to Head Compare
- History
- Live Feed

Some views display an overall rating column, which lists categories used to evaluate the assessable record. Only categories in which the assessable record has been evaluated appear on the scorecard. If the ratings section does not display any data, the assessable record or category results associated to the assessable record have been deleted.

Click a category to view the category record. Point to a category to display a line chart that shows the rating trend for that category.

Vendor scorecard trend chart

Set up and administer quizzes

Set up and administer quizzes.

Role required: assessment_admin or admin

1. Optional: Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.

   You can create unique answers or select preconfigured answers from a template.

Publish and distribute the quiz. You can send the quiz to a single user or all users in each category.

Review the results from the submitted quizzes in reports and scorecards.

Quizzes
Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
- A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
- The system can send email notifications to these users:
  - Recipients: The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  - Recipient’s manager: The recipient’s manager can receive notification when a quiz is overdue.
  - Quiz manager: The quiz manager can receive notification of an overdue quiz to which he or she is assigned.

- Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  - Checkbox
  - Choice
  - Duration
  - Likert Scale
  - Numeric Scale
  - Template
  - Yes/No

- A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers No to a specific question.

Important terms

The quiz application involves several terms.
### Terms used in quiz application

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Quizzes</strong></td>
<td>A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient.</td>
</tr>
<tr>
<td><strong>Categories</strong></td>
<td>A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.</td>
</tr>
<tr>
<td><strong>Questions</strong></td>
<td>A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.</td>
</tr>
<tr>
<td><strong>Category user</strong></td>
<td>A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.</td>
</tr>
<tr>
<td><strong>Templates</strong></td>
<td>A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.</td>
</tr>
</tbody>
</table>

### Quiz roles

The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

#### Quiz roles

<table>
<thead>
<tr>
<th>Role Title (Name)</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assessment administrator (assessment_admin)</td>
<td>Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.</td>
</tr>
</tbody>
</table>

**Note:** The itil_admin role and the survey_admin role contain the assessment_admin role.
Data types for quizzes
You need to choose a data type for each quiz question. Various data types helps you collect and analyze different kinds of data.

Available data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>
</tr>
<tr>
<td>Boolean</td>
<td>Question with a check box or a Yes/No list for user responses.</td>
</tr>
<tr>
<td>Choice</td>
<td>List of predefined options. For more information, see the definition for Choices in the Create quiz questions topic. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Date</td>
<td>Date field.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Time and date field.</td>
</tr>
<tr>
<td>Number</td>
<td>Number field with predefined minimum and maximum values. The default is 1-10.</td>
</tr>
<tr>
<td>Percentage</td>
<td>Percentage field with a prescribed range.</td>
</tr>
<tr>
<td>Scale</td>
<td>Predefined Likert scale. Answer options appear as radio buttons. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Image Scale</td>
<td>Predefined set of images. Five emojis similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Numeric scale</td>
<td>Selectable number scale. The default is 1-5. Answer options appear as radio buttons. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>String</td>
<td>Single or multi-line text field.</td>
</tr>
<tr>
<td>Template</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see Configure a template question. Multiple correct answers are supported.</td>
</tr>
<tr>
<td>Reference</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers.</td>
</tr>
</tbody>
</table>
Activate the quiz designer
Administrators can activate the Quiz Designer plugin.
Role required: assessment_admin or admin

1. Navigate to System Definition > Plugins.
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

   ![Banner](image)

   - You have been redirected to All Applications. To see the Plugins list click here

2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in [Request a plugin](#).

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.

   ![Activate Plugin](image)

   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the **Activate/Update** related link.
     3. In the dialog box, review the dependent plugins.
        - If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.
     4. If demo data is available and you want to install it, click **Load demo data**.

Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

### Quiz Overview module

The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.

Role required: assessment_admin or admin

Users with the **assessment_admin** role can view the overview page and refresh, add, delete, and rearrange widgets.

1. Navigate to **Quizzes > Overview**.
2. Click elements within reports to obtain more information. The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes by State</td>
<td>Assessment Instance (asmt_assessment_instance)</td>
</tr>
<tr>
<td>Total Questions by Quiz</td>
<td>Assessment Metric (asmt_metric)</td>
</tr>
<tr>
<td>Questions by Data Type</td>
<td>Assessment Metric (asmt_metric)</td>
</tr>
<tr>
<td>Correct Answers by Assigned User</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
<tr>
<td>Number of Correct Answers</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
<tr>
<td>Incorrect Answers by Assigned User</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
<tr>
<td>Number of Incorrect Answers</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
</tbody>
</table>

### Quiz designer

The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the **assessment engine** to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see **Create quizzes with forms**.

### Tools on the Quiz Designer

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to **Quizzes > Quiz Designer**.

The designer contains the following elements:

- Controls tab
- Questions tab
- Categories tab
- Header bar
- Design canvas
Controls tab

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.

Question controls
### Question controls

<table>
<thead>
<tr>
<th>Data type</th>
<th>Description</th>
<th>Scored</th>
</tr>
</thead>
<tbody>
<tr>

<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers.</td>
<td></td>
</tr>
</tbody>
</table>

Questions tab

This tab displays all metrics added to the question bank for quizzes. Use the Filter field to search for questions. Each metric is displayed with its name and type.

Categories tab

This tab displays all metric categories added to the question bank for quizzes. All metrics in the question bank are group under the corresponding metric category. Use the Filter field to search for categories or questions.

Header Bar

The header bar contains tabs that display different views and a menu of various functions.

Click one of the following tabs to change the view in the canvas:

- **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- **Configuration**: Create introductions and end notes for quizzes, and select a signature.
- **Availability**: Select the recipients for each category in the quiz.

Point to the menu icon (≡) in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.
- **Copy Quiz**: Creates a copy of the quiz.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

Design Canvas

New quizzes open in the **Design** view. The quiz **Name** field appears above first category in the canvas. A blank question field appears in the category container.

**Create a quiz**

When you create a quiz, you can create one or more categories and then add questions to each category.
Role required: assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

Create quiz categories
A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Role required: assessment_admin or admin

When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either Quizzes > Quiz Designer or Quizzes > Quizzes and click Quiz Designer in the list header.
2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category.
3. To configure the category, click the gear icon in its title bar.
   
   The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.
4. Click the X icon to close the category properties dialog box and save your settings.

5. To add a new category, click the + icon in the title bar of an existing category.
Create quiz questions
You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin

The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

Note:
To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.

2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

**Question property fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td><em>(Required)</em> Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td><em>(Read-only)</em> Data type selected for this question. See the table in Controls for possible data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red introduction to fields field status indicator.</td>
</tr>
<tr>
<td></td>
<td>This field is available when the question does not have a dependency and the question controls is not Boolean with a check box option.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:</td>
</tr>
<tr>
<td></td>
<td>- Single line: Single line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>- String line wide: Full page width text field that allows a single line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>- Multiline: Full page width multi-line text field that allows word wrap and returns.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question data type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. <strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except Date, Date/Time, and String. Multiple correct answers are supported for a few data types. See data types.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of Choice or Scale. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of Boolean, Choice, Scale, or Template. Create the condition that must exist for recipients to see the dependent question, using the is or is one of operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met for a question to appear on the quiz, click the Dependency tab. Fill in the fields, as appropriate.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category.

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.

7. Click X to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.
9. Drag questions to change their order within a category or move them between categories.

10. To delete a question, click the X in its title bar.

Configure a quiz
   You can configure an entire quiz.
   
   Role required: assessment_admin, survey_creator, or admin
   
   The values you enter and select on this page are applied to the entire quiz.
   In the quiz designer, click Configuration and then fill in the fields as described in the table.

### Quiz designer configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.</td>
</tr>
<tr>
<td>Owners</td>
<td>Owners of the quiz. You can add a user with the survey_creator, survey_admin, or assessment_admin role.</td>
</tr>
<tr>
<td>Signature</td>
<td>(Optional) Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.</td>
</tr>
<tr>
<td>Manager</td>
<td>Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.</td>
</tr>
<tr>
<td>Notify manager if overdue</td>
<td>Check box for sending email notifications to a recipient's manager when that user fails to submit an assigned quiz before the due date.</td>
</tr>
</tbody>
</table>

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Select a quiz recipient
When the system distributes a quiz, it sends email notifications to the category users and their managers.

Role required: assessment_admin or admin
A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients’ My Assessments & Surveys portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click Availability and then fill in the fields as described in the table.

Select recipients

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>

Publish a quiz
When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient’s My Assessments & Surveys portal displays a link to the quiz.

Role required: assessment_admin or admin

1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.
2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.

Create quizzes with forms
As an alternative to the Quiz Designer, you can create a complete quiz using records in the Assessment application.
All the elements of a quiz, the categories, questions, and answers, are stored in tables used by the assessment engine and are displayed in quiz views of these tables. Users creating quizzes in the Assessment application must have the assessment_admin role.

Create a quiz using assessment forms by following the procedures in the order shown here:

- Create the quiz.
- Set up the categories.
- Create the questions for the quiz.
- Create the answers for the questions.
- Distribute the quizzes to recipients.

**Note:** The recommended method of creating and editing quizzes is to use the quiz designer, which provides a single, intuitive interface for creating and editing quizzes quickly. If you determine that you need to add specific features to your quiz not offered through the quiz designer, you can do so by using some of the specific procedures described here.

Set up a category

A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

When you create a quiz, the system creates a default category with the name of the quiz. You can use this category, modify it, or create additional categories as needed. Categories are records in the Quiz view of the Metric Category table.

Categories have weighting values that contribute to the overall score for the quiz. By default, all categories are given a weighting value of 10. You can assign any weight to your categories. To have any results, a category must contain scored questions.

You can create a new category or edit an existing one from the Metric Categories related list of a quiz record.
Select a user for a category

Category users are the recipients of the questions for each category.

A category can have one or more assigned users, and the same user can be assigned to more than one category. When the system distributes a quiz, it sends an email notification, if configured, to the category users and creates a link to the appropriate questionnaire in their assessments and surveys portal. Users can only answer questions attached to their assigned categories.

To select users for a category, select the Users related list in a category record, and click Edit.
Create questions

A category can have multiple questions associated with it.

Each question can only be associated with one category. Each question has an answer data type that determines how recipients answer the question. Questions are records in the Quiz view of the Assessment Metric table.

To create questions, open a category record and create a question record from the Assessment Metrics related list. Alternatively, you can navigate to Quiz Management > Questions and create a new record (see table).

**Warning:** When you create a Choice or Likert Scale question, you must reopen the Assessment Metric form after you submit it to create answers. If you distribute a questionnaire without creating the answers for questions with these data types, recipients are unable to answer the questions. If the questions are mandatory, the recipients are unable to submit their questionnaires.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Name of the question.</td>
</tr>
<tr>
<td>Category</td>
<td>(Required) Category the question belongs to. The system populates this category if you create a new question from the Metric Category form.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the category if the **Depends on** field is set or if another metric depends on this metric.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Method    | Setting that determines how to use the question.  
  - **Assessment**: Makes the question available on a quiz distributed to users. The **Assessment** method is compatible with all data types except **Duration**.  
  - **Script**: Queries the database without user participation. Scripted questions are of limited value for quizzes, because they do not assess a user's knowledge of a topic.  
  
  **Note**: If you select a **Data type** that is incompatible with the selected **Method**, the system automatically changes the **Method** to the correct value. |
| Weight    | Numeric value that represents the importance of this question relative to other questions in the same category. By default, the weight is 10. For weighting suggestions, see **weight categories and metrics**. This field is available and required unless the **Data type** is **Date**, **Date/Time**, or **String**. These data types are not included in results calculations. |
| Order     | (Required) Numeric value that determines the order of the question in the category. The question with the smallest order value appears as the first question in the category's section. By default, the order is 100.  
  
  **Note**: It does not matter which order value you use for metrics with the **Script** method, because they do not appear on questionnaires. |
| Active    | Check box that determines whether this question appears on quizzes. If a question is inactive, it does not appear on quizzes generated after the question becomes inactive. |
| Mandatory | Check box for requiring users to answer the question. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator.  
  This field is available only if the **Method** is **Assessment**, the **Depends on** field is empty, and the **Data type** is not **Checkbox**. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow not applicable</td>
<td>Check box for including Not Applicable as a possible answer for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results.</td>
</tr>
<tr>
<td>Question</td>
<td>The question that is displayed in quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question and what it evaluates. Include details that help users understand how to answer the question or when you need HTML enhanced details for your question. You can create HTML text in this field with the WYSIWYG editor, such as embedding links and images.</td>
</tr>
<tr>
<td>Depends on</td>
<td>An existing question that this question is dependent on. You can select Checkbox, Choice, Likert Scale, Template, and Yes/No questions from the same category as this question. Then use the Displayed when field to set the conditions for displaying this question. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Question Type</td>
<td>(Required) Format of the expected response data. See the table of data types for details.</td>
</tr>
<tr>
<td>Data type</td>
<td>(Required) Format of the expected response data. See the table of data types for details.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying the possible answers for this question in a random order whenever the question appears. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomizing answer options can help prevent this bias. This check box is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

**Note:** You cannot change the data type if another question depends on this question.

**Note:** Randomizing answer options for certain questions may make those questions confusing for users. In general, only randomize answer options that do not follow a logical order.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether lesser or greater numerical values equate to a good score in quiz result calculations. Select <strong>Low</strong> if lesser numerical values are better. Select <strong>High</strong> if greater numerical values are better. The default value is <strong>High</strong>. This field is available and required unless the <strong>Data type</strong> is <strong>Date</strong>, <strong>Date/Time</strong>, or <strong>String</strong>. The results for these data types are not included in results calculations. When the Scored check box is selected, the scale value is set to <strong>High</strong> and the field is hidden.</td>
</tr>
<tr>
<td>Min</td>
<td>Lowest numerical value that can be used as an answer option. This field is available and required only if <strong>Data type</strong> is <strong>Number</strong>, <strong>Duration</strong>, or <strong>Percentage</strong>.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest numerical value that can be used as an answer option or scaled value. This field is available and required if <strong>Data type</strong> is <strong>Number</strong>, <strong>Duration</strong>, or <strong>Percentage</strong>.</td>
</tr>
</tbody>
</table>
| String option | Setting for the appearance of a string field in a question. This field is available when the question type is **String**. The string options are:  
  - **Single line**: Single line text field 40 characters in length that allows strings of any length.  
  - **String line wide**: Full page width text field that allows a single line entry of any length.  
  - **Multiline**: Full page width multiline text field that allows word wrap and returns. |
| Scored        | Check box for using answers in scoring the category results and showing them in the quiz results. Scored questions are available for these data types:  
  - **Choice**  
  - **Likert Scale**  
  - **Template**  
  - **Checkbox**  
  - **Yes/No**  
  Selecting this check box hides the **Scale definition** field and sets the value in that field to **High**. |
Create answers for questions

Questions with Choice or Likert Scale data types must have defined answer options, called metric definitions.

When you create a question with one of these data types, the Assessment Metric Definitions related list appears. Each metric definition appears as one answer option for a question on a quiz. For example, the question *What type of men’s trousers are not permitted by company policy?* might have these three answers configured as metric definitions: *Slacks*, *Jeans*, and *Casual cotton*.

To create an answer option, open the question record you want to edit and click **New** in the Assessment Metric Definitions related list. Be sure to give each option a **Value**. The system uses this number to establish the order in which the answers appear in the quiz.

Distribute a quiz

When you finish configuring the answers for the quiz questions, you are ready to distribute the quiz.

You can send the quiz to all the category users configured for the quiz or to a single category user.

1. Navigate to **Quiz Management > Quizzes**.
2. Open the quiz record, and click **Publish**. The quiz is placed in the Published state, and it is sent to all its category users. You can edit and resend published quizzes. See **Modifying Published Quizzes** to learn how various modifications affect the quiz contents.
3. To resend a quiz, click the appropriate button:
- **Assign Quiz**: Send the quiz to one category user.
- **Send Quizzes**: Send the quiz to all of its category users.

**Note**: These buttons are hidden if there are no category users defined for the quiz.
Modify a published quiz
Post changes to existing questions immediately. Make new questions available to users who have not started the quiz.

You can edit a quiz even after it has been distributed, with these results:

- Added questions are available only on quizzes that are distributed after this change.
- Changes to existing questions are immediately available to users before the quiz is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed quizzes in users' queues.

Add a metric category and metric in the question bank for quizzes
Reuse the question categories (metric categories) and questions (metrics) added in the question bank for quizzes. You can add metric categories or metrics from the question bank to a quiz, or from the quiz to a question bank.

Role required: admin or assessment_admin

1. Navigate to Quizzes > Question Bank.
2. Click New.
3. In the Metric Category form, fill the fields.

<table>
<thead>
<tr>
<th>Metric Category fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Description</td>
</tr>
<tr>
<td>Total metrics</td>
</tr>
</tbody>
</table>

4. Right-click on the title bar and click Save.
5. In the Assessment Metrics related list, click New.
6. In the Assessment Metric form, fill the fields. For more information on these fields, refer to Create questions.
7. Click Submit.

Configure metric categories or metrics for a quiz using the question bank
Reuse question categories (metric categories) and questions (metrics) from the Question Bank module while creating or updating a quiz.

Role required: admin or assessment_admin

1. Navigate to Quizzes > Quizzes.
2. Open a quiz definition.
3. Optional: To add metric categories to a quiz from the question bank in Platform, perform the following steps.
   a) In the Metric Categories related list, click New Category from Bank.
      The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.
   b) Select the required categories and click Add Selected.
      A copy of the metric category and the corresponding metric definitions is created in the Metric Categories related list.
4. Optional: To add metrics to a quiz from the question bank in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) In the Assessment Metrics related list, click **New Metric from Bank**.
      The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.
   c) Select the required metrics and click **Add Selected**.
      A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.

5. Optional: To add a metric category to the question bank from a quiz in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) Click **Add to Question Bank**.
      A copy of the category is created along with its metrics and metric definitions in the question bank.

6. Optional: To add a metric to the question bank from a quiz in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) In the Assessment Metrics related list, open the required metric definition.
   c) Click **Add to Question Bank**.
      The Add to Question Bank dialog box is displayed.
   d) In the **Choose a question bank to add this question/metric** field, select a metric category that you want to add this metric to, and click **OK**.
      A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

7. Optional: To add a metric category or metric to a quiz from the question bank in Quiz Designer, perform the following steps.
   a) Open the quiz in Quiz Designer.
   b) Optional: To add a metric category from the question bank, from the **Categories** tab in the left panel, drag the required category banner and drop in the **Design** tab.
   c) Optional: To add a metric from the question bank, drag and drop the required metric from the **Questions** tab or the **Categories** tab.

---

**Note:**
- When you drag and drop a metric category, all dependencies within the category are also added to the quiz.
- From the **Categories** tab, you can drag and drop an individual metric within a metric category.
- When you drag and drop a parent metric, all dependent questions are also added to the metric category.
- When you drag and drop a child metric, only the child question is added to the metric category.
**Edit a quiz**

You can update a quiz after the quiz has been distributed.

Role required: assessment_admin or admin

You can only edit a quiz that has the same application scope as that of your current session.

- Questions that you add are available only on quizzes that are distributed after the update.
- Before a quiz is submitted or during the retake period:
  - Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  - Deleted questions are deleted from distributed quizzes in users' queues.

Open the quiz: Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes &gt; Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Right-click a quiz in the list and select Quiz Designer.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Open a quiz from the list and click Quiz Designer in the header of the Assessment Metric Type form.</td>
</tr>
</tbody>
</table>

Configure a scored question

Only scored questions are considered when calculating category and quiz results.

Role required: assessment_admin or admin

A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

1. Navigate to Quizzes > Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.
4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.
5. In the Question Type section of the Assessment Metric form, select the Scored check box.
   This check box is not available if the question's data type is not supported for scoring.
6. Select the Correct answer for the question.
   **Note:** Multiple correct answers are supported for a few data types. See Data types for quizzes.
7. Click Update.
8. Repeat the process for all the questions in the category that you want the system to score.
9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a template question

You can configure template questions when designing quizzes.

Role required: assessment_admin or admin

1. Drag the Template data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.

Question entry fields appear for that template.
4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.
7. Configure the properties for the remaining questions.
8. Click the X icon to close the template properties dialog box and save your settings.

Enable a quiz retake
You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz’s due date.

Role required: assessment_admin or admin

Results are not calculated until the quiz’s configured duration has elapsed. The card in the user’s queue remains visible until the quiz’s due date and displays a button to allow retakes.

1. Navigate to Assessments > Metric Definition > Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.
View a quiz result
You can view quiz results for each question and category, or view the quiz scorecard for a
detailed breakdown.

Role required: assessment_admin or admin

Quiz results are stored in the Metric Result (asmt_metric_result) table and display recipients'
answers to each question in a category.

Navigate to **Quizzes > Quiz Results**.

---

### Quiz reports

Quizzes provide several global reports so that assessment administrators can view important
statistics.

You can share these reports with specific users or groups and change the display options

For detailed field information and reporting options, click the link for the chart **Type**. To sort a
column in ascending or descending order, click the arrow in the column heading

#### Quiz reports

View a quiz scorecard
You can view scorecards for a quiz record.
Role required: assessment_admin or admin
For detailed information about scorecards, see Quiz scorecards.

1. Navigate to **Quizzes > Quizzes**.
2. Open a quiz record.
3. Under **Related Links**, select **View Scorecard**.
   The scorecard link is hidden if there are no quiz results to report.
4. The scorecard contains a header that displays the name of the quiz and a section that displays results or a comparison of ratings. You can select from these principal views:
   • Category Results
   • Question Results
   • Average Ratings
   • History

Quiz scorecards
The Quizzes application prepares printable scorecards.
A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.

The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

Category results
The Category Results view is a stacked bar chart of responses to all questions in a category.

Select the category to display from the choice list above the chart. Category results are only calculated for scored questions.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Quiz category results
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

Quiz category result details

Question results
The Question Results view shows the results for all questions in a quiz.
Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

Pie chart

The pie chart shows question results for these data types:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer.
Quiz scorecard question results - pie chart
Bar chart

A bar chart appears when question results use this data type:

- Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.
Average Ratings view

To view the effect of each question’s ratings on the entire category’s ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question’s weighted average.
Scorecard history

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current ratings against the previous ratings. Ratings are only calculated for **scored questions** questions.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Metric Category form containing the questions.

- **3 Years**: To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The **Diff** column shows the discrepancy between the current ratings and the previous calendar year’s ratings.
Scorecard history - 3 years

- **4 Quarters**: Quarterly quizzes compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2013, then the previous quarters appear as 2nd (2013), 1st (2013), 4th (2012), and 3rd (2012). All four of the previous quarters appear, whether or not there was any data for those quarters.
Scorecard history - 4 quarters

View an assessment category result
Category results contain values that represent an evaluated record’s performance in a specific metric category. Each category result record stores data from one assessment group. Category result values are calculated based on category and metric weights and from metric result values for the same category.

Role required: assessment_admin or admin

![Quiz Scorecard]

**Note:** The system does not include metric results from certain responses in category result calculations. To compensate, the system adjusts the weight of the other normalized metric result values within the same category.

1. Navigate to **Assessments > Results > Category Results**.
2. Click the reference icon («) next to an assessment group number to open the category result record.
3. View the Assessment Category Result form. All fields on the form are read-only.

**Assessment Category Result form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Name of the metric category that the category result values apply to.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Rating</td>
<td>Rating is used on scorecards and decision matrixes. Rating is updated dynamically as users complete assessments. Rating is calculated as:</td>
</tr>
</tbody>
</table>

\[
\text{Rating} = \frac{\text{Sum of all normalized values that share a particular assessment group, category, and assessable record}}{\text{Number of assessment instances for the assessment group}}
\]

For example: In the Assessment Category Results table example, the assessment group `ASG0000801` with category `Politeness` from group `NY DB` (the assessable record) has a Rating value 8.86.

On the associated Metric Results table, you can see that there are 4 instances of this group: `AINST0000801`, `AINST0000802`, `AINST0000803`, and `AINST0000804`.

The system calculated the rating using

\[
\frac{5.14 + 5.14 + 1.43 + 5.14 + 1.43 + 5.71 + 5.14 + 4.29 + 4.29 + 4.29}{4} = 8.86
\]
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the category result is associated. The category result <strong>Rating</strong> and <strong>Normalized value</strong> are calculated from metric results in this assessment group only.</td>
</tr>
</tbody>
</table>
| Normalized value | Calculated value that measures the **Rating** relative to the weights of categories used to assess the record evaluated.  
The normalized value is calculated as follows:

\[
\text{Normalized value} = \text{Rating} \times \left( \frac{\text{Associated category weight}}{\text{Sum of weights of all categories the source record has category results for in this assessment group}} \right)
\]

**Example:** A source record has four associated category results in assessment group ASG0000907, one for each of these categories:
- Importance Rating (weight = 10)
- Product Reliability (weight = 9)
- Company Alignment (weight = 9)
- Compliance Score (weight = 9)

If this source record’s category result for Product Reliability has a Rating of 7.81, the normalized value calculation is:

\[
7.81 \times \frac{9}{10+9+9+9} = 1.9
\]

<table>
<thead>
<tr>
<th>Weight</th>
<th>Weight of the associated category. You may need to configure the form to see this field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>Record evaluated as the assessment subject. You may need to configure the form to see this field.</td>
</tr>
</tbody>
</table>

### Create a decision matrix

The name and labels on a decision matrix are closely linked to the categories you choose for the axes. For that reason, first select the metric type and define the X and Y axes before you fill in other fields on the Decision Matrix form.

Role required: assessment_admin or admin

1. Navigate to **Assessments > Admin > Decision Matrixes**.
2. Click **New** and then select the metric **Type** to plot results for.
3. Right-click the form header and select **Save**.  
The X Axis and Y Axis related lists appear.
4. Define which metric categories the axes represent. Each axis can represent a single category or multiple categories. You must specify at least one category per axis in order for the decision matrix to render properly.

The available categories are limited to those associated to the metric type selected. To avoid confusion, always update the text for the axis and quadrant labels after editing or adding metric categories to an axis.
5. Fill in the remaining fields on the Decision Matrix form (see table) and save the record.
**Note:** For color fields, either HTML color names or hexadecimal (hex) values are acceptable. For hex values, the # character is optional. Values are not case-sensitive. For example, all of the following values are valid: LightGray, lightgray, #D3D3D3, d3d3d3.

### Decision Matrix form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the decision matrix, which appears as the title on the decision matrix page. It is recommended to include the axis categories in the name. For example, if you selected Importance Rating as the X-axis and User Satisfaction as the Y-axis, you might name the matrix Importance vs. User Satisfaction.</td>
</tr>
<tr>
<td>Type</td>
<td>Metric type associated with this decision matrix. Only results for assessable records of the selected metric type are plotted on the decision matrix.</td>
</tr>
<tr>
<td>Default</td>
<td>Determines whether or not this is the default decision matrix. The default decision matrix opens when you click View Matrix on a scorecard. Select the check box to set the matrix as the default decision matrix. The system prevents you from creating more than one default decision matrix per metric type. If there is already a default decision matrix for the type and you try to save a different matrix with the check box selected, an error message appears. The maximum values for the default decision matrix are controlled by the Maximum number of items to show for a decision matrix field filter property (com.snc.assessment.decision_matrix_filter_max_entries), which has a default value of 1000.</td>
</tr>
</tbody>
</table>

### Quadrant Design Section

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quadrant label color</td>
<td>Color of the label text for the quadrants. Each quadrant label displays in the center of the quadrant. You can enter an HTML color name or hex value for this and the other color fields.</td>
</tr>
<tr>
<td>X-Axis label</td>
<td>Label text for the X-axis of the decision matrix. It is recommended to include the metric category name in the label text. For example, for an X-axis category of Importance Rating, the X-axis label is Importance.</td>
</tr>
<tr>
<td>Plotted item color</td>
<td>Color used to display plotted items.</td>
</tr>
<tr>
<td>Top left label</td>
<td>Label text for the top left quadrant. For an X-axis labeled Importance and Y-axis labeled Support, you might label the top left quadrant Low importance, high support.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Top left color</td>
<td>Fill color for the top left quadrant.</td>
</tr>
<tr>
<td>Bottom left label</td>
<td>Label text for the bottom left quadrant.</td>
</tr>
<tr>
<td>Bottom left color</td>
<td>Fill color for the bottom left quadrant.</td>
</tr>
<tr>
<td>Bottom left label</td>
<td>Label text for the bottom left quadrant.</td>
</tr>
<tr>
<td>Bottom left color</td>
<td>Fill color for the bottom left quadrant.</td>
</tr>
<tr>
<td>Y-Axis label</td>
<td>Label text for the Y-axis of the decision matrix.</td>
</tr>
<tr>
<td>Highlight item color</td>
<td>Color of highlighted plotted items. When you view a decision matrix from an assessable record’s scorecard, the assessable record plotted item appears in the highlight color. Specify a highlight color that is different than the Plotted item color.</td>
</tr>
<tr>
<td>Top right label</td>
<td>Label text for the top right quadrant.</td>
</tr>
<tr>
<td>Top right color</td>
<td>Fill color for the top right quadrant.</td>
</tr>
<tr>
<td>Bottom right label</td>
<td>Label text for the bottom right quadrant.</td>
</tr>
<tr>
<td>Bottom right color</td>
<td>Fill color for the bottom right quadrant.</td>
</tr>
</tbody>
</table>

**Related Lists**

<table>
<thead>
<tr>
<th>X Axis</th>
<th>Lists categories that define the X-axis of the decision matrix.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y Axis</td>
<td>Lists categories that define the Y-axis of the decision matrix.</td>
</tr>
</tbody>
</table>

**Decision matrixes**

Assessment results obtained by questionnaires and scripted metrics can be mapped to decision matrixes.

Assessment administrators can view and create these dynamically updated graphs, which make it possible to compare assessable records by category. Decision matrixes display data from a trailing twelve month (TTM) period.
**Note:** Assessment administrators can access decision matrixes through the Assessment application and vendor managers can access them through the *Vendor Performance* application.

### Decision matrix components

The decision matrix page has these components:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Options</strong></td>
<td>Select the subset of assessable records you want to view. The filter options available vary by metric type, based on the <strong>Filter</strong> field and <strong>Filter condition</strong> field settings for each type.</td>
</tr>
<tr>
<td><strong>Filter</strong></td>
<td>Select the scale for the decision matrix. The greater the scale, the larger the decision matrix appears.</td>
</tr>
<tr>
<td><strong>Decision matrix</strong></td>
<td>Each axis represents one or more metric categories. If multiple categories are used for an axis, their respective <strong>weights</strong> determine the positioning of the plotted items.</td>
</tr>
<tr>
<td><strong>X- and Y-axes</strong></td>
<td>The maximum values in the filter are controlled by the <strong>Maximum number of items to show for a decision matrix field filter</strong> property (com.snc.assessment.decision_matrix_filter_max_entries), which has a default value of 1000.</td>
</tr>
<tr>
<td>Component</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Plotted items</td>
<td>The labeled points you see on a decision matrix, called plotted items, represent averages of category result data for assessable records. Point to a plotted item label to view a rating summary for that assessable record. Click a plotted item label to view the scorecard for the assessable record.</td>
</tr>
</tbody>
</table>
**Plotted item rating summaries**

If you point to a plotted item label on a decision matrix, a rating summary appears. The summary displays the assessable record's average ratings for each axis. If an axis represents one metric category, the ratings are calculated averages from results for that category. If an axis represents multiple categories, the ratings are calculated averages from weighted results for all of the categories.

The summary shows:

- Current rating
- Difference between the current rating and the rating from the previous year
- Ratings from each previous year, going back three years

![Decision matrix rating summary](image)

**Take an assessment**

Assessments that are assigned to you appear in your assessment and survey queue as a card that displays the assessment name, state, due date, and the associated incident number. Click **Take Survey** when you are ready.

Role required: none
Overdue surveys and assessments are marked with a red icon and red due date. You must answer every required question, indicated by a red bar, before you can submit the assessment as complete. If you start to take an assessment but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the assessment.

By default, you cannot modify your answers to an assessment after submission. However, if the administrator has configured an assessment to allow retakes, you can edit your answers and resubmit the questionnaire. Completed assessments configured for retake remain in the queue until their due date and display the Modify Assessment button on the card.

1. Navigate to Self-Service > My Assessments & Surveys.

   Note: Users with the assessment_admin role can display other users’ assessments and surveys in addition to their own. Use the Show all and Show assigned to me related links to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. On the assessment card, note the due date.

   Note: Depending on the configuration, you may receive email notifications to remind you of the due date.

3. Click Take Assessment to open the questionnaire.

   Assessment questionnaires are arranged in sections: first by record, then by category. Each record appears as a section title. Questions for the record appear below, grouped by category. Each category appears as a subsection below the record name. Click the collapse icon () or expand icon () to hide or show the questions in a category, or all the categories and questions for a record. Colored bars indicate the status of each question.
4. Answer each question to the best of your ability. Point to a question for more information.

If you are unsure of how to respond to a question or if a question does not apply to a particular record, select **Not Applicable**, if available.

5. Read any assertions present at the end of the assessment and acknowledge with a signature, if required.

A signature can require you to select a check box or authenticate your full name, which the system displays in a read-only field. You cannot submit your answers to the assessment until you provide the required signature.
6. Save or submit the assessment.
   - **Save**: Saves your responses without submitting them. You can close the questionnaire and access it later from your queue.
   - **Submit**: Submits the completed assessment when you are finished.

7. If prompted, enter your user name and password to verify your full name signature.
   If all the questions are answered with valid values, a success message appears. If the system detects an unanswered mandatory question or invalid response, the assessment is not submitted, and a message appears at the top of the questionnaire explaining the error. Questions with problems are temporarily highlighted.

8. You can modify your responses to the assessment until its due date. To update your answers and resubmit an assessment that permits retakes, click **Modify Assessment**.

**Assessment questionnaires**

In the assessment process, users complete assessment questionnaires on topics of interest to provide subjective data for future business decisions.
No special role is required to complete an assessment. You are eligible to complete assessments that are assigned to you. For example, you might be expected to evaluate vendors your organization works with, based on traits related to customer service. The system stores your responses so decision makers can compare the performance of the items you evaluate. You and your manager may receive email notifications as reminders of important assessment information.

**Metric types and assessable records**

In the Assessments application, assessment administrators create and administer metric types and assessable records.

A metric type defines a set of records an organization wants to evaluate, such as vendors, projects, or employees. For each type, the system generates unique assessable records that link the type to records that need to be evaluated, such as the individual records for the vendors Amazon and Intel. There may be multiple assessable records for the same source record if the source record meets the criteria for more than one type. For example, you might want to evaluate a record on the Company table, such as Intel, as a vendor and as a manufacturer, with different categories and metrics.

For configuration suggestions, see *Assessment administrator tasks*.

**Assessable records**

An assessable record links a source record you want to evaluate, such as the company record for Amazon or the user record for a sales representative, to a metric type, such as vendors or employees.

You use assessments to evaluate the assessable record. The system generates assessable records from the source records that match the table and conditions set on the Assessment Metric Type form. You evaluate the assessable records with metric categories and metrics, which define traits and values to assess. For metric types with the *On demand* schedule type, you can generate on-demand assessments from the Assessable Record form. This method of assessment generation makes it easy to create and preview short questionnaires or to quickly obtain assessment results for specific assessable records.

You can set up an assessment description that includes information from multiple fields on an assessable record and is displayed on multiple lines. This setup provides the user who is taking the assessment with a more detailed and understandable description of the information being requested on the assessment questionnaire. Create a multi-line description using table titles, which can be defined to use one or more fields from the selected table. See *Define a new smartphone table title* for more information.

**Delete an assessable record**

When you delete an assessable record, the system deletes any stakeholders for the record.

Role required: assessment_admin or admin

*Note:* If a source record is deleted, the system deletes the associated assessable record. To delete the source record, you must first delete all associated metric results and category results.

Delete the assessable record:

- To delete a single record, open the record and click Delete.
- To delete multiple records, use the Assessable Records list.
View an assessable record

View the Assessable Record form to edit preferences and perform various actions.

Role required: assessment_admin or admin

1. Navigate to Assessments > Assessable Records.
2. Open a record from the list.
   By default, the list displays only assessable records with Active metric types.
3. On the Assessable Record form, edit fields and perform other actions as necessary (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Read-Only) Assessable record name based on the display value of the source record. The name appears on assessment questionnaires.</td>
</tr>
<tr>
<td>Source</td>
<td>(Read-Only) Source record the assessable record is linked to. The Source reflects the table name and source record display value. For example, if the Name field is the display value for the Company table, the assessable record for a company record named Amazon has the Source value Company: Amazon.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Check box that, when selected, creates a live feed group for the assessable record, which appears on the scorecard. If you clear the check box after a live feed group has been created, the system deletes the live feed group and all its messages.</td>
</tr>
<tr>
<td>Type</td>
<td>(Read-Only) Metric type from which the assessable record was generated.</td>
</tr>
<tr>
<td>Decision matrix</td>
<td>Check box that, when selected, enables this assessable record's results data to appear on decision matrixes of the same metric type. Decision matrixes are graphs that plot the assessment results for multiple assessable records. If you clear the check box, the assessable record still appears on the default decision matrixes if you click the View Matrix related link on the assessable record's scorecard.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Live feed group</td>
<td>(Read-Only) Live feed group for this assessable record. When you select the Live feed check box and save the record, the system populates this field.</td>

<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>Category</td>
<td>All metric categories associated with the assessable record. An assessable record must be associated to a category to be evaluated. Click Edit to add or remove category associations. Note that it is often more efficient to associate assessable records to categories using the Metric Category form.</td>
</tr>
<tr>
<td>Category users</td>
<td>All stakeholders who can take assessment questionnaires about this assessable record. Click Edit to create and delete stakeholders. For more information about this and other methods of creating stakeholders, see Stakeholders. This related list is available only when the associated metric type has the Scheduled schedule type.</td>
</tr>
</tbody>
</table>

### Domain separation and Assessments

This is an overview of domain separation and Assessments. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

### Support level: Standard

- Includes **Basic** level
- Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another. Business logic:

### Overview

As an assessment creator, assessment_admin can create or edit an assessment in their assigned domain. A Global domain assessment_admin can create or edit assessment in any domain.
As an assessment taker, a user in a particular domain can see assessable records in the Global domain, in the user’s domain, and in any child domains. Users in the Global domain can see all assessable records.

**How domain separation works in Assessments**

If the metric type is global:
- All the categories and metric should be Global
- Assessable records can be from different domains
- When the assessment is assigned to a user, then:
  - Users in the Global domain can see all assessable records
  - Users in a particular domain can see assessable records in the Global domain, in their domain, and in any child domains
  - If the user does not have access to any of the assessable records (for example, the metric type is Global, but all assessable records are in Acme domain and a user in the XYZ domain is assigned the assessment), the assessment instance is not created and an “Instance could not be created” error message occurs.

If the metric type is not Global:
- All categories and metrics must be in the same domain as the metric type
- All assessable records must be in the same domain as the metric type
- You can assign assessments to users that are in the Global domain, in the domain of the metric type, or in any parent of the domain of the metric type

**Approvals**

Require authorization on tasks before the work is done. You can define approvals for all tasks and associate users or groups to a task to approve or reject them.

Approvals are defined by navigating to **System Policy > Approvals**.

The following information defines an approval:

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approver</td>
<td>A reference to the user who is responsible for approving the related record.</td>
</tr>
<tr>
<td>Approving</td>
<td>A document_id reference field to the record being approved, on any table.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Choices are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not Yet Requested (This state indicates that you are not yet asking your</td>
</tr>
<tr>
<td>approvers to approve this request. Until you set the status to Requested they</td>
</tr>
<tr>
<td>will receive no email notifications about the request.)</td>
</tr>
<tr>
<td>Requested</td>
</tr>
<tr>
<td>Approved</td>
</tr>
<tr>
<td>Rejected</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>---------------------------</td>
</tr>
<tr>
<td>Comments</td>
</tr>
<tr>
<td>Approval Summarizer</td>
</tr>
</tbody>
</table>

### Approval engines

The differences in the way that companies handle their approvals, as well as the differences between approvals for the various applications (such as Service Catalog Requests and Change Management), calls for supporting flexibility in setting up approvals within applications. This flexibility is provided through the selection of an "approval engine" that is used to manage the approvals for each of the Task tables (that is, all tables that extend the Task table).

There are three different approval engine options available for each Task table.

#### Approval engine options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Rules</td>
<td>A simple set of rules that are evaluated until one matches for the Task table. The matching approval rule is used to create the users that are to approve the task. Set up approval rules by navigating to <a href="#">System Policy &gt; Approvals</a>.</td>
</tr>
<tr>
<td>Process Guides</td>
<td>A sequence of approval steps over which you may control how approvals and rejections are handled. This option is deprecated and should not be used.</td>
</tr>
<tr>
<td>Turn off Engines</td>
<td>Turn off both approval engines for this Task table. This option should be selected and is made read-only when a workflow is used to manage the approval process for the table. <strong>Caution:</strong> Not turning off the approval engines might have a performance or behavioral impact on your instance.</td>
</tr>
</tbody>
</table>

### Set up an approval engine

To manage the approvals for each of the Task tables in the system, set up an approval engine.

1. **Navigate to [System Properties > Approval Engines](#).**

   The following page appears with the **Approval Engine** option for each Task table in the system. If the **Approval Engine** option is greyed out and shows **Turn engines off**, read the **Notes** in the same row. The most common reason an approval engine is turned off is that a workflow is managing the approvals on the table. Having the approval engine turned off prevents conflicts with the workflow that could cause a range of issues. If you want to use an approval engine on the table, set the workflow to inactive.
2. Select the approval engine option for each Task table from the choice list.

3. Click Save.

These preferences are saved as system properties that are named glide.approval_engine.<table_name>.
Approval rules

Many organizations rely on an approval process to ensure that requests are reasonable and fit an organization's budget.

The service catalog can use these classes of approvals:

<table>
<thead>
<tr>
<th>Approvals</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gating approvals</td>
</tr>
<tr>
<td>Process approvals</td>
</tr>
</tbody>
</table>

**Note:** To enable approval processes to operate smoothly, make sure that the appropriate users have the correct role, and that the role grants access to the necessary tables for users in all the relevant departments and domains.

Set automatic approval rules

Approval rules can automatically set the approval state to something other than Not yet requested. As a result, an approval rule can create a set of approvers. You can also start the approval process by setting the approval state to Requested.

Prerequisites

Role required: admin

Approval rules have two new fields:

- **Run rule before**: If true, the approval rule runs before the record is inserted/updated.
- **Set State**: If this rule applies, then the task record's approval state is automatically set to this value.

**Note:** The Set State field only behaves as expected if the Run rule before check box is enabled.

- In the example below, this rule automatically sets the state of the task to Approved thereby auto-approving the task.
Approval Rules fields

Gating approvals

A gating approval acts as a gate through which a request must pass before it can start. Until all gating approvals are met, no notifications go out, no tasks get sent to technicians, and nobody starts working on the request in question.

Generate gating approvals with:

<table>
<thead>
<tr>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval rules</td>
<td>Can apply to the service catalog as well as any other task table.</td>
</tr>
<tr>
<td>Item-based approvals</td>
<td>Flag specific catalog items as requiring specific approvals. Any requests for these items automatically require these approvals.</td>
</tr>
</tbody>
</table>

Set up a gating approval via an approval rule

You can set up a gating approval via an approval rule.

Role required: admin

1. From the left navigation pane, select System Policy > Approval Rules.
2. Click New.
### Approval rules

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this rule.</td>
</tr>
<tr>
<td>Table</td>
<td>Task table to which this rule applies. For most service catalog approvals, select <strong>Requested</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are <strong>in the same scope</strong> as the approval rule.</td>
</tr>
<tr>
<td>Active</td>
<td>Indicator of whether the rule is active (defaults to true).</td>
</tr>
<tr>
<td>Run Rule Before</td>
<td>Indicator of whether the rule runs before or after the request record is saved. For most approvals, select this check box.</td>
</tr>
<tr>
<td>User</td>
<td>User who must approve this request (can be empty).</td>
</tr>
<tr>
<td>Group</td>
<td>Group that must approve this request (can be empty).</td>
</tr>
<tr>
<td>Set State</td>
<td>Value of the approval field on the task in after this rule runs. In most cases, select <strong>Requested</strong>.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition under which the rule applies.</td>
</tr>
<tr>
<td>Script</td>
<td>An optional server script to programmatically specify who the approver should be. For example, for the one-line script <code>current.requested_for.manager</code>, ServiceNow checks the <code>requested_for</code> reference field on the current record. It then locates the <code>manager</code> field on the referenced record and assigns that person as the approver. For other examples, see the Script field on approval rules provided by ServiceNow.</td>
</tr>
</tbody>
</table>

**Notes and limitations:**

1. **You can have as many rules as you want on a given table. If more than one rule applies, you'll get more than one approver.**
2. **You can't get duplicate approvers, for example, if two rules both want Fred Luddy to approve a particular request, the system will only create one approval entry for him.**
3. **By default all requests start out in a Not yet requested approval state. Approval notifications will not go out until the request's approval state is set to Requested. You can do that manually, or you can do it in script, but the easiest way to do it is to use the Set State field to automatically set the request to Requested.**

**Set up a gating approval based on the item being ordered**

In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered.
In addition to adding approvals via approval rules, you can also add approvals based on what kind of item is being ordered. We can, for example, specify that all Blackberrys need to be approved by David Loo.

To do so, navigate to the item in question and scroll to the related list of required approvers. There are two lists:

- **Approved By Group**: A list of groups that have to approve requests for this item
- **Approved By**: A list of users who have to approve requests for this item

### Approved By Group

<table>
<thead>
<tr>
<th>Approval group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware</td>
</tr>
</tbody>
</table>

### Approved By

<table>
<thead>
<tr>
<th>Approver</th>
</tr>
</thead>
<tbody>
<tr>
<td>David Loo</td>
</tr>
</tbody>
</table>

Approve list

In the example above, this request must be approved by all members of the Hardware group and by David Loo.

Notes and limitations:

1. As with approval rules, you are protected against duplicate entries. Thus if David Loo is a member of the hardware group, as well as being a standalone approver, he will only get one approval request.

2. Item-based approved work in addition to rather than instead of approval rules so you can (and probably will) use both.

**Process approvals**

Once a request has passed its gating approvals, any relevant execution plans are initiated.

Those plans, in turn, create a sequence of required tasks. You can add an approval step to an execution plan, which is configured to occur at the appropriate point.

From the left navigation pane, select **Service Catalog > Execution Plans**, and then select the plan to which to add an approval step. Then click the **New Approval** button.
The Approval Task screen appears. Just like a regular Service Catalog execution task, an approval execution task has:

- **Name**: The name of this task
- **Order**: Sequence of this task within the plan
- **SLA**: SLA to which this task applies
- **Delivery Time**: Time allowed for the completion of this task

After you create the task, right click the title bar and select **Save**. Two related lists appear at the bottom of the screen:

- **Approved By Group**: A list of groups that must approve the request before this task is complete
- **Approved By**: A list of users who must approve the request before this task is complete
In the example above, this security approval task must be approved by Fred Luddy.

**Note:** When an in-process approval is rejected, that particular line item is canceled as well, but the request itself isn't necessarily canceled. Thus if one ordered a blackberry and a laptop, and the blackberry was rejected, the laptop request would continue being processed.

**Approve with a process guide**

Process guides work similarly to approval rules in that their execution is controlled via a condition. The default version of approval tasks allows you to specify that the approval in question be approved by:

1. One or more specific people
2. One or more groups of people
You can optionally use Process Guides instead of approval tasks. Process guides are more flexible in that they allow for:

1. "Any of" or "All of" approvals
2. Sequenced approvals

You can link a process guide to an execution task.

1. From the left navigation pane, select **System Policy > Process Guides**.
2. Create a new guide.
3. Set the table to **Catalog task**.
4. Fill in a condition under which this guide should attach.

Example #1: Apply to all "Capacity Review" tasks.

Example #2: Apply to all "Capacity Review" tasks where the requester is in Atlanta.

Process guide tips and tricks:

1. All catalog tasks are generated when a request is first submitted, but tasks which aren’t active yet have a state of “pending”. So if you do not want to send out approval requests until a task has actually started, add “state=open” as part of your condition.
2. There is a “Default” process guide in the system for catalog tasks with a sequence number of 10,000. It behaves exactly the same way the old, pre-process guide code did in regards to approvals. Approvals are based on the execution of task-related lists.

**Schematic of a hypothetical approval process**

In the diagram below of a hypothetical approval process, the gating approval is color coded blue and an in-process approval is orange.
Approval process

Approval summarizer formatter

The approval summarizer formatter creates the summary at the bottom of an approval form. The approval summarizer displays different information depending on what is being approved, such as a change request or a service catalog request. Following are two examples.
### Summary of Item being approved

#### Change Request

<table>
<thead>
<tr>
<th>Number</th>
<th>CHG0000001</th>
<th>Requested by</th>
<th>David Loo</th>
</tr>
</thead>
<tbody>
<tr>
<td>Affected CI</td>
<td>Sales Force Automation</td>
<td>Type</td>
<td>Normal</td>
</tr>
<tr>
<td>Planned start date</td>
<td>2016-07-27 16:00:00</td>
<td>Risk</td>
<td>High</td>
</tr>
<tr>
<td>Planned end date</td>
<td>2016-07-27 18:00:00</td>
<td>Impact</td>
<td>3 - Low</td>
</tr>
</tbody>
</table>

**Short description**
Rollback Oracle Version

**Description**
Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend.

We moved to an unsupported Oracle DB version. Need to rollback the Oracle Instance to a supported version.
Summary of a catalog request

The **Reject** button allows the approver to deny one or more requested items in a multi-item request, before approving the overall request. If a requested item is denied, the workflow for that item never starts. The approver can then choose to **Accept** the item.

**Note:** When the overall request is approved, you must ensure this **Reject** button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state. Similarly, the **Accept** button on requested items should only appear before the overall request is approved or rejected.

**Summarizers**

Approval summarizers are stored in the Macro (sys_ui_macro) table.

From the left navigation pane, select **System UI > UI Macros**. Summarizers use a naming convention of approval_summarizer_ + `<table_name>` (for example, approval_summarizer_change_request is the summarizer for change requests, while approval_summarizer_sc_request is the summarizer for service catalog requests).

Each summarizer is written in Jelly script, which is used to define internal forms. The script is stored in the large XML field at the bottom of the UI Macro form.

**Change an approval summarizer**

You can modify existing approval summaries to include additional information.

These are advanced customizations that might not be appropriate for all implementations, and require creating a custom form.

1. Navigate to **System UI > UI Macros**.
2. Open the summarizer you want to change.
3. Copy the script to another location before editing, in case you need to revert it.
4. Modify the script.
5. Click **Update**.

*Create a new custom approval summarizer*

After you add a new table that has approvals to an instance, you can add a custom activity formatter by creating a new UI macro and then add it to the appropriate form. The approval_summarizer can only be used on approval forms in the global scope.

1. Navigate to **System UI > UI Macros**
2. Click **New**.
3. Give the macro a name that follows the summarizer naming convention: approval_summarizer_<tablename>
4. Complete the rest of the form and click **Submit**.
5. *Create an activity formatter* and add it to the appropriate form.

To learn more about activity formatters, see **Activity formatter**.

**Approval with e-signature**

Approval with e-signature allows users to approve requests by re-entering their login credentials. Approval with e-signature supports the following authentication credentials:

- User name and password matching a user in the local database.
- User name and password matching a user authorized by an external identity provider as part of a SAML 2.0 single sign-on integration.

**Activate Approval with e-Signature plugin**

The Approval with e-Signature plugin (com.glide.e_signature_approvals) allows users to approve requests by re-entering their login credentials.

Role required: admin

1. Navigate to **System Definition > Plugins**.

A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

![Note: To redirect to the legacy list view for plugins, click the link.](image)

2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in **Request a plugin**.

3. Activate the plugin.

You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

- If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.
To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

**De-activate e-signatures**
Use this procedure to de-activate e-signatures.
Although plugins cannot be removed, e-signatures can be disabled.
1. Navigate to System Definition > E-Signature Registry.
2. Set Enabled to **False** on any tables where e-signatures are no longer required.

**Use e-signature approvals**
Users can approve requests with an e-signature.
Users can approve requests with an e-signature by:
- Selecting the **Approve** or **Reject** option on a list context menu.
- Clicking the **Approve** or **Reject** button on a form.
- Changing a request record’s State to **Approved** in either the list-editor or form.
Selecting any of these options presents the user with an Approver Authentication window, which requests the user's credentials again.

**Installed with approval with e-signature**

Installing approval with e-signature installs certain properties.

- Module - E-Signature Registry
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with no action name)
- UI Action - Approve (on table sysapproval_approver, with the action name authenticated_list_approval)
- UI Page - form_login_validate_dialog
- UI Page - login_validate_dialog
- UI page: saml2_esignature_login, the re-authentication page that appears when an approver tries to approve a request.
- Properties: see E-signature SAML properties
- Client Script - Authenticate Approver
- Script Include - User
- Script Include - UserAuthentication
- Processor: eSigSaml2AssertionConsumer

Installing the plugin also disables the two out-of-the-box Approve UI Actions on the sysapproval_approver table.

**Select an approval table**

By default, activating the Approval with E-signature plugin enables e-signature for all tables for which a previous approval exists.

E-signature approvals can also be enabled on a table-by-table basis. To enable e-signatures for a table:

1. Navigate to System Definition > E-Signature Registry.
2. In Table name, use the drop-down list to select a specific table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>A table drop-down to select the table that requires e-signatures.</td>
</tr>
<tr>
<td>Enabled</td>
<td>If selected, e-signature is required. Clear this option to remove the e-signature requirement.</td>
</tr>
</tbody>
</table>

**Set up an approval from a local database**

Enable users to authorize e-signature approvals using local database credentials.

1. Activate the Approval with e-signatures plugin.
2. Create user records for approval users.

**Use Multi-Provider SSO to set up an SSO approval for a SAML 2.0 authentication**

An SSO approval with e-signature requires configuration on the SAML IdP and the ServiceNow instance.
The SAML IdP must support and honor the forceAuthn attribute in SAML assertion requests. E-signature does not function without this IdP setting. Set up an approval with e-signature using credentials from a SAML 2.0 authentication.

1. Activate or upgrade to SAML 2.0 with the Integration - Multiple Provider Single Sign-On Installer plugin.
2. Activate the Approval with E-Signature plugin.
3. Navigate to Multi-Provider SSO > Identity Providers and verify your 2.0 SAML IdP configuration. Advanced tab shows the Force AuthnRequest attribute checked. Your SAML 2.0 IdP must support the Force AuthnRequest attribute, or e-signature is not supported.
4. On the eSignature Approval tab, enter the following e-signature SAML properties:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assertion Consumer URL for eSignature authentication</td>
<td>This property defaults to the appropriate URL. To configure this property, click the lock icon to make this field editable. After edits, click the icon to lock the field.</td>
</tr>
<tr>
<td>Assertion Consumer Index for eSignature authentication</td>
<td>If your Service Provider has more than one URL set for the AssertionConsumerURL, you can set the index to use for eSignature, starting with index 1 or more.</td>
</tr>
<tr>
<td>AuthnRequest URL for eSignature Authentication</td>
<td>You can enter the URL that points to the SAML 2.0 IdP AuthnRequest URL for eSignature authentication. If the URL is the same as the Assertion Consumer URL, you can leave this setting blank.</td>
</tr>
<tr>
<td>Authentication Pop-up Dialog Width</td>
<td>When a user approves a request using eSignature, a dialog opens and a user can enter credentials. This setting controls the width of that dialog box. The default is 500.</td>
</tr>
<tr>
<td>Authentication Pop-up Dialog Height</td>
<td>When a user approves a request using eSignature, a dialog opens and a user can enter credentials. This setting controls the height of that dialog box. The default is 300.</td>
</tr>
</tbody>
</table>
5. Click the **Generate Metadata** button underneath the tabs to regenerate the service provider metadata. Copy this data and update it on the SAML IdP.

**Set up e-signature approvals**

The setup required depends on where user credentials are stored.

See the section that matches the source of your user credentials:

- *Setting up approvals from a local database*
- *E-signature SAML properties*

**Note:** ADFS 2.0 does not support re-authentication requests that E-Signature requires.

**Approval status**

The approval status of a change request is determined by looking at the current status of all the approvers.

If any approver has rejected the change, the approval status will be Rejected. If all approvers have approved the change, the approval status will be Approved. If all approvers are in the Not Requested status or if there are no approvers, the change status will be Not Requested, otherwise the status will be Requested.

For added flexibility when creating approvals, including the ability to set up an “one of” approval where only one person of a group of approvers needs to approve, consider using [Workflows](#).

**Generate an approval using approval rules**

The system can automatically generate an approval request to individuals or groups when specific criteria are met. The automatic generation of approval requests is driven using the System Policy feature.
In the sample below, a change opened in the category **network** is assigned to the System Administrator:

<table>
<thead>
<tr>
<th>Approval Rules</th>
<th>Update</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name: Network Approvals</td>
<td></td>
</tr>
<tr>
<td>Table: Change</td>
<td></td>
</tr>
<tr>
<td>Match conditions: All</td>
<td></td>
</tr>
<tr>
<td>Conditions: Add</td>
<td></td>
</tr>
</tbody>
</table>

**Approval Rules**

When an approver is automatically added based on approval rules, the status of the approval automatically defaults to "Requested".

**Generate approvals using the approvers related list**

It is possible to manually add approvers to a request.

Additional approvers can be added by clicking the **Edit** button in the Approvers section near the bottom of a request. When an approver is added manually, the status for that approver defaults to **Not Yet Requested**. When the status of the approver changes to **Requested**, the approver is sent an email requesting approval action.

**Generate approvals using workflows**

Workflows are a powerful and flexible method of generating approvals. Use workflows to create group approvals and user approvals.

A variety of variables are available to fine-tune the approval process, including the actions that occur when approval or rejection take place. When a workflow activity generates an approval record, the system populates the **Workflow activity** field on the approval record with a reference to the activity. Do not use this field when creating business logic. For more information, see [Approval and Rollback Activities](#).

**Note:** Conflicts can arise when the approval process for a table is managed by both the workflow engine and the approval engine. In general, if there is a workflow that manages the approval process for a table, the **approval engine** should be turned off for that table.

**Multiple approvers**

With multiple approvers, all approvers must authorize the request before the status will change to "Approved".

Should any approver reject the request, the status will immediately be set to "Rejected".

**Receive notifications**

Individuals who are designated approvers automatically receive approval notifications, including approval status updates.
Approval notifications will be sent at the following times:

- When an individual is assigned as an approver either automatically or manually. If a group is chosen, then all members of the group will be sent an email. By default, the email an approver receives will contain a "mailto" link that will allow the approver to either approve or reject the request directly from their email system.
- When the request reaches approved status, the person assigned to the request will receive an email indicating it has been approved.

The details contained in the emails and the points at which they are sent can be tailored using System Definition > Business Rules and System Policy.

Note for Blackberry users: In order to see the "mailto" links mentioned above to approve or reject a request (i.e. 'Click here to approve CHG55555' or 'Click here to reject CHG55555'), your Blackberry device must be using version 4.5 of their software which supports HTML emails. If your Blackberry device is using an earlier version, you will not be able to view or use the "mailto" links. However, as a workaround, users can reply to the email and add the statements state:approved or state:rejected within the body of the email before sending it to force the automatic approval/rejection functionality.

If you create an appropriate Inbound Email Action, you can let approvers respond to approval email notifications with a simple "yes" or "no" answer.

**Embed an approval request within the Outlook email client**

Embed an interactive approval request for service catalog requests in the email notification sent to a user. The user can accept or reject the approval request from the email client.

Role required: admin

The Outlook Actionable Messages plugin (com.sn_ms_oam) should be activated.

*Note:*
- The Outlook Actionable Messages (OAM) feature is not supported in all Microsoft mail products and versions. To verify whether your version of Outlook supports OAM, refer to the Microsoft documentation.
- Actionable messages are supported only for emails sent from the @service-now.com email address. If you are sending an email from a customized email address, you should register as a new service in the Microsoft website setting the scope as Organization. Specify the provider ID value in the sn_ms_oam.outlookactionable.originator property.
- Actionable messages are based on the Sender Policy Framework (SPF)/DomainKeys Identified Mail (DKIM) validation for the email sender verification. If an email recipient receives email via an external provider, emails may not be rendered as adaptive cards.
- You cannot customize the default actionable message templates.

1. Navigate to System Notification > Email > Notifications.
2. For the approval notification that requires user approval, in the What it will contain tab, add the following script in the Message field in addition to the existing information, or to the Message field in the configured email template if applicable.

   ```
   ${mail_script:include_approval_actionable}
   ```

   For example, for the Catalog Approval Request and Approval Request notifications, you can include the script in request.itil.approve.role and change.itil.approve.role email templates.
This script includes the Outlook actionable message in the email notification sent to the user for approvals.

3. Click **Update**.

### Dynamic approval forms

When you are looking at an approval request, the form has a context-appropriate summary of the item to be approved.

For example, if you're looking at a Change Management approval request, you'll see details from the relevant change request. For a Service Catalog approval request, you'll get details of the request.

<table>
<thead>
<tr>
<th>Approval</th>
<th>Update</th>
<th>Approve</th>
<th>Reject</th>
<th>Delete</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approver: Bow Ruggeri</td>
<td>Approval for: CHG00001</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>State: Approved</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Summary of Item Under Review:

**Rollback Oracle Version**

Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend. We moved to an unsupported Oracle DB version. Need to rollback the Oracle instance to a supported version.

Change request approval example
Scripts and engines execution order

Scripts, assignment rules, business rules, workflows, escalations, and engines all take effect in relation to a database operation, such as insert or update. In many cases, the order of these events is important.

**Note:** Client-based code that executes in the browser, using Ajax or running as JavaScript, will always execute before the form submission to the server.

The order of execution is as follows:

1. **Before** business rules: Scripts configured to execute before the database operation with an order less than 1000.

2. **Before** engines. The following are not executed in any specific order:
   - Approval engine (for task and sys_approval_approver tables)
   - Assignment rules engine (for task tables)
   - Data policy engine
   - Escalation engine
   - Field normalization engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember, and sys_user_role tables)
   - Execution plan engine (for task tables)
   - Update version engine - creates version entry when sys_update_xml entry is written (for sys_update_xml table)
   - Workflow engine (for default workflows)

3. **Before** business rules: Scripts configured to execute before the database operation with an order greater than or equal to 1000.
4. The database operation (insert, update, delete).
5. After business rules: Scripts configured to execute after the database operation with an order less than 1000.
6. After engines. The following are not executed in any specific order:
   - Label engine
   - Listener engine
   - Table notifications engine
   - Role engine - keeps role changes in sync with sys_user_has_role table (for sys_user, sys_user_group, sys_user_grmember and sys_user_role tables)
   - Text indexing engine
   - Update sync engine
   - Data lookup engine inserts or updates
   - Workflow engine (for deferred workflows)
   - Trigger engine (for all Flow Designer flows)
7. Email notifications. The following are executed based on the weight of the notification record:
   - Notifications sent on an insert, update, or delete
   - Event-based notifications
8. After business rules. Scripts configured to execute after the database operation with an order greater than or equal to 1000.

**Fulfiller experience in ServiceNow Agent**

Approve catalog requests, requested items, or change requests from anywhere using the ITSM ServiceNow Agent application.

As an ITSM agent or technician, you can use the mobile app when connected online to accomplish the following:

- Accept or reject the pending approval requests.
- View the completed approval requests.

The request experience is not available in this mobile app.

Watch this three-minute video to learn how to manage approval requests in the mobile app.

**Activation information**

This mobile application runs on the ServiceNow® mobile platform. You should activate the ITSM Mobile Experience (com.sn_itsm_mobile) plugin that enables the ITSM mobile application.

**Get started with the mobile app for Approvals**

Access the My Approvals application instance on your mobile app to manage approval requests using your mobile device.

Role required: business_stakeholder or approver_user
Download the ServiceNow® mobile application on an iOS platform from the Apple App Store or on an Android platform from the Google Play Store.

1. Open the mobile app and tap the plus icon.

2. Add a ServiceNow instance. For more information on adding the instance, refer to Add a ServiceNow instance.

3. Tap My Approvals to start managing your requests.

Manage a catalog request approval

Manage your assigned catalog request or requested item by approving or rejecting it from anywhere using your mobile device.

Role required: business_stakeholder or approver_user

1. Tap My Approvals on your mobile app.
2. To approve or reject a pending approval request, perform the following steps.
   a) Tap the Pending Approvals applet. All approvals in the Requested state are displayed.
   b) Swipe a request and tap Approve or Reject.

   Note: You should specify the reason while rejecting a request.

   c) Optional: To view the details of a pending approval request, tap it.

   Note: To approve or reject a request, tap the menu icon and tap Approve or Reject.

3. To view a completed approval request, perform the following steps.
   a) Tap the Completed Approvals applet. All approval requests that are either accepted or rejected are displayed.
   b) To view the details of the request, tap it.

Geolocation

The geolocation feature uses Google Maps to track users, plan efficient routes between locations, and assist in finding accurate travel times for applications that require this information, such as Work Management.

The system locates users from latitude and longitude information provided by their mobile devices or browsers. Tracking the location of certain users can improve business processes such as the completion of work order tasks. For example, in work management geolocation, the system updates an agent’s position each time that agent updates a task record. When the system updates an agent’s location frequently, agents and dispatchers can use features like auto-routing to create efficient schedules.

Geolocation features can be configured by users with the admin role.
Activate geolocation

An administrator can activate the Geolocation plugin.

Role required: admin

1. Navigate to System Definition > Plugins.
   
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   ![Note: To redirect to the legacy list view for plugins, click the link.]

   ![You have been redirected to All Applications. To see the Plugins list click here](image)

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you're certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.

   ![Activate Plugin](image)

   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.

     If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.

     4. If demo data is available and you want to install it, click Load demo data.
Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

### Installed with geolocation

Several component types are installed with Geolocation.

**Modified by Geolocation**

The Geolocation plugin adds a field called **Geolocation tracked** to the User [sys_user] table. This field allows the system to track individual users by their geographical coordinates.

### Business rules installed with geolocation

Business rules are added with activation of Geolocation.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GeoLocation Data updated</td>
<td>User (sys_user)</td>
<td>Populates the <strong>Latitude</strong> and <strong>Longitude</strong> fields on the Geolocation History (geo_history) table when the <strong>Latitude</strong> and <strong>Longitude</strong> fields are updated on the User (sys_user) table.</td>
</tr>
</tbody>
</table>

### Client scripts installed with geolocation

Client scripts are added with activation of Geolocation.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update Geolocation on Task</td>
<td>Task (task)</td>
<td>Populates the <strong>Latitude</strong> and <strong>Longitude</strong> fields on a user record with GPS coordinates when that user loads any record on the Task table or a table that extends Task. This occurs only when geolocation tracking is enabled for the user.</td>
</tr>
</tbody>
</table>

### Properties installed with geolocation

Geolocation provides the following configurable properties in **Geolocation > Administration > Geolocation Properties**.

The Google Maps plugin provides additional **map properties** that are used to implement and control specific geolocation features. You must have a **private key** for Google Maps API for Business to take advantage of the properties listed here.
### Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.geolocation.allow.toll.roads</td>
<td>Allow toll roads to be used. Allows the system to use toll roads when auto-routing or optimizing task routes for agents.</td>
</tr>
</tbody>
</table>
|                                           | • **Type:** True/false
|                                           | • **Default value:** True                                                  |
| glide.geolocation.default.start.time      | Default start time for all agents when no schedule is set. This value sets the start time for a day other than the current day, when no scheduled task exists or is continued from the previous day. This property uses a 24 hour clock. |
|                                           | • **Type:** String
|                                           | • **Default value:** 08:00                                                  |
| glide.geolocation.evening.rush.hours      | Evening rush hour span, formatted as 14:30-16:00. All times are expressed as a range, separated by a dash with no spaces. Times not using this format are ignored. This property must be used with the work.management.morning.rush.hours and work.management.rush.travel.buffer properties and uses a 24 hour clock. |
|                                           | • **Type:** String
|                                           | • **Default:** 0                                                          |
| glide.geolocation.history.cleanup         | Number of days to keep history data. ServiceNow keeps agent geolocation history records for the number of days specified by this value. |
|                                           | • **Type:** Integer
|                                           | • **Default value:** 30                                                    |
| glide.geolocation.morning.rush.hours      | Morning rush hour span, formatted as 06:30-08:00. This property uses a 24 hour clock. All times are expressed as a range, separated by a dash with no spaces. Times not using this format are ignored. This property must be used with the work.management.evening.rush.hours and work.management.rush.travel.buffer properties. |
|                                           | • **Type:** String
<p>|                                           | • <strong>Default:</strong> 0                                                          |</p>
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.geolocation.proximity</td>
<td>Minimum distance an agent must move to be considered in a new location (in meters). This setting establishes a geolocation perimeter that prevents ServiceNow from creating unnecessary history records when an agent has multiple tasks in the same vicinity. An example of this might be when an agent has several tasks in one building. The system assumes that all task activity within the specified radius is part of a single record and does not create additional records when the agent moves from task to task around the building.</td>
</tr>
<tr>
<td>· Type: Integer</td>
<td>· Default value: 500</td>
</tr>
<tr>
<td>· Note:</td>
<td>Note: The iOS version of the app updates geolocation only when the mobile device detects a significant location change, which is determined by the your device's operating system. When the operating system updates it's location, your app updates with that location change. Distance and time property values are not honored for the iOS version of ServiceNow apps.</td>
</tr>
<tr>
<td>glide.geolocation.proximity.location</td>
<td>Maximum distance an agent can be from a specific location and still be placed at that location (in meters). This setting defines the maximum distance that an agent can be from a specified location and still be placed at that location by the system.</td>
</tr>
<tr>
<td>· Type: Integer</td>
<td>· Default value: 200</td>
</tr>
<tr>
<td>glide.geolocation.rush.travel.buffer</td>
<td>Percentage to add to all rush hour travel times. The system uses this percentage to calculate schedules when auto-routing an agent. Use this property when both morning and evening rush hour times are defined. An example of a valid time buffer percentage is 15.</td>
</tr>
<tr>
<td>· Type: Integer</td>
<td>· Default value: 0</td>
</tr>

</tbody>
</table>

---

**Script includes installed with geolocation**

Script includes are added with activation of Geolocation.
### Geolocation Google key

Geolocation requires a Google Maps API for Business license to enable the use of Google driving time estimates and to use Google Maps. Applications, such as Field Service Management, have functionality that requires this license.

If you are using auto-routing or auto-dispatch in Field Service Management, both the Google Maps API for Business private key and the client ID must be set for precise time estimates. Without these values, driving times for auto-routing and auto-dispatch are not available, and a rough estimate or fixed time is used. Use these properties, found in System Properties > Google Maps, to enable the geolocation feature.

- **Client ID for Google Maps API for Business:** Google client ID for your organization. This ID is from Google and starts with `gme-`, such as `gme-mycompanyname`.
- **Private key for Google Maps API for Business:** Key required to get accurate driving time estimates from Google for some features of Geolocation. An example of an encoded key is: `vNIXE0xscrmjlyV-12Nj_BvUPaw=`

### Geolocation history

The Geolocation History (geo_history) table contains the history of each tracked user’s location over time.

To view geolocation history, navigate to Geolocation > Geolocation History. The record list shows time stamped location data for all users configured for geolocation tracking.

The following system properties, located in Geolocation > Administration > Geolocation Properties, control the data that appears in this table.

- **Minimum distance an agent must move to be considered in a new location (in meters):** Perimeter that defines a single location in which multiple tasks are present. This property prevents the system from creating unnecessary history records when multiple tasks are in the same general location.
- **Maximum distance an agent can be from a specific location and still be placed at that location (in meters):** Distance that a user can be from a specified location and still be placed at that location when the system creates history data.
- **Number of days to keep history data:** Time period for which the system retains history data.
- **Minimum amount of time between updating the user’s location (in seconds):** Time period the system waits before updating a user’s location, regardless of how often the user accesses tasks.

### Location tracking

Geolocation adds the Geolocation tracked field to the User form. In the default view of a user record, select the Geolocation tracked check box to enable location tracking for the user.

When a user has geolocation tracking enabled, the system updates the user’s geographic coordinates whenever the user opens, or loads, a record from the Task (task) table or from a table that extends Task. After this initial update, the system continues to update the user’s geographic coordinates at a recurring interval if the user does not close or reload the record. To edit the...
length of this interval, navigate to Geolocation > Administration > Geolocation Properties and change the setting for the property that regulates the update interval for the user’s location. The default setting for this property is 300 seconds (5 minutes).

**Note:** The system can update geographic coordinates only for users who have location services enabled in their browsers. Even users who have the Geolocation tracked check box selected may be prompted by their browsers to share or withhold their location.

### State flows

State flows enable an administrator to customize transitions from one state to another in tables derived from the Task (task) table and configure the system to perform work during transitions to specific states.

An example of a state transition is when the State field in an incident changes from Active to Awaiting User Info. An administrator might want to trigger an event during this transition or make a specific field mandatory when the incident reaches the end state.

State transitions in the Field Service Management application were reimplemented to use state flows. For information about customizing Field Service Management state flows, see *State flow customization.*

### Installed with state flows

Several types of components are installed with state flows.

#### Tables installed with state flows

Tables are added with state flows.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State Flow (sf_state_flow)</td>
<td>Contains state flow definitions. This table contains all state flow definitions, including those for work orders and work order tasks.</td>
</tr>
<tr>
<td>Work Order Flow (sf_work_order)</td>
<td>Contains state flow definitions for work orders. This table is installed when Field Service Management is activated.</td>
</tr>
<tr>
<td>Work Task Flow (sf_work_task)</td>
<td>Contains state flow definitions for work order tasks. This table is installed when Field Service Management is activated.</td>
</tr>
</tbody>
</table>

#### Business rules installed with state flows

Business rules are added with state flows.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assert Field Uniqueness in State Flow</td>
<td>State Flow (sf_state_flow)</td>
<td>Ensures that business rules and UI actions are not accidentally copied to new state flows.</td>
</tr>
<tr>
<td>Check Client Script</td>
<td>State Flow (sf_state_flow)</td>
<td>Adds a client script to new records.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Check Event Rule</td>
<td>State Flow</td>
<td>Adds or deletes event rules, as the event field is updated.</td>
</tr>
<tr>
<td></td>
<td>(sf_state_flow)</td>
<td></td>
</tr>
<tr>
<td>Check Work Notes Rule</td>
<td>State Flow</td>
<td>Adds or deletes work note rules, as the work notes for a state flow are updated.</td>
</tr>
<tr>
<td></td>
<td>(sf_state_flow)</td>
<td></td>
</tr>
<tr>
<td>Create Business Rule</td>
<td>State Flow</td>
<td>Automatically creates a business rule when automatic conditions or script are present.</td>
</tr>
<tr>
<td></td>
<td>(sf_state_flow)</td>
<td></td>
</tr>
<tr>
<td>Create script for Field controls</td>
<td>State Flow</td>
<td>Create scripts for field controls, when they are in use.</td>
</tr>
<tr>
<td></td>
<td>(sf_state_flow)</td>
<td></td>
</tr>
<tr>
<td>Create UI Action</td>
<td>State Flow</td>
<td>Automatically creates a UI action when manual conditions or script are filled in.</td>
</tr>
<tr>
<td></td>
<td>(sf_state_flow)</td>
<td></td>
</tr>
<tr>
<td>Delete Related Elements</td>
<td>State Flow</td>
<td>When state flows are deleted, delete all related client scripts, business rules, UI actions and overrides.</td>
</tr>
<tr>
<td></td>
<td>(sf_state_flow)</td>
<td></td>
</tr>
<tr>
<td>Remove script for Field controls</td>
<td>State Flow</td>
<td>If all field controls are disabled, see if any of the client scripts should be removed.</td>
</tr>
<tr>
<td></td>
<td>(sf_state_flow)</td>
<td></td>
</tr>
<tr>
<td>State Change</td>
<td>State Flow</td>
<td>Get the correct state choice value when the state is changed.</td>
</tr>
<tr>
<td></td>
<td>(sf_state_flow)</td>
<td></td>
</tr>
<tr>
<td>Update dependent records</td>
<td>State Flow</td>
<td>When a state flow is made active or inactive, ensure the business rule and UI actions are made active or inactive as well.</td>
</tr>
<tr>
<td></td>
<td>(sf_state_flow)</td>
<td></td>
</tr>
</tbody>
</table>

**Script includes installed with state flows**

Script includes are added with state flows.

**Script includes for state flows**

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>StateFlow</td>
<td>Implements state flows and supports creation of state flow elements, such as business rules, UI actions, dictionary overrides, and client scripts.</td>
</tr>
<tr>
<td>StateFlowAJAX</td>
<td>Allows access to state flow functionality from client scripts.</td>
</tr>
</tbody>
</table>

**Use state flows**

You can create custom state flows for any table that uses states.
Make state transitions occur in any order or skip specific states according to your business practices. State flows can manage the behavior of fields and field visibility on a task form. State flows can also trigger system events that perform work such as sending email notifications.

Administrators can configure state flows to:

- Limit the choice list for the State field to contain only those states that are valid for the flow.
- Define the behavior and visibility of specific fields on a task form when state transitions occur and for certain end states.
- Configure events that are triggered when a task changes states.
- Set up UI actions and business rules to implement certain state transitions, or while the task is in certain states.

The State Flow plugin installs records used by work management to control state transitions for work orders and work order tasks. For detailed information about using work management state flows, see State flow customization.

Creating and customizing state flows requires scripting knowledge. Users with the admin role can create state flow records.

**Dictionary overrides for state flows**

A dictionary override in a state flow defines the starting state for all new records in a specific table.

You set an override in tables that extend a base table only, so that your customizations are applied only to the extended table.

1. In a state flow record, select an Ending state.
   - This is the override value which becomes the starting state for all new records in the table named.

2. Click Create Default Value.
   - The system populates the Dictionary override field with a value of state, which is the field in the task table affected by the override. The Dictionary override field is read-only. After the override is created, the system hides the Create Default Value button on all subsequent state flow forms for that table.

**Events triggered on state changes**

You can configure a state flow to trigger a registered system event when a task transitions from a starting state to a specified end state.

For example, you can use events to trigger email notifications and create script actions. When you attach an event to a state flow, the system creates a business rule called State Flow Events for <table name> for the table specified in the state flow. If you specify a start and end state, the business rule executes when the record transitions from the start state to the end state. If the state flow only specifies an end state, the business rule executes whenever that end state is reached. The system creates one business rule for all state flows containing events on a single table. When all events or all state flows on a table are deleted, the system deletes the business rule.
Field controls

You can define controls for individual fields that are enforced when a record transitions between states.

Settings in the Field Controls section of the State Flow form enable you to apply field controls when the system detects a specified state transition or when the end state is the current state when the form is opened. The control is applied only to existing fields on the form. State flows cannot add fields to the form.

For example, you might want the Problem field to be visible when an incident moves to the Awaiting Problem state. If the incident state changes to Awaiting User Info, you hide the Problem field and make the Caller field mandatory.

When creating field controls, configure state flow records with an ending state only and to create the correct behavior for every ending state you want to control. This configuration ensures that the field controls are set properly when the user selects a new state, and also when the user returns a record’s State field to the original state. Only specify a full state transition, with both a starting and ending state, when you want a particular behavior for that precise state transition.

Note: State flows use client scripts to enforce field controls. It is possible that your settings can be changed by existing UI policies, which execute after client scripts.

The system creates the following objects, as needed, to enforce field properties in state flows:

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business rule</td>
<td>State Flow Notes for &lt;table name&gt;</td>
<td>Enforces mandatory fields for the table on which that field behavior is defined.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td>&lt;table name&gt; state flow</td>
<td>Sets possible states and initial mandatory, read-only, and visible properties when a record is loaded.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td>&lt;table name&gt; change state flow</td>
<td>Sets updated mandatory, read-only, and visible properties when a record is changed.</td>
</tr>
</tbody>
</table>

Rebuild state flows

You can rebuild state flows when a mismatch between existing and new sys_ids occurs.

When you use an XML file to import a state flow record into an instance, the system attempts to match the incoming states with existing states by comparing sys_ids. Because the sys_ids of items in a choice list can vary between instances, the system can fail to match the states, even though they are otherwise identical.

When matching fails, the start and end states of affected records are left blank or contain numeric values. To repair these records navigate to State Flows > Admin > Rebuild State Flows. This module runs a script that compares the numerical value of each item in the State field choice list until it finds a match in the imported state flow record.
State flow cleanup

Work notes

Create a state flow

Creating State Flows.

2. Fill in the fields, as appropriate.

The system enforces the field controls with the same client script that filters the choice list for the State field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number</td>
</tr>
<tr>
<td>Table</td>
<td>(Required) Table on which the state flow record runs. Only tables that extend the Task [task] table are available in the list.</td>
</tr>
<tr>
<td>Starting state</td>
<td>Name of the state at the beginning of the transition. The selections in this field are filtered by the possible states for the table selected.</td>
</tr>
<tr>
<td>Ending state</td>
<td>Name of the state at the end of the transition. The selections in this field are filtered by the possible states for the table selected.</td>
</tr>
<tr>
<td>Client script</td>
<td>Client script to run for this transition. The client script controls the available states you can select by limiting the contents of the State choice list to valid states. This client script also controls specific field behavior configured for state changes in the Field Controls section of the form.</td>
</tr>
<tr>
<td>Event</td>
<td>Name of an existing event to trigger when this transition occurs. See events triggered on state changes for more information.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of this record. Make sure the name is descriptive of the state transition or the processing that the record is performing. This name does not have to be unique.</td>
</tr>
<tr>
<td>Roles</td>
<td>Not used for any processing.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables or disables this state flow record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Class                  | Defines the state flow class for this record. The system selects the appropriate class from these options:  
  - **State Flow**: Records created for state flows in all task-based tables except those in work management.  
  - **Work Order Flow**: Records created for state flows in the Work Order table. This class is available when work management is activated.  
  - **Work Task Flow**: Records created for state flows in the Work Order Task table. This class is available when work management is activated.                                                                                                                                 |
<p>| Dictionary override    | Sets the starting value for the State field on all new records for the table named in the state flow record. See dictionary overrides for configuration procedures.                                                                                                               |
| Work notes             | Noteworthy comments about this state flow transition. For details about how these notes are used, see Work Notes.                                                                                                                                                                                                                       |
| Comment                | Details about the customized record.                                                                                                                                                                                                                                                                                                      |
| Manual (Runs scripts from a UI action that require the user to click a button or related link.) |                                                                                                                                                                                                                                                                                                                                         |
| Manual condition string| Conditions for enabling a UI action that cannot be defined with the condition builder. For example, you can use this string to define UI actions for mobile devices. This condition has an (and) relationship with the condition in the Manual condition field.                                                                                                               |
| Manual condition       | Conditions for enabling a UI action that can be defined for fields in the target table. This condition has an (and) relationship with the condition in the Manual condition string field.                                                                                                                                                        |
| Manual script          | Script that defines what the UI action does when the conditions are true. This script runs when the user clicks a button or a related link.                                                                                                                                                                                                  |
| UI action              | (Read Only) Name of the button that the system creates to enable this transition. The system creates the label using the same name as the state flow record that created it.                                                                                                                                                                      |
| Automatic (Runs a business rule automatically when a task record is changed and updated.) |                                                                                                                                                                                                                                                                                                                                         |
| Automatic condition string| Conditions for running the business rule that cannot be defined with the condition builder, such as evaluating if the proposed transition is a valid flow. This condition has an (and) relationship with the condition in the Automatic condition field.                                                                                     |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic condition</td>
<td>Conditions for running the business rule that can be defined for fields in the target table. This condition has an (and) relationship with the condition in the <strong>Automatic condition string</strong> field.</td>
</tr>
<tr>
<td>Automatic script</td>
<td>Script that performs additional work when the condition is true. This script can do tasks such as update the date and time the transition occurred or notify someone using email when a specific state change occurs. Automatic state transitions occur when changes are made to the task record.</td>
</tr>
<tr>
<td>Business rule</td>
<td>Name of the business rule created for this transition. Two conditions must be satisfied before this business rule can run. The task must be on a specific starting state, and the <strong>Automatic condition</strong> must be true. If both of these conditions are satisfied, the business rule performs the transition requested, using the starting and ending states from the State Flow form.</td>
</tr>
<tr>
<td>Field Controls</td>
<td>(Determines <strong>field properties</strong> when a record transitions between states or reaches a specific end state.)</td>
</tr>
<tr>
<td>Mandatory fields</td>
<td>Makes the selected fields required when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Read only fields</td>
<td>Prevents the selected fields from being edited when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Visible fields</td>
<td>Displays the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not mandatory</td>
<td>Makes the selected fields optional when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not read only</td>
<td>Makes the selected fields editable when this transition occurs, or when the end state is the current state.</td>
</tr>
<tr>
<td>Not visible</td>
<td>Hides the selected fields when this transition occurs, or when the end state is the current state.</td>
</tr>
</tbody>
</table>

3. Determine if you want the state transition method to be manual or automatic and open the appropriate section on the form.

- **Manual**: Click **Create UI Action** to create a button on the task form that enables users to execute the transition manually. The system uses the value in the **Name** field as the label for the UI action. The UI action executes the script in the **Manual Script** field when the conditions are true. For example, a manual transition can create an **Activate** button when an incident is in the **New** state that enables a user to mark the incident as active.

- **Automatic**: Click **Create Business Rule** to create the business rule. The business rule executes the script in the **Automatic Script** field when the conditions are true. For example, a business rule created by the system can set an incident state to **Assigned** when the
Assigned to field is populated. Business rules are automatically deleted when the state flow record is deleted. For more information, see Business Rules.

4. Optional: Click Create Client Script to create the script that limits the values offered in a task record’s State field to valid states for that transition.

5. Configure the fields in the Field Controls section to control how specific fields display when a task record changes states.

State flow cleanup

The business rules, client scripts, and UI actions that the system creates automatically to perform custom transitions exist only while the state flow records that use them are present.

When all the state flows on a table are deleted, the system attempts to delete any unnecessary programming elements that were created on that table, using these criteria:

<table>
<thead>
<tr>
<th>Element</th>
<th>Deleted When</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI action</td>
<td>The state flow that created it is deleted.</td>
</tr>
<tr>
<td>Business rule</td>
<td>All state flows for the table specified that have events configured are deleted.</td>
</tr>
<tr>
<td>Dictionary override</td>
<td>All state flows for the table are deleted.</td>
</tr>
<tr>
<td>Business rule that processes events triggered by a state flow</td>
<td>All state flows with field controls are deleted.</td>
</tr>
<tr>
<td>Client script (onLoad)</td>
<td>All state flows with field controls or work notes are deleted.</td>
</tr>
<tr>
<td>Client script (onChange)</td>
<td>All state flows with field controls or work notes are deleted.</td>
</tr>
<tr>
<td>Work notes business rule</td>
<td>All state flows with field controls or work notes are deleted.</td>
</tr>
</tbody>
</table>

Work notes

Work notes are an important part of the state flow process and are used to communicate information about state transitions.

The state flow adds these work notes to the Work notes field of any task making this transition. These rules apply to state flow work notes:

- For a state flow with no Starting state, the work note is added every time the task transitions to the Ending state.
- For a state flow with a Starting state and an Ending state, the work note is added only when the task transitions from that starting state to that ending state.
- If two state flows with work notes have the same Ending state, but only one has a Starting state, the system adds the work notes from the state flow with the starting state. This better matches the state flow work note to the more important transition between specific starting and ending states.

Domain separation and State Flows

This is an overview of domain separation and State Flows. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
No support

- The domain field may exist on data tables, but no logic exists to manage data.
- This level is not considered domain-separated.

Overview

Domain separation provides complete data isolation for domain-specific users.

Survey Management

With the ServiceNow® Survey Management application you can create, send, and collect responses for basic surveys. If installed, you can also use the Survey widget to set up a survey within Service Portal.

Get started with Survey Management

Two versions of the application are supported, Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

Note: Survey Management does not support domain separation.
Configuring surveys

There are many options for advanced configuration in Survey Management:

- Create a survey, add questions, and choose recipients, all in one interface.
- Create conditional questions, which appear only when users answer other questions a certain way.
- Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even anonymous users (users who have not logged in to the ServiceNow system).

**Tip:** The assessment_take2 UI page should be public for public surveys. If that page is not public, anonymous users do not have access to the page and public surveys do not work.

- Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
- Customize the look and feel of survey questionnaires.
- Save anonymous survey responses.
- Convert survey responses to numerical scores and view them on scorecards.
- Deactivate a survey for maintenance or to retire it without deleting it.

**Note:** Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

Legacy Surveys

Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

**Note:** The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

Survey Management roles

The Survey Management application uses the following roles. No role is required to take assigned survey questionnaires.

### Survey Management roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey administrator (survey_admin)</td>
<td>Create and administer surveys. Survey administrators know what types of surveys are necessary, when to send a survey, and to whom. Survey administrators can use all modules in the Survey application menu.</td>
<td>survey_reader, assessment_admin</td>
</tr>
<tr>
<td>Survey reader (survey_reader)</td>
<td>View surveys and related information, such as survey responses, survey groups, scorecards, and reports.</td>
<td>none</td>
</tr>
</tbody>
</table>

Key survey terms

These survey terms are used throughout the documentation to describe survey management functions and capabilities.

### Key survey terms

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey definition</td>
<td>Root record on which a survey is built. A survey definition contains information such as the survey name, state, and distribution schedule. Each survey definition has its own categories and questions. Survey definitions are comparable to legacy survey masters.</td>
</tr>
<tr>
<td>Public survey</td>
<td>Any user can take a public survey, even users who have not logged in to the ServiceNow system. For a completed survey, the <strong>Assigned to</strong> field value is Guest.</td>
</tr>
<tr>
<td>Survey category</td>
<td>Represents a theme for survey questions. Categories contain one or more questions. The system creates one category per survey by default. Additional categories are optional.</td>
</tr>
<tr>
<td>Survey question</td>
<td>A question that appears on a survey questionnaire for the associated survey definition. Survey questions are comparable to legacy survey questions.</td>
</tr>
<tr>
<td>Survey user</td>
<td>User who is authorized to receive invitations for a restricted survey.</td>
</tr>
<tr>
<td>Term</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Survey instance</td>
<td>Represents one survey questionnaire assigned to one user. Survey instances are comparable to legacy survey instances.</td>
</tr>
<tr>
<td>Trigger condition</td>
<td>Defines a rule that enables the system to send a survey when an action occurs on a table, such as when an incident closes. Trigger conditions are comparable to legacy survey conditions.</td>
</tr>
<tr>
<td>Scorecard</td>
<td>Visual representation of survey responses. Scorecards display a variety of data summaries for one survey definition.</td>
</tr>
</tbody>
</table>

**Survey questionnaires**

All surveys that are assigned to you appear in your personal assessment and survey queue. No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.

**Survey notification**

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.

*Take a survey*

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Role required: none

Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

1. Navigate to **Self-Service > My Assessments & Surveys**.

   Users with the assessment_admin role, including survey administrators, can display other users' assessments and surveys in addition to their own. Use the **Show all** and **Show assigned to me** related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click **Take Survey** on a survey card to open the questionnaire.

   If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.

   If you are unsure of how to respond to a question or if a question does not apply to a particular record, select **Not Applicable**, if available.

4. Complete one of the following steps.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Save your responses without submitting them</strong></td>
<td>Click <strong>Save</strong>. You can close the questionnaire and access it later from your queue.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.</td>
</tr>
<tr>
<td><strong>Submit the survey after answering all questions</strong></td>
<td>Click <strong>Submit</strong>. You cannot return to the questionnaire after submitting.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.</td>
</tr>
</tbody>
</table>

**Domain separation for Survey Management**

This is an overview of domain separation as it pertains to Survey Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: Basic**

- There is business logic to ensure data goes into the proper domain for the application’s service provider use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at run time.
- The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Use case: As a service provider when I use chat to respond to a tenant-customer’s message, the client must be able to see my response.

**Overview**

As a survey creator, survey_admin can create surveys in the assigned domain. A Global domain survey_admin can create or edit survey in any domain.

As a survey taker, a user can access the survey record and take the survey based on the domain of the survey record and user. Global domain users can take a survey in any domain.

**How domain separation works in Survey Management**

There are several main areas to consider in how domain separation works in Survey Management.

**Survey Management in domain-separated instances**
The following domains are available by default after activating the Domain Support-Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin. Only ServiceNow employees can activate this plugin.

- Global
- Acme
- Cisco

Access to surveys in domain-separated instances

Based on the domain of the survey record and users, users can access the survey record and take the survey.

Global domain users can access survey records in any domain. Users in any other domain can access records in their domain and Global domain. For example, users in the Acme domain can access records in the Acme domain and the Global domain.

Global domain users can take a survey in any domain. Users in any other domain can take surveys in their domain as well as the Global domain. For example, users in Acme domain can take surveys in the Acme domain and the Global domain.

<table>
<thead>
<tr>
<th>Location of the survey record</th>
<th>Users who can access and take the survey</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Global</td>
</tr>
<tr>
<td>Global</td>
<td>Yes</td>
</tr>
<tr>
<td>Acme</td>
<td>Yes</td>
</tr>
<tr>
<td>Cisco</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Any domain user can assign a survey in that domain to the same domain user or a Global domain user. For example, an Acme domain user can assign a survey to a Global domain user or an Acme domain user. Users from other domains are not visible to the Acme domain user.

Although the Global domain user can view a survey from other domains, this user cannot assign the survey of one domain to a user from a different domain. For example, a Global domain user can assign a survey from the Acme domain to another Global domain user or an Acme domain user, but not to a Cisco domain user.

Note: When a task is closed in a child domain and the assigned survey is either in the child domain or the global domain, the user from the child domain can then take the survey.

Trigger conditions in domain-separated instances

A Global domain user can create a triggered condition for a survey from any domain. The Global domain user can create an incident and trigger the survey by selecting a user from the other domain in the User field under Caller. However, the Global user cannot assign the survey to the user of different domain.

A user can assign a trigger condition to a survey if the user belongs to the Global domain or the Survey domain.

If there is no domain path for a trigger condition, users from any domain can view the trigger condition. For example, in the asmt_condition table that has no column for the domain path, users from the Acme domain can view the trigger condition created by the Cisco domain users.
Survey responses and results

There is a metric result record for each user response to each question on every survey instance. Survey results for each question and category are calculated automatically based on the metric result records.

If you use survey result calculations for results and scorecards, ensure that the positive indicator field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.

Survey responses

Survey responses are stored in the Metric Result (asmt_metric_result) table and display the recipients’ answers to each question in a category. To view general results, navigate to Survey > Survey Responses. To view results for a particular criterion, use a filter on the Metric Result (asmt_metric_result) table. For example, to view results based on the assignment group, apply a filter condition for assignment group.
Category results

Category results are stored in the Assessment Category Result (asmt_category_result) table and display the overall ratings for each category based on the weighted value for each scored question. To view these results, navigate to Assessments > Results > Category results and filter the results using the (Type.Evaluation method) (is) (Survey) condition.
Survey scorecards
A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a survey scorecard.

View results for all surveys
You can view the survey responses that are stored on the Metric Result (asmt_metric_result) table.

Role required: survey_admin or survey_reader

1. Navigate to Survey > Survey Responses.

Do not confuse this module with Survey > Legacy Surveys > Survey Responses, which displays legacy survey responses.

The Type column displays the survey definition each response is associated with.
2. Select a response to view its details.

View the results for a survey
You can view the responses for one survey definition. Survey results are stored on the Metric Result (asmt_metric_result) table.
Role required: survey_admin or survey_reader

1. Navigate to Survey > View Surveys
2. Open a survey definition.
3. Under Related Links, click View Responses, which is available only if there are results.
   The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail.
   The metric result contains the user's response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.

Metric result fields
List of field descriptions for the Metric Result form.
### Metric Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.</td>
</tr>
<tr>
<td>Metric</td>
<td>Question that the user answered.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question the user answered.</td>
</tr>
<tr>
<td>Method</td>
<td>Assessment method. Always <strong>Assessment</strong> for surveys.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Survey definition from which the associated survey instance was generated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the survey questionnaire.</td>
</tr>
<tr>
<td>Instance</td>
<td>Survey instance completed by the <strong>Assigned to</strong> user.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Value obtained from the user response to the question. The actual value is determined by the question data type:</td>
</tr>
<tr>
<td></td>
<td>* Checkbox: The actual value is 0 if the check box is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>* Choice or Likert Scale: The actual value is equal to the <strong>Value</strong> of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>* Date, Date/Time, or String: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>* Template: The actual value is equal to the <strong>Value</strong> of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>* Yes/No: The actual value is 0 if the response is <strong>No</strong> and 1 if it is <strong>Yes</strong>.</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Adjusted value that accounts for the <strong>Scale definition</strong> setting, minimum and maximum values, and other factors.</td>
</tr>
<tr>
<td></td>
<td>The equation that generates the value and an example calculation appear in <strong>Normalized value for an assessment</strong>.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String value</td>
<td>Value that displays the response as it appears on a questionnaire. In some cases this is the same as the Actual value, such as when the question data type is Percentage. The string value is N/A for unanswered questions of certain data types.</td>
</tr>
</tbody>
</table>

**Normalized value for an assessment**

The normalized value is calculated based on a linear equation and the scale definition of the metric. This value can be used for risk assessment.

**Normalized value for any metric**

The normalized value is directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then

\[
\text{Normalized value} = 1.0 - \text{Normalized value}. 
\]

For reporting purpose, use the Metric Result (asmt_metric_result) table.

\[
\text{Normalized value} = \frac{\text{Input Value} - \text{Min value defined in metric}}{\text{Max value defined in metric} - \text{Min value defined in metric}} \times \frac{\text{current metric weight}}{\text{(sum of valid metric weight in the metric category)}} \times \text{scale_factor} 
\]

For example, consider the following scenario.

Calculate the normalized value for the Please rate the competency of the technician metric.

**Values of the metric**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input value</td>
<td>3</td>
</tr>
<tr>
<td>Minimum value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum value</td>
<td>6</td>
</tr>
<tr>
<td>Current metric weight</td>
<td>10</td>
</tr>
<tr>
<td>Number of metrics in the metric category</td>
<td>6</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>4 of type=number</td>
</tr>
<tr>
<td></td>
<td>1 of type=yes/no</td>
</tr>
<tr>
<td></td>
<td>1 of type=string (invalid data type; value cannot be calculated)</td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
<td>10</td>
</tr>
<tr>
<td>Scale factor</td>
<td>10</td>
</tr>
</tbody>
</table>

\[
\text{Normalized value} = \frac{3 - 1}{6 - 1} \times \frac{10}{(10 + 10 + 10 + 10 + 10)} \times 10 = 0.8 
\]

Several data types are ignored because the values cannot be calculated. These invalid data types include string, date, and datetime.
Normalized value for a multiple selection metric

The normalized value for a multiple selection metric is calculated by using the weight of the metric and the score for each choice of the metric.

In a multiple selection metric, for each choice that should be used for the normalization calculation, define the normalization input value.

Normalized value = (Score of all choices) * (current metric weight / (sum of valid metric weight in the metric category)) * scale_factor

Here, score of all choices of the metric is the sum of individual scores of each choice.

* Score of each choice in a multiple selection metric= Normalization input of the choice / max value of the metric
* max value of the metric = Sum of the normalization input for all choices of the metric
* min value of the metric is always 0

For example, consider the following scenario.

Calculate the normalized value for the multiple selection metric, **Please rate the competency of the technician**, with three choices, A, B, and C.

<table>
<thead>
<tr>
<th>Values of the metric</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Choice A</td>
<td>Normalization input is 1</td>
</tr>
<tr>
<td>Choice B</td>
<td>Normalization input is 1</td>
</tr>
<tr>
<td>Choice C</td>
<td>Normalization input is 2</td>
</tr>
<tr>
<td>Minimum value</td>
<td>0</td>
</tr>
<tr>
<td>Maximum value</td>
<td>4</td>
</tr>
<tr>
<td>Current metric weight</td>
<td>10</td>
</tr>
<tr>
<td>Number of metrics in the metric category</td>
<td>5</td>
</tr>
<tr>
<td>Valid metric weight of each metric</td>
<td>10</td>
</tr>
<tr>
<td>Scale factor</td>
<td>10</td>
</tr>
</tbody>
</table>

If Choice A and B are selected, Normalized value = \(((1 / 4) + (1 / 4)) \times (10 / (10 + 10 + 10 + 10 + 10)) \times 10 = 1

**Weighted value for a risk assessment**

For a risk assessment, the weighted value from metric results table is calculated as following.

\[ \text{weighted\_value} = \text{metric\_weight} \times \text{result\_actual\_value} \]

**View a survey scorecard**

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Role required: survey_admin or survey_reader
A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. Under Related Links, click View Scorecard. The interactive scorecard displays the following filters:
   - Question Results: Displays the result of all questions or an individual question.
   - Category Results: Displays the results of all questions associated with an individual category or all categories.
   - Average Ratings: Displays the result of weighted average rating for each survey question in an individual category or all categories.
   - History: Displays the result of all questions in comparison with their history (by calendar year or quarters).
   - Sentiment Analysis Results: Displays the results of sentiment analysis for the survey.

**Note:** The scorecard link is hidden if there are no survey results to report.

Survey scorecard category results

The Category Results view is a stacked bar chart showing survey results for all questions in an individual category or all categories by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No
- Multiple selection
- Image Scale
- Numeric Scale

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the Survey Designer.
Survey category results

To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

Survey scorecard category results detail
Survey scorecard question results

The Question Results filter displays the result of all questions or an individual question using charts or lists. For the String, Attachment, Date, Date/time, Reference, and Ranking data types, the results are displayed in the list view. The results of all other data types are displayed in the pie chart view.

Pie chart

The pie chart shows question results for all data types other than those that are displayed in the list view. See Survey question data types.

- Checkbox.
- Boolean.
- Choice.
- Likert Scale.
- Number.
- Percentage.
- Yes/No.
- Image Scale.
- Multiple Selection.
- Template. The question result shows the aggregated net promoter score (NPS) with promoters, detractors, and passives.

### Net promoter score categories

<table>
<thead>
<tr>
<th>Question score</th>
<th>NPS category</th>
</tr>
</thead>
<tbody>
<tr>
<td>9 or 10</td>
<td>Promoter</td>
</tr>
<tr>
<td>7 or 8</td>
<td>Passive or Neutral</td>
</tr>
<tr>
<td>0 to 6</td>
<td>Detractor</td>
</tr>
</tbody>
</table>

The result is calculated as:

- %Promoters = Number of promoters / Sample size
- %Detractors = Number of detractors / Sample size
- %Passives = Number of passives / Sample size
- NPS = %Promoters - %Detractors

**Note:** The Checkbox and Yes/No data types are combined into the Boolean data type in the survey designer.
Service Desk Satisfaction Survey

Survey Scorecard

How courteous and respectful was the technician who responded? (1=poor, 6=excellent)

- 6 = 2 (14.29%)
- 5 = 2 (14.29%)
- 4 = 9 (54.29%)
- 3 = 1 (7.14%)
- 2 = 1 (7.14%)
- 1 = 2 (14.29%)
Survey scorecard average ratings
The Average Ratings view displays the weighted average rating for each survey question in an individual category or all categories.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
Service Desk Satisfaction Survey

Survey Scorecard

Average question rating in category: Service Desk Satisfaction Survey

- How courteous and...
- How satisfied are...
- How satisfied were...
- Please rate the t...
- Was technician ab...

Average Normalized value
To view the effect of each question’s ratings on the entire category’s ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question’s weighted average.

![Chart showing Compare Plans and Benefit Satisfaction with Benefit Satisfaction rating of 0.88 (23.75%).]

**Average ratings detail**

**Survey scorecard history**
The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the **Diff** column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.
Survey scorecard trend chart

3 years

To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.

</table>

Survey scorecard history - 3 years
4 quarters

Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2015, then the previous quarters appear as 2nd (2015), 1st (2015), 4th (2014), and 3rd (2014). All four of the previous quarters appear, whether or not there was any data for those quarters.

#### Survey scorecard history - 4 quarters
Export a survey scorecard as an image
You can export a scorecard as an image to use in presentations or other documents.

Role required: admin or survey_admin

1. Click the menu icon (⋯) and select **Save as PNG** or **Save as JPEG** and wait for the export to complete.

2. Click **Download** and save the scorecard image to a storage location.
Survey administration

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey administration includes the following procedures.

- Create, customize, and publish surveys.
- Write and maintain survey questions.
- Define trigger conditions for when surveys are sent to users, such as when an incident closes.
- Maintain surveys and survey questions as the organization's needs change.

To set up surveys in Service Portal, you must first install Service Portal and then configure the Survey widget on the page. The base system includes the Survey widget.

View the overview of all surveys

Use this homepage to view various survey reports such as results by metric type and state.

Role required: admin or survey_admin

You can refresh, add, delete, and rearrange widgets. All reports on the Survey Overview page have demo data.

1. Navigate to Survey > Overview.
   The following reports are available:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>

3. To refresh, edit, or close a widget, point to the widget and select the required option.

Survey designer

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.

You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to
another question. The following describes the procedures you follow to create and publish a survey.

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

**Note:** The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

**Survey designer elements**
The survey designer is accessible from Survey > Survey Designer.

The survey designer contains the Controls tab, the Questions tab, the Categories tab, a header bar, and the design canvas.

**Controls tab**
To create a question, drag the appropriate data type control from the Controls palette and drop it onto the designer canvas.
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score from 0 through 10.

**Question data types**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Scored</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>No</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>

</tr>
<tr>
<td>Ranking</td>
<td></td>
<td>Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.</td>
</tr>
</tbody>
</table>

**Questions tab**

This tab displays all metrics added to the question bank for surveys. Use the **Filter** field to search for questions. Each metric is displayed with its name and type.

**Categories tab**

This tab displays all metric categories added to the question bank for surveys. All metrics in the question bank are group under the corresponding metric category. Use the **Filter** field to search for categories or questions.

**Header bar**

The tabs on the header bar display views and a menu of functions. Click a tab to change the view on the canvas:

- **Design**: Add and configure the properties of categories and questions. This is the default view.
- **Configuration**: Create introductions and end notes for surveys and select a **signature**.
- **Availability**: Select the recipients for each category in the survey.

Point to the menu icon (≡) to select an option. The list of options depends on the currently open survey:

- **Save**: Save the current survey without changing its state.
- **Preview**: Display a preview of the survey as it appears to recipients.
- **Publish**: Distribute the survey to the selected recipients.
- **Save and Publish**: Save the survey to the Draft state and distribute the survey in one step.
- **New Survey**: Open a fresh canvas for a new survey.
- **Load Survey**: View the list of existing surveys.
- **Copy Survey**: Copy the current survey.

**Design canvas**

New surveys open in the canvas of the **Design** view. The survey **Name** field appears above first category in the canvas. A blank question field appears in the category container.
Initial appearance of the Survey Designer canvas

Configure a survey in the survey designer
Configuration settings apply to the entire survey.
Role required: admin, survey_creator, or survey_admin

1. Navigate to Survey > View Surveys.
2. Open a survey definition in Survey Designer.
3. Select the Configuration tab and complete the Survey Designer Configuration form.

### Configuration tab fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<td><strong>Note:</strong> This field is displayed only if the Accessible by is Specific users.</td>
</tr>
</tbody>
</table>

### Survey categories

Survey categories provide a way to group questions of a similar theme for a given survey.

There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks:

- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

Create a category in the survey designer

A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Role required: admin or survey_admin
When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate to **Survey > Survey Designer**.
2. Enter the name of the survey in the **Name** field.
   The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box.
   a) Enter a new name and a description for the category.
   b) Enter text in the **Details** field that introduces or explains the category to recipients.
   c) Click the **X** icon to close the Properties dialog box and save your settings.

4. To add a new category, click the **+** icon in the title bar of an existing category.
   The new category appears below the category that you selected to create it. You can click the **X** icon in a category header to delete a category that you added in error.

Create a survey category in a survey

You can modify an existing survey to add one or more survey categories.

Role required: admin or survey_admin

Only one category is required for each survey, but you can add additional categories as needed.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category or click **New**.
   Each survey category is stored as a record on the Metric Category (asmt_metric_category) table with a modified view for survey use.
4. Enter the survey category name and description.
   The category name appears on questionnaires when either of the following is true.
   - There is more than one category for the survey.
   - There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.
5. Right-click the form header and click **Save**.
   The **Assessment Metrics** and **Users** related lists appear.
6. Click **Update**.

Create a question in the survey designer

You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Role required: admin or survey_admin

The data type that you select for each question determines how it can be answered by survey recipients.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar.
   The Properties dialog box opens.
3. Complete the form.
### Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in Controls for the available data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted. This field is available when the question does not have a dependency and the question type is not Boolean with a check box option.</td>
</tr>
<tr>
<td>Allow Additional Information</td>
<td>If selected, the Additional Information Label field is enabled. The Additional Information Label field value is displayed as a field on the survey response page to provide additional information for a question.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for a Boolean question.</td>
</tr>
<tr>
<td>String option</td>
<td>Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options include the following.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Single line</strong>: Single-line text field 40 characters in length that allows strings of any length.</td>
</tr>
<tr>
<td></td>
<td>- <strong>String line wide</strong>: Full page width text field that allows a single-line entry of any length.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Multiline</strong>: Full page width multiline text field that allows word wrap and returns</td>
</tr>
</tbody>
</table>

Note: This is not applicable for the String and Template data types.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is <em>Number</em>, <em>Percentage</em>, or <em>Numeric Scale</em>.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is <em>Number</em>, <em>Percentage</em>, or <em>Numeric Scale</em>.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <em>Not Applicable</em> as an option for this question. Users can select <em>Not Applicable</em> if they do not have sufficient information to respond to a question. User responses of <em>Not Applicable</em> are excluded from results calculations. This field is available when the question does not have a dependency and the question type is not <em>Boolean</em> with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low values</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High values</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a ${param} placeholder is added at the end of the question label.</td>
</tr>
<tr>
<td></td>
<td>Note: You can move this placeholder anywhere in the question label.</td>
</tr>
<tr>
<td></td>
<td>When a user takes the survey, the question with dynamic value is included in the survey instance and ${param} placeholder is replaced with the source field value.</td>
</tr>
<tr>
<td></td>
<td>If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the ${param} placeholder is not replaced by any value and is displayed as is in the question.</td>
</tr>
<tr>
<td></td>
<td>For example, if the survey is triggered from a PRB record and the survey question is configured with a dynamic value from Incident, the ${param} placeholder in the survey question label is not replaced by any dynamic value and is displayed as is.</td>
</tr>
<tr>
<td></td>
<td>Note: When survey questions are translated to other languages by a survey admin, the ${param} placeholder should not be translated.</td>
</tr>
<tr>
<td>Allow Sentiment Analysis</td>
<td>Includes this question for the sentiment analysis of a survey.</td>
</tr>
<tr>
<td></td>
<td>Note: This field is available only for String type questions.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Choices | Options for a question with a data type of **Choice** or **Scale**. The system automatically adds text and values that you can edit for each option. You must have at least two options, and each option must have a unique value.

Click the **+** icon to add an option, or click the **X** icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.

**Note:** Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators.

4. To create any special conditions that must be met before the question appears on the survey, click the **Dependency** tab.

The question must have a data type of **Boolean**, **Choice**, **Scale**, or **Template**.

5. Select a question in the **Displayed when** field.

The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answer that satisfies the condition.

You can select more than one answer. Selected answers are indicated by a check mark.

The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

7. Click the **X** icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the **+** icon in the title bar of the existing question.

9. Drag and drop questions to change their order within a category or move them between categories.

10. To delete a question, click the **X** icon in its title bar.

*Survey question data types*

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.
The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question. Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See *Administering Attachments* for more information.

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.

If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.
Date and Date/Time data types

The **Date** and **Date/Time** data types are similar.

- **Date**: On questionnaires, users select a date.

- **Date/Time**: On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application's ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

<i>Note: </i>The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select **Number**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally **0** and **100** are appropriate minimum and maximum values. If you choose values other than **0** and **100**, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

> **Note:** Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User (sys_user) as the reference table.
String data type

On questionnaires, users enter text. When you select **String**, the **String option** field appears. Select one of the following options to determine how the string field appears on questionnaires:

- **Single line**

![ServiceNow interface](image)
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

Yes/No data type

On questionnaires, users select **Yes** or **No** from a list.
If you select Yes/No, you must fill in the **Scale definition** field. Select **High** if Yes is the best answer.

### Image Scale data type

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected Image</th>
<th>Unselected Image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

### Multiple selection data type

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

1. Please rate following device in order of importance.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Edit a survey in the survey designer
You can modify surveys using the survey designer.

Role required: admin or survey_admin
You can edit a survey even after it has been distributed, with the following results.

- Added questions are available only on surveys that are distributed after this change.
- Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed surveys in user queues.

**Note:** You can only edit a survey that has the same application scope as that of your current session.

1. Navigate to **Survey > Survey Designer**.
2. Point to the menu icon in the survey header bar, and select **Load Survey**.
3. Select a survey from the list and modify it as needed.
4. Point to the menu icon in the survey header bar, and select **Save** or **Save and Publish**.

When you publish the edited survey, the system generates survey instances for any associated survey users.

**Configure category weights for a survey**
You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Configure the Survey Category form to display the **Weight** field.

Role required: admin or survey_admin

Weights are set to a value of **10** by default but can be changed.

1. Navigate to **Survey > View Surveys** and select a survey from the list.
2. In the Survey Definition form, select a category from the **Metric Categories** related list.
3. Edit the default weight value.
4. Click **Update**.

**View a survey instance**

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Role required: admin or survey_admin

1. Navigate to **Survey > Survey Instances**. The following sub-modules are available based on the state of the instances:
   - **Ready to take**: Displays survey instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the **Number** field.
   - **In progress**: Displays survey instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.
   - **Completed**: Displays survey instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.
   - **Cancelled**: Displays survey instances that are cancelled. By default, these instances are sorted in ascending order by the **Number** field.
   - **All**: Displays survey instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. Open a survey instance from the required sub-module. By default, the following fields are displayed in the Survey Instance form for all sub-modules other than **Completed**.
Note:
- When you open an instance in the Completed sub-module, you are redirected to the User’s Response page.
- Each survey instance is stored as a record on the Assessment Instance (asmt_assessment_instance) table with a modified view for survey use.

### Survey Instance form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>

<tr>
<td></td>
<td>- <strong>Category:</strong> Displays the survey categories the questions belong to.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Metric:</strong> Displays the survey questions.</td>
</tr>
</tbody>
</table>

**Survey users and groups**

Survey users and survey user groups help survey administrators control who can take a survey. Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.

**Administering survey users**

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition **Schedule** period is set to **Daily**, **Weekly**, **Monthly**, or **Yearly**. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

**Note:** If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

**Create a survey user group**

Survey user groups are groups that have the **Type** field set to survey and display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.

Role required: admin or user_admin

Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey **User Groups** module.
By default, the Survey Creators user group is available. When you add a user to this group, the user will be assigned the survey_creator role to create surveys, quizzes, or assessments and view only those surveys, quizzes, or assignments created by the user.

1. Navigate to Survey > Administration > User Groups.
2. Click New.
3. Complete the Group form.
4. Right-click the form header and click Save.
   The Group Members and Groups related lists appear.
5. To add group members, complete the following steps.
   a) In the Group Members related list, click Edit.
   b) Select users from the list on the left and add them to the Group Members List on the right.
   c) Click Save.

Select recipients for a survey in the Survey Designer
You can assign survey users while designing or modifying the survey.

Role required: admin or survey_admin

1. In the Survey Designer, click the Availability tab.
2. Under Accessible by:, select the Specific users option, then select users.
3. If desired, select the Survey groups only check box, then select survey user groups or other groups.
4. Click Save.

Designate a survey user
You can designate one survey user at a time from the Survey Definition form.

Role required: admin or survey_admin

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
   There must be at least one category.
3. In the Survey Users related list, click New.
4. Select a User.
5. Click Submit.
   The Survey Definition form reopens.
6. Optional: To remove survey users, in the Survey Users related list, select the check box beside the user, and then select Delete from the action list below the list.

Designate or remove multiple survey users at one time
Use the Survey Category form to designate or remove multiple survey users at a time.

Role required: admin or survey_admin

1. Open a survey definition.
2. In the Metric Categories related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey's categories automatically.
3. In the Users related list, click Edit.
4. Use the slushbucket to add or remove survey users.
5. Click Save to return to the survey category.
   The changes are also reflected in the Survey Users related list on the survey definition.
Allow recipients to retake a survey
You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey’s due date.

Configure the Survey Definition form to display the **Allow retake** field. For more information, see *Configuring the form layout*.

Role required: admin or survey_admin

Results are not calculated for the survey until the configured duration has elapsed. The card in the user’s queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

1. Navigate to **Surveys > View Surveys**.
2. Select a survey from the list.
3. Select the **Allow retake** check box.
4. Click **Update**.

Copy a survey

Create a copy of a survey with at least one category to reduce the effort of creating another survey with similar data.

Role required: survey_admin or admin

All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Perform any of the following steps:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click <strong>Copy</strong>.</td>
</tr>
<tr>
<td>From Platform</td>
<td>In the title bar, select <strong>Copy</strong> from the context menu.</td>
</tr>
<tr>
<td>From survey designer</td>
<td>1. In the title bar, click Survey Designer.</td>
</tr>
<tr>
<td></td>
<td>2. In the Survey Designer title bar, point to the menu icon (📜) on the header bar and click <strong>Copy Survey</strong></td>
</tr>
</tbody>
</table>

Publish a survey

You must publish a survey to enable people to receive and complete survey instances.

Role required: admin or survey_admin

The **State** field on the Survey Definition form indicates whether the survey is in the **Draft** or **Published** state.

**Note:** You cannot return a survey to the **Draft** state after it has been published. You do have the option to deactivate a survey by clearing the **Active** check box.

1. Navigate to **Survey > View Surveys** and select a survey to publish.
2. Click **Publish**.  
When you publish a survey, the system generates survey instances for any associated survey users. You can **assign** the survey to other users manually.

**Publish a survey in the Survey Designer**  
You must save changes to a survey before you can publish it to the specified recipients or groups.  

**Role required:** admin or survey_admin  

1. In the Survey Designer, point to the menu and select **Load Survey**.  
2. Select a survey to publish.  
3. To preview the survey as a user, point to the menu icon and click **Preview**.  
4. When you are satisfied with the survey, click either **Save and Publish** or **Publish** to distribute it.  

When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient’s My Assessments & Surveys portal.

**Customize the appearance of a survey**  
Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.  

**Role required:** admin or survey_admin  

For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the `#` character is required. Values are not case-sensitive.  

For example, all of the following formats are valid: `LightGray`, `lightgray`, `#D3D3D3`. A preview of the color appears next to the field.  

Note that the customizations you make apply to all assessments and surveys.

1. Navigate to either of the following modules.  
   - **Assessments** > **Admin** > **Assessment Properties**  
   - **Survey** > **Administration** > **Properties**  

2. On the properties page, edit the properties as needed.  

Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.
3. Click Save. You may need to clear the browser's cache to see updates.

Assessment and survey properties
You can configure a variety of properties to customize the appearance of assessment and survey questionnaires, require authentication for user signatures, open surveys in the service portal view from emails, and limit the number of items shown in a decision matrix field filter.

<table>

| sn_portal_surveys.sp_survey.email_redirection | Allow survey link from email to open in service portal view (applies only for surveys) | When Yes is selected, a survey accessed from a link in an email opens in the Service Portal. **Note:** This property applies only to surveys.  
- Default value: No |
| com.snc.assessment.signature_authentication  | Require authentication for user signature.                 | When Yes is selected, this property requires credentials for a full name signature.  
- Default value: Yes |
| css.assessment.question.header.background.color | Assessment question header background color                  | Sets the background color of question headers on assessment and survey questionnaires.  
- Default value: #767676 |
| css.assessment.caption.background.color      | Assessment caption background color                         | Sets the background color of the caption on assessment and survey questionnaires.  
- Default value: #eee |
| com.snc.assessment.decision_matrix_filter_max_entries | Maximum number of items to show for a decision matrix field filter |  
- Default value: 1000 |
| css.assessment.caption.font.color            | Assessment caption font color                               | Sets the font color of the caption text on assessment and survey questionnaires.  
- Default value: #ffffff |

Survey definitions
A survey definition is the root record upon which a survey is built.
The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.
Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

**Modify a survey definition**

You can configure additional options for a survey definition.

Role required: admin, survey_creator, or survey_admin

1. **Navigate to Survey > View Surveys.**
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.

2. **Open a survey definition.**
   The Response Trend chart with the weekly trend of the survey instance count, and the Survey Summary chart with the overall summary response based on instance states are displayed.

3. **Modify the fields on the Survey Definition form.**

   **Note:** You can only edit a survey that has the same application scope as that of your current session.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the survey which appears on the questionnaire.</td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about the survey.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the survey definition. When the Active check box is cleared, new survey instances cannot be generated and users cannot complete existing survey instances. Use the Active check box to deactivate or activate a published survey.</td>
</tr>
<tr>
<td>Owners</td>
<td>Owners of the survey. You can add a user with the survey_creator, survey_admin, or assessment_admin role.</td>
</tr>
<tr>
<td>Anonymize responses</td>
<td>Check box to ensure that all responses for this survey are stored without the submitting user names. When a user submits a survey, the system clears the Assigned to field for the associated survey instance. Also, survey responses for anonymous surveys do not contain Assigned to values.</td>
</tr>
<tr>
<td>Send notifications</td>
<td>Check box to send a notification that the survey has been taken.</td>
</tr>
<tr>
<td>State</td>
<td>Status of the survey: Draft or Published.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow retake</td>
<td>Check box that allows users to modify their answers to a completed survey. Users can resubmit a survey as many times as they want until the due date. After that date, the system removes the survey from the user's My Assessments &amp; Surveys page.</td>
</tr>
</tbody>
</table>
| Scheduled job         | Scheduled job that the system creates for this survey definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. If you change the schedule period and save the survey definition:  
  - The system deletes the old scheduled job.  
If you selected a recurring schedule period:  
  - A new scheduled job is created.  
For example, if you change the schedule period from Daily to Weekly and save the record:  
  - The system deletes the daily scheduled job.  
  - Creates a weekly one set to run a week from the current date.  
This field is visible to administrators only if the schedule period is Daily, Weekly, Monthly, or Yearly. |
<p>| Assessment duration   | The length of time to complete assigned survey instances, starting from the time the survey instance is generated. The assessment duration sets the Due date for each survey instance. The default duration is 14 days. Configure the form to view this field. |
| Note: By default, the system runs the Cancel Expired Assessments script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states. |
| Send notifications    | send notifications for the survey when it is published. Configure the form to see the field.                                                                                                                  |
| Other Options         |                                                                                                                                                                                                             |</p>

| Assessment Instances         | All survey instances for this survey. Configure the form to add this related list to see it.                                                                                                                |
|                              | **Note:** If you add a related list to the form, use list control to omit the **New** button. The system generates survey instances to produce functional surveys.                                              |
| Improvement Initiatives      | Displays improvement initiatives associated with the survey.                                                                                                                                                 |
|                              | **Note:** This related list is available only when there is at least one improvement initiative record.                                                                                                      |
| Survey Recipients Lists      | Recipients lists that are added to the survey.                                                                                                                                                              |

4. Save the record.

*Schedule periods*
The available schedule periods are **Only Once, No Limit, Daily, Weekly, Monthly**, and **Yearly**.
The default schedule period is **No Limit**. When you set the schedule period to anything except **Only Once** or **No Limit**, the system creates a corresponding scheduled job. The scheduled job performs the following actions:

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not **Complete**.

For example, if you set the schedule period to **Monthly** and someone attempts to send survey invitations twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the **Expiration date** field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything except **No Limit**, the **Expiration date** field is automatically set to the appropriate date. For example, if the schedule period is **Weekly**, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.

Consider the following example: Sal Pindell receives a survey instance when the schedule period is **Weekly**. The next day, a survey administrator changes the schedule period to **No Limit**. Sal cannot receive another survey instance until one of the following actions occurs.

- Seven days pass from the time Sal’s survey instance was generated.
- A survey administrator deletes Sal’s survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

**Note:** If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances.

**Create a survey designer template question**

You can create a question that uses choice lists from a template.

Role required: admin or survey_admin

1. Navigate to Survey > Survey Designer and load a survey or create a new survey.
2. Drag the **Template** data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.
Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey > Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.

Create or modify survey questions
You can create and administer survey questions.

Role required: admin or survey_admin
Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category.
4. In the Assessment Metrics related list, open an existing question or click New.
   Each survey question is stored as a record on the Assessment Metric (asmt_metric) table with a modified view for survey use.
5. Complete the Survey Question form.
The fields that appear depend on the selected Data type.

Survey Question form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the question. When you create a survey, the question name is the same as the text in the Question field.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question. The fields for the response depend on the data type.</td>
</tr>
<tr>
<td>Template</td>
<td>Question template to use for the answer options.</td>
</tr>
<tr>
<td>Scale definition</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five. This field is visible and required only when certain data types are selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias. This field is visible only if the data type is Choice or Likert Scale.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the Depends on field is empty and the data type is not Checkbox. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a Not Applicable answer option for this question on survey questionnaires. User responses of Not Applicable are excluded from results calculations.</td>
</tr>
<tr>
<td></td>
<td>This field is visible only if the data type is Choice, Likert Scale, Template, or Yes/No.</td>
</tr>
<tr>
<td>Allow Additional Information</td>
<td>If selected, the Additional Information Label field is enabled. The Additional Information Label field value is displayed as a field on the survey response page to provide additional information for a question. ➡️ <strong>Note:</strong> This is not applicable for the String and Template data types.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depends on</td>
<td>Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays Checkbox, Choice, Template, and Yes/No questions of the same category as this question. Then, use the Displayed when field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected Depends on question which, when chosen on surveys, display this question. This field is visible and required only when the Depends on field is set.</td>
</tr>
<tr>
<td>Min</td>
<td>Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is Choice, Likert Scale, Number, or Percentage.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is String.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a <code>${param}</code> placeholder is added at the end of the question label.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> You can move this placeholder anywhere in the question label.</td>
</tr>
<tr>
<td></td>
<td>When a user takes the survey, the question with dynamic value is included in the survey instance and <code>${param}</code> placeholder is replaced with the source field value.</td>
</tr>
<tr>
<td></td>
<td>If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the <code>${param}</code> placeholder is not replaced by any value and is displayed as is in the question.</td>
</tr>
<tr>
<td></td>
<td>For example, if the survey is triggered from a PRB record and the survey question is configured with a dynamic value from Incident, the <code>${param}</code> placeholder in the survey question label is not replaced by any dynamic value and is displayed as is.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> When survey questions are translated to other languages by a survey admin, the <code>${param}</code> placeholder should not be translated.</td>
</tr>
<tr>
<td>Allow Sentiment Analysis</td>
<td>Includes this question for the sentiment analysis of a survey.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available only for String type questions.</td>
</tr>
<tr>
<td>Related Lists</td>
<td></td>
</tr>
<tr>
<td>Assessment Metric Definitions</td>
<td>Answer options for this question.</td>
</tr>
<tr>
<td></td>
<td>This related list is available only if the Data type is Choice or Likert Scale.</td>
</tr>
</tbody>
</table>

6. Save the record.

**Note:**
- Be sure to create answer options if you select the Choice or Likert Scale data type.
You cannot delete a survey question (metric) with user responses. To delete a survey question with user responses, you should delete the responses, and then delete the survey question.

Survey question data types
You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

**Attachment data type**

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See *Administering Attachments* for more information.

**Boolean data type**

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

**Choice data type**

On questionnaires, users select a value from a list of choices.
If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

**Note:** The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

**Date and Date/Time data types**

The **Date** and **Date/Time** data types are similar.

- **Date:** On questionnaires, users select a date.
  
  ![Date selection example](image)

- **Date/Time:** On questionnaires, users select a date and time.
  
  ![Date and time selection example](image)
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select **Number**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

### Percentage data type

On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally 0 and 100 are appropriate minimum and maximum values. If you choose values other than 0 and 100, it is usually best to state the range of acceptable answers in the question text.

### Reference data type

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

*Note:* Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User (sys_user) as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Single line

Additional comments

© 2020 ServiceNow, Inc. All rights reserved.
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

Yes/No data type

On questionnaires, users select **Yes** or **No** from a list.
If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.

**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected Image</th>
<th>Unselected Image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Survey question template
Question templates define reusable sets of answer options for survey questions.
Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named **Satisfaction** represents a satisfaction scale and contains the following template definitions: **Very Satisfied**, **Satisfied**, **Neutral**, **Dissatisfied**, and **Very Dissatisfied**.

**Template definition**

Templates are available for survey questions that have **Data type** set to **Template**. The following question templates are available in the base system. You can create or update a template as described in *Create a survey question template*.

<table>
<thead>
<tr>
<th>Name</th>
<th>Template definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

**Create a survey question template**

You can create and administer question templates.

**Role required:** admin or survey_admin

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.

1. Navigate to **Survey > Templates**.
   Each template is stored as a record on the Assessment Metric Template (asmt_template) table.
2. Click **New**.
3. Enter a **Name**.
4. Right-click the form header and click **Save**.
5. In the **Assessment Template Definitions** related list, click **New**.
Create a template definition for each answer option you want to appear on a question.

6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest Value. Each template definition for a given template must have a unique Value.</td>
</tr>
</tbody>
</table>

7. Click Update.

Update min and max values to match templates

If you use survey result calculation data, ensure that the Min and Max values for a question that uses a template are equal to the smallest and largest template definition Value.

Role required: admin or survey_admin

When you create a question of the Template data type, the system sets the Min and Max fields based on the template definition values. The fields for existing questions are not updated if you add a new template definition to a template or if you update the Value of an existing template. If the new Value is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

1. Navigate to Survey > Questions.
2. Configure the list to show the Min and Max columns.
3. Add the following list filter condition: (Template) (is) (<select the template you updated>).
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template.

   If the values do not match, edit the Min and Max values directly from the list.

   Note: When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

Add a metric category and metric in the question bank for surveys

Reuse the question categories (metric categories) and questions (metrics) added in the question bank for surveys. You can add metric categories or metrics from the question bank to a survey, or from the survey to a question bank.

Role required: admin or survey_admin

Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

1. Navigate to Survey > Question Bank.
2. Click New.
3. In the Metric Category form, fill the fields.
### Metric Category fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the metric category.</td>
</tr>
<tr>
<td>Total metrics</td>
<td>Total number of metrics in the metric category. This number is automatically updated when you add or delete metrics from the category.</td>
</tr>
</tbody>
</table>

4. Right-click on the title bar and click **Save**.
5. In the Assessment Metrics related list, click **New**.
6. In the Survey Question form, fill the fields. For information on these fields, see **Create or modify survey questions**.
7. Click **Submit**.

Configure metric categories or metrics for a survey using the question bank

Reuse question categories (metric categories) and questions (metrics) from the **Question Bank** module while creating or updating a survey.

Role required: admin or survey_admin

Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Optional: To add metric categories to a survey from the question bank in Platform, perform the following steps.
   a) In the Metric Categories related list, click **New Category from Bank**.
      The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.
   b) Select the required categories and click **Add Selected**.
      A copy of the metric category and the corresponding metric definitions is created in the Metric Categories related list.

4. Optional: To add metrics to a survey from the question bank in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) In the Assessment Metrics related list, click **New Metric from Bank**.
      The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.
   c) Select the required metrics and click **Add Selected**.
      A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.

5. Optional: To add a metric category to the question bank from a survey in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) Click **Add to question Bank**.
A copy of the category is created along with its metrics and metric definitions in the question bank.

6. Optional: To add a metric to the question bank from a survey in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) In the Assessment Metrics related list, open the required metric definition.
   c) Click Add to Question Bank. The Add to Question Bank dialog box is displayed.
   d) In the Choose a question bank to add this question/metric field, select a metric category that you want to add this metric to, and click OK. A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

7. Optional: To add a metric category or metric to a survey from the question bank in Survey designer, perform the following steps.
   a) Open the survey in Survey Designer.
   b) Optional: To add a metric category from the question bank, from the Categories tab in the left panel, drag the required category banner and drop in the Design tab.
   c) Optional: To add a metric from the question bank, drag and drop the required metric from the Questions tab or the Categories tab.

Note:
- When you drag and drop a metric category, all dependencies within the category are also added to the survey.
- From the Categories tab, you can drag and drop an individual metric within a metric category.
- When you drag and drop a parent metric, all dependent questions are also added to the metric category.
- When you drag and drop a child metric, only the child question is added to the metric category.

Create or modify answer options
You must create answer options, called metric definitions, for survey questions that have Data type set to Choice or Likert Scale.

Role required: admin or survey_admin

Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

1. Navigate to Survey > Questions.
2. Open a choice or Likert scale survey question.
3. In the Assessment Metric Definitions related list, open a metric definition or click New.
   Each answer option is stored as a record on the Assessment Metric Definition (asmt_metric_definition) table.
4. Complete the Assessment Metric Definition form.
Assessment Metric Definition fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different Value.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

On survey questionnaires, the answer options for a question appear in order from smallest to largest **Value**. For example, consider the survey question **How do you feel?** with the answer options **Good**, **Neutral**, and **Bad**. The following table shows the answer option order based on the **Value**.

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question **Scale definition** is set appropriately based on the answer options. In the previous example, if you want the answer option **Good** to earn the highest score, the scale definition should be **Low** because **Good** has the smallest value.

**Change the order of survey questions**

You can easily reorder survey questions at the category level or the question level.

Role required: admin or survey_admin

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. If you add a new question manually after you create other questions, you may want to change the order of questions.

When you create questions using the survey creator, the system sets the **Order** field for the first question to **101**, the second to **102**, and so on. After you create a new question outside of the survey creator, the **Order** is set to **100** by default, which means it appears before all questions generated by the survey creator.

1. Navigate to **Survey > View Surveys** and open the appropriate survey definition.
2. In the **Metric Categories** related list, edit the values in the **Order** column.
3. To change the order of questions within a category, complete the following steps.
   a) Open the **Assessment Metrics** related list.
   b) Edit the values in the **Order** column.
4. Click Update.

Survey trigger conditions

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

**Note:** Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

Configure a trigger condition for a survey

Configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Role required: admin or survey_admin

1. Navigate to Survey > Trigger Conditions.
2. Click New.

**Note:** Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.

3. Complete the form.

### Trigger condition fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Survey to send.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey whenever an incident closes, select the Incident (incident) table.</td>
</tr>
<tr>
<td>User field</td>
<td>Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User (sys_user) table. Use the tree picker to select a field.</td>
</tr>
</tbody>
</table>

**Note:** To avoid requiring users to log in to take a survey with a trigger condition, set the survey to Public.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat interval</td>
<td>Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the Schedule period of the selected survey definition is set to <strong>No Limit</strong>. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected.</td>
</tr>
<tr>
<td>Application</td>
<td>(Admin only) Application is set to Core.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>(Admin only) Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when <strong>Trigger randomly</strong> is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Related Field 1- 4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields. For example, select the Incident table, <strong>Assigned to</strong> and <strong>Problem</strong> as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance. <strong>Note:</strong> You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the trigger_id column of the table.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition. <strong>Note:</strong> For a triggered record, the table title is used for the survey description.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition <strong>(State) (is) (Closed)</strong>.</td>
</tr>
</tbody>
</table>

You can also create a trigger condition directly from the survey creator. If you select **Certain users can take this survey, based on conditions** in the Survey User Access section, the Trigger Condition form opens automatically when you click **Save as Draft** or **Publish**.
<table>
<thead>
<tr>
<th>Assessment</th>
<th>Service Desk Satisfaction Survey</th>

- Value —
**Trigger condition example**
You can send out auto-triggered surveys when an incident is closed or resolved.

A trigger condition is configured as follows:

- **Assessment**: Service Desk Satisfaction Survey
- **Table**: Incident (incident)
- **User field**: Caller
- **Repeat interval**: 30 days
- **Active**: true
- **Trigger randomly**: false
- **Related Field 1**: Assigned to
- **Related Field 2**: Problem
- **Condition**: (State) (is) (Closed) (or) (State) (is) (Resolved)

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie’s complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- User (Related Field 1): **Boris Catino**
- Problem (Related Field 2): **PRB010101**
- Task (automatically created): **INC00004305**

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to *networking* group, for instance).

**Note:** Even though the trigger condition is set to be triggered each time that the conditions are met, the **Repeat interval** setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

**Survey report example based on task field**

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).
To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to ReportsView/Run and clicking Create a report.

**Survey distribution**

There are several ways for survey administrators to distribute surveys to users. Surveys are distributed using any of the following methods.

- Send survey invitations to users
- Share a survey URL that opens the survey directly.
- Create a module that opens a survey.

**Send survey invitations to users**
You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

Role required: admin or survey_admin

Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

- **Active** check box is selected.
- **State** is Published.
· Survey is associated with at least one question.

**Note:** You (or a trigger) can send more than one instance of a survey to a user at any time.

1. Navigate to **Survey > View Surveys**.
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click <strong>Send invitations</strong>.</td>
</tr>
<tr>
<td>Assign a survey to any user</td>
<td>Click <strong>Assign Survey</strong> and select one or more users, and then click <strong>OK</strong>.</td>
</tr>
</tbody>
</table>

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the **Assign Survey** button, the selected user is not saved as a survey user.

**Define a recipients list for surveys**
Use a recipients list to define targeted set of users for whom the survey invite can be sent. You can use a recipients list for multiple surveys.

Role required: admin or survey_admin

1. Navigate to **Survey > Administration > Recipients Lists**.
2. Click **New**.
3. In the Recipients List form, add the field information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the recipients list.</td>
</tr>
</tbody>
</table>
| Type  | Type of users to include in the list. Possible values are:  
- Contacts  
- Internal Users |
| State | State of the recipients list.  
- **New**: List has not yet been generated.  
- **In Progress**: List is currently being generated. (You can see this state only when generating a very large list of recipients.)  
- **Complete**: List is generated. |

Setup
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method</td>
<td>Method used to generate the recipients list. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Upload File</strong>: Upload an Excel file with the recipients list using the specified template.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Dynamic Condition</strong>: Run a script or condition builder to create the recipients list.</td>
</tr>
<tr>
<td>Choose File</td>
<td>Allows you to download an Excel template, and then upload the Excel file with user information using the specified template.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td></td>
<td>The templates vary based on the entity selected in the <strong>Type</strong> field. For accounts, the template includes columns for <code>sys_id</code> and account number values. For contacts, consumers, and internal users, the template includes columns for <code>sys_id</code> and <code>email</code> values.</td>
</tr>
<tr>
<td>Show Script</td>
<td>If selected, displays the script to create the recipients list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to create the recipients list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong> and the <strong>Show Script</strong> check box is selected.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that stores the user information. The table is selected based on the <strong>Type</strong> field.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td>User Field</td>
<td>Table field that refers to users.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
</tbody>
</table>
## Field Conditions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Condition builder to create the recipients list based on the specified table and user field. A condition is made up of a selected field, an operator, and a value. Add conditions using the AND and OR buttons. Delete conditions by clicking the Delete button to the right of a condition.</td>
</tr>
</tbody>
</table>

**Note:** This field is available only if the Method is Dynamic Condition.

**Note:** When the Method is Dynamic Condition, you can either use a script or a condition builder to create the recipients list.

4. Click **Submit**.
   For recipients lists created by the file upload, clicking **Submit** validates the records in the Excel file. Following validation, the system displays a pop-up window with the upload results, including valid and invalid user records.

5. Optional: To get the updated user list, navigate to the recipient list and click **Refresh Recipient List**.

### Add a recipients list to a survey

Send the survey invites to targeted sets of users by adding a recipients list to a survey.

**Role required:** admin or survey_admin

Recipients lists should be pre-defined in the Recipients Lists submodule. For more information on defining recipients lists, see [Define a recipients list for surveys](#).

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Perform any of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>From Platform</strong></td>
<td>1. Under the Survey Recipients Lists related list, click <strong>New</strong>.</td>
</tr>
<tr>
<td></td>
<td>2. In the Survey Recipients Lists form, from the Recipients List list, select the required recipients list.</td>
</tr>
<tr>
<td></td>
<td>3. Click <strong>Submit</strong>.</td>
</tr>
</tbody>
</table>

**From Survey Designer**

1. Under the Availability tab, for the Accessible By field, select **Specific users**.
2. In the Add recipients lists list, select the required recipients list.
3. To send the survey to users, click **Save and Publish**.

4. To send survey invites to all survey users and recipients lists, click **Send Invitations**.

**Note:**

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3912
The Send Invitations UI action is available when there is at least one recipients list or survey user for the survey.
If a user is available in the Survey Users related list and multiple recipients lists, the survey invite is sent only once to the user.

Embed a survey within the Outlook email client
Embed an interactive survey in the email notification sent to a user. The user can answer the survey questions and submit the survey from the email client instead of opening the survey in a new browser tab.

Role required: admin or survey_admin
The Outlook Actionable Messages plugin (com.sn_ms_oam) should be activated.

Note:
- Outlook Actionable Message (OAM) is not supported for Outlook 2016 for Mac. For information about detailed support matrix, refer to the Microsoft website.
- Actionable messages are supported only for emails sent from the @service-now.com email address. If you are sending an email from a customized email address, you should register as a new service in the Microsoft website setting the scope as Organization. Specify the provider ID value in the sn_ms_oam.outlookactionable.originator property.
- Actionable messages are based on the Sender Policy Framework (SPF)/DomainKeys Identified Mail (DKIM) validation for the email sender verification. If an email recipient receives email via an external provider, emails may are not rendered as adaptive cards.
- You cannot customize the default actionable message templates.

1. Navigate to System Notification > Email > Notifications.
2. For the Survey User Invite notification, in the What it will contain tab, add the following script in the Message field in addition to the existing information.

```
${mail_script:include_survey_actionable}
```

This script includes the Outlook actionable message in the email notification sent to the user.

3. Navigate to Survey > View Surveys, and open a survey.
4. To send an email notification to the survey user, select the Send notifications check box.
5. Select the Outlook Actionable Message check box and save the survey.

Note:
The following questions are not supported for an embedded survey:
- Attachment
- Date
- Datetime
- Template
- Reference
- Image Scale
- Ranking
- Dependant questions are not supported.
- Signature is not supported.
ServiceNow Orlando Now Platform capabilities

- Mandatory questions are supported.

In both the Platform UI and Survey Designer, a validation is run to ensure all survey questions are supported.

6. Click **Assign Survey** and assign the survey to a user.
   An email notification with the embedded survey is sent to the user. The user can take the survey and submit it from the email client instead of opening the survey in a new browser tab.

**Enable localization for a survey**
Enable a survey user to take a survey in multiple languages.

Role required: admin or survey_admin

The plugin for the language that you want the survey to be available in should be installed.

**Note:** Localization is applicable only for public surveys.

1. Navigate to **Survey > Administration > Properties**.
2. Enable the **Enable/Disable whether to show language picker when a public survey is taken** (show_lang_picker_for_publicsurveys) property.
3. In the System Settings window, from the **Language** list, select the language that you want the survey to be available in.

**Note:** The Language list is available only when a language plugin is installed.

4. Navigate to **Survey > View Surveys** and open a public survey.
5. Enter the translated text for the survey title, questions, and answers.
6. Save and publish the survey.

**Note:** The localization is also applicable in Service Portal if the **Assessment Properties Allow survey link from email to open in service portal view (applies only for surveys)** (sn_portal_surveys.sp_survey.email_redirection) property is enabled.

- The survey is available for survey users in the translated language.
- Users can change the language of the survey using the language picker.

**Survey URLs**
You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs.

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the **State** of the survey instance (see table). If there are multiple active survey instances (**Ready to take** or **In progress**), the instance with the earliest due date opens.
  - If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.

The appropriate action occurs, depending on the **State** of the survey instance (see table).

---

**Survey states**

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Ready to take</strong>: User has not saved any responses.</td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td><strong>In progress</strong>: User has saved at least one response.</td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
<tr>
<td><strong>Complete</strong>: User has submitted all required responses.</td>
<td>If the schedule period is <strong>No Limit</strong> or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin. If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears.</td>
</tr>
</tbody>
</table>

If someone opens a URL for an unpublished or deactivated survey, an error message appears.

**Obtain and distribute a general survey URL**

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

**Role required:** admin or survey_admin

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the **View Survey URL** related link. This related link is visible only if the survey definition is **Active**.
4. To distribute the URL to users, paste the copied URL as desired, or click the **Email** button to send via email. The **Email** button is visible only for a public survey that is published.

When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the **Ready to take** state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.

**Deactivate auto-notification for surveys**

When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.
Role required: admin or survey_admin

1. Navigate to System Notification > Email > Notifications.
2. Open the Survey User Invite notification.
3. Configure the form to add the Send to event creator check box to the Who will receive section.
   The Send to event creator check box is selected by default.
4. Clear the Send to event creator check box.
   The system will no longer send auto-notification messages to survey users.

Obtain a survey instance URL
You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Role required: admin or survey_admin

The survey instance URL is available on the survey instance record.

1. Navigate to Survey > Survey Instances.
2. Open the instance for the survey.
3. To view or copy the URL, click View Instance URL related link.
   The related link is available only when the survey instance State is Ready to take or In progress and the associated survey definition is Active.
4. In the dialog box, select and copy the URL then click OK or Cancel.
5. Distribute the URL to the assigned user.

Test a survey URL
When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

Role required: admin or survey_admin

1. Navigate to Survey > View Surveys and open a survey for which you are not a survey user.
2. Under Related Links, click View Survey URL.
3. Copy the URL and click OK or Cancel.
4. Navigate to the URL.
   You see a message that you are not authorized to take the survey.

Create a survey module
You can create a module that opens a survey.

Role required: admin or survey_admin

When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.

- Creates a new survey instance
- Opens an existing survey instance
- Displays an error message.

1. Perform the appropriate action for your version of the UI:
   - UI16: Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.
   - UI15: Right-click the application menu you want to add the module to and select Edit Application Menu
2. In the Modules related list, click New.
3. Complete the following fields.
   - **Link type**: Assessment
     Do not select **Survey**, which is used for legacy surveys only.
   - **Assessment**: Select the survey you want the module to open.

4. Complete and save the form.

**Sharing surveys: export and import**
You can export a survey and then import it to a different ServiceNow instance.

**Note**: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

The system exports a single XML file that contains a survey definition (asmt_metric_type) and the associated records, including the following.
- Assessment Metric Template (asmt_template)
- Assessment Template Definition (asmt_template_definition)
- Metric definitions (asmt_metric_definition) (survey question answer options)
- Scheduled Jobs associated with the Survey (sys_trigger)
- Survey categories (asmt_metric_category)
- Survey questions (asmt_m2m_category_user)
- Trigger Condition (asmt_condition)

**Export a survey**
You can export a survey and then import it to another instance.

Role required: admin, survey_reader, or survey_admin

For information about update sets, see [System update sets](#).

1. Navigate to **Survey > View Surveys**.
2. Right-click the name of a record to show the context menu.
3. Select **Export Assessment**.
4. If applicable, follow the prompt in your browser to save the XML file.

**Import a survey**
You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.

Role required: admin or survey_admin

**Note**: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see [System update sets](#).

1. Verify that the target instance has assessments enabled.
2. Follow the steps in [Import an XML file](#) to import the assessment.

**Use update sets for surveys and assessments**
Use an update set to capture changes to surveys and assessments.

Role required: admin or survey_admin
When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates (asmt_template)
- Assessment Template Definitions (asmt_template_definition)
- Assessment Metric Definitions (asmt_metric_definition): survey question answer options
- Schedule (sys_trigger): scheduled jobs associated with the survey
- Assessment Metric Categories (asmt_metric_category): survey categories
- Assessment Metrics (asmt_metric): survey questions
- Assessment Category Users (asmt_m2m_category_user): survey users
- Trigger Conditions (asmt_condition)

**Configure a survey in the Connect chat support**

Enable a user to take a survey after chatting with a survey agent.

Role required: admin or survey_admin

**Note:** The Connect Support plugin (com.glide.connect.support) should be activated.

1. Navigate to **Survey > Chat survey**.
2. Click **New**.
3. In the Chat Survey form, fill the fields.

**Chat Survey form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey</td>
<td>Survey whose instance should be available in Connect Support.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of chat where the survey is available.</td>
</tr>
<tr>
<td>Chat queue</td>
<td>Chat queue where the survey is available.</td>
</tr>
<tr>
<td>Active</td>
<td>Specifies if the chat survey configuration is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the chat survey configuration.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

When a support agent of the assignment group associated with the chat queue ends a chat with a user, the survey instance is available in the chat window for the users.

**Sentiment analysis for surveys**

You can use sentiment analysis to determine whether user responses for a survey are considered positive, negative, or neutral.

Activate the Sentiment Analysis (com.snc.sentiment_analysis) plugin.

For a survey, you can select questions that should be used for analysis. The survey responses of these questions are sent to the thirdparty platforms for analysis through the specified connector configurations.
Note: You can only use string type questions for sentiment analysis.

The sentiment analysis results are displayed under Survey > Question Sentiment Results. The sentiment label is based on the normalized score:

<table>
<thead>
<tr>
<th>Normalized score</th>
<th>Sentiment label</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1 to 0</td>
<td>Negative</td>
</tr>
<tr>
<td>0</td>
<td>Neutral</td>
</tr>
<tr>
<td>0 to 1</td>
<td>Positive</td>
</tr>
</tbody>
</table>

Configure a sentiment connector
Specify the service URL and other configuration information for third party APIs that are used for sentiment analysis.

Role required: admin
1. Change the scope of the current session to Sentiment Analysis.
2. Navigate to Sentiment Analysis > Sentiment Connector Configurations.
3. Add or edit the connector configuration for a third party vendor such as Google, IBM Watson, and MSAzure.

Note: By default, placeholders are available for configuring connectors for Google, IBM Watson, and MSAzure.

Sentiment connector fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the sentiment analysis connector configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the connector configuration.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Credential alias associated with the connector configuration. It has a reference to the system level table (sys_alias_list).</td>
</tr>
<tr>
<td>Default</td>
<td>Check box to make this as the default connector configuration.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the connector configuration.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to call the Sentiment Analysis API and the normalize the values.</td>
</tr>
</tbody>
</table>

4. Configure the connector credentials
   a) Open the record referred in the Credential Alias field.
   b) Under the Connections tab, select the connection.
   c) In the Connection URL field, enter the value.
   d) Open the record referred in the Credentials field.
   e) Enter the credential information.
Note:
- You should obtain the connection credentials from the respective third-party vendors.
- If the credential is an API key, specify its value. If the credential is basic authentication, that is, user name and password, specify the corresponding information.

f) Select the **Active** check box and click **Update**.

5. Select the **Active** check box for the connector configuration and click **Update**.

**Sentiment analysis properties**
You can use the sentiment analysis properties to customize the **Sentiment Analysis** module.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response time for the outbound call of Sentiment Analysis API (sn_nlp_sentiment.glide.sentiment.transaction.timeout)</td>
<td>Maximum time (milliseconds) expected for executing the outbound call for Sentiment Analysis API before it’s timeout.</td>
</tr>
</tbody>
</table>

**Sentiment analysis results**
The sentiment analysis results view contains a bar chart that displays the percentage of positive, negative, and neutral results, along with the instance count for each category.

**Color indicators**
Following are the color indicators in the bar chart:
- Green: Positive
- Red: Negative
- Blue: Neutral

**Surveys in Service Portal**
If Service Portal is installed, you can use the Survey widget to set up surveys, quizzes, assessments, risk assessments, and attestations in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in **Service Portal**. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see **configure widget instances**.
To configure a Survey widget on a page, CTRL + right-click the widget heading and select **Instance Options**.

**Service Portal: Instance options (properties) for the Survey widget**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Number of surveys to list on the Service Portal homepage. The user can click the <strong>View all</strong> link to view all items. Default: 5</td>
</tr>
<tr>
<td>Title of the widget</td>
<td>Text that appears in the title bar of the surveys widget. Default: <strong>My Surveys</strong></td>
</tr>
</tbody>
</table>
Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.

For mobile users, the *Pagination setting for Service Portal view* survey designer property is set to one question per page by default.
One Click survey

A One Click survey has no introduction page in Service Portal. This survey does not have the Submit and Cancel buttons in the desktop and iPad view.

Note:
- The One Click Survey field should be selected in the survey definition.
- If the public access is enabled for a One Click survey, a user can submit the survey without having to log in.

A kiosk survey is a One Click survey with only one question of any of the following types:
- Image Scale
- Choice
- Likert Scale
- Numeric Scale
- Yes/No

When you click the answer of the kiosk survey question in Service Portal, the survey is submitted and the end note is displayed on the same page as that of the survey questions.

Note:
- A kiosk survey does not have any Submit or Cancel buttons.
- A kiosk survey cannot have a signature, dependent questions, or additional information.

URI parameters for One Click survey

Pass these URI parameters through the createAssessment() API to store their values in the asmt_assessment_instance table for both platform view and Service Portal view.

**URI parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_refresh_interval</td>
<td>Refresh time (in seconds) after the survey submission to create another instance. For example, sysparm_refresh_interval=5.</td>
</tr>
<tr>
<td>sysparm_trigger_table</td>
<td>Location that is stored as the Trigger Table field in the asmt_assessment_instance table. For example, sysparm_trigger_table=incident.</td>
</tr>
<tr>
<td>sysparm_trigger_id</td>
<td>Location sysId that is stored as the Trigger ID field in the asmt_assessment_instance table. For example, sysparm_trigger_id=1c741bd70b2322007518478d83673af3.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>sysparm_kiosk</td>
<td>When set to true, both sysparm_trigger_table and sysparm_trigger_id parameters should be specified. This is a mandatory parameter for kiosk requests. For example, sysparm_kiosk=true.</td>
</tr>
</tbody>
</table>

**Surveys in ITSM Virtual Agent**

You can use surveys in ITSM Virtual Agent to collect survey responses from users through conversational questionnaires (pre-chat and post-chat surveys) in the chat client.

A chat survey is available in ITSM Virtual Agent through the Provide Virtual Agent Feedback topic. The logic that renders the survey dynamically is called from the re-usable Survey topic block. It is common to use the Provide Virtual Agent Feedback topic as the survey setup topic in the general definitions of ITSM Virtual Agent, so that employees automatically receive a survey at the end of their conversations. For information about the Survey topic block, see *ITSM Virtual Agent*.

When you select the **Chat Survey** check box for a survey, it validates the following conditions for a survey on ITSM Virtual Agent.

- Survey should contain only one metric category.
- Survey can contain only these metric types.
  - Attachment
  - Boolean
  - Check box
  - Choice
  - Date
  - Date/Time
  - Image scale
  - Number
  - Numeric scale
  - Percentage
  - Scale
  - String

For information on configuring a survey, see *Modify a survey definition* and *Configure a survey in the survey designer*.

The following capabilities are supported for the survey:

- Dependent survey fields
- Introduction and end notes

**Quick start tests for Assessments and Surveys**

Validate that Assessments and Surveys still work after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Assessments and Surveys quick start tests require activating the Automated Test Framework for Survey plugin (com.glide.automated_testing_impl.Survey).

Legacy survey migration

Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.

The following legacy survey components are migrated:
- Survey masters
- Supported survey questions and question choices
- Survey instances
- Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

Note:
- The Legacy Surveys and Legacy Administration modules are available on instances upgraded from a previous release but not available for new instances. Customers using legacy survey or survey wizard should plan to migrate to the Survey Management application to create modern and high quality surveys for their users.
- The following legacy survey plugins are inactive by default, and are available upon request:
  - Best Practice - Task Survey Management (ID: com.snc.bestpractice.task_survey)
  - Survey Management (ID: com.glideapp.survey)
  - Assessment Components (ID: com.snc.assessment)
  - Survey Wizard (ID: com.glideapp.survey_wizard)
- Survey wizards cannot be migrated.

Migrate a legacy survey

Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

Role required: admin or survey_admin
To avoid timing out for very large surveys, you can disable the transaction quota. See Transaction quotas.

1. Navigate to Survey > Legacy Surveys > Masters.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the Assessment is empty breadcrumb.

2. Open a survey and click the Migrate to New Survey Management related link or Migrate to New Survey Management in the title bar.
   A dialog box describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.

3. Click OK.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.
   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated Multiple Choice questions.

4. Optional: Click the reference icon beside the Assessment field to view the new survey definition.

5. Optional: Remove survey users from the assessment survey if you want all users to be able to take it.
   When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.

6. Deactivate any survey conditions associated with the survey by completing the following steps.
   a) Navigate to Survey > Legacy Administration > Survey Conditions.
   b) In the Active column, ensure the value is false for any survey conditions that reference the migrated survey.

7. Navigate to Survey > Administration > Trigger Conditions to create new trigger conditions for the migrated survey.

The Migrate to Assessment related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the Assessment field, the related link reappears and you can migrate the legacy survey again.

Survey question migration
Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question (survey_question_new) table to the Assessment Metric (asmt_metric) table. In legacy surveys, the Type field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the Data type field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.

<table>
<thead>
<tr>

</table>

**Migrated components**

When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

**Migrated components**

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey master (survey_master)</td>
<td>• Survey definition (asmt_metric_type)</td>
</tr>
<tr>
<td></td>
<td>• Assessable record (asmt_assessable_record), for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey category (asmt_metric_category)</td>
</tr>
<tr>
<td>Survey question (survey_question_new)</td>
<td>• Survey question (asmt_metric)</td>
</tr>
<tr>
<td>Question choice (question_choice)</td>
<td>• Assessment metric definition (asmt_metric_definition)</td>
</tr>
</tbody>
</table>
Survey component | Assessment survey components
---|---
Survey instance (survey_instance) | • Assessment group (asmt_assessment), for system use only  
| • Survey instance (asmt_assessment_instance)  
Survey response (survey_response) | • Survey instance question (asmt_assessment_instance_question)  
| • Survey response (asmt_metric_result)  
| • Category result (asmt_category_result), for system use only

**Migrated question review**
To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric (asmt_metric) table. For legacy questions of the **Multiple Choice** and **Select Box** types, the system also creates a metric definition record, on the Assessment Metric Definition (asmt_metric_definition) table, for each legacy question choice.

**Comparable metric definitions and survey question choices**

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest Value is first)</td>
</tr>
</tbody>
</table>

When the system migrates legacy survey question choices, it uses the legacy **Order** to set each metric definition **Value**. For the legacy question choice with the smallest **Order**, the corresponding metric definition **Value** is set to 1. For the legacy question choice with the next smallest **Order**, the metric definition **Value** is 2, and so on.

The **Scale definition** field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to **High**, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. **Excellent** has the lowest **Order** value, so when the system creates a metric definition for this question choice, the **Value** is set to 1. In this case the default scale definition value, **High**, does not make sense, as the system will calculate the worst scores for responses of **Excellent**.
Legacy question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice value</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no Order values for the legacy survey question choices, the system sets each corresponding metric definition Value based on the alphanumeric order of the legacy Text value.

Migrated question: Please rate the overall quality of your service.

You may also need to change the Scale definition setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.

Quizzes

Quizzes are questionnaires you can assign to one or more users to assess their knowledge of any subject. The quiz functionality is built on the assessment engine and provides many of the same features as assessments and surveys.

Each question is scored, and the overall score indicates the percentage of questions the user answered correctly. A quiz may have categories of questions that are assigned only to some users. You can assign weighting values to individual questions or categories of questions that make them more or less important when calculating the overall score. Quizzes require activation by a system administrator.

- An administrator can create a quiz for any purpose and assign it to a single user or multiple users.
- A quiz can contain one or more categories of questions. Each category can be assigned to users who answer only the questions in that category.
• The system can send email notifications to these users:
  • **Recipients:** The recipient can receive notification of an assigned quiz, a quiz whose allowed duration is at 50%, and a quiz that is overdue.
  • **Recipient’s manager:** The recipient’s manager can receive notification when a quiz is overdue.
  • **Quiz manager:** The quiz manager can receive notification of an overdue quiz to which he or she is assigned.

• Quizzes can contain questions that are scored or not scored. Unscored questions assess opinions or involve dates and are not counted in the final score. Scored questions specify correct answers and are scored either as 0% or 100%. You can apply a weighting scale to scored questions to establish their relative importance. You can designate questions with these data types as scored questions:
  • Checkbox
  • Choice
  • Duration
  • Likert Scale
  • Numeric Scale
  • Template
  • Yes/No

• A quiz question can be dependent on the response to any scored question. For example, you can create a dependent question requesting additional information that appears only if a recipient answers **No** to a specific question.

**Important terms**

The quiz application involves several terms.

<table>
<thead>
<tr>
<th>Terms used in quiz application</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Quizzes</strong></td>
<td>A quiz contains information such as duration, state, and notification controls and lists the existing categories. Text fields on the quiz form allow an administrator to create introductory content and end notes that are displayed to the recipient.</td>
</tr>
<tr>
<td><strong>Categories</strong></td>
<td>A quiz category represents a theme for quiz questions. Each category contains one or more questions and names the recipients for the questions in that category. By default, the system creates one category with the same name as the quiz. You can create additional categories as needed. Categories can be weighted higher or lower to determine the importance of that category in the overall score.</td>
</tr>
<tr>
<td><strong>Questions</strong></td>
<td>A quiz question is a question configured for a category and sent only to the users for that category. Questions have a wide variety of data types and can be individually weighted higher or lower. Questions may be scored or unscored.</td>
</tr>
</tbody>
</table>
Category user

A category user is the recipient of questions for a specific category. You can select different users to answer the questions for each category.

Templates

A template is a question data type that provides reusable rating scales for answers to questions. For example, the answer template named Satisfaction contains a satisfaction scale ranging from Very Satisfied to Very Dissatisfied.

---

**Quiz roles**

The Quizzes application uses these roles. No role is required to take quizzes that are assigned to you.

<table>
<thead>
<tr>
<th>Role Title (Name)</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>assessment administrator (assessment_admin)</td>
<td>Can administer the Assessments application and all quiz records. Can access all the modules of the Assessments application.</td>
</tr>
<tr>
<td>Administrator (admin)</td>
<td>Can access all aspects of the assessment and survey processes. Only administrators can modify survey notifications, create survey modules, and import surveys.</td>
</tr>
</tbody>
</table>

---

**Set up and administer quizzes**

Set up and administer quizzes.

Role required: assessment_admin or admin

1. Optional: Create reusable question templates for quizzes.
2. Create the quiz using the Quiz Designer or with forms accessed from the navigation menu.
   The quiz record includes specifics such as duration, notification preferences, a questionnaire introduction, and ending notes displayed to recipients.
3. Edit the default category or create additional categories as needed.
   The system creates a category with the same name as the quiz.
4. Define users for each category.
   These are the recipients who answer the questions in a category. You can define different users for each category.
5. Create the questions for each category.
6. Create the answers for each question and determine if the questions are scored.
   You can create unique answers or select preconfigured answers from a template.
Publish and distribute the quiz. You can send the quiz to a single user or all users in each category. Review the results from the submitted quizzes in reports and scorecards.

**Activate the quiz designer**

Administrators can activate the Quiz Designer plugin. 
Role required: assessment_admin or admin

1. Navigate to **System Definition > Plugins**.
   
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   ![Note: To redirect to the legacy list view for plugins, click the link.](image)

   1. You have been redirected to All Applications. To see the Plugins list click here

2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.

   ![Activate Plugin](image)

   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the **Activate/Update** related link.
     3. In the dialog box, review the dependent plugins.
If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.

4. If demo data is available and you want to install it, click **Load demo data**.

Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

---

**Quiz Overview module**

The Quiz Overview module is a homepage that displays various reports on data such as results for each category and quizzes that are complete, pending, or in progress.

Role required: assessment_admin or admin

Users with the **assessment_admin** role can view the overview page and refresh, add, delete, and rearrange widgets.

1. Navigate to **Quizzes > Overview**.
2. Click elements within reports to obtain more information. The available reports are:

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes by State</td>
<td>Assessment Instance (asmt_assessment_instance)</td>
</tr>
<tr>
<td>Total Questions by Quiz</td>
<td>Assessment Metric (asmt_metric)</td>
</tr>
<tr>
<td>Questions by Data Type</td>
<td>Assessment Metric (asmt_metric)</td>
</tr>
<tr>
<td>Correct Answers by Assigned User</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
<tr>
<td>Number of Correct Answers</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
<tr>
<td>Incorrect Answers by Assigned User</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
<tr>
<td>Number of Incorrect Answers</td>
<td>Metric Results (asmt_metric_result)</td>
</tr>
</tbody>
</table>

**Quiz designer**

The quiz designer provides a single interface that users with the assessment_admin role can use to create, edit, and distribute quizzes.

You can also use it to edit existing quizzes and change scoring parameters.

Alternatively, you can use the modules of the **assessment engine** to create and edit the records that make up a quiz. All quiz records are stored in assessment tables and displayed in Quiz views of those tables. For details, see **Create quizzes with forms**.

**Tools on the Quiz Designer**

The quiz designer includes a design canvas, a header bar, and many controls that you can use to create quizzes.

To open the quiz designer, navigate to **Quizzes > Quiz Designer**.

The designer contains the following elements:
- Controls tab
- Questions tab
- Categories tab
- Header bar
- Design canvas

**Controls tab**

Controls for the supported question data types are available in the Controls palette. Drag and drop a control onto the designer canvas to create a question of that type.
### Question controls

<td>Selectable number scale. The default is 1-5. Answer options appear as radio buttons. Multiple correct answers are supported.</td>
<td>Y</td>
</tr>
<tr>
<td>Image Scale</td>
<td>Predefined set of images. Five emojis similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Multiple correct answers are supported.</td>
<td>Y</td>
</tr>
<tr>
<td>String</td>
<td>Single or multiline text field.</td>
<td>N</td>
</tr>
<tr>
<td>Template</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see <strong>Configure a template question</strong>. Multiple correct answers are supported.</td>
<td>Y</td>
</tr>
<tr>
<td>Reference</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers.</td>
<td></td>
</tr>
</tbody>
</table>

**Questions tab**

This tab displays all metrics added to the question bank for quizzes. Use the **Filter** field to search for questions. Each metric is displayed with its name and type.
Categories tab

This tab displays all metric categories added to the question bank for quizzes. All metrics in the question bank are grouped under the corresponding metric category. Use the Filter field to search for categories or questions.

Header Bar

The header bar contains tabs that display different views and a menu of various functions. Click one of the following tabs to change the view in the canvas:

- **Design**: Add categories and questions, and configure the properties of each. This is the default view of the canvas when you open the designer.
- **Configuration**: Create introductions and end notes for quizzes, and select a signature.
- **Availability**: Select the recipients for each category in the quiz.

Point to the menu icon (≡) in the upper right of the quiz designer to select the following options:

- **Save**: Saves the current quiz.
- **Preview**: Displays a preview of the quiz as it appears to the recipients.
- **Publish**: Distributes the quiz to the selected recipients.
- **Save and Publish**: Saves and distributes the quiz in one step.
- **New Quiz**: Opens a fresh canvas for a new quiz.
- **Load Quiz**: Opens a list of existing quizzes that you can select and edit.
- **Copy Quiz**: Creates a copy of the quiz.

The availability of each option depends on the status of the quiz that is opened in the quiz designer.

Design Canvas

New quizzes open in the **Design** view. The quiz **Name** field appears above the first category in the canvas. A blank question field appears in the category container.

Create a quiz

When you create a quiz, you can create one or more categories and then add questions to each category.

Role required: assessment_admin or admin

Each category can be assigned to a different user or the same users. You can also customize each question and make it dependent on the response to another question.

Create a quiz using these procedures:

- **Create quiz categories**
  A category represents a theme for evaluating a specific element of the quiz topic and contains questions pertaining to that theme.

Role required: assessment_admin or admin
When you create a quiz, the system creates a default category, using the name of the quiz. You can use this category, modify it, or create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate either Quizzes > Quiz Designer or Quizzes > Quizzes and click Quiz Designer in the list header.
2. Enter the name of the quiz in the Name field. The system uses this name as the name of the quiz and the first category.
3. To configure the category, click the gear icon in its title bar.
   
   The Properties dialog box appears. You can change the name of the category, add a description for it, and enter text in the Details field that introduces or explains the category to the recipients. The system updates the category as you type.
4. Click the X icon to close the category properties dialog box and save your settings.

5. To add a new category, click the + icon in the title bar of an existing category.

Create quiz questions
You can create multiple questions for each category but each question can be associated with only one category.

Role required: assessment_admin or admin

The data type that you select for each question determines how it can be answered by quiz recipients.

You can designate questions to be scored. Only scored questions are shown in the quiz results and considered when calculating the category results. You must also specify a correct answer for scored questions.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Note:
To designate a question as scored, you must use Assessment forms. For instructions, see Configure a scored question.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.

2. To configure the question, click in the gear icon in its title bar. The Properties dialog box appears for the question.
3. Fill in the fields on the form, as appropriate.

**Question property fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Name of the question. Create a concise and easily recognizable name for your question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on quizzes. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>(Read-only) Data type selected for this question. See the table in Controls for possible data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a quiz. If a question is marked inactive, it does not appear on quizzes generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Boolean option</td>
<td>Whether a check box or a Yes/No list appears as the option for the Boolean question.</td>
</tr>
</tbody>
</table>
| Mandatory           | Check box for requiring users to answer the question. Users cannot submit quizzes until they answer all mandatory questions, which are denoted by a red Introduction_to_Fields#Field_Status_Indicator  
|                     | --> field status indicator. This field is available when the question does not have a dependency and the question Controls is not Boolean with a check box option. |
| String option       | Setting for the appearance of a string field in a question. This field is available when the question type is String. The string options are:  
|                     | - Single line: Single line text field 40 characters in length that allows strings of any length.  
|                     | - String line wide: Full page width text field that allows a single line entry of any length.  
<p>|                     | - Multiline: Full page width multi-line text field that allows word wrap and returns.                                                       |
| Min                 | Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale. |
| Max                 | Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is Number, Percentage, or Numeric Scale. |
| Allow not applicable| Check box for including Not Applicable as an option for this question. Users can select Not Applicable if they do not have sufficient information to respond to a question. User responses of Not Applicable are excluded from results calculations. This field is available when the question does not have a dependency and the question data type is not Boolean with a check box option. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order whenever the question appears in a quiz. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias. <strong>Note:</strong> Randomizing options for certain questions may make those questions confusing for users. In general, only randomize options that do not follow a logical order.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the quiz. Include details that help users understand how to answer the question. You can also enter HTML text in this field with the WYSIWYG editor. For example, include HTML to embed links and images.</td>
</tr>
<tr>
<td>Correct answer</td>
<td>Answer option that you want to be selected by users. When you specify a correct answer for a question, the system scores the question. This field is available for all data types except <em>Date</em>, <em>Date/Time</em>, and <em>String</em>. Multiple correct answers are supported for a few data types. See <em>data types</em>.</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of <em>Choice</em> or <em>Scale</em>. The system automatically adds text and values that you can edit for each option. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displayed when</td>
<td>Condition builder that hides or displays the question depending on the answer to another question in the same category. Select an existing question from the list with a data type of Boolean, Choice, Scale, or Template. Create the condition that must exist for recipients to see the dependent question, using the is or is one of operator. The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
</tbody>
</table>

4. To create any special conditions that must be met for a question to appear on the quiz, click the Dependency tab. Fill in the fields, as appropriate.

Dependent questions appear on the quiz when a recipient selects a specific answer or combination of answers to another question in the same category.

5. Select a question in the Displayed when field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answers that satisfy the condition. Selected answers are indicated by a check mark.

7. Click X to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + in the title bar of the existing question.
9. Drag questions to change their order within a category or move them between categories.

10. To delete a question, click the X in its title bar.

*Configure a template question*
You can configure template questions when designing quizzes.

Role required: assessment_admin or admin

1. Drag the **Template** data type icon into a category container.
2. Click the gear icon in the question title bar to open the template properties dialog box.
3. Select a predefined scale from the list.

Question entry fields appear for that template.

4. Enter one or more questions that are appropriate for the template.
5. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
6. Click the up or down arrow to move between questions, or click the back arrow to return to the template properties dialog box.
7. Configure the properties for the remaining questions.
8. Click the X icon to close the template properties dialog box and save your settings.

Configure a scored question
Only scored questions are considered when calculating category and quiz results.
Role required: assessment_admin or admin
A question must have a correct answer specified to be scored. Only results for scored questions are displayed in the quiz scorecard.

1. Navigate to Quizzes > Quizzes.
2. Open the quiz containing the questions you want to mark as scored.
3. In the Metric Categories related list on the Assessment Metric Type form, select the category for the questions you want to mark as scored.
4. In the Assessment Metrics related list on the Metric Category form, select a question from the list.
5. In the Question Type section of the Assessment Metric form, select the Scored check box.
This check box is not available if the question’s data type is not supported for scoring.

6. Select the Correct answer for the question.

Note: Multiple correct answers are supported for a few data types. See Data types for quizzes.

7. Click Update.

8. Repeat the process for all the questions in the category that you want the system to score.

9. Return to the list of metric categories, select another category, and configure scoring for the appropriate questions in that category.

Configure a quiz

You can configure an entire quiz.

Role required: assessment_admin, survey_creator, or admin

The values you enter and select on this page are applied to the entire quiz.

In the quiz designer, click Configuration and then fill in the fields as described in the table.

### Quiz designer configuration

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box for enabling the distribution of this quiz to recipients.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this configuration or the quiz to which it is attached.</td>
</tr>
<tr>
<td>Introduction</td>
<td>Introductory content to display on quizzes. You can add a welcome message or background information about the quiz.</td>
</tr>
<tr>
<td>Owners</td>
<td>Owners of the quiz. You can add a user with the survey_creator, survey_admin, or assessment_admin role.</td>
</tr>
<tr>
<td>Signature</td>
<td>(Optional) Acknowledgement by a quiz recipient of requirements, admonitions, or expectations related to a quiz.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed quiz. When a return URL is configured, the End note content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed quiz. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a Return URL is specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>Amount of time that recipients are given to complete this quiz, starting from the time that the quiz is generated. The default duration is 14 days.</td>
</tr>
</tbody>
</table>
### Field Description

**Manager**
Assessment manager for this quiz. These users are only responsible for managing the quiz process and not the results. The system notifies the manager when submissions for this quiz are past due.

**Notify manager if overdue**
Check box for sending *email notifications* to a recipient's manager when that user fails to submit an assigned quiz before the due date.

### Related Links

**Show Benchmarks**
Opens the Benchmarks Dashboard that provides visibility into your key performance indicators (KPIs) and trends.

**Note:**
- This related link is available only for survey_admin, assessment_admin and survey_reader with bm_viewer role.
- You must opt in to Benchmarks to view the dashboard. See *Enable Benchmarks*.
- This is applicable only for a published quiz.

---

**Select a quiz recipient**
When the system distributes a quiz, it sends email notifications to the category users and their managers.

Role required: assessment_admin or admin

A category can have one or more assigned users, and the same user can be assigned to more than one category.

The system also creates a link to the quiz in the recipients' **My Assessments & Surveys** portal. Users can only answer questions in the categories that they are assigned to.

To select the recipients for each quiz category, click **Availability** and then fill in the fields as described in the table.

### Select recipients

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select category</td>
<td>Category for which the selected users are recipients.</td>
</tr>
<tr>
<td>Add users</td>
<td>Users selected as recipients for this category. The choice list shows all users in the system.</td>
</tr>
</tbody>
</table>
Publish a quiz
When you publish a quiz, the system sends email notifications to the recipients and to their managers. A card in each recipient’s My Assessments & Surveys portal displays a link to the quiz.
Role required: assessment_admin or admin
1. If you want to see the quiz as the recipients will see it, point to the menu icon in the upper right of the quiz designer and click Preview.
2. When you are satisfied with the quiz, click Save and Publish or Publish to distribute it.

Copy a quiz
Create a copy of a quiz with at least one category to reduce the effort of creating another quiz with similar data.
Role required: assessment_admin or admin
All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.
1. Navigate to Quizzes > Quizzes.
2. Select a quiz.
3. Perform any of the following steps:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click Copy.</td>
</tr>
<tr>
<td>From Platform</td>
<td>In the title bar, select Copy from the context menu.</td>
</tr>
<tr>
<td>From quiz designer</td>
<td></td>
</tr>
<tr>
<td>1.</td>
<td>In the title bar, click Quiz Designer.</td>
</tr>
<tr>
<td>2.</td>
<td>In the Quiz Designer title bar, point to the menu icon on the header bar and click Copy Quiz</td>
</tr>
</tbody>
</table>

Edit a quiz
You can update a quiz after the quiz has been distributed.
Role required: assessment_admin or admin
You can only edit a quiz that has the same application scope as that of your current session.
• Questions that you add are available only on quizzes that are distributed after the update.
• Before a quiz is submitted or during the retake period:
  • Changes to existing questions are immediately available to users. This includes changes to the answers, such as additional choices or changes to the data type.
  • Deleted questions are deleted from distributed quizzes in users’ queues.

Open the quiz: Group the Service Details form with one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quizzes &gt; Quiz Designer</td>
<td>Point to the menu icon in the quiz header bar and select Load Quiz.</td>
</tr>
<tr>
<td>Quizzes &gt; Quizzes</td>
<td>Right-click a quiz in the list and select Quiz Designer.</td>
</tr>
</tbody>
</table>
Enable a quiz retake

You can configure a quiz to allow recipients to resubmit their answers as many times as they like, until the quiz’s due date.

Role required: assessment_admin or admin

Results are not calculated until the quiz’s configured duration has elapsed. The card in the user’s queue remains visible until the quiz’s due date and displays a button to allow retakes.

1. Navigate to Assessments > Metric Definition > Types.
2. Remove the Evaluation method = Assessment filter condition so you can see all the records in the list.
3. Open the quiz.
4. In the Assessment Metric Type form, select the Allow retake check box and save the record.

View a quiz result

You can view quiz results for each question and category, or view the quiz scorecard for a detailed breakdown.

Role required: assessment_admin or admin

Quiz results are stored in the Metric Result [asmt_metric_result] table and display recipients’ answers to each question in a category.

Navigate to Quizzes > Quiz Results.

View a quiz designer scorecard

The quiz scorecard opens in the Category Results view.

For detailed information about scorecards, see Quiz Scorecards.

1. Navigate to Quizzes > Quizzes.
2. Open the quiz whose results you want to view.

The scorecard for the selected quiz opens in the Category Results view.
4. Select a category to view from the choice list above the chart.
View a quiz category result

Category results are stored in the Assessment Category Result (asmt_category_result) table and display the overall ratings for each category based on the weighted value for each scored question.

1. To view category results, navigate to Quizzes > Category Results.

![Assessment Category Results](image)

2. The system calculates results from the weight configured for each category. Weights are set to a value of 10 by default but can be changed. To edit a category's weight:

3. Navigate to Quizzes > Categories, and select a category from the list.

4. In the Metric Category form, edit the default value in the Weight field.

5. Click Update.

   Note: You can also edit the weight of a question in the Quiz view of the Assessment Metric form.

Take a quiz

All available quizzes assigned to you appear in your personal assessment and survey queue. When you submit a quiz, the system stores your responses. If a quiz allows retakes, you can resubmit it as many times as you like until its due date.

Role required: none

No special role is required to complete a quiz, but you must be logged in and the quiz must be assigned to you.

If configured to send email, the system sends you a notification when a quiz is assigned to you. The message contains a link to the quiz and instructions for viewing the assessment and survey queue.

Each quiz assigned to you appears in your assessment and survey queue as a card that contains information about the quiz, including a launch button. Overdue quizzes are marked with a red icon and red due date.

You must answer every required question, indicated by a red star, before you can submit the quiz. If you start to take a quiz but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the quiz.

By default, you cannot modify your answers to a quiz after submission. However, if the administrator has configured this quiz to allow retakes, the quiz remains in your queue after you
finish it and the card shows a Modify Quiz button. You can retake the quiz as many times as you like before the due date.

1. Navigate to **Self-Service > My Assessments & Surveys**.
2. Click **Take Quiz** on a quiz card to open the questionnaire. If there is more than one quiz category, you can click the collapse or expand icon to hide or show the questions in the category.
3. Answer each question to the best of your ability. If you are unsure of how to respond to a question or if a question does not apply to you, select Not Applicable, if that choice is available.
4. Click **Save** at any time to save your responses without submitting them. You can reopen the quiz from your queue when you are ready to work on it again.
5. When you are ready to submit the completed quiz, read any assertions that require your attention.
6. If present, select the check box to acknowledge the assertion. If your full name is displayed, you are required to provide authentication to acknowledge the assertion after you submit the quiz.
7. Click **Submit**.
8. If prompted, enter your user name and password to verify your signature. If you provided valid answers for all mandatory questions, a success message appears, displaying any end note that was configured. If the quiz allows retakes, the card remains in your queue with a Modify Quiz button after submission. If retakes are not permitted, the card disappears from your queue.
9. If the system displays an error message indicating that a question has an invalid response or must still be answered, correct the error and resubmit the quiz.
10. To edit your answers and resubmit a quiz that permits retakes, click Modify Quiz. You can modify your responses to the quiz until its due date.

**View a quiz instance**

View an instance to verify that quiz instances were created, to check the state of a quiz instance, or to reassign a quiz instance. A quiz instance represents one questionnaire assigned to one user.

Role required: admin or assessment_admin

1. Navigate to **Quizzes > Quiz Instances**.
   
   The following submodules are available based on the state of the instances:
   
   - **Ready to take**: Displays quiz instances that the user can take. By default, these instances are sorted in ascending order by the **Number** field.
   - **In progress**: Displays quiz instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.
   - **Completed**: Displays quiz instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.
   - **Cancelled**: Displays quiz instances that are canceled. By default, these instances are sorted in ascending order by the **Number** field.
   - **All**: Displays quiz instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. From the required submodule, click a quiz instance.

   **Note**: When you select an instance in the **Completed** submodule, you are redirected to the User’s Response page.
3. In the form, fill the fields. By default, the following fields are displayed for all submodules other than the **Completed** submodule.

**Quiz instance form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Automatically generated record number.</td>
</tr>
<tr>
<td>Metric type</td>
<td>Metric type of this quiz.</td>
</tr>
<tr>
<td>Due Date</td>
<td>Date by which the quiz instance should be completed. The system populates the due date based on the <strong>Assessment duration</strong> of the associated quiz definition, which is set to 14 days by default. The quiz due date is not enforced in the base system. If you want to enforce the due date, consider using a workflow or other mechanism to send survey recipients reminders when a survey is overdue.</td>
</tr>
<tr>
<td>State</td>
<td>State of the quiz.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User that the quiz instance is assigned to. This field becomes read-only when the state is <strong>In progress</strong>, <strong>Complete</strong>, or <strong>Canceled</strong>.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain associated with the instance.</td>
</tr>
<tr>
<td>Related Link</td>
<td></td>
</tr>
<tr>
<td>View User’s Response</td>
<td>Shows a read-only version of the survey responses completed by the user.</td>
</tr>
<tr>
<td>Related List</td>
<td></td>
</tr>
<tr>
<td>Assessment Instance Questions</td>
<td>All instance question records that store user response values for each question on the quiz questionnaire. The following columns are relevant to quiz:</td>
</tr>
<tr>
<td></td>
<td><strong>Category</strong>: Displays the quiz categories the questions belong to.</td>
</tr>
<tr>
<td></td>
<td><strong>Metric</strong>: Displays the quiz questions.</td>
</tr>
</tbody>
</table>

**Quiz scorecards**

The Quizzes application prepares printable scorecards.

A scorecard analyzes category and question responses and compares current ratings with previous ratings. You can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected.
The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed quizzes.

**Category results**

The Category Results view is a stacked bar chart of responses to all questions in a category. Select the category to display from the choice list above the chart. Category results are only calculated for *scored questions*

This view displays responses that use the following *data types*:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

**Note:** The Checkbox and Yes/No data types are combined into the **Boolean** data type in the Quiz designer.
Quiz category results
To view details about a specific response to a question, point to the colored segment representing a specific response. The chart displays the count for those responses and the percentage it represents of the total responses to that question.

Quiz category result details

Question results
The Question Results view shows the results for all questions in a quiz.
Select a question by name from the choice list to display the results in a pie chart or a bar chart, based on the data type.

Pie chart
The pie chart shows question results for these data types:
- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the Quiz designer
Quiz scorecard question results - pie chart
Bar chart

A bar chart appears when question results use this data type:

- Percentage

By default, all results for percentage questions use a report range of 20% segments. To configure a report range, navigate to Reports > Administration > Report Ranges.

Average ratings

The Average Ratings view displays a bar chart of the weighted average rating for each question in a category.

Use this view to learn how individual questions affect the overall rating for the category. Select a category from the second choice list above the chart. Ratings are only calculated for scored questions.
Average Ratings view

To view the effect of each question’s ratings on the entire category’s ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question’s weighted average.
Quiz reports

Quizzes provide several global reports so that assessment administrators can view important statistics.

You can share these reports with specific users or groups and change the display options. For detailed field information and reporting options, click the link for the chart Type. To sort a column in ascending or descending order, click the arrow in the column heading.

<table>

**Wizards**

The Wizards functionality, which enabled administrators to create wizards that provide a step-by-step sequence of dialog boxes that lead the user through a procedure, was deprecated in the Eureka release. However, some users are still able to access this functionality if they enabled its plugin in previous releases.

For more information about this functionality, see https://docs.servicenow.com/bundle/archive/page/archive/fuji-archive.html.

**Service Portal**

Service Portal is a portal framework that allows administrators to build a mobile-friendly self service experience for users. It interacts with parts of the Now Platform, so users can access specific platform features using Service Portal. It is an alternative to the Content Management System (CMS) based on more modern technologies.

Both expert developers and beginners can configure Service Portal.

Less technical users can make basic configuration changes to the UI using Branding Editor and other components of Service Portal. More advanced users can edit and extend portals, pages, and widgets. Expert users can use the Widget Editor tool to write scripts to power a portal, and even create rich web applications on the Now Platform.

Understanding Service Portal

Service Portal provides a modular user interface framework for quick and easy building of application portals and dashboards for the platform. It helps developers and non-technical administrators create attractive and engaging user experiences that drive employee adoption of critical enterprise applications.

How do you use Service Portal?

Service Portal is an application included in the platform UI, however it includes a visual layer for you to do most of your configuration. In the application navigator, navigate to Service Portal > Service Portal configuration to view the configuration page.

The Service Portal configuration page provides a unique, intuitive way of viewing all the pieces of your portal and how they interact with one another. The configuration page allows you to take advantage of a real-time preview, while configuring portal settings. Use each of the tiles on the configuration homepage to assemble the different components of your portal.

If you prefer the platform layout for configuring Service Portal, you still have the option of creating your portal components within the platform UI. The two options are not separate. Everything you create in the Service Portal configuration page also appears in a table in the platform UI.

Watch this five-minute video for an introduction to the Service Portal user interface, guided tours of the Service Portal, using the Service Portal, chat support, and Virtual Agent.

Who uses Service Portal?

Several different kinds of users can configure a portal.

- Limited coding: Service Portal was designed so that even users with limited coding ability or knowledge of the platform UI could set up a portal.
- ServiceNow Experts: Users with an understanding of the Now Platform can create portals, set up URL redirects, and view all the components of the portal in a table. Most portal configuration takes place in the Service Portal configuration page, but in specific circumstances, Service Portal administrators may need to do additional configuration directly within the platform.
- Developers: Advanced customizations and new widget creation are tasks for a developer or someone who understands AngularJS and Twitter bootstrap.

In all cases, the user configuring a portal must have the admin or sp_admin role.

Basic concepts

You should have a basic understanding of all the following components that make up a portal:
Themes: Themes define the look and feel of the whole portal, but can be overridden by other style configurations.

Pages: Pages control where and how you store portal content. Pages do not have a defined relationship to portal records, they simply exist.

Widgets: Components in Service Portal are called widgets. You can use HTML templates, CSS, client scripts, server scripts, and any JavaScript dependencies to define what a widget does. From an AngularJS standpoint, widgets are essentially a superset of an Angular directive.

Most of the data in Service Portal is managed in different locations throughout the system.

For example, if you are building a knowledge portal, the data exists in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. Take time to understand which tables contain and control the data you are working with in Service Portal.

Additional resources

Service Portal is built using several well known technologies. Use the following websites as resources to help you understand and configure your portal:

- Twitter Bootstrap
- CSS 3 Flexbox
- AngularJS

Service Portal core concepts

Service Portal contains two parts: a framework and a portal. The framework is composed of a set of APIs, Angular services, directives, and tools that help to build portals. The portal is a group of pages linked by page IDs.
After you enter a URL, the framework uses the suffix and picks the appropriate portal to determine the theme and configurations. Then it loads the configured default portal homepage unless the URL has a specified ID.

Each widget added to a page becomes its own instance. A widget instance is basically the application of a widget in a page. Because widgets are reusable and can appear on different pages to do different things, the manifestation of a widget on a page is referred to as a Widget Instance. The page loads with content represented by widgets.

Widget instances get their logic from the base widget template, client scripts, server scripts, and depending on the widget, CSS.
Activate Service Portal

If Service Portal is not active on your instance, you can activate it from the plugin module. You must have the administrator role to activate a plugin.

Locate the Service Portal for Enterprise Service Management (com.glide.service-portal.esm) plugin in the list of plugins. Activate the plugin and select the option to include demo data. For more information on activating a plugin, see the Activate a plugin topic.

Activating Service Portal automatically activates the following plugins:

- Service Portal - Knowledge Base (com.glide.service-portal.knowledge-base)
- Service Portal - Service Catalog (com.glide.service-portal.service-catalog)
- Service Portal - Service Status (com.glide.service-portal.service-status)
- Service Portal Configuration Pages (com.glide.service-portal.config)
- Service Portal Designer (com.glide.service-portal.designer)
- Service Portal Social QA (com.glide.service-portal.sqanda)
- Service Portal Surveys (com.glide.service-portal.survey)

Content Management and Service Portal

Service Portal is a compelling alternative to the Content Management System (CMS) with a refined user experience. It does not duplicate CMS or platform UI functionality. Users who have sophisticated experiences delivered through CMS may need to invest time into transitioning to Service Portal, especially if the CMS implementation includes complex and customized Service Catalog forms.

Service Portal compatibility with existing CMS sites

ServiceNow continues to support CMS in current and upcoming releases. If you have existing CMS sites and activate Service Portal on your instance, your CMS sites will continue to work, as CMS and Service Portal are separate applications.

Differences between Service Portal and CMS

Service Portal is an alternative to CMS based on more modern technologies. Major differences include:

**Underlying technology**

CMS uses Jelly, which is not a widely used technology. Service Portal instead uses AngularJS, server-side JavaScript, HTML, and CSS. Any scripts that use Jelly do not work in Service Portal. Building widgets in Service Portal requires knowledge of AngularJS.

**Visual layer**

CMS uses iFrames which can be difficult to work with, limited in terms of styling, and susceptible to upgrade issues. Alternatively, Service Portal is a self-contained application that accesses data from other tables on the platform. This enables fine-tuned control over style and responsive design.

**Mobile first**

Unlike CMS, Service Portal is optimized for a mobile environment. For this reason, the following apply to the Service Portal environment:
Any scripts used in Service Portal can only use APIs supported in a mobile environment. For example, some APIs used in your Service Catalog client scripts may not be supported. For a list of supported APIs, see Service Portal and client scripts.

Service Portal forms support a maximum of two-columns. As a result, any highly customized Service Catalog forms, such as catalog items and record producers that use containers and variable sets, must be simplified to work in a two-column layout.

If transitioning to Service Portal, review the following resource: Mobile client GlideForm (g form) scripting and migration.

To understand how core CMS components are configured in Service Portal, refer to the following table.

### CMS and Service Portal components

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal equivalent</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

### CMS and Service Catalog customizations

Service Portal comes with base system widgets to address common use cases and to display record data. Even though there is no direct migration path from CMS to Service Portal, there may
be some items, such as catalog items or knowledge articles, that render as expected in Service Portal without any effort.

However, because Service Portal is supported in a mobile environment, you may need to modify any customized forms and scripts. This approach ensures that the items display well on a mobile device and present a better user experience. Before transitioning to Service Portal, you may need to:

- Refactor client scripts used in your CMS/Service Catalog to use supported mobile APIs and global objects. For a list of supported APIs, see Service Portal and client scripts.
- Build widgets to replace UI Macros and other unsupported scripts. If using a UI Macro in a catalog item form and referencing values on the form, you can use the following workaround instead: Replace a Service Catalog form script with a widget.
- Simplify any complex forms used in your Service Catalog to fit the Service Portal two-column form layout.
- Consider which release supports the required functionality. You may want to upgrade your instance before transitioning to ensure that you have the required base system features.

**CMS to Service Portal transition**

Your CMS may include complex forms and customizations that do not render as expected in Service Portal. Use this guide to understand how best to modify your CMS and Service Catalog implementation for Service Portal adoption, and to understand how a conversion may affect your users.

If you are considering transitioning from CMS to Service Portal, make sure that you understand the impact of moving to a mobile environment. Review the Mobile client GlideForm (g form) scripting and migration.

**Support level and transition actions**

<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data lookups</td>
<td>The client-side component of a data lookup is not supported in Service Portal. However, the data lookup is applied in the platform when a record is submitted or updated in Service Portal.</td>
<td>While data lookups are not applied in the Service Portal, the record updates as expected in the platform UI when submitted or updated in the Service Portal. If your CMS is used by requesters only, this limitation may not affect your implementation.</td>
</tr>
<tr>
<td>Content blocks</td>
<td>Because Content blocks use Jelly, they are not supported in Service Portal.</td>
<td>In the Service Portal, content blocks are replaced by widgets. Widgets are highly customizable components that can query record data, display and update records, and gather user input. Base system widgets generally cover most use cases. Just as you add content blocks to a page in your CMS, you can add widgets to a page using the Service Portal Designer.</td>
</tr>
<tr>
<td>CMS component</td>
<td>Service Portal support</td>
<td>Possible transition actions</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------</td>
<td>----------------------------</td>
</tr>
</tbody>
</table>
| UI Macros     | Because UI Macros use Jelly, they are not supported in Service Portal. | • In Service Portal, you can use widgets instead of UI Macros. Base system widgets generally cover most use cases, but for custom solutions, you can develop new widgets using AngularJS.  
• If your implementation includes UI Macros in Service Catalog forms that reference other fields or variables in the form, you can embed the widget inside a Service Catalog variable. Learn more: Replace a Service Catalog form script with a widget. |
| UI actions    | All server-side UI actions are supported in Service Portal, although `setRedirectURL()` operations are ignored because Service Portal forms handle redirection in a different way than the platform. The form widget ignores all UI actions marked as Client. | • Refactor any UI actions to remove `setRedirectURL()` operations.  
• Check that UI actions are not marked as client. |
<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
</table>
| Catalog client scripts | Only UI Type options **Mobile / Service Portal** and **All** are supported. UI type **Desktop** is not supported in Service Portal. For a list of supported APIs, see **Service Portal and client scripts**. | - Update your scripts to remove any unsupported client APIs.  
- Check that the script UI Type is set to **Mobile / Service Portal** or **All**. |

**Note:** Synchronous JavaScript calls are not supported in Service Portal and must be replaced by asynchronous calls. For example, the `getXMLWait()` method of the GlideAjax class is not supported in Service Portal. Instead, use one of the following supported asynchronous methods:

- `getXML(Function callback)`
- `getXMLAnswer(Function callback)`

For additional information on GlideAjax, refer to **GlideAjax**.

To understand the impact of updating your CMS to work in a mobile environment, review **Mobile client GlideForm (g form) scripting and migration**.

<p>| UI policies | Scripted UI policies can only use APIs supported in Service Portal. For a list of supported APIs, see <strong>Service Portal and client scripts</strong>. | Update your scripts to remove any unsupported client APIs. |</p>
<table>
<thead>
<tr>
<th>CMS component</th>
<th>Service Portal support</th>
<th>Possible transition actions</th>
</tr>
</thead>
</table>
| Service Catalog variables | Service Catalog variables are supported in Service Portal with the following exceptions:  
- UI Macros and UI pages variable types are not supported.  
- Validation Scripts for variables are not supported. Supported validation types include:  
  - The Mandatory field on the variable form.  
  - Read-only variables.  
  - All fields in the Availability tab of the variable form.  
- Default variable size is not supported.  
- Expanding and collapsing help text is not supported. Rather, the Help text and Instructions fields defined in the Annotations tab on the variable form are always expanded. The Help tag does not display.  
- The List Collector variable displays as a choice list instead of a slushbucket in the Service Portal. | • If embedding a widget in a catalog item form, you can use the UI Macro variable type. Learn more: Replace a Service Catalog form script with a widget.  
• If using variable with annotations, make sure to test your catalog items in Service Portal to ensure that help text displays as expected. |
| Order guides | Order Guides in Service Portal use the Order Guide widget.                                                                                                                                                           | Large order guides can cause performance issues in the Service Portal. If you have large order guides, you can:  
• Break them into multiple order guides.  
• Simplify variables used in the order guides.  
• As a temporary solution, you can render the Service Catalog item using an iFrame. See Service Catalog forms in Service Portal. |
| Record producers | Record producers are used in Service Portal with the following differences:  
- The sort order for catalog items in record producers is not honored.  
- Date values do not honor time zone when the record producer submits a record. | Make sure to test all record producers used in Service Portal to make sure that they behave as expected. |
<table>
<thead>

</thead>
<tbody>
<tr>
<td>Login scenarios and redirects</td>
<td>In CMS, you used the CMSEntryPage script include to define login scenarios. Instead, Service Portal uses the SPEntryPage script include and related system properties to define login scenarios. Redirects are not supported in Service Portal.</td>
<td>In Service Portal, define login behavior by modifying the SPEntryPage script include and setting system properties. For more information, see Single sign-on, logins, and URL redirects.</td>
<td></td>
</tr>
</tbody>
</table>
| Service Catalog forms             | Service Catalog forms such as catalog items and record producers are rendered within widgets in a two-column layout. Complex forms may not display as expected.                                                      | • Simplify any complex forms in your Service Catalog.  
• As a temporary solution, you can render the Service Catalog item using an iFrame. See Service Catalog forms in Service Portal.                                             |  |
| Shopping cart                     | The Service Portal includes a base system Shopping Cart widget.                                                                                                                                                        | Use the Shopping Cart widget.                                                                                                                                                                                                  |  |

**Service Catalog forms in Service Portal**

Service Catalog forms are rendered within Service Portal widgets in a two-column layout. Complex forms may not display as expected.

**Recommendations when creating Service Catalog forms**

Use the following recommendations as a guide to building scalable forms that can be used in both applications:
• Keep forms simple. Because forms with multiple containers, variable sets, and client scripts do not always display as expected in Service Portal, keep forms short to eliminate conversion and debugging issues.

• Think in mobile. Any support for Catalog Client Scripts or Catalog UI Policies is the same as in mobile. Review the following resource: Mobile client GlideForm (g form) scripting and migration.

Form rendering in Service Portal

Containers and variable sets within Service Catalog forms are translated into a two-column layout when implemented in Service Portal. Service Catalog forms are rendered in Service Portal using the following rules:

• Only the top-level container settings are honored. If there are other containers within the top-level container, they are rendered as a single column. If there are container splits or nested containers within these additional containers, they are rendered as a single column. A top-level container is not a child of any other container.

• There can be a maximum of two columns in Service Portal. If your implementation includes forms with more than two columns, the fields are reorganized into two-columns in Service Portal.

• Variable sets are treated as containers. All previously listed rules apply to variable sets as well as any containers within them.

• Default variable size is not supported in Service Portal.

For other forms in the platform, the view determines how the form displays in Service Portal. For base system tables, the form opens in the Service Portal using the Service Portal table form view.

Example layout conversions

The following examples demonstrate how Service Catalog forms display in Service Portal.

Single-column form

A Service Catalog form with:

• Two containers.

• A single-column layout.
**Service Catalog form**

In Service Portal, the single-column layout renders as expected.
Two-column layout with subcontainers

A Service Catalog form with:

- A container with a two-column layout.
- A subcontainer with a single-column layout.
- A subcontainer with a two-column layout.
In Service Portal, the two-column layout setting of the subcontainer is ignored. The subcontainer renders as a single column.
Two-column layout with variable sets and subcontainers

A Service Catalog form with:
- Containers with single-column and two-column layouts.
- Variable sets with a two-column layout within containers.
In Service Portal, the two-column layout settings of the variable sets are ignored when inside a container column.
<table>
<thead>
<tr>
<th>Container1</th>
<th>Variable1</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>VariableSet1</td>
<td>Variable5</td>
</tr>
<tr>
<td>Variable6</td>
<td></td>
</tr>
<tr>
<td>Variable2</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Container2</th>
<th>Variable3</th>
<th>VariableSet2</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>VariableSet3</td>
<td>Variable9</td>
<td>Variable7</td>
</tr>
<tr>
<td>Variable8</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Variable10</td>
<td>Variable4</td>
<td></td>
</tr>
</tbody>
</table>

Containers within variable sets

A Service Catalog form with:

- Variable sets with single-column layouts.
- A container with a single-column layout with a container split within a single-column variable set.
- A container with a two-column layout within a single-column variable set.

Service Catalog form

In Service Portal, the container split and two-column container settings are ignored when inside a single-column variable set.
<table>
<thead>
<tr>
<th>Variable</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable1</td>
<td></td>
</tr>
<tr>
<td>Variable2</td>
<td></td>
</tr>
<tr>
<td>Variable3</td>
<td></td>
</tr>
<tr>
<td>Variable4</td>
<td></td>
</tr>
<tr>
<td>Variable5</td>
<td></td>
</tr>
<tr>
<td>Variable6</td>
<td></td>
</tr>
<tr>
<td>Variable7</td>
<td></td>
</tr>
<tr>
<td>Variable8</td>
<td></td>
</tr>
</tbody>
</table>
**Nested containers**

A Service Catalog form with:

- Containers that contain variable sets.
- Variable sets that contain nested containers.

---

### Service Catalog form

In Service Portal, nested container formatting is ignored and displays as a single-column.
Service Portal result
Render a complex form in Service Portal using an iFrame

Because complex forms do not display as expected in Service Portal, you can render catalog items, record producers, and order guides in Service Portal using an iFrame. This workaround is a temporary solution to enable your Service Portal to function as expected while you simplify any complex Service Catalog forms.

When rendering items in an iFrame in Service Portal, the following limitations apply:

- On catalog items and record producers, the attachment icon is not visible. As a result, users cannot attach any files during the submission. As a workaround, you can add the attachment button to your form.
- Click-through for the hover-over icon is not available.
- Forms are not optimized for a mobile environment.

Use the attached resources and follow the instructions detailed in the Community post: Service Catalog on Service Portal.

**Note:** Be sure to make changes in a test environment before updating your production instance.

Replace a Service Catalog form script with a widget

You can use widgets in Service Portal to replace UI Macros. If your Service Catalog form includes a UI Macro that references other fields or variables on the form, you can create a widget to hold reusable code and embed it within the Service Catalog form. Use special syntax to access any variable fields on the form.

Role required: admin or sp_admin

1. Create a widget that performs the action you would like to use in catalog item forms. See step 7 for a simple example widget that accesses another variable on the form.
2. Open a catalog item that previously used a UI Macro or other reusable component not supported in Service Portal.
3. In related lists, add a new variable to the catalog item.
4. Configure the variable form to add the **Widget** field.
5. In the **Type** field, select **Macro**.
6. In the **Widget** field, select a widget that performs the desired action.
7. Optional: Use the `$scope.page.g_form()` or `$scope.page.field` syntax in the embedded widget to access the catalog item values.

This example shows how to modify the value of a single-line text variable with the name **color** associated with the catalog item.

**Widget HTML Template**

```html
<div>
  Data from catalog variable:
  <h1>{{ c.data.message }}</h1>
</div>
```

**Widget client script**

```javascript
function($scope) {
  var c = this;
```
```javascript
//Watch for changes in the color variable
$scope.$watch(function () {
    return $scope.page.g_form.getValue('color');
}, function (value) {
    //Update local data object with data from variable
c.data.message = value ? 'Content of color variable: ' + value : '';
});
```

You can use the following to access variable or catalog item fields:

- `$scope.page.g_form()`: The `g_form` instance on the form. You can use all supported `g_form` methods described in Service Portal and client scripts. For example, `g_form.setValue('variable_name', 'new value');`.
- `$scope.page.field()`: The object that represents the variable.

When you open the catalog item in the Service Portal, the embedded widget accesses the variable fields associated with the catalog item.

**What color would you like?**

Blue

**Data from catalog variable:**

**Content of color variable: Blue**

---

**Supported features in Service Portal**

Service Portal is an alternative presentation layer for the platform. As such, not all features of the platform are extended to Service Portal. Consider your full application and the abilities of Service Portal before making considerable investments.

**Not currently supported**

- Domain separation at Levels 1-3. However, Service Portal does include support for domain separation at the **Data only** level. For more information, see Application support for domain separation and Domain separation in Service Portal.
No plans to support

- @ Mentions
- Click-through/pop-ups
- Embedded HTML outside of HTML fields
- Embedded lists
- UI macros
- Formatters
- UI actions marked as Client
- Nested container Catalog variables
- Survey wizards
- OpenFrame

Service Portal and client scripts

You can use client scripts and catalog client scripts in the Service Portal if the UI Type is set to Mobile / Service Portal or All. Client scripts and catalog client scripts are used with the Form widget and SC Catalog Item widget, as opposed to a widget client controller.

Before flagging a script as Mobile/Service Portal or All, make sure that you are only using the mobile APIs. Setting a client script to Mobile does not ensure that it will work, it simply flags that the script should be attempted by the mobile app or the Service Portal. Many of your existing client scripts can be set to All as long as the API calls are supported by the mobile client scripting environment.

The topics in this section require advanced coding knowledge and an understanding of Service Portal APIs.

Checking desktop vs mobile runtime

You might want to mark a client script compatible with both desktop and mobile, but include behavior that depends on the runtime. You can use this script:

```javascript
if (window === null)
    // Write your mobile compatible code here
else
    // Write your desktop compatible code here
```

Unsupported client scripting globals

The following globals and APIs are unavailable in client scripts and catalog client scripts used in the Service Portal:

- $  
- $$  
- $j  
- angular  
- control  
- document  
- jQuery  
- window
Embedded widgets & g_form

When using the Service Catalog variable type Macro and Macro with Label, you can pick a widget to embed in a catalog item form. Within the client controller for the embedded widget you can access the field object and catalog item g_form instance using:

- $scope.page.field
- $scope.page.g_form()

**g_list and g_service_catalog in client scripts used with Service Portal**

The g_list global helps you set the filter of a Glide list element or a list collector variable. Use this API in place of the g_filter API on desktop client scripts.

```javascript
function onLoad() {
  var myListCollector = g_list.get("my_list_collector");
  myListCollector.reset();

  myListCollector.setQuery("active=true^category=8c7b22230b402200b0b02c6317673a62");
  myListCollector.addItem('3a700d39af5f4fc0aab978df90f4c692', 'Power Supply');
  myListCollector.addItem('1cb93419a3a248318da8f814140b42f6', 'Backpack');
}
```

**g_service_catalog is only available in Service Portal service catalog item scripts.**

Use this API to know if your catalog item script is run as part of an order guide or on its own.

```javascript
function onLoad() {
  if (window) // if CMS, don't run this
    return;

  // g_service_catalog api for Service Portal and Mobile
  var isOrderGuide = g_service_catalog.isOrderGuide();
  g_form.setValue("is_order_guide", isOrderGuide ? "Yes!" : "Nope :(");
}
```

**Supported client script types and APIs**

Some client scripts are not supported in Service Portal. Others must have a UI type set to All or Mobile / Service Portal. If using a client script in the Service Portal, only client-side APIs supported in a mobile environment can be used.
## Client script support in Service Portal

<table>
<thead>
<tr>
<th>Client script</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalog client scripts</td>
<td>Service Portal requires that the <strong>UI Type</strong> field be set to <strong>All</strong> or <strong>Mobile / Service Portal</strong>. Client Scripts marked as <strong>Desktop</strong> rely on legacy APIs that are not supported in Service Portal. Before flagging a script as Mobile / Service Portal or All, make sure you are only using supported client-side APIs.</td>
</tr>
<tr>
<td>Validation scripts</td>
<td>Service Portal requires that the <strong>UI Type</strong> field be set to <strong>All</strong> or <strong>Mobile / Service Portal</strong>. Client Scripts marked as <strong>Desktop</strong> rely on legacy APIs that are not supported in Service Portal. Before flagging a script as Mobile / Service Portal or All, make sure you are only using supported client-side APIs. Validate user input in a specific field type using a validation script. In new instances, Service Portal includes XML, Script, Script (Plain), Email, and Version validation scripts by default. If upgrading from a previous release, the Mobile and Service Portal version is not active by default. You must activate the Mobile and Service Portal version of the validation script to validate user input in the Service Portal. See <a href="#">Activate Service Portal validation scripts</a>.</td>
</tr>
<tr>
<td>UI scripts</td>
<td>Service Portal requires that the <strong>UI Type</strong> field be set to <strong>All</strong> or <strong>Mobile / Service Portal</strong>. Client Scripts marked as <strong>Desktop</strong> rely on legacy APIs that are not supported in Service Portal. Before flagging a script as Mobile / Service Portal or All, make sure you are only using supported client-side APIs.</td>
</tr>
<tr>
<td>UI Actions</td>
<td>All server-side UI actions are supported in Service Portal, although <code>setRedirectURL()</code> operations are ignored because Service Portal forms handle redirection in a different way than the platform. The form widget ignores any UI Actions marked as <strong>Client</strong>.</td>
</tr>
<tr>
<td>UI Policies</td>
<td>Supported, although you should use only declarative UI Policies. Avoid scripting unless the outcome cannot be achieved through the condition builder.</td>
</tr>
<tr>
<td>UI Macros</td>
<td>Not supported as UI macros use Jelly.</td>
</tr>
</tbody>
</table>

---

*Note:* To call a UI script within a Validation script, use the `g_ui_scripts` global object. For more information, see [GlideUIScripts](#). Verify that the UI script has the **Global** field set to false and **UI Type** set to Mobile / Service Portal or All.
<table>
<thead>
<tr>
<th>Client script</th>
<th>Description</th>
</tr>

<tr>
<td></td>
<td>showRelatedList(relatedTableName)</td>
</tr>
<tr>
<td></td>
<td>showRelatedLists()</td>
</tr>
<tr>
<td></td>
<td>submit(submitActionName)</td>
</tr>
</tbody>
</table>

**Note:** Using the `variables.var_name` notation with the `g_form` API is not supported in Service Portal. `g_form` as a global object cannot be used in a widget client controller or in a UI script.
<table>
<thead>
<tr>
<th>Class</th>
<th>Available methods</th>
</tr>
</thead>
<tbody>
<tr>
<td>g_list</td>
<td><em>get(fieldName)</em></td>
</tr>
<tr>
<td></td>
<td><em>addItem(value, displayValue)</em></td>
</tr>
<tr>
<td></td>
<td><em>removeItem(value)</em></td>
</tr>
<tr>
<td></td>
<td><em>reset()</em></td>
</tr>
<tr>
<td></td>
<td><em>setQuery(queryString)</em></td>
</tr>
<tr>
<td></td>
<td><em>setDefaultOperator(operator)</em></td>
</tr>
<tr>
<td></td>
<td><em>getDefaultOperator()</em></td>
</tr>
<tr>
<td>g_service_catalog</td>
<td><em>isOrderGuide()</em></td>
</tr>
<tr>
<td>GlideAjax</td>
<td><em>addParam(name, value)</em></td>
</tr>
<tr>
<td></td>
<td><em>getParam(name)</em></td>
</tr>
<tr>
<td></td>
<td><em>getXML(callback)</em></td>
</tr>
<tr>
<td></td>
<td><em>getXMLAnswer(callback)</em></td>
</tr>
<tr>
<td></td>
<td><em>getJSON(callback)</em></td>
</tr>
<tr>
<td></td>
<td><em>setErrorCallback(errorCallback)</em></td>
</tr>
<tr>
<td></td>
<td><em>getURL()</em></td>
</tr>
<tr>
<td></td>
<td><em>getParams()</em></td>
</tr>
<tr>
<td></td>
<td><em>execute()</em></td>
</tr>
<tr>
<td></td>
<td><em>successCallback(data, status, xhr)</em></td>
</tr>
<tr>
<td></td>
<td><em>errorCallback(xhr)</em></td>
</tr>
<tr>
<td></td>
<td><em>setScope(scope)</em></td>
</tr>
</tbody>
</table>

**Note:** Because the mobile platform does not allow synchronous GlideAjax calls, the getXMLWait() method in a GlideAjax call does not work in the Service Portal. Instead, use one of the asynchronous calls such as getXML(Function callback) or getXMLAnswer(Function callback).

**Note:** GlideAjax cannot be used in a widget client controller.
### Activate Service Portal validation scripts

Validate user input in a specific field type using a validation script. In new instances, Service Portal includes XML, Script, Script (Plain), Email, and Version validation scripts by default. If upgrading from a previous release, the Mobile and Service Portal version is not active by default. You must activate the Mobile and Service Portal version of the validation script to validate user input in the Service Portal.

**Role required:** admin

Service Portal requires that the **UI Type** field be set to **All** or **Mobile / Service Portal**. Client Scripts marked as **Desktop** rely on legacy APIs that are not supported in Service Portal. Before flagging a script as **Mobile / Service Portal** or **All**, make sure you are only using supported client-side APIs. See [Supported client script types and APIs](#).

**Note:** To change the UI Type from **Mobile / Service Portal** to **All**, delete the Desktop version from your instance to avoid activating conflicting scripts. Before deleting the Desktop version, make a backup in case you need to revert any changes.

1. Navigate to **System Definition > Validation Scripts**.
2. Open the Mobile / Service Portal version of the validation script you would like to use in the Service Portal.
3. Click the **Active** flag to activate the validation script.
4. Optional: Set the UI Type to **All** to use the validation script in desktop, mobile, and Service Portal environments. To avoid activating conflicting validation scripts, you must first delete the Desktop version of the script.

---

© 2020 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
a) Navigate to the desktop version of the validation script you would like to replace. Desktop versions have the **UI Type** field set to **Desktop**.

b) Open the record.

c) Right-click the header menu and select **Export > XML (This Record)** to create a backup of the record.

d) Once the export completes, click **Delete** and confirm the selection.

e) Navigate back to the validation script set to **Active** in earlier steps and change the **UI Type** to **All**.

User input into the designated field type in the Service Portal and Mobile environments is validated for correct formatting. For example, if you activated the Email validation script for use in the Service Portal, invalid user input into an Email field generates an error and prevents the browser from submitting the form.

**Note:** On a desktop browser, the field is validated when you submit the record. On a mobile browser, the field is validated when you navigate away from the field.

### Domain separation in Service Portal

This is an overview of domain separation and the Service Portal. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

#### No support

- The domain field may exist on data tables, but no logic exists to manage data.
- This level is not considered domain-separated.

#### Overview

Domain separation provides complete data isolation for domain-specific users.

#### How domain separation works in Service Portal

Elements of the Service Portal platform such as settings, portals, pages and widgets cannot be domain-separated. However, the data within widgets does display, based on domain. Separate portals with different URLs can be created to provide different experiences for different domains.

#### Antivirus Scanning in Service Portal

View the health status of file attachments in Service Portal. Antivirus Scanning scans files in the Attachments (sys_attachments) table by default. When viewed from a Service Portal page, attachments may not be available for download depending on their health status.
Note: Antivirus Scanning is a Now Platform feature. For more information, see Antivirus Scanning.

Scanning scenarios

Review these scanning scenarios to understand how Antivirus Scanning interacts with attachments in Service Portal.

Upload a file

1. A user uploads an infected file to a record in Service Portal.

2. The system scans the file, moves it to quarantine, and displays a message. The file is unavailable for download. If viewing the record in the Ticket Form page, the thumbnail does not display.

3. The system sends an email notification to the user and the antivirus administrator.
Microsoft Wired Keyboard

PC / Mac Compatible

Microsoft Wired Keyboard 200:

- PC/MAC compatible
- USB interface

File failed security scan
Download a file

1. A user opens a record with an attachment in Service Portal.
2. The system scans the file and moves it to quarantine. The file is unavailable for download. If viewing the record in the Ticket Form page, the thumbnail does not display.
3. The system sends an email notification to the user and the antivirus administrator.
View a file

1. A user opens a record with an infected attachment.
2. The file is unavailable for download. If viewing the record in the Ticket Form page, the thumbnail does not display.

Set up Service Portal

Set up a site for your users using Service Portal.

Requirements

Role required: admin or sp_admin
Before you begin

Take the following into consideration before configuring Service Portal:

- Who are you building your site for and why?
- What information do you want to include in your site?
- What do you want the mobile experience to be for users?
- Which platform applications do you plan to use in your portal?

You can use parts of the platform, such as knowledge articles and catalog items, as the content for your portal.

For example, if you are building a knowledge portal, the content displays in Service Portal, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. It is important to take time to understand the table structure of data to become acquainted with content.

- How customized is your service catalog? Catalog client scripts and UI policies only work in Service Portal if they use the mobile GlideForm API, so you may need to make some changes.

What to do

Create a portal

A portal is the engine that houses all the references to content for your site. The portal record defines the URL extension for a site, as well as things like the knowledge base, catalog, and homepage. You can also use the portal record to define the header menu and the portal branding.

From the Service Portal configuration page, click the **New Portal** tile. Use the fields on the form to associate pages to the portal.

- **Create a portal**

Create a page

Pages are the centerpiece of the end user experience. Page definitions not only control the layout of the content, they craft the experience for the user. Pages also help define mobile responsiveness, which is a key component in the user experience.

Use any existing page included with Service Portal as an example for your own creation.

Use the Service Portal Designer to create pages, assign layouts, and add widgets.

- **Create and edit a page using the Service Portal Designer**

Create a widget

Widgets are the power behind the portal. Widgets are highly customizable and can be used to provide an endless variety of experiences for your users. Anytime you add a widget to a page it becomes an instance of itself. Each **widget instance** has its own record so you can configure it specifically for each use. For example, you can add several **Icon Link widgets** to a page and configure them to link to different areas with different icons. None of the widgets are affected by the others.

You can start by cloning an existing widget and making changes to your cloned version. Developers with an advanced understanding of AngularJS can create widgets from scratch.

Create a portal homepage
When a portal is referenced by the URL suffix, it lands on a home page. This homepage is often labeled index in website language. The home page is probably the most important page of your portal as it houses the major information and actions that your users see.

- Assign a homepage to a portal

**Configure the header menu**

The header menu in a portal is comprised of two separate widgets: a header widget, which determines the style of the header, and the menu widget, which determines the actual items that appear in the header. Configure both widgets for the header menu to appear and act like a header menu in your portal.

- Create a portal header menu
- Add a header or footer to a portal

**Configure the branding for the portal**

With the Branding Editor, you can configure the styles and theme of your portal in a view with real-time updates. You can see how your portal appears to users with the click of a button. More advanced users still have the option of creating CSS style sheets for the portal theme. However, they cannot take advantage of the real-time update that the Branding Editor provides. Changes made in the Branding Editor or to specific components of the portal (such as a widget or a page container) override any customizations made to the theme.

- Configure portal branding
- Create a portal theme

**Next steps**

- Configure search in the portal.
- Limit user access to specific components.
- Set up URL redirects.

**Service Portal configuration page**

Most Service Portal configuration is accessible through the Service Portal configuration page landing page.

In your instance, access the Service Portal configuration page by navigating to Service Portal > Service Portal configuration. The Service Portal configuration page opens in a new tab in your browser.
Service Portal
Create rich, engaging and modern experiences to help your business run better
Select one of the options below to continue

- **Branding Editor**
  Customize your portal's title, logo and theme colors.
  Preview changes as you make them

- **Designer**
  Create and layout pages with drag-and-drop functionality.
  Preview pages as you make changes

- **Page Editor**
  Configure the properties of pages, containers and widgets from a map view

- **Widget Editor**
  Create widgets from scratch or customize an existing one. Write HTML, CSS, and Javascript with real-time preview

- **New Portal**
  Create a new Service Portal

- **Get Help**
  Browse guides, tutorials and videos to learn how to set up, configure and customize your portals
You can also access the configuration page by appending your URL with sp_config. For example, https://<instance name>.service-now.com/sp_config. Use each option on the Service Portal config page to set up the different parts of your portal.

**Service Portal properties**

The Service Portal properties page provides several configuration options for Service Portal. Administrators can access these properties by navigating to Service Portal > Properties.

<table>
<thead>
<tr>
<th>Service Portal Properties</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Property</strong></td>
</tr>
<tr>
<td>Default 404 page (page ID or sp_page sys_id) for Service Portal</td>
</tr>
</tbody>
</table>
| glide.service_portal.default_404_page | - Type: string  
- Default value: 404  
- Learn more: [Assign a default error page](#)  
The string must match the name of the page exactly. |
| Enable Social Q&A in Service Portal | Allow users to ask questions in a portal using the social Q&A widgets. |
| glide.sp.socialqa.enabled | - Type: true | false  
- Default value: true |
| Show a message to admin users in Service Portal pages if a browser error is encountered |  
- Type: true | false  
- Default value: true |
| glide.sp.show_console_error |  
- Type: integer  
- Default value: 100 |
| Maximum number of stream entries displayed in Service Portal (activity widget, conversation widget, and so on) | Limit the number of entries users can see in the ticket conversation widget. Users only see the most recent entries and cannot go further back in the history than the max allowed amount. |
| glide.service_portal.stream_entry_limit | - Type: integer  
- Default value: 100 |
| Duration (in seconds) info and error messages persist in the Service Portal before auto-dismissal | Set the duration in seconds that error and info messages remain on the screen before they are auto-dismissed. If set to 0, messages do not auto-dismiss and require that a user close them. |
| glide.service-portal.notification_timeout.seconds | - Type: integer  
- Default value: 5  
If the glide.ui.accessibility preference is enabled, messages do not auto-dismiss, regardless of the system property value. To set this preference, see [Enabling accessibility features](#). |
### Property Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Default sort order for announcements | Define the sort order for banner announcements. Type: choice list  
- Default value: Start Date Descending  
Options include:  
- Start Date Ascending: The oldest start date appears first.  
- Start Date Descending: The most recent start date appears first.  
- End Date Ascending: The oldest end date appears first.  
- End Date Descending: The most recent end date appears first. |
| Enable debug runtime information | Controls whether the Angular.js flag `$compileProvider.debugInfoEnabled` is set to true or false. This option allows debug runtime information in the compiler, such as adding binding information and a reference to the current scope on to DOM elements. This property is disabled by default to improve performance on the instance.  
- Type: true | false  
- Default value: false |

If *user criteria* (`com.glide.service-portal.user-criteria`) is enabled, the following properties also appear in the Service Portal properties page:

### User criteria properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable use of User Criteria records instead of Roles fields for Service Portal entitlements | Define permissions for Service Portal widgets, widget instances, pages, and search sources.  
- Type: true | false  
- Default value: true  
More information: [User criteria for Service Portal](#) |
| List of roles (comma-separated) that bypass User Criteria validation in Service Portal | Allow users with a specific role to see any page, widget, widget instance, or search source regardless of user criteria.  
- Type: string  
- Default value: admin |

### Create a portal

Create a portal using the Service Portal configuration page.  
Role required: admin or sp_admin

© 2020 ServiceNow, Inc. All rights reserved.  
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The Branding Editor affects the look of your portal and essentially changes the CSS for the pages. The changes you make in the Branding Editor are recorded in the portal record in the following fields. If you have experience with CSS and HTML you can configure these fields in the portal form directly as accessed through the portal UI. By theming your portal in the Branding Editor instead, you can take advantage of the real-time theme preview.

1. Navigate to **Service Portal > Portals**, then click **New**.
2. Complete the portal form using the following fields.

### Portal form fields

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Title</strong></td>
<td>The name you use to define your portal. In the browser header and for bookmarks, the title appears as <code>&lt;Portal Title&gt; - &lt;Page Title&gt;</code></td>
</tr>
<tr>
<td><strong>URL Suffix</strong></td>
<td>The value that appears appended to an instance URL when you access a portal. For example, if you use <code>sp</code>, the instance URL for that portal would be <code>&lt;instance name&gt;.service-now.com/sp</code>. Make sure this value is unique and is not the same as any other portal.</td>
</tr>
<tr>
<td><strong>Homepage</strong></td>
<td>The page you want users to see first after they sign in.</td>
</tr>
<tr>
<td><strong>Social QA Knowledge Base</strong></td>
<td>Name of the knowledge base where you want to store questions and answers from portal users.</td>
</tr>
<tr>
<td><strong>KB home page</strong></td>
<td>The home page you created that you want users to see when they go to a knowledge base.</td>
</tr>
<tr>
<td><strong>Login page</strong></td>
<td>The page you created for users to be authenticated.</td>
</tr>
<tr>
<td><strong>Logo</strong></td>
<td>Logo that appears in the page header. You can also configure the logo in the Branding Editor.</td>
</tr>
<tr>
<td><strong>Icon</strong></td>
<td>The icon that appears in the address bar for your portal. Each portal you create can have a different icon.</td>
</tr>
<tr>
<td><strong>Default</strong></td>
<td>The portal you want to use as your main portal</td>
</tr>
</tbody>
</table>

**Note:** Avoid using reserved words in your URL to prevent errors when navigating to your portal page. Words such as portal and cms should not be used. Also avoid any javascript protected terms.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick start config</td>
<td>Schema that defines configuration items in the Branding Editor. In JSON format, you can define fields and records used to generate your branding options.</td>
</tr>
<tr>
<td>CSS variables</td>
<td>Portal-specific Sass variables. You can overwrite existing theme variables here.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope. This field is uneditable and <strong>Global</strong> by default</td>
</tr>
<tr>
<td>404 page</td>
<td>The default page your users see whenever a page cannot load properly. You can also define a default 404 page using the system property <code>glide.service_portal.default_404_page</code>.</td>
</tr>
<tr>
<td>Catalog home page</td>
<td>Catalog page that you created in the portal to represent the catalog.</td>
</tr>
<tr>
<td>Main menu</td>
<td>Reference to the menu in the (sp_instance_menu) table that appears in the header</td>
</tr>
<tr>
<td>Theme</td>
<td>Refers to a theme in the (sp_theme) table that defines the style and branding for the portal. The theme is the lowest level of style configuration and any changes made in the Branding Editor or to specific portal components (such as widget or container CSS) override those styles.</td>
</tr>
<tr>

</tr>
<tr>
<td>Stock</td>
<td></td>
</tr>
</tbody>
</table>
3. Click **Submit** to save the portal page.
4. In the **Knowledge Bases** related list, click **Edit** to select which knowledge bases appear for the knowledge base page. For example, if you select **IT** and **Instance Security Center**, only the article categories defined for these knowledge bases appear in the **KB categories widget**.
5. In the **Catalogs** related list, click **Edit** to select one or more catalogs listed in the sc_catalog table to use in the portal.

**Configure a catalog in Service Portal**

Associate a portal with multiple catalogs. By default, Service Portal is associated with Service Catalog.

Role required: admin or sp_admin

1. Navigate to **Service Portal > Portals**.
2. Click the **Service Portal** record.
3. To associate a portal with a catalog, perform the following steps.
   a) In the **Catalogs** related list, click **Edit**.
   b) Select one or more catalogs to add to the portal. The categories and catalog items associated with the selected catalogs are displayed in Service Portal. If no catalogs are selected, all catalogs accessible to the requester are available in Service Portal.
4. Optional: To edit the label for a catalog, perform the following steps.
   a) For the **Main menu** field, click **Open Record**.
   b) From the **Menu Items** section, click the **Catalog** record.
   c) In the **Label** field, specify the label for the catalog. The catalog label is displayed in the main menu of Service Portal.
5. Click **Update**.

**Associate a portal with a knowledge base**

You can associate a portal with any knowledge base. Multiple knowledge bases can be associated with a portal.

Role required: admin or sp_admin

1. Navigate to **Service Portal > Portals**.
2. In the **Knowledge Bases** related list, click the **Edit** button.
3. Select one or more knowledge bases to add to the portal. The knowledge bases are displayed in Service Portal page listed in the **KB Home page** for the portal. If no knowledge bases are selected, all knowledge bases are available in the portal.
4. Click **Update**.

**Configure Agent Chat in Service Portal**

Your end users can initiate and maintain an Agent Chat conversation in any portal page. Write a script to pass portal-specific data to Agent Chat. For example, pass the name of your knowledge base to a Virtual Agent conversation.

Role required: admin
- Activate the Glide Virtual Agent (com.glide.cs.chatbot) or the Agent Chat (com.glide.interaction.awa) plugin. You can activate the Glide Virtual Agent plugin only if you have a subscription.

1. Navigate to **Service Portal > Agent Chat**.
   The Service Portal Agent Chat Configurations (sp_agent_chat_config) table opens.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Select to make the configuration active.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a unique name for the configuration record.</td>
</tr>
<tr>
<td>Portals</td>
<td>Select the portals in which you would like to use the specified chat configuration. If no portal is selected, the configuration applies to all portals in the system.</td>
</tr>
<tr>
<td>Application</td>
<td>Read-only application scope for the record.</td>
</tr>
<tr>
<td>Public</td>
<td>Select to make Agent Chat available to users before they log in.</td>
</tr>
<tr>
<td>Roles</td>
<td>Select the roles a user must have to use Agent Chat. If you don't select a role, Agent Chat is available to all users regardless of their role.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number indicating the order that the configurations should run. Only one configuration applies per portal. If there are multiple configurations on a portal, the system runs the first configuration found from lowest to highest.</td>
</tr>
</tbody>
</table>

**Server script**

Write a script that passes page and widget data to an Agent Chat conversation when a user initiates the conversation. For example, pass a field to the chat conversation to enable Agent Chat to access the value. Data passed in this script is available to every page in the portal associated with this record. This script has access to the GlideSPScriptable API.

**Note:** The portal suffix, page ID, and language are automatically available to Agent Chat and do not require a custom script. Sys ID and table are automatically available to Agent Chat when they are present in the URL.

```javascript
(function ($sp) {
  return {
    catalogs: $sp.getValue('catalogs')
  };
})(sp);
```

When Agent Chat opens in an iframe HTML element, the list of catalogs is included in the iframe URL. Parameters from this field override any conflicting page data passed to Agent Chat.

4. Click **Submit**.

Users can initiate and maintain an Agent Chat conversation from any page in the selected portal.
Migrate from the Virtual Agent Service Portal widget

If you are upgrading from a previous release, your portal implementation may include the Virtual Agent Service Portal widget. Migrate widget options to the Agent Chat in Service Portal configuration and remove all instances of the widget to enable your users to initiate and maintain an Agent Chat conversation in any portal page.

1. Record instance options and delete instances of the Virtual Agent Service Portal widget.
   a) Locate each instance of the Virtual Agent Service Portal widget and open the instance options.
   b) Record the values.
   c) Delete the widget instance.

2. If your widget instance included a color instance option, add the color variable to the portal theme record.
   a) Navigate to Service Portal > Themes.
   b) Open the theme record for the portal.
   c) In the CSS variables field, add the $sp-agent-chat-bg variable and set the value to the desired color.

   $sp-agent-chat-bg: #ff0000

3. If your widget instance options included URL parameters, add them to the Service Portal Agent Chat Configurations form Server script field.

Note: The portal suffix, page ID, and language are automatically available to Agent Chat and do not require a custom script. Sys ID and table are automatically available to Agent Chat when they are present in the URL.

   a) Navigate to the record in the Service Portal Agent Chat Configurations (sp_agent_chat_config) table for the desired portal.
   b) In the Server script field, write a custom script to pass the parameters to Agent Chat.

   This example returns the value of the chat_queue field to the current conversation.

   (function ($sp) {
   return {
   chat_queue: $sp.getValue('chat_queue')
   };
   })($sp);

Widget instances are removed from individual portal pages. Instead, the portal applies the Service Portal Agent Chat Configurations record to every portal page.

Pass page data to Agent Chat

Use the spContextManager class in a widget client script to pass dynamic page data to Agent Chat. For example, pass the number of approvals in the Approvals widget to Agent Chat when a user initiates a conversation from the Service Portal homepage.

Role required: admin

Examine the widget to understand how data is passed to the widget client script. To make data available to Agent Chat, you must pass it to the spContextManager service. You can then access
the data in a Virtual Agent topic using the `vaContext` object. For more information about using context variables in Virtual Agent scripts, see Virtual Agent scripts.

1. Open the widget in the widget editor.
2. Update the widget client script.
   a) Inject the `spContextManager` service into the widget client script function.
   b) Pass variables to Agent Chat using the `spContextManager` API.

This example passes `approval_count` to Agent Chat. When a user initiates a conversation from the Service Portal homepage, the system appends `&sysparm_approval_count=5` to the Agent Chat iframe URL.

```javascript
function ($scope, spContextManager) {
    spContextManager.addContext('agent-chat', {
        'approval_count': 5
    });
};
```

Keys passed to this API are unique per page. For example, if the `agent-chat` key is already initialized by another widget on the page through the `addContext()` method, you must use the `updateContextForKey()` method to update the key's data. For more information about the `spContextManager` class, see `spContextManager`.

3. Click Save.
4. Use Service Portal data in a Virtual Agent topic.
   a) Navigate to Virtual Agent > Designer and open the topic in which you would like to use Service Portal data.
   b) Click Edit Topic Flow.
   c) Configure the topic as needed. In a script field, use the `vaContext` object to access the context variable passed from the Service Portal.

   For more information about creating a Virtual Agent topic, see Create a Virtual Agent topic.

   For example, this script accesses the value of the `approval_count` variable in the Approvals widget.

   ```javascript
   (function execute() {
       return "Your approval count is: " + vaContext.approval_count;
   })()
   ```

   d) Save and publish the topic.

Agent Chat can access the variables when an end user initiates a conversation from the Service Portal page.
Remove Live Chat link from the header menu

If your portal includes a Live Chat link in the header menu, you can remove it by updating the widget's option schema.

Role required: admin
Adding the **Chat Queue** field to a portal record adds the Live Chat link to the portal’s header menu. If you integrate your portal with Agent Chat, the Live Chat link is no longer needed.

1. In the Service Portal configuration page, navigate to **Portal Tables > Instance with Menu**.
2. Open the record for your portal’s header menu. For example, open **SP Header Menu** if using the base system portal.
3. In the **Additional options, JSON format** field, add the following JSON key-value pair.

   ```json
   "enable_live_chat": {
   "displayValue": "false",
   "value": false
   }
   ``

   The final JSON looks like this.

   ```json
   {
   "enable_cart": {
   "displayValue": "true",
   "value": true
   },
   "enable_wishlist": {
   "displayValue": "true",
   "value": true
   },
   "enable_live_chat": {
   "displayValue": "false",
   "value": false
   }
   }
   ``

4. Click **Update**.

   When you navigate to the portal, **Live Chat** does not appear in the header menu.

**Service Portal styles**

Pages are made up of containers, columns, rows, widgets, and widget instances. You can configure the CSS of each component, or use the CSS defined in theme and branding as global definitions for the portal. If you do not define CSS in theme or branding, Bootstrap defaults are used.

You can define CSS in your portal at multiple levels.

**Bootstrap defaults**

If no other CSS is defined, all elements use Bootstrap version 3.3.6 defaults.

**Branding editor theme colors/Portal CSS**

CSS defined in the Branding Editor Theme Colors tab. Changes made to the theme colors in the Branding Editor appear in the CSS variables field in the portal table (**sp_portal**).
Customizing the theme colors overwrites the Bootstrap defaults.

**Theme CSS**

CSS defined in the CSS variables field in the Themes table (`sp_theme`). Use the Theme CSS as much as possible to allow for more flexible evolution of your portal in the future.

Using a theme overwrites the Portal CSS/Branding Editor theme colors.

**Page CSS**

CSS defined in the Page Specific CSS field in the Pages table (`sp_page`). Page-specific CSS overwrites the theme CSS.

**CSS classes**

You can define CSS classes elements on the page within each respective record.

**Widget CSS**

CSS defined in the CSS field in the Widgets table (`sp_widget`). Widget CSS overwrites container, column, and row CSS.

**Widget instance CSS**

CSS defined in the CSS field in the Instance table (`sp_instance`).

Widget instance CSS overwrites all other CSS definitions.

Configure portal branding
Use Branding Editor to give your portal its own look and feel.
To access the Branding Editor, navigate to Service Portal > Service Portal Configuration, then click Branding Editor.
Select the portal you want to customize the theme for from the portal list. Then use the options on the Quick Setup and Theme Colors tabs to customize your portal.
Branding Editor

Quick Setup tab options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portal Title</td>
<td>The name of your portal. Changing the name of the portal in the Branding Editor also changes the title on the portal form field in the platform UI.</td>
</tr>
<tr>
<td>Logo</td>
<td>The logo that appears in the header for your portal. This image is scaled to a maximum height of 46 px and a maximum width of 200 px.</td>
</tr>
<tr>
<td>Logo padding</td>
<td>Where you want the logo to sit in location to the edge of the header. This information is stored in the CSS variables section on the portal form.</td>
</tr>
</tbody>
</table>
Field & background

Fields defined by the JSON schema in the Quick start config field on the portal record in the platform UI. The sample Service Portal adds Tag Line and Background to the Branding Editor using the following schema:

```json
[
  {
    "tagline": {
      "table": "sp_instance",
      "sys_id": "34fe3d96cb20020000f8d856634c9cf4",
      "field": "title"
    },
    "hero_background": {
      "table": "sp_container",
      "sys_id": "be98a8d2cb20020000f8d856634c9c63",
      "field": "background_image"
    }
  }
]
```

Tag line

Introduce your users to a portal page with a tag line. This text is stored in an instance of the homepage search widget.

Tag line color

Select a color for the tag line.

Homepage background color

Add a color for your background. You can type in a color name, hex color, decimal (RGB), or select from the color palate.

Background image

Upload an image to appear in the background of your homepage. This image is stored in the container for the widget on your homepage.

For any colors on the theme tab, you can use the standard color name, hex code, decimal (RGB) code, or select the color from the color palate. All the color definitions are stored in the CSS variables field of the portal form. The theme preview updates in real time as you make changes.

**Theme colors tab**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Navbar</td>
<td>Use the fields in this section to customize the colors for the header menu.</td>
</tr>
<tr>
<td>Brand</td>
<td>Use the fields in this section to customize the page colors. For example, the page background or the widget background.</td>
</tr>
<tr>
<td>Text</td>
<td>Use the fields in this section to customize the color of the text on a page.</td>
</tr>
</tbody>
</table>

Changes made to the theme colors in the Branding Editor appear in the CSS variables field of the portal form in the platform UI.
Activate La Jolla theme branding

Activate the Service Portal La Jolla Brand to apply the latest ServiceNow branding, which includes WCAG-AA compliance for contrast. This plugin is active by default on new instances, but admins must activate the plugin on instances upgraded from earlier versions.

Role required: admin

The **Service Portal La Jolla Brand Update** activates these related plugins if they are not already active.

### Plugins for Service Portal La Jolla Brand Update

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Portal La Jolla Brand (com.glide.service-portal.themes.la-jolla)</td>
<td>This plugin updates your /sp and /sp_config portals with the ServiceNow La Jolla branding. If the portal record has not been modified, the logo, favicon, login page background image, hero banner, theme, and widget instance options are updated.</td>
</tr>
</tbody>
</table>

**Note:** If you have modified the /sp or sp_config portal pages before installing the plugin, you may not see all elements of the La Jolla branding. All branding images are located in the db_image table for manual updates to your custom portals.

To purchase a subscription, contact your ServiceNow account manager. After purchasing the subscription, activate the plugin within the production instance.

You can evaluate the feature on a sub-production instance without charge by requesting it from the HI Customer Service System.

1. Navigate to **System Definition > Plugins**.
   
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in *Request a plugin*.

3. Activate the plugin.
   
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.
To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the Activate/Update related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click Load demo data.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
5. Click Activate.

Create a portal theme

If you need more customization than Branding Editor can provide, you can create your own custom theme.

Only users with an understanding of CSS should create custom themes.
1. Navigate to Service Portal > Themes, then click New.
2. Complete the form fields and select **Save**.

Theme form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of your theme. Use this name to associate the theme with your portal. This name is not visible to users, you should know it to apply the correct theme to a portal.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Header</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme. Headers and footers are widgets and can be configured the same way.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Footer</td>
<td>List of headers and footers from the sp_header_footer table that you can associate with a portal theme.</td>
</tr>
<tr>
<td>Fixed header</td>
<td>Locks the header at the top of the page so that when a user scrolls the header remains on the screen.</td>
</tr>
<tr>
<td>Fixed footer</td>
<td>Locks the footer at the bottom of the page so that when a user scrolls the footer remains on the screen.</td>
</tr>
<tr>
<td>CSS variables</td>
<td>CSS custom properties that you can use to change the color and styles in a portal. For example, the stock theme uses some of the following variables:</td>
</tr>
</tbody>
</table>

```plaintext
$sp-logo-margin-x: 15px !default;
$sp-tagline-color: $text-color !default;
$navbar-inverse-bg: #3a3f51 !default;
```

Note: Use the CSS variables field to define CSS variables only. Use CSS Includes to define CSS rules. As of the Madrid release, Sass and LESS can be used within CSS Includes. For more information on CSS Includes, see Create a portal theme.

3. To add a style sheet to the theme, in the CSS Include related list, click New.
CSS include record

4. Complete the style sheet form fields, the click **Save**.

**Style sheet form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the CSS Include. Remember this name to associate the CSS Include with the theme.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Source</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Style Sheet</strong>: Add an internal style sheet that has been uploaded to the CSS table (sp_css). For example, ng-sortable.min.css. Internal style sheets use standard CSS in the CSS field.</td>
</tr>
<tr>
<td></td>
<td>- <strong>URL</strong>: Link to an external style sheet. Use external style sheets to use the same CSS as a corporate website or other online resource.</td>
</tr>
<tr>
<td>Style sheet</td>
<td>Associate a style sheet or CSS file URL, depending on which option you select in the Source field.</td>
</tr>
</tbody>
</table>

5. To add a JavaScript include to the theme, in the **JS Include** related list, click **New**.
JS Include form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name of the JS Include. Remember this name to associate the JS Include with the theme.</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Source</td>
<td>Select one of the following options:</td>
</tr>
<tr>
<td></td>
<td>- <strong>UI Script</strong>: Add an internal UI script that has been uploaded to the UI script table (sys_ui_script). UI scripts allow you to create client-side JavaScript and reuse it in multiple locations. For more information on UI scripts, see <a href="#">UI scripts</a>.</td>
</tr>
<tr>
<td></td>
<td>- <strong>URL</strong>: Link to an external JavaScript file. Use external URLs to use the same JavaScript as a corporate website or other online resource.</td>
</tr>
<tr>
<td>UI Script or Java file URL</td>
<td>Associate an internal UI script or Java file URL, depending on which option you select in the Source field.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time that the JS Include was last updated</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Package</td>
<td>The Service Portal package that the JS include is associated with. For example, Service Portal Configuration Pages. This field is populated by default.</td>
</tr>
</tbody>
</table>

### Configure a portal header menu

Service Portal is designed to allow customers to have deep control over the behavior of their portals. One of the main navigation controls for users is the header main menu. The menu options are determined by the assignment of a main menu to the portal, but the look and behavior of the menu is defined within the theme and associated header.

Configuring a portal header with a menu involves several steps.

1. Create a header and add it to a theme.
   
   Until you add a theme with a header to a portal, the header menu does not display.

2. Create a main menu with menu items and assign it to the portal.
   
   The main menu record is where you assign which navigation options appear in the header. For example, you can add a menu item that links to another page within your portal, such as the service catalog.

The main menu and header form a header menu when associated with a theme and a portal.

![Configure a portal header menu](image)

### Add a header or footer to a portal

Use the theme to add a header or footer to your portal.

1. Navigate to the portal theme (Service Portal > Service Portal Configuration > Portal Tables > Themes) then click the theme you want to add the header or footer to.

2. In the header or footer field, select the header or footer you want to use for your portal.
   
   If you are just getting started, you can reuse the base system Stock Header or Sample Footer widgets.

3. Optional: Select **Fixed Header** or **Fixed Footer** to lock the header or footer in one place so when users scroll up or down they remain in the same location on the page.
4. To configure the appearance of the header, in the Service Portal configuration page, open the Branding Editor. Under the Theme Colors tab, use the color selectors in the Navbar section to control the colors in the header.

Create a portal header menu

Create a menu with menu items to display in the header of a portal.

1. In the Service Portal configuration page (Service Portal > Service Portal Configuration), navigate to Portal Tables > Instance with Menu and click New.
2. Complete the fields in the menu form.

Menu fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the header menu. You need to know this when you associate the menu with your portal.</td>
</tr>
<tr>
<td>Additional options, JSON format</td>
<td>Advanced configuration options. For example, use this field to enable the shopping cart in the header menu with the following code:</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;enable_cart&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;displayValue&quot;: &quot;true&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;value&quot;: true</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>Application</td>
<td>The record scope. The header menu record and the source table must have the same application scope.</td>
</tr>
<tr>
<td>Widget</td>
<td>The widget that the header menu is based on. Select a menu-type widget from the list. For example, the header menu widget that is included as a base system widget.</td>
</tr>
</tbody>
</table>

3. Save the form, and then click Menu Items from the related lists.
4. Click New and complete the menu item form.

Menu item fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name that appears for the item in the menu</td>
</tr>
<tr>
<td>Parent menu</td>
<td>This field should already contain the name of the menu you are adding items to. You can change the value as needed to other menus</td>
</tr>
<tr>
<td>Parent menu item</td>
<td>Use this field to nest menu items within other menu items</td>
</tr>
<tr>
<td>Order</td>
<td>Value that determines where the item appears in the menu in relation to other menu items</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>The kind of page the item links to. Form fields vary depending on the option that you select from this list. Choose from:</td>
</tr>
<tr>
<td></td>
<td>- Page: Link to another page in the Service Portal.</td>
</tr>
<tr>
<td></td>
<td>- URL: Link to an external website. To have the URL open on a new browser tab or window, enter _blank in the URL target field.</td>
</tr>
<tr>
<td></td>
<td>- Service Catalog: Link to the Service Catalog.</td>
</tr>
<tr>
<td></td>
<td>- Catalog Category: Link to a specific catalog category within the Service Catalog.</td>
</tr>
<tr>
<td></td>
<td>- Catalog Item: Link to a specific catalog item.</td>
</tr>
<tr>
<td></td>
<td>- Knowledge Base: Link to the knowledge base that you previously configured as the portal’s default knowledge base.</td>
</tr>
<tr>
<td></td>
<td>- KB Topic: Link to a KB topic page.</td>
</tr>
<tr>
<td></td>
<td>- KB Article: Link to a KB article by number.</td>
</tr>
<tr>
<td></td>
<td>- KB Category: Link to a specific KB category within the knowledge base.</td>
</tr>
<tr>
<td></td>
<td>- Filtered List: Set conditions to determine which page to link to.</td>
</tr>
<tr>
<td></td>
<td>- Scripted List: Enter a script to determine which page to link to.</td>
</tr>
<tr>
<td>Page</td>
<td>Name of the portal page the item links to. This option is available if you select Page as the menu item type.</td>
</tr>
<tr>
<td>Condition</td>
<td>Determines what conditions are required for menu items to show in the header. For example, the condition gs.hasRole(&quot;sp_admin&quot;) restricts access to menu items to users with the sp_admin role. Hide a menu item by setting this value to false. For more information on what conditions to use in the Condition field, see Create a UI action.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that appears beside the menu item</td>
</tr>
</tbody>
</table>

5. Click Submit.

6. After you create a menu and menu items, add the menu to a portal.
   a) Navigate to Service Portal > Portals, then open the portal you want to add a menu to.
   b) From the main menu field, click the reference lookup icon, then select the appropriate menu by name.
c) Click **Save**.

Associate the menu you created with a portal, then create a header with a theme for your menu.

**Service Portal pages**

Use pages to organize content, ensure responsive mobile optimization, and design meaningful portal user experiences for your customers. A page houses containers and rows, which then contain widgets. By manipulating the layout of the page, and the widgets within it, you can construct your desired user experience.

- Pages are referenced using the page ID.
- Pages can be referenced in more than one portal.
- Use base system pages as templates.
Containers

Containers are markup artifacts that are put on a page to contain the layouts that house the widgets.

You can view containers and how they make up a page in the Service Portal Designer (Service Portal > Service Portal Configuration > Designer). Open a page in the Service Portal Designer, then click anything on the page. In the top left corner, breadcrumbs appear to show you which element on the page you have selected. Use the breadcrumbs to select a container, then click the edit icon (edit).

Service Portal Designer breadcrumbs

You can also edit a container by navigating to the Page Editor and selecting the container node in the tree view. In this view, you can:

- Change the layout of widgets on a page.
- Determine the number of columns on a page.
- Determine whether to scale with changes to the browser window.
- Add a background color to a portion of a page.
- Add an background image to a portion of a page.
- View the current layout of the widgets within the page.
Create and edit a page using the Service Portal Designer

Create or edit a page and use layouts to organize the columns that house the widgets.

These steps are intended for users with little to no coding experience. The Service Portal Designer includes several layers of customization from simply adding widgets in a particular configuration on a page, to adding CSS classes.

1. Navigate to Service Portal > Service Portal Configuration.
2. Click Designer.
3. Switch to the portal you want to design pages for by selecting the portal name in the header.

4. From the Service Portal Designer, select a page to customize or click Add a new page.
5. Under Layouts, select Container and drag it onto the page.
6. Drag one of the other layouts and drop it in the container.
   This layout defines the structure of your page and the space available to drop widgets. The structure of the layout aligns with the Bootstrap grid template and always adds up to 12.
7. Use the filter to search for a widget, then drag the widget to the layout.
Service Portal Designer

Drag containers, layouts, then widgets onto a page.

Drag and drop a set of columns from the left pane or use the plus [-] button to then drag and drop widgets inside.
   a) Click **Edit Page Properties**.  
      The page record from the Pages table (sp_page) opens.  
   b) Edit the form.  

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Internal name of the page. Use the title to search for a page in the Service Portal Designer.</td>
</tr>
<tr>
<td>ID</td>
<td>A unique ID for the page. The ID is what you use to assign a page to a portal. It also determines the URL for the page, for example: <a href="https://instance">https://instance</a> name.service-now.com/doc_portal/?id=doc_page, where doc_page is the page ID.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope.</td>
</tr>
<tr>
<td>Public</td>
<td>Enables the page to be accessed without the need for authentication. If Public is selected, all users can view the page no matter the roles listed.</td>
</tr>
<tr>
<td>Draft</td>
<td>Mark a page as draft to limit user ability to view the page while you are still creating it. Only users with the admin role can view a page in draft, all other users see a 404 page.</td>
</tr>
<tr>
<td>Roles</td>
<td>Limit user access to a page by role.</td>
</tr>
<tr>
<td>Short description</td>
<td>Describes the portal page. This field is not public facing.</td>
</tr>
<tr>
<td>Page Specific CSS</td>
<td>Unless a page has Page Specific CSS, the page inherits CSS from the Theme and Branding. If you need a page to look different, the Page Specific CSS overrides the inheritance from the Theme and Branding.</td>
</tr>
<tr>
<td>Dynamic page title</td>
<td>Create variables to generate descriptive titles depending on the content loaded into a page.</td>
</tr>
<tr>
<td>Clone Page</td>
<td>Enables you to make a copy of a page that can be modified. If you clone a base system page, a new widget instance is created for each widget on the page.</td>
</tr>
</tbody>
</table>

   a) Click within the container you would like to edit, or select **Container** in the breadcrumbs.  
   b) Click the edit icon ( ![edit_icon] ).  
      The container record from the Containers table (sp_container) opens.  
   c) Edit the form.  

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal name of the container.</td>
</tr>

</tr>
<tr>
<td>Background style</td>
<td>The display style of a background image. Options include:</td>
</tr>
<tr>
<td></td>
<td>- Default</td>
</tr>
<tr>
<td></td>
<td>- Cover</td>
</tr>
<tr>
<td></td>
<td>- Contain</td>
</tr>
<tr>
<td></td>
<td>- Repeating</td>
</tr>
<tr>
<td>Bootstrap alternative</td>
<td>Selecting this field removes the standard Bootstrap grid classes and disables the Bootstrap grid system in the container. If selected, the following are not applied:</td>
</tr>
<tr>
<td></td>
<td>- The Width field in the container record.</td>
</tr>
<tr>
<td></td>
<td>- Standard Bootstrap class in the row record within the container.</td>
</tr>
<tr>
<td></td>
<td>- The Size - xs, Size - sm, Size - md, and Size - lg fields in column records within the container.</td>
</tr>
<tr>
<td>Move to header</td>
<td>If selected, the container sticks to the header and does not scroll. Use this option to create a subheader.</td>
</tr>
</tbody>
</table>

10. Optional: To switch to a different page, click the **Pages** tab in the left pane, then select the next page you want to configure.

11. Optional: Use the Preview button in the header to view your page as you design it. You can also use **Preview** to view your page in mobile or tablet mode through the controls presented in the header.
Designer tablet view
Add a subheader to a page

Select a container record to serve as a page subheader. A subheader sticks to the page header and does not scroll.

Role required: admin

1. From the Service Portal configuration page (Service Portal > Service Portal Configuration) open the Service Portal Designer.
2. Open the page you want to add a subheader to.
3. Click the container that you would like to use as a subheader, or select the container using the breadcrumbs.
4. Click the edit icon (edit).
5. Select Move to header.
As a subheader, the container sticks to the header and does not scroll.

**Assign a homepage to a portal**

Edit your portal record to specify any page as your homepage.

When a portal is referenced by the URL suffix, it lands on a home page. This homepage is often labeled `index` in website language. The home page is probably the most important page of your portal as it houses the major information and actions that your users see.

1. From any page in the Service Portal Designer, click **Edit Portal Properties**.
Edit Portal Properties

2. From the Homepage list, select the page you want for your portal homepage and click Save.
Assign a default error page

Create a default 404 error page for your portal using a system property.

You can assign an error page to a portal using the portal form. If you do not assign an error page using that form, the system uses the default 404 page containing the breakout game widget. Use the default 404 page property `glide.service_portal.default_404_page` to configure the default error page.

Create a page before adding it as the default error page.

1. Navigate to Service Portal > Properties.
2. In the Default 404 page for Service Portals, type the page ID found in the ID field of the page form.

Add SEO information to Service Portal pages

Improve the searchability of Service Portal pages by adding meta tags and descriptive titles.

You can add SEO information to Service Portal pages by:

- Associating public pages with meta tags to optimize search from external search engines.
- Using record data loaded in a page to dynamically generate descriptive page titles and meta tags.

Dynamic meta tags and titles

Some pages in the Service Portal load record data based on a URL parameter. You can add meta tags and page titles that vary depending on the record loaded in the page.

Using Service Catalog as an example, the following URL includes a sys_id parameter in addition to the page ID. Different content is loaded depending on the value of the sys_id parameter.

https://<yourInstance>.service-now.com/sp?id=sc_cat_item&sys_id=060f3afa3731300054b6a3549dbe5d3e

If a page loads dynamic content, you can:

- Add meta tags to the page.
- Add meta tags that vary based on content.
- Add variables that generate descriptive page titles based on content.
- Add dynamic content to a page title.
- Create targeted page titles for use with a screen reader.

For example, you can set a Service Catalog page to generate a dynamic title and meta tag based on record data associated with the sys_id in the URL parameter.
Add meta tags to a public page

Improve the searchability of Service Portal pages by adding meta tags. You can add the meta name and description attributes to a page, define the robots attribute, or create dynamic meta tags for pages that load record data based on a URL parameter.

Role required: admin or sp_admin

1. Navigate to Service Portal > Pages.
2. Open a page.
3. Check that Public is selected.
   - Pages that are not public are not indexed by external search engines.
4. Click the Meta tags related list tab.
5. Click New to create a new meta tag.
6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Page</td>
<td>Page to apply the meta tag to.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the page. This value is read-only.</td>
</tr>
</tbody>
</table>
### Field Description

**Name**
- The HTML meta name attribute.
- To define the meta robots attribute, add **ROBOTS**.

**Content**
- The HTML meta description attribute.
- If **ROBOTS** is defined in the **Name** field, you can add one of the following content values:
  - **INDEX, FOLLOW**: The search engine shows the page in search results and trusts any links in the page. This is the default value.
  - **NOINDEX, FOLLOW**: The search engine does not show the page in search results, but trusts any links in the page.
  - **INDEX, NOFOLLOW**: The search engine shows the page in the search results, but does not trust links in the page.
  - **NOINDEX, NOFOLLOW**: The search engine does not show the page in search results and does not trust links in the page.

Alternatively, you can pass a variable into this field based on record data. For example, you can define a `%description` variable in this field, and create a content variable to populate the content tag with record data.

---

7. **Click Submit**.
   The meta information is added to the page header. For example:

   ```html
   <meta name="description" content="Order something from the Service Catalog">
   ```

8. **Optional**: Create a content variable to populate the content tag with record data.
   If the page loads record data based on one or more URL parameters, you can add meta tags generated from the record data.
a) Open a meta tag record and check that the **Content** field contains a variable, or add a variable. Depending on the available URL parameters and the meta tag you would like to define, you can add the following types of values:

<table>
<thead>
<tr>
<th>Value types</th>
<th>Description</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>One URL parameter variable</td>
<td>Populates the content tag with the value defined in the associated content variables record.</td>
<td>%description</td>
</tr>
<tr>
<td>More than one URL parameter variable</td>
<td>Populates the content tag with the values defined in the associated content variables records.</td>
<td>%description %price</td>
</tr>
<tr>
<td>Static value and a URL parameter variable</td>
<td>Populates the content tag with a static value and the associated content variables record.</td>
<td>Catalog item: %description</td>
</tr>
</tbody>
</table>

b) In the **Content variables** related list, click **New**. The **Content variables** related list is only available after saving the meta tag record.

c) Complete the form. Associate a field with a URL query parameter. When the value of the query parameter is used to display content, a field from the same record is used to generate the content tag. You can define the field to generate the content tag through the **Table field** field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The variable to store the value. Must begin with % and cannot contain spaces. This value must match one of the variables defined in the <strong>Content</strong> field in the Meta tag record.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the page. This value is read-only.</td>
</tr>
<tr>
<td>Metatag</td>
<td>The meta tag to apply the dynamic variable to.</td>
</tr>
<tr>
<td>URL query parameter</td>
<td>The URL parameter that determines the record to display.</td>
</tr>
<tr>
<td>Table</td>
<td>The source table of the URL query parameter record.</td>
</tr>
<tr>
<td>Table field</td>
<td>Select a field from the table defined in the <strong>Table</strong> field. This field is used to generate the value of the content tag.</td>
</tr>
</tbody>
</table>

**Important:** To support SEO, ensure that the referenced table field is public. For more information on granting access to a table field, see **Create an ACL rule**.

If more than one content variables match a variable defined in the **Content** field of the meta tag record, the record with the earliest Created date is used.

d) Click **Submit**.
Add dynamic titles to a page

Create variables to generate descriptive titles depending on the content loaded into a page.

The content tag loads record data. For example:

```
<meta name="description" content="Apple iPad 3">
```
Role required: admin

1. Navigate to **Service Portal > Pages**.
2. Open a page.
3. Add one or more variables to the **Dynamic page title** field.

Depending on the available URL parameters and the dynamic title you would like to define, you can add the following types of values:

<table>
<thead>
<tr>
<th>Value types</th>
<th>Description</th>
<th>Example value</th>
</tr>
</thead>
<tbody>
<tr>
<td>One URL parameter variable</td>
<td>Generates a page title using the associated record of one URL parameter.</td>
<td>%question</td>
</tr>
<tr>
<td>More than one URL parameter variable</td>
<td>Generates a page title using the associated records of multiple URL parameters.</td>
<td>%question - %author</td>
</tr>
<tr>
<td>Static value and a URL parameter variable</td>
<td>Generates a page title using a static value and the associated record of a URL parameter.</td>
<td>Q&amp;A: %question</td>
</tr>
</tbody>
</table>

Enter the variables in the intended syntax of the title. For example, to have a question and author separated by a hyphen, you would enter %question - %author.
In the page title, this syntax would render as something like "How do I reset my password? - Beth Anglin".

4. Click the **Dynamic page title variables** related list tab.
5. Click **New** to create a new variable.
6. On the form, fill in the fields.
   Associate a field with a URL query parameter. When the value of the query parameter is used to display content, a field from the same record is used to generate the title. You can define the field to generate the title through the **Table field** field.
### Field | Description
--- | ---
Name | The variable to store the value. Must begin with `%` and cannot contain spaces. This value must match one of the variables defined in the **Dynamic page title** field.
Application | Application scope of the page. This value is read-only.
Page | The page to apply the dynamic variable to.
URL query parameter | The URL parameter that determines the record to display.
Table | The source table of the URL query parameter record.
Table field | Select a field from the table defined in the **Table** field. This field is used to generate the dynamic page title.

If more than one dynamic page variables match a variable defined in the **Dynamic page title** field, the record with the earliest Created date is used.

In this example, the value of the Question field in the Social Q&A Question table populates the page title. The `%question` variable must also be defined in the **Dynamic page title** field in the page record.

7. **Click Submit.**

When the page loads, the record defined in the URL query parameter displays. The field defined in **Table field** determines the title of the page.
ServiceNow

Orlando

Now Platform capabilities

Page navigation by URL
You can navigate to a portal or a page using the URL.
A Service Portal URL contains the following elements.
https://<base instance url>/<sp url suffix>?id=<page id>&<page parameters>
Element

Description

Base Instance URL

Unique, secure web address for each instance. The default format is:

sp url suffix

Suffix established for the Service Portal. For example /sp.

id

The id of the Page to navigate to within the portal frame. For example, ?
id=index.

page parameters

Some pages require additional parameters to look up a record (table,
sys_id). Find the $sp.getParameter calls in a widget server script to
see what parameters a widget uses. For more detail on this method see
GlideSPScriptable

For example, https://<instance name>.service-now.com/sp?id=kb_view2
Note: If you use article versioning with the Knowledge Management - Service Portal
(com.snc.knowledge_serviceportal) plugin enabled, you must add the article version
number to the URL to open a knowledge article in the base system or knowledge portals.
For example, instead of accessing an article using the URL https://<instance name>/
sp?id=kb_article&sys_id=KB0000005, you must include the article version number:
https://<instance name>/sp?id=kb_article&sys_id=KB0000005%20V1.0. To learn
more, see Article versioning.

Referencing a page id
Widgets and widget instance options reference Service Portal pages using the page id. For
example, a link to the sc_home page within a widget HTML template might appear as:
<div><a href="?id=sc_home">${Order something...}</a></div>

Redirect a reference to a page ID
Multiple widgets in the Service Portal may link to a single page using a hard-coded page ID. If you
want to replace the page, all widgets that reference the page must be updated with the new
page ID. Instead of cloning and updating each widget with the new page ID, you can create a
single record that automatically redirects all references to the original page to point to the new
page. This way, you can replace a page without locating and replacing all references to the
page ID.
Role required: sp_admin
To redirect all references to a page, create a record in the Page Route Maps table
[sp_page_route_map]. This table enables you to redirect a reference to a page without cloning
base system widgets.

© 2020 ServiceNow, Inc. All rights reserved.

4047


Creating a record in the Page Route Maps table only redirects references to a page. It does not redirect navigation to a page ID within a URL.

1. Navigate to Service Portal > Page Route Maps.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short Description</td>
<td>Optional short description to describe the redirect.</td>
</tr>
<tr>
<td>Service Portal(s)</td>
<td>Portals that apply the redirect. If you don’t select a portal, the redirect applies to all portals in the instance.</td>
</tr>
<tr>
<td>Route from</td>
<td>Original page you are redirecting from.</td>
</tr>
<tr>
<td>Route to</td>
<td>Page you are redirecting to.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the Page Route Map record is active. The redirect only applies when the record is active.</td>
</tr>
<tr>
<td>Order</td>
<td>Priority of the Page Route Map record. If more than one active record has the same value in the Route from field, the record with the lowest order applies. The system evaluates records from lowest to highest. If multiple records have a matching order, the system honors the oldest record.</td>
</tr>
</tbody>
</table>

4. Click Update.

All references to the page listed in the Route from field redirect to the page in the Route to field.

**Activate the Knowledge Article View page on upgrade**

If upgrading from a previous release, take advantage of the latest article view features by activating the Knowledge Article View page route map. This map routes the kb_article page to the kb_article_view page, which includes new capabilities such as including links and images in article feedback and article versioning. This map is active by default in new instances and applies to all portals in the system.

Role required: admin

By default, users with the public role cannot access the kb_article_view page. However, your administrator can modify this behavior. For more information, see Enable external or public users to view knowledge articles from the Knowledge Management Service Portal.

After activating the Knowledge Article View page route map, you can:

- Comment on a knowledge article
- Create an article version by importing a Word document
- Create a version of a knowledge article from a managed document

1. Navigate to Service Portal > Page Route Maps.
2. Open the Knowledge Article View record.
3. Select Active.
4. Click Update.

Your end users view knowledge articles in the Service Portal using the kb_article_view page.
Include font icons on a page

Include font icons on a page so that all the widgets on the page have access to the font-icon set.

1. In the platform UI, navigate to Service Portal > Pages and click the page you want to add font icons to.
2. Attach the font-icon file to the page record.
3. In the Page Specific CSS field for the page, add the CSS for the font-icon definition. Use the sys_id of the attachment as the src in the CSS.
Result

You can select an icon from the icon set for any widget on this page. For example, in the HTML widget you can use the source code option to use an icon.
Service Portal widgets

Widgets are what define the content in your portal. You can use the base system widgets provided with Service Portal, clone and modify widgets, or develop custom widgets to fit your own needs.

Base system widgets are read-only so you can benefit from future updates. To make changes, you can clone base system widgets. However, cloned widgets are considered custom and don't benefit from future updates to the widgets they were cloned from.

Widget library

Widgets included with Service Portal can be customized to suit your own needs or as a basic code sample for you to refer to as you are building your own widgets.

Note: Base system widgets are read-only so you can benefit from future updates. To make changes, you can clone base system widgets. However, cloned widgets are considered custom and don't benefit from future updates to the widgets they were cloned from.

Due to the ever-changing number of widgets that exist at any given time in Service Portal, this is not a definitive list. More widget descriptions will be added as they become available.

Depending on your configuration, widgets that do not contain any information do not appear in your Service Portal page.

To view the instance options for a widget, use the widget context menu.

Example widgets

- Announcements widget
- Approvals widget
- Approval Info widget
- Approval Record widget
- Breadcrumbs widget
- Breakout Game widget
- Calculator widget
- Carousel widget
- Cool Clock widget
- Header menu widget
- Hello World widgets
- HTML widget
- Icon Link widget
- Icon menu list widget
- Language Switch widget
- Link button widget
- Login widget
- My Requests widget
- Organization Chart widget
- Sample Footer widget
- Ticket Attachments widget
- Ticket Conversations widget
- Ticket Fields widget
- Ticket Location widget
- User Profile widget

Service Catalog widgets

- Catalog Content widget
- Catalog Homepage Search widget
- Recent & Popular Items widget
- Request Fields widget
- Requested Items widget
- Requests and Approvals widget
- SC Catalog Item widget
- SC Categories widget
- SC Category Page widget
- SC Order Guide widget
- SC Popular Items widget
- SC Save Bundles widget
- SC Saved Carts widget
- SC Scroll to top widget
- SC Shopping Cart widget
- SP Variable Editor widget
- SC Wish List Cart widget

Knowledge Management widgets

- KB also in Category widget
- KB Article Comments widget
- KB Article Page widget
- KB Categories widget
- KB Category Page widget
- KB Knowledge Bases widget
- KB Most Viewed widget
- KB News widget
- KB Search widget
- KB Top Rated widget
- KB View widget
- KB View 2 widget
- My Favorite Tags widget
- Popular Questions widget
- SQANDA Create Question widget
- SQANDA Question widget
- SQANDA Related Question widget
- Subscribed Questions widget
- Tagged Question List widget
Service Status widgets
- Business Service Status widget
- Current Status widget
- Planned Maintenance widget
- Service History widget
- Service Status widget
- Service Status Legend widget
- Service Status Subscription widget

Service Portal configuration widgets
- Service Portal Config Overview widget
- Portal config widget
- SP Page Map widget
- SP Portal Map widget
- Theme Preview widget
- Widget Edit Panel widget

List and form widgets
- Simple List widget
- Data table from instance definition widget
- Data Table from URL definition widget
- Form widget

Search widgets
- Home Page Search widget
- Typeahead Search widget
- Contextual Search widget
- Legacy: Search Page widget

Example widgets

All widgets in Service Portal can be used as example code for how scripts are used in a widget. However, several base system widgets have been included expressly for this purpose.

Use the example widgets to see how to use HTML, CSS, or client and server scripts in Service Portal. You can also clone and extend each widget to suit your needs.

Announcements widget
Users can view all active announcements. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
### Instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the type of announcements to display. Announcement types can be selected in the announcement record. Choices include:</td>
</tr>
<tr>
<td></td>
<td>- Banner</td>
</tr>
<tr>
<td></td>
<td>- Widget</td>
</tr>
<tr>
<td></td>
<td>If a type is not defined, the widget instance displays all active announcements.</td>
</tr>
<tr>
<td>Title</td>
<td>Widget header title.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Glyph displayed to the left of the title.</td>
</tr>
<tr>
<td>Use Display Style</td>
<td>If selected, each announcement displays according to the style defined in the announcement record. Before selecting this option, consider how the widget will display if multiple announcements in the widget use different styles.</td>
</tr>
<tr>
<td>Paginate</td>
<td>Paginates multiple announcements.</td>
</tr>
<tr>
<td>Max Records</td>
<td>Number of announcements displayed per page.</td>
</tr>
<tr>
<td>View All Page</td>
<td>Click target for View all link. The View all link only displays when:</td>
</tr>
<tr>
<td></td>
<td>- There are more announcements than can be displayed on a single page.</td>
</tr>
<tr>
<td></td>
<td>- The Max Records field defines the number of records displayed per page.</td>
</tr>
<tr>
<td></td>
<td>- A view all page is defined.</td>
</tr>
<tr>
<td>Who Can View</td>
<td>Control who can and cannot view a widget instance with user criteria. Only visible if user criteria for the Service Portal is activated.</td>
</tr>
<tr>
<td>Instances</td>
<td>Who Cannot View Instances</td>
</tr>
</tbody>
</table>

### Approvals widget

Users can approve or reject items directly within Service Portal. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

### Using the widget

The Approvals widget displays data from the Approvals (sysapproval_approver) table. If the user has been assigned to approve a request, the approval record is displayed in the widget.
You can enable e-signature for the approvals widget to require re-authentication for your users. For more information on enabling e-signature, see *Enable e-signature for Service Portal*.

**Instance options**

Use the instance options to change the appearance of the approvals widget.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Add an icon to display beside the widget name.</td>
</tr>
<tr>
<td>Buttons stacked side by side</td>
<td>If this check box is selected, the Approve and Reject buttons appear horizontally beside each other. If this check box is cleared, the Approve and Reject buttons appear stacked vertically.</td>
</tr>
<tr>
<td>Max number of elements shown in the list</td>
<td>Limit the number of approvals users see on a page. The default number is 10. Only enter numbers greater than 0.</td>
</tr>
<tr>
<td>Who can view instances/who cannot view instances</td>
<td>Control who can or cannot view a widget instance with user criteria. User criteria must be enabled for this option to appear.</td>
</tr>
</tbody>
</table>

Approval Info widget
The Approval Info widget works in tandem with the Approval widget to display details about the approval request. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Approval Info widget

Instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
</tbody>
</table>

Approval Record widget
The Approval Record widget shows the full record for an approval including the activity stream. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
Approval Record widget

Instance options

The approval record widget does not include instance options.
**Breadcrumbs widget**

The breadcrumbs widget allows users to easily navigate around a portal. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

**Using the widget**

The breadcrumbs widget displays information based on where a page is located in a portal. For example, if you navigate to the Knowledge Base from the home page, then the breadcrumb reads as **Home > Knowledge Base**. Each subsequent page that you open expands the breadcrumb.

Click a page name on the breadcrumbs widget to navigate to that page. For example, to return to the home page, click **Home**.

You can customize this widget to change the breadcrumb path. For more information, see **KB0719179**.

**Instance options**

The breadcrumbs widget does not have instance options.

**Breakout Game widget**

Add a fun, interactive 404 page to pages that do not exist using the Breakout Game widget. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
The Breakout Game does not have instance option. You can use it as an example of how to use the Link Function as part of an Angular Directive.

Calculator widget

The calculator widget does simple calculations. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Use the calculator widget as an example of how to pass data between the client and server.
Numbers please (no forgiveness)

-7
45
38

Calculator widget

Tale of the tape

38 = -7 + 45

Instance options

The calculator widget does not include instance options.

Carousel widget

Showcase specific items in your catalog using a scrolling list of images in the carousel widget. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Use the carousel widget to showcase items on your portal page. For example, display items available in a service catalog at the top of the service catalog page.
Carousel widget

Add slides to the carousel widget
Use the related lists for an instance of the carousel widget to add images for the carousel widget to scroll through.

Role required: Admin or sp_admin

1. Navigate to Service Portal > Widgets.
2. Open the Carousel widget record.
3. From the carousel form, on the Instances related list, under instances, open a carousel instance.
4. From the instance of carousel form, click New on the Carousel Slides related list.
5. Complete the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the carousel slide. Use the name to differentiate the slide from other slide records.</td>
</tr>
<tr>
<td>Order</td>
<td>Where the slide appears in the list of slides</td>
</tr>
<tr>
<td>HREF/URL</td>
<td>Link to the item in the slide. For example, for a slide with a catalog item, link to page for the catalog item using the HREF ?id=&lt;page name&gt;&amp;sys_id=&lt;sys_id for item&gt;. For more information on linking to a page within a portal, see <a href="#">Page navigation by URL</a>. You can also link to other sites using the URL.</td>
</tr>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Background</td>
<td>Upload an image for the slides. Carousel images should be 1022x300 pixels.</td>
</tr>
<tr>
<td>Application</td>
<td>Automatically populated with the name of the application the portal falls under.</td>
</tr>
<tr>
<td>Carousel</td>
<td>Name of the instance of the carousel widget you are adding the slide to. This field is not automatically populated and you cannot select an instance of the carousel widget if it does not have a name.</td>
</tr>
</tbody>
</table>

Repeat this step for as many slides as you want to appear in the carousel widget.

**Change Password widget**

Users can change their passwords using the Change Password widget.

![Change My Password](image)

**Note:** Updated credentials are stored in the User (sys_user) record in the local instance.
Instance Options

The Change Password widget does not have instance options.

Cool Clock widget
Show different times around the world using the Cool Clock widget. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Cool clocks demonstrates how to use instance options in a widgets. The time zone is loaded using an instance option. If you do not select a time zone, the widget uses a default time zone.

Cool Clock widget

Instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the clock, for example New York, NY. The name appears below the clock so it helps to use a name related to the time zone.</td>
</tr>
<tr>
<td>Timezone</td>
<td>The location from which the time is displayed. Use the local full name, for example, America/New York, instead of the abbreviated time zone. Using the full name allows time zones to stay consistent with daylight savings time. The default value is America/Los Angeles.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Second hand color</td>
<td>Color of the second hand using the hex code, RGB, or color name. The default value is red.</td>
</tr>
</tbody>
</table>

**Data table from instance definition widget**

Display a filtered list on your portal using the data table from instance definition widget. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

After you add the data table from instance definition widget to a page, use the instance options to configure the appearance of the table.

![Incidents Table](image-url)

**Data table from instance definition widget**

## Instance options

### Data table instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget. If you leave this field empty the name of the table displays as the widget name.</td>
</tr>
<tr>
<td>Table</td>
<td>The table that the widget displays records from.</td>
</tr>
<tr>
<td>Filter</td>
<td>Text field from the condition builder that you can use to limit the items returned in the table. To create a filter, use the context menu to open the widget instance in the platform. Then use the condition builder to create a filter.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>Limits the number of items displayed in the table. If there are more entries than allowed in the table, users can scroll to the next page.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that displays beside the widget title</td>
</tr>
<tr>
<td>Fields</td>
<td>Columns to display in the table.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Link to this page</td>
<td>Direct users to a specific page when they click a record. By default, clicking an entry in the table opens that entry in a form.</td>
</tr>
</tbody>
</table>

### Data Table from URL definition widget

The Data Table from URL definition widget displays the table you select from the list. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
Data Table from URL definition widget

Instance options

Complete the instance options to define the table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>The title of the widget. Select the <strong>Use Instance Title</strong> check box to use this title instead of the name of the table.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that displays beside the widget title</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Link to this page</td>
<td>Direct users to a specific page when the click a record. By default, clicking an entry in the table opens that entry in a form.</td>
</tr>
<tr>
<td>Fields</td>
<td>Columns to display in the table. For example, short description or priority.</td>
</tr>
<tr>
<td>Use Instance Title</td>
<td>Select to use the title in the Title field instead of the table title.</td>
</tr>
<tr>
<td>Enable Filter</td>
<td>Select this check box to allow users to create their own filter for the table</td>
</tr>
</tbody>
</table>

If **Enable filter** is enabled in the instance options, users can add custom conditions to filter the results.
Data Table URL with condition builder

For more information on using the condition builder, see Create a filter in List v3.

Note: The condition builder is only available in the desktop view.

Form widget
The form widget is a platform form within the Service Portal UI with a few differences. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
Form widget

**URL Parameters**

The form widget accepts the following parameters within the URL.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_id or sl_sys_id</td>
<td>Sys_id for the record to be displayed</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>table, si_table, or t</td>
<td>Table for the record to be displayed</td>
</tr>
<tr>
<td>view or v</td>
<td>View used to display the record</td>
</tr>
</tbody>
</table>

In the following example, the URL would display an incident with a sys_id of 1c741bd70b2322007518478d83673af3 in the portal view.

https://example.service-now.com/sp?id=form&table=incident&sys_id=1c741bd70b2322007518478d83673af3&view=portal

**Scripting**

Not all client scripts are supported in the Service Portal. To understand how client scripts interact with forms in the Service Portal, see *Service Portal and client scripts* and *Supported client script types and APIs*.

**Header menu widget**

The Header Menu widget controls which options appear in the page header. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Unlike other widgets in Service Portal, the header menu widget is not something you drag onto a page. Instead you configure the header menu by associating the header menu with a portal. For more information on configuring a header menu, see *Configure a portal header menu*.

**Instance options**

The header menu widget does not include instance options.

**Hello World widgets**

The Hello World widgets are included with Service Portal as examples of how to use and create widgets. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

All three Hello World widgets display the same way. The real difference between them is in their underlying code base. Each version of the widget uses a different method of using the server and client script.

To view the Hello World widgets, navigate to *Service Portal > Service Portal Configuration* then click *Widget Editor*. In the Widget Editor, click *Check out the Hello World Example*. 
Hello World 1

Hello world 1 displays how the HTML template and the client script communicate. For more information on using the client script in Service Portal, see Widget developer guide. Use the widget list to switch to Hello World 2 or 3.
Hello World 2

Hello World 2 includes an example of how the server script can be used as well.
Hello World 3

For more information on Service Portal APIs, see the GlideScriptable API.

**HTML widget**

Use the HTML widget to directly inject HTML, text, lists, or content in general into a page. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs. Because the HTML widget can contain content of any kind, any example may just appear as regular text. For example, the HTML widget appears as a box of text on the 404 page.
Sorry, the page you requested was not found.
This page you were trying to reach at this address doesn't seem to exist. This is usually the result of a bad or outdated link. We apologize for any inconvenience.
While you are here, see if you can beat the "404" in a game of Breakout.

**HTML widget**

**Instance options**

**HTML widget instance options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name for the HTML text. Users do not see this information.</td>
</tr>
<tr>
<td>HTML</td>
<td>Text box for the HTML. Use the toolbar like most word processing tool bars. For more information on using the toolbar, see Formatting icons for the HTML field editors.</td>
</tr>
</tbody>
</table>

**Icon Link widget**

Link to any other item. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Configure Icon Link widgets to link to a specific URL, page within the portal, or a specific category in the knowledge base or the service catalog.

**Order Something**

Browse the catalog for services and items you need
**Instance options**

**Instance options fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the icon link. Choose something that defines what the widget is linking to.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon for the widget.</td>
</tr>
<tr>
<td>Bootstrap class name</td>
<td>Use concurrently with page or theme level CSS.</td>
</tr>
<tr>
<td>Type</td>
<td>Defines what the widget links to. The fields that appear on the form vary depending on which option you select. Choose from:</td>
</tr>
<tr>
<td></td>
<td>- Page: Another page in the Service Portal</td>
</tr>
<tr>
<td></td>
<td>- URL: Link to an external website.</td>
</tr>
<tr>
<td></td>
<td>- Catalog category: Link to a specific catalog category within the service catalog.</td>
</tr>
<tr>
<td></td>
<td>- Catalog item: Link to a specific catalog item.</td>
</tr>
<tr>
<td></td>
<td>- KB topic: Link to a KB topic page.</td>
</tr>
<tr>
<td></td>
<td>- KB article: Link to a KB article by number.</td>
</tr>
<tr>
<td></td>
<td>- KB category: Link to a specific KB category within the knowledge base.</td>
</tr>
<tr>
<td>Page</td>
<td>Page within the portal that you want to link to. This field varies depending on the Type you choose.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>

</table>

**Icon menu list widget**

A simple list with a glyph icon next to each link. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Configure the icon information using the Menu Items related list.
1. From the instance options for the icon menu list widget, under Related Lists, click **Menu Items**.
2. Click **New**.
3. Use the fields on the New Menu Items form to configure the icons for the icon menu list widget.

### Icon menu list widget instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name or description of the icon</td>
</tr>
<tr>
<td>Parent Menu</td>
<td>The name of the menu that the icon appears in. This automatically populates with the name of the icon menu list widget that you created but you have the option to switch it to another menu.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the icons appear in the icon menu list widget.</td>
</tr>
<tr>
<td>Parent menu Item</td>
<td>Nest menu items within a parent menu.</td>
</tr>
<tr>
<td>Page</td>
<td>The page within Service Portal that the icon links to. Select <strong>Page</strong> from the Type list to enable this option.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of link you want the icon to have. You can link to pages within Service Portal, external URLs, KB articles, Service Catalog, or lists. Different fields will appear on the form depending on the option you select from the list.</td>
</tr>
<tr>
<td>Condition</td>
<td>Determines what conditions are required for menu items to show in the header. For more information on what conditions to use in the Condition field, see Create a UI action.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon that you want to display in the icon menu list widget.</td>
</tr>
</tbody>
</table>
Language Switch widget
Add the Language Switch widget to a landing or homepage to allow your users to change the language of the page. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Instance options

The Language Switch widget does not include any instance options.

Link button widget
The Link Button widget is a button you can nest in any other widget that links to another destination. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Instance options

Instance option fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</tr>
<tr>
<td>Link for button</td>
<td>Page that the button links to. Use ?id=&lt;page_name&gt; to link to another page in the portal.</td>
</tr>
</tbody>
</table>
### Login widget
The login widget controls user access to your site. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The login widget by default includes a **Forgot Password?** link that enables users to reset their password using the Password Reset application. For more information about Password Reset configuration, see [Password Reset application](#).

**Note:** When the user clicks **Forgot Password?**, the system redirects the user to the page value specified in the `glide.security.password_reset.uri` system property.

If you do not want to include the **Forgot Password?** link, set the `glide.security.forgot_password.display.link` system property to false.

### Instance options

</tr>
</tbody>
</table>

**My Requests widget**

The My Requests widget stores all of your open requests in one place. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The list is updated in real time so you can see your requests getting processed. The widget pulls open request information from the sc_request table.

<table>
<thead>
<tr>
<th>My Requests</th>
</tr>
</thead>

My Requests widget

Use the My Requests widget (my-requests-v2) to enable requesters to view open or closed requests in Service Portal. Requests, incidents, and tasks are displayed in a single view that is based on the filter conditions and display settings in the My Request Filter module. For information on defining filters for this module, refer to the Related information section.

Instance options

Use the widget instance options to customize the settings for the My Requests widget. To customize the settings for this widget, press the Ctrl key, click on the widget, and select Instance Options.
Enable the My Requests menu for an upgrade scenario

Enable the My Requests menu that uses the My Requests (my-requests-v2) widget for an upgrade scenario.

Role required: admin

The My Requests menu that is based on the My Requests (my-requests-v2) widget is available by default for zBoot users. For more information about this widget, refer to My Requests widget.

1. Navigate to Service Portal > Portals.
2. Select a portal.
3. Next to the Main menu field, click Preview this record and open the record.
4. In the Menu items related list, perform the following steps.
   a) For the Requests menu item of the Page type, set Active as true.
   b) For the Requests menu item of the Scripted List type, set Active as false.
5. Navigate to Service Portal > Page Route Maps.
6. For the My Request page route map, set Active as true.
7. Click Update.

Organization Chart widget

The Organization Chart widget shows employees in a tree structure relative to their manager. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Using the widget

In the text input field, enter or select a user to see their manager and subordinates. The widget uses information from the User (sys_user) record to display the organization hierarchy relative to the selected user.
Click a card to open the profile page for that user. To reconfigure the card link, change the **URL** or **Page** in the widget instance options.

You can drag individual cards to rearrange the chart.

You can zoom in or out of the chart view by clicking the magnifying glass icons or by scrolling.

**Instance options**

Use the instance options to configure the Organization Chart widget for a portal page.

![Note: There are no valid values for several instance options. By default, you can set only the following instance options:](image)

</tbody>
</table>

**Sample Footer widget**

The Sample Footer widget is an example of a footer you can use in your portal. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Unlike other widgets in Service Portal, you add a footer to your portal by configuring it in the Theme form. For more information on adding a footer to a portal, see **Add a header or footer to a portal**.
Sample Footer widget

Instance options

The Sample footer widget does not include instance options.

Ticket Attachments widget
Use the attachment widget to attach items to tickets. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Attachments should be less than 24MB. You can drag files into the Attachments widget to add them to a record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record ID</td>
<td>The ID number of the record for the attachment.</td>
</tr>
<tr>
<td>Record table</td>
<td>Limit the records users can add an attachment to by adding a table to the attachment widget. Users can then only add attachments if they are in a record for that table.</td>
</tr>
</tbody>
</table>

Ticket Conversations widget

Record of ticket items. Users can use this widget to communicate back and forth with the fulfiller and the receiver. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The Ticket Conversations widget displays journal entries from the activity formatter of the target record. Journal entries are presented in chronological order, with the oldest entries appearing at the bottom of the widget. Entries made by the user that created the record appear on the right side of the center divider. Entries made by other users appear to the left.

The Ticket Conversations widget is intended only for tables that extend task.
Limit the number of journal entries that appears in the ticket conversation widget using the `glide.service_portal.stream_entry_limit` system property. The default number is 100. Change the number by navigating to Service Portal > Properties, and enter the new number in the Maximum number of stream entries displayed in Service Portal field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use dynamic placeholder</td>
<td>Use a placeholder for journal fields. The default value is false.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>No readable journal field message</td>
<td>The message that displays when there are no readable journal fields. Forms that have added journal fields may not display in the Ticket Conversation widget.</td>
</tr>
</tbody>
</table>

**Ticket Fields widget**

The Ticket Fields widget displays information about a request that a user has made. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

**Using the widget**

After a user submits a request, they can track their request on a ticket page in Service Portal. The user can consult the Ticket Fields widget to review the details of their request and check its resolution status.

---

**Your request has been submitted**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

**Instance options**

The Ticket Location widget does not include any instance options.

**User Profile widget**

Display user profile information. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Users can use the User Preferences section to enable accessibility in a portal.
User Profile widget

Instance options

The User Profile widget does not include instance options.

Search widgets

Several search widgets are provided with Service Portal.

You can configure search in Service Portal using any of the search widgets.

Contextual Search widget

Contextual Search is an embedded widget that can be added to a record producer. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
By default, the widget is included in the **Create Incident** record producer form to display items based on keywords entered in the description. These items can be knowledge articles, service catalog items, and social Q&A records. These search results appear as the user types the information.

* Please describe your issue below

The more information you can provide here, the easier time the support organization will have in diagnosing and resolving your incident.

**Contextual Search widget**

**Faceted Search widget**
The Faceted Search widget displays search results and search facets defined for a search source. The Faceted Search widget enables end users to filter search results for a more meaningful result set.

KB Article Page widget

Use the Article page widget to view Knowledge Base articles within Service Portal. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Any specialized font or formatting added in the text field for the knowledge article within the platform, appears the same way in the portal.
Getting Around in Windows

Windows 8.x

Windows 8.x is designed for using touch, mouse, and keyboard together, on hardware ranging from touch-enabled tablets and laptops to PCs and all-in-one computers, including those without touch capability.

Start screen and Desktop

- 8.1: Microsoft updated the Windows 8.1 interface by returning the Start button, providing its ease of access along with the option of the Metro interface. The intent is to provide a seamless experience on desktops, laptops, tablets, and phone devices. By default, the Start screen is displayed. Move your mouse pointer to the bottom left corner of the screen to make the Start button appear. Click it to display the desktop; click it again to display the Start screen.

- 8: The Start screen has a default application display you can customize:
  1. Right-click any app and the Application bar will appear at the bottom, with options for the application you have selected.
  2. To add an app to the Start screen, click Pin to Start.
   If an application is already on the Start screen, you’ll see Unpin from Start instead.

Power User menu

The Power User menu displays the most commonly used applications from the Control Panel, File Explorer, and Task Manager, as well as Restart, Run, Search, and Shutdown/Update. Access it in one of the following ways:

- Press Win+X

<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Show star rating</td>
<td>Displays the star rating on the article page widget. If you select Use system properties, the appearance of the star rating is defined by the glide.knowman.show_star_rating system property.</td>
</tr>
</tbody>
</table>

KB Categories widget
Lists the categories for your Knowledge Base. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
Categories are determined by the list of Knowledge Categories provided for the Knowledge Base. To view a list of categories for a knowledge base, in the platform navigate to Knowledge > Administration > Knowledge bases then select the name of the knowledge base, for example IT. Categories for the knowledge base appear in the related lists. If a category does not have any associated articles, it does not appear in the portal. For more information on defining categories for a knowledge base, see Define a knowledge article category.

The knowledge base that a portal uses is determined in the portal form. If your portal uses multiple knowledge bases, you can use the KB Knowledge Bases widget to filter the content of the KB Categories widget.

For more information on associating your portal with a knowledge base, see Associate a portal with a knowledge base.

Instance options

The KB categories widget does not include instance options.
KB Category Page widget
Articles and article preview within a particular category. Categories are specified within the Knowledge Base module. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The KB Category Page widget works together with the KB Categories widget. When you select a category in the KB Categories widget, the KB Category page widget lists articles within that category.

To have the KB Categories and KB Category Page widgets work in tandem, add the two widgets to the same page.
KB Categories widget

KB Category Page widget
If you add the KB Category Page widget to a page without adding the KB Categories widget, the KB Category Page widget displays an uncategorized list of all articles within the knowledge base.

Categories are determined by the list of Knowledge Categories provided for the Knowledge Base. To view a list of categories for a knowledge base, in the platform navigate to Knowledge > Administration > Knowledge bases, then select the name of the knowledge base, for example IT. Categories for the knowledge base appear in the related lists. If a category does not have any associated articles, it does not appear in the portal. For more information on defining categories for a knowledge base, see Define a knowledge article category.

The knowledge base that a portal uses is determined in the portal form. For more information on associating your portal with a knowledge base, see Associate a portal with a knowledge base.

</tr>
</tbody>
</table>

**KB Knowledge Bases widget**

Give users the option to select which knowledge base to browse on your portal. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
Using the widget

If you associate your portal with multiple knowledge bases, the KB Knowledge Bases widget provides users with a menu to select a knowledge base. After a user selects a knowledge base, other KB widgets on the page filter their content accordingly.

For example, if a user selects to browse only the IT knowledge base, then the KB Categories widget shows only the categories within the IT knowledge base.

If you associate your portal with only one knowledge base, then the KB Knowledge Bases widget remains hidden on the page.

For more information on associating your portal with knowledge bases, see Associate a portal with a knowledge base.

Instance options

The KB Knowledge Bases widget doesn't include instance options.

KB Most Viewed widget
List of most viewed knowledge base articles, based on user feedback. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

**KB View widget**

The KB View widget is an example of how to structure a knowledge base page. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Use the search filter to find a specific topic or article.
Instance options

The KB view widget does not have any included instance options.
**KB View 2 widget**

The KB View 2 provides an alternative structure to the KB View widget to show a different example of how to display knowledge articles. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The KB View 2 widget displays each knowledge category as a card. Click a card to access the articles within that category.

**Categories**

- **Applications**: 3 articles
- **Devices**: 1 article
- **Email**: 8 articles
- **IT**: 7 articles
- **Operating Systems**: 12 articles
- **Suppliers**: 1 article

**KB View 2**

Categories are determined by the list of Knowledge Categories provided for the Knowledge Base. To view a list of categories for a knowledge base, in the platform navigate to **Knowledge > Administration > Knowledge bases**, then select the name of the knowledge base, for example IT. Categories for the knowledge base appear in the related lists. If a category does not have any associated articles, it does not appear in the portal. For more information on defining categories for a knowledge base, see **Define a knowledge article category**.

The knowledge base that a portal uses is determined in the portal form. For more information on associating your portal with a knowledge base, see **Associate a portal with a knowledge base**.

**Instance options**

The KB View 2 widget does not have any included instance options.

**My Favorite Tags widget**

The My Favorite Tags widget allows you to follow specific questions based on the tags. By saving favorite tags, you can see questions that are specific to that tag. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
The My Favorite Tags widget does not have any included instance options.

**Popular Questions widget**
List of popular questions asked in the community. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The SQANDA Create Question widget does not have any included instance options.

SQANDA Question widget
Use the Social Q&A question widget to view and respond to questions. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
**Has anyone tried ordering accessories that are not listed on the catalog?**

I want to order an ergonomic mouse but everything in the company catalog is pretty basic. Can I just order one online and expense it if it's the same price?

Share • Comment

4mo ago • Asked by Abel Tuter

**1 Answer**

You can always consult with your manager and they may be already on the approved list of accessories. You can also submit a request and we'll let you know if you should order it and expense it.

Service Catalog widgets

Use the Service Catalog widgets to build a catalog for your portal.

Most service catalog widgets are part of the Service Portal Service Catalog (com.glide.service-portal.service-catalog) plugin that is activated automatically with the Service Portal for Enterprise Service Management (com.glide.service-portal.esm) plugin.

The Service Portal - Service Catalog v2 plugin (com.glideapp.servicecatalog.portal) provides an enhanced Service Catalog experience. This plugin is active by default and enables the following widgets:

- Catalog Homepage Search (ID: cat-homepage-search)
- SC Scroll to top (ID: sc-scroll-to-top)
- Requests and Approvals (ID: sc_request_and_approvals)
- Recent & Popular Items (ID: sc-recent-popular)

Most of the configuration for the Service Catalog widgets takes place in the Service Catalog application of the platform. For more information on Service Catalog, see Service Catalog.

Catalog Content widget

The Catalog Content widget is part of the Service Catalog and includes a tiled list of all the content items available in the catalog. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The items that appear on the page are grouped by category alphabetically. Catalog items and categories are defined in the Service Catalog application in the platform. For more information on creating catalog items to appear in the catalog, see Create or edit a catalog item.
### Catalog Content widget

**Instance Options**

The Catalog Content widget does not include instance options.

**Catalog Homepage Search widget**

Give your users the option to search the Service Catalog as soon as they log in. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
Using the widget

Add the Catalog Homepage Search widget on your Service Catalog landing page. When users navigate to the Service Catalog, they can use the Catalog Homepage Search widget to find what they are looking for.

Users can enter a keyword in the search bar. The Catalog Homepage Search widget uses a predictive search feature that shows words as users type.

Alternatively, to navigate to a list of Service Catalog categories, users can select Browse by Categories.

Instance options

Use the instance options to configure the Catalog Homepage Search widget for a portal page.

<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td>Typeahead Search</td>
<td>Configuration of the search bar. You configure the search bar by using the instance options for the Typeahead Search widget. Use the syntax <code>{field1: 'value1', field2: 'value2'}</code>. For example, to configure the title, color, and size of the search bar, enter the following: <code>{title: 'Search...', color: 'default', size: 'lg'}.</code></td>
</tr>
</tbody>
</table>
Recent & Popular Items widget

Allow a user to browse recent and popular catalog items. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Using the widget

The Recent & Popular Items widget includes two tabs: **My Recent Items** and **Popular Items**. A user opens the My Recent Items tab to see catalog items that they recently viewed or requested. A user opens the Popular Items tab to see catalog items that have been widely requested by other users.

<table>
<thead>
<tr>
<th>My Recent Items</th>
<th>Popular Items</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Google Nexus 7</strong></td>
<td><strong>Google Droid Razr Maxx</strong></td>
</tr>
<tr>
<td>View Details</td>
<td>View Details</td>
</tr>
<tr>
<td>$199.99</td>
<td>$99.99</td>
</tr>
<tr>

Requests and Approvals widget
Allow a user to refer to their open requests and approvals in the Service Catalog. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Using the widget

The Requests and Approvals widgets includes two tabs: My Requests and My Approvals.
A user opens the My Requests tab to see data from the Task (task) table. If the user has opened any task record, such as an incident or a change request, the record is displayed in the widget.
A user opens the My Approvals tab to see data from the Approvals (sysapproval_approver) table. If the user has been assigned to approve a request, the approval record is displayed in the widget.
If the user doesn't have any open requests or approvals, the widget remains hidden on the page.

**Instance options**

The Requests and Approvals widget doesn't include instance options.

*SC Catalog Item widget*

Use this widget (widget-sc-cat-item-v2) to view the information about a catalog item and order the item. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Configure `catalog items` using the Service Catalog in the platform UI by navigating to **Service Catalog > Catalog Definitions > Maintain Items**.

Catalog variables determine what information your users are allowed to select from, for example, color, size, or price. For more information on defining the variables for a catalog item, see **Create a service catalog variable**.

<td>• Click <strong>Show more</strong> to display the entire description.</td>
</tr>
<tr>
<td></td>
<td>• Click <strong>Show less</strong> to display only 150 characters of the description.</td>
</tr>
</tbody>
</table>

**SC Categories widget**

The SC Categories widget displays Service Catalog categories. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The system renders the categories available in this widget from the Categories table in Service Catalog (sc_category).
If you associate your portal with multiple catalogs, then the SC Categories widget also includes a menu to select which catalog to browse.
For more information on associating your portal with catalogs, see Configure a catalog in Service Portal.

**Instance options**

**Categories widget instance options fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data</td>
<td>Defines what page opens when a user clicks a category. By default, this option redirects to the page for the selected category.</td>

<td>Specifies the number of categories displayed in the Categories pane. By default, ten categories are displayed. If there are additional categories,</td>
</tr>
<tr>
<td></td>
<td>the Show All option is available.</td>
</tr>
<tr>
<td>Number of categories to load</td>
<td>Select a flat or nested layout. A flat layout shows all of the available categories. A nested layout shows only the parent categories. Use a</td>
</tr>
<tr>
<td></td>
<td>nested layout if you have a large number of categories to prevent an unnecessarily long list. Click the + symbol next to a category with nested</td>
</tr>
<tr>
<td></td>
<td>topics to expand the subcategories. The widget only supports three levels of nesting. After level four, categories appear in the flat view.</td>
</tr>
<tr>
<td>Bootstrap color</td>
<td>Color scheme for the widget. The default colors are defined by the portal theme, but if you want the instance to have a specific color, select the option from the list.</td>
</tr>
<tr>
<td>Presentation</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Hide at XS</td>
<td>Hides the categories option on small screens, for example, on smartphones. The default is set to false.</td>
</tr>
<tr>
<td>Omit badges</td>
<td>Show or hide the number of items included in each category.</td>
</tr>
<tr>
<td>Check canView per item</td>
<td>Verifies with each item that the user has the right roles to view the catalog item.</td>
</tr>
</tbody>
</table>

**Note:** If a category contains more than 200 items, update the following instance options on this widget for better performance:

- Category Layout: Flat
- Omit badges: True
- Check canView per item: False

**SC Category Page widget**

Lists the catalog items available within a certain category. Categories are determined within the Service Catalog module. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

**Note:** Catalog items are sorted in ascending order by their **Order** value. If catalog items have the same order, they are sorted by the **Name** field.
Field | Description
---|---
Click event name | The name of the event that is emitted when a user clicks a catalog item.

You can override the default behavior when clicking on a catalog item by providing a different event name. This would be in a situation where you embedded the category page in another widget.

The default value is $sp.cat_item_list.click.

</tbody>
</table>

**SC Order Guide widget**

Use this widget (widget-sc-order-guide-v2) to request an order guide, that is, a single service catalog request for several catalog items with a specific purpose. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Configure Order guides using the Service Catalog in the platform UI by navigating to Service Catalog > Catalog Definitions > Order Guides.

The order guide form comprises the following sections:

**Describe Needs**

This section displays the following that are associated with the order guide:

- Image
- Description
- Variables

**Choose Options**

This section displays a list of catalog items included in the order guide based on the information provided in the Describe Needs section and the rule base configured for the order guide. Each catalog item is displayed with its name and description on an accordion.

Each accordion displays:

- **Options**, if a catalog item has fields that need user inputs.

  Note: If the fields are mandatory, a red asterisk is displayed beside Options.

- A toggle to include the catalog item in the order guide request. You can make it mandatory to include all items in the order guide request by not displaying the toggle. You can make it optional to include items in the order guide request by displaying the toggle. To display the toggle for each catalog item of the order guide, select the Show Include Toggle (Service
Portal) check box while configuring the order guide. For more information, see Create an order guide.

Note: When an item is excluded from the order guide request, the item is not editable and the corresponding mandatory field restrictions are ignored.

Summary

This section provides a summary of the order guide that you can review before requesting the order guide.

Instance options

Use the widget instance options to customize the settings for the SC Order Guide widget. To customize the settings for this widget, press the Ctrl key, click on the widget, and select Instance Options.

Instance options for the SC Order Guide widget

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Presentation</td>
<td>Name of the order guide.</td>
</tr>
<tr>
<td>Title</td>
<td>Name of the order guide.</td>
</tr>
<tr>

SC Save Bundles widget

Instance Options

The Save Bundles widget does not have any included instance options.
**SC Saved Carts widget**

The Saved Carts widget shows previously created and saved bundles from the Service Catalog. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

<table>
<thead>
<tr>
<th>Saved Bundles</th>
</tr>
</thead>
<tbody>
<tr>
<td>New sales hire bundle</td>
</tr>
</tbody>
</table>

**SC Saved Cart widget**

When you add an existing cart bundle to a shopping cart, you have two options. You can:

- Replace the items in the shopping cart with the items in the bundle.
- Add the bundle in addition to the rest of the items in the cart.
Add bundle items to a cart

Instance Options

The Saved Carts widget does not have any included instance options.

SC Scroll to top widget
In the Service Portal mobile view, the SC Scroll to top widget (sc_scroll_to_top) lets you scroll to the top of the screen after you scroll down. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

This widget is displayed when you start to scroll upwards after reaching a specific screen height.

</tr>
</thead>
</table>

**SC Shopping Cart widget**

The SC Shopping Cart widget (sc-shopping-cart-v2), used with Service Catalog, stores all your orders at one place. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Use the shopping cart widget to:

- Control the quantity of items in the cart.
- Add items to a cart. This information is stored in the sc_cart table.
- Define who the items are being requested for.
- Save specific items together as a bundle, which can be reloaded later. You can replace the cart items with the saved bundles, or add the bundles to the cart items.
- Remove all items from your cart.
SC Shopping Cart widget

Instance options

Use the widget instance options to customize the settings for the SC Shopping Cart widget. To customize the settings for this widget, press the Ctrl key, click on the widget, and select Instance Options.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Presentation</td>
<td></td>
</tr>

</tr>
<tr>
<td>Cart Template</td>
<td>Enter the name of a ng-template you want to use to provide a different template for the shopping cart. By default, two ng-templates are provided: small_shopping_cart_v2.html and large_shopping_cart_v2.html.</td>
</tr>
<tr>
<td>Auto update cart</td>
<td>Automatically updates the cart across all sessions.</td>
</tr>
</tbody>
</table>

Enable the Shopping Cart widget
The shopping cart widget is enabled automatically for instances upgrading to Istanbul, however, there are several ways to manually enable or disable the widget.

To enable the shopping cart for a catalog item:

1. Navigate to a catalog item on the Service Catalog page in Service Portal.
2. CTRL+right-click a catalog item widget to open the widget instance options.
3. Select or clear the **Show Add Cart Button** option to enable or disable the shopping cart for that particular catalog item.
To enable the shopping cart in the portal header:

1. From the Service Portal configuration page, select the Portal editor.
2. Select the SP Header Menu in the portal hierarchy.
3. In the Additional options section, make sure the enable cart value is set to true.

```json
{
    "enable_cart": {
        "displayValue": "true",
        "value": true
    }
}
```
Set the value to `false` to hide the shopping cart.
Shopping cart in the header menu

```json
{
   "enable_cart": {
      "displayValue": "true",
      "value": true
   }
}
```
Enable automatic updates to the shopping cart
Update the shopping cart automatically with user-specific changes from multiple tabs and platforms.

Role required: admin or sp_admin

1. Navigate to Service Portal > Service Portal Home.
   The Service Portal homepage is displayed.
2. In the banner, click Cart.
3. Press and hold the Ctrl key, click the wish list widget, and select Instance Options.
4. Select the Auto update cart check box and click Save.
5. Perform these steps only for upgrade customers.
   a) Navigate to Service Portal > Service Portal Configuration.
   b) In the banner, click Portals.
   c) In the list, ensure that Service Portal is selected.
   d) In the portal hierarchy chart, select SP Header Menu.
   e) In the Additional options, JSON format field, set the auto_update_cart value as true.

"auto_update_cart": {
   "displayValue": "true",
   "value": true}
Automatic updates to the shopping cart
**SP Variable Editor widget**

The Variable Editor widget allows you to change the specifications you chose for an item in the Service Catalog. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

You can embed the variable editor widget in the shopping cart widget, to allow users to edit and make changes to their cart items. The options included in the widget are determined by the specific catalog item and the variables that have been configured for it.

For more information on the service catalog variables that are available in Service Portal, see [Types of service catalog variables](#).

Instance Options

The Variable Editor widget is embedded as part of the shopping cart widget, therefore no instance options are included.

SC Wish List Cart widget
Use this widget to add catalog items or record producers to the wish list so that you can review them. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

If the wish list is enabled for Service Catalog, SC Wish List Cart widget (sc_wishlist_cart) is available in Service Portal. Once enabled, the following options are available:

- The Wish List menu option on the main navigation bar.
- The Add to Wish List button in the Ordering widget for catalog items and record producers.
- A wish list details page that displays all items in the Wish List.

From the wish list details page, you can view or delete catalog items, clear the wish list, or navigate to the Service Catalog landing page.

Instance options

Use the widget instance options to customize the settings for the SC Wish List Cart widget. To customize the settings for this widget, press the Ctrl key, click on the widget, and select Instance Options.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto update wish list</td>
<td>Automatically updates the wish list across all sessions.</td>
</tr>
</tbody>
</table>

Enable the SC Wish List Cart widget in Service Portal

Add catalog items or record producers to the wish list after you enable the wish list.

Role required: admin or sp_admin

1. Navigate to **Service Catalog > Maintain Catalogs**.
2. From the Catalogs list, select **Service Catalog**.
3. On the catalog form, select the **Enable Wish List** check box and click **Update**. The Wish List menu option is displayed in the Service Portal banner.

   **Note:** The Use the sc_layout driven cart macros (default true) (glide.sc.use_cart_layouts) property must be set to true to enable the wish list.

4. To enable the Wish List menu option in the Service Portal banner, perform these additional steps only for upgrade customers.
   a) Navigate to **Service Portal > Service Portal Configuration**.
   b) In the banner, click **Portals**.
   c) In the list, ensure that **Service Portal** is selected.
   d) In the portal hierarchy chart, select **SP Header Menu**.
   e) In the Additional options, JSON format field, set the enable_wishlist value as true.

```json
"enable_wishlist": {
   "displayValue": "true",
   "value": true}
```
Enable the SC Wish List Cart widget

5. Enable the Add to Wish List icon (🔗) in the Ordering widget of a catalog item or record producer:
a) Navigate to **Service Portal > Service Portal Home > Order Something**. The Service Portal homepage is displayed.

b) Click one of the available catalog items.

c) Press and hold the Ctrl key, click a catalog item widget, and select **Instance Options**.

d) Select the **Show Add/Update Wish List buttons** check box and click **Save**.

Enable automatic updates to the wish list
Update the wish list automatically with user-specific changes from multiple tabs and platforms.

Role required: admin or sp_admin

1. Navigate to **Service Portal > Service Portal Home**. The Service Portal homepage is displayed.

2. Access the wish list.

3. Press and hold the Ctrl key, click the wish list widget, and select **Instance Options**.

4. Select the **Auto update wish list** check box and click **Save**.

5. Perform these additional steps only for upgrade customers.

a) Navigate to **Service Portal > Service Portal Configuration**.

b) In the banner, select **Portals**.

c) In the list, ensure that **Service Portal** is selected.

d) In the portal hierarchy chart, select **SP Header Menu**.

e) In the **Additional options, JSON format** field, set the `auto_update_wishlist` value as `true`.

```
"auto_update_wishlist": {
  "displayValue": "true",
  "value": true}
```
Automatic updates to the wish list
**Service Portal configuration page widgets**

Service Portal uses widgets for configuration. When you configure a page or a widget for a portal in the Service Portal Configuration page, you actually use Service Portal widgets to do so.

Service Portal configuration widgets are internal only and cannot be extended.

Configuration page widgets are included as part of the Service Portal Configuration Pages plugin (com.glide.service-portal.config), which is activated automatically when you activate the Service Portal for Enterprise Service Management plugin (com.glide.service-portal.esm).

Navigate to **Service Portal > Service Portal Configuration** to view these widgets in action.

**Service Portal Config Overview widget**

The Service Portal Config Overview widget is the widget that appears on the sp_config homepage. Use this widget to navigate Service Portal Configuration. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
Service Portal

**SP Page Map widget**

The Page Map widget works in the Page Editor to display any Service Portal page in a tree structure. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

**SP Portal Map widget**

The Portal Map widget displays your portal in a tree structure.

**Theme Preview widget**

The Theme Preview widget appears in the Branding Editor and allows you to see any theme changes you make to your portal. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
Theme Preview

Navbar

Brand

Text Primary - Nullam id dolor id nibh ultricies vehicula ut id elit.
Text Success - Duis mollis, est non commodo luctus, nisi erat porttitor ligula.
Text Info - Maecenas sed diam eget risus varius blandit sit amet non magna.
Text Warning - Etiam porta sem malesuada magna mollis euismod.
Text Danger - Donec ullamcorper nulla non metus auctor fringilla.
**Widget Edit Panel widget**

The Widget Edit Panel appears on the main page of the Widget Editor in Service Portal Configuration. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Use the Widget Edit Panel to view widgets that have recently been updated, create a widget, or view an existing widget.

![Widget Edit Panel](image)

**Service Portal service status widgets**

Use the service status widgets to display current, planned, and historical outages for business services to your end users.

The service catalog widgets are part of the Service Portal Service Status (com.glide.service-portal.service-status) plugin, which is activated automatically with the Service Portal for Enterprise Service Management (com.glide.service-portal.esm) plugin.
**Business Service Status widget**

View how services are running on your system. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The Business Service Status widget pulls information from the cmdb_ci_service table. You can change where the data comes from in a cloned version of the widget by adjusting the settings in the widget server script.

### Instance option fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the widget. This only appears in the header for the widget instance options, it is not user-facing. To change the title for the list of services, clone and edit the widget HTML.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Icon for the widget. This is not user-facing.</td>
</tr>
<tr>
<td>Number of Services</td>
<td>The number of services displayed in the widget. The default number is 250.</td>
</tr>
</tbody>
</table>

**Current Status widget**

The Current Status widget displays any issues reported in the system. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The Current Status widget checks the Outages (cmdb_ci_outage) table to see if the system is experiencing any outages.

Service owners and service desk managers report planned or unplanned outages by creating outage records. Each outage record includes **Begin** and **End** fields to indicate the duration of the outage. If the **End** time is later or empty, then the outage is still ongoing. The Current Status widget displays all ongoing outages.
Current Status widget

The Current Status displays outages only for services, which are tracked in the Services (cmdb_ci_service) table.

Instance options

Use the instance options to configure the Current Status widget for a portal page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show outage details</td>
<td>Option to display details from the Outage (cmdb_ci_outage) record.</td>
</tr>
<tr>
<td>Standalone</td>
<td>Option to remove explanatory information. This option also adds a link to more information.</td>
</tr>
</tbody>
</table>

Planned Maintenance widget

Describes any planned system maintenance. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The widget gathers information from the cmdb_ci_outage table. Any planned maintenance within the following five days appears in the Planned Maintenance widget.
Planned Maintenance widget

Instance options

The Planned Maintenance widget does not have any included instance options.

Service History widget
Displays the history of specific service's status. For example, if the Bond Trading widget has a history of planned outages or degradations, the widget displays those with a varied color scheme to differentiate the outage type. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
### Service History widget

From most recent to oldest, this list shows all outages, degradations and planned maintenance for this service:

<table>
<thead>
<tr>
<th>Time</th>
<th>Description</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>3d</td>
<td>Outage - Bond Trading</td>
<td>1 hour 15 min</td>
</tr>
<tr>
<td>7d</td>
<td>Planned Outage - Bond Trading</td>
<td>3 hours 31 min</td>
</tr>
<tr>
<td>8d</td>
<td>Planned Outage - Bond Trading</td>
<td>3 hours 32 min</td>
</tr>
<tr>
<td>9d</td>
<td>Planned Outage - Bond Trading</td>
<td>3 hours 24 min</td>
</tr>
</tbody>
</table>

### Instance options

The Service History widget does not include any instance options.

### Service Status widget

The Service Status widget provides a visual representation of service availability over the past three months. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

The Service Status widget displays the history of service availability for one service from the Services (cmdb_ci_service) table. The widget uses the page URL to determine which service to represent.
Service Status widget

Each pill represents one day. Each color correlates with a type of service availability.

<table>
<thead>
<tr>
<th>Color</th>
<th>Service availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>No issues</td>
</tr>
<tr>
<td>Blue</td>
<td>Planned maintenance</td>
</tr>
<tr>
<td>Yellow</td>
<td>Service degradation</td>
</tr>
<tr>
<td>Red</td>
<td>Outage</td>
</tr>
</tbody>
</table>

Instance options

The Service Status widget does not have any included instance options.

Service Status Legend widget

Use concurrently with the Status History widget to show what the icons in the Status History widget mean. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.
Instance options

The Service Status Legend widget does not have any included instance options.

Service Status Subscription widget

Used in conjunction with the service status widget. Users subscribe to receive updates about the service status. You can use this base system widget as-is in your Service Portal or clone it to suit your own business needs.

Instance options

The Service Status Subscription widget does not have any included instance options.

Widget instances

When you add a widget to a page using the Service Portal Designer, it creates a widget instance. A widget instance is a reference to a widget that contains a location, properties, and CSS specific to that instance. Adding the same widget multiple times to the same page creates multiple instances.
For example, the **Icon Link widget** displays as many different versions of itself as you add to a page.

**Icon link widgets**

All widget instances point to a widget. If you make changes in that specific widget, all of the widget instances receive that change as well. You can also make changes specifically to a widget instance and only the widget instance will be affected.

**Configure widget instance options**

Each instance of the widget you configure remains unique, so you can have several instances of the same widgets on a page. For example, each instance of the cool clock widget on a page shows a different time zone. Configure a widget on a page by adjusting the instance options.

**Role required:** admin or sp_admin

Each time you add a widget to a page it creates a record on the sp_instance table with the following information:

- Reference to the column where the widget is located
- Reference to a widget
- Configuration for a widget in the form of pre-defined form fields and an Additional Options field in JSON format

1. On a page in the Service Portal Designer, point to the Edit icon (-pencil) in a widget to open the widget instance options. You can also access widget instance options using the control + right-click menu.
2. From the Instance Options window, make the selections you want to configure your widget. Instance options vary depending on which widget you select.
Advanced users can configure the available options for a widget. For more information, see Widget option schema.

**Widget context menu**

From any rendered Service Portal page you can CTRL+right-click a widget to see more configuration options in a context menu.

For example, navigate to Service Portal > Service Portal Home to open a sample portal page. CTRL+right-click Knowledge Base on that page.
**Note:** You must have the admin or sp_admin role to see the widget context menu. When you impersonate a user without one of those roles, you can still see the menu. However, a regular user signed in without those roles cannot see the menu.

### Widget context menu options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Widget performance</td>
<td>How long it takes for a widget to load</td>
</tr>
<tr>
<td>Instance options</td>
<td>Specify an instance of a widget. Widgets instance options vary depending on the widget you select. For example, the instance options for the cool clock widget include different time zones for each instance, so you can have the same clock four times on a page, but with all different time zones.</td>
</tr>
<tr>
<td>Instance in Page Editor</td>
<td>Opens that instance of the widget in the Page Editor</td>

<td>Opens the widget form in a pop up window so you can make quick changes to the widget.</td>
</tr>
<tr>
<td>Widget in Editor</td>
<td>Opens the widget in the Widget Editor. You can use the Widget Editor to configure HTML templates, CSS, client scripts, service scripts, and demo data for the widget.</td>
</tr>
<tr>
<td>Log to console: $scope.data</td>
<td>The $scope.data object passes data from the server to the client side controller. Instead of adding console.log messages or alerts into the controller code, you can just log the $scope.data object to the browser console and view the data there.</td>
</tr>
<tr>
<td>Log to console: $scope</td>
<td>Similar to the $scope.data object, except it logs everything in $scope to the console.</td>
</tr>
</tbody>
</table>

### Widget developer guide

Develop custom widgets in the Service Portal using AngularJS, Bootstrap, and the ServiceNow API.

### What to know before you begin

To develop widgets, you need ServiceNow API experience to:

- Run record queries on the server.
- Create and update records.

You need AngularJS experience to:

- Bind variables to client controllers.
- Access server objects in a widget.
- Gather user input.

Optionally, you can build on the Bootstrap template by accessing Bootstrap components. Service Portal uses Bootstrap version 3.3.6.

**Parts of a widget**

Like Angular directives, widgets execute a specified behavior within a Service Portal page. A widget includes mandatory and optional scripting components.

**HTML template**

A mandatory widget component.

The HTML template requires knowledge of AngularJS to display and gather data. Use the HTML template to:

- Render the dynamic view that a user sees in the browser using information from the model and controller.
- Bind client script variables to your markup.
- Gather data from the end user.

**Client script**

A mandatory widget component.

A client script requires knowledge of both the ServiceNow API and AngularJS to create a client controller. Use the client script to:

- Map server data from JavaScript and JSON objects to client objects.
- Process data before rendering it.
- Pass data to the HTML template.
- Pass user input and data back to the server for processing.

**Server script**

A mandatory widget component.

A server script requires knowledge of the ServiceNow API to work with record data. Use the server script to:

- Set the initial state of the widget.
- Send record data to the widget client script using the **data** variable.
- Run server-side queries.

**Link function**

An optional widget component.

The link function requires knowledge of AngularJS. Use a link function to directly manipulate the DOM.

**Option schema**

An optional widget component.

Allows a Service Portal admin to configure a widget. Use the option schema to:
• Specify the parameters for a widget.
• Allow admin users to define instance options for a widget instance.
• Develop flexible, reusable widgets.

Angular Providers

An optional widget component.

Angular Providers require knowledge of AngularJS. Use Angular Providers to:
• Keep widgets in sync when changing records or filters.
• Share context between widgets.
• Maintain and persist state.
• Create reusable behaviors and UI components and inject them into multiple widgets.

Dependencies

An optional widget component.

A widget dependency is an external resource used by your widget such as JavaScript or CSS files.

Global objects in widgets

When a widget begins to render for the first time on a page, the server script executes first and accesses three global objects: input, options, and data. Because the input variable is a data object sent from the client script, this variable is undefined when first initialized.
When a widget is first instantiated, the server script:

1. Initializes an empty `data` object.
2. Initializes the `input` object with any data sent from the client controller, or the `options` object with any data used to initialize the widget.
3. Sends the `data` object to the client controller as JSON.

The client script:

1. Accesses the server `data` object using `c.data`.

   **Note:** By default, widgets use the `c` variable to represent the controller instance using `controller as` syntax. You can change this variable when creating or cloning widgets.

2. Uses `server.update()` to post changes to the data model. This method updates the server script using the `input` object.

   **Note:** After calling `server.update()`, the client script `data` object is automatically overwritten by the server script `data` object.

3. Uses `c.options` to access the values used to invoke the widget on the server. This object is read-only.
Using the Widget Editor

When you create a widget, a record is created in the sp_widget table. However, you can use the Widget Editor in Service Portal Configuration as your scripting environment. The Widget Editor is a full page application similar to an IDE. You can show the parts of the widget you want to edit and hide the rest, while previewing your changes in real time.
Recommendations for developing widgets

When developing custom widgets, keep these recommendations in mind for optimal performance, scalable development, and a good user experience.

Create a default state that provides an example to the end user

A widget does not have instance options defined when initially added to a page. A widget in this empty state can appear blank and cause confusion. In situations where a widget requires some initial configuration, ensure that your widget has a default state that communicates to the admin what configuration is necessary.

Widgets can also be created with demo data. Demo data can also be used to:

- Clearly demonstrate the widget functionality to the user.
- Provide data when previewing the widget in the widget editor. (Demo data is not visible in the designer).

Learn more: Tutorial: Build a custom widget.

Embed a widget rather than clone when possible

Embedding an existing widget into your custom widget takes advantage of pre-existing functionality without cloning or duplicating code. You can still pass parameters into the embedded widget to control its behavior.

Learn more: Embed an existing widget

Add limits to GlideRecord queries to improve performance

If your server-side script uses GlideRecord queries, the setLimit function can restrict the number of records returned, and improve response time on queries. For added flexibility, you can tie this limit to an instance option rather than assigning a hard-coded value (for example: gr.setLimit(options.limit || 100)).

Learn more: GlideRecord setLimit Function

Create a directive instead of embedding a complex widget

When an embedded widget is called from the server, all the scripts associated with that widget are returned. If you only need a subsection of a widget, embedding the entire widget creates unnecessary overhead. Instead, use directives to share lightweight code between widgets. Directives are useful, for example, when building UI components. Complex components with server-side and client-side functionality are best left as widgets. Use a directive instead of an embedded widget to:

- Share scope or custom scope behavior with multiple widgets.
- Share a reusable, lightweight subsection of a widget.
- Share a common UI feature, such as a list or an avatar.
- Augment widget behavior.

Learn more: Reuse components with Angular Providers.

Use a service or factory to share data and persist state

Data services and factories maintain and persist state in a widget without requiring multiple calls to the server, enabling you to:

- Keep widgets synchronized when changing records or filters.
- Share data between widgets.
• Develop more performant widgets.

Learn more: Reuse components with Angular Providers.

Handle events with a publish/subscribe service

Avoid using $broadcast in the DOM. $broadcast dispatches the event name to all child scopes notifying registered listeners, which can be an expensive call that requires the use of the $rootScope global object.

Instead, use a publish/subscribe service to handle events. When using a publish/subscribe service, a clear relationship forms between your widgets through callback handlers. In this model, you can better control the state of your events.

Use REST calls or server.get to fetch data from the server

When you call server.update(), the entire widget is returned from the server. If your widget includes divergent code paths, multiple calls to update the server can affect performance. As a rule, use your server script to set up the initial state of your widget. For subsequent updates, use scripted REST APIs that call script includes on your instance. This practice:

• Separates business logic from UI elements.
• Centralizes your code, allowing changes to be made in one place.

You can also use server.get to pass information to the server. Use this function along with input.action to execute specific parts of the server script.

Develop with localization, accessibility, and UI in mind

To create the best experience for your users, follow these guidelines:

• Consider the impact of your widget in a mobile environment. For example, avoid using mouse-over and other events that do not translate to a mobile device.
• Use SCSS variables to reuse items. See SCSS variables.
• Use variable names when using colors.
• Wrap strings for translation in localization APIs. See Internationalize a widget.

Remove unused Angular Providers from client script

For easier maintenance, remove any unused Angular Providers that were injected into the client script function statement.

Avoid using <script> tags in HTML templates

To lessen the likelihood of production issues in Service Portal, avoid using inline templates using <script> tags in a widget's HTML template. Instead, create a related Angular ng-template record for the widget.

Clone a widget

Take advantage of existing code by cloning and editing an existing widget.

Role required: admin or sp_admin

Note: Base system widgets are read-only so you can benefit from future updates. To make changes, you can clone base system widgets. However, cloned widgets are considered custom and don't benefit from future updates to the widgets they were cloned from.

1. Open the Widget Editor in the Service Portal Configuration page, then select an existing widget from the Select a widget list. For example, select Hello World 2.
2. From the list menu in the widget header, click **Clone "Hello World 2"**.

3. Enter a name for the cloned widget. The widget ID is created automatically based on the widget name.

4. Optional: Select **Create test page** to automatically create a page containing the widget.

5. Use the check boxes to show or hide the different components of the widget editor as needed. Make changes to the HTML Template, CSS, client script, server script, or the link function.
¡Hola, mundo!
6. In order to enable a preview of your widget, use **Enable Preview** from the menu. Use the eye icon that appears to show or hide a preview of your widget.

If you clone a widget that uses the Angular ng-template, you must manually clone the template and change the name of the template reference in the widget.

For example, the header menu widget uses the Angular ng-template `menuTemplate`. If you clone the header menu widget, you must also clone the `menuTemplate` and give the clone a unique name. When you open the clone of the header menu widget, you can see a reference to the `menuTemplate` in the HTML.

```html
menuTemplate in header widget HTML

Create a new widget

Create a new widget to build a custom widget from scratch.

Role required: admin or sp_admin

1. Navigate to **Service Portal > Service Portal Configuration > Widget Editor**.
2. Click **Create a new widget**.
3. Enter a name for the new widget. The widget ID is created automatically based on the widget name. Optionally select **Create test page** to automatically create a page containing the widget.
4. Click **Submit**.

The widget HTML template, client script, and server script display in the widget editor. Basic script templates are included as a guide.

**Note:** After completing development of a widget with a test page, delete the test page. Maintaining test pages can create clutter when managing pages.
Widget option schema

Widget instances allow users to uniquely configure each widget they add to a page. Use the option schema to define the parameters for your widget.

Storing instance options

When developing a widget, you can edit the option schema to create parameters for your widget, or you can create a table to store instance options. If you edit the existing option schema, any instance options defined are stored in JSON format in the Additional options, JSON format field in the sp_instance table. The following field types are available:

- String
- Boolean
- Integer
- Reference
- Choice
- Field_list (depends on table)
- Field_name (depends on table)
To use other field types not supported in the option schema, create an extension table to store your custom widget option schema. Using a table enables you to:

- Add any ServiceNow field type, including fields with advanced customization, to the option schema.
- Define a complex option schema.
- Search and filter instance options.

**Note:** While storing options in a table enables you to define more complex options, this method is more difficult to maintain than editing the option schema. To avoid creating unnecessary tables and adding additional server calls to your widget, edit the existing option schema when possible. Store options in a table only when complex or searchable options are required.

**Using options in a widget**

Access options in the widget from both the client script and the server script using the **options** global variable. You can access to any option value in your widget client script or server script using `options.optionName`.

**Client script**

```javascript
function() {
    /* widget controller */
    var c = this;
    console.log(c.options.text_color) //Outputs the text_color option for this instance
}
```

**Server script**

```javascript
(function() {
    $sp.log(options.text_color) //Logs the value of the text_color option to the browser console.
})();
```

**Defining default options**

Before an option value is set on an instance, it appears as an undefined value when you access that option variable. Use the widget server script to specify default values for your options.

```javascript
(function() {
    options.text_color=options.text_color||"blue";
    options.maximum_entry_count=options.maximum_entry_count||5;
})
```

**Edit the widget option schema**

Widget instances allow users to uniquely configure each widget they add to a page. Edit the option schema to define basic parameters for your widget.

Role required: admin or sp_admin

1. Navigate to **Service Portal > Service Portal Configuration > Widget Editor**.
2. Select the widget you want to configure the option schema for.

3. Click the menu icon (☰) and select **Edit option schema**. This option only appears for users that have the right to edit the widget.

4. Click + to add a widget option.

5. Define a label, name, type, hint and form section. More fields appear depending on the type you select.

   Adding flexible widget options allows you to create more reusable widgets. You can add default values to help users understand each widget option. If you do not select a form section, the default is set to **Other options**.
6. Click **Save**.

The option schema you defined is stored in JSON format in the **Option schema** field in the `sp_widget` table. Based on this option schema, each instance of the widget can use individually defined instance options.
7. Test the option schema by adding the widget to a page in the Service Portal Designer.
   a) Navigate to **Service Portal > Service Portal Configuration > Service Portal Designer**.
   b) Add the widget to a page and click the edit icon on the widget instance to view the instance options.
   c) **Configure the widget instance options**.
   d) View the configuration by navigating to the instance record in the sp_instance table. The instance options are stored in JSON format in the **Additional options, JSON format** field.

---

**Store instance options in a table**

Create a table to store widget instance options instead of editing the existing option schema. When using a table as your widget option schema, you can define custom fields using any ServiceNow field type, add filters to fields, and search or query instance options.

**Role required:** admin or sp_admin

To define a custom option schema, add fields to an sp_instance extension table, then set your widget to use the extension table as a data source. Using an extension table enables you to:

- Add any ServiceNow field type, including fields with advanced customization, to the option schema.
- Define complex widget options.
- Search and filter instance options.

**Note:** While storing options in a table enables you to define more complex options, this method is more difficult to maintain than editing the option schema. To avoid creating unnecessary tables and adding additional server calls to your widget, edit the existing option schema when possible. Store options in a table only when complex or searchable options are required.

---

1. Create a table that extends an sp_instance table to store your custom option schema.
   a) Navigate to **System Definition > Tables**.
   b) Click **New**.
   c) Define a label and name.
   d) In the **Extends table** field, select an sp_instance table that provides the necessary fields.

<table>
<thead>
<tr>
<th>Instance table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance (sp_instance)</td>
<td>Includes base instance fields.</td>
</tr>
<tr>
<td>Instance with Table (sp_instance_table)</td>
<td>Includes sp_instance fields and fields to display table data such as Table and Filter.</td>
</tr>
</tbody>
</table>

   e) Save the form.

2. Define custom fields in the extension table.
   You can define any field type to use in your option schema by adding new columns in the **Columns** list.

3. Update your widget to use the extension table as a data source.
   a) Navigate to **Service Portal > Widgets**.
   b) Open the widget you would like to create custom options for.
c) In the **Data table** field, select your `sp_instance` extension table.

4. Configure the extension table form to display the desired fields. Fields configured on the form are available as instance options.
   a) Navigate to the extension table form: `<yourInstance>/<your_extension_table>.do`.
   b) Right-click the header menu and select **Configure > Form Layout**.
   c) Add the fields to the form.
   d) Click **Save**.

5. Configure the widget to display the desired fields as instance options.
   a) Navigate to **Service Portal > Widgets**.
   b) Open the widget that has the extension table set as the data source.
   c) Use the **Fields** slushbucket to select fields to display as instance options.
d) Save the form.

Test the option schema by adding the widget to a page in the Service Portal Designer. Click the edit icon on the widget instance to view the instance options. After configuring the widget instance options, view the configuration by navigating to the instance record in the sp_instance extension table.

**Reuse components with Angular Providers**

Angular Providers are reusable components that can be injected into multiple widgets. To ensure quick loading widgets and a high performing portal, create Angular Providers instead of overloading your client controllers with persistent data and additional logic. With Angular Providers, you can maintain data for the lifetime of your Service Portal and reuse components and data objects across multiple widgets.

Role required: admin or sp_admin

By creating an Angular Provider, you can:

- Keep widgets in sync when changing records or filters.
- Share context between widgets.
- Maintain and persist state.
- Create behaviors and inject them into multiple widgets.

To learn more, visit [Angular Providers](#).

**Tip:** For easier maintenance and troubleshooting, remove any unused providers from the Angular Providers related list in the Widget (sp_widget) table.

   The Widget Angular Providers table opens.
2. Click New to create a new record.
3. Select the type of Angular Provider.
   - Directive
   - Factory
   - Service

   To facilitate migration to ECMAScript 6 in the future, consider using services over factories.

4. Define a name.
   You will use the name to associate the Provider with your widget.

5. Add a script in the **Client Script** field.

   A basic factory that formats a number in US currency.

   ```javascript
   function formatterFactory()
   {
   var myVal = Number;
   return {
      format: function(myVal) {
```

---

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
6. Associate the Angular Provider with a widget.
   a) Navigate to `<yourInstanceURL>/sp_config?id=widget_edit`.
   b) Open the widget you would like to associate with the Angular Provider.
   c) Under **Related Lists**, select **Angular Providers**.
   d) In the **Angular Providers** list, click **New**.
   e) In the **Angular Provider** field, select the appropriate Provider. Check the **Widget** field to ensure that you are associating the Angular Provider with the correct widget.
   f) Click **Save**.

7. Update the appropriate scripts in your widget to inject the Angular Provider into the widget.
Inject the factory into your widget client script by passing the name of the factory as an argument in your client controller function. You can then access the object defined in the factory function in your widget client script.

```
function(formatterFactory) {
    /* widget controller */
    var c = this;
    console.log(formatterFactory.format(300));
}
```

If defining a directive, use the directive in the widget HTML template.

8. To edit the Angular Provider after it is registered with your widget, open the Angular Provider client script in the widget editor.
   a) Navigate to Service Portal Configuration > Widget Editor.
   b) Under Edit an existing widget, select the widget associated with your Angular Provider.
   c) In the Show menu, open the Dependencies list and select the Angular Provider.

   ![Dependencies](image)

   **Note:** Only Angular Providers associated with the widget are displayed in the Dependencies list. This list includes any external resources your widget depends on.

   The Angular Provider client script displays in the widget editor. In the widget editor interface, you can edit and save your widget and Provider scripts at the same time.

To use an Angular Provider with multiple widgets, register your Provider with each widget and update the appropriate scripts.

**Embedded widgets**

Embed a widget in the HTML template, server script, or client script.

**Embed a widget in an HTML template**

Use the `<widget></widget>` element to embed a widget in an HTML template. Pass in the ID of the widget you are trying to embed as a parameter.

```
<div>
    <widget id="widget-cool-clock"></widget>
</div>
```

If a widget has an option schema, you can define instance options in JSON format.

```
<widget id="widget-cool-clock" options='{"zone": "America/Los_Angeles","title": "San Diego, CA"}'></widget>
```
Alternatively, you can define options in the widget server script.

**HTML template**

```html
<widget id="widget-cool-clock" options='data.clockOptions'></widget>
```

**Server script**

```javascript
(function() {
  data.clockOptions = {
    "zone": "America/Los_Angeles","title": "San Diego, CA"
  };
})();
```

**Embed a widget in a client script**

Use `spUtil.get()` to get a widget model in the client script.

```javascript
spUtil.get("widget-sc-cat-item", {sys_id: "your_catalog_item_sys_id"}).then(function(response) {
  c.catalogItemWidget = response;
});
```

When using the `spUtil` class in a widget client script, you must inject the class into the client script function. The following example embeds the Cool Clock widget:

**Client script**

```javascript
function(spUtil) {
  var c = this;
  spUtil.get("widget-cool-clock").then(function(response) {
    c.myClockWidget = response;
  });
}
```

**HTML template**

```html
<sp-widget widget="c.myClockWidget"/></sp-widget>
```

**Embed a widget in a server script**

Use `$sp.getWidget()` to get a widget model in the server script.

```javascript
data.catalogItemWidget = $sp.getWidget("widget-sc-cat-item");
```

The following example embeds the Cool Clock widget:

**Server script**

```javascript
(function() {
  var coolClockOptions = {
    "zone": "America/Los_Angeles","title": "San Diego, CA"
  };
  data.coolClockWidget = $sp.getWidget('widget-cool-clock', coolClockOptions);
});
```
Widget model properties

When a widget model is called from within another widget, the HTML template, client script, and link function are loaded just as they are in the sp_widget record. The data property is the result of the widget server script execution. Anything that you put on the data object on the server is available in the data object on the client.

<table>
<thead>
<tr>
<th>Property name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_script</td>
<td>string</td>
<td>Widget client script field.</td>
</tr>
<tr>
<td>css</td>
<td>string</td>
<td>Compiled CSS output from the SASS field for the widget.</td>
</tr>
<tr>
<td>data</td>
<td>object</td>
<td>Data object containing keys and values from the widget server script.</td>
</tr>
<tr>
<td>dependencies</td>
<td>array</td>
<td>Any third-party libraries to load before the widget executes.</td>
</tr>
<tr>
<td>options</td>
<td>object</td>
<td>Options used to initialize the widget.</td>
</tr>
<tr>
<td>template</td>
<td>string</td>
<td>HTML template field for the widget.</td>
</tr>
</tbody>
</table>

Embed a widget multiple times with custom options

Embed the cool clock widget multiple times using custom options.

Role required: admin or sp_admin

Create a widget that embeds multiple instances of the cool clock widget, each with a different time zone and title. Open the cool clock widget in the Widget Editor to see widget options referenced in the HTML template and the Client Script.
Cool Clock widget with Options highlighted

1. Clone the Cool Clock widget with the name **Embedded clock**.
2. Replace the code blocks with the following:
Each instance of the clock in the embedded clock widget appears with a different time zone.
Create a widget dependency

In Service Portal, you can link JavaScript and CSS files to widgets to create dependencies between widgets and third-party libraries, external style sheets, and angular modules.

Role required: admin or sp_admin

Dependencies are loaded asynchronously from the server when needed.

Widgets can have as many or as few dependencies as needed. However, the more you add, the more content a widget must download to render on the page. Keep dependencies as small as possible for more efficient load times.

1. Create a dependency package.

   A dependency package is a collection of JavaScript and CSS files that can be then connected to a widget.

   a) Navigate to Service Portal > Dependencies.

   b) In the dependency record, define the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of your dependency. (Useful for selecting a dependency from a dropdown list.)</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the dependency record.</td>
</tr>
<tr>
<td>Include on page load</td>
<td>Select if you want your dependency to be loaded onto the page on the initial page load of Service Portal, or leave unchecked to load the dependency only when the linked widget is loaded onto a page.</td>
</tr>
</tbody>
</table>
2. Add files to the dependency package.

After you save the information for your dependency package, use the related lists to add JS and CSS Include files. For each related list, include the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display name</td>
<td>Name of the script include.</td>
</tr>
<tr>
<td>Source</td>
<td>Depending on whether you add a JS Include or a CSS Include, select one of these options from the list:</td>
</tr>
<tr>
<td></td>
<td>• URL</td>
</tr>
<tr>
<td></td>
<td>• UI script (for a JS Include) or Style Sheet (for a CSS Include)</td>
</tr>
<tr>
<td></td>
<td>For a JS Include, use the UI Script field to reference a UI Script found in System UI &gt; UI Scripts.</td>
</tr>
<tr>
<td></td>
<td>For the CSS Include, use the Style Sheet field to reference a record in the sp_css table.</td>
</tr>
</tbody>
</table>

3. Add a dependency package to a widget.

After you have created a dependency package and added files, create a relationship between the dependency and a widget.

a) Navigate to Service Portal > Widgets and find the widget record you want to add the dependency to.

b) From the Dependencies related list, click Edit.

c) In the slushbucket, find the dependency you created and double-click to add it to the selected items column on the right.

d) Save the page to return to the widget record.

Include a font icon in a single widget

If you only want one widget to have access to a font icon, include the font icon in a single widget.

Role required: admin or sp_admin

Adding an icon to a specific widget keeps the icon scoped and prevents it from interfering with other CSS on the page.

1. In the platform UI, navigate to Service Portal > Widgets, then click the widget you want to add an icon to.

2. Attach the individual icon file to the widget record.

3. In the HTML template, include something like the following:

```html
<div>
  <i class='font-family'>icon_name</i> you did it!
</div>
```
Make sure the class is exactly the same as the font family called out in the CSS. For example `<i class='material-icons'>` should be the same as the `.material-icons` included in the CSS. The `icon_name` should match the name of the file you attached.

4. In the CSS field for the widget, add the CSS for the font-icon definition. Most font-icon sets include a CSS file similar to the material icons one used below. Use the sys_id of the attachment as the `src` in the CSS.
An icon that you can select in the widget or widget instance.

To use custom font-icons across widgets, add the icon to a page or make it a widget dependency.
Include font icons as a widget dependency
You can include font icons wherever a widget is loaded by including them as a widget dependency.

Role required: admin or sp_admin

Note: CSS included as a widget dependency is not scoped and can disrupt other CSS on a page.

1. In the platform UI, navigate to Service Portal > CSS and create a new style sheet.
2. Attach the font-icon set to the sp_css record you created, and use the sys_id of the attachment as the src for the font icon.
3. Navigate to **Service Portal > Dependencies** and create a new dependency.
4. Attach the CSS record you created to the new dependency using the CSS Includes related list.
Internationalize a widget

Use the `$()` or `gs.getMessage()` syntax in widgets to tag strings for translation so you can localize your Service Portal content.

The `$()` or `gs.getMessage()` searches in the messages table (sys_ui_message) in the platform to see what the translation would be.
Use the HTML template to internationalize strings in a widget. Type the following in an HTML template.

```html
<div>
  <p>${This message will be internationalized.}</p>
  <p>However, this will NOT be.</p>
</div>
```

Writing text as `{$message}` is the equivalent of writing `$gs.getMessage("message")` in other parts of the system, but written as a more legible shorthand.

**Note:** In some cases, the translation might have quotes or double quotes on it. That could lead to JavaScript errors if you are using the `$()` syntax in the client script. The safest way to fetch a translated message is to do it in the server script. Then, assign the value to a client-side Angular binding.

### Translating strings in the client script

```javascript
function() {
  var c = this;
  c.message = "${This message will be internationalized}";
}
```

**HTML template:**

```html
<div>
  <!-- The output of this text will be internationalized. -->
  <p>{{c.message}}</p>
</div>
```

### Translating strings in the server script

Use the server script to translate schema options and other values during server-side runtime.

**Server script**

```javascript
function() {
  data.message = gs.getMessage("this message contains 'quotes'");
  // You can also translate schema options using the server script
  // For example, data.message = gs.getMessage(options.title);
}
```

**HTML template**

```html
<div>
  <p>{{c.data.message}}</p>
</div>
```

### Tutorial: Build a custom widget

Follow this tutorial to build a custom widget that displays Service Catalog items. Use this tutorial as a model to help you understand the advanced scripting power of the Service Portal.

In this tutorial, you will create the Quick Order widget. This widget:

- Displays popular items to the user prior to any search.
• Queries the Service Catalog and displays available options to the user.
• Includes an embedded SC Catalog Item widget, allowing the user to view and order items within the Quick Order widget.
• Uses an Angular Provider to display a category icon beside each queried item.

Create a widget and set up a template
Create the Quick Order widget to query items in the Service Catalog.

Role required: admin or sp_admin

1. Navigate to Service Portal > Service Portal Configuration and click Widget Editor.
2. Click Create a new widget.

![Widget Editor](image)

Widget Editor is a development tool that allows you to view an widgets, create new widgets from scratch, and update the varia

- Check out the Hello World Example
- Create a new widget
- Edit an existing widget

3. Define the following values.
   - Widget Name: Quick Order
   - Widget ID: quick_order
   - Create a test page: Active
   - Page ID: quick_order
Adding a widget to a test page creates a record in each of the following tables:

- sp_page
- sp_container
- sp_row
- sp_column
- sp_instance
- sp_widget

**Note:** You can use the Page Editor in Service Portal Configuration to view the hierarchy of elements on your test page.

4. Click **Submit**.
5. From the **Widget Editor**, open the Quick Order widget.
6. Add the following simple template to the HTML field.

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    My catalog results
  </div>
</div>
```

7. Click **Save**.
8. Preview your test page in a new tab using the following URL: `<yourInstanceUrl>/sp?id=quick_order`.

Your widget template displays on the test page.
Add a server script to query an instance table

After adding your widget and creating a basic template, you can define more advanced scripts that enable the user to query data from an instance table. Using client and server scripts, you can pass the data model between the client and server by querying data from the database, displaying it to the user, and sending any updates back to the server.

Role required: admin or sp_admin

1. From the **Widget Editor**, open the Quick Order widget.
2. Select **Server Script** to open the server script field.
3. Replace the default server script with the following custom script.

```javascript
(function() {
  if (input.keywords != null && input.keywords != '')
    data.items = getCatalogItems(input.keywords);

  function getCatalogItems(keywords) {
    var sc = new GlideRecord('sc_cat_item');
    sc.addActiveQuery();
    sc.addQuery('123TEXTQUERY321', keywords);
    sc.addQuery('sys_class_name', 'NOT IN',
 'sc_cat_item_wizard,sc_cat_item_content');
    sc.addQuery('sc_catalogs', 'e0d8b13c3330100c8b837659bba8fb4');
    sc.setLimit(100);
    sc.orderByDesc("ir_query_score");
    sc.query();
    var results = [];
    while (sc.next()) {
      if (!$sp.canReadRecord(sc))
        continue;

      var item = {};
      $sp.getRecordDisplayValues(item, sc, 'name,price,sys_id');
      item.category = sc.getValue('category');
      results.push(item);
    }
    return results;
  }

})()
```

This script performs a keyword search on the sc_cat_item table using the 123TEXTQUERY321 query method.

4. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
    <ul class="list-group result-container">
      <li class="list-group-item" ng-repeat="item in c.data.items">
        <a href>{{item.name}}</a><span class="pull-right">{{item.price}}</span>
      </li>
    </ul>
  </div>
</div>
```

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
This template adds a search field and displays the results of the query performed in the server script using the following Angular directives. To learn more about these directives, review the Angular API Reference.

### Angular directives used in the template

<table>
<thead>
<tr>
<th>Angular directive</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ng-model</td>
<td>Automatically reads and writes value changes to the model variable <code>c.data.keywords</code>.</td>
</tr>
<tr>
<td>ng-model-options</td>
<td>Configures ng-model behavior. In this template, ng-model updates the model after a user has stopped typing for 250 milliseconds.</td>
</tr>
<tr>
<td>ng-change</td>
<td>Executes <code>c.server.update()</code> after the model value changes. This function posts the data object to the server script. After the script is executed, the data object is automatically updated with the new values from the server generated data object.</td>
</tr>
<tr>
<td>ng-repeat</td>
<td>Creates a template from the parent element and child elements. For each <code>item</code> in <code>c.data.items</code>, an instance of the template is created and the expressions <code>{{item.name}}</code> and <code>{{item.price}}</code> are replaced with the values from each item.</td>
</tr>
</tbody>
</table>

5. Add the following script to the **CSS - SCSS** field:

```html
.result-container {
  margin-top: 10px;
}
```

6. Refresh your test page preview to view the changes.

As you type in the search box, matching catalog items appear. Try searching for **ipad**.

### Manage the empty state of a widget

Display a list of popular items to the user before any search terms are entered.

**Role required:** admin or sp_admin

Because no search has been executed when the widget initializes, the server input variable is undefined. This empty state may cause confusion when a user first interacts with the widget. To solve this issue, give your widget something to display when the input variable is empty. This initial data can guide your users when initially interacting with your widget.

1. From the **Widget Editor**, open the Quick Order widget.
2. Replace the existing server script with the following script:

```
(function() {
  if (input.keywords != null && input.keywords != '')
    data.items = getCatalogItems(input.keywords);
  else data.items = getPopularItems();

  function getCatalogItems(keywords) {
    var sc = new GlideRecord('sc_cat_item');
    sc.addActiveQuery();
    sc.addQuery('123TEXTQUERY321', keywords);
    sc.addQuery('sys_class_name', 'NOT IN',
               'sc_cat_item_wizard,sc_cat_item_content');
    sc.addQuery('sc_catalogs', 'e0d08b13c3330100c8b837659bba8fb4');
    sc.setLimit(100);
    sc.orderByDesc("ir_query_score");
    sc.query();
    var results = [];
    while (sc.next()) {
      if (!$sp.canReadRecord(sc))
        continue;
      var item = {};
      $sp.getRecordDisplayValues(item, sc, 'name,price,sys_id');
      item.category = sc.getValue('category');
      results.push(item);
    }
    return results;
  }

  function getPopularItems() {
    var items = [];
    var count = new GlideAggregate('sc_req_item');
    count.addAggregate('COUNT','cat_item');
    count.groupBy('cat_item');
    count.addQuery('cat_item.sys_class_name', 'NOT IN',
                   'sc_cat_item_guide,sc_cat_item_wizard,sc_cat_item_content');
    count.addQuery('cat_item.sc_catalogs',
                   'e0d08b13c3330100c8b837659bba8fb4');
    count.orderByAggregate('COUNT', 'cat_item');
    count.query();
    while (count.next() && items.length < 9) {
      if (!$sp.canReadRecord("sc_cat_item",
                            count.cat_item.sys_id.getDisplayValue()))
        continue; // user does not have permission to see this item
      var item = {};
      item.name = count.cat_item.name.getDisplayValue();
      item.category = count.cat_item.category.toString();
      item.price = count.cat_item.price.getDisplayValue();
      item.sys_id = count.cat_item.sys_id.getDisplayValue();
      items.push(item);
    }
    return items;
  }
})(

This script introduces a new function `getPopularItems()` to query the database and return popular items when the `input` variable is empty.

3. Replace the HTML template with the following script:

```
</div>
```

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
This script provides a template to display the popular items returned from the server script.

4. Refresh your test page preview to view the changes.

The widget displays popular items to the user prior to any search input.

Embed an existing widget

Enable the user to view and purchase Service Catalog items in the Quick Order widget by embedding the SC Catalog Item widget.

Role required: admin or sp_admin

Instead of duplicating code, you can embed widgets to leverage pre-existing functionality. The SC Catalog Item widget is a base system widget that enables the user to view and purchase Service Catalog items.

1. Inspect the SC Catalog Item widget.
Before embedding the SC Catalog Item widget, inspect the widget to understand what data it needs access to. You may need to update your Quick Order widget client or server script to make sure that the correct data is passed to the embedded widget.

a) Navigate to `<yourInstanceURL>/sp_config?id=widget_editor`.

b) Open the SC Catalog Item widget.

c) Note that the widget ID is `widget-sc-cat-item`. You will use this ID to embed the widget model in the client script.

d) Examine the server script.

Notice that the `data` object includes a `sys_id` property populated by either the `input` or `options` objects. If neither `input` nor `options` include a `sys_id`, the `$sp.getParameter()` method retrieves the `sys_id` from the request query string.

```
if (input)
    data.sys_id = input.sys_id;
else if (options.sys_id)
    data.sys_id = options.sys_id;
else
    data.sys_id = $sp.getParameter('sys_id') || $sp.getParameter('sl_sys_id');
```

```javascript
if (!data.sys_id)
    return;

data._attachmentGUID = gs.generateGUID();
var validatedItem = new sn_sc.CatItem('id ' + data.sys_id);
if (!validatedItem.canView())
    return;

data.sc_cat_item = $sp.getCatalogItem(data.sys_id, true);
if (data.sc_cat_item.category) {
    var categoryJS = new sn_sc.Category(data.sc_cat_item.category);
    data.category = {
        name: categoryJS.getTitle(),
        url: '?id=' + data.sc_category_page + '&sys_id=' + data.sc_cat_item.category
    }
}

$sp.logStat('Catalog View', data.sc_cat_item.sys_class_name, data.sys_id, data.sc_cat_item.name);
```
To populate the **input** object, you can pass a catalog item sys_id from the Quick Order widget client script.

2. From the **Widget Editor**, open the Quick Order widget.
3. Replace the Quick Order widget client script with the following script:

```javascript
function($location, spUtil) {
    var c = this;

    c.select = function(item_id) {
        if (c.openItem == item_id) {
            c.openItem = null;
            return;
        }

        renderCatalogItemWidget(item_id);
    }

    function renderCatalogItemWidget(item_id) {
        c.catalogItemWidget = null;
        spUtil.get("widget-sc-cat-item", {sys_id: item_id}).then(function(response){
            c.catalogItemWidget = response;
            c.openItem = item_id;
        });
    }
}
```

This script uses `spUtil.get()` to retrieve the widget model by ID (`widget-sc-cat-item`) and define the `{sys_id: item_id}` object. This object posts to the server script as **input**.

4. Replace the HTML template with the following script:

```html
<div class="panel panel-primary">
    <div class="panel-heading">Request an item from the catalog</div>
    <div class="panel-body">
        <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
        <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
        <ul class="list-group result-container">
            <li class="list-group-item" ng-repeat="item in c.data.items">
                <a href ng-click="c.select(item.sys_id)">{{item.name}}</a><span class="pull-right">{{item.price}}</span>
                <div class="catalog-item" ng-if="item.sys_id == c.openItem">
                    <sp-widget ng-if="c.catalogItemWidget" widget="c.catalogItemWidget" />
                </div>
            </li>
        </ul>
    </div>
    <div class="panel-footer" ng-if="c.data.keywords">
        <ng-pluralize count="c.data.items.length"
            when="{"0": "No items found for ",
                "1": "One item matching ",
                "other": "Found {} items matching "}">
            {{c.data.keywords}}
        </ng-pluralize>
    </div>
</div>
```

This template:
- Adds on-click behavior using the ng-click directive.
- Displays the embedded SC Catalog Item widget using the sp-widget directive.

5. Replace the CSS with the following script:

```css
/result-container {
  margin-top: 10px;
}

/catalog-item {
  background-color: #f5f5f5;
  padding: 10px;
  @include border-top-radius($panel-border-radius);
  @include border-bottom-radius($panel-border-radius);
}
```

6. Refresh your test page preview to view the changes.

When you select a search result, the item opens in the embedded SC Catalog Item widget.

Create a reusable directive and add it to a widget.

Angular Providers are reusable components that can be added to multiple widgets. Using the Widget Angular Providers table, create a directive that shows a category icon next to each result in the Quick Order widget.

Role required: admin or sp_admin

Angular Providers let you build angular directives and services that can be injected into your client script controller. The code in a Provider differs from a typical Angular directive or service because it must be anonymous, without being appended to a specific module.

The Widget Angular Providers table opens.

2. Click **New** to create a new record.

3. Fill out the form.
   a) Add the type and name.
      - **Type**: Directive
      - **Name**: categoryIcon
   
   b) Add the client script.

```javascript
function() {
    return {
        template: '<span class="fa fa-stack fa-lg"><i class="fa fa-circle fa-stack-2x"></i><i class="fa fa-{{::icon}} fa-stack-1x fa-inverse"></i></span>',
        restrict: 'E',
        replace: true,
        scope: {
            category: '='
        },
        link: function(scope, element) {
            var _iconMap = {
                "b06546f23731300054b6a3549dbe5dd8": "tablet", /* Tablets */
                "15706fc0a0a0aa7007fc2lelab70c2f": "question", /* Can we help you? */
                "d68eb4d637b1300054b6a3549dbe5db2": "mobile-phone", /* Mobiles */
                "109c9ff8c6112276003b17991a09ad65": "print", /* Office and Print */
                "5d643c6a3771300054b6a3549dbe5db0": "print", /* Printers */
                "2c0b59b74f7b4200086eed18110c71f": "plug", /* Peripherals */
                "2809952237b1300054b6a3549dbe5dd4": "desktop" /* Software */
            };
            scope.icon = _iconMap[scope.category] || "shopping-cart";
        }
    }
}
```

This script associates the sys_id of the Category record with the Service Catalog item. The icon that displays is the icon defined in the Category record in the Service Catalog.

    "3b09921370313b0054ac4c0e55f568d": "desktop" /* Software */
    }
    var _icon = _iconMap[scope.category] || "shopping-cart";
  }
}
```

Application

Global
c) Click **Save**.

4. **Associate the new Angular directive with the Quick Order Widget.**
   a) Navigate to `<yourInstanceURL>/sp_config?id=widget_editor`.
   b) Open the Quick Order widget.
   c) Under **Related Lists**, select **Angular Providers**.
   d) In the Angular Providers list, click **New** to associate an existing Angular Provider with the Quick Order widget.
   e) Add the following values to the form.
      - **Angular Provider**: categoryIcon
      - **Widget**: Quick Order
   f) Click **Save**.

5. **Add the categoryIcon directive to your Quick Order HTML template.**
   a) From the **Widget Editor**, open the Quick Order widget.
   b) Replace the HTML template with the following script.

```html
<div class="panel panel-primary">
  <div class="panel-heading">Request an item from the catalog</div>
  <div class="panel-body">
    <input class="form-control" type="search" placeholder="Start typing here to search the list of catalog items" ng-model="c.data.keywords" ng-change="c.server.update()" ng-model-options="{debounce: 250}" />
    <h5 ng-if="!c.data.keywords">Showing the most popular items</h5>
    <ul class="list-group result-container">
      <li class="list-group-item" ng-repeat="item in c.data.items">
        <a href ng-click="c.select(item.sys_id)"
           category="item.category" style="margin-right: 10px">
           category-icon
           {{item.name}}
        </a>
        <span class="pull-right">{{item.price}}</span>
        <div class="catalog-item" ng-if="item.sys_id == c.openItem">
          <sp-widget ng-if="c.catalogItemWidget"
                     widget="c.catalogItemWidget" />
        </div>
      </li>
    </ul>
  </div>
  <div class="panel-footer" ng-if="c.data.keywords">
    <ng-pluralize count="c.data.items.length"
                 when="{{0}: 'No items found for ',
                      '1': 'One item matching ',
                      'other': 'Found {} items matching '}">
      {{c.data.keywords}}
    </ng-pluralize>
  </div>
</div>
```

6. **Refresh your test page preview to view the changes.**
   A category icon displays beside each result.
Widget API reference

Service Portal includes client and server side APIs to use in widget client and server scripts.

Service Portal client-side APIs

These are Service Portal APIs that you can use in a widget client controller.
See the API reference for detailed class and method information.

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spAriaUtil</td>
<td>Show messages on a screen reader.</td>
</tr>
<tr>
<td>spContextManager</td>
<td>Make data from a Service Portal widget available to other applications and services in a Service Portal page. For example, pass widget data to Agent Chat when it opens in a Service Portal page.</td>
</tr>
<tr>
<td>spUtil</td>
<td>Utility methods to perform common functions in a Service Portal widget client script.</td>
</tr>
<tr>
<td>spModal</td>
<td>Show alerts, prompts, and confirmation dialogs in Service Portal widgets. The SPModal class is available in Service Portal client scripts.</td>
</tr>
</tbody>
</table>

Note: g_form as a global object cannot be used in a widget client controller or in a UI script.

Service Portal server-side APIs

These are Service Portal APIs that you can use in a widget server script.
<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GlideSPScriptable</td>
<td>Interact with data and perform record operations in Service Portal widgets.</td>
</tr>
<tr>
<td>GlideSPSearchAnalytics</td>
<td>Generates search analytics from custom ServiceNow search widgets.</td>
</tr>
<tr>
<td>spScriptedFacet</td>
<td>Define facet items, filters, or mapped queries for a facets object.</td>
</tr>
<tr>
<td>spScriptedFacetService</td>
<td>Generate a multi choice or single choice facets object for an advanced search source.</td>
</tr>
</tbody>
</table>

**Widget properties**

Global variable and functions available in widget client and server scripts.

**Server script global objects**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>An object containing client-side properties set under c.data. The value is undefined until the client controller calls c.server.update().</td>
</tr>
<tr>
<td>data</td>
<td>An object containing properties set during server-side execution.</td>
</tr>
<tr>
<td>options</td>
<td>An object containing the schema option properties.</td>
</tr>
</tbody>
</table>

**Client script global functions**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>this.server.get([Object])</td>
<td>Calls the server and sends custom input. Returns Promise.</td>
</tr>
<tr>
<td>this.server.update()</td>
<td>Calls the server and posts this.data to the server script. Returns Promise.</td>
</tr>
<tr>
<td>this.server.refresh()</td>
<td>Calls the server and automatically replaces the current options and data from the server response. Returns Promise.</td>
</tr>
</tbody>
</table>

A promise represents the eventual result of an asynchronous operation. For more information on promises, see https://promisesaplus.com/ or AngularJS documentation.

**Widget troubleshooting guide**

Use the following tools to investigate and resolve unexpected behavior in your custom Service Portal widgets.

**Reduce complexity**
Deactivate widgets unrelated to the widget you are troubleshooting to isolate parts of the page that may be causing errors or unexpected behavior. Set the active field to false on a widget record to hide the widget on the page, and prevent associated scripts from executing.

Use the browser developer console

All supported desktop browsers have built in developer tools. Access your browsers developer tools to view console messages and errors thrown by client-side javascript. Many of the logging tools detailed below output information to this console.

Use the widget context menu to access information and options

CTRL+right-click a widget to access configuration options for the widget. There are also options to output the scope and scope data object to the browser console. For more detail on this menu, see Widget context menu.

Use script methods to capture debugging output

Several methods are available to output debugging information within your server and client-side code.

Scripted debugging methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Availability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>console.log()</td>
<td>Server and client</td>
<td>Logs output to the browser developer console.</td>
</tr>
<tr>
<td>$sp.log()</td>
<td>Server</td>
<td>Logs output to the Service Portal Log Entries (sp_log) table, when the logged in user has the sp_admin or admin role.</td>
</tr>
<tr>
<td>gs.log()</td>
<td>Server</td>
<td>Logs output to the Log (syslog) table.</td>
</tr>
<tr>
<td>gs.warn()</td>
<td>Server</td>
<td>Produces warning level output in the Log (syslog) table.</td>
</tr>
<tr>
<td>gs.error()</td>
<td>Server</td>
<td>Produces error level output in the Log (syslog) table.</td>
</tr>
<tr>
<td>gs.addInfoMessage()</td>

<td>Sets a break point in Chrome and Firefox browsers, allowing you to step through a script line by line in the browsers developer console.</td>
</tr>
<tr>
<td>{{data</td>
<td>json}}</td>
<td>HTML</td>
</tr>
</tbody>
</table>

**Check for security restrictions**

Often, widget display issues are caused by access rules rather than the widget script. Verify that any records that are not accessible within a widget are accessible using the platform UI. Use the ACL debugger to ensure that your users have the expected access to records used by your widgets. For more detail on the debugger, see *ACL debugging tools*.

**Create a reference to the widgets scope in the console**

Use reference to a widget to manipulate scope data or manually run the widgets client and server scripts. Use the following steps to create the reference.

- 1. Right-click the widget and choose **Inspect**.
- 2. In dev tools Elements tab, click to highlight the element with attribute `widget=widget`. You can find it a few elements above the currently inspected element. This element points the $0 scripting tool at the widget.
- In the Javascript console, run the following code:

  ```javascript
  var scopeRef = angular.element($0).scope();
  ```

Use the reference to your widget to change data within the console. See the following example. Remember to run AngularJS `$apply()` on the scope to apply changes to the page.

```
scopeRef.data.prop1 = "Pear";
scopeRef.$apply();
```

Run any function defined in the widgets client controller from your reference using the syntax below.

```
scopeRef.exampleFunction();
```

Use the refresh command to manually execute the widgets server script.

```
scopeRef.server.refresh();
```

**Widget diagnostics**

Resolve Service Portal page issues by identifying widget customization levels and checking widget code directly from a portal page.

If a portal page isn’t working as expected, it may be because of a bug in widget code. To diagnose the page, try diagnosing the widgets on the page.

Diagnosing widgets involves:

- Identifying widget customization levels
• Checking the code that is used in each widget

### Identifying customization levels

*Customization levels* describe how widgets have been modified or developed. Identifying the customization level of a widget can help you know which part of the widget code is most important to check. There are four levels of widget customization.

<table>
<thead>
<tr>
<th>Customization level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base system</td>
<td>Base system widget with no modifications, including widgets for which you have set instance options.</td>
</tr>
<tr>
<td>Cloned</td>
<td>Widget that you cloned from a base system widget.</td>
</tr>
<tr>
<td>New</td>
<td>Widget that you created.</td>
</tr>
</tbody>
</table>
| Customized          | Base system widget that you configured in any of the following ways:  
  • Modified the widget code directly  
  • Modified widget option schema  
  • Modified widget dependencies, ng-templates, or Angular Providers |

To identify the customization levels of widgets on a portal page, open the *widget context menu* and select *Show Widget Customizations*. Widgets are color-coded as follows:
- Green – base system widget
- Yellow – cloned widget
- Blue – new widget
- Red – customized widget
Checking the widget code

After you've identified the customization levels of widgets on a portal page, check the code in each widget.

To view the widget code from the portal page, click the information icon (i) on a widget.

From the widget diagnostics window, you can check the widget code in several ways:

- **View a widget record from a portal page**
  
  View and identify potentially problematic code in the widget record without navigating away from the portal page.

- **View related records**
View and identify potentially problematic code in the widget dependencies, Angular Providers, and ng-templates that are being used by the widget.

- **Compare changes to related records**
  Compare an Angular Provider or ng-template against its previous version so that you check if your most recent code changes are causing issues on a portal page.

- **Compare changes to a customized widget**
  Compare your most recent update of a customized widget against the previous version to check if your recent changes are causing issues on a portal page.

- **Compare a customized widget against the base system**
  Identify customizations to a base system widget so that you can revert your customized widgets and resolve issues on a portal page.

### Recommendations for diagnosing widgets

Of the four customization levels, the highest priority issue is customized widgets. These widgets aren't supported in system upgrades. If you're experiencing page issues during an upgrade, it may be because you have a customized widget on your portal page.

To resolve page issues that may be caused by customized widgets, identify which parts of the widget code have been customized. Then revert the code to the original configuration. For more information on identifying these code differences, see **Compare a customized widget against the base system**.

**Tip:** Even if a customized widget is not causing page issues now, you may want to revert to the original widget to prevent issues during upgrades later.

If you're still experiencing page issues after reverting customized widgets, check your new and cloned widgets next.

With a new widget, it's likely that your most recent code changes are causing issues on your portal page. To identify your most recent changes so that you can debug your code, follow the steps in **Compare changes to related records**.

If you cloned a widget prior to a system upgrade, it's likely that the cloned widget didn't receive the same updated code as the base system widget. In this case, it's recommended that you clone the widget again and add your customizations to the clone.

A base system widget is least likely to cause page issues. If you've already checked other widgets and are still experiencing page issues, remove base system widgets from the page and add them again without any widget options set. You can also try adding base system widgets to another page instead.

### Limitations

There are several known limitations using widget diagnostics from a portal page:

- Although you can view and compare widget code, you can't fix or revert code directly. Navigate away from the portal to change the code.

- If you navigate to another portal page while using widget diagnostics, the system disables the tool.

- Because the tool uses color to categorize widgets, it may not be accessible for visually impaired users.
- The widget dependencies that are listed on the portal page reflect only the first-level dependencies. Any dependency that is nested deeper than the first level is not included. To further troubleshoot the widget, check the nested dependencies in the widget record.
- There is no way for the system to track a Widget Dependency after you’ve deleted it.

**View a widget record from a portal page**
View and identify potentially problematic code in the widget record without navigating away from the portal page.

Role required: admin or sp_admin

1. Navigate to a portal page.
2. On the page, open the widget context menu by CTRL+right-clicking any widget.
3. On the widget context menu, click **Show Widget Customizations**.

Widgets are color-coded as follows:

<table>
<thead>
<tr>
<th>Color</th>
<th>Customization level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Base system widget</td>
</tr>
<tr>
<td>Yellow</td>
<td>Cloned widget</td>
</tr>
<tr>
<td>Blue</td>
<td>New widget</td>
</tr>
<tr>
<td>Red</td>
<td>Customized widget</td>
</tr>
</tbody>
</table>

4. On any widget, click the information icon (i).
5. On the window, click **Open widget in platform**.
### Widget Diagnostics

Base system widget with no modifications, including widgets with instance options set.

<table>
<thead>
<tr>
<th>Name</th>
<th>Typeahead Search</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dependencies</td>
<td>None</td>
</tr>
<tr>
<td>Angular providers</td>
<td>None</td>
</tr>
</tbody>
</table>
| Angular templates   | sp-typeahead-popup.html  
|                     | sp-typeahead.html |

A new window opens with a read-only view of the widget record.

**View related records**
View and identify potentially problematic code in the widget dependencies, Angular Providers, and ng-templates that are being used by the widget.

**Role required:** admin or sp_admin

Your widget may be using potentially problematic code from any of the following records:
- Widget Dependencies
- Angular Providers
- Angular ng-templates

---

**Note:** The Open widget in platform button doesn’t appear for all customized widgets. The button appears for customized widgets only if you modified one or more widget dependencies, Angular Providers, or ng-templates.
You can view these related records directly from your portal page to check the code in each record.

1. Navigate to a portal page.
2. On the page, open the widget context menu by CTRL+right-clicking any widget.
3. On the widget context menu, click **Show Widget Customizations**.

Widgets are color-coded as follows:

<table>
<thead>
<tr>
<th>Color</th>
<th>Customization level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Base system widget</td>
</tr>
<tr>
<td>Yellow</td>
<td>Cloned widget</td>
</tr>
<tr>
<td>Blue</td>
<td>New widget</td>
</tr>
<tr>
<td>Red</td>
<td>Customized widget</td>
</tr>
</tbody>
</table>

4. On any widget, click the information icon (ℹ️).
5. On the window, open links to the following related records:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dependencies</td>
<td>JavaScript and CSS files that the widget uses from the Widget Dependencies</td>
</tr>
<tr>
<td></td>
<td>(sp_dependency) table.</td>
</tr>
<tr>
<td>Note:</td>
<td>The widget dependencies listed on this window only reflect the first-level</td>
</tr>
<tr>
<td></td>
<td>dependencies. Any dependency that is nested deeper than the first level is</td>
</tr>
<tr>
<td></td>
<td>not included. To further troubleshoot the widget, check the nested</td>
</tr>
<tr>
<td></td>
<td>dependencies in the widget record.</td>
</tr>
<tr>
<td>Angular Providers</td>
<td>Angular Providers that the widget uses from the Widget Angular Providers</td>
</tr>
<tr>
<td></td>
<td>(sp-angular_provider) table.</td>
</tr>
<tr>
<td>Angular templates</td>
<td>Angular ng-templates that the widget uses from the Angular ng-templates</td>
</tr>
<tr>
<td></td>
<td>(sp_ng_template) table.</td>
</tr>
</tbody>
</table>

Related records that you modified or developed are outlined in red.
## Widget Diagnostics

A base system widget that you configured in one of the following ways:

- Modified the widget code directly
- Modified widget dependencies, ng-templates, or angular providers

### Learn more

<table>
<thead>
<tr>
<th>Name</th>
<th>Announcements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dependencies</td>
<td>angular-ellipsis1</td>
</tr>
<tr>
<td>Angular providers</td>
<td>bmKpiDetails  [Compare]</td>
</tr>
<tr>
<td>Angular templates</td>
<td>None</td>
</tr>
</tbody>
</table>

You can open each related record by clicking the record name.

If you're still unable to diagnose the widget, consider checking nested dependencies or URL dependencies.

**Compare changes to related records**

Compare an Angular Provider or ng-template against its previous version so that you check if your most recent code changes are causing issues on a portal page.

Role required: admin or sp_admin

Your widget may be using potentially problematic code from any of the following records:

- Widget Dependencies
- Angular Providers
- Angular ng-templates

You can compare versions for these related records directly from your portal page to check code changes for each related record.

**Note:** There's no option to compare versions for Widget Dependency records. Also, there's no option to compare versions for related records that you created. You can only compare versions of a base system record that you modified.

1. Navigate to a portal page.
2. On the page, open the widget context menu by CTRL+right-clicking any widget.
3. On the widget context menu, click **Show Widget Customizations**.

Widgets are color-coded as follows:

<table>
<thead>
<tr>
<th>Color</th>
<th>Customization level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Base system widget</td>
</tr>
<tr>
<td>Yellow</td>
<td>Cloned widget</td>
</tr>
<tr>
<td>Blue</td>
<td>New widget</td>
</tr>
<tr>
<td>Red</td>
<td>Customized widget</td>
</tr>
</tbody>
</table>

4. On a widget, click the information icon (i).

Related records that you modified or developed are outlined in red.

**Widget Diagnostics**

Base system widget that you configured in one of the following ways:
- Modified the widget code directly
- Modified widget dependencies, ng-templates, or angular providers

Learn more

<table>
<thead>
<tr>
<th>Name</th>
<th>Announcements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dependencies</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>angular-ellipsis1</strong></td>
</tr>
<tr>
<td>Angular providers</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>bmKpiDetails</strong> [Compare]</td>
</tr>
<tr>
<td>Angular templates</td>
<td>None</td>
</tr>
</tbody>
</table>

5. Next to a Angular Provider or ng-template record, click **Compare**.

The system displays the records of the current and previous versions side by side.
Although both sides are labeled **Version**, the left-side record represents the previous version and the right-side record represents the current version.

6. For each field in which it appears, click the window icon (/png) to open the code comparator.

Your most recent changes to the widget code are highlighted in the code comparator.
Compare two versions

Compare changes to a customized widget
Comparison changes to a customized widget

Compare your most recent update of a customized widget against the previous version to check if your recent changes are causing issues on a portal page.

Role required: admin or sp_admin

The option to compare versions is available only for customized widgets that you modified directly. There’s no option to compare versions of a customized widget for which you modified only the widget dependencies, Angular Providers, or ng-templates.
There's no option to compare versions for new, cloned, or base system widgets.

1. Navigate to a portal page.
2. On the page, open the widget context menu by CTRL+right-clicking any widget.
3. On the widget context menu, click **Show Widget Customizations**.
   Customized widgets are outlined in red.
4. On a customized widget, click the information icon (\(i\)).
5. On the window, click **Compare with previous version**.
   The system displays the widget records of the current and previous widget versions side by side.
<table>
<thead>
<tr>

| Link           |                  |                  |
Although both widget records are labeled **Version**, the left-side record represents the previous version and the right-side record represents the current version.

6. For each field in which it appears, click the window icon ( ◀️ ) to open the code comparator.

Your most recent changes to the widget code are highlighted in the code comparator.
**Compare a customized widget against the base system**

Identify customizations to a base system widget so that you can revert your customized widgets and resolve issues on a portal page.

Role required: admin or sp_admin

The option to compare a widget against the base system version is available only for customized widgets. There's no option to compare a cloned widget against the widget that you cloned it from.

1. Navigate to a portal page.
2. On the page, open the widget context menu by CTRL+right-clicking any widget.
3. On the widget context menu, click **Show Widget Customizations**.
   
   Customized widgets are outlined in red.

4. On any customized widget, click the information icon (i).
5. On the window, click **Compare with Base system widget**.

   The system displays the widget records of the base system and customized widgets side by side.
### Compare two versions

<table>

6. For each field in which it appears, click the window icon () to open the code comparator.

Differences between the code of current and previous widget versions are highlighted.
Service Portal search

Service Portal displays search data within a widget on the search page. To make data searchable from Service Portal, create a search source that fetches data from a single table within your ServiceNow instance, from multiple ServiceNow tables, or from an external site. Configure search options or build custom search components.

Search sources

A search source is a record that describes the behavior and source of searchable data. A search source defines:

- Where to retrieve search data from.
- Whether search suggestions can populate the search field based on user input.
- How a search entry displays in the search result page.

Search sources have simple and advanced configurations.

Simple

Define a table within your ServiceNow instance as a source of searchable data. To learn more, see Define a search source.

Advanced

Define a data fetch script to return data. A data fetch script executes on the server and returns a result array to the search widget. This method is more complex, but offers complete power over how a search executes. You are not limited to querying single tables within ServiceNow and can define a script that fetches data from multiple tables, or from anywhere on the web. To learn more, review the Tutorial: set up an external knowledge base search source.

Note: Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.

Text index groups

A text index group defines how users see search results. For example, combine search results from several sources, or set the weight of certain fields. Text index groups are a Now Platform feature. To learn more, see Configure multiple tables for indexing and searching.

Associate a portal with a text index group to create common search rules and to combine search results from all search sources in the group. If you have a custom search source or portal, consider whether you want to use the base system portal_index_group text index group, or create your own text index group. The base system text index group includes the Catalog items, Knowledge, and Social Q&A Questions tables. When a user searches for an item in Service Portal, they see combined results from these tables. To add an index group to a portal, see Add a text index group to a portal.

Note: Text index groups do not support external search sources.
Typeahead settings

Typeahead returns search results as a user types in the search field. You can configure typeahead settings, or disable the feature entirely, within the search source record.

**Simple**
Define an icon to display beside typeahead results and the target page to display typeahead selections.

**Advanced**
Define a template for the typeahead result. See *Create an advanced typeahead template*.

Search facets

Enable your end users to filter search results for a more meaningful result set. Facets can return results based on:

- Fields in a table such as **Active** or **Author**.
- Query conditions such as **(Updated)(After)(Last week)**.

**Note:** Only set search facets for indexed fields. Fields that are not indexed may take longer to return results and are not optimized for a fast search experience. Learn more: *Enable text indexing for a table*.

Search facets render in the Faceted Search widget on the sp_search page. In new instances, search facets are enabled by default. If upgrading from a previous release, enable search facets by activating a record in the Page Route Maps (sp_page_route_map) table. See *Enable search facets*.

**Simple**
Enable end users to refine search results for a simple search source. You can create facets for a table search source that return results based on field values or query conditions. See *Add facets to a simple search source*.

**Advanced**
Define facets for advanced search sources using the **Facet generation script** on the search source record. Use facet APIs to create facets and assign ServiceNow facet items or mapped queries to the facet.

<table>
<thead>
<tr>
<th>API</th>
<th>Use</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPScriptedFacetService</td>
<td>Creates a single or multi-choice facet.</td>
</tr>
<tr>
<td>SPScriptedFacet</td>
<td>Defines facet items, filters, or mapped queries for the facet.</td>
</tr>
</tbody>
</table>

Search analytics and suggestions

Generate relevant search suggestions for your users and monitor search analytics to understand what your users are searching for and whether they're finding what they need. Search analytics
and suggestions is a Now Platform feature. For more information, see *Search analytics and suggestions.*

**Populate suggestion data on upgrade**

If you are upgrading from a previous release, run a script to populate search suggestions with data from a platform search table to provide search suggestions to your users. For more information, see *Populate search suggestions in Service Portal.*

**Generate suggestions from custom widgets**

By default, the Search Events (sys_search_event) and Search Source Events (sys_search_source_event) tables collect search data from base system search widgets. To generate search analytics from custom Service Portal search widgets, use the GlideSPSearchAnalytics API. For more information, see *GlideSPSearchAnalytics.*

**Use suggestions instead of typeahead search**

Search suggestions replaces typeahead search in Service Portal. Update the glide.service_portal.search_as_you_type_behavior system property to change this behavior. For more information, see *Enable and disable search suggestions.* Service Portal search widgets automatically use whichever feature you enable.

**Search configurations**

When you create a simple search source, Service Portal uses the search engine settings configured on your instance. To learn more, see *Search administration.*

**Performance recommendations**

To avoid performance degradation and to ensure a fast search experience for end users, follow these recommendations.

- Limit search sources when possible to perform only the necessary query. For example, if a search only needs to return active incidents, add a condition to the search source set to *(Active) (is) (true).* A search that queries only active incidents is faster than a search that queries all records in the incident table.
- Create facet items and mapped queries with no more than 30 filter items. To verify, test each search source with a variety of keywords as a user with low permissions.

**Note:** Service Portal search results display as text only. HTML tags, images, and formatting do not display in search results.

**Define a search source**

Configure a basic search source to query data from an instance table, or configure an advanced data fetch script to query data across multiple tables and data sources, or to pull data from anywhere on the web.

1. In the platform UI, navigate to *Service Portal > Portals* and select the portal you want to add search sources to.
2. From the *Search Sources* related list, click *New* to add a search source.
3. Define the fields on the *Search Source* form.
### Search Source form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The display value for the search category.</td>
</tr>
<tr>
<td>ID</td>
<td>The record ID. The value should be unique, and should not include any spaces or special characters.</td>
</tr>
<tr>
<td>Application</td>
<td>The scope of the search source.</td>
</tr>
<tr>
<td>Roles</td>
<td>If the Service Portal User Criteria Support plugin is not enabled, define user roles to access this search source.</td>
</tr>
<tr>
<td>Search page template</td>
<td>The HTML template that displays the search results. If defining a basic search source, you do not need to change the default template. For an example of a modified template, see Tutorial: set up an external knowledge base search source.</td>
</tr>
</tbody>
</table>

4. Complete the fields on the **Data Source** tab.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is scripted source</td>
<td>Adds an advanced data fetch script. If configuring an instance table as the data source, do not check this option.</td>
</tr>
<tr>
<td>Data fetch script</td>
<td>Script defining the endpoint and API calls to fetch data. This field is only visible when Is scripted source is selected. For an example of a data fetch script, see Tutorial: set up an external knowledge base search source.</td>
</tr>
<tr>
<td>Note:</td>
<td>If defining a facet generation script, inject the facets object into the data fetch script and update the script to generate data for each facet item. For an example, see the Knowledge Base and Service Catalog search sources. Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.</td>
</tr>
<tr>
<td>Facet generation script</td>
<td>Script defining search facets for a scripted search source. Enable your end users to filter search results for a more meaningful result set. This field is only visible when Is scripted source is selected.</td>
</tr>
<tr>
<td>Note:</td>
<td>If defining a facet generation script, inject the facets object into the data fetch script and update the script to generate data for each facet item. For an example, see the Knowledge Base and Service Catalog search sources. Search facets may not behave as expected if integrated into an advanced search source that queries data from a non-ServiceNow site.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table from the list that you want to draw your results from. You can select any table in the platform. For example, User (sys_user) or Knowledge (kb_knowledge).</td>
</tr>
<tr>
<td>Note:</td>
<td>Only indexed tables return search results. Learn more: Enable text indexing for a table.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Filters results based on defined conditions. For example, Active is True.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Primary display field</td>
<td>Select which field you want to display on the search results page. For example, Name.</td>
</tr>
<tr>
<td>Display fields</td>
<td>Select additional fields to display on the search results page. For example, User ID, Email, and City.</td>
</tr>
</tbody>
</table>
| Paginate results      | Paginates search results. True by default.  
If Is scripted source is selected, the value updates to false. To enable pagination for a scripted search source, see Paginate search source results.  
Define the maximum number of results per query for the search source in the Search Page widget or Faceted Search widget instance options. |

5. Configure **Typeahead** settings to allow search results to populate the search field based on user input.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable typeahead</td>
<td>Allows typeahead functionality. If you do not want to integrate typeahead into your search source, clear the check box.</td>
</tr>
<tr>
<td>Advanced typeahead config</td>
<td>Optionally add an advanced typeahead script to configure the way search results display. For more information, see Create an advanced typeahead template.</td>
</tr>
<tr>
<td>Typeahead glyph</td>
<td>Adds an icon beside each typeahead result.</td>
</tr>
<tr>
<td>Page</td>
<td>Defines a service portal page to display the selected result. For example, if form is configured, a selected typeahead result opens in a form.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

To enable end users to refine search results, **Add facets to a simple search source**.
Paginate search source results

Limit the number of results that a search source displays at one time to improve performance. End users can load more results as needed.

Role required: admin or sp_admin

If adding pagination to a simple search source, set Paginate results on the search source record to true. However, if adding pagination to an advanced search source, you must also modify the data fetch script to handle multiple pages of results. When a user loads more search results, the search source re-executes the data fetch script.

Note: If paginating a search source with advanced facets, do not modify the facet generation script to load facets based on the results from each page. Facets should enable end users to filter results from an entire result set, rather than page-specific results.

1. In the platform UI, navigate to Service Portal > Search Sources.
2. Open a search source to add pagination to.
3. Set Paginate results to true.
   Enabling this field adds a Load more results button to the search results page. This flag automatically enables pagination for simple search sources.
4. Optional: If the search source is advanced, modify the data fetch script to handle multiple search result pages.
   Update the data fetch script using one of the following GlideRecord APIs, depending on the scope of the search source.

<table>
<thead>
<tr>
<th>Scope</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>setLocation() in GlideRecord</td>
</tr>
<tr>
<td>Scoped application</td>
<td>chooseWindow() in GlideRecord</td>
</tr>
</tbody>
</table>

The following is an example data fetch script for a global search source that queries the incident table and paginates results.

```
// queryLocation is a special value injected into the script, // which holds the query_location property of the last item // in the previously fetched result set
(function(query, queryLocation, count) {
  var results = [];
  var gr = new GlideRecord("incident");
  gr.addQuery("123TEXTQUERY321", query);
  gr.query();
  // Here, we are utilizing queryLocation to implement pagination.
  // In practice, there are many other ways to use the
  // query_location value of the last item in the previous
  // result set to implement pagination. Your implementation
  // will vary by use case.
  gr.setLocation(queryLocation - 1);
  var resultCount = 0;
  while(gr.next() && resultCount < count + 1) {
    results.push(
      label: gr.getDisplayValue(),
      short_description: gr.getValue("short_description"),
      // Here, we are populating the query_location
      // property of each result item. This is how the
      // framework knows what value to pass into the
      // next fetched search result script execution
    );
  }
});
```
query_location: gr.getLocation(),
primary: gr.getDisplayValue(),
state: gr.getDisplayValue("state")
);
resultCount++;
}

if (results.length == 0)
return results;

if(results.length > count) {
results.pop();
} else {
// In order to indicate that a result in the result
// set is the final result (that there are
// no more results to be fetched), add this property
// to the final element in your result set.
results[results.length - 1].isLastResult = true;
}
return results;
})(query, queryLocation, count, facets);

For an additional example, see the Knowledge Base search source.

5. Define the maximum number of results per query for the search source in the Search Page
widget or Faceted Search widget instance options.

The search page only returns the defined number of results at one time. When a user selects Load
more results, the search source re-executes the query or data fetch script.
Create an advanced typeahead template

Configure the way typeahead results display with an advanced template.

1. Complete the required fields in Define a search source.
2. In the Typeahead tab of the Search Source record, select the Advanced typeahead config check box.
3. In the Typeahead template field, add an HTML template.
   This example uses AngularJS bindings to display service catalog images in the typeahead results.

```html
<i class="ta-img" ng-if="match.model.type=='sc'" style="background-image:url('{{match.model.picture}}')"></i>
<i class="ta-img" ng-if="match.model.type=='sc_guide'" style="background-image:url('{{match.model.picture}}')"></i>
```
4. Click Update.

Typeahead results display beside the image defined in the service catalog record.

Tutorial: set up an external knowledge base search source

Define an advanced search source to return data from any source on the Internet. To understand the power of search sources, follow this tutorial to set up an external knowledge base search source.

To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.
In this integration, you will:

- Create a data fetch script that uses the ServiceNow Table API to query a knowledge base from another ServiceNow instance.
- Decode the JSON response and define the fields that the search widget expects.
- Update the search sources HTML template to open the search result in the external site.

1. In the platform UI, navigate to Service Portal > Portals and select the portal you want to add the search source to.
2. From the Search Sources related list, click New.
3. Create a name and ID for the search source. The ID should be unique, and should not include any spaces or special characters.
4. On the Data Source tab, select the Is scripted source check box.
5. Add content to the data fetch script field.

   a) Define the search function to be executed by the instance.

   This example uses a recordless RESTMessage, but you can modify this example to use a pre-configured Outbound REST web service if needed, or create a more secure authentication profile.

   ```javascript
   (function(query) {
     var results = [];
     /* Calculate your results here. */
     var url = "https://myInstance.service-now.com/api/now/table/
      kb_knowledge?sysparm_query=GOTO123TEXTQUERY321%3D" + encodeURI(query) + 
      "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory
      %2Ctext";
     var ws = new sn_ws.RESTMessageV2();
     ws.setBasicAuth("search_user", "search");
     ws.setHttpMethod("get");
     ws.setEndpoint(url);
     var jsonOutput = ws.execute();

     return results;
   })(query);
   ```

   Note: In the preceding example, ws.setBasicAuth requires a user and password for the remote instance. For more detail, see `RESTMessageV2 - Scoped, Global`.

   b) Add an if statement to the data fetch script to decode the JSON object being returned, iterate over each result, and set expected fields.

   The final data fetch script:

   ```javascript
   (function(query) {
     var results = [];
     /* Calculate your results here. */
     var url = "https://<my-instance>.service-now.com/api/now/table/
      kb_knowledge?sysparm_query=GOTO123TEXTQUERY321%3D" + encodeURI(query) + 
      "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
     var ws = new sn_ws.RESTMessageV2();
     ws.setBasicAuth("search_user", "search");
     ws.setHttpMethod("get");
     ws.setEndpoint(url);

     var jsonOutput = ws.execute();
     if (jsonOutput) {
       var results = [];
       /* Calculate your results here. */
       var url = "https://<my-instance>.service-now.com/api/now/table/
      kb_knowledge?sysparm_query=GOTO123TEXTQUERY321%3D" + encodeURI(query) + 
      "&sysparm_fields=sys_id%2Cnumber%2Cshort_description%2Ccategory%2Ctext";
     var ws = new sn_ws.RESTMessageV2();
     ws.setBasicAuth("search_user", "search");
     ws.setHttpMethod("get");
     ws.setEndpoint(url);

     var jsonOutput = ws.execute();
     if (jsonOutput) {
       var results = [];
       /* Calculate your results here. */
   ```
In this example, the following fields are set on the result object:

- **url**: If linking to an external site rather than opening the record in your ServiceNow instance, this defines where the link leads to.
- **target**: The target for the link. Set the target to `_blank` to open results in a new tab, otherwise leave it blank.
- **primary**: The primary field displayed in the search results.

6. Update the search page template to open the search results in the external site.

```html
<div>
<a href="https://myInstance.service-now.com/kb_view.do?sysparm_article={{item.number}}" target="_blank" class="h4 text-primary m-b-sm block">
  <span ng-bind-html="highlight(item.primary, data.q)"/></a>

<span class="text-muted" ng-repeat="f in item.fields | limitTo: 4">
  {{f.label}}: <span ng-bind-html="highlight(f.display_value, data.q)"/>
</span>
</div>
```

7. Click Update.

Test the external search in your portal. Results display under the name field value defined in step three.
Each search result opens in the external site defined in the search page template.
Example: set up a GitHub search source

Set up an advanced search source that queries data from an external site.

To create an advanced search source, you need an external resource that you can access via REST and basic knowledge of AngularJS.

1. In the platform UI, navigate to **Service Portal > Portals** and select the portal you want to add search sources to.
2. From the Search Sources related list, click New.
3. Create a name and ID for the search source.
   The ID should be unique, and should not include any spaces or special characters.
4. On the Data Source tab, select the Is scripted source check box.
5. Add content to the data fetch script field.

   To set up a GitHub integration:

   ```javascript
   (function(query) {
       var results = [];
       /* Calculate your results here. */
       var url = "https://api.github.com/search/repositories?q=" +
       encodeURI(query);
       var ws = new GlideHTTPRequest(url);
       ws.setBasicAuth("YOUR_USERNAME_HERE", "YOUR_PASSWORD_HERE");
       var jsonOutput = ws.get();
       if (jsonOutput) {
           var response = new JSON().decode(jsonOutput.getBody());
           results = response.items;
           results.forEach(function(result) {
               result.url = result.svn_url;
               result.target = "_blank";
               result.primary = result.full_name;
           });
       }
   return results;
   })(query);
   ```

6. Use the Search page template to customize the way the search results display.

   ```html
   <div>
       <div class="pull-right">
           <strong>{{item.language}}</strong>
           <a ng-href="{{item.svn_url}}/stargazers" target="_blank" class="m-l-sm"><span class="fa fa-star m-r-xs"></span>{{item.stargazers_count}}</a>
           <a ng-href="{{item.svn_url}}/network" target="_blank" class="m-l-sm"><span class="fa fa-code-fork m-r-xs"></span>{{item.forks}}</a>
       </div>
       <a ng-href="{{item.svn_url}}" target="_blank" class="h4 text-primary m-b-sm block">
           <span ng-bind-html="highlight(item.full_name, data.q)"></span>
       </a>
       <p>{{item.description}}</p>
       <p>Updated <sn-time-ago timestamp="item.updated_at"></sn-time-ago> ago</p>
   </div>
   ```

Enable search facets

In new instances, search facets are enabled by default. If upgrading from a previous release,
enable search facets by activating a record in the Page Route Maps (sp_page_route_map) table.

Role required: admin or sp_admin

Search facets render in the Faceted Search widget on the sp_search page. To enable search
facets after upgrade, activate the page route map record to route your search results to render in
the sp_search page.

1. Navigate to Service Portal > Page Route Maps.
2. Locate the Search record in the list. This record redirects users from the search page to the sp_search page when viewing search results in Service Portal. The sp_search page includes the Faceted Search widget, which supports search facets in both desktop and mobile environments.

3. Set the Active field to true.

When using search in Service Portal, results render in the sp_search page. Add facets to the search source to enable end users to filter search results. To learn more about facets, see Add facets to a simple search source.

Add facets to a simple search source

Enable end users to refine search results for a simple search source. You can create facets for a table search source that return results based on field values or query conditions.

Role required: admin or sp_admin

In new instances, search facets are enabled by default. If upgrading from a previous release, enable search facets by activating a record in the Page Route Maps (sp_page_route_map) table. See Enable search facets. Create facet items and mapped queries with no more than 30 filter items. To verify, test each search source with a variety of keywords as a user with low permissions.

Note: Only set search facets for indexed fields. Fields that are not indexed may take longer to return results and are not optimized for a fast search experience. Learn more: Enable text indexing for a table.

1. Navigate to Service Portal > Search Sources.
2. Open or create a simple search source.
   Simple search sources do not use a data fetch script. Rather, they define a table as the source of searchable data. To learn more about search sources, see Service Portal search.
3. Select the Facets related list.
4. Click New.
   The Facet form displays.
5. Complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name of the facet header.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the search source. This value is read-only.</td>
</tr>
<tr>
<td>Selection type</td>
<td>Type of user selection allowed:</td>
</tr>
<tr>
<td></td>
<td>• Single: Only one filter value can be selected at a time. For example, if a facet is created for the Assigned to field, the end user can select Fred Luddy or Beth Anglin, but not both at the same time. Before filtering for a new value, the user must first clear the current value.</td>
</tr>
<tr>
<td></td>
<td>• Multiple: Multiple filter values can be selected at the same time. For example, if a facet is created for the Assigned to field, the end user can select both Fred Luddy and Beth Anglin. Because multi choice results in an OR query, records assigned to either Fred Luddy or Beth Anglin display.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the filter option displays in search results.</td>
</tr>
</tbody>
</table>
Use mapped facet filters
Maps a facet to a query condition, such as `(Updated)(After) (Last week)`. When selected, the **Fields** and **Sort** fields are removed from the form. After saving, define filters in the Facet Filters related list.

Order
Defines the display order when multiple facets are defined. If some facets do not have an order value defined, facets with an order defined display first. Facets without an order defined are displayed alphabetically.

Table
Table that the query is created for. This value is read-only and defined by the table used in the search source.

Field
Field that end users can filter search results by. For example, if **Active** is selected, the user can filter search results by true or false. Only fields of the following types are supported: True/False, Choice, Decimal, Floating Point Number, Integer, IP Address, Long, Reference, String, String (Full UTF-8), and URL.

Sort
Determines the order in which filter options display.
- **Ascending**: Sorts filter options from A to Z when alphabetical, and from lowest to highest when numerical. This is the default option.
- **Descending**: Sorts filter options from Z to A when alphabetical, and from highest to lowest when numerical.

6. Save the record.
   If **Use mapped facet filters** is selected, the **Facet Filters** related list appears in the facet form.

7. Optional: If **Use mapped facet filters** is selected, define facet filters. Map facet filters map a query condition to a facet label. When the end user selects the label from the facet list, the defined query executes.
   a) In the **Facet Filters** related list, click **New**. The Mapped Facet Form appears.
   b) Define the facet filter fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Display name of the facet filter option.</td>
</tr>
<tr>
<td>Order</td>
<td>Defines the display order when multiple facet filters are defined. If some facet filters do not have an order value defined, facets filters with an order defined display first. Facet filters without an order defined are displayed alphabetically.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope of the search source. This value is read-only.</td>
</tr>
<tr>
<td>Facet</td>
<td>The search facet that uses the mapped query. This value is read-only.</td>
</tr>
<tr>
<td>Table</td>
<td>The table defined in the search facet. This value is read-only.</td>
</tr>
<tr>
<td>Mapped query</td>
<td>A query condition that users can set to filter search results. For example, <code>(Updated)(On)(Today)</code></td>
</tr>
</tbody>
</table>

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
c) Click **Submit**.

Users can filter search results based on the query defined.

**Disable facets for a search source**

Disable facets for one or more search sources by adding a system property. Once disabled, the search source does not display search facets in the Faceted Search widget on the sp_search page. You can disable facets for simple or advanced search sources.

Role required: admin or sp_admin

1. Enter `sys_properties.list` in the Application Navigator to navigate to the System Properties table.
2. Click **New**. The System Property form opens.
3. In the **Name** field, enter `glide.service_portal.disable_facets_for_search_sources`.
4. In the **Value** field, enter a comma-separated list of search source Sys IDs to disable facets for. Do not include spaces. For example, `c6170ae86721220023c82e08f585efe6,c96eb1686721220023c82e08f585efff`.
5. Click **Submit**.

Facets do not display when the defined search source is selected in the sp_search page.

**Populate search suggestions in Service Portal**

If you are upgrading from a previous release, run a script to populate search suggestions with data from a platform search table to provide search suggestions to your users. Alternatively, you can wait until users search for keywords instead of running this script.

Role required: admin

In new instances, the search suggestions are enabled by default. In upgraded instances, you must enable the search suggestions. For more information, see **Enable search suggestions**.

The Now Platform collects search data and analytics that generate search suggestions. If you are upgrading from a previous release, the search analytics do not contain any data yet. To immediately provide suggestions to your users, you can populate the search suggestions using data from either the Text Searches (text_search) table or the Service Portal Log Entries (sp_log) table. The Service Portal Log Entries table includes search data from Service Portal only and may take less time to populate search suggestions. The Text Search table includes search data from the entire platform.

Search suggestions improve over time as more people use Service Portal. Search analytics and suggestions is a Now Platform feature. For more information, see **Search analytics and suggestions**.

**Caution:** Populating search suggestions can be a resource-intensive task that may take a while to complete. Do not run this script during peak hours. Populating search suggestions is not supported on domain-separated instances.

1. Navigate to **System Definition > Scheduled Jobs**.
2. Open the **Populate Suggestions to avoid Cold Start - Portals** scheduled job.
3. Modify the script for your search implementation.
a) Define which portals the suggestions apply to. By default, the script populates suggestions in the base system service portal, but you can add as many as you want to the array.

```javascript
var portals = ["Service Portal"];  
```

b) Change where the data comes from. By default, the script imports data from the Text Searches (text_search) table, but you can change the source table to the Service Portal Log Entries (sp_log) table. The Service Portal Log Entries only saves records from the last 90 days.

```javascript
var searchLogTable = "text_search";
```

c) Push data to any custom search sources in your instance. Suggestions are not enabled for external search sources. You must push data to both the search source name and the Sys ID.

For example, push text searches from the Incident table to your custom Incident search source. For more information about custom search sources, see Define a search source. By default, the system pushes text searches from the Catalog, Knowledge, and Social Q&A Questions tables to the respective search sources.

Add the following code after line 11 in the script for each of your custom search sources.

```javascript
searchSources.push("<search-source-table-name>");
searchSourceIds.push("<search-source-sys-id>");
```

If the search source table does not exist, the system does not push suggestions to that search source.

d) Save the record.

Make sure that the script includes the configuration you need. You can only run the script once.

4. Activate the record and select Execute Now.

Running this scheduled job populates the Search Events (sys_search_event), Search Source Events (sys_search_source_event), and Search Suggestions (sys_search_suggestion) tables.

Users see suggestions when they start typing in a Service Portal search widget.

**Add a text index group to a portal**

Define how users see search results. For example, combine search results from several sources, or set the weight of certain fields.

Role required: admin

If you have a custom search source or portal, consider whether you want to use the base system portal_index_group text index group, or create your own text index group. The base system text index group includes the Catalog items, Knowledge, and Social Q&A Questions tables. When a user searches for an item in Service Portal, they see combined results from these tables.

**Note:** Index tables before adding them to a text index group. To learn more about text indexing, see Enable text indexing for a table.

Text index groups are a Now Platform feature. To learn more, see Configure multiple tables for indexing and searching.
Note: Text index groups do not support external search sources.

1. Navigate to **Service Portal > Portals**.
2. Open the portal that you would like to add a text index group to.
3. Configure the form to add the **Text Index Group** field.
4. Add the text index group you want to the **Text Index Group** field.

Search results display according to the text index group’s rules.

**Set the default portal search source**

Use the `glide.service_portal.default_search_sources` system property to define default search sources.

Role required: admin

If you don’t define specific search sources for your portal, the system uses default search sources instead.

---

**Default search source flow chart**

1. In the Navigation filter, enter `sys_properties.list`.
   The entire list of properties in the System Properties (sys_properties) table appears.
2. On the list, find the system property `glide.service_portal.default_search_sources`, and then open the property record.
3. Copy the sys_ID of any search source you want to add into the **Value** field of the system property using a comma-separated list.
To change the order in which the default search sources show in the Search List, change the order of the IDs in the property.
You can remove the default search source behavior by deleting the property value or deleting the property altogether.

4. Click Update.

**Configure Search Sources available on a page**

Use contextual search to limit search results for an instance of the type-ahead search widget.
With contextual search enabled, users only see type-ahead results for specific search sources. For example, searching on the Service Catalog page only shows results from the Service Catalog search source when contextual search is enabled.

1. In the Service Portal Designer (Service Portal > Service Portal Configuration > Service Portal Designer, find an instance of the type-ahead search widget.

2. Point to the widget and click the edit icon ( ).
Alternatively, in any preview page containing the type-ahead search widget, for example the Service Catalog homepage, control + right-click to open the widget context menu. Then click Instance Options.

3. In the Contextual Search Sources field, select search sources from the list.
   Search sources listed for contextual search can be limited to just one, several, or all search sources.

   Default search sources are defined in the glide.service_portal.default_search_sources property, so even if you do not have search sources configured, type-ahead search widget still shows type-ahead suggestions. For more information on default search sources, see Set the default portal search source.

**Service Portal announcements**

Use announcements to broadcast messages to Service Portal users. Announcements can display in an announcement banner or an announcement widget instance.

Announcements are active on new instances. To activate announcements after upgrade, you can activate the Service Portal Announcements plugin (com.glide.service-portal.announcements).

When creating announcements, you can define the way an announcement displays.

**Sort order**

Announcements are displayed depending on the order defined in:

- The glide.service_portal.announcement.default.sort_order system property. See Service Portal properties.
- The Display First field in the announcement record.

If there is a tie between two records set to Display first, the sort order defined in the system property is honored.

**Display location**
Announcements can display in the following locations:

- Announcement banner
- Announcements widget instance
Email server down
We are aware of the issue and are taking steps to correct it.
To define the announcement display location, define the announcement type in the announcement record.

**Display Style**

Using display styles, you can:
- Create a custom color scheme.
- Change the text alignment.

Announcements that appear in a banner use the display style defined in the Announcement record by default. To use the display style in an instance of the Announcements widget, you can select the **Use Display Style** instance option.

**User criteria**

If user criteria is set up for the Service Portal, you can define who can and who cannot view an announcement. Through user criteria, you can create announcements only visible to specific users, groups, roles, organizations, and more.

**Create an announcement**

Announcements display as a banner in a Service Portal or within the announcements widget.

Role required: admin, sp_admin, or announcement_admin

1. Navigate to **Service Portal > Announcements**. The Announcements table (announcement) displays all announcements.
2. Click **New**.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal title that does not display in the announcement.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the announcement is active. Inactive announcements do not display.</td>
</tr>
<tr>
<td>Title</td>
<td>The display title of the announcement.</td>
</tr>
<tr>
<td>From</td>
<td>Date and time the announcement begins to display.</td>
</tr>
<tr>
<td>To</td>
<td>Date and time the announcement ends. If this field is not defined, the announcement continues to display until it is deactivated.</td>
</tr>
<tr>
<td>Summary</td>
<td>The display text of the announcement.</td>
</tr>
<tr>
<td>Display style</td>
<td>Defines the background color, text color, and text alignment of banner announcements. Base system styles include:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Normal</strong>: Blue background and left-aligned, white text. This is the default style.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Urgent</strong>: Red background and left-aligned, white text.</td>
</tr>
</tbody>
</table>

Announcements that appear in a banner use the display style defined in the Announcement record by default. To use the display style in an instance of the Announcements widget, you can select the **Use Display Style** instance option.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Defines where an announcement displays. By default, announcements display in the following locations:</td>
</tr>
<tr>
<td></td>
<td>· <strong>Banner</strong>: Announcement banner above the banner frame in the Service Portal.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Widget</strong>: Instance of the announcements widget.</td>
</tr>
<tr>
<td></td>
<td>You can create an announcement type to define other widget instances to display an announcement.</td>
</tr>
<tr>
<td>Glyph</td>
<td>Glyph to display to the left of the title in banner announcements.</td>

<td>· <strong>URL in current browser tab</strong>: Opens a URL in the current browser tab.</td>
</tr>
<tr>
<td></td>
<td>· <strong>URL in new browser tab</strong>: Opens a URL in a new browser tab.</td>
</tr>
<tr>
<td></td>
<td>If the <strong>Details link text</strong> field is blank and a click target is defined, the title of the announcement is the link.</td>
</tr>
<tr>
<td>Details page</td>
<td>The page that opens in the current browser tab. Available if the <strong>Click target</strong> is <strong>Page</strong>.</td>
</tr>
<tr>
<td>Details URL</td>
<td>The URL that opens in the current or new browser tab. Available if the <strong>Click target</strong> is URL in current browser tab or URL in new browser tab.</td>
</tr>
<tr>
<td>Details link text</td>
<td>Link text for the page or URL click target. If this field is blank and a click target is defined, the title of the announcement is the link.</td>
</tr>
<tr>
<td>Dismiss options</td>
<td>Determines whether the user can dismiss the announcement. Options include:</td>
</tr>
<tr>
<td></td>
<td>· <strong>User can dismiss</strong> - no redisplay</td>
</tr>
<tr>
<td></td>
<td>· <strong>User can dismiss</strong> for current session only</td>
</tr>
<tr>
<td></td>
<td>· <strong>User cannot dismiss</strong></td>
</tr>
<tr>
<td>Portals</td>
<td>Portals that display the announcement. If this value is not defined, the announcement displays in all portals.</td>
</tr>
</tbody>
</table>

4. Save or submit the record.
5. Optional: If User criteria for Service Portal is set up and Public is not selected, you can define user criteria for the announcement record. Announcements only display to users that pass the access criteria.

6. Update the record.

If the Type is Banner, test your announcement by navigating to the portal defined in the Portals field. If the Type is Widget or a custom type, test your announcement by navigating to the page with the associated widget instance.

Create an announcement display style

Define the background color, foreground color, and text alignment of an announcement.

Role required: admin, sp_admin, or announcement_admin

1. Navigate to Service Portal > Announcements.
2. Open an existing announcement or create a new announcement.
3. In the Display style field, click the reference lookup icon to open the referenced table. The Announcement Styles [announcement_style] list view opens.
4. Click New to create a new display style.
5. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Internal name of the display style.</td>
</tr>
<tr>
<td>Application</td>
<td>The application scope of the announcement. This value is read-only.</td>
</tr>
<tr>
<td>Background color</td>
<td>Color name or HEX value in the format #000000 for the announcement background.</td>
</tr>
<tr>
<td>Foreground color</td>
<td>Color name or HEX value in the format #000000 for the announcement text.</td>
</tr>
<tr>
<td>Alignment</td>
<td>Text alignment. Options include:</td>
</tr>
<tr>
<td></td>
<td>· Left align</td>
</tr>
<tr>
<td></td>
<td>· Center align</td>
</tr>
</tbody>
</table>

6. Click Submit.

By default, the announcement appears in both the portal banner and the Announcements widget, but only the banner uses your new display style. You can configure the widget to use the display style also. For more information, see the instance options in Announcements widget.

Create an announcement type

Announcement types determine where an announcement displays. Announcements include two base system types: banner and widget.

Role required: admin, sp_admin, or announcement_admin

Similar to creating a category tag, you can create alternative types to define custom locations. For example, to display an announcement only in a specific widget instance, you can create an announcement type for that widget instance. Any announcements tagged with that type will only display in the desired widget instance.

1. Navigate to System Definition > Tables > Announcement Consumer Type. The Announcement Consumer Type table (announcement_consumer_type) opens.
2. In the Columns section of the form, Click **New**.
3. Define a **Name**. The name is used to associate an announcement with a widget instance.
4. Click **Save**.
5. Add the custom type to an announcement.
   a) Navigate to **Service Portal > Announcements**.
   b) Open an existing announcement or create a new announcement.
   c) In the **Type** field, select the custom type.
   d) Click **Save**.
6. If using the type in a widget, define the type as a widget instance option.
   The announcement banner only displays announcements tagged with the **Banner** type.
   a) Navigate to an instance of the Announcement widget.
   b) Control + right-click the widget instance and select **Instance Options**.
   c) In the **Type** field, select the custom announcement type.

The widget instance associated with the type displays any announcements tagged with the same type.

**Service Portal security**

Control user access to a portal.

Control who accesses your portal and what they can see in the following ways:

- **Authentication**: Configure login and single sign on for users
- **Limit page access by role**: Use roles to limit the users who can see a page.
- **Public pages**: Use the public check box on a page record to make the page publicly accessible.

*Note: A number of portal pages that are installed by default are marked public. Filter your list of Service Portal pages for Public (is) true to identify these pages. Setting the Public value to false will prevent these pages from being publicly available.*

- **User criteria**: For a more advanced way of limiting user access, create and apply user criteria to pages, widgets, widgets instances, and search sources.
- **Multifactor authentication**: If an instance is configured to require multifactor authentication, users are automatically directed to set up multifactor authentication upon initial login. For setup instructions, see [Set up multifactor authentication upon initial login](#). If multifactor authentication is optional, users can still enable or disable authentication from their user profile. For setup instructions, see [Set up multifactor authentication on your own profile](#).

**Single sign-on, logins, and URL redirects**

Service Portal uses a combination of system properties and script includes to determine how the system handles URL redirects for users logging in to the portal.

Only users who understand SSO, URL redirects, and the Now Platform should make any changes.
Single sign-on and Service Portal

To use single sign-on with Service Portal, you must enable the Integration - Multiple Provider Single Sign-On Installer plugin (com.snc.integration.sso.multi.installer).

If you are using the system property to automatically redirect to your primary IdP, then Service Portal automatically redirects to that IdP. If you have multiple identity providers, Service Portal shows a link on the login page to **Use external login**. For more information on SSO and authentication in the platform, see *External single sign-on (SSO)*.

Require authentication for a Service Portal page

If you want to require authentication for a Service Portal page, ensure that the **Public** flag on the page record is not selected. For more information, see *Create and edit a page using the Service Portal Designer*. If a user navigates to a non-public page, they are redirected to the login page for the requested portal.

Because every page request is routed through the $sp page, this page must be public. The following values in the Public Pages sys_public table define the page as public:

- **Page**: $sp
- **Active**: true

Configure the Service Portal login page

Administrators can configure a login page URL redirect for a portal.

1. **Add a system property** with the following settings:
   - Name: glide.entry.page.script
   - Type: string
   - Value: `new SPEntryPage().getLoginURL()`

2. To customize the actual entry page, from the Script Includes table, search for **SPEntryPage**.

   **Note**: If you make changes to the script include, it won’t be upgraded with future updates.

3. Edit the script on the SPEntryPage to change the assigned portal to the portal_suffix you want. SPEntryPage uses `/sp/` as the portal path to redirect to. Enter your own portal_suffix in place of `sp`.

   ```javascript
   SPEntryPage.prototype = {

   initialize: function() {
     this.logVariables = false; // for debugging
     this.portal = "\sp\"; // The URL suffix specified in the sp_portal record
   },
   
   **Note**: The slash character (/) after `/sp` may cause issues when configuring single sign-on. If you’re experiencing issues, try removing the character from the script.
Redirect to Service Portal after login

Use system properties and script includes to conditionally redirect users to a page after logging in. Follow these steps to redirect a user to Service Portal after they log in.

1. In the `sys_properties` table, add the following property:

<table>
<thead>
<tr>
<th>Property</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.entry.first.page.script</td>
<td>string</td>
<td>new SPEntryPage().getFirstPageURL()</td>
<td>First page after authentication</td>
</tr>
</tbody>
</table>

`getFirstPageURL` primarily does the following:

- Redirects to `login_redirect.do` in order to break out of the frameset (if there is one).
- Redirects to Service Portal if the user has no roles, or the full platform for everyone else.

2. Customize the after login behavior by navigating to the `SPEntryPage` script include.

**Note:** If you make changes to the script include, it won’t be upgraded with future updates.

**Note:** If you are using external authentication, ensure that your IdP supports the RelayState URL parameter. This parameter retains the originally requested URL while the user authenticates, and is necessary for redirection after login.

Debug Service Portal URL redirects

Debug the URL redirects for logging in to Service Portal and redirecting to the first page.

To view debug output from `SPEntryPage` and see the session variables it redirects based on:

1. Make sure the system property `glide.entry.first.page.script` has the value: `new SPEntryPage().getFirstPageURL()`.
2. From the `SPEntryPage` script include, set `this.logVariables = true`.
3. In a separate browser, log in.
4. From the system navigator, view the log output by navigating to System Logs > System Log > All.

Configure page security by role

Set up pages to be public or filter them by role.

Role required: admin or sp_admin

Public pages won’t require a user login; anyone can access them. All other options require user authentication.

1. In the Service Portal configuration page (Service Portal > Service Portal Configuration), open the Page Editor.
2. In the Select Page list, search for the page to apply page security to.
3. Select the highest level node in the tree view.
4. Configure page security.
• To make a page public, select the **Public** check box. All users can access pages marked as **Public**.

• To limit access to a certain role, add roles in a comma separated list. Users without the role listed can see links to the page if they appear in the portal. Trying to open the page results in a ‘page not found’ error.

  **Note:** If you select **Public** and add a list of roles, the page is still accessible by any user.

• To create a draft page that only administrators can see while the page is still in development, select **Draft**. Users must have the admin role to see any pages in draft. Everyone else sees a ‘page not found’ error.

5. Click **Save**.
Follow the steps in *Configure widget security* to configure security for the widgets on your page.

**Configure widget security**

Configure widget security to ensure that your widget is being accessed only by the intended audience.

**Role required:** admin or sp_admin

There are several ways to configure widget security:

- Make the widget public to unauthenticated users
- Make the widget accessible to any user with a login
- Make the widget accessible to certain roles only

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
When you configure widget security, configure the page security accordingly so that users can access the widget via the page on which it appears. For more information, see *Configure page security by role*.

1. Navigate to *Service Portal > Widgets*.
2. Open the record of the widget to configure.
3. On the form, configure the widget security.

<table>
<thead>
<tr>
<th>Option</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Make the widget public to unauthenticated users</td>
<td>Select the <em>Public</em> check box.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If you select <em>Public</em> and add a list of roles, the widget is still accessible by any user.</td>
</tr>
<tr>
<td>Make the widget accessible to any user with a login</td>
<td>Clear the <em>Public</em> check box and leave the <em>Roles</em> field blank.</td>
</tr>
<tr>
<td>Make the widget accessible to certain roles only</td>
<td>1. Clear the <em>Public</em> check box.</td>
</tr>
<tr>
<td></td>
<td>2. Next to <em>Roles</em>, click the edit icon ( ).</td>
</tr>
<tr>
<td></td>
<td>3. On the Roles window, select a role by moving it from the <em>Available</em> list to the <em>Selected</em> list.</td>
</tr>
<tr>
<td></td>
<td>4. Click <em>Done</em>.</td>
</tr>
</tbody>
</table>

4. Click *Update*.

**User criteria for Service Portal**

User criteria enables you to allow access to users based on role, department, group, location, or company. Administrators can control access to pages, widgets, widget instances, announcements, and search sources in a portal by creating and applying user criteria.

User criteria records define conditions that are evaluated against user records. When user criteria is defined, portal records are only visible to users who pass the defined conditions.

User criteria is a platform feature used in Service Portal. Learn more about user criteria in the Now Platform:

- Service Catalog: *Set security for items and categories*.  
- Knowledge management: *Control access at the knowledge base level through user criteria*.

**Important:** After making user criteria additions or changes, you may need to log out and back in to clear the prior configuration.

**Converting role-based permissions to user criteria records**

User criteria in Service Portal replaces role-based permissions. After activating the user criteria for Service Portal plugin, you must *Set the user criteria for Service Portal system property to true*. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to *false*.
User criteria checks

User criteria uses the following checks in Service Portal to verify user access.

Page access user criteria

The following diagram shows how the system decides whether a user can access a page based on user criteria.
Widget access user criteria

The following diagram shows how the system determines whether a user has access to a particular widget or widget instance.
Activate the user criteria for Service Portal plugin

You can activate the Service Portal User Criteria Support plugin (com.glide.service-portal.user-criteria) if you have the admin role.

Role required: admin

1. Navigate to System Definition > Plugins.
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.
   
   **Note:** To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   - If you’re certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.

   ![Activate Plugin dialog box](image)

   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.
        If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.
4. If demo data is available and you want to install it, click **Load demo data**.

Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.

5. Click **Activate**.

---

**Set the user criteria for Service Portal system property**

After activating the Service Portal User Criteria Support plugin, you must set the system property to true.

**Role required:** admin

Setting the system property activates user criteria for Service Portal. When the system property is set to true, any existing roles defined for a page, widget, or search source are automatically converted into user criteria records. To disable user criteria and continue using role-based permissions, set the system property to false.

1. Navigate to **Service Portal > Properties**.
2. Click the check box to set the following property to true.

**Enable use of User Criteria records instead of Roles fields for Service Portal entitlements**

Defines permissions for Service Portal widgets, widget instances, search sources and pages

- Yes | No

3. Click **Save**.

---

**Create a user criteria record for Service Portal**

Create a user criteria record to apply to items in Service Portal and control user access to pages, widgets, widget instances, and search sources.

You can **apply existing user criteria** to records in Service Portal through Service Portal configuration (**Service Portal > Service Portal configuration**). You can only create user criteria within the platform UI.

1. In the navigation filter, type **Service Portal**.
2. Select a page, widget, or widget instance record.
3. In the related list at the bottom of the record, select the **Can View** or **Cannot View** tab, then click **New**. If a user criteria record is already created, you can click **Edit** to apply user criteria to the page, widget, or widget instance.

User criteria records are stored in the user_criteria table.
4. Complete the fields on the form, as appropriate.

**Service Portal User Criteria**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the criteria record.</td>
</tr>
<tr>
<td>Users</td>
<td>User records to match access criteria.</td>
</tr>
<tr>
<td>Groups</td>
<td>Group records to match access criteria.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles to match access criteria.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Displays or hides the Script field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Script</td>
<td>Defines any additional criteria, and returns true or false. This field is available only if Advanced is selected.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>• Because scripts are evaluated dynamically, including scripts in user criteria records can decrease performance.</td>
</tr>
<tr>
<td></td>
<td>• Do not use a function with its name as answer, that is, answer().</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the user criteria record.</td>
</tr>
<tr>
<td>Active</td>
<td>Activate or deactivates this criteria record.</td>
</tr>
<tr>
<td>Companies</td>
<td>Companies to match access criteria.</td>
</tr>
<tr>
<td>Locations</td>
<td>Locations to match access criteria.</td>
</tr>
<tr>
<td>Departments</td>
<td>Departments to match access criteria.</td>
</tr>
<tr>
<td>Match All</td>
<td>Determines whether all elements from each populated criteria field must match. If selected, only users who match all criteria are given access. If cleared, the user must meet one or more of the set criteria to be given access. By default, this check box is cleared so that any condition met provides a match. For example, consider a user criteria record for the following: • Locations A or B • Company C or D With <strong>Match All</strong> selected, only users meeting all these conditions are matched. For example, a user with a location A and a company C. With <strong>Match All</strong> cleared, users meeting any of these conditions are matched. For example, a user with a location B. <strong>Note:</strong> If you select <strong>Match All</strong>, ensure that you do not create contradictory conditions that can never be met. For example, if all users in location A work for company G, then the conditions in this example can never be met.</td>
</tr>
</tbody>
</table>
Apply user criteria to a page, widget, or widget instance

Assign user criteria to pages, widgets, or widget instances to limit user access to content in a portal.

Activate the Service Portal User Criteria Support (com.glide.service-portal.user-criteria) plugin and set the glide.service_portal.user_criteria_enabled system property to true.

Role required: admin or sp_admin

You can apply several user criteria records to a single portal item.

1. In the Service Portal Configuration page (Service Portal > Service Portal Configuration), open the Page Editor.
2. Select a page from the list.
3. Select a page, widget, or widget instance node from the page tree.
4. Under related lists, click Who Can View or Who Cannot View.
5. Click New.
6. Select a criteria from the Can View or Cannot View list.

Selecting criteria from the Can View or Cannot View list applies user criteria records created in Create a user criteria record for Service Portal to the selected page, widget, or widget instance.
7. Click **Save**.

**Apply user criteria to a search source**

Assign user criteria to search sources to limit user access to content in a portal.

Role required: admin

You can add user criteria to custom or default **Service Portal search**.

1. In the Service Portal Configuration page (**Service Portal > Service Portal Configuration**), navigate to **Portal Tables > Search Source** in the header menu.
Service Portal
Create rich, engaging and modern experiences to help your business run. Select one of the options below to continue.

**Branding Editor**
Customize your portal's title, logo and theme colors. Preview changes as you make them.

**Designer**
Create and layout pages with drag-and-drop functionality. Preview pages as you make changes.

**Page Editor**
Configure the properties of pages, containers and widgets from a map view.

**Widget Editor**
Create widgets from scratch or customize an existing one. Write HTML, CSS, and JavaScript with real-time preview.

**Search Source**
- Service Portal
- Service Portal Documentation
- Service Portal Log Entry
2. Open the search source record that you would like to modify.
3. Under related lists, click Who Can View Search Sources or Who Cannot View Search Sources.
4. Click New.
5. Select a criteria from the Can View or Cannot View list.

Selecting criteria from the Can View or Cannot View list applies user criteria records created in Create a user criteria record for Service Portal to the selected search source.

6. Click Save.

Enable e-signature for Service Portal

You can configure e-signature in Service Portal to require re-authentication from approving users.

Role required: admin

1. Activate the Approvals with e-Signature (com.glide.e_signature_approvals) plugin.
2. Navigate to System Definition > e-Signature Registry.
3. Add any tables you want to require an e-signature for to the list.

With e-signature enabled, approvers are required to provide a password to approve or reject any requests. Authentication with touch ID works in the mobile app. On the mobile web, approvers
are still required to enter a password. For more information on configuring e-signature, see Approval with e-signature.

**Service Portal SCSS Primer**

SCSS is a subset of the Syntactically Awesome StyleSheets (Sass) specification and is an extension of CSS. Every valid CSS style sheet is valid SCSS.

**SCSS variables**

SCSS variables are a way to store information that you want to reuse throughout your style sheet. You can store things like colors, font stacks, or any CSS value you think you want to reuse. SCSS uses the $ symbol to make something a variable.

SCSS supports the following data types:

- Numbers (including units)
- Strings (with quotes or without)
- Colors (name, or names)
- Booleans

Variables can also be arguments to or results from one of several available functions or mixins. During translation, the values of the variables are inserted into the output CSS document.

For example:

```
$font-stack:    Helvetica, sans-serif;
$primary-color: #333;

body {
    font: 100%$font-stack;
    color: $primary-color;
}
```

For more information on Sass, see the Sass/SCSS reference.

**SCSS functions**

List of functions for Service Portal SCSS compiler.

**RGB functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rgb($red, $green, $blue)</td>
<td>Creates a Color from red, green, and blue values.</td>
</tr>
<tr>
<td>rgba($red, $green, $blue, $alpha)</td>
<td>Creates a Color from red, green, blue, and alpha values.</td>
</tr>
<tr>
<td>red($color)</td>
<td>Gets the red component of a color.</td>
</tr>
<tr>
<td>green($color)</td>
<td>Gets the green component of a color.</td>
</tr>
<tr>
<td>blue($color)</td>
<td>Gets the blue component of a color.</td>
</tr>
<tr>
<td>mix($color1, $color2, ($weight))</td>
<td>Mixes two colors together.</td>
</tr>
</tbody>
</table>
### HSL functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>hsl($hue, $saturation, $lightness)</td>
<td>Creates a Color from hue, saturation, and lightness values.</td>
<td>Yes</td>
</tr>
<tr>
<td>hsla($hue, $saturation, $lightness, $alpha)</td>
<td>Creates a Color from hue, saturation, lightness, and alpha values.</td>
<td>Yes</td>
</tr>
<tr>
<td>hue($color)</td>
<td>Gets the hue component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturation($color)</td>
<td>Gets the saturation component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lightness($color)</td>
<td>Gets the lightness component of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>adjust-hue($color, $degrees)</td>
<td>Changes the hue of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>lighten($color, $amount)</td>
<td>Makes a color lighter.</td>
<td>Yes</td>
</tr>
<tr>
<td>darken($color, $amount)</td>
<td>Makes a color darker.</td>
<td>Yes</td>
</tr>
<tr>
<td>saturate($color, $amount)</td>
<td>Makes a color more saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>desaturate($color, $amount)</td>
<td>Makes a color less saturated.</td>
<td>Yes</td>
</tr>
<tr>
<td>grayscale($color)</td>
<td>Converts a color to grayscale.</td>
<td>Yes</td>
</tr>
<tr>
<td>complement($color)</td>
<td>Returns the complement of a color.</td>
<td>No</td>
</tr>
<tr>
<td>invert($color)</td>
<td>Returns the inverse of a color.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Opacity functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>alpha($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacity($color)</td>
<td>Gets the alpha component (opacity) of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>rgba($color, $alpha)</td>
<td>Changes the alpha component for a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>opacify($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
<tr>
<td>fade-in($color, $amount)</td>
<td>Makes a color more opaque.</td>
<td>No</td>
</tr>
<tr>
<td>transparentize($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
<tr>
<td>fade-out($color, $amount)</td>
<td>Makes a color more transparent.</td>
<td>No</td>
</tr>
</tbody>
</table>
### Other color functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjust-color()</td>
<td>Increases or decreases one or more components of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>scale-color()</td>
<td>Fluidly scales one or more properties of a color.</td>
<td>Yes</td>
</tr>
<tr>
<td>change-color()</td>
<td>Changes one or more properties of a color.</td>
<td>No</td>
</tr>
<tr>
<td>ie-hex-str()</td>
<td>Converts a color into the format understood by IE filters.</td>
<td>No</td>
</tr>
</tbody>
</table>

### String functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>unquote($string)</td>
<td>Removes quotes from a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>quote($string)</td>
<td>Adds quotes to a string.</td>
<td>Yes</td>
</tr>
<tr>
<td>str-length($string)</td>
<td>Returns the number of characters in a string.</td>
<td>No</td>
</tr>
<tr>
<td>str-insert($string, $insert, $index)</td>
<td>Inserts $insert into $string at $index.</td>
<td>No</td>
</tr>
<tr>
<td>str-index($string, $substring)</td>
<td>Returns the index of the first occurrence of $substring in $string.</td>
<td>No</td>
</tr>
<tr>
<td>str-slice($string, $start-at, ($end-at))</td>
<td>Extracts a substring from $string.</td>
<td>No</td>
</tr>
<tr>
<td>to-upper-case($string)</td>
<td>Converts a string to upper case.</td>
<td>No</td>
</tr>
<tr>
<td>to-lower-case($string)</td>
<td>Converts a string to lower case.</td>
<td>No</td>
</tr>
</tbody>
</table>

### Number functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>percentage($number)</td>
<td>Converts a unitless number to a percentage.</td>
<td>Yes</td>
</tr>
<tr>
<td>round($number)</td>
<td>Rounds a number to the nearest whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>ceil($number)</td>
<td>Rounds a number up to the next whole number.</td>
<td>Yes</td>
</tr>
<tr>
<td>floor($number)</td>
<td>Rounds a number down to the previous whole number.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### List functions

Lists in SCSS are immutable. All list functions return a new list rather than updating the existing list in-place.

All list functions work for maps as well, treating them as lists of pairs.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Availability</th>
</tr>
</thead>
<tbody>
<tr>
<td>length($list)</td>
<td>Returns the length of a list.</td>
<td></td>
</tr>
<tr>
<td>nth($list, $n)</td>
<td>Returns a specific item in a list.</td>
<td></td>
</tr>
<tr>
<td>set-nth($list, $n, $value)</td>
<td>Replaces the nth item in a list.</td>
<td></td>
</tr>
<tr>
<td>join($list1, $list2)</td>
<td>Joins two lists into one.</td>
<td></td>
</tr>
<tr>
<td>append($list1, $val)</td>
<td>Appends a single value onto the end of a list.</td>
<td></td>
</tr>
<tr>
<td>zip($lists...)</td>
<td>Combines several lists into a single multidimensional list.</td>
<td></td>
</tr>
<tr>
<td>index($list, $value)</td>
<td>Returns the position of a value within a list.</td>
<td></td>
</tr>
<tr>
<td>list-separator($list)</td>
<td>Returns the separator of a list.</td>
<td></td>
</tr>
</tbody>
</table>

### Adding custom functions

Scss @function my-calculation-function($some-number, $another-number){ @return $some-number + $another-number }

### SCSS nesting

SCSS lets you nest your CSS selectors in a way that follows the same visual hierarchy of your HTML.

For example:

```css
nav {
  ul {
    margin: 0;
    padding: 0;
    list-style: none;
  }
  li { display: inline-block; }
}
```
The `ul`, `li`, and `a` selectors are nested inside the `nav` selector, which is a great way to organize your CSS and make it more readable. When the widget is rendered, the generated CSS looks something like the following code block:

```css
nav ul {
    margin: 0;
    padding: 0;
    list-style: none;
}
nav li {
    display: inline-block;
}
nav a {
    display: block;
    padding: 6px 12px;
    text-decoration: none;
}
```

For more information on Sass, see the [Sass/SCSS reference](#).

**SCSS operators**

SCSS has a handful of standard math operators like `+`, `-`, `*`, `/`, and `%.

Use simple math to calculate widths for an aside & article. For example:

```css
.container { width: 100%; }
article[role="main"] {
    float: left;
    width: 600px / 960px * 100%;
}
aside[role="complementary"] {
    float: right;
    width: 300px / 960px * 100%;
}
```

The generated CSS looks like:

```css
.container {
    width: 100%;
}
article[role="main"] {
    float: left;
    width: 62.5%;
}
aside[role="complementary"] {
    float: right;
    width: 31.25%;
}
```
For more information on Sass, see the Sass/SCSS reference.

**SCSS mixins**

A mixin lets you make groups of CSS declarations that you want to reuse throughout your site. You can pass in values to make your mixin more flexible.

The following code block is an example for border-radius.

```css
@mixin border-radius($radius) {
  -webkit-border-radius: $radius;
  -moz-border-radius: $radius;
  -ms-border-radius: $radius;
  border-radius: $radius;
}

.box { @include border-radius(10px); }
```

The generated CSS looks like:

```css
.box {
  -webkit-border-radius: 10px;
  -moz-border-radius: 10px;
  -ms-border-radius: 10px;
  border-radius: 10px;
}
```

For more information on Sass, see the Sass/SCSS reference.

**Performance Analytics Content Pack for Service Portal**

The Performance Analytics Content Pack for Service Portal enables service delivery executives to improve user engagement with your organization’s portals by tracking the usage of portals in preconfigured indicators and data visualizations.

To enable the Performance Analytics Content Pack for Service Portal, install the content pack from the ServiceNow Store. Purchasing a subscription to the licensed Performance Analytics is required to install the content pack.

After you enable the content pack, you can access the Service Portal dashboard by navigating to **Performance Analytics > Dashboards**. From the dashboard picker, open the Service Portal Usage dashboard.

Assign the pa_viewer role to users who need to view the dashboard. You must have the sp_admin or admin role to edit the dashboard.

The Service Portal Usage dashboard includes the following tabs:

- **Overview**
- **Visitors**
- **Views**
- **Searches**

You can view reports by selecting options in the interactive filter based on the Service Portal and the Service Portal User Country. The statistics provided in each tab change based on the options selected in the interactive filter.
Overview tab

The Overview tab displays the following widgets:

<table>
<thead>
<tr>
<th>Widget</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Searches</td>
<td>Total number of user searches today.</td>
</tr>
<tr>
<td>Average Click-Through Rate</td>
<td>Average number of searches that have resulted in a click today.</td>
</tr>
<tr>
<td>Average Click Rank</td>
<td>Average position of clicked items in a search result list today. Lower value means a higher position on the search result list.</td>
</tr>
<tr>
<td>Visitors vs Views</td>
<td>Comparison of three metrics:</td>
</tr>
<tr>
<td></td>
<td><strong>Visitors</strong></td>
</tr>
<tr>
<td></td>
<td>Total number of unique visitors per week.</td>
</tr>
<tr>

<td>Number of clicks within each click rank today.</td>
</tr>
<tr>
<td>Searches</td>
<td>Total number of user searches today.</td>
</tr>
</tbody>
</table>
Breakdowns

To analyze data according to different categories, select a breakdown from the dashboard menu:

- Service Portal
- Service Portal Page
- Service Portal User Country
For more information on analyzing data with breakdowns, see Using breakdowns on dashboards.

Skills Management

Use Skills Management to associate skills with individual users or groups and assign them to tasks or projects. You can also assess the skills needed for your organization, identify gaps, and implement effective plans for hiring or training of your teams.

Skills can contain other skills. For example, if you define network as a skill, you can add router as the skill it contains. A user assigned to a parent skill grants access to a child skill. Once a skill is assigned to a group, all members of the group inherit that skill and any others contained within it. Skills management works similar to ServiceNow platform role management.

Using this application, you can:

- Manage skills for agents and your employees from a central location.
- Use a standard way to identify skills for your organization and keep them up to date.
- Group skills into categories and define skill levels to track the expertise of your resources at a granular level.
- Prevent task or project reassignments by assigning tasks to agents and projects to teams that have the right skills to work on those items.
- Identify skill gaps and resolve them by implementing effective plans for coaching and training of resources.
- Manage the effectiveness of your team by evaluating the skills your team has and determining what skills you need to work on your projects.
Integration with ServiceNow® applications

A skill is an ability to do something that comes from training, experience, and practice. As a system administrator, you can define skills for your organization and assign it to users and groups from a central location. As an application manager, you can assign users to tasks based on these skills. For example, if you are an IT manager, you can use the Skills Management application to define skills for your agents and assign those agents to resolve incidents using the ITSM application.

Group skills into categories and define skill levels to standardize skill implementation across your organization.

Use skills from the centralized location in the following applications:

- **IT service management** As an IT manager, reduce your time and costs while resolving incidents by assigning work items to the right agent. Assess the skill gaps that agents have in your team.
and coach or train agents based on those needs. Identify and define a standard way to keep skill categories and levels consistent within your team.

- **Assignment workbench** As a customer service manager, identify agent skills and automatically route tasks to agents who have the required skill to work on those tasks. Manage your team’s effectiveness by understanding what type of skills your employees need to get hired, leave, or get trained to take on other roles.

- **Manage Field Service and Customer Service skills** As a field service or customer service manager, use rules to identify skills and skill levels that agents require to resolve work items such as cases, work order tasks, and agent interactions. Automate skill assignment to reduce a manager’s work load. Automatically assign tasks to agents using Field Service dynamic scheduling.

- **HR skills management** As an HR manager, use skills to identify the type of skills your organization needs and make hiring decisions based on those needs. Manage your team’s effectiveness by understanding what type of skills your employees need to get hired, leave, or get trained to take on other roles.

- **Project tasks** As a project and portfolio manager, standardize how you categorize skills, define skill level types, and add skill levels for your team. Set up skills for your team in a central location and make them available within your team. Prevent project reassignments by assigning the right projects to the team members who have the right skills to work on those projects.

### Roles used in Skills Management

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
</table>
| Skill administrator (skill_admin)   | - Inherits the skill manager (skill_manager) and skill user (skill_user) roles.  
|                                     | - Can perform create, read, update, and delete (CRUD) operations on skills, skill levels, skill level types, skill categories, and sub categories. |
| Skill manager (skill_manager)       | - Inherits the skill user (skill_user) role.  
|                                     | - Can perform read operations on skills, skill levels, skill level types, skill categories, and sub categories.  
|                                     | - Can assign skills to users and groups. |
| Skill user (skill_user)             | Can perform read operations on skills, skill levels, skill level types, skill categories, and sub categories. |

### Activating Skills Management

The Skills Management application is activated when you enable the Skills Management (com.snc.skills_management) plugin.

### Configuring skills

Create skills, identify the type of skill level it belongs to and associate skill levels for each type to define skills for your users consistently across your organization. For example, you can add French as a skill, language as the skill level type, and familiar, proficient, and expert as the skill levels.
Identify all skills you currently have and would need across your organization to begin implementing skills. For example, if you are using Customer Service, you may have agents who have Java as a technical skill and you may need agents who have experience in network administration. If you are using Human Resources, you may have employees who have coaching as a skill and you may need employees who can get new hires on board.

Associate each skill you have identified with a skill level type. For example, you can associate Java with programming as the skill level type and coaching with leadership as the skill level type.

Define skill levels for each type you have identified. As an example, you can use familiar, proficient, and expert as skill levels for the Java skill level type and beginner, intermediate, and advanced as the skill levels for the coaching skill level type.

**Define skill taxonomy**

Organize related skills into categories and subcategories so that you can manage skills and create reports quickly and efficiently.

Role required: skill_admin

A skill category can contain parent and child categories that together create a category hierarchy. You can add skills to the lowest category in the hierarchy.

You can build your skill taxonomy from scratch or use the sample data provided with your application.
**Skill Taxonomy**

1. Navigate to Skills > Skill Taxonomy.

---

### Financial Management

- **Name:** Financial Management
- **Description:** Financial Management skills include planning, organizing, directing and controlling the financial activities such as procurement and utilization of funds of the enterprise.

### Category Hierarchy

**View hierarchy:** Parent view | Full view

- **Financial Management - (Current Skill)**
  - Accounting
  - Budget & Finance

### Child Categories

- **Parent = Financial Management**
  - Accounting
  - Budget & Finance
  - Collection & Payments

---

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
2. In the **Skills Categories** list, click **New**.
3. In the **Name** field, enter a unique name for the category.
4. Optional: In the **Parent** field, select a parent category.
5. Right-click the form header and click **Save**.
   The category is added to the **Category Hierarchy**.
6. Do one of the following:

<table>
<thead>
<tr>
<th>To add</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subcategories</strong></td>
<td>In the <strong>Child Categories</strong> related list, click <strong>New</strong>.</td>
</tr>
<tr>
<td></td>
<td>In the <strong>Name</strong> field, enter a unique name for the category.</td>
</tr>
<tr>
<td><strong>Skills</strong></td>
<td>Enable the <strong>Add Skills</strong> check box.</td>
</tr>
<tr>
<td></td>
<td>Right-click the form header and click <strong>Save</strong>.</td>
</tr>
<tr>
<td></td>
<td>In the <strong>Skills</strong> related list, click <strong>New</strong>.</td>
</tr>
<tr>
<td></td>
<td>In the <strong>Name</strong> field, enter the name of the skill.</td>
</tr>
</tbody>
</table>

7. Click **Submit**.

**Create skill categories using sample data**

Onboard your team quickly using the skill taxonomy framework provided with your application.

Role required: skill_admin

The sample data provides 150 records that you can use to get started with to build your skill taxonomy.

1. **Activate** the Skills Library Data for Skills Management (com.snc.skills_management.seed_data) plugin.
2. Navigate to **Skills > Skill Taxonomy**.
3. In the **Skill Categories** list, review each category and set the **Add skills** field to true for all skill categories you want to add to your application.

**Define a skill level type**

Define skill levels (for example, beginner, intermediate, advanced) for different skill level types (for example, a language or an IT certification) and then associate skill levels to users and define skill levels and types required for tasks.

Role required: skill_admin or admin

1. Identify skill level types.

   You can group skills that belong to the same category into a skill level type. For example, you could use language as the skill level type if Japanese and French are defined as skills. Take an inventory of every type of skill your organization needs.

2. Add skill level types, define skill levels, and associate them with a skill level type.

   After you add a skill level type, you can define different levels for that type of skill. For example, if you add language as a type of skill, you can associate familiar, proficient, and expert as skill levels. When you select French, for example, as a skill for a user, you will be able to define the user’s skill level for French as either familiar, proficient, or expert.

   a) Navigate to **Skills > Skill Level Types**.
   b) Click **New**.
   c) Enter a name and description for the skill level type and then right-click the form and click **Save**.
d) To associate skill levels with this skill type, add a name and value for the skill level. By default, skill level types are associated with the Default skill level and has a value of 1. You can change the name and value for this default skill level. The value is used to measure skill gaps. For example, if you give a value of 10 for a skill level defined as proficient and a value of 25 for a skill level defined as expert, when you create a skill report to measure gaps, you will see a value of 15 as a measure for the skill gap.

3. Click Submit.

The example below shows a system administrator creating the skill level type Language, adding the skill level Proficient to that type and associating a value for the level.
Add a skill

Create skills to specify the competencies of your users and associate them with sub skills, users, and configuration items.

Role required: skill_admin or admin

1. Identify skills.
   
   Take an inventory of all skills you currently have and would need across your organization. For example, if you are using Customer Service, you may have agents who have Java as a technical skill and you may need agents who have experience in network administration. If you are using Human Resources, you may have employees who have coaching as a skill and you may need employees who can get new hires on board.

2. Add skills.
   
   You can associate each skill with other skills, users, or configuration items. You can assign users to tasks or projects, or identify employees with specific skills using these associations.
   
   a) Navigate to Skills > All Skills.
   
   b) Click New.
   
   c) Enter a name and description for the skill and then right-click the form and click Save.
   
   d) To associate sub skills to the skill, click the Contains Skills tab and create a new skill or add an existing skill.
      
      The sub skill is automatically inherited by the user or group that contains the associated skill.
   
   e) To specify skills for users, click the Users tab and create a new user for the skill or add existing users.
   
   f) To associate the skill with configuration items, click the Model tab and add one or more configuration items.

3. Click Update.

Managing skills

Manage skill assignment efficiently by simultaneously assigning a skill to multiple users or multiple skills to multiple users. Assign your agents to tasks and teams to projects based on skills.

Assign IT skills to users

Assign IT skills and skill levels to users to facilitate the automatic assignment of skill-based tasks to agents.

Role required: skill_manager or skill_admin

Only skill administrators can create or edit skills. Skill managers can assign skills to users.

1. Navigate to Skills > Manage IT Skills.

2. Do one of the following:
<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
</table>
| **Add a skill to a user** | 1. Click **New Skill**.  
2. In the **Skill** field, enter a name for the skill.  
3. In the **Level Type** field, select the type to which the skill belongs. |

| **Assign a skill to multiple users** | 1. From the **All Skills** list, select a skill.  
2. Click **Assign/Remove Users**.  
3. Select the name of each user you want to assign this skill.  
4. From the list, select the level for this skill for each user.  
5. Click **Assign/Remove Users** again to assign the skill and skill level to the users.  

To remove the assigned skill, select the name of the user and clear the check box for the skill. |

| **Assign multiple skills to multiple users** | 1. From the **All Users** list, select a user.  
2. From the **Skill** list, select each skill and the skill level to assign for this user.  
3. Repeat the steps above for all users you would like assign multiple skills and associated skill levels. |
In this example, a system administrator assigns the skill **iPhone** to multiple users and adds a skill level for each user.
In this example, a system administrator assigns multiple skills and associated skill levels to multiple users.
**Associate skills with users and groups**

Add skills to users and groups and effectively assign users to tasks and teams to projects.

Role required: skill_manager

Users automatically inherit a skill contained within a skill. Members of a group inherit all skills assigned to the group.

1. Perform one of the following actions:

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a skill to a user</td>
<td>1. Navigate to <strong>Skills &gt; User Skills</strong>.</td>
</tr>
<tr>
<td></td>
<td>2. Click <strong>New</strong>.</td>
</tr>
<tr>
<td></td>
<td>3. In the <strong>Skill</strong> field, click the lookup icon and select a skill.</td>
</tr>
<tr>
<td></td>
<td>4. In the <strong>User</strong> field, click the lookup icon and select a user.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Assign a skill to a group</th>
<th>1. Navigate to <strong>Skills &gt; Group Skills</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2. Click <strong>New</strong>.</td>
</tr>
<tr>
<td></td>
<td>3. In the <strong>Skill</strong> field, click the lookup icon and select a skill.</td>
</tr>
<tr>
<td></td>
<td>4. In the <strong>Group</strong> field, click the lookup icon and select a group.</td>
</tr>
</tbody>
</table>

2. Optional: In the **Skill level** field, click the lookup icon and select a level for the selected skill.
3. Optional: If the skill level is inherited, enable the **Skill level inherited** check box.
   You must configure the form to display the **Skill level** field and **Skill level inherited** check box.
4. Click **Submit**.

**Associating skills with work items**

Assign skills to tasks manually or use rules to associate them automatically to work items such as cases, tasks, or chat interactions.

**Assign skills to tasks**

Add skills and the level required for each skill to tasks. Identify whether the skill is mandatory to perform the task.

Role required: admin

1. Navigate to incident, problem, change request or any task record to which you want to associate skills.
2. In the related list, select the **Tasks Skills** tab.
   You must configure the related list and add **Task Skill->Task** to the **Selected** column to display this tab.
3. In the Task Skills table, do the following:
   1. In the **Skill** field, click the lookup icon and select a skill.
   2. In the **Skill level** field, select a level for the selected skill.
   3. In the **Mandatory** field, select **true** if the skill is mandatory for the selected task.
4. Click **Submit**.
The image below shows an administrator configuring skills for an incident task where the user is unable to access the shared folder. It is
mandatory for agents working on this task to have familiarity with IT skills.
Using rules to identify skills for work items

Automate the identification of skills required for work items using rules, which eliminates the need to assign them manually.

When you automate skill identification, you prevent task reassignments by assigning agents with the right skills to work on tasks and make time available for agents and managers to work on more important tasks.

You can identify skills using rules for tasks such as cases, work order tasks, incidents, problems, and change requests and also for interactions such as chat, phone, or walk-up experience.

Create rules to assign skills to work items

Create rules to identify skills and automatically associate them to work items.

Role required: skill_admin or admin

You can automatically add a skill to a case based on the product associated with the case if you enable the Product to Skill mapping table (Skill Required for Model Maintenance [cmn_m2m_skill_model]).

A skill determination rule is created for every new skill required for a work item.

- If a skill is no longer required for a work item, you must deactivate or remove the rule applied for the work item.
- If two rules have the same skill associated with one work item and one rule evaluates the skill as mandatory and the other rule evaluates it as optional, then the rule that evaluates the skill as mandatory is always used.

Note: If you create a new skill determination rule, you also need to create a corresponding business rule.

1. Navigate to Skills > Skill Determination Rules.
2. Click New.
3. In the Name field, enter a name for the rule.
4. Select the Active check box to enable the rule to assign skills to work items.
5. From the Source table drop-down menu, select the work item source table for this rule.
6. Using the condition builder, select the conditions to evaluate the work item.
7. Do any of the following:

<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
</table>
| **Create a simple rule** | 1. From the Type drop-down menu, select Simple.  
2. In the Skills table, add each skill that is required for the selected work item.  
3. If a skill is optional for selected work item, in the Mandatory field, select False.  
4. In the Skill Level field, add a level for the skill. You must configure the form to display this field. |

Note: You can define skill levels using the Skills Management application.
Create a lookup rule

1. From the Type drop down menu, select Lookup.
2. From the Lookup table drop-down menu, select the reference table to connect to the source table.
   The Skills Field that connects the source and reference tables is automatically populated.
3. If this skill is mandatory, enable the Mandatory check box.
4. From the Skill Level Field drop-down menu, select a level for this skill.
5. Click Save.
6. In the Field Mappings related list, click New.
7. From the Source table field drop-down menu, select an attribute to map to the reference table.
8. From the Lookup table field drop-down menu, select an attribute to map to the source table.

Create an advanced rule

1. From the Type drop down menu, select Advanced.
2. In the Script window, enter a script.

8. Click Submit.

Activate business rules for skill determination

Enable the business rules to determine skills for cases, work order tasks, and chat interactions that are available in your application.

Role required: admin

You can also Create a business rule for tasks such as incidents, problems and change requests to associate skills to those tasks.

Create skill determination rules based on any of the following rule types:

- **Simple**
  Adds skills to work items based on a set of conditions used to evaluate the source table.

- **Lookup**
  Adds skills to work items based on selections from two different tables connected using one or more reference fields.

- **Advanced**
  Adds skills to work items using a script.

1. Enable the Skill Determination (com.snc.skill_determination) plugin.
2. Do one of the following:
<table>
<thead>
<tr>
<th>To</th>
<th>Do this</th>
</tr>
</thead>
</table>
| Enable the business rules for cases, work order tasks, or chat interactions | - To create rules for cases, select the `Active` check box in the `Skill determination for case` business rule record.  
- To create business rules for work order tasks, select the `Active` check box in the `Skill determination for work order task` business rule record.  
- To create rules for chat interactions, select the `Active` check box in the `Skill determination for interaction` business rule record. |

| Create business rules for tasks such as incidents, problems, and change requests | 1. Open a case, work order, or chat interaction business rule record.  
2. Right-click the record and select `Insert and Stay`.  
3. In the `Name` field, enter a name for the business rule.  
4. In the `Table` field, select the task table.  
5. Click `Update`. |

**Routing work items to agents based on skills**

Use rules to automatically route work items to agents.

For more information on routing agents to work items, see [Advanced work assignments](#).

**Qualify and rank users based on skills and skill levels**

Rank users so that you can select the right users based on skills needed to complete tasks. Qualify users to work on tasks such as case, work order task, or chat interaction based on the number of skills and skill levels required to work on those tasks.

Role required: `skill_admin`

Use the [UserSkillAnalyzer API](#) to analyze the skills and skill levels of users and the [UserSkillRanking API](#) to rank and assign them to tasks. For example, when you use the Field Service Management application to assign agents to tasks, you can analyze and rank them based on their skills and skill levels using these APIs and use dynamic scheduling to assign them to tasks.

**Note:** You must add the Matching Skill Level Gap for Dynamic Scheduling criterion to the task filter to rank agents assessed based on skill gaps. For more information on adding this criterion, see [Create a task filter](#).

1. Analyze the skills and skill levels users have to complete work items using the UserSkillAnalyzer API.

   The API performs the following verification to check if users are qualified to be assigned to the work items:

   1. If the user has all mandatory skills required to complete the work item, but does not have the skill level, the agent is not qualified to work on the task if the skill level is mandatory to work on the task.
2. If the user does not have all mandatory skills required to complete the task, the agent is not qualified to work on the task.

3. If the user has all skills and the skill levels required to complete the task, the agent is qualified to work on the task.

4. If the user has all skills required, but not mandatory to complete the task, the agent is qualified to work on the task.

If the user is qualified to work on the task, the API performs the following verification to analyze gaps in skill level and the total number of skills the users have to execute tasks based on the skill requirements for the work item:

1. Verifies if a work item requires a skill that does not have a level type defined.

2. Verifies if a work item requires a skill that has a level type defined but does not have the skill level defined.

3. Verifies if a work item requires a skill that has the skill level defined, but the agent does not have the skill level defined. If the skill level is mandatory to complete the task, the user who does not have those skill levels will not be assigned to those tasks.

4. Verifies whether a user has all skill levels that are mandatory, but not optional, to perform a task.

2. Rank users qualified to complete work items using UserSkillRanking API.

The API retrieves a list of qualified users based on matching and mandatory skills and skill levels.

Skills Management dashboard and reporting

Use the Skills Management dashboard to analyze trends in assessing skill gaps in your organization and plan for coaching or training of your employees based on needs. Identify users and teams who have the right skills to work on tasks and projects. The Skills Management dashboard provides comprehensive reports on skill competencies of users, the tasks that require those skills, and skill gaps you can address to fulfill your organizational needs.

You can access the dashboard by navigating to Skills > Dashboard.

End user and roles

### End user and goal

As a skills manager, you can:

- Build your teams based on the skills set your organization needs.
- Have visibility into skill competencies of employees.
- Analyze skill gaps and plan for coaching or training of your employees based on the needs.
- Identify users who have a specific skill or belong to specific skill categories.
- Track skill proficiencies of users over time.
- Identify key skills being used in solving your business needs and the users with those skills.
- Build learning programs based on skill strengths, weaknesses, preferences, gaps, and risks identified for your organization.
- Build teams based on skills you need to complete projects.
- Evaluate how effectively users solve business needs using their skill competencies and provide feedback to implement improvements.
- Review how efficiently work assignments are made based on skill levels.
- Match user skills with skills needed to complete work items and assign projects to teams based on those skills.

### Required role

| skill_manager |

**Domain separation and skills management**

Domain separation in Skill Management app is configured to apply to all features of the application. Separation of data is configured along with separation of logic and process. Domain separation enables you to separate data, processes, and administrative tasks into logical...
groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

Support: Level 1

Domain separation is supported in this application. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Domain separation and skills management. The Skills Management application enables you to track and organize skill data of service agents and employees in a domain separated environment. The skill data can be used for skill-based task assignment, skill gap analysis to identify coaching and training needs, career growth planning, workforce optimization and skill-based hiring. All skill related tables support domain separation so that the people with skill user, skill manager and skill admin roles can view only the skill and related tasks within the (tenant) domain to which they belong.

How domain separation works in Skills Management

Domain separation is supported in Skill Management with no explicit setup or configuration requirements. Skills, skill categories, skills levels can be created in separate domains, including the global domain. When domain separation is implemented, people with skill app roles can view skill information only in the domain assigned. Domain and Domain Path columns are available for all Skill tables provided with the base system. The Domain column contains the name of the domain to which the event or alert belongs, and the Domain Path column contains the unique domain identifier.

<table>
<thead>
<tr>
<th>Table name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys_user_has_skill</td>
<td>User skill information</td>
</tr>
<tr>

<td>Define skill categories</td>
</tr>
<tr>
<td>cmn_skill_level_type</td>
<td>Define skill level type</td>
</tr>
<tr>
<td>cmn_skill_level</td>
<td>Define skill level</td>
</tr>
<tr>
<td>sys_group_has_skill</td>
<td>Group skills</td>
</tr>
<tr>
<td>cmn_skill_contains</td>
<td>Define skills contained within skills</td>
</tr>
<tr>
<td>task_m2m_skill</td>
<td>Task skill information</td>
</tr>
</tbody>
</table>

Note: If the domain column is not shown, click the Update Personalized List icon and add the required column. You can also add the domain path column, if desired.

Use cases:

- A Skill Manager that belongs to the Acme domain creates a skill and wants to view and associate it to user in the Acme domain. A user must belong to the Acme domain, its parent domain, or the global domain to view the skill record.
- A Skill Manager that belongs to a parent domain tries to view a skill in a child domain. The user of a parent domain can view a skill record of the parent as well as all child domains of that parent.
- A Skill Manager that belongs to a parent domain wants to create/associate a skill on behalf of another user in the Acme domain. A user must belong to the same domain as the user for which the skill record is created.
- A Skill Manager wants to associate a record for an integrated application in the Acme domain. A user must belong to the domain of the integrated application from which a record is associated.
- A Skill Manager has access to multiple domains but wants to update a record with content within a specific domain. The domain specified for the current record drives the functionality of that record and reference fields.

**Quick start tests for Skills Management**

Validate that Skills Management still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Skills Management quick start tests require activating the Skills Management plugin (com.snc.skills_management).

**Skills Management test suite**

**Use**
- Allocating users to a Per-User subscription
- Allocating your custom tables to subscription entitlements
- Build a subscription user set
- Add a user set to a subscription
- Allocate an individual user from the Subscription form
- Unsubscribe a user

**Troubleshoot and get help**
- Ask or answer questions in the Subscription forum
- Search the HI Knowledge Base for known error articles
- Contact ServiceNow Technical Support

**Subscription Management setup**

Because Subscription Management is active for all production instances by default, you do not need to activate a plugin. To set up Subscription Management, you assign the usage_admin role to the users who administer subscriptions. The admins allocate users to appropriate subscriptions, monitor usage of applications (both by subscribed users and by users who are not subscribed), and update subscription levels as needed.

**What to do**

**Assign the Usage Admins**

Before you (the admin user) do anything else, assign the usage_admin role to the persons who will manage subscriptions for your organization.

Admin responsibilities and activities are described in Allocating users to a Per-User subscription, Allocating your custom tables to a subscription entitlement and Monitoring how your resources are allocated for subscriptions.

**View the list of your subscription applications**
See View your subscription applications and allocation levels.

If your organization purchased Per-User subscriptions, the usage_admin allocates users

Note: You perform this task only for Per-User subscriptions. Your instance auto-allocates and reports on monthly usage for all other subscription types.

With a Per-User subscription, a specified number of users is entitled to use the application. You perform the following tasks:

- Build user sets.
- Allocate users to appropriate subscriptions.
- Monitor whether you have allocated the right number of users.
- Monitor and manage how users are allocated.

See Allocating users to a Per-User subscription.

If your organization purchased subscriptions that include a custom table entitlement, the usage_admin allocates custom tables to subscriptions

Some ServiceNow subscriptions include custom table entitlements to enable and track configurations and customizations. For these subscriptions, you perform the following tasks:

- Allocate custom tables to subscription entitlements. For example, a single subscription might include a total entitlement of 50 custom tables. You can create custom tables for any purpose, up to the entitlement limit in the subscription.
- Monitor and manage how custom tables are allocated to specific subscription entitlements.

See Allocating your custom tables to a subscription entitlement.

What to do next

Day-to-day administration: Monitor and manage subscriptions

See Monitoring how your resources are allocated for subscriptions

Domain separation in Subscription Management

This is an overview of domain separation in Subscription Management. This application does not support domain separation. For more information, see Application support for domain separation.

No support

- The domain field may exist on data tables, but no logic exists to manage data.
- This level is not considered domain-separated.

Configure the color codes for subscription allocation levels

On lists, forms, and charts, a configurable color code indicates the percentage of the subscription that has been allocated. This applies to both user and custom table allocations.
Role required: usage_admin or admin

In the example, the green color code that appears in the **Allocated** column for Financial Management, and the yellow code for the ITSA Fulfiller application, indicate that you can allocate additional users. The red code for Facilities Service Automation indicates that you have allocated more users (or custom tables) than you have purchased a subscription for.

**Note:** If the subscription contains a custom table entitlement, this color coding scheme also appears in a **Tables used** column in the Subscriptions list. To learn more about custom table allocations, see [Allocating your custom tables to a subscription entitlement](#) and [Allocate your custom tables to subscriptions](#).

1. Navigate to **Subscription Management** > **Properties**.
2. Update the **Threshold for color codes** (subscription.used.thresh) property setting and then click **Save**.
   - Specify a percentage value greater than 0 and less than 100. Default: 90% of the purchased subscription limit.
   - Subscription allocation levels below the specified threshold are marked with a green color code.
   - Allocation levels between the threshold and 100% are marked yellow.
   - Allocation levels above 100% are marked red.

**Subscription Management administration**

You use the ServiceNow® Subscription Management application to review and manage how purchased subscriptions are used on your production instance. You can monitor usage of
subscription applications to update subscription levels and to make informed decisions about subscription purchases.

What is a subscription?

In contrast to companies that sell software licenses, ServiceNow sells subscription services.

- Your organization has purchased a subscription to an application family. The subscription entitles an agreed-upon number of users or resources in your organization to use the applications.
- For Per-User type subscriptions only, you allocate users to the subscription. As a result, the user is subscribed to the family of applications. For other subscription types, the instance auto-allocates users or resources to the subscription.
- For your organization to comply with its service contract, only subscribed users or resources should use a subscription application family.
- The Subscription Management application monitors your purchased subscriptions on production instances only.

How do you use Subscription Management?

The usage_admin can perform the following tasks:

- Receive and view subscriptions that your organization has purchased.
- Monitor and adjust allocation levels.
- Plan for renewing subscriptions.
- Determine which users (by role, by user group, or by some other criterion) should be subscribed to which Per-User subscription applications.
- Build user sets.
- Manage user sets as users, roles, and groups change over time.
- Allocate users and user sets to each of the Per-User subscriptions.
- Allocate custom tables created in the instance to subscriptions with custom table entitlements.
- Monitor App Engine subscription usage and compliance

View your subscription applications and allocation levels

The Subscriptions page lists the subscriptions that your organization has purchased and indicates how many users or resources are allocated to each subscription.

Role required: usage_admin or admin

The page lists only subscriptions that are currently active (have not expired). To view expired subscriptions as well, set the list filter to All.

1. On your production ServiceNow instance, navigate to Subscription Management > Subscriptions.
   - The page attempts to list all subscriptions that your organization has purchased. Some subscriptions do not appear. See Why a subscription might not appear in the list.
   - A color code indicates the allocation level (the number of resources that are subscribed to the application).
   - Headings on the Subscriptions list are described in Subscription form.
2. Click a subscription **Name** to open the **Subscription** form, where you can:

- View or update how users are allocated to a Per-User subscription, and how custom tables are allocated to subscriptions that contain custom table entitlements. See **Subscription form**
- View the applications, plugins, and roles that are included with a subscription.
- View history reports that provide the usage administrator with subscription status and trend information.

**Subscription form**

Use the Subscription form to view a list of applications that are associated with the subscription and to view or update how resources, such as users or custom tables, are allocated to it.

In any list of subscriptions, click a subscription name to open the Subscription form. Some fields do not appear for ServiceNow Store applications.

**Note:** For information on why a subscription is not in the list, see **Why a subscription might not appear in the list.**
# Subscription form

<tr>
<td>Entitlements</td>
<td>List of entitlements that are included with the subscription. An entitlement is a feature that is part of the application, such as the Employee Relations or Payroll feature in the HR application. For subscription applications, your organization can buy some entitlements and not buy others. The entitlements that appear in the list are the entitlements that your organization purchased with the subscription application. This related list appears only for subscription applications that implement entitlements.</td>
</tr>
</tbody>
</table>

**Types of subscriptions**
The Subscriptions module lists all subscription types that your organization has purchased.
<table>
<thead>
<tr>
<th>Subscription type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capacity</td>
<td>Your ServiceNow instance auto-allocates resources such as users, devices, software, or nodes to Capacity subscriptions. For example, resources like each CI that Discovery finds or each password reset request.</td>
</tr>
<tr>
<td>Max User</td>
<td>Your organization purchased a subscription for the anticipated maximum number of active ServiceNow users. To monitor overall usage, the instance auto-allocates each active user up to the limit of the Max User subscription.</td>
</tr>
<tr>
<td>PA Indicator</td>
<td>Your organization purchased a subscription for an application family that uses Performance Analytics capabilities (for example, PA for ITSM or PA for Service Management). The PA admin creates indicators on tables that are used by the applications.</td>
</tr>
<tr>
<td>Per-User</td>
<td>Your organization purchased a subscription for the number of fulfiller users for subscription applications and capabilities. By default, the instance can monitor and report on usage of the application by both subscribed users and users who are not subscribed. See Allocating users to a Per-User subscription.</td>
</tr>
<tr>
<td>Unlimited</td>
<td>ServiceNow Store apps only. Your instance auto-allocates and tracks active users to an Unlimited subscription. There is no limit to the number of users that can be allocated. An active user is any user in the sys_user table that has a user id and has the Active field set to true.</td>
</tr>
</tbody>
</table>

**Note:** You allocate users only to Per-User subscriptions. Because the instance auto-allocates all other subscription types, no action is required on your part.

**Note:** Some subscriptions come with an entitlement of custom tables that can be created in a production instance. To learn more about custom table entitlements and allocations, see Allocating your custom tables to a subscription entitlement.

**Pooled subscriptions**

When you purchase multiple qualifying subscriptions for certain types of products, such as IntegrationHub, those individual subscriptions combine into a single subscription pool. Any usage against that subscription deducts from the common pool.

For example, if you buy an IntegrationHub spoke with 1,000 entitlements, and another type of spoke with 500 entitlements, they combine into a common pool of 1,500 entitlements. This total entitlement pool appears in the Purchased field in the Subscription form. Qualifying entitlement usage for either type of spoke automatically deducts from this common pool.
Why a subscription might not appear in the list
The Subscriptions list displays the subscriptions that your organization has purchased. There are, however, several types of non-subscription items that do not appear in the list.

Why does my subscription not appear in the Subscriptions list?
- You might not see all subscription services that you have purchased because the Subscription Management application does not yet allow management of some subscription services.
- The subscription may have expired. The page lists only subscriptions that are currently active. To view expired subscriptions as well, set the list filter to All.
- Subscription data arrives on production instances only.
- Self-hosted instances do not receive subscription information.
- Subscriptions that are marked as Display only do not currently support resource allocation or monitoring.

Why is the Subscriptions list empty?
- The subscription information might not yet have arrived. The data is downloaded daily.

View the applications and plugins that are included with a subscription
You can activate a plugin that is associated with a for-fee subscription only if your organization has purchased the subscription.
Role required: usage_admin or admin
1. On your production instance, navigate to Subscription Management > Subscriptions. The page lists all active subscriptions for your organization. If a subscription does not appear in the list, contact your ServiceNow account representative to purchase the subscription. Some subscriptions do not appear for other reasons. See Why a subscription might not appear in the list.
2. Click a subscription name and then, on the Subscription form, click an application name in the Subscription Applications related list. (A subscription can include multiple applications.) The page lists the plug-ins that are associated with the application.

View the roles that are associated with the plugin for a subscription application
The Application Roles related list includes all roles that are loaded with the plugin for an application. The roles in the list form a good basis for constructing a user set.
Role required: usage_admin or admin
1. On your production ServiceNow instance, navigate to Subscription Management > Subscriptions, and then click a subscription name.

   The Application Roles related list includes all roles that are loaded with the plugin for an application. The fulfiller type roles in the list that are subscription roles form a good basis for constructing a user set.

2. Use the list as a basis for creating a user set.

View Subscription Management history reports

History reports provide the usage administrator with subscription status and trend information for the organization.

Role required: usage_admin or admin

   Follow the How to instructions in the table.
History reports

Allocating users to a Per-User subscription

Use the Subscriptions module to allocate users to all Per-User subscriptions that your organization has purchased.
Example: allocate users to a Per-User subscription

In this example, your organization purchased a subscription for 200 fulfiller users. You, the usage admin, can therefore specify the 200 users—the *subscribed users*—who have the right to use the application family on your production instance. You can allocate users either individually or by adding user sets to the subscription.

**Note:** User sets are the preferred automated method for managing the pool of users who are allocated to a subscription. Once you configure and allocate a user set, the system regularly updates the list of members based on the conditions that you specified. You do not need to manage individual users.
The subscription admin allocates a mix of user sets and individual users to the 200-user subscription.

The 200 users that the admin allocated to the subscription are now subscribed.

Allocate

User Set 1

Allocate

User Set 2

Allocate

5 Individual Users
Guidelines for allocating users

- You allocate users only to Per-User subscriptions. The instance auto-allocates and reports on monthly usage for all other subscription types.
- When you add a user set to a subscription, the system allocates all users in the user set, up to the purchased subscription limit.
- In the case that adding the users in a user set would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to the Pending state and are listed on the Pending Users related list. Users that are currently subscribed are not affected. See Manage users in the Pending state.
- You can unsubscribe any user as needed.
- You can exclude users. Excluded users cannot be allocated to a subscription individually or through a user set. At any time, you can remove a user from the list of excluded users.

Note: If you unsubscribe a user who is a member of a user set that is associated with an auto-synced subscription, the user will be resubscribed in the next synchronization cycle. To remove such a user, exclude the user. See Exclude a user from a subscription.

Methods for allocating users

- Define user sets and then add user sets to the subscription
- Allocate individual users to the subscription (as many as are required)

Overview of the procedure for allocating users

1. Allocate users to the subscription using one or both of the following methods:
   - Build one or more user sets and add the user sets to the subscription
   - Allocate individual users

2. After you have allocated users to the subscription, you can add or remove user sets and individual users as needed. In addition, you can exclude individual users as needed.

Note: Some subscriptions come with an entitlement of custom tables that can be created in a production instance. To learn more about custom table entitlements and allocations, see Allocating your custom tables to a subscription entitlement.

Subscription user sets

User sets make it easy to specify which users should be allocated to a subscription. You can use roles, user groups, or both roles and groups as the conditions for a user to be a member of a user set (for example, everyone with the fulfiller role in the ‘IT department’ group).

Auto-sync

When you add a user set to a subscription, the system attempts to subscribe all users in the user set. The system updates the members in a user set whenever a user update causes the user to meet or fail to meet the criteria for the user set. For example, if a user loses the ‘fulfiller user’ role, the user is removed from the user set.
To make subscriptions self-maintaining, you can auto-sync a subscription. The system then regularly subscribes or unsubscribes users based on updates to the user sets that are assigned to the subscription. The option is described in Auto-sync a subscription to user set updates.

**Note:** Even if you select the Auto-sync with user sets option, you can update, remove, or manually synchronize the user set at any time.

### How users are subscribed and unsubscribed

- When you add a user set to a subscription, the system allocates all users in the user set to the subscription, up to the purchased subscription limit.
- You can add a user set to any number of subscriptions.
- Users that are allocated from multiple user sets are subscribed only one time.
- In the case that adding the users would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to the Pending state and are listed in the Pending Users related list.
- When you remove a user set from a subscription, the system attempts to unsubscribe all users in the set. If a user is added from another user set, however, the user is not unsubscribed.
- Users that the usage admin has flagged as excluded are not allocated, even if other members of the user set are allocated. The usage admin can unexclude a user so that the user can be allocated.

### Why a user is not subscribed when you add a user set

- The user set is empty (contains no users).
- The user had been excluded from the subscription.
- The user had already been directly allocated
- Another user set added the user (duplicate user)
- A user could not be allocated because adding the user would exceed the subscription limit. In this case, all users in the user set are set to the Pending state. The names of the users are listed in the Pending Users related list.

### Why a user is not unsubscribed when you remove a user set

- The user set is empty (contains no users).
- The user was already directly allocated
- The user is added from another user set

### Build a subscription user set

You can create a user set using either or both of two methods: Configure a filter (for example, filter by role) that selects particular users from the User (sys_user) table or specify a particular set of user groups from the Group (sys_user_group) table.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscription User Sets.
2. On the Subscription User Sets page, click New and then enter a unique Name (for example, Fulfiller users in the IT department) and Description for the user set.
3. To specify a user set by filtering users:
   a) In the Source field, select User (sys_user).
b) Specify the filters that determine which users to extract from the table. The extracted users make up the user set. For example, filter for `Role` (is) `itil`. The **Conditions** setting is a standard ServiceNow condition builder.

**Tip:** The **Application Roles** related list on the Subscriptions page includes all roles that are loaded with the plugin for the application. The roles in the list (that are identified as Subscription roles) form a good basis for constructing a user set. See [View the roles that are associated with the plugin for a subscription application](#).

c) Click (🔍) to view the number of users that the filter generates. Members of the user set appear in the Subscription User Set Members related list.

4. **To specify a user set based on user groups that should be included in the set:**
   a) In the **Source** field, select **Group (sys_user_group)**
   b) Unlock the **Groups** box and add appropriate groups.
   c) Click (🔍) to view the number of users that the filter generates. Members of the user set appear in the Subscription User Set Members related list.

5. When the Subscription User Set Members related list is correct, click **Submit** or **Update**. The user set that you created is available to add to any subscription.

**Add a user set to a subscription**

When you add a user set to a subscription, all users in the user set are allocated to the subscription.

Role required: usage_admin or admin

1. Navigate to **Subscription Management > Subscriptions**.
2. Click the **Name** of the Per-User subscription to allocate users to.
3. On the **User Sets** related list, click **Edit**.
4. The Add User Sets form displays the list of user sets that you can add. Move the desired user sets from the **Collection** list into the **User Sets** list and then click **Save**. The users in the list are allocated to the subscription and the number of subscribed users is updated.

**Note:** In the case that adding the users would exceed the subscription limit, then none of the users in the user set are subscribed. Instead, all users in the user set are set to the **Pending** state and are listed in the Pending Users related list. Users that are currently subscribed are not affected. See [Manage users in the Pending state](#).

5. Optional: You can configure any subscription to check associated user sets for updates regularly and then update the list of subscribed users accordingly. On the Subscription form, select **Auto-sync with user sets**.

**Note:** If you do not select the **Auto-sync with user sets** option, then the user sets that you add to the subscription are never updated and the list of subscribed users does not auto-update over time.

6. On the Subscription form, click **Update**.
Auto-sync a subscription to user set updates
You can configure any subscription to check user sets regularly to find users who were added or removed. The system regularly subscribes or unsubscribes users based on updates to user sets.

Role required: usage_admin or admin

If the system cannot allocate a user because adding the user would exceed the subscription limit, the user is set to the Pending state and is listed in the Pending Users related list.

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription to update.
3. On the Subscription form, select Auto-sync user sets.
4. Optional: On the Subscription form, click Sync Now to synchronize and update the list of subscribed users immediately.

Remove a user set from a subscription
When you remove a user set from a subscription, the system attempts to unsubscribe all users in the set. User sets are removed regardless of the Auto-sync with user sets setting.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the User Sets list, select all user sets to remove.
4. In the Actions on selected rows list, select Remove From Subscription. On the Remove User Set from Subscription pop-up, click Remove.
   All users in the selected user sets are unsubscribed. If users in the user sets are pending, then the users are removed from the Pending Users list.

Delete a subscription user set
You can delete a subscription user set only if no subscriptions use the user set.

Role required: usage_admin or admin

Note: Deleting a user set is a permanent action — the user set will no longer exist. In contrast, you can remove a user set from a subscription to unsubscribe all users in the user set — the user set will still exist.

1. Ensure that the user set is not used by any subscription.
2. Navigate to Subscription Management > Subscription User Sets and select the user set.
3. Click Delete.

Allocate an individual user from the Subscription form
In addition to adding user sets to a subscription, you can add individual users directly. Users that you allocate directly are subscribed immediately.

Role required: usage_admin or admin

Note: A user set, not individual allocation, is the preferred automated method for managing the pool of users who are subscribed to an application. Once you configure and allocate a user set, you do not need to manage individual users.

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription to allocate users to.
3. Optional: On the Subscription form, to ensure that you do not exceed the purchased subscription limit, click Limit to purchased.
4. On the Subscribed Users related list, click Edit to view a listing of the users you can add.
5. Move the desired users from the Collection list into the Subscribed Users list.
6. Click Save.

The selected users are allocated to the subscription and the Allocated value is updated. If allocating a user would exceed the subscription limit, the user is not subscribed. Instead, the user is set to the Pending state and is listed in the Pending Users related list. See Manage users in the Pending state.
7. Click Update on the Subscription form.

Allocate an individual user from the User Record form

To simplify the process of setting up user capabilities, you can allocate or deallocate an individual user to a subscription while viewing the user data on the User form. Users that you allocate directly are subscribed immediately.

Role required: usage_admin or admin

**Note:** A user set, not individual allocation, is the preferred automated method for managing the pool of users who are subscribed to an application. Once you configure and allocate a user set, you do not need to manage individual users.

1. Navigate to User Administration > Users and then click the Name of the user. The User form opens.
2. On the Manage Subscriptions related list, click Edit.

The Edit Members slushbucket lists the subscriptions that you can allocate the user to.
3. To allocate the user, move a subscription from the **Collection** list into the **Manage Subscriptions** list.

4. **Click Save.**

The selected users are allocated to the subscription and the **Allocated** value is updated. If allocating a user would exceed the subscription limit, the user is not subscribed. Instead, the user is set to the **Pending** state and is listed in the Pending Users related list. See **Manage users in the Pending state**.

To deallocate the user, move a subscription from the **Manage Subscriptions** list into the **Collection** list.

5. **Click Update** on the **User** form.

The **Subscriptions** related list is updated to list all subscriptions that the user is allocated to and the applications that the user is subscribed to.

**Manage users in the Pending state**

Users are set to the **Pending** state when adding the users would exceed the subscription limit (the **Purchased** value).

Role required: **usage_admin** or **admin**

Users are added to the Pending Users list when you attempt to allocate users in the following situations:

- User sets: If adding the user set exceeds the subscription limit, the user set is not added and all users in the set are set to the **Pending** state.
- Individual user: If allocating a user directly would exceed the subscription limit, the user is not subscribed and is instead set to the **Pending** state.

1. **Navigate to Subscription Management > Subscriptions.**
2. **Click the Name** of the Per-User subscription.
3. In the Pending Users related list, select all users to update.
4. In the **Actions on selected rows** list, select an action.

<table>
<thead>
<tr>
<th>Action</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Allocate selected users</strong></td>
<td>Allocates the users to the subscription and removes the user from the Pending Users list.</td>
</tr>
<tr>
<td></td>
<td>- If the <strong>Limit to purchased</strong> option is selected and adding the selected users would exceed the subscription limit (the <strong>Purchased</strong> value), then the action is not allowed.</td>
</tr>
<tr>
<td></td>
<td>- If the <strong>Limit to purchased</strong> option is not selected and adding the selected users would exceed the subscription limit (the <strong>Purchased</strong> value), then the system displays a pop-up to notify you.</td>
</tr>
<tr>
<td><strong>Exclude from subscription</strong></td>
<td>Excludes the user and removes the user from the Pending Users list.</td>
</tr>
<tr>
<td></td>
<td>Excluded users cannot be allocated to the selected subscription. The auto-sync process does not add excluded users.</td>
</tr>
<tr>
<td><strong>Delete</strong></td>
<td>Removes the selected users from the Pending Users list and performs no other action.</td>
</tr>
</tbody>
</table>
Unsubscribe a user

When you remove a user from a subscription, the user is unsubscribed.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Subscribed Users list, select all users to unsubscribe.
4. In the Actions on selected rows list, select Remove from subscription and then click Remove on the pop-up.

Note: If you unsubscribe a user who is a member of a user set that is associated with an auto-synced subscription, the user will be resubscribed in the next synchronization cycle. To remove such a user, exclude the user.

Exclude a user from a subscription

You can exclude users. Excluded users cannot be allocated to a specified subscription. The auto-sync process does not add excluded users.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Subscribed Users list, select all users to exclude.
4. In the Actions on selected rows list, select Exclude from subscription and then click Exclude on the pop-up.

Remove a user from the Excluded list

You can unexclude a user so that the user can be allocated to a subscription.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the Per-User subscription.
3. In the Excluded Users related list, select all users to unexclude.
4. In the Actions on selected rows list, select Delete and then click Delete on the pop-up.

The selected users are no longer excluded and are removed from the Excluded Users related list. No other action is taken.

Note: The users are not yet allocated to the subscription. You must manually add the users or synchronize the associated update set. On the Subscription form, click Sync Now to synchronize and update the list of subscribed users immediately.

Allocating your custom tables to a subscription entitlement

Allocate custom tables you create in production instances to subscriptions that include custom table entitlements. Performing this task on a consistent basis enables you to track custom table subscription compliance over time.
Custom table entitlements

A custom table is defined as any non-ServiceNow provided table that you create or install on the Now Platform. Some tables are exempted from being classified as a custom table.

**Note:** For a detailed description of custom table use rights, and a listing of exempt ServiceNow provided tables, see the Custom Table Guide on [http://www.servicenow.com/upgrade-schedules.html](http://www.servicenow.com/upgrade-schedules.html).

You can freely create or install custom tables on a non-production instance. However, creation or installation of custom tables on a production instance requires a custom table entitlement granted when you purchase a product subscription. For example, a single subscription might include a total entitlement of 50 custom tables.

**Note:** A custom table entitlement is an individual component of a subscription, but is not a type of subscription itself. Standard licensing metrics, such as fulfiller, requester, and unrestricted, and the subscription types, such as Per-User and Capacity, still apply to subscriptions with custom table entitlements. To learn more about licensing metrics and subscription types, see:

- Subscription Management administration
- Types of subscriptions

Allocating custom tables to custom table entitlements

After you finalize the purchase of a subscription with a custom table entitlement, the entitlement is delivered, with related subscription data, to your production instance. The subscription and custom table entitlement data appear in a subscription record in Subscription Management.

As your developers create and deploy new custom tables on your production instance, use the Subscription form to allocate them to individual subscriptions. You can use Subscription Management dashboards to monitor the current table allocations and their compliance statuses, and take corrective action as needed. To learn more about how this allocation process works, see:

- Allocate your custom tables to subscriptions
- Monitor custom table allocations and subscriptions

Custom table entitlements

Scenario: Your organization has purchased three subscriptions and each has differing table entitlements.

For example, Subscription 1 has an entitlement of 100 fulfillers and a total entitlement of 50 custom tables. Subscription 2 has 20 fulfillers and a total entitlement of 25 custom tables. Subscription 3 has 5000 users and a total entitlement of five custom tables. In total, you can manually allocate up to 80 custom table to these three subscriptions as you create them in your production instance.
Multiple subscriptions with custom table entitlements

<table>
<thead>
<tr>
<th>Subscription</th>
<th>User/custom table entitlements</th>
<th>Can manually allocate up to entitlement quantity of</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>100 fullfillers/50 custom tables</td>
<td>50</td>
</tr>
<tr>
<td>2</td>
<td>20 fullfillers/25 custom tables</td>
<td>25</td>
</tr>
<tr>
<td>3</td>
<td>5000 users/5 custom tables</td>
<td>5</td>
</tr>
</tbody>
</table>

Allowing grandfathered tables on an instance

Sometimes an extra subscription with a grandfathered table entitlement may be delivered to your production instance. This type of subscription triggers an automatic allocation of grandfathered tables to the grandfathered entitlement, up to its specified maximum limit. This one-time process ensures that custom tables that currently exist in a production instance do not count against custom table entitlements for a new ServiceNow subscription. You cannot manually allocate these grandfathered tables to a subscription entitlement.

Once a grandfathered table is auto-allocated to a subscription that has a grandfathered entitlement, this mapping is permanent. Deleting a grandfathered custom table does not free up a custom table entitlement.

**Scenario:** You purchased three new subscriptions, with a total of 80 custom table entitlements. An extra subscription with an entitlement for 23 grandfathered tables has also been delivered to your instance. The grandfathered tables are visible within Subscription Management. This subscription triggers an automatic allocation of the custom tables that currently exist in your production instance, up to its 23 table limit. These subscriptions result in a total custom table entitlement of 103. You manually allocate the remaining 80 as you create custom tables in your production instance.

Multiple subscriptions with legacy and custom table entitlements

<table>
<thead>
<tr>

<td>25</td>
<td>25</td>
</tr>
<tr>
<td>New Subscription 3</td>
<td>5</td>
<td>5</td>
</tr>
</tbody>
</table>

Custom table subscription allocation life cycle

The life cycle begins with the purchase of a subscription, and it continues with the allocation of custom tables. The cycle ends with the monitoring of custom table allocations over time.
3. Monitor custom table allocation over time
• A subscription that contains a custom table entitlement is delivered to your production instance.
• Sometimes an extra subscription with a grandfathered table entitlement may also be delivered. The extra subscription triggers an automatic allocation of legacy custom tables to the entitlement.
• Subscription Management records are automatically updated to reflect the new subscription and grandfathered table entitlement. The subscription is ready for you to administer.

2. Allocate custom tables to custom table entitlements.
   • As you deploy new custom tables on a production instance, you allocate them to the relevant custom table entitlement from the subscription record.
   • You can allocate tables to any subscription with a custom table entitlement, up to the entitlement limit.

3. Monitor custom table allocation over time.
   • Reports provide the current usage of each custom table entitlement, as well as usage over time.

Allocate your custom tables to subscriptions

Allocate specific custom tables to subscriptions that include a custom table entitlement. You perform this allocation process to maintain and track custom table compliance over time. Tracking custom table compliance ensures that your organization does not run out of custom table entitlements and enables you to plan your future subscription purchases.

Role required: usage_admin or admin

1. Navigate to Subscription Management > Subscriptions.
2. Click the Name of the purchased subscription you want to allocate custom tables to.
   If a subscription contains an entitlement of custom tables, you can find the following information about the entitlement:

   **Tables included**
   Number of custom tables that are included in the custom table entitlement for the subscription.

   **Tables used**
   Number of custom tables in production that have been allocated to a subscription with a custom table entitlement. This number increments when you allocate custom tables against the entitlement for the subscription.

   The color coding indicates the percentage of custom tables that have been already allocated. To learn more about how to configure color coding, see Configure the color codes for subscription allocation levels.

3. On the Custom Tables related list, click Edit.
   A listing of all custom tables in the production instance that are eligible for allocation to the subscription appears in the Collection list.

   **Note:** Not all custom tables appear in this list. Examples of tables that do not appear in the list include:
ServiceNow Orlando Now Platform capabilities

- Custom tables that are already allocated to a different subscription with a custom table entitlement.
- Custom tables that are accounted for in the process.
- Custom tables that are exempted.

4. Allocate specific custom tables to the subscription by moving them from the Collection list to the Custom Tables Inventory List.
   You can only select the custom tables that meet the criteria that was outlined in the note of the previous step.

5. On the Subscription form, click Save, and then click Update.

The selected custom tables are allocated to the subscription, and the Tables used value in the Subscriptions list and form is incremented.

Monitoring how your resources are allocated for subscriptions

Manage and monitor how resources, such as users, custom tables, or nodes, are allocated to your organization’s subscriptions throughout the life cycle of your subscriptions. By monitoring the usage of your subscribed applications, you can make better decisions about your subscription purchases.

A typical subscription life cycle is as follows:

1. You receive and view subscriptions after you are notified by email that subscription information has successfully downloaded to your instance. See View your subscription applications and allocation levels.

2. You allocate your fulfiller users to Per-User subscriptions by using the Subscriptions module. Allocation is typically a one-time task with minor maintenance. To learn how to allocate users to this type of subscription, see Allocating users to a Per-User subscription.

   Note: The Now Platform instance automatically allocates all other subscription types.

3. If a subscription contains a custom table entitlement, you allocate the custom tables that are created in a production instance to the subscription entitlement. To learn how to allocate custom tables, see Allocating your custom tables to a subscription entitlement.

4. Monitor and adjust the subscription usage by verifying:
   - How many users are subscribed to specific subscriptions.
   - If you can allocate more users to specific subscriptions.
   - If you see users who are not subscribed. For example, you see out-of-policy users.
   - If some subscriptions are over-allocated. For example, too many subscribers might be allocated to a specific subscription.

To learn how to monitor and adjust the subscription usage, see Monitor how resources are allocated to subscriptions and Monitor subscription compliance.

5. You review the historical activity of the subscriptions by verifying:
   - How usage patterns have changed over time.
   - If a particular application has a high demand.

To learn about reviewing historical subscription activity, see View your subscription applications and allocation levels and View Subscription Management history reports.
6. You review the subscriptions that your organization has purchased and verify their allocation levels. To learn how to review subscriptions, see View your subscription applications and allocation levels.

Monitor how resources are allocated to subscriptions

Monitor how users and resources, such as nodes, transactions, or custom tables, are allocated to your subscriptions over time.

Role required: usage_admin or admin

you can do the following actions:

- Monitor how your resources, such as discovered nodes or password reset requests, use Capacity subscriptions.
- Monitor if the custom tables that are created in your production instance have been allocated to subscriptions with custom table entitlements.
- Plan and budget for upcoming or future subscription needs.
  - Assess whether you have allocated too many fulfiller users to a Per-User subscription. You might need to deallocate some users or purchase a subscription for more users.
  - Assess whether you have allocated too few fulfiller users to a Per-User subscription. You might need to allocate more users.
- Determine whether users who are not subscribed are accessing a subscription application.

Navigate to Subscription Management > Subscription Overview.

The Expired Subscriptions report lists all subscriptions where the service contract term has expired (the end date has passed). Assess whether to renew any subscription that has expired.

The following data appears for a single subscription (at least one month of data is required) in each Subscription Metrics chart:

**Purchased**

The number of resources that were purchased for the subscription.

**Allocated**

The average number of users for the month who are allocated to the subscription.

**Non-subscribed users**

The average number of individual users who performed fulfiller actions in the associated applications without being subscribed to the applications. You can click a data point to view an application.

In the example, the organization updated the purchased subscription from 15 to 20 users in November 2015. In April 2016, the usage administrator allocated an average of 19 users. In addition, one user who was not subscribed performed fulfiller actions in an application that was associated with the subscription.
The **Subscription Allocation** chart is a listing of all subscriptions and their allocation status as described in the table.
Subscription Allocation report

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>One of the following values:</td>
</tr>
<tr>
<td></td>
<td>• For Per-User, Max User, PA Indicator, and Unlimited subscriptions: Name of the subscription that your organization purchased.</td>
</tr>
<tr>
<td></td>
<td>• For Capacity subscriptions: Name of the product, standard offering, option, or add-on that your organization purchased.</td>
</tr>
<tr>
<td></td>
<td>Click a subscription Name to open the Subscription form, where you can view or update how users are allocated to the subscription.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of subscription: Max User, Per-User, Capacity, or Unlimited.</td>
</tr>
<tr>
<td>Start Date</td>
<td>Start and end of the subscription period.</td>
</tr>
<tr>
<td>End Date</td>
<td></td>
</tr>
<tr>
<td>Purchased</td>
<td>Number of users or other resources that the subscription permits to access the subscription application.</td>
</tr>
<tr>
<td></td>
<td>For custom tables, it is the number of custom tables that comprise the entitlement in the purchased subscription.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To learn more about custom table entitlements and allocations, see Allocating your custom tables to a subscription entitlement.</td>
</tr>
<tr>
<td>Allocated</td>
<td>Number of currently allocated users or other resources, such as nodes or transactions.</td>
</tr>
</tbody>
</table>

Monitor subscription compliance

Use the Compliance Overview module to monitor fulfiller actions by subscribed users and by users who are not subscribed to an application that your organization has purchased. In addition, a chart shows usage for applications where your organization has not yet purchased a subscription.

Role required: usage_admin or admin

Navigate to Subscription Management > Compliance Overview to view the following charts:

- The **Unique Application Users** chart shows the number of individual subscribed users who performed fulfiller actions in the application. Each user is counted one time only, regardless of number of accesses.
- The **Unique Out-of-Policy Users** chart shows the number of individual users who performed fulfiller actions in the application without being subscribed to the application. Each user is counted one time only, regardless of number of accesses. This chart might alert you to users in the Pending state or users who are accessing the application without being subscribed.
- The **Application Use Without a Purchased Subscription** chart shows the number of users who performed fulfillment actions in an application even though your organization has not purchased a subscription for the application.

**Monitor custom table allocations and subscriptions**

Monitor how many custom tables are in your instance are allocated to subscriptions. Monitoring custom table allocations is a critical task in ensuring that your organization remains in compliance with subscription entitlements.

Role required: admin

1. Navigate to **Subscription Management > Custom Table Subscription Overview**.
2. Click a tile for more information.

<table>
<thead>
<tr>
<th>Tile</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Custom Tables</td>
<td>Total number of custom tables that you created your production instance.</td>
</tr>
<tr>
<td></td>
<td>To view a listing of subscriptions you allocated the custom tables to, click the tile. To learn more, see <a href="http://www.servicenow.com/upgrade-schedules.html">Review custom and exempt table inventories</a>.</td>
</tr>
<tr>
<td>Tables not Mapped</td>
<td>Total number of custom tables that you have not allocated to custom table entitlements in purchased subscriptions.</td>
</tr>
<tr>
<td></td>
<td>To view a listing of the custom tables you have not allocated to custom table entitlements in subscriptions, click the tile.</td>
</tr>
<tr>
<td>Custom Tables per Subscription</td>
<td>Number of custom table your subscriptions include. It includes the number of custom tables that you allocated to each subscription.</td>
</tr>
</tbody>
</table>

**Review custom and exempt table inventories**

Use the Custom Table Inventory and Exempted Table listings to review the custom and exempted tables in your production instance.

**Note:** For a detailed description of custom table use rights, and a listing of exempt ServiceNow provided tables, see the Custom Table Guide on [http://www.servicenow.com/upgrade-schedules.html](http://www.servicenow.com/upgrade-schedules.html).

**Custom table inventory**

Use Custom Table Inventory to view a listing of the custom tables created in your production instance, and to monitor what subscriptions you allocated them to.

To use Custom Table Inventory, navigate to **Subscription Management > Custom Table Inventory**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Name</td>
<td>Name of the custom table.</td>
</tr>
<tr>
<td>Subscription</td>
<td>Name of the subscription you allocated the custom table to.</td>
</tr>
<tr>
<td>Application</td>
<td>Name of the application that the custom table belongs to. <strong>Global</strong> appears if the custom table is for global use.</td>
</tr>
</tbody>
</table>
Exempted table inventory

Use Exempted Table Inventory to view a listing of the custom tables in your production instance that are exempt from subscription allocations. These tables consist mostly of certain system-related tables, such as sys_portal_page and sys_user_preference, that you extended in your production instance.

To use Exempted Table Inventory, navigate to Subscription Management > Exempted Table Inventory.

### Field | Value
--- | ---
Application Scope | Application scope for the application you allocated the custom table to, or Global for the global scope. The application scope is system-assigned and cannot be changed. For more information about the use of scoping, see Application scope.

**Field | Value**
--- | ---
Exempted by Entity Name | Name of the entity that exempted the custom table from subscription allocation.
Entity Type | Type of entity that exempted the custom table from subscription allocation. For example, if Base Table appears, it denotes that you extended the custom table from a base table designated as exempt.
Table Name | Name of the exempted table. If a u_ prefix appears in the table name, it indicates it is extended from a base table.
Table Reference | Name of the reference or base table you extended the exempt table from.
Table Reference ID | Identifier assigned to the reference table.

Monitor App Engine subscription usage and compliance

Track your App Engine subscriptions with the App Engine Usage dashboard. Use this dashboard to better understand how to manage subscription compliance.

App Engine subscriptions entitle you to develop applications and deploy custom tables in production instances. The App Engine Usage dashboard provides information about each type of active App Engine subscription in your instance and its current compliance status.

For each type of App Engine subscription present on your instance, this compliance dashboard lists:

- The total number of users that are currently allocated to each subscription.
- The number of custom tables that each user in the subscription is entitled to access.
- The list of specific users that are counted against each App Engine subscription.

The dashboard also indicates unlicensed App Engine subscription usage, so you can correct any compliance issues by user, role, or group. Unlicensed usage includes:

- Too many users that are allocated to any given App Engine subscription.
- Individual users with access to more custom tables than are allowed by available entitlements.
Analyze App Engine subscription compliance
Analyze the App Engine Usage dashboard to get a good understanding of your App Engine
subscription compliance, and any issues affecting subscription compliance that may require
correction.

Role required: usage_admin or admin

1. Navigate to Subscription Management > App Engine Usage.
2. To view the users or roles assigned to a specific App Engine subscription, click the subscription’s corresponding tile.

<table>
<thead>
<tr>
<th>Tile</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subscription</strong></td>
<td><strong>n/n allocated</strong></td>
</tr>
<tr>
<td></td>
<td>Total number of users that are currently allocated to the selected App Engine subscription and the total number of users who are licensed to use it. For example,</td>
</tr>
<tr>
<td></td>
<td>1. If 105/100 appears, the subscription is not in compliance because it has 105 currently allocated users, while only 100 users are entitled to use the subscription. A red vertical bar appears, indicating that the subscription is over-allocated and out of compliance.</td>
</tr>
<tr>
<td></td>
<td>Note: To fix this situation, you must remove 5 users from the subscription. To learn how to remove users, see Remove Individual user access to a custom table by role or group or Remove access to a custom table for large numbers of users.</td>
</tr>
<tr>
<td></td>
<td>2. If 85/100 appears, then the subscription is in compliance because it has 85 currently allocated users, and 100 users are entitled to use the subscription. A green vertical bar appears, indicating that the subscription is in compliance.</td>
</tr>
<tr>
<td></td>
<td>Note: Both of these scenarios apply for all types of App Engine subscriptions.</td>
</tr>
<tr>
<td><strong>n-n custom tables</strong></td>
<td>Total number of custom tables that each user can access for the selected App Engine subscription. For example, if 1-5 appears, a Starter subscription lets each entitled user to access from 1 through 5 custom tables.</td>
</tr>
<tr>
<td><strong>Unlicensed</strong></td>
<td>Red vertical bar and an Unlicensed message appears, indicating the unlicensed use of any of the App Engine subscriptions:</td>
</tr>
<tr>
<td></td>
<td>• Users with access to more custom tables than allowed by any purchased App Engine subscription that is present on the instance.</td>
</tr>
<tr>
<td></td>
<td>• Total number of tables that are unlicensed, or over-allocated, based on the total of all purchased App Engine subscriptions.</td>
</tr>
</tbody>
</table>

3. To view the individual users that are assigned to the selected subscription, click the Users related list.
Users related list

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Names of the users who can access the selected subscription. Click a user to view the user’s profile and the related lists of the custom tables and custom applications that they can access.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To learn more about how to manage user compliance, including how to remove individual users that are assigned to an App Engine subscription, see Remove individual user access to a custom table by role or group.</td>
</tr>
<tr>
<td>Entitled Custom Tables</td>
<td>Number of entitled custom tables per user. It is the total number of custom tables that each user can access for the selected subscription.</td>
</tr>
<tr>
<td>Entitled Custom Applications</td>
<td>Number of entitled custom applications per user. It is the total number of custom applications that each user can access for the selected subscription.</td>
</tr>
</tbody>
</table>

4. To view the roles that grant access to the custom tables for the selected subscription, click the Roles related list.

Roles related list

<table>
<thead>
<tr>
<th>Field Granting Access</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roles Granting Access</td>
<td>Names of the individual role that grants custom table access to users that are counted in the selected subscription. Click a role to view the users that are associated with the role.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> To learn more about how to manage roles, including how to remove the roles that grant access to custom tables in an App Engine subscription, see Remove access to a custom table for large numbers of users.</td>
</tr>
<tr>
<td>Entitled Custom Tables</td>
<td>Names of the custom tables that are granted access by the role.</td>
</tr>
<tr>
<td>Entitled Custom Applications</td>
<td>Names of the custom applications that are granted access by the role.</td>
</tr>
<tr>
<td>Users in Subscription</td>
<td>Names of the users in the associated roles.</td>
</tr>
</tbody>
</table>
Note: To learn more about how to manage role compliance, see Remove access to a custom table for large numbers of users.

**Remove individual user access to a custom table by role or group**

Remove an individual user’s access to a role or group to fix situations where too many users have access to custom tables for the subscription.

Role required: usage_admin or admin

The Users related list in the App Engine Usage dashboard lets you view all users who currently use App Engine subscriptions. You can select any user and view their user profile. The user profile lists each custom table and related custom application that the user can access.

1. Navigate to Subscription Management > App Engine Usage.
2. To view the users or roles that are assigned to a specific App Engine subscription, click a subscription tile.
3. In the Users related list, click an individual user to view their standard user profile.
   To learn more about the standard user profile, see User profile page.
4. Click the Entitled Custom Tables related list to view information about the custom tables that the user can access for the subscription.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the custom table that the user is entitled to access.</td>
</tr>
<tr>
<td>Application</td>
<td>Name of the custom application that the custom table belongs to. Global appears if the custom table is for global use.</td>
</tr>
<tr>
<td>Role</td>
<td>Role(s) that grant the user access to the table.</td>
</tr>
</tbody>
</table>

5. To remove the selected user from the subscription, select a line in the Entitled Custom Tables listing.
6. From Actions on selected rows, click Remove user’s access to table.
7. When the Remove User from Role confirmation dialog appears, click OK.
   If you receive a message stating that access to the table was granted via an inherited role or group, you must instead remove the user from the group:
   - Click the Groups related list.
   - Select the user that you want to remove.
   - From Actions on selected rows, click Delete.
   - When the confirmation dialog appears, click Delete.

8. To formally remove the user’s access to the custom table, click Confirm when the final Remove User from Role confirmation dialog appears.

**Remove access to a custom table for large numbers of users**

Adjust roles or remove multiple users from those roles by granting custom table access in the subscription as needed. Use the Roles related list in the App Engine Usage dashboard to view the roles that grant user access to custom tables in a selected App Engine subscription.

Role required: usage_admin or admin
This procedure is similar to the procedure for removing custom table access for an individual user or smaller number of users. However, you may need to remove custom table access for several hundred, or several thousand users. Rather than doing this one by one, you can either:

- Remove the role or roles that grant access to the custom tables for these groups of users, depending on permissions
- Remove large groups of users from these roles.

For example, you would use this procedure if you are developing an application for use in North America and need to remove access for all European users.

1. Navigate to **Subscription Management > App Engine Usage**.
2. To view the users or roles assigned to that specific App Engine subscription, click a subscription tile.
3. In the Roles related list, click a role to view the Role record.
   To learn more about roles and how they relate to users and groups, see **Roles**.
   The Custom Tables related list contains information about the custom tables that the role can access for the subscription:

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Name of the custom application that the custom table belongs to. <strong>Global</strong> appears if the custom table is for global use.</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the custom table that belongs to the application.</td>
</tr>
</tbody>
</table>

4. To view the users assigned to the role, click the Subscribed Users related list.

<table>
<thead>
<tr>
<th>Fields</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>Name of the subscribed user who is assigned to the role.</td>
</tr>
<tr>
<td>State</td>
<td>Indicator of whether this role is active for the user.</td>
</tr>
<tr>
<td>Inherited</td>
<td>Indicator of whether the user has inherited this role from a parent group.</td>
</tr>
</tbody>
</table>

5. To remove users from the role, select the users in the Subscribed Users listing, and from **Actions on selected rows**, click **Remove user’s access to table**.
6. When the **Remove User from Role** confirmation dialog appears, click **OK**.
7. To formally remove the user’s access to the custom table, click **Confirm** when the final **Remove User from Role** confirmation dialog appears.

The selected user’s access is removed from the custom table for the selected subscription. After either remediation action is complete, the subscription compliance automatically updates to reflect the change.

### Survey Management

With the ServiceNow® Survey Management application you can create, send, and collect responses for basic surveys. If installed, you can also use the Survey widget to set up a survey within Service Portal.
ServiceNow Orlando Now Platform capabilities

Explore
- Upgrade to Orlando
- Get started with Survey Management

Troubleshoot and get help
- Ask or answer questions in the IT Service Management forum
- Search the NI Knowledge Base for known error articles
- Contact ServiceNow Technical Support

Get started with Survey Management

Two versions of the application are supported, Survey Management, which is the latest version, and Legacy Surveys. Survey Management improves the user interface and extends the capabilities of the Legacy Surveys application.

**Note:** Survey Management does not support domain separation.

Configuring surveys

There are many options for advanced configuration in Survey Management:
- Create a survey, add questions, and choose recipients, all in one interface.
- Create conditional questions, which appear only when users answer other questions a certain way.
- Restrict a survey so only specific survey users can take it, and send invitations to those users simultaneously. Alternatively, make the survey a public survey so that any user can take the survey, even anonymous users (users who have not logged in to the ServiceNow system).

**Tip:** The assessment_take2 UI page should be public for public surveys. If that page is not public, anonymous users do not have access to the page and public surveys do not work.

- Set a schedule to automatically assign a survey to users and to limit how often the same user can take a survey.
- Customize the look and feel of survey questionnaires.
- Save anonymous survey responses.
- Convert survey responses to numerical scores and view them on scorecards.
- Deactivate a survey for maintenance or to retire it without deleting it.

**Note:** Because surveys use the same tables and other back-end components as assessments, you may see assessment elements such as table and field names in certain places throughout the survey feature.

## Legacy Surveys

Survey administrators can continue to use legacy survey functionality and data, however, it is recommended that you migrate legacy surveys to the Survey Management application. Concurrent use of both survey applications can cause confusion and redundancy.

Survey wizards are not impacted and cannot be migrated.

**Note:** The Legacy Surveys application is not described in the documentation that you are viewing. It is documented on the ServiceNow wiki.

### Survey Management roles

The Survey Management application uses the following roles.
No role is required to take assigned survey questionnaires.

#### Survey Management roles

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
</table>
| Survey administrator (survey_admin) | Create and administer surveys. Survey administrators know what types of surveys are necessary, when to send a survey, and to whom. Survey administrators can use all modules in the Survey application menu. | • survey_reader  
• assessment_admin                                      |
| Survey reader (survey_reader)            | View surveys and related information, such as survey responses, survey groups, scorecards, and reports.                                                                                                           | none                                                |
Key survey terms

These survey terms are used throughout the documentation to describe survey management functions and capabilities.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey definition</td>
<td>Root record on which a survey is built. A survey definition contains information such as the survey name, state, and distribution schedule. Each survey definition has its own categories and questions. Survey definitions are comparable to legacy survey masters.</td>
</tr>
<tr>
<td>Public survey</td>
<td>Any user can take a public survey, even users who have not logged in to the ServiceNow system. For a completed survey, the <strong>Assigned to</strong> field value is Guest.</td>
</tr>
<tr>
<td>Survey category</td>
<td>Represents a theme for survey questions. Categories contain one or more questions. The system creates one category per survey by default. Additional categories are optional.</td>
</tr>
<tr>
<td>Survey question</td>
<td>A question that appears on a survey questionnaire for the associated survey definition. Survey questions are comparable to legacy survey questions.</td>
</tr>
<tr>
<td>Survey user</td>
<td>User who is authorized to receive invitations for a restricted survey.</td>
</tr>
<tr>
<td>Survey instance</td>
<td>Represents one survey questionnaire assigned to one user. Survey instances are comparable to legacy survey instances.</td>
</tr>
<tr>
<td>Trigger condition</td>
<td>Defines a rule that enables the system to send a survey when an action occurs on a table, such as when an incident closes. Trigger conditions are comparable to legacy survey conditions.</td>
</tr>
<tr>
<td>Scorecard</td>
<td>Visual representation of survey responses. Scorecards display a variety of data summaries for one survey definition.</td>
</tr>
</tbody>
</table>

Survey questionnaires

All surveys that are assigned to you appear in your personal assessment and survey queue. No special role is required to complete a survey but you must be logged in and the survey must be assigned to you. When you submit a survey, the system stores your responses.
Survey notification

If the system is configured to send email, it sends you a notification when a survey is assigned to you. The message contains a link to the survey and instructions for viewing the assessment and survey queue.

Take a survey

Surveys that are assigned to you, and that are not complete, appear in your assessment and survey queue.

Role required: none

Each assessment or survey appears as a card in the queue. The card contains helpful information, including the survey name, state, and due date, and a button to launch the questionnaire. Overdue surveys are clearly marked with a red icon and red due date. You must answer every mandatory question, indicated by a red asterisk, before you can submit the survey. If you start to take a survey but cannot complete it, save your responses and return to it later. When you have answered all the questions and are satisfied with the responses, submit the survey.

1. Navigate to **Self-Service > My Assessments & Surveys**.
   Users with the assessment_admin role, including survey administrators, can display other users' assessments and surveys in addition to their own. Use the **Show all** and **Show assigned to me** related links at the bottom of the queue to show and hide assessments and surveys. Click a card assigned to another user to open the associated metric type or survey definition.

2. Click **Take Survey** on a survey card to open the questionnaire.
   If there is more than one survey category, you can click the collapse or expand icon to hide or show the questions in the category.

3. Answer each question to the best of your ability.
   If you are unsure of how to respond to a question or if a question does not apply to a particular record, select **Not Applicable**, if available.

4. Complete one of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Save your responses without submitting them</strong></td>
<td>Click <strong>Save</strong>. You can close the questionnaire and access it later from your queue.</td>
</tr>
</tbody>
</table>

  **Note:** The system does not save the survey if there are invalid responses, such as a letter in a date field. You must enter valid responses or remove invalid responses before you can save the survey.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Submit the survey after answering all questions</strong></td>
<td>Click <strong>Submit</strong>. You cannot return to the questionnaire after submitting.</td>
</tr>
</tbody>
</table>

  **Note:** If there is an unanswered mandatory question or an invalid response, an error message appears and the problematic questions are temporarily highlighted.
Domain separation for Survey Management

This is an overview of domain separation as it pertains to Survey Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: Basic

- There is business logic to ensure data goes into the proper domain for the application’s service provider use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at run time.
- The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Use case: As a service provider when I use chat to respond to a tenant-customer’s message, the client must be able to see my response.

Overview

As a survey creator, survey_admin can create surveys in the assigned domain. A Global domain survey_admin can create or edit survey in any domain.

As a survey taker, a user can access the survey record and take the survey based on the domain of the survey record and user. Global domain users can take a survey in any domain.

How domain separation works in Survey Management

There are several main areas to consider in how domain separation works in Survey Management.

Survey Management in domain-separated instances

The following domains are available by default after activating the Domain Support-Domain Extensions Installer (com.glide.domain.msp_extensions.installer) plugin. Only ServiceNow employees can activate this plugin.

- Global
- Acme
- Cisco

Access to surveys in domain-separated instances

Based on the domain of the survey record and users, users can access the survey record and take the survey.

Global domain users can access survey records in any domain. Users in any other domain can access records in their domain and Global domain. For example, users in the Acme domain can access records in the Acme domain and the Global domain.

Global domain users can take a survey in any domain. Users in any other domain can take surveys in their domain as well as the Global domain. For example, users in Acme domain can take surveys in the Acme domain and the Global domain.
<table>
<thead>
<tr>
<th>Location of the survey record</th>
<th>Users who can access and take the survey</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>Global</td>
<td>Acme</td>
</tr>
<tr>
<td>Global</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Acme</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Cisco</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Any domain user can assign a survey in that domain to the same domain user or a Global domain user. For example, an Acme domain user can assign a survey to a Global domain user or an Acme domain user. Users from other domains are not visible to the Acme domain user.

Although the Global domain user can view a survey from other domains, this user cannot assign the survey of one domain to a user from a different domain. For example, a Global domain user can assign a survey from the Acme domain to another Global domain user or an Acme domain user, but not to a Cisco domain user.

**Note:** When a task is closed in a child domain and the assigned survey is either in the child domain or the global domain, the user from the child domain can then take the survey.

**Trigger conditions in domain-separated instances**

A Global domain user can create a triggered condition for a survey from any domain. The Global domain user can create an incident and trigger the survey by selecting a user from the other domain in the **User field** under **Caller**. However, the Global user cannot assign the survey to the user of different domain.

A user can assign a trigger condition to a survey if the user belongs to the Global domain or the Survey domain.

If there is no domain path for a trigger condition, users from any domain can view the trigger condition. For example, in the `asmt_condition` table that has no column for the domain path, users from the Acme domain can view the trigger condition created by the Cisco domain users.

**Survey responses and results**

There is a metric result record for each user response to each question on every survey instance. Survey results for each question and category are calculated automatically based on the metric result records.

If you use survey result calculations for results and scorecards, ensure that the **positive indicator** field for the question is set appropriately, based on the answer options. To have any results, a category must contain scored questions.

**Survey responses**

Survey responses are stored in the Metric Result (asmt_metric_result) table and display the recipients' answers to each question in a category. To view general results, navigate to **Survey > Survey Responses**. To view results for a particular criterion, use a filter on the Metric Result (asmt_metric_result) table. For example, to view results based on the assignment group, apply a filter condition for assignment group.
Survey metric results

Category results

Category results are stored in the Assessment Category Result (asmt_category_result) table and display the overall ratings for each category based on the weighted value for each scored question. To view these results, navigate to Assessments > Results > Category results and filter the results using the (Type.Evaluation method) (is) (Survey) condition.
A scorecard provides a visual breakdown of survey responses, based on the way questions were answered, by category. To access a scorecard, see View a survey scorecard.

View results for all surveys

You can view the survey responses that are stored on the Metric Result (asmt_metric_result) table. Role required: survey_admin or survey_reader

1. Navigate to Survey > Survey Responses.

Do not confuse this module with Survey > Legacy Surveys > Survey Responses, which displays legacy survey responses.

The Type column displays the survey definition each response is associated with.
2. Select a response to view its details.

**View the results for a survey**

You can view the responses for one survey definition. Survey results are stored on the Metric Result (asmt_metric_result) table.

Role required: survey_admin or survey_reader

1. Navigate to **Survey > View Surveys**
2. Open a survey definition.
3. Under **Related Links**, click **View Responses**, which is available only if there are results.
   - The results are grouped by metric, which is what questions are called in assessments.
4. Open a metric result to view more detail.
   - The metric result contains the user's response and calculated values of interest to advanced survey administrators. Because the Metric Result table is also used by the assessment feature, many field names are not clear in the context of surveys.

**Metric result fields**

List of field descriptions for the Metric Result form.
Metric Result form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment group</td>
<td>Assessment group to which the metric result belongs. An assessment group is a container for survey instances and results generated in a single occurrence. The system generates an assessment group every time at least one survey instance is created. If multiple survey instances are created at once, such as when a survey administrator sends invitations to a list of survey users, they are all stored in the same assessment group.</td>
</tr>
<tr>
<td>Metric</td>
<td>Question that the user answered.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question the user answered.</td>
</tr>
<tr>
<td>Method</td>
<td>Assessment method. Always Assessment for surveys.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time the metric result was last updated.</td>
</tr>
<tr>
<td>Source</td>
<td>Survey definition from which the associated survey instance was generated.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User who completed the survey questionnaire.</td>
</tr>
<tr>
<td>Instance</td>
<td>Survey instance completed by the Assigned to user.</td>
</tr>
<tr>
<td>Actual value</td>
<td>Value obtained from the user response to the question. The actual value is determined by the question data type:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Checkbox</strong>: The actual value is 0 if the check box is cleared and 1 if it is selected.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Choice</strong> or <strong>Likert Scale</strong>: The actual value is equal to the Value of the metric definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Date</strong>, <strong>Date/Time</strong>, or <strong>String</strong>: The actual value is -1 to indicate that these data types do not contribute to category result calculations.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Template</strong>: The actual value is equal to the Value of the template definition associated with the chosen answer option.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Yes/No</strong>: The actual value is 0 if the response is No and 1 if it is Yes.</td>
</tr>
<tr>
<td>Normalized value</td>
<td>Adjusted value that accounts for the Scale definition setting, minimum and maximum values, and other factors.</td>
</tr>
<tr>
<td></td>
<td>The equation that generates the value and an example calculation appear in Normalized value for an assessment.</td>
</tr>
</tbody>
</table>
Normalized value for an assessment

The normalized value is calculated based on a linear equation and the scale definition of the metric. This value can be used for risk assessment.

Normalized value for any metric

The normalized value is directly proportional to the scale definition of the metric. If the scale definition is low, that is, the lower scale values are better, then \( \text{Normalized value} = 1.0 - \text{Normalized value} \).

For reporting purpose, use the Metric Result (asmt_metric_result) table.

\[
\text{Normalized value} = \frac{(\text{Input Value} - \text{Min value defined in metric})}{(\text{Max value defined in metric} - \text{Min value defined in metric})} \times \left( \frac{\text{current metric weight}}{\text{sum of valid metric weight in the metric category}} \right) \times \text{scale_factor}
\]

For example, consider the following scenario.

Calculate the normalized value for the Please rate the competency of the technician metric.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input value</td>
<td>3</td>
</tr>
<tr>
<td>Minimum value</td>
<td>1</td>
</tr>
<tr>
<td>Maximum value</td>
<td>6</td>
</tr>
<tr>
<td>Current metric weight</td>
<td>10</td>
</tr>
<tr>
<td>Number of metrics in the metric category</td>
<td>6</td>
</tr>
<tr>
<td></td>
<td>• 4 of type=number</td>
</tr>
<tr>
<td></td>
<td>• 1 of type=yes/no</td>
</tr>
<tr>
<td></td>
<td>• 1 of type=string (invalid data type; value cannot be calculated)</td>
</tr>
<tr>
<td>Valid metric weight of each response</td>
<td>10</td>
</tr>
<tr>
<td>Scale factor</td>
<td>10</td>
</tr>
</tbody>
</table>

\[
\text{Normalized value} = \frac{(3 - 1)}{(6 - 1)} \times \left( \frac{10}{10 + 10 + 10 + 10 + 10} \right) \times 10 = 0.8
\]

Several data types are ignored because the values cannot be calculated. These invalid data types include string, date, and datetime.
Normalized value for a multiple selection metric

The normalized value for a multiple selection metric is calculated by using the weight of the metric and the score for each choice of the metric.

In a multiple selection metric, for each choice that should be used for the normalization calculation, define the normalization input value.

Normalized value = \( \frac{(\text{Score of all choices}) \times (\text{current metric weight})}{(\text{sum of valid metric weight in the metric category})} \times \text{scale_factor} \)

Here, score of all choices of the metric is the sum of individual scores of each choice.

- Score of each choice in a multiple selection metric = Normalization input of the choice / max value of the metric
- max value of the metric = Sum of the normalization input for all choices of the metric
- min value of the metric is always 0

For example, consider the following scenario.

Calculate the normalized value for the multiple selection metric, Please rate the competency of the technician, with three choices, A, B, and C.

<table>
<thead>
<tr>
<th>Choice</th>
<th>Normalization input</th>
<th>Values of the metric</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choice A</td>
<td>1</td>
<td>Minimum value 0</td>
</tr>
<tr>
<td>Choice B</td>
<td>1</td>
<td>Maximum value 4</td>
</tr>
<tr>
<td>Choice C</td>
<td>2</td>
<td>Current metric weight 10</td>
</tr>
</tbody>
</table>

If Choice A and B are selected, normalized value = \( \frac{(1 / 4) + (1 / 4)}{(10 / (10 + 10 + 10 + 10))} \times 10 = 1 \)

Weighted value for a risk assessment

For a risk assessment, the weighted value from metric results table is calculated as following.

\[ \text{weighted_value} = \text{metric.weight} \times \text{result.actual_value} \]

View a survey scorecard

A survey scorecard provides a visual breakdown of survey responses by category, based on the way questions were answered.

Role required: survey_admin or survey_reader
A scorecard displays charts for survey results, in which category and question responses are analyzed and current ratings are compared with previous ratings. Users can examine ratings over time, compare question ratings, or compare the ratings of all categories. All ratings are averages for the time range selected. The system dynamically updates a scorecard each time you view it, so the ratings reflect recently completed surveys.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Under **Related Links**, click **View Scorecard**. The interactive scorecard displays the following filters:
   - **Question Results**: Displays the result of all questions or an individual question.
   - **Category Results**: Displays the results of all questions associated with an individual category or all categories.
   - **Average Ratings**: Displays the result of weighted average rating for each survey question in an individual category or all categories.
   - **History**: Displays the result of all questions in comparison with their history (by calendar year or quarters).
   - **Sentiment Analysis Results**: Displays the results of sentiment analysis for the survey.

**Note**: The scorecard link is hidden if there are no survey results to report.

### Survey scorecard category results

The Category Results view is a stacked bar chart showing survey results for all questions in an individual category or all categories by respondent count.

Select a category from the list to display the questions from that category in the chart.

This view displays responses that use the following data types:

- Checkbox
- Choice
- Likert Scale
- Number
- Template
- Yes/No
- Multiple selection
- Image Scale
- Numeric Scale

**Note**: The **Checkbox** and **Yes/No** data types are combined into the **Boolean** data type in the Survey Designer.
Scorecard Customer Satisfaction Survey

To view details about a specific response, point to the colored bar to display the response, the number of responses, and the percentage it represents of all the responses to that question.

Survey category results

Survey scorecard category results detail
Survey scorecard question results

The Question Results filter displays the result of all questions or an individual question using charts or lists. For the String, Attachment, Date, Date/time, Reference, and Ranking data types, the results are displayed in the list view. The results of all other data types are displayed in the pie chart view.

Pie chart

The pie chart shows question results for all data types other than those that are displayed in the list view. See Survey question data types.

- Checkbox.
- Boolean.
- Choice.
- Likert Scale.
- Number.
- Percentage.
- Yes/No.
- Image Scale.
- Multiple Selection.
- Template. The question result shows the aggregated net promoter score (NPS) with promoters, detractors, and passives.

<table>
<thead>
<tr>
<th>Question score</th>
<th>NPS category</th>
</tr>
</thead>
<tbody>
<tr>
<td>9 or 10</td>
<td>Promoter</td>
</tr>
<tr>
<td>7 or 8</td>
<td>Passive or Neutral</td>
</tr>
<tr>
<td>0 to 6</td>
<td>Detractor</td>
</tr>
</tbody>
</table>

The result is calculated as:

- %Promoters = Number of promoters / Sample size
- %Detractors = Number of detractors / Sample size
- %Passives = Number of passives / Sample size
- \( NPS = \%Promoters - \%Detractors \)

Note: The Checkbox and Yes/No data types are combined into the Boolean data type in the survey designer.
Service Desk Satisfaction Survey

Survey Scorecard

How courteous and respectful was the technician who responded? (1=poor, 6=excellent)

- 2 = 2 (14.29%)
- 3 = 2 (14.29%)
- 4 = 9 (54.29%)
- 5 = 1 (7.14%)

Survey scorecard average ratings

The Average Ratings view displays the weighted average rating for each survey question in an individual category or all categories.

Use this view to learn how individual questions affect the overall rating for the category. Select a survey category from the choice list to display the chart for that category.
Service Desk Satisfaction Survey

Survey Scorecard

Average question rating in category: Service Desk Satisfaction Survey

Average Normalized value
To view the effect of each question’s ratings on the entire category’s ratings, point to the colored bar. The pop-up box shows the percentage of the total ratings represented by each individual question’s weighted average.

Average ratings detail

Survey scorecard history

The History view compares the current ratings for the categories and their questions with ratings from the previous three years or four quarters.

Ratings that have declined are highlighted in red and display negative numbers. Ratings that have improved are highlighted in green with positive numbers. Arrow icons beside the values in the Diff column indicate the trend of the current survey against the previous survey.

Point to a category to display a line chart that shows the rating trend for that category. Click a category to view the Survey Category form containing the survey questions.
3 years

To calculate the current ratings, the system averages the ratings from the trailing twelve month (TTM) period. The Diff column shows the discrepancy between the current ratings and the previous calendar year's ratings.

</tr>
</tbody>
</table>

Survey scorecard history - 3 years
4 quarters

Quarterly surveys compare the average rating for each question and category in the current quarter against the average ratings from the previous four quarters. The **Diff** column shows the discrepancy between the current ratings and the previous quarter's ratings. The column labels count backward, by quarter from the current quarter. For example, if the current quarter is the 3rd quarter of 2015, then the previous quarters appear as 2nd (2015), 1st (2015), 4th (2014), and 3rd (2014). All four of the previous quarters appear, whether or not there was any data for those quarters.

Survey scorecard history - 4 quarters
Export a survey scorecard as an image

You can export a scorecard as an image to use in presentations or other documents.

Role required: admin or survey_admin

1. Click the menu icon (Menu) and select Save as PNG or Save as JPEG and wait for the export to complete.

2. Click Download and save the scorecard image to a storage location.
Survey administration

Survey administrators—users with the survey_admin role—create and maintain surveys and configure how they are distributed and published. Surveys on Service Portal are also supported.

Survey administration includes the following procedures.

- Create, customize, and publish surveys.
- Write and maintain survey questions.
- Define trigger conditions for when surveys are sent to users, such as when an incident closes.
- Maintain surveys and survey questions as the organization's needs change.

To set up surveys in Service Portal, you must first install Service Portal and then **configure the Survey widget** on the page. The base system includes the Survey widget.

View the overview of all surveys

Use this homepage to view various survey reports such as results by metric type and state.

Role required: admin or survey_admin

You can refresh, add, delete, and rearrange widgets. All reports on the Survey Overview page have demo data.

1. Navigate to **Survey > Overview**.
   The following reports are available:

   **Survey Overview page**

<table>
<thead>
<tr>
<th>Report</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assignment group Customer Satisfaction 90 day average</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey 'Timely Response' 90 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Surveys by Metric Type and State</td>
<td>Assessment Instance (asmt_assessment_instance)</td>
</tr>
<tr>
<td>Service Desk Survey 'Overall Experience' 60 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey 'Tech Courteous' 90 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey 'First Call Resolve' 60 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
<tr>
<td>Service Desk Survey 'Tech Competence' 60 Days</td>
<td>Metric Result (asmt_metric_result)</td>
</tr>
</tbody>
</table>

2. To view the required information, click elements within the reports.
3. To refresh, edit, or close a widget, point to the widget and select the required option.

Survey designer

Users with the survey_admin role can use the survey designer. The survey designer lets you create survey categories and questions, configure the details, and publish the survey to specific users or groups.
You can assign a survey to individual users or groups who receive all the questions from all the categories. You can also customize each question and make it dependent on the response to another question. The following describes the procedures you follow to create and publish a survey:

- Create survey categories.
- Create questions within each category.
- Configure survey details, such as introductory and closing remarks and time limit.
- Select recipients for the survey.
- Publish the survey to the selected users or groups.

**Note:** The survey designer replaces the survey creator in the Legacy Surveys application. If you are using Internet Explorer version 8 or earlier, the system redirects you to the survey creator.

**Survey designer elements**

The survey designer is accessible from Survey > Survey Designer.

The survey designer contains the Controls tab, the Questions tab, the Categories tab, a header bar, and the design canvas.

**Controls tab**

To create a question, drag the appropriate data type control from the Controls palette and drop it onto the designer canvas.
The assessment engine provides a built-in result calculation feature that converts responses to scored question data types to a score from 0 through 10.

### Question data types

<table>
<thead>
<tr>
<th>Data type</th>
<th>Scored</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attachment</td>
<td>No</td>
<td>Question with a Manage Attachments icon that allows users to attach one or more files.</td>
</tr>
<tr>
<td>Boolean</td>
<td>Yes</td>
<td>Question with a check box or <strong>Yes</strong> and <strong>No</strong> choices for user responses.</td>
</tr>
<tr>
<td>Choice</td>
<td>Yes</td>
<td>List of predefined options. For more information, see the definition of the <strong>Choices</strong> field in <em>Create a question in the survey designer</em>.</td>
</tr>
<tr>
<td>Date</td>
<td>No</td>
<td>Date field.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>No</td>
<td>Date and time field.</td>
</tr>
<tr>
<td>Number</td>
<td>No</td>
<td>Number field with predefined minimum and maximum values. The default is 1-10.</td>
</tr>
<tr>
<td>Percentage</td>
<td>No</td>
<td>Percentage field with a prescribed range.</td>
</tr>
<tr>
<td>Scale</td>
<td>Yes</td>
<td>Predefined Likert scale. Answer options appear as radio buttons.</td>
</tr>
<tr>
<td>Numeric Scale</td>
<td>Yes</td>
<td>Selectable number scale. The default is 1-5. Answer options appear as radio buttons.</td>
</tr>
<tr>
<td>String</td>
<td>No</td>
<td>Single or multi-line text field.</td>
</tr>
<tr>
<td>Template</td>
<td>Yes</td>
<td>Choice list of templates that provide a predefined scale of options. For details, see <em>Quiz scorecards</em>.</td>
</tr>
<tr>
<td>Reference</td>
<td>No</td>
<td>Choice list of fields from a specified reference table. This data type does not support reference qualifiers. For example, a user could select a user name if you specify <code>sys_user</code> as the reference table.</td>
</tr>
<tr>
<td>Image Scale</td>
<td>Yes</td>
<td>Question with a choice of images that can be selected. A template can be used to apply the same images to multiple questions.</td>
</tr>
</tbody>
</table>
### Data type | Scored | Description
--- | --- | ---
Multiple Selection | Yes | Question with multiple check boxes that can be selected.
Ranking | | Question with an order number to be selected for each option. One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

### Questions tab

This tab displays all metrics added to the question bank for surveys. Use the **Filter** field to search for questions. Each metric is displayed with its name and type.

### Categories tab

This tab displays all metric categories added to the question bank for surveys. All metrics in the question bank are grouped under the corresponding metric category. Use the **Filter** field to search for categories or questions.

### Header bar

The tabs on the header bar display views and a menu of functions. Click a tab to change the view on the canvas:

- **Design**: Add and configure the properties of categories and questions. This is the default view.
- **Configuration**: Create introductions and end notes for surveys and select a signature.
- **Availability**: Select the recipients for each category in the survey.

Point to the menu icon (≡) to select an option. The list of options depends on the currently open survey:

- **Save**: Save the current survey without changing its state.
- **Preview**: Display a preview of the survey as it appears to recipients.
- **Publish**: Distribute the survey to the selected recipients.
- **Save and Publish**: Save the survey to the Draft state and distribute the survey in one step.
- **New Survey**: Open a fresh canvas for a new survey.
- **Load Survey**: View the list of existing surveys.
- **Copy Survey**: Copy the current survey.

### Design canvas

New surveys open in the canvas of the **Design** view. The survey **Name** field appears above the first category in the canvas. A blank question field appears in the category container.
Configure a survey in the survey designer

Configuration settings apply to the entire survey.
Role required: admin, survey_creator, or survey_admin

1. Navigate to Survey > View Surveys.
2. Open a survey definition in Survey Designer.
3. Select the Configuration tab and complete the Survey Designer Configuration form.

**Configuration tab fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<tr>
<td>Introduction</td>
<td>Introductory content to display on surveys. You can add a welcome message or background information about the survey.</td>
</tr>
<tr>
<td>Signature</td>
<td>Acknowledgement by a survey recipient of requirements, admonitions, or expectations related to a survey.</td>
</tr>
<tr>
<td>Return URL</td>
<td>Destination address of a web page that is presented to users after they submit a completed survey. When a return URL is configured, the <strong>End note</strong> content does not appear.</td>
</tr>
<tr>
<td>End note</td>
<td>Content that is displayed to recipients after they submit a completed survey. You can add a thank you message, follow-up instructions, or other applicable information. End notes are not displayed if a <strong>Return URL</strong> is specified.</td>
</tr>
<tr>
<td>Public Survey</td>
<td>Enables public access to the survey. No login is required to take a public survey and users or non-users can respond anonymously. For completed public surveys, the <strong>Assigned to</strong> field value is Guest. <strong>Note:</strong> This check box is available only after you save the survey.</td>
</tr>
<tr>
<td>Survey Publish URL</td>
<td>Specifies a URL of the survey that can be shared with users. <strong>Note:</strong> This field is available only after you publish the survey.</td>
</tr>
</tbody>
</table>
| Pagination setting for Service Portal view | Specify how the user will see pages on the desktop or tablet view in Service Portal.  
- **Category:** Display each category on a separate page.  
- **Question:** Display each question on a separate page. This happens for mobile regardless of this setting.  
- **None:** All items on a single page—no pagination  
**Default:** **Category**  
**Note:** This field appears only when Service Portal is installed. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Chat Survey           | Option to validate if survey questions are supported in a chat survey. Enables conversational questionnaires (pre-chat and post-chat surveys) in the chat client. Also enables you to map chat context variables to survey questions. For information on a chat survey in ITSM Virtual Agent, see [Surveys in ITSM Virtual Agent](#).  
**Note:** This field is available only when the Glide Conversation Server plugin (com.glide.cs) is activated. |
| One Click Survey      | Enables a One Click survey in Service Portal.  
**Note:** This option can be selected if the [Pagination setting for Service Portal view](#) is set to None.                                                                                       |
| Source Table          | Table whose field is used as a dynamic value for a question in a triggered survey.  
**Note:** When you select a source table, ensure that its relevant field is selected as `Source Field` value of a metric.                                                                                 |
| Allow Sentiment Analysis | Enables sentiment analysis for this survey.                                                                                                                                                                       |
| Duration              | Amount of time that recipients are given to complete this survey, starting from the time that the survey is generated. The default duration is 14 days.  
**Note:** By default, the system runs the [Cancel Expired Assessments](#) script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states. |
| Outlook Actionable Message | Includes an embedded survey in the survey email notification. After you select this check box and save the survey, a validation is run to ensure all survey questions are supported. |

4. Select the **Availability** tab and complete the form,
### Availability tab fields

<table>

**Note:** This field is displayed only if the Accessible by is Specific users.

### Survey categories

Survey categories provide a way to group questions of a similar theme for a given survey.  
There must be at least one survey category per survey definition and every survey question must be associated with a category. When you create a survey, the system generates one category, which all the questions belong to.

For simple surveys, one category is usually enough. Consider creating additional categories if you want to accomplish any of the following tasks:

- Separate groups of questions into collapsible sections by category on the survey questionnaire.
- Report on category scores, which are calculated based on responses for all questions within each category.

**Create a category in the survey designer**

A category represents a theme for evaluating a specific element of the survey topic and contains questions pertaining to that theme.

Role required: admin or survey_admin
When you create a survey, the system creates a default category, using the name of the survey. You can use this category, modify it, and create additional categories as needed. To have any results, a category must contain scored questions.

1. Navigate to **Survey > Survey Designer**.
2. Enter the name of the survey in the **Name** field.
   The system uses this name as the name of the survey and of the first category.
3. To configure the category, click the gear icon in its title bar and complete the following steps in the Properties dialog box.
   a) Enter a new name and a description for the category.
   b) Enter text in the **Details** field that introduces or explains the category to recipients.
   c) Click the **X** icon to close the Properties dialog box and save your settings.

4. To add a new category, click the **+** icon in the title bar of an existing category.
   The new category appears below the category that you selected to create it. You can click the **X** icon in a category header to delete a category that you added in error.

**Create a survey category in a survey**

You can modify an existing survey to add one or more survey categories.

Role required: admin or survey_admin

Only one category is required for each survey, but you can add additional categories as needed.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. In the **Metric Categories** related list, open a category or click **New**.
   Each survey category is stored as a record on the Metric Category (asmt_metric_category) table with a modified view for survey use.
4. Enter the survey category name and description.
   The category name appears on questionnaires when either of the following is true.
   - There is more than one category for the survey.
   - There is only one category and its name is different from the survey definition name. If you create a survey using the survey creator, the category name is the same as the survey definition name.

5. Right-click the form header and click **Save**.
   The **Assessment Metrics** and **Users** related lists appear.
6. Click **Update**.

**Create a question in the survey designer**

You can create multiple questions for each category in the survey designer, but each question can only be associated with one category.

Role required: admin or survey_admin

The data type that you select for each question determines how it can be answered by survey recipients.

1. In the Design view, drag a data type icon from the Controls palette and drop it into a category container.
2. To configure the question, click the gear icon in its title bar.
   The Properties dialog box opens.
3. Complete the form.
## Question property fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Concise name of the question. The system uses this value to identify the question in Assessment Metric lists and in scorecard charts.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to display as the question on surveys. Enter a clear, straightforward question that is easy to understand.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type selected for this question. See the table in <em>Controls</em> for the available data types.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this question is available on a survey. A question does not appear on surveys that are generated after the question becomes inactive.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box to require users to answer the question. Mandatory questions are denoted by a red field status indicator and must be answered before the survey can be submitted. This field is available when the question does not have a dependency and the question type is not <em>Boolean</em> with a check box option.</td>
</tr>
</tbody>
</table>
| Allow Additional Information | If selected, the Additional Information Label field is enabled. The Additional Information Label field value is displayed as a field on the survey response page to provide additional information for a question.  

*Note: This is not applicable for the String and Template data types.* |
| Boolean option         | Whether a check box or a Yes/No list appears as the option for a Boolean question.                                                            |
| String option          | Setting for the appearance of a string field in a question. This field is available when the question type is *String*. The string options include the following.  
- **Single line**: Single-line text field 40 characters in length that allows strings of any length.  
- **String line wide**: Full page width text field that allows a single-line entry of any length.  
- **Multiline**: Full page width multiline text field that allows word wrap and returns... |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Min</td>
<td>Lowest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number</strong>, <strong>Percentage</strong>, or <strong>Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Max</td>
<td>Highest positive whole number that users can enter or select to answer the question. This field is available when the question type is <strong>Number</strong>, <strong>Percentage</strong>, or <strong>Numeric Scale</strong>.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box for including <strong>Not Applicable</strong> as an option for this question. Users can select <strong>Not Applicable</strong> if they do not have sufficient information to respond to a question. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is available when the question does not have a dependency and the question type is not <strong>Boolean</strong> with a check box option.</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box for displaying answer options in a random order. Answer preference is sometimes influenced by the order in which options appear, which can result in biased results. Randomizing options can help prevent this bias.</td>
</tr>
<tr>
<td>Positive indicator</td>
<td>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select <strong>Low values</strong> if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select <strong>High values</strong> if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a <code>${param}</code> placeholder is added at the end of the question label.</td>
</tr>
<tr>
<td></td>
<td>Note: You can move this placeholder anywhere in the question label.</td>
</tr>
<tr>
<td></td>
<td>When a user takes the survey, the question with dynamic value is included in the survey instance and <code>${param}</code> placeholder is replaced with the source field value.</td>
</tr>
<tr>
<td></td>
<td>If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the <code>${param}</code> placeholder is not replaced by any value and is displayed as is in the question.</td>
</tr>
<tr>
<td></td>
<td>For example, if the survey is triggered from a PRB record and the survey question is configured with a dynamic value from Incident, the <code>${param}</code> placeholder in the survey question label is not replaced by any dynamic value and is displayed as is.</td>
</tr>
<tr>
<td></td>
<td>Note: When survey questions are translated to other languages by a survey admin, the <code>${param}</code> placeholder should not be translated.</td>
</tr>
<tr>
<td>Allow Sentiment Analysis</td>
<td>Includes this question for the sentiment analysis of a survey.</td>
</tr>
<tr>
<td></td>
<td>Note: This field is available only for String type questions.</td>
</tr>
<tr>
<td>Details</td>
<td>Information about the question that is displayed on the survey. Include details that help users understand how to answer the question.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Choices</td>
<td>Options for a question with a data type of <strong>Choice</strong> or <strong>Scale</strong>. The system automatically adds text and values that you can edit for each option. You must have at least two options, and each option must have a unique value. Click the + icon to add an option, or click the X icon to delete an option. By default, the system arranges options in the order established by their values. To change the order, drag and drop the options.</td>
</tr>
</tbody>
</table>

**Note:** Value numbers also contribute to the calculations of survey response scores, which can be used by advanced survey administrators. |

4. To create any special conditions that must be met before the question appears on the survey, click the Dependency tab. The question must have a data type of **Boolean**, **Choice**, **Scale**, or **Template**.

5. Select a question in the **Displayed when** field. The system selects the appropriate operator and displays the possible answers for the selected question.

6. Select the answer that satisfies the condition. You can select more than one answer. Selected answers are indicated by a check mark.

The system prevents recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.

7. Click the X icon to close the question properties dialog box and save your settings.

8. To add a question with the same data type as an existing question in the category, click the + icon in the title bar of the existing question.

9. Drag and drop questions to change their order within a category or move them between categories.

10. To delete a question, click the X icon in its title bar.

**Survey question data types**

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.
The following data types are available for surveys:

### Attachment data type

On questionnaires, users can attach one or more files to a question.

Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached to a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See *Administering Attachments* for more information.

### Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select **Boolean**, you must fill in the **Scale definition** field. Select **High** if it is best when users select the check box.

### Choice data type

On questionnaires, users select a value from a list of choices.

If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.
Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Date and Date/Time data types

The Date and Date/Time data types are similar.

- **Date**: On questionnaires, users select a date.

- **Date/Time**: On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

Note: The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select **Number**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

**Percentage data type**

On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally **0** and **100** are appropriate minimum and maximum values. If you choose values other than **0** and **100**, it is usually best to state the range of acceptable answers in the question text.

**Reference data type**

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User (`sys_user`) as the reference table.
String data type

On questionnaires, users enter text. When you select String, the String option field appears. Select one of the following options to determine how the string field appears on questionnaires:

- Single line
Single line wide

Multiline

**Template data type**

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select **Template**, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select **High** if the answer option with the largest template definition **Value** is best.

**Yes/No data type**

On questionnaires, users select **Yes** or **No** from a list.
If you select Yes/No, you must fill in the **Scale definition** field. Select High if Yes is the best answer.

**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

The result behavior depends on the presence of uploaded images. If no selected image is uploaded, then the question shows up blank.

<table>
<thead>
<tr>
<th>Selected Image</th>
<th>Unselected Image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>
</tr>
<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Edit a survey in the survey designer

You can modify surveys using the survey designer.
Role required: admin or survey_admin

You can edit a survey even after it has been distributed, with the following results.

- Added questions are available only on surveys that are distributed after this change.
- Changes to existing questions are immediately available to users before the survey is submitted or during the retake period. This includes changes to the answers, such as additional choices or changes to the data type.
- Deleted questions are also deleted from the distributed surveys in user queues.

**Note:** You can only edit a survey that has the same application scope as that of your current session.

1. Navigate to **Survey > Survey Designer**.
2. Point to the menu icon in the survey header bar, and select **Load Survey**.
3. Select a survey from the list and modify it as needed.
4. Point to the menu icon in the survey header bar, and select **Save** or **Save and Publish**.

When you publish the edited survey, the system generates survey instances for any associated survey users.

**Configure category weights for a survey**

You can assign a weight to each category in a survey. The system calculates results from the weight that you configure.

Configure the Survey Category form to display the **Weight** field.

Role required: admin or survey_admin

Weights are set to a value of 10 by default but can be changed.

1. Navigate to **Survey > View Surveys** and select a survey from the list.
2. In the Survey Definition form, select a category from the **Metric Categories** related list.
3. Edit the default weight value.
4. Click **Update**.

**View a survey instance**

A survey instance represents one questionnaire assigned to one user. You view an instance to verify that survey instances were created, to check the state of a survey instance, or to reassign a survey instance.

Role required: admin or survey_admin

1. Navigate to **Survey > Survey Instances**. The following sub-modules are available based on the state of the instances:
   - **Ready to take**: Displays survey instances that are ready to be taken by the user. By default, these instances are sorted in ascending order by the **Number** field.
   - **In progress**: Displays survey instances that are in progress. By default, these instances are sorted in ascending order by the **Number** field.
   - **Completed**: Displays survey instances that are complete. By default, these instances are sorted in descending order by the **Taken on** field.
   - **Cancelled**: Displays survey instances that are cancelled. By default, these instances are sorted in ascending order by the **Number** field.
- **All**: Displays survey instances in all states. By default, these instances are sorted in ascending order by the **Number** field.

2. Open a survey instance from the required sub-module. By default, the following fields are displayed in the Survey Instance form for all sub-modules other than **Completed**.

   **Note:**
   - When you open an instance in the **Completed** sub-module, you are redirected to the User’s Response page.
   - Each survey instance is stored as a record on the Assessment Instance (asmt_assessment_instance) table with a modified view for survey use.

**Survey Instance form**

<table>
<thead>
<tr>

                                 | · Metric: Displays the survey questions.                                                                                                          |

**Survey users and groups**

Survey users and survey user groups help survey administrators control who can take a survey. Survey administrators can restrict a survey so that only specified users can access it unless a survey administrator manually assigns the survey to a different user. Survey user groups provide a way to quickly designate multiple survey users.

**Administering survey users**

The list of survey users for a survey is visible on the Survey Definition and Survey Category forms. You can add or remove users from the list of survey users at any point. Note that designating a survey user does not automatically generate a survey instance for that user unless both of the following conditions are true:

- The survey definition Schedule period is set to **Daily**, **Weekly**, **Monthly**, or **Yearly**. In this case the system assigns a new survey instance to each survey user at the beginning of each schedule period.
- The user has no instances of the survey that are incomplete or that have not yet reached their expiration date.

You can designate survey users from the Survey Designer, the Survey Definition form, or the Survey Category form.

**Note:** If there are trigger conditions for a survey, do not create survey users. Instead, use the Trigger Conditions form to assign users.

**Create a survey user group**

Survey user groups are groups that have the **Type** field set to survey and display only the information most relevant to surveys. You can assign survey groups or any user group to surveys.

Role required: admin or user_admin
Though it is possible to designate members of any group as survey users, one reason to create a survey group is to view it conveniently in the survey User Groups module.

By default, the Survey Creators user group is available. When you add a user to this group, the user will be assigned the survey_creator role to create surveys, quizzes, or assessments and view only those surveys, quizzes, or assignments created by the user.

1. Navigate to Survey > Administration > User Groups.
2. Click New.
3. Complete the Group form.
4. Right-click the form header and click Save.
   The Group Members and Groups related lists appear.
5. To add group members, complete the following steps.
   a) In the Group Members related list, click Edit.
   b) Select users from the list on the left and add them to the Group Members List on the right.
   c) Click Save.

Select recipients for a survey in the Survey Designer

You can assign survey users while designing or modifying the survey.

Role required: admin or survey_admin

1. In the Survey Designer, click the Availability tab.
2. Under Accessible by:, select the Specific users option, then select users.
3. If desired, select the Survey groups only check box, then select survey user groups or other groups.
4. Click Save.

Designate a survey user

You can designate one survey user at a time from the Survey Definition form.

Role required: admin or survey_admin

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
   There must be at least one category.
3. In the Survey Users related list, click New.
4. Select a User.
5. Click Submit.
   The Survey Definition form reopens.
6. Optional: To remove survey users, in the Survey Users related list, select the check box beside the user, and then select Delete from the action list below the list.

Designate or remove multiple survey users at one time

Use the Survey Category form to designate or remove multiple survey users at a time.

Role required: admin or survey_admin

1. Open a survey definition.
2. In the Metric Categories related list, open a category.
   You can choose any category. The system applies survey user changes to all the survey's categories automatically.
3. In the **Users** related list, click **Edit**.
4. Use the slushbucket to add or remove survey users.
5. Click **Save** to return to the survey category.

   The changes are also reflected in the **Survey Users** related list on the survey definition.

---

**Allow recipients to retake a survey**

You can configure a survey to allow recipients to resubmit their answers as many times as they like, up to the survey’s due date.

Configure the Survey Definition form to display the **Allow retake** field. For more information, see *Configuring the form layout*.

Role required: admin or survey_admin

Results are not calculated for the survey until the configured duration has elapsed. The card in the user’s queue remains visible until the due date of the survey, and a button is displayed to allow retakes.

1. Navigate to **Surveys > View Surveys**.
2. Select a survey from the list.
3. Select the **Allow retake** check box.
4. Click **Update**.

---

**Copy a survey**

Create a copy of a survey with at least one category to reduce the effort of creating another survey with similar data.

Role required: survey_admin or admin

All associated questions (type), configurations, categories, metrics, domain separation rules, and role-based categories are copied. Assigned users, category users, instances, and trigger conditions are not copied.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Perform any of the following steps:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Platform</td>
<td>In the title bar, click <strong>Copy</strong>.</td>
</tr>
<tr>
<td>From Platform</td>
<td>In the title bar, select <strong>Copy</strong> from the context menu.</td>
</tr>
<tr>
<td>From survey designer</td>
<td>1. In the title bar, click Survey Designer.</td>
</tr>
<tr>
<td></td>
<td>2. In the Survey Designer title bar, point to the menu icon (≡) on the header bar and click <strong>Copy Survey</strong></td>
</tr>
</tbody>
</table>

---

**Publish a survey**

You must publish a survey to enable people to receive and complete survey instances.

Role required: admin or survey_admin
The **State** field on the Survey Definition form indicates whether the survey is in the **Draft** or **Published** state.

**Note:** You cannot return a survey to the **Draft** state after it has been published. You do have the option to deactivate a survey by clearing the **Active** check box.

1. Navigate to **SurveyView Surveys** and select a survey to publish.
2. Click **Publish**.
   - When you publish a survey, the system generates survey instances for any associated survey users. You can assign the survey to other users manually.

**Publish a survey in the Survey Designer**

You must save changes to a survey before you can publish it to the specified recipients or groups.

Role required: admin or survey_admin

1. In the Survey Designer, point to the menu and select **Load Survey**.
2. Select a survey to publish.
3. To preview the survey as a user, point to the menu icon and click **Preview**.
4. When you are satisfied with the survey, click either **Save and Publish** or **Publish** to distribute it.
   - When you publish a survey, the system sends email notifications to the recipients and to their managers. The system displays a link to the survey on a card in each recipient’s My Assessments & Surveys portal.

**Customize the appearance of a survey**

Assessment and survey administrators can set properties to customize the color of various elements on the questionnaires.

Role required: admin or survey_admin

For color properties, enter either an HTML color name or hexadecimal (hex) value. For hex values, the `#` character is required. Values are not case-sensitive.

For example, all of the following formats are valid: `LightGray`, `lightgray`, `#D3D3D3`. A preview of the color appears next to the field.

Note that the customizations you make apply to all assessments and surveys.

1. Navigate to either of the following modules.
   - **Assessments > Admin > Assessment Properties**
   - **Survey > Administration > Properties**

2. On the properties page, edit the properties as needed.
   - Refer to the screenshot below to see what parts of assessment questionnaires are controlled by the properties.
3. Click **Save**.
   You may need to clear the browser’s cache to see updates.

**Assessment and survey properties**

You can configure a variety of properties to customize the appearance of assessment and survey questionnaires, require authentication for user signatures, open surveys in the service portal view from emails, and limit the number of items shown in a decision matrix field filter.

<table>

</tbody>
</table>
Survey definitions

A survey definition is the root record upon which a survey is built.

The survey designer generates a survey definition automatically when you save or publish the survey. Survey administrators may want to modify the survey definition to configure additional options for the survey, or to publish the survey when it is ready for distribution.

Survey administrators and survey readers can also send survey invitations directly to users from the survey definition.

Modify a survey definition

You can configure additional options for a survey definition.

Role required: admin, survey_creator, or survey_admin

1. Navigate to Survey > View Surveys.
   Each survey definition is stored as a record on the Assessment Metric Type [asmt_metric_type] table with a modified view for survey use.

2. Open a survey definition.
   The Response Trend chart with the weekly trend of the survey instance count, and the Survey Summary chart with the overall summary response based on instance states are displayed.

3. Modify the fields on the Survey Definition form.

   Note: You can only edit a survey that has the same application scope as that of your current session.

Survey Definition form

<table>
<thead>

</tbody>
</table>
| Scheduled job  | Scheduled job that the system creates for this survey definition when the schedule period is a repeating interval. The system sets the scheduled job to run according to the selected schedule period. If you change the schedule period and save the survey definition:  
  - The system deletes the old scheduled job.  
  If you selected a recurring schedule period:  
    - A new scheduled job is created.  
  For example, if you change the schedule period from **Daily** to **Weekly** and save the record:  
    - The system deletes the daily scheduled job.  
    - Creates a weekly one set to run a week from the current date.  
  This field is visible to administrators only if the schedule period is **Daily**, **Weekly**, **Monthly**, or **Yearly**. |
| Assessment duration | The length of time to complete assigned survey instances, starting from the time the survey instance is generated. The assessment duration sets the Due date for each survey instance. The default duration is 14 days. Configure the form to view this field. |
| Send notifications | send notifications for the survey when it is published. Configure the form to see the field.                                                                                                             |
| Other Options  |                                                                                                                                                                                                           |
| Sample Metric  | A metric of the current survey that you can include as an image in the email or invitation sent to a survey user. When the survey user clicks the image in the email or while previewing the HTML body, the entire survey is available to be taken.  
  **Note:** You cannot edit or delete a metric that is selected in this field. |

[Note: By default, the system runs the **Cancel Expired Assessments** script every 30 days to cancel expired survey, assessment, and quiz instances that are in the Work in progress or Ready to take states.]
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Signature                     | Acknowledgement by a survey recipient of requirements, admonitions, or policies related to the survey. The signature may require the recipient to select a check box or to type in a full signature to verify having read these assertions. You can display assertions without requiring a signature. Select an existing signature from the list or click **New** to create a new one. The signature form contains these fields:  
  - **Name**: Descriptive name for this signature.  
  - **Signature type**: Type of signature required. The selections are **Check box**, **Full name**, or **Assertion only**. If **Assertion only** is selected, no signature is required to submit the survey.  
  - **Assertion**: Text you want to display to recipients.  
  By default, a property called **Require authentication for user signature** (com.snc.assessment.signature_authentication) requires users to authenticate when providing a full name signature. |
| Schedule period                | Option that determines how often a user can take the same survey and whether the system generates survey instances on a schedule.                                                                                   |
|                               | **Note**: If you use a trigger condition for a survey, ensure the schedule period is set to **No Limit**. Trigger conditions use a different method to regulate how often users can receive survey instances.                  |
| Do not show survey introduction notes | Check box to skip the introduction notes when a survey is launched. This functionality is applicable in both the Now Platform and Service Portal product versions.                                                                 |
| Pagination setting for Service Portal view | The setting on which the pagination is based for desktop or tablet view in Service Portal.  
  - **Category**: default  
  - **Question**: 1 question per page (automatic for mobile)  
  - **None**: no pagination  
  **Note**: This field is displayed only when Service Portal is installed. |

</table>

4. Save the record.

**Schedule periods**

The available schedule periods are **Only Once**, **No Limit**, **Daily**, **Weekly**, **Monthly**, and **Yearly**.

The default schedule period is **No Limit**. When you set the schedule period to anything except **Only Once** or **No Limit**, the system creates a corresponding scheduled job. The scheduled job performs the following actions.

- Ensures that a user can take one survey instance of the same survey per schedule period.
- Generates a new survey instance for each survey user at the beginning of the new schedule period, as long as the survey user does not have an incomplete instance of that survey. A survey instance is incomplete if the state is not **Complete**.

For example, if you set the schedule period to **Monthly** and someone attempts to **send survey invitations** twice in the same day, the system generates survey instances for the survey users the first time only. At the beginning of the next schedule period, the system generates another survey instance for each survey user who completed the previous one.

Schedule periods are enforced by the **Expiration date** field on the survey instance. As long as the survey instance expiration date has not passed, the assigned user cannot receive a new survey instance. When the system generates a survey instance and the schedule period is anything except **No Limit**, the **Expiration date** field is automatically set to the appropriate date. For example, if the schedule period is **Weekly**, the expiration date is a week after the survey instance is generated.

If you change the schedule period, the scheduled job updates automatically to the correct schedule. However, users who have survey instances for the survey cannot receive new survey instances until their existing survey instances expire, regardless of the new schedule period.
Consider the following example: Sal Pindell receives a survey instance when the schedule period is *Weekly*. The next day, a survey administrator changes the schedule period to *No Limit*. Sal cannot receive another survey instance until one of the following actions occurs.

- Seven days pass from the time Sal’s survey instance was generated.
- A survey administrator deletes Sal’s survey instance.

After one of these actions occurs, Sal can receive a new survey instance anytime, as long as he has no incomplete instances of the survey.

**Note:** If you use a trigger condition for a survey, ensure the schedule period is set to *No Limit*. Trigger conditions use a different method to regulate how often users can receive survey instances.

**Create a survey designer template question**

You can create a question that uses choice lists from a template.

**Role required:** admin or survey_admin

1. Navigate to **Survey > Survey Designer** and load a survey or create a new survey.
2. Drag the **Template** data type icon into a category container.
3. Click the gear icon in the question title bar to open the template properties dialog box.
4. Select a predefined scale from the list.
Question entry fields appear for that template.

5. Enter one or more questions that are appropriate for the template.
6. Click the arrow to the right of a question to configure its properties. You must provide a name for each question.
7. Click the back arrow to return to the template properties dialog box.
8. Configure the properties for the remaining questions.
9. Click the X icon to close the template properties dialog box and save your settings.

Survey questions

Survey questions appear on survey questionnaires for the associated survey definition.

The survey creator generates questions and answer options automatically. However, it provides only the basic configuration options for questions, such as the question text and the data type. You may want to create additional questions or set advanced configuration options for the questions, including making a question appear conditionally or making a question mandatory. You can also use question templates to define reusable sets of answer options.

Survey questions are available from Survey > Questions. The list displays information about each question, including the associated survey definition listed in the Type column, and the data type. Survey administrators can modify these questions.

Create or modify survey questions

You can create and administer survey questions.
Role required: admin or survey_admin

Changes to a survey, such as the addition of questions or the modification of question templates, do not apply immediately to the existing survey instances. However, the changes apply immediately to any new survey instances that are created after the changes are saved.

1. Navigate to Survey > View Surveys.
2. Open a survey definition.
3. In the Metric Categories related list, open a category.
4. In the Assessment Metrics related list, open an existing question or click New.
   Each survey question is stored as a record on the Assessment Metric (asmt_metric) table with a modified view for survey use.
5. Complete the Survey Question form.
   The fields that appear depend on the selected Data type.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the question. When you create a survey, the question name is the same as the text in the Question field.</td>
</tr>
<tr>
<td>Question</td>
<td>Text to use for the question, which appears on survey questionnaires.</td>
</tr>
<tr>
<td>Data type</td>
<td>Data type of the question. The fields for the response depend on the data type.</td>
</tr>
</tbody>
</table>

   **Note:** If another question depends on this question, you cannot change the data type.

<table>
<thead>
<tr>
<th>Template</th>
<th>Question template to use for the answer options.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This field is visible and required only if the data type is Template.</td>
</tr>
</tbody>
</table>

   **Note:** If another question depends on this question, you cannot change the template.

<table>
<thead>
<tr>
<th>Scale definition</th>
<th>Setting that determines whether smaller or larger numerical values equate to a good score in result calculations. Select Low if smaller numerical values are better, such as for a question that measures the number of incidents for a vendor. Select High if larger numerical values are better, such as for a question that measures user satisfaction on a scale of one to five.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This field is visible and required only when certain data types are selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Randomize answers</td>
<td>Check box that determines whether to present the answer options for this question in a random order each time a user opens the survey. Answer preference is sometimes influenced by the order in which answer options appear, which can result in biased results. Randomize answer options to help prevent this bias. This field is visible only if the data type is <strong>Choice</strong> or <strong>Likert Scale</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Randomizing answer options may make a question confusing. In general, only randomize answer options that do not follow a logical order.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>Check box that makes the question mandatory (selected) or optional (cleared) on survey questionnaires. Users cannot submit questionnaires until they provide valid responses to all mandatory questions, which are denoted by a red field status indicator. This field is visible only when the <strong>Depends on</strong> field is empty and the data type is not <strong>Checkbox</strong>. Questions that depend on other questions and check box questions cannot be mandatory.</td>
</tr>
<tr>
<td>Allow not applicable</td>
<td>Check box that determines whether to include a <strong>Not Applicable</strong> answer option for this question on survey questionnaires. User responses of <strong>Not Applicable</strong> are excluded from results calculations. This field is visible only if the data type is <strong>Choice</strong>, <strong>Likert Scale</strong>, <strong>Template</strong>, or <strong>Yes/No</strong>.</td>
</tr>
<tr>
<td>Allow Additional Information</td>
<td>If selected, the <strong>Additional Information Label</strong> field is enabled. The <strong>Additional Information Label</strong> field value is displayed as a field on the survey response page to provide additional information for a question.  <strong>Note:</strong> This is not applicable for the <strong>String</strong> and <strong>Template</strong> data types.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Depends on</td>
<td>Setting used to make this a conditional question, meaning that it only appears when users answer another question a certain way. To make a question depend on another question, select an existing question from the list, which displays <strong>Checkbox</strong>, <strong>Choice</strong>, <strong>Template</strong>, and <strong>Yes/No</strong> questions of the same category as this question. Then, use the <strong>Displayed when</strong> field to set the conditions that cause this question to appear on surveys. The system prevents the creation of recursive dependencies between questions. For example, if Question A depends on Question B, Question B cannot depend on Question A.</td>
</tr>
<tr>
<td>Displayed when</td>
<td>Answer options for the selected <strong>Depends on</strong> question which, when chosen on surveys, display this question. This field is visible and required only when the <strong>Depends on</strong> field is set.</td>
</tr>
<tr>
<td>Min</td>
<td>Smallest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is <strong>Choice</strong>, <strong>Likert Scale</strong>, <strong>Number</strong>, or <strong>Percentage</strong>.</td>
</tr>
<tr>
<td>Max</td>
<td>Largest numerical value to be used as an answer option for this question. This field is visible and required only if the data type is <strong>Choice</strong>, <strong>Likert Scale</strong>, <strong>Number</strong>, or <strong>Percentage</strong>.</td>
</tr>
<tr>
<td>String option</td>
<td>Selection that determines what kind of response text box appears for this question on survey questionnaires. This field is visible and required only if the data type is <strong>String</strong>.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Field</td>
<td>Source table field that appears as a dynamic value for the question in a triggered survey. When this field value is selected, a ${param} placeholder is added at the end of the question label.</td>
</tr>
</tbody>
</table>

**Note:** You can move this placeholder anywhere in the question label.

When a user takes the survey, the question with dynamic value is included in the survey instance and \$\{param\} placeholder is replaced with the source field value.

If the record table specified in the trigger condition does not match the source table specified for the survey, or if the system fails to get the dynamic value from the source record, the \$\{param\} placeholder is not replaced by any value and is displayed as is in the question.

For example, if the survey is triggered from a PRB record and the survey question is configured with a dynamic value from Incident, the \$\{param\} placeholder in the survey question label is not replaced by any dynamic value and is displayed as is.

**Note:** When survey questions are translated to other languages by a survey admin, the \$\{param\} placeholder should not be translated.

<table>
<thead>
<tr>
<th>Allow Sentiment Analysis</th>
<th>Includes this question for the sentiment analysis of a survey.</th>

This related list is available only if the Data type is Choice or Likert Scale.                                                                 |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

6. Save the record.

**Note:**
- Be sure to create answer options if you select the Choice or Likert Scale data type.
Survey question data types

You must choose a data type for each survey question. The data type determines the format of the question and the kind of data that is collected on survey questionnaires.

The following data types are available for surveys:

Attachment data type

On questionnaires, users can attach one or more files to a question. Users click the Manage Attachments icon and select one or more files in the Attachments pop-up window to attach to the question. From this window, users can:

- View a list of the attached files.
- View an attached file in a separate window.
- Rename an attached file.
- Add or delete files

Once a survey has been submitted, attachments cannot be updated or deleted.

Any type of file supported by the platform can be attached to a question. One or more files can be attached a question while taking a survey or completing an assessment.

The assessment administrator can see the attachments associated with an individual question as well as those associated with the survey.

See Administering Attachments for more information.

Boolean data type

On questionnaires, users select a check box beside a statement or leave it cleared.

If you select Boolean, you must fill in the Scale definition field. Select High if it is best when users select the check box.

Choice data type

On questionnaires, users select a value from a list of choices.
If you select **Choice**, you must fill in the **Scale definition** field and create answer options. Select **High** for the scale definition if the answer option with the largest metric definition **Value** is best.

**Note:** The system sets the **Min** and **Max** fields automatically based on the **Value** settings for the associated metric definitions.

### Date and Date/Time data types

The **Date** and **Date/Time** data types are similar.

- **Date:** On questionnaires, users select a date.
  - ![Date selection](image)
  - **Date/Time:** On questionnaires, users select a date and time.
Likert Scale data type

On questionnaires, users select a multiple choice value from a custom Likert scale. Each answer option is represented by a radio button on the scale. A Likert scale question that evaluates an application’s ease of use might have the answer options Easy, Average, and Difficult.

If you select Likert Scale, you must fill in the Scale definition field and create answer options. Select High for the scale definition if the answer option with the largest metric definition Value is best.

**Note:** The system sets the Min and Max fields automatically based on the Value settings for the associated metric definitions.

Number data type

On questionnaires, users enter a number.
If you select **Number**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger number is better, such as for a question that measures the number of sales made in a quarter.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. State the range of acceptable answers in the question text.

### Percentage data type

On questionnaires, users enter a number.

If you select **Percentage**, you must fill in these additional fields:

- **Scale definition**: Select **High** if a larger percentage is better, such as for a question that measures the percentage of work an agent has completed.
- **Min** and **Max**: Enter the smallest and largest numbers users can enter. Generally **0** and **100** are appropriate minimum and maximum values. If you choose values other than **0** and **100**, it is usually best to state the range of acceptable answers in the question text.

### Reference data type

On questionnaires, users select a value from a list that is generated from a specified reference table. The response field supports auto-completion.

**Note**: Reference qualifiers are not supported.

For example, a user could select a user name in response to a question if you specify User (sys_user) as the reference table.
String data type

On questionnaires, users enter text. When you select **String**, the **String option** field appears. Select one of the following options to determine how the string field appears on questionnaires:

- **Single line**
Template data type

On questionnaires, users select a value from a predefined series of answer options. To use this data type, a question template must be defined.

If you select Template, you must fill in these additional fields:

- **Template**: Select a template.
- **Scale definition**: Select High if the answer option with the largest template definition Value is best.

Yes/No data type

On questionnaires, users select Yes or No from a list.
If you select Yes/No, you must fill in the Scale definition field. Select High if Yes is the best answer.

**Image Scale data type**

On questionnaires, users select an image from a predefined set of images as their response. Image scale questions can also be used in a template for better performance with surveys that have the same type of answer options.

Five emojis, similar to the Likert scale (very dissatisfied to very satisfied) are provided. However, you can upload additional images in JPG, PNG, or GIF format. Two images can be uploaded, one for selected case and another for unselected case. Larger size images are reduced to 64 x 64 pixels.

<table>
<thead>
<tr>
<th>Selected Image</th>
<th>Unselected Image</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Unselected image loads. Clicking on the image changes it to the selected image.</td>

<tr>
<td>Yes</td>
<td>No</td>
<td>Selected image loads with 50% opacity. Clicking on the image changes the opacity to 100%.</td>
</tr>
<tr>
<td>No</td>
<td>Yes</td>
<td>A blank placeholder box is displayed.</td>
</tr>
<tr>
<td>No</td>
<td>No</td>
<td>A blank placeholder box is displayed.</td>
</tr>
</tbody>
</table>

**Note:** N/A option is not supported for image scale type question.

**Multiple selection data type**

On questionnaires, users can select multiple check boxes indicating all answers that apply. For instance, a user can be instructed to “Select all that apply” in a multiple selection question.
Ranking data type

On questionnaires, users can select a different order number for each option to rank them. Drag-and-drop functionality is also supported, which allows a user to either fill in the number, or simply drag an option.

1. Please rate following device in order of importance.

One order number cannot be selected twice. This question can be mandatory and it can also be dependent on a parent question, but not vice versa.

Survey question template

Question templates define reusable sets of answer options for survey questions.
Question templates define reusable rating scales for answering questions, where each answer option on the scale is a template definition. For example, the template named Satisfaction represents a satisfaction scale and contains the following template definitions: Very Satisfied, Satisfied, Neutral, Dissatisfied, and Very Dissatisfied.

### Template definition

Templates are available for survey questions that have Data type set to Template. The following question templates are available in the base system. You can create or update a template as described in Create a survey question template.

<table>
<thead>
<tr>
<th>Name</th>
<th>Template definitions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amount</td>
<td>None, Few or little, Average amount, Many, Quite a lot</td>
</tr>
<tr>
<td>Complexity</td>
<td>Very Complex, Complex, Moderate, Simple, Very Simple</td>
</tr>
<tr>
<td>Frequency</td>
<td>Never, Seldom, Sometimes, Most of the time, All of the time</td>
</tr>
<tr>
<td>Likert 5</td>
<td>Strongly Disagree, Disagree, Neutral, Agree, Strongly Agree</td>
</tr>
<tr>
<td>Quality</td>
<td>Very Poor, Poor, Average, Good, Very Good</td>
</tr>
<tr>
<td>Satisfaction</td>
<td>Very Dissatisfied, Dissatisfied, Neutral, Satisfied, Very Satisfied</td>
</tr>
<tr>
<td>Size</td>
<td>Very Small, Small, Average, Large, Very Large</td>
</tr>
</tbody>
</table>

**Create a survey question template**

You can create and administer question templates.

Role required: admin or survey_admin

Changes to a survey, such as the modification of question templates, apply to existing survey instances immediately. Templates that you create are available for use with both surveys and assessments.

1. Navigate to Survey > Templates.
   Each template is stored as a record on the Assessment Metric Template (asmt_template) table.
2. Click New.
3. Enter a Name.
4. Right-click the form header and click Save.
5. In the Assessment Template Definitions related list, click New.
Create a template definition for each answer option you want to appear on a question.

6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Enter the text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter a numeric value, greater than or equal to zero, to which the answer option equates. Values are used in results calculations. When you view questions that use templates, answer options appear in order from smallest to largest Value. Each template definition for a given template must have a unique Value.</td>
</tr>
</tbody>
</table>

7. Click Update.

*Update min and max values to match templates*

If you use survey result calculation data, ensure that the Min and Max values for a question that uses a template are equal to the smallest and largest template definition Value.

Role required: admin or survey_admin

When you create a question of the Template data type, the system sets the Min and Max fields based on the template definition values. The fields for existing questions are not updated if you add a new template definition to a template or if you update the Value of an existing template. If the new Value is less than the minimum value or greater than the maximum value of any questions that use the template, update the questions accordingly.

1. Navigate to Survey > Questions.
2. Configure the list to show the Min and Max columns.
3. Add the following list filter condition: [Template] (is) (<select the template you updated>).
4. Ensure the Min and Max values match the smallest and largest template definition Value for the selected template.

   If the values do not match, edit the Min and Max values directly from the list.

   **Note:** When the data type is Template, a UI policy prevents the editing of Min and Max from the form.

*Add a metric category and metric in the question bank for surveys*

Reuse the question categories (metric categories) and questions (metrics) added in the question bank for surveys. You can add metric categories or metrics from the question bank to a survey, or from the survey to a question bank.

Role required: admin or survey_admin

Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

1. Navigate to Survey > Question Bank.
2. Click New.
3. In the Metric Category form, fill the fields.
### Metric Category fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the metric category.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the metric category.</td>
</tr>
<tr>
<td>Total metrics</td>
<td>Total number of metrics in the metric category. This number is automatically updated when you add or delete metrics from the category.</td>
</tr>
</tbody>
</table>

4. Right-click on the title bar and click **Save**.
5. In the Assessment Metrics related list, click **New**.
6. In the Survey Question form, fill the fields. For information on these fields, see [Create or modify survey questions](#).
7. Click **Submit**.

Configure metric categories or metrics for a survey using the question bank

Reuse question categories (metric categories) and questions (metrics) from the **Question Bank** module while creating or updating a survey.

Role required: admin or survey_admin

Activate the Survey Question Bank Sample Data plugin (com.snc.question_bank_data) to access the demo data for the question bank.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Optional: To add metric categories to a survey from the question bank in Platform, perform the following steps.

   a) In the Metric Categories related list, click **New Category from Bank**.
      The New Category from Bank dialog box is displayed with a list of all metric categories added in the question bank.

   b) Select the required categories and click **Add Selected**.
      A copy of the metric category and the corresponding metric definitions is created in the Metric Categories related list.

4. Optional: To add metrics to a survey from the question bank in Platform, perform the following steps.

   a) In the Metric Categories related list, open a metric category definition.
   b) In the Assessment Metrics related list, click **New Metric from Bank**.
      The New Metric from Bank dialog box is displayed with a list of questions available in the question bank.

   c) Select the required metrics and click **Add Selected**.
      A copy of the metric and the corresponding metric definitions is created in the Assessment Metrics related list of the category.

5. Optional: To add a metric category to the question bank from a survey in Platform, perform the following steps.

   a) In the Metric Categories related list, open a metric category definition.
   b) Click **Add to question Bank**.
A copy of the category is created along with its metrics and metric definitions in the question bank.

6. Optional: To add a metric to the question bank from a survey in Platform, perform the following steps.
   a) In the Metric Categories related list, open a metric category definition.
   b) In the Assessment Metrics related list, open the required metric definition.
   c) Click Add to Question Bank.
      The Add to Question Bank dialog box is displayed.
   d) In the Choose a question bank to add this question/metric field, select a metric category that you want to add this metric to, and click OK.
      A copy of the metric and the corresponding metric definitions is created for the selected category in the question bank.

7. Optional: To add a metric category or metric to a survey from the question bank in Survey designer, perform the following steps.
   a) Open the survey in Survey Designer.
   b) Optional: To add a metric category from the question bank, from the Categories tab in the left panel, drag the required category banner and drop in the Design tab.
   c) Optional: To add a metric from the question bank, drag and drop the required metric from the Questions tab or the Categories tab.

**Note:**
- When you drag and drop a metric category, all dependencies within the category are also added to the survey.
- From the Categories tab, you can drag and drop an individual metric within a metric category.
- When you drag and drop a parent metric, all dependent questions are also added to the metric category.
- When you drag and drop a child metric, only the child question is added to the metric category.

**Create or modify answer options**

You must create answer options, called metric definitions, for survey questions that have Data type set to Choice or Likert Scale.

**Role required:** admin or survey_admin

Changes to a survey, such as the addition or modification of answer options, apply to existing survey instances immediately.

1. Navigate to Survey > Questions.
2. Open a choice or Likert scale survey question.
3. In the Assessment Metric Definitions related list, open a metric definition or click New.
   - Each answer option is stored as a record on the Assessment Metric Definition (asmt_metric_definition) table.
4. Complete the Assessment Metric Definition form.
Assessment Metric Definition fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Text to appear as the answer option.</td>
</tr>
<tr>
<td>Value</td>
<td>Numeric value, greater than or equal to zero, to which the answer option equates. Values determine the order in which answer options appear. See the example below. Values are also used to calculate survey results. Each metric definition for a given question must have a different Value.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

On survey questionnaires, the answer options for a question appear in order from smallest to largest **Value**. For example, consider the survey question **How do you feel?** with the answer options **Good**, **Neutral**, and **Bad**. The following table shows the answer option order based on the **Value**.

<table>
<thead>
<tr>
<th>Answer option</th>
<th>Value</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Good</td>
<td>1</td>
<td>First</td>
</tr>
<tr>
<td>Neutral</td>
<td>3</td>
<td>Second</td>
</tr>
<tr>
<td>Bad</td>
<td>5</td>
<td>Third</td>
</tr>
</tbody>
</table>

If you use survey result calculations, ensure the question **Scale definition** is set appropriately based on the answer options. In the previous example, if you want the answer option **Good** to earn the highest score, the scale definition should be **Low** because **Good** has the smallest value.

### Change the order of survey questions

You can easily reorder survey questions at the category level or the question level.

**Role required:** admin or survey_admin

You can change the order in which the questions in one category appear relative to those in other categories for the same survey definition. If you add a new question manually after you create other questions, you may want to change the order of questions.

When you create questions using the survey creator, the system sets the **Order** field for the first question to **101**, the second to **102**, and so on. After you create a new question outside of the survey creator, the **Order** is set to **100** by default, which means it appears before all questions generated by the survey creator.

1. Navigate to **Survey > View Surveys** and open the appropriate survey definition.
2. In the **Metric Categories** related list, edit the values in the **Order** column.
3. To change the order of questions within a category, complete the following steps.
   a) Open the **Assessment Metrics** related list.
b) Edit the values in the **Order** column.

4. **Click Update.**

**Survey trigger conditions**

Trigger conditions specify when to send a particular survey and the persons to send it to.

Survey administrators can use trigger conditions to configure the system to generate a survey instance each time a specified action occurs on a specified table, for example, when an incident or change request closes. The system sends the survey to users that are related to the triggering record, for example, incident callers or change request assignees. You can choose to send a survey every time the condition is met, or you can set a probability for the system to send a survey at random when the condition is met.

Trigger conditions are ideal for sending transactional surveys. Transactional surveys generally measure satisfaction with a recent experience, such as closing an incident or purchasing an item.

**Note:** Trigger conditions are comparable to survey conditions in legacy surveys. If you migrate a legacy survey that has survey conditions, ensure that the survey conditions are deactivated before you recreate them as trigger conditions.

**Configure a trigger condition for a survey**

Configure trigger conditions to specify when to send a particular survey and the persons to send it to.

Role required: **admin or survey_admin**

1. **Navigate to Survey > Trigger Conditions.**
2. **Click New.**
   - **Note:** Do not specify particular users for a triggered survey because only the specified users are allowed to take the survey.
3. **Complete the form.**

**Trigger condition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assessment</td>
<td>Survey to send.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to run the trigger condition on. You can select only tables in the current application scope. For example, to send a survey whenever an incident closes, select the Incident (incident) table.</td>
</tr>
<tr>
<td>User field</td>
<td>Field that stores the users you want to send the survey. You can select any field, on the selected table or on a referenced table, that references the User (sys_user) table. Use the tree picker to select a field.</td>
</tr>
</tbody>
</table>

**Note:** To avoid requiring users to log in to take a survey with a trigger condition, set the survey to **Public**.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat interval</td>
<td>Minimum period that must pass before the trigger condition can resend the survey to the same user. For example, assume the repeat interval is set to 30 days. Even if the same user qualifies for multiple surveys from this trigger condition, the system can send only one survey every 30 days.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the Schedule period of the selected survey definition is set to <strong>No Limit</strong>. If the schedule period is set to a different value, it prevents the trigger condition from sending surveys as expected.</td>
</tr>
<tr>
<td>Application</td>
<td>(Admin only) Application is set to Core.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that determines whether this trigger condition is active (selected).</td>
</tr>
<tr>
<td>Business rule</td>
<td>(Admin only) Business rule the system creates to monitor the selected table. When the condition is met, the business rule sends the survey to the correct user. No configuration is necessary for this business rule.</td>
</tr>
<tr>
<td>Trigger randomly</td>
<td>Check box that determines whether to send the survey to the appropriate user every time the condition is met (cleared) or only a percentage of the time (selected).</td>
</tr>
<tr>
<td>Probability (%)</td>
<td>Approximate probability that the survey is sent each time the condition is met. For example, if the probability is set to 50, the system sends the survey approximately 50% of the time the conditions are met. There are no repeat interval restrictions is assumed. This field is visible and required only when <strong>Trigger randomly</strong> is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Related Field 1-4</td>
<td>Field that contains a value you want to store for reporting purposes. You can pick any reference field on the selected table. When the trigger condition generates a survey instance, the system stores the value from the triggering record. Specify up to four fields. For example, select the Incident table, <strong>Assigned to</strong> and <strong>Problem</strong> as related fields. The system stores the assigned user and problem associated with the incident as Related record 1 and Related record 2 in the survey instance record. To view the fields, configure the form for any survey instance. <strong>Note:</strong> You cannot use a related field for the ticket number because you cannot select the Number column. You can, however, use the trigger_id column of the table.</td>
</tr>
<tr>
<td>Description</td>
<td>Summary information to identify the trigger condition. <strong>Note:</strong> For a triggered record, the table title is used for the survey description.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition builder that defines the criteria that must be true to send the survey. For example, to send a survey whenever an incident closes, create the condition <strong>(State) (is) (Closed)</strong>.</td>
</tr>
</tbody>
</table>

You can also create a trigger condition directly from the survey creator. If you select **Certain users can take this survey, based on conditions** in the Survey User Access section, the Trigger Condition form opens automatically when you click **Save as Draft** or **Publish**.
Trigger condition example

You can send out auto-triggered surveys when an incident is closed or resolved.

A trigger condition is configured as follows:

- **Assessment**: Service Desk Satisfaction Survey
- **Table**: Incident (incident)
- **User field**: Caller
- **Repeat interval**: 30 days
- **Active**: true
- **Trigger randomly**: false
- **Related Field 1**: Assigned to
- **Related Field 2**: Problem
- **Condition**: (State) (is) (Closed) (or) (State) (is) (Resolved)

Fannie Steese is the caller on incident INC00004305 that is assigned to Boris Catino, a service desk technician. Boris creates PRB010101 based on Fannie’s complaint and closes the incident. The system creates a survey instance assigned to Fannie so she can rate her satisfaction with the incident experience.

Because two related fields were selected as part of the trigger condition, the survey instance stores the following information from the incident:

- **User (Related Field 1)**: Boris Catino
- **Problem (Related Field 2)**: PRB010101
- **Task (automatically created)**: INC00004305

Because the task field is automatically populated, UI-based filtering by dot-walking on incidents (or any task-based table) is supported when creating a report on survey results. For example, you can query all survey instances related to incidents assigned to a group (survey reports on all incidents assigned to networking group, for instance).

![Note](image)

Even though the trigger condition is set to be triggered each time that the conditions are met, the Repeat interval setting ensures that Fannie does not receive another survey for another of her incidents closes within 30 days of the first incident.

Survey report example based on task field

One of the most common use cases for Surveys is to send out an auto-triggered survey when an incident, request, or task is closed. Once you get the survey results back, you can filter the results by users and groups related to the ticket, such as Assignment Group, or Assignee.

Filtering the survey results provides more detail on how people and teams are performing based on ticket data. Since this information is automatically captured, you can dot-walk while filtering the data (instead of utilizing a related field on the Survey trigger condition form, as previously required).
To create a report on incident-triggered survey responses by Assignment group, set up the report on the Task Assessment Details by navigating to ReportsView/Run and clicking Create a report.

Survey distribution

There are several ways for survey administrators to distribute surveys to users.

Surveys are distributed using any of the following methods.

- Send survey invitations to users
- Share a survey URL that opens the survey directly.
- Create a module that opens a survey.

Send survey invitations to users

You can send survey invitations using the Assign Survey or Send Invitations buttons on the Survey Definition form.

Role required: admin or survey_admin

Use the Send Invitations button to immediately assign survey instances to each survey user that is listed in the survey definition. Use the Assign Survey button to assign a survey instance to any one user at a time.

Each of the buttons generates survey instances assigned to the appropriate users. In addition, if the instance is configured to send email, the system generates survey notifications. For either button to be available, the survey definition must meet all of the following conditions.

- Active check box is selected.
- State is Published.
- Survey is associated with at least one question.

**Note:** You (or a trigger) can send more than one instance of a survey to a user at any time.

1. Navigate to **Survey > View Surveys**.
2. Select an active, published survey.
3. Complete one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign a survey to users listed in the Survey Users related list</td>
<td>Click <strong>Send invitations</strong>.</td>
</tr>
<tr>
<td>Assign a survey to any user</td>
<td>Click <strong>Assign Survey</strong> and select one or more users, and then click <strong>OK</strong>.</td>
</tr>
</tbody>
</table>

The system creates a survey instance assigned to the user or users, assuming the user is eligible to receive a new survey instance. When you use the **Assign Survey** button, the selected user is not saved as a survey user.

**Define a recipients list for surveys**

Use a recipients list to define targeted set of users for whom the survey invite can be sent. You can use a recipients list for multiple surveys.

Role required: admin or survey_admin

1. Navigate to **Survey > Administration > Recipients Lists**.
2. Click **New**.
3. In the Recipients List form, add the field information:

**Recipients List form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the recipients list.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of users to include in the list. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- Contacts</td>
</tr>
<tr>
<td></td>
<td>- Internal Users</td>
</tr>
<tr>
<td>State</td>
<td>State of the recipients list.</td>
</tr>
<tr>
<td></td>
<td>- <strong>New</strong>: List has not yet been generated.</td>
</tr>
<tr>
<td></td>
<td>- <strong>In Progress</strong>: List is currently being generated. (You can see this state only when generating a very large list of recipients.)</td>
</tr>
<tr>
<td></td>
<td>- <strong>Complete</strong>: List is generated.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method</td>
<td>Method used to generate the recipients list. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>· <strong>Upload File</strong>: Upload an Excel file with the recipients list using the specified template.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Dynamic Condition</strong>: Run a script or condition builder to create the recipients list.</td>
</tr>
<tr>
<td>Choose File</td>
<td>Allows you to download an Excel template, and then upload the Excel file with user information using the specified template.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td></td>
<td>The templates vary based on the entity selected in the <strong>Type</strong> field. For accounts, the template includes columns for <code>sys_id</code> and account number values. For contacts, consumers, and internal users, the template includes columns for <code>sys_id</code> and <code>email</code> values.</td>
</tr>
<tr>
<td>Show Script</td>
<td>If selected, displays the script to create the recipients list.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to create the recipients list.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong> and the <strong>Show Script</strong> check box is selected.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that stores the user information. The table is selected based on the <strong>Type</strong> field.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
<tr>
<td>User Field</td>
<td>Table field that refers to users.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field is available only if the <strong>Method</strong> is <strong>Dynamic Condition</strong>.</td>
</tr>
</tbody>
</table>
### Field Description

**Conditions**

Condition builder to create the recipients list based on the specified table and user field. A condition is made up of a selected field, an operator, and a value. Add conditions using the AND and OR buttons. Delete conditions by clicking the Delete button to the right of a condition.

**Note:** This field is available only if the Method is Dynamic Condition.

---

**Note:** When the Method is Dynamic Condition, you can either use a script or a condition builder to create the recipients list.

4. Click **Submit**.

For recipients lists created by the file upload, clicking **Submit** validates the records in the Excel file. Following validation, the system displays a pop-up window with the upload results, including valid and invalid user records.

5. Optional: To get the updated user list, navigate to the recipient list and click **Refresh Recipient List**.

---

### Add a recipients list to a survey

Send the survey invites to targeted sets of users by adding a recipients list to a survey.

Role required: admin or survey_admin

Recipients lists should be pre-defined in the Recipients Lists submodule. For more information on defining recipients lists, see *Define a recipients list for surveys*.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition.
3. Perform any of the following steps.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>From Platform</strong></td>
<td></td>
</tr>
<tr>
<td>1.</td>
<td>Under the Survey Recipients Lists related list, click <strong>New</strong>.</td>
</tr>
<tr>
<td>2.</td>
<td>In the Survey Recipients Lists form, from the <strong>Recipients List</strong> list, select the required recipients list.</td>
</tr>
<tr>
<td>3.</td>
<td>Click <strong>Submit</strong>.</td>
</tr>
</tbody>
</table>

| **From Survey Designer** |             |
| 1.                      | Under the Availability tab, for the Accessible By field, select **Specific users**. |
| 2.                      | In the **Add recipients lists** list, select the required recipients list. |
| 3.                      | To send the survey to users, click **Save and Publish**. |

4. To send survey invites to all survey users and recipients lists, click **Send Invitations**.
Embed a survey within the Outlook email client

Embed an interactive survey in the email notification sent to a user. The user can answer the survey questions and submit the survey from the email client instead of opening the survey in a new browser tab.

Role required: admin or survey_admin

The Outlook Actionable Messages plugin (com.sn_ms_oam) should be activated.

1. Navigate to **System Notification > Email > Notifications**.
2. For the Survey User Invite notification, in the **What it will contain** tab, add the following script in the **Message** field in addition to the existing information.

   ```
   ${mail_script:include_survey_actionable}
   ```

   This script includes the Outlook actionable message in the email notification sent to the user.
3. Navigate to **Survey > View Surveys**, and open a survey.
4. To send an email notification to the survey user, select the **Send notifications** check box.
5. Select the **Outlook Actionable Message** check box and save the survey.

Note:
- The following questions are not supported for an embedded survey:
  - Attachment
  - Date
  - Datetime
  - Template
  - Reference
  - Image Scale
  - Ranking
In both the Platform UI and Survey Designer, a validation is run to ensure all survey questions are supported.

6. Click Assign Survey and assign the survey to a user. An email notification with the embedded survey is sent to the user. The user can take the survey and submit it from the email client instead of opening the survey in a new browser tab.

Enable localization for a survey

Enable a survey user to take a survey in multiple languages.

Role required: admin or survey_admin

The plugin for the language that you want the survey to be available in should be installed.

Note: Localization is applicable only for public surveys.

1. Navigate to Survey > Administration > Properties.
2. Enable the Enable/Disable whether to show language picker when a public survey is taken (show_lang_picker_for_publicsurveys) property.
3. In the System Settings window, from the Language list, select the language that you want the survey to be available in.

Note: The Language list is available only when a language plugin is installed.

4. Navigate to Survey > View Surveys and open a public survey.
5. Enter the translated text for the survey title, questions, and answers.
6. Save and publish the survey.

Note: The localization is also applicable in Service Portal if the Assessment Properties Allow survey link from email to open in service portal view (applies only for surveys) (sn_portal_surveys.sp_survey.email_redirection) property is enabled.

- The survey is available for survey users in the translated language.
- Users can change the language of the survey using the language picker.

Survey URLs

You can distribute a survey by giving survey users a survey URL.

Survey administrators can obtain one of the following types of URLs.

- A general URL for a survey, which users can open to take the survey questionnaire. The following process occurs.
  - When someone opens the URL, the system ensures that the person is logged in. It then searches for an instance of the associated survey that is assigned to the logged-in user.
  - If a survey instance is found, the appropriate action occurs based on the State of the survey instance (see table). If there are multiple active survey instances (Ready to take or In progress), the instance with the earliest due date opens.
- If no survey instance is found, the system creates a new instance for the survey, assigns it to the user, and opens the survey questionnaire.

- A URL for a specific survey instance, which the assigned user can open to take the survey questionnaire. The following process occurs.

- When someone opens the URL, the system ensures the person is logged in as the user the survey instance is assigned to. Only the assigned user can access the survey questionnaire.

- The appropriate action occurs, depending on the **State** of the survey instance (see table).

### Survey states

<table>
<thead>
<tr>
<th>Survey instance state</th>
<th>Action upon opening URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Ready to take</strong>: User has not saved any responses.</td>
<td>The survey questionnaire appears for the user to begin. The user can save or submit responses.</td>
</tr>
<tr>
<td><strong>In progress</strong>: User has saved at least one response.</td>
<td>The survey questionnaire appears for the user to continue. Any previously saved responses are displayed. The user can save or submit responses.</td>
</tr>
<tr>
<td><strong>Complete</strong>: User has submitted all required responses.</td>
<td>If the schedule period is No Limit or if the period restriction has expired, the survey questionnaire for a new survey instance appears for the user to begin. If the schedule period restricts the number of times a user can take the same survey, and the period restriction has not expired since the user last completed survey, an error message appears.</td>
</tr>
</tbody>
</table>

If someone opens a URL for an unpublished or deactivated survey, an error message appears.

**Obtain and distribute a general survey URL**

You can distribute a general survey URL to allow any eligible user to open a survey questionnaire.

**Role required**: admin or survey_admin

The general URL is available on the Survey Definition form and on the survey creator. You can also email the URL for a public survey that is published.

1. Navigate to **Survey > View Surveys**.
2. Open a survey definition from the Assessment Metric Types list.
3. To view or copy the URL, click the **View Survey URL** related link.
   - This related link is visible only if the survey definition is **Active**.
4. To distribute the URL to users, paste the copied URL as desired, or click the **Email** button to send via email.
   - The **Email** button is visible only for a public survey that is published.

When a survey user clicks the general survey URL, the system creates a survey instance for the survey user as long as the user does not have an instance in the **Ready to take** state. The system is configured by default to send an email notification when a survey instance is generated.

As a result, the survey user receives a second notification in addition to the notification that you sent with the general survey URL. This may confuse the survey user. To avoid this issue, you can deactivate auto-notification.
Deactivate auto-notification for surveys
When you send a survey notification with a general survey URL to a survey user, the user may receive a second system-generated notification. To avoid this issue, you can deactivate auto-notification.

Role required: admin or survey_admin
1. Navigate to **System Notification > Email > Notifications**.
2. Open the **Survey User Invite** notification.
3. Configure the form to add the **Send to event creator** check box to the **Who will receive** section.
   The **Send to event creator** check box is selected by default.
4. Clear the **Send to event creator** check box.
   The system will no longer send auto-notification messages to survey users.

Obtain a survey instance URL
You can distribute a survey instance URL to allow the assigned user to open a survey questionnaire.

Role required: admin or survey_admin
The survey instance URL is available on the survey instance record.
1. Navigate to **Survey > Survey Instances**.
2. Open the instance for the survey.
3. To view or copy the URL, click **View Instance URL** related link.
   The related link is available only when the survey instance **State** is **Ready to take** or **In progress** and the associated survey definition is **Active**.
4. In the dialog box, select and copy the URL then click **OK** or **Cancel**.
5. Distribute the URL to the assigned user.

Test a survey URL
When there are survey users associated with a survey, the survey is restricted so only those users can use the survey URL. You can test the survey URL to ensure it is restricted.

Role required: admin or survey_admin
1. Navigate to **Survey > View Surveys** and open a survey for which you are not a survey user.
2. Under **Related Links**, click **View Survey URL**.
3. Copy the URL and click **OK** or **Cancel**.
4. Navigate to the URL.
   You see a message that you are not authorized to take the survey.

Create a survey module
You can create a module that opens a survey.

Role required: admin or survey_admin
When a user clicks a survey module, the system performs one of the following actions, depending on the configuration options for the survey and other factors.

- Creates a new survey instance
- Opens an existing survey instance
- Displays an error message.

1. Perform the appropriate action for your version of the UI:
UI16: Point to the application menu that contains the module to which you want to add the survey module and click the edit application (pencil) icon.

UI15: Right-click the application menu you want to add the module to and select Edit Application Menu

2. In the Modules related list, click New.
3. Complete the following fields.
   - Link type: Assessment
     Do not select Survey, which is used for legacy surveys only.
   - Assessment: Select the survey you want the module to open.
4. Complete and save the form.

Sharing surveys: export and import

You can export a survey and then import it to a different ServiceNow instance.

Note: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

The system exports a single XML file that contains a survey definition (asmt_metric_type) and the associated records, including the following.

- Assessment Metric Template (asmt_template)
- Assessment Template Definition (asmt_template_definition)
- Metric definitions (asmt_metric_definition) (survey question answer options)
- Scheduled Jobs associated with the Survey (sys_trigger)
- Survey categories (asmt_metric_category)
- Survey questions (asmt_metric)
- Survey users (asmt_m2m_category_user)
- Trigger Condition (asmt_condition)

Export a survey

You can export a survey and then import it to another instance.

Role required: admin, survey_reader, or survey_admin

For information about update sets, see System update sets.

1. Navigate to Survey > View Surveys.
2. Right-click the name of a record to show the context menu.
3. Select Export Assessment.
4. If applicable, follow the prompt in your browser to save the XML file.

Import a survey

You can import a survey that has been exported as an XML file. The exported XML file does not contain result data.

Role required: admin or survey_admin

Note: Update sets are available in the Helsinki release and should be used to move data from one instance to another. For information about update sets, see System update sets.

1. Verify that the target instance has assessments enabled.
2. Follow the steps in *Import an XML file* to import the assessment.

*Use update sets for surveys and assessments*

Use an update set to capture changes to surveys and assessments.

Role required: admin or survey_admin

When developing surveys and assessments, you can use an update set to capture the changes and move them from a development instance to a production instance. Once an update set is created and marked current, all of the updates to the following tables are recorded in the update set.

The following tables are now update set enabled and also extend the application file:

- Assessment Metric Templates (asmt_template)
- Assessment Template Definitions (asmt_template_definition)
- Assessment Metric Definitions (asmt_metric_definition): survey question answer options
- Schedule (sys_trigger): scheduled jobs associated with the survey
- Assessment Metric Categories (asmt_metric_category): survey categories
- Assessment Metrics (asmt_metric): survey questions
- Assessment Category Users (asmt_m2m_category_user): survey users
- Trigger Conditions (asmt_condition)

**Configure a survey in the Connect chat support**

Enable a user to take a survey after chatting with a survey agent.

Role required: admin or survey_admin

**Note:** The Connect Support plugin (com.glide.connect.support) should be activated.

1. Navigate to **Survey > Chat survey**.
2. Click **New**.
3. In the Chat Survey form, fill the fields.

**Chat Survey form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey</td>
<td>Survey whose instance should be available in Connect Support.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of chat where the survey is available.</td>
</tr>
<tr>
<td></td>
<td>- Connect: Survey is available in Connect Support.</td>
</tr>
<tr>
<td>Chat queue</td>
<td>Chat queue where the survey is available.</td>
</tr>
<tr>
<td>Active</td>
<td>Specifies if the chat survey configuration is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the chat survey configuration.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

When a support agent of the assignment group associated with the chat queue ends a chat with a user, the survey instance is available in the chat window for the users.
Sentiment analysis for surveys

You can use sentiment analysis to determine whether user responses for a survey are considered positive, negative, or neutral.

Activate the Sentiment Analysis (com.snc.sentiment_analysis) plugin.

For a survey, you can select questions that should be used for analysis. The survey responses of these questions are sent to the thirdparty platforms for analysis through the specified connector configurations.

Note: You can only use string type questions for sentiment analysis.

The sentiment analysis results are displayed under Survey > Question Sentiment Results. The sentiment label is based on the normalized score:

<table>
<thead>
<tr>
<th>Normalized score</th>
<th>Sentiment label</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1 to 0</td>
<td>Negative</td>
</tr>
<tr>
<td>0</td>
<td>Neutral</td>
</tr>
<tr>
<td>0 to 1</td>
<td>Positive</td>
</tr>
</tbody>
</table>

Configure a sentiment connector

Specify the service URL and other configuration information for third party APIs that are used for sentiment analysis.

Role required: admin

1. Change the scope of the current session to Sentiment Analysis.
2. Navigate to Sentiment Analysis > Sentiment Connector Configurations.
3. Add or edit the connector configuration for a third party vendor such as Google, IBMWatson, and MSAzure.

Note: By default, placeholders are available for configuring connectors for Google, IBMWatson, and MSAzure.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the sentiment analysis connector configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate the connector configuration.</td>
</tr>
<tr>
<td>Credential Alias</td>
<td>Credential alias associated with the connector configuration. It has a reference to the system level table (sys_alias_list).</td>
</tr>
<tr>
<td>Default</td>
<td>Check box to make this as the default connector configuration.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the connector configuration.</td>
</tr>
</tbody>
</table>
4. Configure the connector credentials
   a) Open the record referred in the Credential Alias field.
   b) Under the Connections tab, select the connection.
   c) In the Connection URL field, enter the value.
   d) Open the record referred in the Credentials field.
   e) Enter the credential information.

   Note:
   - You should obtain the connection credentials from the respective third-party vendors.
   - If the credential is an API key, specify its value. If the credential is basic authentication, that is, user name and password, specify the corresponding information.

   f) Select the Active check box and click Update.

5. Select the Active check box for the connector configuration and click Update.

Sentiment analysis properties
You can use the sentiment analysis properties to customize the Sentiment Analysis module.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Response time for the outbound call of Sentiment Analysis API (sn_nlp_sentiment.glide.sentiment.transaction.timeout) | Maximum time (milliseconds) expected for executing the outbound call for Sentiment Analysis API before it’s timeout.

Sentiment analysis results
The sentiment analysis results view contains a bar chart that displays the percentage of positive, negative, and neutral results, along with the instance count for each category.

Color indicators
Following are the color indicators in the bar chart:
- Green: Positive
- Red: Negative
- Blue: Neutral

© 2020 ServiceNow, Inc. All rights reserved.

Surveys in Service Portal

If Service Portal is installed, you can use the Survey widget to set up surveys, quizzes, assessments, risk assessments, and attestations in Service Portal. Surveys for users on mobile devices are fully supported in Service Portal.

To create an intuitive interface for your users, you can set up surveys in Service Portal. You must first install Service Portal and then configure the survey widget on the page. To learn more about configuring a widget, see configure widget instances.

To configure a Survey widget on a page, CTRL + right-click the widget heading and select Instance Options.
Service Portal: Instance options (properties) for the Survey widget

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max records</td>
<td>Number of surveys to list on the Service Portal homepage. The user can click the View all link to view all items. Default: 5</td>
</tr>
<tr>
<td>Title of the widget</td>
<td>Text that appears in the title bar of the surveys widget. Default: My Surveys</td>
</tr>
</tbody>
</table>

Each survey on the My Surveys page contains a progress bar and a description. The color in the progress bar increases as a survey is completed. In the case of a triggered record, the table title is used for the survey description.

![My Surveys]

For mobile users, the Pagination setting for Service Portal view survey designer property is set to one question per page by default.
One Click survey

A One Click survey has no introduction page in Service Portal. This survey does not have the Submit and Cancel buttons in the desktop and iPad view.

**Note:**

- The One Click Survey field should be selected in the survey definition.
- If the public access is enabled for a One Click survey, a user can submit the survey without having to log in.

A kiosk survey is a One Click survey with only one question of any of the following types:

- Image Scale
- Choice
- Likert Scale
- Numeric Scale
- Yes/No
When you click the answer of the kiosk survey question in Service Portal, the survey is submitted and the end note is displayed on the same page as that of the survey questions.

**Note:**
- A kiosk survey does not have any **Submit** or **Cancel** buttons.
- A kiosk survey cannot have a signature, dependent questions, or additional information.

### URI parameters for One Click survey

Pass these URI parameters through the `createAssessment()` API to store their values in the `asmt_assessment_instance` table for both platform view and Service Portal view.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sysparm_refresh_interval</td>
<td>Refresh time (in seconds) after the survey submission to create another instance. For example, <code>sysparm_refresh_interval=5</code>.</td>
</tr>
<tr>
<td>sysparm_trigger_table</td>
<td>Location that is stored as the <strong>Trigger Table</strong> field in the <code>asmt_assessment_instance</code> table. For example, <code>sysparm_trigger_table=incident</code>.</td>
</tr>
<tr>
<td>sysparm_trigger_id</td>
<td>Location sysId that is stored as the <strong>Trigger ID</strong> field in the <code>asmt_assessment_instance</code> table. For example, <code>sysparm_trigger_id=1c741bd70b232007518d83673af3</code>.</td>
</tr>
<tr>
<td>sysparm_kiosk</td>
<td>When set to true, both <code>sysparm_trigger_table</code> and <code>sysparm_trigger_id</code> parameters should be specified. This is a mandatory parameter for kiosk requests. For example, <code>sysparm_kiosk=true</code>.</td>
</tr>
</tbody>
</table>

### Surveys in ITSM Virtual Agent

You can use surveys in ITSM Virtual Agent to collect survey responses from users through conversational questionnaires (pre-chat and post-chat surveys) in the chat client.

A chat survey is available in ITSM Virtual Agent through the **Provide Virtual Agent Feedback** topic. The logic that renders the survey dynamically is called from the re-usable Survey topic block. It is common to use the **Provide Virtual Agent Feedback** topic as the survey setup topic in the general definitions of ITSM Virtual Agent, so that employees automatically receive a survey at the end of their conversations. For information about the Survey topic block, see *ITSM Virtual Agent*.

When you select the **Chat Survey** check box for a survey, it validates the following conditions for a surveys on ITSM Virtual Agent:

- Survey should contain only one metric category.
- Survey can contain only these metric types.
  - Attachment
  - Boolean
  - Check box
· Choice
· Date
· Date/Time
· Image scale
· Number
· Numeric scale
· Percentage
· Scale
· String

For information on configuring a survey, see Modify a survey definition and Configure a survey in the survey designer.

The following capabilities are supported for the survey:

· Dependent survey fields
· Introduction and end notes

**Quick start tests for Assessments and Surveys**

Validate that Assessments and Surveys still work after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Assessments and Surveys quick start tests require activating the Automated Test Framework for Survey plugin (com.glide.automated_testing_impl. Survey).

<table>
<thead>
<tr>
<th>Test Suite for Survey</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
</tr>
<tr>
<td>Survey: Basic Platform Based Test</td>
</tr>
<tr>
<td>Survey: Clone Action</td>
</tr>
<tr>
<td>Survey: Platform test for Dynamic Validation</td>
</tr>
<tr>
<td>Survey: Question Bank Flow</td>
</tr>
<tr>
<td>Survey: Survey Creator Work Flow</td>
</tr>
<tr>
<td>Assessment: Assign assessment to assessor</td>
</tr>
<tr>

</tr>
<tr>
<td>Assessment: Basic test flow</td>
</tr>
</tbody>
</table>

**Legacy survey migration**

Users with the survey_admin role can migrate legacy survey data to create copies of legacy surveys and their related records in assessment tables. The Survey Management application, which is built on the assessment engine, is available as an alternative to legacy surveys.
The following legacy survey components are migrated:

- Survey masters
- Supported survey questions and question choices
- Survey instances
- Survey responses

Legacy survey conditions are not migrated and must be recreated as trigger conditions.

**Note:**

- The **Legacy Surveys** and **Legacy Administration** modules are available on instances upgraded from a previous release but not available for new instances. Customers using legacy survey or survey wizard should plan to migrate to the Survey Management application to create modern and high quality surveys for their users.
- The following legacy survey plugins are inactive by default, and are available upon request:
  - Best Practice - Task Survey Management (ID: com.snc.bestpractice.task_survey)
  - Survey Management (ID: com.glideapp.survey)
  - Assessment Components (ID: com.snc.assessment)
  - Survey Wizard (ID: com.glideapp.survey_wizard)
- Survey wizards cannot be migrated.

### Migrate a legacy survey

Migrate a legacy survey and its related records to take advantage of a more powerful feature set.

**Role required:** admin or survey_admin

To avoid timing out for very large surveys, you can disable the transaction quota. See Transaction quotas.

1. Navigate to **Survey > Legacy Surveys > Masters**.
   The list of legacy survey masters appears. By default, the list shows only survey masters that have not been migrated. To show all survey masters, remove the **Assessment is empty** breadcrumb.

2. Open a survey and click the **Migrate to New Survey Management** related link or **Migrate to New Survey Management** in the title bar.
   A dialog box describes what happens when you migrate the survey. Note that certain types of survey questions cannot be migrated.

3. Click **OK**.
   The system generates records on assessment tables based on the survey master, eligible questions and choices, results, and other related survey components. The original survey components are unaffected.

   System messages may appear at the top of the Survey form to notify you of questions that could not be migrated and to advise you to review migrated **Multiple Choice** questions.

4. Optional: Click the reference icon beside the **Assessment** field to view the new survey definition.

5. Optional: Remove survey users from the assessment survey if you want all users to be able to take it.
   When you migrate a survey, any users who have taken it are automatically associated with the assessment survey and become survey users. When there are survey users associated with an assessment survey, only those users can take it.
6. Deactivate any survey conditions associated with the survey by completing the following steps.
   a) Navigate to **Survey > Legacy Administration > Survey Conditions**.
   b) In the *Active* column, ensure the value is false for any survey conditions that reference the migrated survey.

7. Navigate to **Survey > Administration > Trigger Conditions** to create new trigger conditions for the migrated survey.

The **Migrate to Assessment** related link on the legacy survey record becomes unavailable after the migration. However, if you delete the record referenced in the **Assessment** field, the related link reappears and you can migrate the legacy survey again.

**Survey question migration**

Before you migrate a legacy survey, understand that some legacy survey questions cannot be migrated due to incompatible question types.

Legacy survey questions are migrated from the Survey Question (survey_question_new) table to the Assessment Metric (asmt_metric) table. In legacy surveys, the **Type** field on the Survey Question table determines how the question renders on the survey questionnaire. In assessment surveys, the **Data type** field on the Assessment Metric table serves a similar purpose. Certain legacy survey types are not supported in assessment surveys.

The following table shows the conversion path for each legacy survey question type to an assessment data type, if there is one.

<table>
<thead>
<tr>
<th>Legacy survey type</th>
<th>Assessment data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Break</td>
<td>Not available</td>
</tr>
<tr>

</tr>
<tr>
<td>Multiple Choice</td>
<td>Likert Scale</td>
</tr>
<tr>
<td>Numeric Scale</td>
<td>Number</td>
</tr>
<tr>
<td>Reference</td>
<td>Not available</td>
</tr>
<tr>
<td>Select Box</td>
<td>Choice</td>
</tr>
<tr>
<td>Single Line Text</td>
<td>String <em>(String option set to Single line)</em></td>
</tr>
<tr>
<td>Legacy survey type</td>
<td>Assessment data type</td>
</tr>
<tr>
<td>--------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>UI Page</td>
<td>Not available</td>
</tr>
<tr>
<td>Wide Single Line Text</td>
<td>String (String option set to Single line wide)</td>
</tr>
<tr>
<td>Yes / No</td>
<td>Yes/No</td>
</tr>
</tbody>
</table>

**Migrated components**

When you migrate a survey, the system maps records from survey tables to assessment tables.

To create a functional survey on the assessment framework, the system converts survey records to the most logical equivalent assessment survey records. This may mean multiple assessment survey records represent one legacy survey record.

**Migrated components**

<table>
<thead>
<tr>
<th>Survey component</th>
<th>Assessment survey components</th>
</tr>
</thead>
<tbody>
<tr>
<td>Survey master (survey_master)</td>
<td>• Survey definition (asmt_metric_type)</td>
</tr>
<tr>
<td></td>
<td>• Assessable record (asmt_assessable_record), for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey category (asmt_metric_category)</td>
</tr>
<tr>
<td>Survey question (survey_question_new)</td>
<td>• Survey question (asmt_metric)</td>
</tr>
<tr>
<td>Question choice (question_choice)</td>
<td>• Assessment metric definition (asmt_metric_definition)</td>
</tr>
<tr>
<td>Survey instance (survey_instance)</td>
<td>• Assessment group (asmt_assessment), for system use only</td>
</tr>
<tr>
<td></td>
<td>• Survey instance (asmt_assessment_instance)</td>
</tr>
<tr>
<td>Survey response (survey_response)</td>
<td>• Survey instance question (asmt_assessment_instance_question)</td>
</tr>
<tr>
<td></td>
<td>• Survey response (asmt_metric_result)</td>
</tr>
<tr>
<td></td>
<td>• Category result (asmt_category_result), for system use only</td>
</tr>
</tbody>
</table>

**Migrated question review**

To maintain accurate result calculations, you may need to make minor adjustments to some of the migrated survey records to ensure results are calculated correctly.

**Note:** The assessment engine provides a built-in result calculation feature that converts each survey response to a score between 0 and 10. The configuration required to maintain accurate result calculations is advanced and is not recommended for basic survey implementations. If you do not plan to use result calculation data, ignore the information in this section.

For each legacy question migrated, the system creates a survey question record on the Assessment Metric (asmt_metric) table. For legacy questions of the **Multiple Choice** and **Select**
Box types, the system also creates a metric definition record, on the Assessment Metric Definition (asmt_metric_definition) table, for each legacy question choice.

Comparable metric definitions and survey question choices

<table>
<thead>
<tr>
<th>Survey question choice field</th>
<th>Related metric definition field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Display</td>
</tr>
<tr>
<td>Value (can be any string value)</td>
<td>Value (must be a numerical value)</td>
</tr>
<tr>
<td>Order</td>
<td>Value (metric definition with smallest Value is first)</td>
</tr>
</tbody>
</table>

When the system migrates legacy survey question choices, it uses the legacy Order to set each metric definition Value. For the legacy question choice with the smallest Order, the corresponding metric definition Value is set to 1. For the legacy question choice with the next smallest Order, the metric definition Value is 2, and so on.

The Scale definition field on the migrated Survey Question form determines whether smaller or bigger metric definition values equate to a good score in survey result calculations. By default, the scale definition is set to High, meaning bigger values are good. When you migrate a legacy survey, check that the default scale definition makes sense for each question.

For example, the following tables depict a sample migrated question and the metric definitions automatically created for it. Recall that the system uses the order of the legacy survey question choices to set the metric definition value. Excellent has the lowest Order value, so when the system creates a metric definition for this question choice, the Value is set to 1. In this case the default scale definition value, High, does not make sense, as the system will calculate the worst scores for responses of Excellent.

Legacy question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Question choice text</th>
<th>Question choice value</th>
<th>Question choice order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>A</td>
<td>100</td>
</tr>
<tr>
<td>Good</td>
<td>B</td>
<td>200</td>
</tr>
<tr>
<td>Fair</td>
<td>C</td>
<td>300</td>
</tr>
<tr>
<td>Poor</td>
<td>D</td>
<td>400</td>
</tr>
</tbody>
</table>

Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

If there are no Order values for the legacy survey question choices, the system sets each corresponding metric definition Value based on the alphanumeric order of the legacy Text value.
Migrated question: Please rate the overall quality of your service.

<table>
<thead>
<tr>
<th>Metric definition display</th>
<th>Metric definition value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excellent</td>
<td>1</td>
</tr>
<tr>
<td>Good</td>
<td>2</td>
</tr>
<tr>
<td>Fair</td>
<td>3</td>
</tr>
<tr>
<td>Poor</td>
<td>4</td>
</tr>
</tbody>
</table>

You may also need to change the Scale definition setting for other migrated questions. For details, see the scale definition recommendations for each survey question data type.

**Task Communications Management**

Task Communications Management (TCM) provides a framework for defining and managing a communication process for any entity that extends the task table.

**Explore**
- Task Communications Management process
- Slack Communication

**Set up**
- Activate Task Communications Management

**Administer**
- Working with Task Communications Management

**Use**
- NA

**Develop**
- Developer training
- Developer documentation

**Integrate**
- NA

**Troubleshoot and get help**
- Ask or answer questions in the Incident Management community
- Search the HI Knowledge Base for known error articles
- Contact ServiceNow Technical Support

**Task Communications Management process**

Task Communications Management helps you to streamline the process by creating designated communication plans for effective communication during an event. The communication plan, with its defined tasks, helps you to focus on resolving the current issue instead of deciding when to send a communication, what information to share, and whom to inform.
Task Communications Management basic components

How Task Communications Management works

With Task Communications Management, you can predefine a communication plan for an event such as major incident, planned maintenance, and release. Each plan generally involves a series of tasks that define different communication and collaboration activities along with frequency and method of communication. For each task, you must specify the communication channel for contacting the stakeholders. You can also define templates for email and SMS messages.

After defining the task and channel for communication, you can define the contacts or the target audience to be contacted for each task.

After a communication plan is defined, the plan gets associated with the appropriate task table based on the conditions defined. Thereafter, the tasks defined in the plan get executed sequentially and stakeholders are contacted as defined in the plan. The communication plan makes communication and collaboration process smoother and brings a quicker resolution of the issue.

Task Communications Management flow in major incident management

Assume that you want an incident communication plan generated for a high-priority major incident.

- As the major incident manager, you can predefine a communication plan and the conditions that drive its attachment. In this case, the conditions are: Priority = High and Major Incident state = Accepted. Consider that the target audience is the technical stakeholders of the incident and the communication plan definition is named Technical Communications.
- The plan definition can have multiple communication task definitions such as:
  - Initiate Technical Communications
  - Technical Status Update
- Each communication task definition also specifies the channel of communication and the communication frequency (one time or recurring).
- Initiate Technical Communications uses email as a channel of communication and communication frequency is one time.
- Technical Status Update uses email and SMS as channel of communication and the communication frequency is recurring.
- The target audience for in the communications is defined as communication contact definitions on the plan definition. In this case, consider Service owners of the affected configuration items (CIs) related to the incident as technical stakeholders.
- When an incident meets these conditions, an incident communication plan together with its tasks gets attached to the incident record.
- As the major incident manager, you can effectively carry out the communication without any delay in the resolution of the major incident.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

Task Communications Management plugins

The Task Communications Management plugins is activated in the base system. The plugin includes demo data.

Activate Task Communications Management

The Task Communications Management plugin (com.snc.task_communication_management) is activated when you activate the Incident Communications Management plugin (com.snc.iam) or the Incident Management - Major Incident Management plugin (com.snc.incident.mim). This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

Task Communications Management activates these related plugins if they are not already active.

Plugins for Task Communications Management

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Management</td>
<td>The Contact Management plugin manages the connections between users or groups and other resources in the system.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

1. Navigate to System Definition > Plugins.
A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

Note: To redirect to the legacy list view for plugins, click the link.

1. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   - If you’re certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.

   • To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.
        If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.
     4. If demo data is available and you want to install it, click Load demo data.
        Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
5. Click **Activate**.

### Components installed with Task Communications Management

Several types of components are installed with the Task Communications Management plugin, including tables and user roles.

**Note:** The Application Files table lists the components installed with this application. For instructions on how to access this table, see *Find components installed with an application*.

Demo data is available for this feature.

#### Roles installed

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
</table>
| Communication Plan Admin  
(sn_comm_management.comm_plan_admin) | Provides overall accountability of Task Communications Management. This role has create and edit access to Task Communications Management tables including Communication Plan Definitions and other related records. | • Notify_admin  
• Sn_publications_recipients_list_user          |
| Communication Plan Viewer  
(sn_comm_management.comm_plan_viewer) | This role has read access to Task Communications Management tables.                                                                                                                                          | • Notify_view  
• Sn_publications_recipients_list_user          |
| Communication Plan Manager  
(sn_comm_management.comm_plan_manager) | This role has create and edit access to Task Communications Management Instance tables such as Communication Plans, Communication Tasks. Users with this role can send impromptu communications. | Communication Plan Viewer                         |

#### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
<th></th>
</tr>
</thead>
</table>
| Communication Plan Type Lookup  
(comm_plan_type_lookup)          | Stores the communication plan types.                                         |                                                              |
| Communication Task Type Lookup  
(comm_task_type_lookup)           | Stores the communication task types.                                         |                                                              |
| Communication Plan Definition  
(comm_plan_definition)            | The definition table for the communication plan entity.                      |                                                              |
| Communication Task Definition  
(comm_task_definition)            | The definition table for the communication task entity.                      |                                                              |
<table>
<thead>

</table>
### Install Collaboration Services for Task Communications Management

Install the Collaboration Services for Task Communications Management plugin (sn_tcm_collab_hook) from the ServiceNow Store to get the Slack functionality.

**Role required:** admin

1. Navigate to ServiceNow® Store.
2. Find the Collaboration Services for Task Communications Management store application.
3. Click the Collaboration Services for Task Communications Management store application and then click Request App.

### Components installed with Collaboration Services for Task Communications Management

Several types of components are installed with the Collaboration Services for Task Communications Management (sn_tcm_collab_hook) plugin, including tables.

**Note:** The Application Files table lists the components installed with this application. For instructions on how to access this table, see Find components installed with an application.

#### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communication Channel Definition – Slack (comm_channel_def_slack)</td>
<td>The table extends the Communication Channel Definition (comm_channel_definition) table.</td>
</tr>
<tr>
<td>Communication Channel – Slack (comm_channel_slack)</td>
<td>The table extends the Communication Channel (comm_channel) table.</td>
</tr>
<tr>
<td>Communication Plan — Collaboration Service Data (comm_plan_collab_data)</td>
<td>Stores Collaboration Service related data.</td>
</tr>
</tbody>
</table>

### Working with Task Communications Management

The section covers topics that help you with a variety of technical concepts related to Task Communications Management such as creating communication plan definition, task definition, channel definition, and contact definition.
Define a communication plan

Define a communication plan for a task record to specify communication task and contact definitions. When specified conditions for the plan definition are met, the communication plan and its associated records are automatically attached to the task record, eliminating manual effort.

Role required: sn_comm_management.comm_plan_admin or admin

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the communication plan.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that the plan is attached to when the conditions are met.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of communication plan such as Technical, Internal, External, Customer.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the communication plans must be associated to the table.</td>
</tr>
<tr>
<td>Condition based</td>
<td>Option to define whether the plan is attached to a table based on the conditions. For example, if you want to attach a communication plan to an incident of priority = 2, you can mention the condition in the Condition field.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to define whether the plan definition is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the plan definition.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition under which a communication plan gets attached to a table.</td>
</tr>
</tbody>
</table>

3. Click Submit.
   The communication plan is submitted. The communication plan definition contains the following related lists:
   - Communication Task Definitions
   - Communication Contact Definitions

Define a communication task

Define a communication task for a communication plan. When a plan gets attached to a table, the tasks related to the plan need to be executed to resolve the issue. You can associate multiple tasks with a communication plan.

Role required: sn_comm_management.comm_plan_admin or admin

You have defined a communication plan.

1. Navigate to Task Communications Management > Plan Definitions.
2. Click the communication plan that you want to define a communication task for.
3. Click the Communication Task Definitions related list and then click New.
4. On the form, fill in the fields.
## Communication Task Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Communication plan definition</td>
<td>Unique name of the communication plan definition that you are defining the task for.</td>
</tr>
<tr>
<td>Name</td>
<td>Unique name for the communication task definition.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of task, such as internal communication, that is applicable globally or to a particular table.</td>
</tr>
<tr>
<td>Note:</td>
<td>The value in the <strong>Type</strong> field helps you to filter a task by its type. The value also helps to generate a report of a particular task type or to create SLAs on any communication task.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the task definition. The task definition is available for all applications or for scoped applications.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the communication tasks appear in the plan. This field indicates which communication task to execute first.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to define whether the task is active or not.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the task definition.</td>
</tr>
<tr>
<td>Communication frequency</td>
<td>Frequency of the communication task execution. You can send the notification once or the notification can be repeated.</td>
</tr>
<tr>
<td>Duration</td>
<td>Time by which you want to send a notification. For example, if the communication frequency is <strong>One time</strong> and the <strong>Duration</strong> is 15 minutes, then the notification is sent only once in 15 minutes. If the communication frequency is <strong>Recurring</strong>, then the notification is sent every 15 minutes.</td>
</tr>
</tbody>
</table>

5. Click **Update**. The communication task is defined for the communication plan.

Define communication channel for the task.

**Define a communication channel**

Define a communication channel for each communication task to determine which mode of communication to use for the task when a plan is attached to a table.

Role required: sn_comm_management.comm_plan_admin or admin

You have defined a communication plan and its related tasks.

- The modes of communication available are: email, SMS, conference, and Slack.
- For the incident table, the functionality for SMS and conference appears only if you activate the Notify plugin (com.snc.notify) and the `com.snc.iam.notify_number` property value is set to the registered notify number. The notify number is registered while configuring the Twilio account.
- For the incident table, the functionality for Slack appears only if you activate the Collaboration Services for Task Communications Management plugin (sn_tcm_collab_hook). To activate the Collaboration Services for Task Communications Management plugin, navigate to...
ServiceNow Store and install the Collaboration Services for Task Communications Management application. For more information, refer to *Collaboration services for Task Communications Management*.

**Note:** For information on how to configure Slack, refer to *Configure Slack workspace*.

- **Add Channel – Conference** is mutually exclusive to **Add Channel – SMS** and **Add Channel – Email**. If you select **Add Channel – Conference**, you cannot select **Add Channel – Email** or **Add Channel – SMS**.

1. Navigate to **Task Communications Management > Plan Definitions**.
2. Click a communication plan.
3. Click the Communication Task Definitions related list and then click the task that you want to define the communication channel for.
4. On the Communication Task Definition form, click any one of the following related links based on your requirement:
   - **Add Channel – Conference**
   - **Add Channel – Email**
   - **Add Channel – SMS**
   - **Add Channel – Slack**
5. On the form, fill in the fields.

### Communication Channel Definition form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Channel – Conference</td>
<td>Communication task definition that the channel definition is associated with.</td>
</tr>
<tr>
<td>Communication task definition</td>
<td></td>
</tr>
<tr>
<td>Notify provider selector</td>
<td>Lookup icon (🔍) to select the selector from the Provider Selector (notify_group_selector) table.</td>
</tr>
<tr>
<td>Note: The selector can be associated with notify number group or conference provider. Each notify number group can have one or more Notify numbers that can be used to make conference calls.</td>
<td></td>
</tr>
<tr>
<td>Add Channel – Email</td>
<td>Communication task definition that this channel definition is associated with.</td>
</tr>
<tr>
<td>Communication task definition</td>
<td></td>
</tr>
<tr>
<td>Email client template</td>
<td>Lookup icon (🔍) to select the email client template used to send emails to the targeted audience.</td>
</tr>
<tr>
<td>Note: This email template must be defined in the Communication task table.</td>
<td></td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Channel – SMS</td>
<td>Communication task definition this channel definition is associated with.</td>
</tr>
<tr>
<td>Notify SMS template</td>
<td>Lookup icon to select the notify SMS template used to send an SMS to the targeted audience. Note: This SMS template must be defined in the Communication task table.</td>
</tr>
<tr>
<td>Notify provider selector</td>
<td>Lookup icon to select the selector from the Provider Selector (notify_group_selector) table. Note: The selector can be associated with notify number group or conference provider. Each notify number group can have one or more Notify numbers that can be used to send SMS.</td>
</tr>
<tr>
<td>Add Channel – Slack</td>
<td>Communication task definition this channel definition is associated with.</td>
</tr>
<tr>
<td>Channel Type</td>
<td>Channel type is Slack.</td>
</tr>
</tbody>
</table>

6. **Click Submit.**
   A communication channel is defined for the communication task.

After creating communication tasks and communication channels for those tasks, define contacts for the communication plan.

**Define a communication contact**

Define the recipients of a particular plan to determine the target audience involved in each communication task and the responsibilities the recipients are expected to handle. A notification for a task is sent to all individuals specified for that task.

Role required: sn_comm_management.communication_plan_admin or admin

You have defined a communication plan.

You can add or remove any particular communication contact manually.

1. **Navigate to Task Communications Management > Plan Definitions.**
2. Click the communication plan that you want to define the contacts for.
3. **Click the Communication Contact Definitions related list and then click New.**
4. On the form, fill in the fields.
**Communication Contact Definition form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Type of contact such as user, group, or recipient list that you want to involve in the plan. The contact type is assigned dynamically at the time of the table execution.</td>
</tr>
<tr>
<td>Responsibility</td>
<td>Responsibility that the user, group, or individuals in the recipient list are expected to handle.</td>
</tr>
<tr>
<td>User</td>
<td>Name of the user, group, or recipient list to be added to the contact list.</td>
</tr>
</tbody>
</table>

**Note:** You can use the recipient list to specify dynamic criteria for fetching the list of users for a particular communication plan.

5. **Click Submit.**
   A communication contact is defined for the communication plan.

**Define a recipient list for communication contact**

A recipient list lets you specify a filter to fetch a list of users. Use the recipient list as the contact for a particular communication plan.

Role required: sn_comm_management.comm_plan_admin or admin

Sometimes, the contacts that you want to include in a plan can only be known dynamically. For example, you might want the support group associated with a particular business service in an incident to be involved in the communication plan. The support group might change depending on the business service that you select. In such a case, a recipient list provides the flexibility to add recipients dynamically.

1. Navigate to **Task Communications Management > Administration > Recipients Lists**, and click **New**.
2. On the form, fill in the fields.

**Recipients Lists form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the recipient list.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of recipient.</td>
</tr>
<tr>
<td>State</td>
<td>(Read only) The state of the recipient list.</td>
</tr>
<tr>
<td>Method</td>
<td>The method used to generate the recipient list.</td>
</tr>
<tr>
<td></td>
<td>· Upload File: Upload an Excel file with the recipient information to create a recipient list. This list is static.</td>
</tr>
<tr>
<td></td>
<td>· Dynamic Condition: Use scripts or conditions to receive recipient information.</td>
</tr>
</tbody>
</table>

3. **Click Submit.**
   A recipient list is defined for the contact.
Define a communication contact for the task.

Create a plan type

Create the communication plan type and specify whether the plan type is applicable globally or to a particular table. When you create the communication plan type, it is referenced in the communication plan definition. The type of the communication plan helps you to filter the plan by its type, generate a report of a particular plan type, or create SLAs for any communication plan.

Role required: sn_comm_management.comm_plan_admin or admin

1. Navigate to Task Communication Management > Administration > Plan Types, and click New.
2. On the form, fill in the fields.

Communication Plan Type Lookup form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the communication plan type.</td>
</tr>
<tr>
<td>Global</td>
<td>Option to determine whether the plan type is available for all tables or for a specific table. If the check box is not selected, the Table field appears where you can select the table for which the plan type appears.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the plan type. The plan type is available for all applications or for scoped applications.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to define whether the plan type is active.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the plan type.</td>
</tr>
</tbody>
</table>

3. Click Submit.
A communication plan type is created.

Define a communication plan.

Create a task type

Create the communication task type and specify whether the task is applicable to a particular table or is globally applicable. The communication task type helps you to filter a task by its type, generate a report of a particular task type, or create SLAs for any communication task.

Role required: sn_comm_management.comm_plan_admin

1. Navigate to Task Communication Management > Administration > Task Types, and click New.
2. On the form, fill in the fields.

Communication Task Type Lookup form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the communication task type.</td>
</tr>
<tr>
<td>Global</td>
<td>Option to determine whether the task type is available for all tables or for a specific table. If the check box is not selected, the Table field appears where you can select the table the task type appears for.</td>
</tr>
</tbody>
</table>
3. **Click Submit.**
A communication task type is created.

Define a communication task.

**Define contact responsibilities**

Define the different contacts or target audience involved in the communication process and their responsibility to understand the expectations from those contacts throughout the process.

Role required: sn_comm_management.comm_plan_admin or admin

1. **Navigate to Task Communication Management > Administration > Contact Responsibilities**, and click **New**.
2. **On the form, fill in the fields.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>Option to determine whether the contact responsibility is available for all tables or for a specific table. If the check box is not selected, the <strong>Table</strong> field appears where you can select the table that you are defining the contact responsibility for.</td>
</tr>
<tr>
<td>Name</td>
<td>Unique name of the contact, such as Business Director or Communication Manager, involved in the communication process.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of contact such as user, group, or recipient list.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that the contact is activated on when a communication plan is attached.</td>
</tr>
</tbody>
</table>

3. **Click Submit.**
Contact responsibilities are defined.

Define a communication contact for the task.

**View communication channel configuration**

View the configuration of different communication channels that are used to contact the target audience in the communication process. By default, the communication channels available are email, SMS, Slack, and conference.

Role required: sn_comm_management.comm_plan_admin or admin
You only have read access to the Channel Configuration module. If you want to create a new channel configuration, request the channel configuration through the HI Customer Service system.

1. Navigate to Task Communication Management > Administration > Channel Configuration.
2. Open any communication channel record.
3. On the form, view the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>(Read only) Mode of channel.</td>
</tr>
<tr>
<td>Configuration script</td>
<td>(Read only) Lookup icon (🔍) to select the script that defines the channel configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>(Read only) Option to define whether the communication channel is active or not.</td>
</tr>
<tr>
<td>Classification</td>
<td>(Read only) Internally used to group the channels between conference or major incident management workbench.</td>
</tr>
</tbody>
</table>

**Configure Slack for a communication task**

Configure Slack as a mode of communication for a communication task to send direct message to the users.

Role required: sn_comm_management.comm_plan_admin or admin

Install the Collaboration Services for Task Communications Management plugin (sn_tcm_collab_hook) from ServiceNow Store.

1. Navigate to Incident > Communication Plan Definitions.
2. Open the communication plan where you want to add Slack as a communication channel for a communication task.
3. Open the communication task definition for which you want to add Slack as the mode of communication.
4. Click the Add Channel – Slack related links.
5. Click Submit.

Slack gets added as a communication channel for the communication task.

**Timeline Visualizations**

A timeline visualization is a representation of an organization's activities over time.

Typically, timeline visualizations are useful for quickly assessing the impact of future strategic and operational activities such as change requests and projects. Timeline visualizations come in two varieties: a two-dimensional (2D) view where activities are grouped by month, and a three-dimensional (3D) view where activities are grouped in lanes. Both views are interactive, and the 2D view can be printed.

Timeline administrators, users with the timeline_admin role, can set up visualizations to represent ITSM-related activities, such as incidents, problems, changes, and projects. Timeline administrators
or users with the timeline_user role can personalize their timeline visualizations from the Settings pane in the visualization.

The CIO Roadmap timeline visualization shows your organization's projects grouped by portfolios. Organizational leaders can use the CIO Roadmap to monitor and evaluate the status of current and upcoming projects.

Note: Activating timeline visualizations does not activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

Key terms for timeline visualizations

- **Lane**: A logical grouping of items on the 3D timeline visualization. For example, one lane might show pending projects while another lane shows open projects.
- **Panel**: A block that represents an item record in a 2D timeline visualization, or a block that represents one or more item records in a 3D timeline visualization.
- **Summary view**: A pop-up window that appears when a user clicks a panel in either the 2D or 3D timeline visualization. The summary view contains additional information about the record. Timeline administrators configure the information that appears in the summary view.
- **Marker**: A bar indicating the start of a month in a 3D timeline visualization.
- **Slider**: A tool used to control the time period seen in a 3D visualization.
- **Slider track**: An alternative view of the panels displayed in both the 2D and 3D timeline visualization.
Activate Timeline Visualization

An administrator can activate the Timeline Visualization plugin (com.snc.timeline_visualization) to access the functionality.

To use the CIO roadmap with timeline visualization, you must activate Project Portfolio Management (com.snc.financial_planning_pmo) plugin.

1. Navigate to **System Definition > Plugins**.
   
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

   - ![You have been redirected to All Applications. To see the Plugins list click here](#)

2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in *Request a plugin*.

3. Activate the plugin.
   
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
• If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.

![Activate Plugin Dialog](image)

- To view plugin details before activation:
  1. Click the plugin name.
  2. On the form, click the **Activate/Update** related link.
  3. In the dialog box, review the dependent plugins.
     - If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.
  4. If demo data is available and you want to install it, click **Load demo data**.
     - Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
  5. Click **Activate**.

### Installed with Timeline Visualizations

Several components are installed with timeline visualizations.

### Tables

Timeline visualization adds the following table.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline Visualization (roadmap_page)</td>
<td>Stores all available timeline visualizations.</td>
</tr>
<tr>
<td>Personalize Timeline (roadmap_user_page)</td>
<td>Stores timeline personalization settings for all timeline visualizations.</td>
</tr>
</tbody>
</table>
### UI Policies

Timeline visualization adds the following UI policy.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Timeline Visualization configuration Page to enable/disable certain fields</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Script that hides fields in the Timeline Visualization form when the form loads.</td>
</tr>
</tbody>
</table>

### Script Includes

Timeline visualization adds the following script includes.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap2DUtil</td>
<td>Timeline Visualization - 2D API to generate data for lanes and panels.</td>
</tr>
<tr>
<td>RoadmapCommonUtil</td>
<td>Timeline visualization common utility to handle generic functions.</td>
</tr>
<tr>
<td>RoadmapConfig</td>
<td>Timeline visualization utility allowing configuration through the Timeline Visualization (roadmap_page) table.</td>
</tr>
<tr>
<td>RoadmapItems</td>
<td>Timeline visualization utility to get lane items.</td>
</tr>
<tr>
<td>RoadmapUtil</td>
<td>API to generate data for lanes and panels.</td>
</tr>
</tbody>
</table>

### Client Scripts

Timeline visualization adds the following client scripts.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadmap Color Choice</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Sets color values for the color choice fields in the timeline visualization configuration page.</td>
</tr>
<tr>
<td>Roadmap Item Table</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Allows changing the color fields for the Item_color_key whenever there is a change to the panel table.</td>
</tr>
<tr>
<td>Roadmap On Load</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Loads the personalized version of the roadmap/visualization.</td>
</tr>
<tr>
<td>Roadmap Panel Table Change</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Allows changing the field name for Item_color_key whenever there is a change to the panel/visualization table.</td>
</tr>
</tbody>
</table>
Business Rules

Timeline visualization adds the following business rule.

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Check only one default</td>
<td>Timeline Visualization (roadmap_page)</td>
<td>Checks if another visualization is already set as default when user sets a new visualization as the default.</td>
</tr>
</tbody>
</table>

Timeline visualizations roles

Timeline visualizations provides two roles.

<table>
<thead>
<tr>
<th>Roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timeline administrator</td>
<td>Create and edit timeline visualization pages and view timeline visualizations.</td>
</tr>
<tr>
<td>Timeline user</td>
<td>View timeline visualizations. Timeline user access is also granted to users with the project_manager and project_user roles.</td>
</tr>
</tbody>
</table>

Create a Timeline Visualization

Set up timeline visualizations for the organization's leaders by creating a timeline that provides visual representations of the organization's operational and strategic activities.

Role required: timeline_admin

Additionally, create timeline visualization views to define what data appears in the summary window when a user clicks a panel on the timeline.

Note: Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

- Navigate to Timeline Visualization > Create New and create a new record.
Timeline visualization configuration form
### Timeline visualization configuration form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the visualization.</td>
</tr>
<tr>
<td>Panel table</td>
<td>Table that provides the records displayed as lanes and panels in the timeline.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The list shows only tables and database views that are in the same scope as the visualization.</td>
</tr>
<tr>
<td>Relationship field</td>
<td>Field on the table that contains values displayed as lane titles. Typically this field is a reference field or a field that contains a limited range of values. <strong>Note:</strong> The CIO Roadmap timeline visualization is a ServiceNow customized visualization for the Project application that does not use the Relationship field.</td>
</tr>
<tr>
<td>Show slider</td>
<td>Check box that enables (selected) or disables (cleared) displaying the timeline slider that users move to change the dates shown.</td>
</tr>
<tr>
<td>Panel name</td>
<td>Field from the Panel table that contains the values displayed in the panel body.</td>
</tr>
<tr>
<td>Panel date</td>
<td>Field from the Panel table that contains the date values displayed in the panel head in 3D view and in the panel body in 2D view. These dates also determine placement of panels on a lane. Only date and date-time fields are available on the choice list.</td>
</tr>
<tr>
<td>Default</td>
<td>Check box that sets (selected) or removes (cleared) the default status of a visualization when you have more than one defined for a specific table. Applications that include a visualization use the default visualization.</td>
</tr>
<tr>
<td>Max items per lane</td>
<td>Maximum number of items that are displayed in a lane in 3D view. The default value is 500.       <strong>Note:</strong> The field is not visible on the form by default. Configure the form to add this field.</td>
</tr>
<tr>
<td>Max items per lane 2d</td>
<td>Maximum number of items that are displayed in a lane in 2D view. The default value is 99.        <strong>Note:</strong> The field is not visible on the form by default. Configure the form to add this field.</td>
</tr>
</tbody>
</table>
### Timeline visualization configuration filtering and sorting form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set <em>(Name) (is not) (IT)</em> as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to <em>(Name) (z to a).</em></td>
</tr>
<tr>
<td>Panel condition</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in 2D and 3D view visualizations. For example, if you set <em>(State) (is one of) (Pending, Open, Work in Progress)</em> as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
</tbody>
</table>

### Timeline visualization configuration color options form field descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Panel color key</td>
<td>Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form. The CIO Roadmap uses State, which is a field in the Project table. Panels on the CIO Roadmap are color coded according to the project state, which can be Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Skipped.</td>
</tr>
</tbody>
</table>

**Note:** You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

Examples of other fields that are suitable for this selection include Priority, Risk, and Approval.
### ServiceNow Orlando  Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label 1</td>
<td>Values to be color coded. The values available are determined by the Panel color key field. For example, the CIO Roadmap is based on the Project table and has the Panel color key set to the State field, which contains the values Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped. You can set specific colors for up to four values from the selected field. Other values are shown in the Default color.</td>
</tr>
<tr>
<td>Label 2</td>
<td></td>
</tr>
<tr>
<td>Label 3</td>
<td></td>
</tr>
<tr>
<td>Label 4</td>
<td></td>
</tr>
<tr>
<td>Default color</td>
<td>Color applied to values that are not selected for labels. For example, the CIO Roadmap color codes and creates labels for the values Pending, Open, Work in Progress, and Closed Complete. The additional values, Closed Incomplete and Closed Skipped, use the default color.</td>
</tr>
<tr>
<td>Color 1</td>
<td>Colors that correspond to each of the Label field values. For example, if Label 1 is the Pending state, and Color 1 is red, then panels for projects in the pending state are red.</td>
</tr>
<tr>
<td>Color 2</td>
<td></td>
</tr>
<tr>
<td>Color 3</td>
<td></td>
</tr>
<tr>
<td>Color 4</td>
<td></td>
</tr>
</tbody>
</table>

### Create a Timeline Visualization view

The timeline visualization view determines which record details appear in the pop-up summary window when a user clicks a panel.

You can create one timeline visualization view per table. For example, if your view shows incident records, you can create a view on the Incident table to show only certain information, such as the incident number, priority, and short description.

If no Timeline Visualization view exists, all panels use the default view that shows all the fields that currently appear on the default view of the form for that table. After you create a Timeline Visualization view for a table, all panels then use that view.

For example, to create a Timeline Visualization view using the Incident form:

1. Navigate to Incident > All.
2. Open an incident.
3. Right-click the form header and select Configure > Form Layout.
4. Under Form view and section, go to the View name field and select New.
5. Enter timeline visualization in the View name field.
6. Click Ok to create the timeline visualization view.
7. Add fields to or remove items from the timeline visualization view using the Available and Selected columns.
8. Click Save.
Planning Your Timeline Visualization

Before creating a timeline visualization, you should have a clear idea of the information that you want to display.

This planning process helps you identify the required table and fields, and determine filtering and sorting requirements. Since users can personalize the visualization, avoid setting restrictive filters that may prevent users from finding categories that they are accustomed to seeing. You can use the CIO Roadmap as a starting point for creating your own timeline visualizations.

Note: Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

Use Timeline Visualization

Timeline Visualization provides a high-level view of an organization's strategic and operational activities over time.

Organizational decision makers can use the information in visualizations for activities such as planning future projects and estimating resource requirements. Users can personalize the information displayed with the visualization Settings pane.

Activating the Timeline Visualization application does not install the CIO Roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap. CIO Roadmap is a timeline visualization that displays an organization's IT projects and portfolios. This following sections use the CIO Roadmap to demonstrate features of timeline visualizations.

Lanes, markers, and panels

Lanes, markers, and panels are the fundamental elements of a timeline visualization. appear in the 3D view only.

Note: Lanes and markers are available in the 3D view only. A panel in the 2D view always represents a single record, while panels in 3D view may represent one or more records.

Lanes

A lane is a channel in which activities are grouped. A visualization can display up to eight lanes at a time. While viewing a visualization, you can use the Settings pane to show or hide individual lanes.

Note: The number of items displayed in a lane depends on the Max items per lane and Max items per lane 2d settings on Timeline Visualization form.

Markers

Markers are horizontal lines that cross all lanes and identify a transition to the next month.
Panels

Panels in both 2D and 3D views are color coded according to values that the administrator selects during the initial setup.

In 2D view, panels are grouped by month and stacked in chronological order, from the earliest date to the latest date. By default, the 2D view opens with the current month displayed on the left side of the visualization. You can print visualizations from the 2D view using the browser's print option. In 3D view, panels are grouped in lanes and ordered by date, from earliest to latest. The date that appears on the panel determines its placement in 2D and 3D view. The date displayed is based on a value the timeline administrator selects during initial setup.

Panels appear in the CIO Roadmap according to the planned completion date for the project. In 3D view, projects with the same planned date of completion are consolidated into a single panel. In 2D view, projects with the same planned date of completion are displayed as individual panels.

Panel headers in the CIO Roadmap are color coded based on project state. However, in 3D view, if a panel represents more than one project, the panel header is colored black. The Settings pane contains a key showing each available project state and the corresponding color.

Note: Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

To view additional information about a panel:
- Click a panel for a single record while in 2D or 3D view to open a summary window that contains additional information. Click the heading in the summary window to open the full record.
- Click a panel that represents multiple records to open a list of those records. Click a record number to open the full record.

The timeline administrator can configure the information that appears in summary windows.

Personalize Timeline Visualizations

You can configure settings for timeline visualizations like lane and panel conditions, colors, and labels.
Personalization

Open the Settings pane and click **Configure**. Complete the form as appropriate (see table).

### Visualization personalization

**Timeline visualization personalization form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lane conditions</td>
<td>Condition builder used to create filters and apply sorting to values that are used as lanes in 3D view visualizations. For example, if you set (Name) (is not) (IT) as a lane condition for the CIO Roadmap, then IT no longer appears as a lane in the roadmap, nor does it appear as a lane option in the Settings pane. Removing the filter restores the IT lane to the visualization and to lane options in the Settings pane. To order the results, specify sorting based on relevant field names. For example, to order the portfolio names so that they appear in reverse alphabetical order on the CIO Roadmap, set the sort fields to (Name) (z to a).</td>
</tr>
</tbody>
</table>
### Field Conditions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Panel conditions</td>
<td>Condition builder used to create filters and apply sorting to values that are used as panels in the visualization. For example, if you set (State) (is one of) (Pending, Open, Work in Progress) as the panel condition for the CIO Roadmap, only projects that are in one of those states appear on the roadmap.</td>
</tr>
<tr>
<td>Panel color key</td>
<td>Field from the Panel table that contains values used for color coding the information displayed. The field selected here determines the values that are available in the Label fields on the form.</td>
</tr>
<tr>
<td>Label 1, Label 2, Label 3, Label 4</td>
<td>Values to be color coded. The values available are determined by the Panel color key field. For example, the CIO Roadmap is based on the Project table and has the Panel color key set to the State field, which contains the values Pending, Open, Work in Progress, Closed Complete, Closed Incomplete, and Closed Skipped. You can set specific colors for up to four values from the selected field. Other values are shown in the Default color.</td>
</tr>
<tr>
<td>Default color</td>
<td>Color applied to values that are not selected for labels. For example, the CIO Roadmap color codes and creates labels for the values Pending, Open, Work in Progress, and Closed Complete. The additional values, Closed Incomplete and Closed Skipped, use the default color.</td>
</tr>
<tr>
<td>Color 1, Color 2, Color 3, Color 4</td>
<td>Colors that correspond to each of the Label field values. For example, if Label 1 is the Pending state, and Color 1 is red, then panels for projects in the pending state are red.</td>
</tr>
</tbody>
</table>

**Note:**
- Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.
The Settings pane

Element names in the Settings pane vary based on the table and fields used to create the visualization.

The Settings pane contains the following elements:

- Max items per lane: If the Max items per lane field is set to more than 1000, you may observe a delay when displaying the timeline data using Internet Explorer (IE) as the browser.
## Settings pane elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>Identifies the type of information that is color coded on the timeline, such as state or priority. It also lists the color assigned to each possible value, such as pending state and open state.</td>
</tr>
<tr>
<td>Configure</td>
<td>Allows you to personalize a visualization by creating filters on lane information and panel information, specifying sort order for results, and reassigning panel colors. These changes affect your view of the visualization only.</td>
</tr>
<tr>
<td>View</td>
<td>Allows you to switch between 2D and 3D view.</td>
</tr>
<tr>
<td>View &lt;table&gt; List</td>
<td>Opens a separate browser tab showing the complete record list for the associated table.</td>
</tr>
<tr>
<td>Portfolio</td>
<td>Allows you to click lane names to add or remove them from the visualization. While the visualization is in 2D view, the Settings pane displays a <em>Show all records</em> button that allows you to override lane filters applied to the initial setup.</td>
</tr>
</tbody>
</table>

### Use the slider and slider track

The slider and slider track are useful for quickly navigating to any point in time on a visualization.

**Note:** Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

For the CIO Roadmap, the slider track allows you to quickly view the distribution of projects over time and determine project states. While in 3D view, click and drag the slider to move the timeline forward or backward. In 2D view, click and drag the slider track right or left to move the timeline forward or backward.

The slider track provides an alternative view of panels on a visualization. For the CIO Roadmap, a colored dot in the slider track indicates the presence of one or more projects for a given day. The different dot colors correspond to different project states. This allows you to scan the slider track to identify projects of interest by their color, and then use the slider or slider track to quickly navigate to those projects. For example, if you are interested in projects that are in a pending state, you can use the slider to navigate to the colored dots that represent that state.

**Note:** Dots in the slider track do not correspond one-to-one with panels in a visualization. A dot represents the presence of one or more projects on a given date. In 3D view, if there is more than one project for a given day, all of the projects for that day are combined into a single panel on the roadmap. When the slider track is populated, projects in a multi project panel are analyzed for project state and then represented as appropriately colored dots in the slider track.

Similarly, you can use the slider or slider track in conjunction with the calendar to quickly navigate to any point in time. For example, if you are concerned about resource issues in April 2014 because you see a large cluster of dots during that time, dragging the slider or slider track to those dots brings those projects into view. Click the individual panels to view additional information.
View timeline visualization

You can view timeline visualizations from a project.

1. Navigate to Project > Projects > All.
2. Scroll to the bottom of the list and click the Timeline Visualization related link.

By default, the CIO Roadmap opens in three-dimensional (3D) view with the current date at the forefront of the timeline. You can use the Settings pane to change between two-dimensional (2D) and 3D view. As soon as you view a timeline visualization, it is considered personalized. After that, you see your personalized view even if the timeline administrator makes changes to the default visualization.

**Note:** Activating timeline visualizations doesn't activate predefined CIO roadmap. You require PPM (com.snc.financial_planning_pmo) plugin to use CIO roadmap.

Timeline administrators can create timeline visualizations on other tables. If you are not sure whether a timeline visualization exists for a certain application, use the application navigator to open the application of your choice, and click All. If a timeline visualization exists for the application's table, a Timeline Visualization related link appears.

Work with timeline visualizations

There are various tools that allow you to move visualizations backward and forward in time depending on whether you are in 2D or 3D view.

The following options are available for navigating between months.

### 2D views

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the slider track right or left to view other months.</td>
</tr>
<tr>
<td>Left and right arrow keys</td>
<td>Press the left or right arrow keys on the keyboard to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Mouse wheel button</td>
<td>Scroll the wheel to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Right and left navigation arrows</td>
<td>Click the arrows to move from month to month. Arrows do not appear if there are no additional months to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating stacked panels.

### Navigating stacked panels

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the stack up or down to view other panels.</td>
</tr>
</tbody>
</table>
### Table: Navigation Arrows

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up and down navigation arrows</td>
<td>Click the arrows in a stack to view additional panels for the same month. Arrows do not appear if there are no additional panels to view.</td>
</tr>
</tbody>
</table>

The following options are available for navigating in 3D view.

#### 3D View

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dragging</td>
<td>Hold down the left mouse button and drag the slider along the slider track to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Mouse wheel button</td>
<td>Scroll the wheel to move the timeline forward or backward.</td>
</tr>
<tr>
<td>Up and down arrow keys</td>
<td>Press the arrow keys to move the timeline forward or backward.</td>
</tr>
</tbody>
</table>

### Visual Task Boards

Visual Task Boards (VTB) transform the navigation of lists and forms into an interactive graphical experience.

With Visual Task Boards, you can view and update multiple task records, which appear as cards that can be moved between lanes. An activity stream on the board displays recent activity so you can easily track changes to tasks. You can add task cards from any table that extends Task to intuitively and easily track updates and edit records directly from the board. Any user can use task boards, regardless of role, though access control rules (ACLS) may limit which cards each user can see. The Visual Task Board interface provides a graphic-rich environment suited for managing and collaborating on records. For example, a support manager might create a board for her team to track their assigned incidents by state in real time.

This video demonstrates how Visual Task Boards work.

**Note:** UI16 or UI15 is required to use Visual Task Boards.

Visual task boards have domain separation at the data level only. For more information, see *Domain separation in Visual Task Boards*.

The following podcast offers additional information on the use of Visual Task Boards.

### Activate Visual Task Boards

Visual Task Boards are active by default on new instances. For upgraded instances, you can activate the Visual Task Boards plugin (`com.glide.ui.vtb`) if you have the admin role.

**Role required:** admin

1. **Navigate to System Definition > Plugins.**
   
   A banner notifies you that you're in the All Applications page, which contains plugins and ServiceNow Store applications.

   ![Banner](summary.png)

   **Note:** To redirect to the legacy list view for plugins, click the link.

2. **Find the plugin using the filter criteria and search bar.**
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in [Request a plugin](#).

3. **Activate the plugin.**
   
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   
   - If you're certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.

   ![Activate Plugin](activate.png)

   - To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

**Domain separation in Visual Task Boards**

This is an overview of domain separation in the Visual Task Boards application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: Basic**

- There is business logic to ensure data goes into the proper domain for the application’s service provider use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at run time.
- The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Use case: As a service provider when I use chat to respond to a tenant-customer’s message, the client must be able to see my response.

**Installed with Visual Task Boards**

Several types of components are installed with Visual Task Boards.

**Tables installed with Visual Task Boards**

Tables are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Board Member</td>
<td>Stores a record for each member of each task board.</td>
</tr>
<tr>
<td>(vtb_board_member)</td>
<td></td>
</tr>
<tr>
<td>Private Task</td>
<td>Stores a record for each personal task on each freeform board.</td>
</tr>
<tr>
<td>(vtb_task)</td>
<td></td>
</tr>
</tbody>
</table>
### Table

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visual Task Board (vtb_board)</td>
<td>Stores a record for each task board.</td>
</tr>
<tr>
<td>Visual Task Board Card (vtb_card)</td>
<td>Stores a record for each task card on each task board.</td>
</tr>
<tr>
<td>Visual Task Board Card History (vtb_card_history)</td>
<td>Stores records for certain task card changes, such as lane or assignee changes. Each record indicates the previous value and the new value.</td>
</tr>
<tr>
<td>Visual Task Board Lane (vtb_lane)</td>
<td>Stores a record for each lane on each task board.</td>
</tr>
</tbody>
</table>

### Properties installed with Visual Task Boards

Properties are added with activation of Visual Task Boards.

**Note:** To open the System Property (sys_properties) table, enter `sys_properties.list` in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vtb.board.upload_limit</td>
<td>Sets the maximum file size in megabytes allowed for each task card attachment.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 10</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location:</strong> System Property (sys_properties) table</td>
</tr>
</tbody>
</table>

### Script includes installed with Visual Task Boards

Script includes are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VisualTaskBoards</td>
<td>Provides general utilities for Visual Task Boards.</td>
</tr>
<tr>
<td>VTBBoardSecurity</td>
<td>Provides security utilities to control board access.</td>
</tr>
<tr>
<td>VTBGetBoardsByUser</td>
<td>Provides a method that retrieves all the boards a specified user owns or is a member of.</td>
</tr>
<tr>
<td>VTBTaskSecurity</td>
<td>Provides security utilities to control task access.</td>
</tr>
</tbody>
</table>

### Client scripts installed with Visual Task Boards

Client scripts are added with activation of Visual Task Boards.
Add Kanban Choice

Visual Task Board
(vtb_board)

Adds the **Kanban Board** option to the Lane field field. This option indicates that the task board is a flexible board.

### Business rules installed with Visual Task Boards

Business rules are added with activation of Visual Task Boards.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add members to live group</td>
<td>Board Member</td>
<td>If a Connect Chat conversation is created for a task board, this business rule adds the board members as conversation members.</td>
</tr>
<tr>
<td></td>
<td>(vtb_board_member)</td>
<td></td>
</tr>
<tr>
<td>Remove member from live group</td>
<td>Board Member</td>
<td>If a Connect Chat conversation exists for a task board and a user is removed from the board members, this business rule removes the user from the conversation members.</td>
</tr>
<tr>
<td></td>
<td>(vtb_board_member)</td>
<td></td>
</tr>
<tr>
<td>Remove member from VTB</td>
<td>Live Group Member</td>
<td>If a Connect Chat conversation exists for a task board and a user is removed from the conversation members, this business rule removes the user from the task board members.</td>
</tr>
<tr>
<td></td>
<td>(live_group_member)</td>
<td></td>
</tr>
<tr>
<td>Sync board name to Connect</td>
<td>Visual Task Board</td>
<td>If a Connect Chat conversation exists for a task board and someone updates the board name, this business rule updates the conversation name.</td>
</tr>
<tr>
<td></td>
<td>(vtb_board)</td>
<td></td>
</tr>
<tr>
<td>Sync chat name to VTB board</td>
<td>Live Group Profile</td>
<td>If a Connect Chat conversation exists for a task board and someone updates the conversation name, this business rule updates the board name.</td>
</tr>
<tr>
<td></td>
<td>(live_group_profile)</td>
<td></td>
</tr>
<tr>
<td>Sync Members With VTB</td>
<td>Live Group Member</td>
<td>If a Connect Chat conversation exists for a task board and a user is added to the conversation members, this business rule adds the user as a board member.</td>
</tr>
<tr>
<td></td>
<td>(live_group_member)</td>
<td></td>
</tr>
<tr>
<td>Update Board on Card Change</td>
<td>Visual Task Board Card</td>
<td>Triggers the system to update the task board when changes occur to the cards.</td>
</tr>
<tr>
<td></td>
<td>(vtb_card)</td>
<td></td>
</tr>
<tr>
<td>Update Board on Lane Change</td>
<td>Visual Task Board Lane</td>
<td>Triggers the system to update the task board when changes occur to the lanes.</td>
</tr>
<tr>
<td></td>
<td>(vtb_lane)</td>
<td></td>
</tr>
</tbody>
</table>
### Business rule | Table | Description
--- | --- | ---
update board on lane change | Board Member (vtb_board_member) | Triggers the system to update the task board when changes occur to the board members.
VTB Previous Additional Assignees | Private Task (vtb_task) | Triggers the system to send an email notification to users when they are designated as additional assignees for cards.

### Notifications installed with Visual Task Boards
Notifications are added with activation of Visual Task Boards.

| Notification | Description |
--- | ---
VTB member addition notification | Sends an email notification to the member about their addition to the board.
VTB member deletion notification | Sends an email notification to the member about their removal from the board.
VTB additional assignee notification | Sends an email notification to users when they are designated as additional assignees for tasks.
VTB assignee notification | Sends an email notification to users when they are designated as the primary assignees for personal tasks.
VTB lane change notification | Sends an email notification to a task’s assignees when the task changes lanes.
VTB lane limit reached | Sends an email notification to the board member that the number of tasks in the lane has reached the set lane limit.
VTB lane limit exceeded | Sends an email notification to the board member that the number of tasks in the lane has exceeded the set lane limit.
VTB card movement across vertical lanes and swimlanes | Sends an email notification to the board member with the details of the card moved and the member who moved the card.

### Supported browsers for Visual Task Boards
The system supports Visual Task Boards on most modern browsers.

**Supported browsers**
- The latest public release of Firefox or Firefox ESR
- The latest public release of Chrome
- Safari version 12
- Internet Explorer version 11
- Edge mode is supported.
- Compatibility mode is not supported.
- Setting Security Mode to High (via the Internet Options > Security tab) is not supported.
- Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

**Note:** VTB loading is comparatively slower on Internet Explorer 11 browsers

The recommended limit to include various elements to the board while working on Internet Explorer and Edge browsers is as follows:

### Browser Limits

<table>
<thead>
<tr>
<th>Browser</th>
<th>Scenario</th>
<th>Recommended Limits</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Cards</td>
<td>Vertical Lanes</td>
</tr>
<tr>
<td>IE</td>
<td>500</td>
<td>20</td>
</tr>
<tr>
<td></td>
<td>500</td>
<td>5</td>
</tr>
<tr>
<td>Edge</td>
<td>1000</td>
<td>20</td>
</tr>
<tr>
<td></td>
<td>1000</td>
<td>10</td>
</tr>
</tbody>
</table>

- Access Visual Task Boards on your mobile device using either a browser or the native mobile app. See for more information.

### Scripting support

Visual task boards do not interact with client scripts. Use a UI policy or a data policy instead.

### Task board structure

Different types of task boards work for different kinds of task management. However, all board types share the same overall structure.

#### Task board types

<table>
<thead>
<tr>
<th>Board type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Freeform boards</td>
<td>Display all types of task records, including personal tasks. Members of freeform boards can add and remove task cards and lanes.</td>
</tr>
<tr>
<td>Flexible boards</td>
<td>Display tasks that match a filter against a particular table. Members of flexible boards can add task cards. Cards are removed automatically when the tasks no longer match the filter conditions. Members can define custom lanes, similar to a freeform board.</td>
</tr>
</tbody>
</table>
You can identify the task board type by the icon beside the board name.

- The freeform board icon:

- Flexible board icon:

- Guided boards icon:
Sample Visual Task Board dashboard

All boards have the displayed elements. The color of the left boundary of a card represents the color you choose in the color palette for that board.

**Task board elements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick panel</td>
<td>Displays labels and users associated with the board. Board members can use the quick panel to quickly label or assign tasks. Members can also configure what appears in the quick panel.</td>
</tr>
<tr>
<td>Element</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Lanes</td>
<td>Organize cards on a board into vertical groups. These groups often represent the status of the task, such as <strong>To Do</strong>, <strong>Doing</strong>, and <strong>Done</strong>. When using a guided board, each lane represents a possible field value. For example, a board on the Incident table can display one lane for each <strong>State</strong> value such as <strong>New</strong>, <strong>Active</strong>, or <strong>Resolved</strong>. Users can move cards from one lane to another to update the task that card represents.</td>
</tr>
<tr>
<td>Cards</td>
<td>Represent individual tasks that you can assign to users. You can add comments, attachments, and labels to cards. Each card is tied to a task record; updating one immediately updates the other. For freeform boards, each card represents a personal task. For flexible and guided boards, each card represents a record from the list that board was created from. For more information, see <a href="#">Create Flexible and Guided boards</a>.</td>
</tr>
<tr>
<td>Task board tools</td>
<td>Displays board information, board members, the board activity stream, and board labels.</td>
</tr>
</tbody>
</table>
| Board header | Displays the board name in the title bar. You can rename the board by double-clicking on the board name. Filter the tasks in the board by:  
  - Entering the title or number of the task card  
  - Selecting an option in the **Due By** list |
| Swimlanes  | Organize cards on a board into horizontal lanes. These lanes often represent the user assigned to a task. You can add any number of swimlanes to the board, and move cards from one user to another easily. |
Sample Visual Task Board elements

Visual Task Board use

Any user can create, view, and edit freeform, flexible, and guided visual task boards, and add users to these boards as members.

You can create a freeform board and add cards from multiple task tables, or create a flexible or guided board from an existing list of records.
Create a freeform board

You can create freeform Visual Task Boards (VTBs) for tracking any kind of task or project.

Role required: none

2. Next to My Task Boards, click New, or if you have never created a task board before click Create New Visual Task Board.
3. From the Create New Board window, click Freeform. A new task board opens with the default freeform lanes, To Do, Doing, and Done.
4. Click the board name and enter a new name.

After the board is created, board members can:

- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

Create a data driven board

You can create a flexible or guided data driven Visual Task Board (VTB) for any table that extends Task, such as Incident or Change.

Role required: none

2. Next to My Task Boards, click New, or if you have never created a task board before click Create New Visual Task Board.
3. From the Create New Board window, click Data Driven Board.
4. From the Task Table list, select a base table of tasks on which to base your board, for example, an incident table.
5. Optional: From the Lane Field list, select the field you want to use for the lane headers. Create a Flexible board with editable lane headers by selecting None.
   The type of board that is created and the lanes that appear on the board depend on which type of column you select. If you select a reference or choice column, the board is a guided board. Each lane in a guided board represents one possible value for that column and the cards appear in the appropriate lane. For example, if you create a guided task board for incidents using the State column, the board shows one lane for each incident state, such as New or Closed. If you select a column that is not a reference or choice, the board is a flexible board and the board shows the default lanes, To Do, Doing, and Done, with all cards in the To Do lane.
6. Optional: Create a filter to show only the records you want to work with. For example, you might filter out incidents that are not assigned to you.
   Any card that no longer fits the parameters of the filter is automatically removed from the task board.
7. Optional: Click the board name and enter a new name.

Note: For guided boards created from choice fields, such as State, the system creates a lane for each possible choice value. For guided boards created from reference
fields, the system creates a lane only for each value in use by a task card. Lanes are added as needed if the reference field values change.

After the board is created, board members can:
- Add and modify lanes
- Create and modify task cards
- Add and remove members
- Configure the look and feel

Delete a task board
You can delete any task board you own.
Role required: none
Deleting a board does not impact the underlying task records. However, you cannot recover a board after you delete it.
2. Under Boards you own, point to a board and click the delete icon (X).
3. In the confirmation dialog, click Delete.

Add or modify task board lanes
Any board member can change the names and add new lanes to accommodate the task workflow you want to track. When you create a freeform or flexible task board, it includes the default lanes To Do, Doing, and Done.
Role required: none
Unlike guided boards, the lanes on a freeform or flexible task board do not match possible field values.

Note: You cannot remove lanes from guided boards.

1. Open a task board.
2. Perform any of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a new lane</td>
<td>1. Scroll past the last lane and click Add Lane.</td>
</tr>
<tr>
<td></td>
<td>2. Enter a title for the lane, then press the Enter key.</td>
</tr>
<tr>
<td></td>
<td>The Add Lane option is always available for freeform and flexible boards. It is available for guided boards only if the lanes are based on a reference field, such as Assigned to.</td>
</tr>
<tr>
<td>Rearrange lanes</td>
<td>Click a lane header and drag the lane to the desired drop zone. To cancel the move, press the Escape key while you drag the lane. You can also change the lane order from the board configuration menu.</td>
</tr>
</tbody>
</table>
### Option | Description
--- | ---
| **Hide a lane** | 1. Click the lane menu (谤) in a lane header.  
2. Select **Hide Lane**. You can restore hidden lanes from the board configuration menu. |
| **Delete a lane** | 1. Click the lane menu in a lane header.  
2. Select **Delete Lane**.  
3. In the confirmation dialog box, click **Delete**. When you delete a lane on a freeform or flexible board, all the cards in the deleted lane are archived.  
The **Delete Lane** option is always available for freeform and flexible boards. It is available for guided boards only if the lanes are based on a reference field, and only for lanes that contain no cards. |
| **Exclude Child Table Records** | 1. Click **Info** icon  
2. Under **Structure** menu, select **Exclude Child Table**  
   ![Image](4522)
   **Records**  
The Child Table lanes and records are excluded. |

---

**Task cards**
Visual Task Board task cards can represent a personal task or a record on a table.
You can add task cards, edit task card details, add labels to cards, and access the underlying task record the card represents, depending on the board type.

**Note:** Each board can display up to 2,000 cards by default. When the number of tasks exceeds the maximum, a warning appears and the system determines which cards to show by most recent update time. Administrators can configure a different maximum card limit for task boards.

### Freeform board tasks

You can add personal task cards directly to lanes on a freeform board. You can also add other kinds of task cards to a freeform board from a list or form.

**Add a personal task to a freeform board**

You can add cards directly to a freeform board lane. These cards are called personal tasks and represent records on the Private Task (vtb_task) table.

**Role required:** none

1. In a lane header, click the lane menu and select **Add Task**. Alternatively, click **Add Task** at the bottom of a lane.
   A new task card appears in the lane.
2. Enter a short description for the new task card.
3. To save the card, click another area of the board or press **Enter**.

**Add a task to a freeform board from a form**

You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.

**Role required:** none

You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

1. Open a task record, such as an incident.
2. Click the menu icon or right-click the form header to show the form context menu.
3. Select **Add to Visual Task Board**.
   A pop-up window appears with a list of freeform task boards.
4. Click the name of the board you want to add the card to. A confirmation message appears.

5. To view the board, click the board name in the confirmation message. The task appears in the first lane by default.

Add a task to a freeform board from a list
You can add a task card to a freeform board from any table that extends Task. These cards represent records on whichever table you add them from.

Role required: none
You can add cards from multiple task tables, such as Incident or Problem, to the same freeform board.

1. Navigate to a list of task records, such as Incident > Open.

2. Perform either of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add one task</td>
<td>Right-click a record and select Add to Visual Task Board</td>
</tr>
<tr>
<td>Add multiple tasks</td>
<td>Select the check box beside each record you want to add and select Add to Visual Task Board from the actions choice list</td>
</tr>
</tbody>
</table>

A pop-up window appears with a list of freeform task boards.
3. Click the name of the board you want to add the card to. A confirmation message appears.
4. To view the board, click the board name in the confirmation message. The task appears in the first lane by default.

Data driven board tasks

You can add a task to a flexible or guided task board.

**Add a task to a flexible or guided board**

Cards in a flexible or guided board represent records on whichever table the board is associated with.

Role required: none

1. In a lane header, click the lane menu and select **Add Task**. Alternatively, click **Add Task** at the bottom of a lane.

A pop-up window appears with a new record. Fields are populated based on any filter conditions for the board and, for guided boards, the lane you add the card to.

Consider the example of a guided board that shows incidents with the **Software** category, with a lane for each assignee. If you add a card to the **ITIL User** lane, the new incident record **Category** and **Assigned to** fields are automatically set to **Software** and **ITIL User**.

2. Complete the form and click **Submit**. A new task card appears in the lane.

**Edit task board card details**

Edit the details of the card if you need to assign tasks, add comments, change the due date, or change other features of the card.

Role required: none
You can edit various card details. Updating these values also updates the underlying task record.
Can't log into SAP from my laptop today

Tried to connect to SAP and all I see is a "Connecting..." message but nothing else happens.

Sample Visual Task Board card
2. Click a card on the board.
The details for the card appear in a pop-up window.
3. Modify the card details.
   Possible modification actions include:
   - Rename the card by clicking the card title and providing the new name.
   - Modify the short description.
   - Add comments or work notes in the activity stream.
   - Edit the users assigned to tasks.
   - Add a label to the card by selecting one or more of the **available labels**.
   - Add or edit the **Due Date**. If the completion of a task exceeds the due date, the date appears in red.

<table>
<thead>
<tr>
<th>Defect tracking tool is down.</th>
<th>My computer is not detecting ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>🧑‍💻 Apr 16</td>
<td>📡 Apr 8</td>
</tr>
<tr>
<td>INC009004</td>
<td>INC009002</td>
</tr>
<tr>
<td>20m ago</td>
<td>10m ago</td>
</tr>
</tbody>
</table>

- Add or remove file attachments.
- Archive the card (freeform boards only). Once archived, the card is not visible in active items.
- Move the card to a different board (freeform boards only).

**Add an attachment to a task card**
You can add an attachment to a record within a task board.

Role required: none

Adding an attachment to a task card also adds the attachment to the underlying task record.
1. Click a card.
2. Click the attachment tab.

3. Click Add Attachment and select a file to add as an attachment.

**Label a task card**

Labels help categorize tasks and visually distinguish them on the task board.

*Enable* labels for the board.

Role required: none

You can filter the visible tasks to show only those with certain labels. Labels appear on cards as colored dots.

**Task card labels**

You can add one or more labels to a task card.

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a label to a card from the quick panel</td>
<td>1. Drag a label from the quick panel directly to a task card.</td>
</tr>
<tr>
<td></td>
<td>2. Drop the label in the drop zone.</td>
</tr>
</tbody>
</table>

| Add a label to a card from the card details | 1. Open the card details for a task.                                        |
|                                            | 2. Click the details tab.                                                    |
|                                            | 3. Under Labels, select one or more labels. Point to a label to display its name. |
|                                            | 4. Close the card detail pop-up window.                                      |

You can use configuration options to *rename or disable* labels or to *hide* labels altogether.
Assign a task card to a user

Assignees represent ownership of task cards and the associated records. Each task card can have one primary assignee and multiple additional assignees.

You can filter the visible tasks on a board to show only tasks assigned to a certain user. Assignees appear on cards as avatars.

![Assignees](image)

When a card changes lanes, all the assignees receive an email notification.

For flexible and guided boards, the primary assignee corresponds to the underlying task’s Assigned to field. For example, on a board created from the Incident table, if you add Joe Employee as the primary assignee for a card, the associated incident is assigned to Joe. Note that assignment rules on the associated table may restrict who you can make the primary assignee of a card. If you attempt to assign a task card to a user in a way that violates an assignment rule, a notification appears and the assignment does not take place.
Note: Assignees are not automatically granted access to the board. Only members can access the board.

Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Add an assignee from the quick panel | 1. Drag a user’s avatar from the quick panel directly to the task card.  
  2. Drop the avatar in the Primary or Additional drop zone. |
| Add an assignee from the card details | 1. Open the card details for a task.  
  2. Click the assignees tab (👥).  
  3. Click Add Primary Assignee or Add Additional Assignee. The Add Primary Assignee option is not available if there is already a primary assignee.  
  4. Select a user.  
  5. Close the card detail pop-up window. |

The system sends an email notification to inform the new assignee of the change.

**Visual Task Board checklists**

Checklists help you track the progress of tasks on your Visual Task Board. Checklists are available as a tab in the card details.
Sample checklist

You can add, remove, or rearrange checklist items. You can also save a checklist as a template for future use on other cards. Any user can create or edit a checklist. When the compact card view is disabled, the task card displays a progress bar to show how many items are complete.
You can also use checklists with task records in the standard interface. For more information, see **Checklists**.

**Create a checklist for a card**

You can create a unique checklist for each Visual Task Board card or create a task from a checklist item.

Role required: none

1. Open the card details for a task.
2. Click the checklist tab (✓).
3. Click **Add Item**.
4. Enter text for the checklist item.
5. Press the Enter key to add the checklist item.
6. Create as many additional checklist items as desired.
7. To delete a checklist item, click the minus (-) icon.
8. To reorder checklist items, click the drag icon (_drag_ ) and drag a checklist item to a different position in the list.
9. To create a task from a checklist item:
   a) Point to a checklist item and click the create task icon (_task_ ).
b) Select the type of task you want to create.
   An administrator can configure which task types are available.
   The new task record appears in a pop-up window. The short description is automatically
   populated with the checklist item text.
   c) Fill in the form with additional detail as necessary.
   d) Click Update.

Create checklist template
A template saves time by creating checklist items automatically. You can add, edit, or remove
checklist items without impacting the template.

Role required: none
1. Open the card details for a task.
2. Click the checklist tab (✓).
3. Add items to the checklist that you want to save as part of the template.
4. Click the more icon (•).
   The more icon does not display unless you have added an item to the checklist, or if you have
   a pre-existing checklist template.
5. Select Save as Template.
6. In the dialog box, enter a descriptive template name to identify the checklist.
   When a user creates a checklist from a template, all templates are listed in alphabetical order
   and there is no way to filter which templates appear. To provide a better user experience,
   consider implementing a naming system for checklist templates. For example, include the
   name of the table or another identifier to clarify how the checklist should be used.
7. Click Save.

Create a checklist from a checklist template by selecting the template from the more icon.

Delete a checklist from a card
You can remove a checklist from a Visual Task Board card.

Role required: none
1. Open a task card that contains a checklist.
2. Click the checklist tab (✓).
3. Click the more icon (•).
4. Select Remove Checklist.
   A confirmation dialog box appears.
5. Click Delete.

Configure which types of tasks can be created from checklist items
A system property controls which types of tasks you can create from a Visual Task Board checklist
item.

Role required: admin
You might want to add custom tables or remove tables you do not use.
1. Navigate to sys_properties.list.
2. Locate the `glide.ui.create_task_type_option_list` property.

3. Edit the Value to add or remove tables.
   
   You can add any table that extends Task (task). Use the table name, not the label. For example, you would enter `change_request`, not Change Request. Ensure the tables listed are separated by commas, with no spaces.

   The property value populates the task type selection list users choose from when they create a task from a checklist item. Note that users can only see task types for which they have the appropriate access roles.

---

![Task Type Selection List](image)

---

**Archive a card**

Archiving a card is a non-destructive way to remove a card from a freeform board. You can archive cards you are no longer working on to reduce visual clutter.

Role required: none

- Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Archive one card from the lane view | 1. Point to a card and click the X icon that appears in the corner.  
                                           2. In the confirmation dialog, click **Archive**.                                        |
| Archive one card from the card details | 1. Click a card and view the **Details** tab.  
                                           2. Under **Tools**, click **Archive**.  
                                           3. In the confirmation dialog, click **Confirm**.                                            |
### Archive all the cards in a lane

1. In the lane header, click the more options icon (⋮).
2. Select **Archive All Tasks**.
3. In the confirmation dialog, click **Archive**.

- To see all archived cards for the current board, from the board navigation panel, open the board information menu (ℹ️) and click **View Archived Tasks**.
- To restore an archived card, point to it and click **Restore**.

### Access a task record from a VTB card

You can open the form view of any task card. Viewing a task record on a form allows you to see all fields for that record, including fields that are not visible in the card details.

**Role required:** none

Access a task record using one of the following options.

- Access the record from the task card by clicking the record number on the task card.
- Access the record from the card details by doing the following:
  a) Open the card details for a task.
  b) Click the record number in the header.

### Move a card to a different lane

You can move a card from one lane to another.

**Role required:** none

When you move a card to a different lane on a guided board, the field on which the lanes are based is updated to reflect the new lane value.

1. Open a Visual Task Board.
2. Select a card and drag it to a different lane.

To cancel the move, press the Escape key while you drag the card.

**Note:** All mandatory fields on a record must be filled in to move the associated card to a new lane. For example, assume you have a guided board based on the Incident (incident) table, with a lane for each **State**. The **Close code** and **Close notes** fields become mandatory when the **State** changes to **Closed**. If you attempt to move an incident card from the **New** lane to the **Closed** lane, a pop-up view of the form appears and prompts you to fill in the mandatory fields.

### Move a card to a different board

You can move a card from one freeform board to another.

1. Open the card details.
2. In the details tab (ℹ️), click **Move Card**.
3. In the pop-up window that appears, select the board and lane to move the card to. The board selection list displays freeform boards only.

**Task board tools**

The task board tools area in a Visual Task Board contains several tabs, each represented by an icon.

Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

**Conversation tool tabs**

<td>Configure the settings for the task board. This setting is only available for the board owner. For more information, see Configure a task board.</td>
</tr>
</tbody>
</table>

### View board information

You can display key information about any task board.

**Role required:** none
Board owner’s view of board information

1. Open a task board.
2. Click the board information icon (i).

Add a board as a favorite

Add boards you access frequently to the application navigator using the favorite option.

Role required: none
Adding a board as a favorite is only available in UI16.

1. Navigate to **Self Service > Visual Task Boards**.
2. From the board you want to favorite, select the information icon from the board tools. Then select the star.
3. Remove the board as a favorite by clearing the star icon.

View a task board in a list
You can view a task board in the list view using the board information option.
Role required: none
1. Open a task board.
2. From the task board tools, click the board information icon (i).
3. Click View List at the bottom of the information panel.
The cards from the board open in the list view.

Note: The freeform board list view only shows cards made by the board and no other tasks that might be added manually.

Add or remove a task board member
You can add and remove task board members using the members tab of the activity stream. You can also promote assignees to board members.
Role required: none
Only members of a task board can access the board. Any board member can add or remove other members.
1. On a Visual Task Board, open the task board tools.
2. Click the members tab.
3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>1. In the Users section, click Add Members.</td>
</tr>
<tr>
<td></td>
<td>2. Enter a user’s name or select a user from the drop-down menu.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>1. In the Members section, point to a user.</td>
</tr>
<tr>
<td></td>
<td>2. Click the remove icon</td>
</tr>
<tr>
<td>Promote an assignee to a member</td>
<td>1. In the Assignees section, point to a user.</td>

**Visual Task Board SLA indicators**

SLA (service level agreement) indicators alert board members if any cards on the board have breached SLAs.

When SLA indicators are enabled, a status bar appears on each card that has an associated SLA. If any cards have breached SLAs, an alert appears at the top of the board and a filter option appears in the quick panel. The indicator displays the elapsed percentage of the SLA. If there are multiple SLAs associated with a task card, the indicator displays the status of the SLA with the greatest elapsed percentage.

Alert! One or more tasks on this board require immediate attention

Apply Filter
Any board member can enable SLA indicators from the board configuration menu. The setting applies to the current user only.

Share a Visual Task Board in a Connect conversation

You can share a Visual Task Board in a Connect Chat or Connect Support conversation.

Role required: none

2. Drag a task board to a Connect mini window.
   A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Only conversation members who are members of the board can access it. If you share a task board in a record conversation, it appears as a URL in the record activity stream.

Create a Connect conversation from a Visual Task Board

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Role required: none

When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

2. Open a task board.
3. In the board header, click the connect with board members icon ( ).
   The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.

Visual Task Board accessibility

Several accessibility improvements are included in Visual Task Boards.

Skip links

Skip links allow you to tab directly to the main content on a page. When accessibility mode is enabled, task boards include a skip link to view tasks as a list. The View tasks as a list skip link switches all the task cards to the table view. For more information on viewing task boards in a list view, see View a task board in a list.

View card details

With accessibility mode enabled, visual indicators appear on task cards that users can tab to in order to open card details. For more information, see View card details in a task board.

View card details in a task board

With accessibility mode enabled, tab through cards in a task board. Use the card details button to view task card details.
Enable accessibility from the General tab of the system settings menu.

Role required: none

1. Navigate to **Self-Service > Visual Task Boards.**  
2. Open an existing task board.  
3. Press the Tab key to navigate through the board to get to a task card.  
4. Press the Tab key to navigate through the card until the Open Card Details button appears.

5. Press **Enter** to open the card.  
6. To exit the card, press **Escape.**

**Configure a task board**

You can configure several options in the Visual Task Boards to customize the look and feel of the board.

Role required: none

1. From the task board tools, click the menu icon ( ).  
2. Click **Advanced Settings.**  
3. In the **Theme** section, select a color from the palette.
The selected theme is applied to the background of the board, lane header, add card button, quick filter, tab header, quick panel, and board header. It also appears as the color for the board on the My Task Boards page. This setting applies only to the boards of the user.

Visual Task Board color palette

4. In the Quick Panel section, toggle the options to customize the quick panel.

Note: Unless otherwise noted, these settings apply to the current user only.
### Quick panel options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Panel</td>
<td>Option for making visible on the board.</td>
</tr>
<tr>
<td>User Names</td>
<td>User names that appear next to user avatars in the quick panel.</td>
</tr>
<tr>
<td>Show Labels</td>
<td>Labels that appear on cards and in the quick panel.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The setting applies to all users.</td>
</tr>
<tr>
<td>Label Names</td>
<td>Label name that appears beside the colored icon for that label in the quick panel.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This setting is available only when you enable <strong>Show Labels</strong>.</td>
</tr>
</tbody>
</table>

When all the options are enabled, a quick panel looks like the following illustration.

![Quick panel illustration](image)

5. In the Configure Cards section, toggle the options to customize the appearance and information of cards.

Changes to the cards apply to the current user only.

### View options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compact Cards</td>
<td>Decreases the lane width and card information. Thumbnail images do not appear on the card.</td>
</tr>
<tr>
<td>Show Card Info</td>
<td>Displays card information on each card. Card information typically includes details like the task state, date opened, and last user to update it. This setting is available only when <strong>Compact Cards</strong> is disabled.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Show Card Attachment</td>
<td>Cards display the first image attached to that card as a thumbnail. This setting is available only when Compact Cards is disabled.</td>
</tr>
<tr>
<td>Show SLAs</td>
<td>SLA status indicators appear on cards and alerts appear when one or more card has a breached SLA. SLA status indicators are hidden when Compact Cards is enabled. This setting is available only when SLAs are associated with the tasks on the board.</td>
</tr>
</tbody>
</table>

6. Under Advanced Settings, in the Lane Configuration section, show or hide lanes by selecting or clearing the check box for each lane. This setting is a user preference.

**Configure Visual Task Boards labels**

Labels help categorize tasks and visually distinguish them on the task board. You can disable or rename labels using the labels tab of the activity stream.

Role required: global_tags_creator, if you want to add or rename labels.

Every board has seven labels by default.

- **Defect**
- **High Priority**
- **Feature**
- **Idea**
- **Request**
- **Story**
- **Low Priority**
Any board member can edit the labels on a board. All the labels are visible on the Quick Panel under Labels.

1. From the task board tools, click the Labels tab.

2. Turn on the Show Labels button if it is turned off. You can see seven default labels.
   - Users with global_tags_creator role can add labels to the board and rename the label.
   - To add labels, click Add.

   Newly added label remains in off state by default. You can assign any color or no color to the label. To rename the label, click the label text and enter new value.
   - To change the color of the label, click the Select color icon beside the label. Select the color of your choice from the color picker and click Save.

   - To disable or enable a specific label, toggle the button next to the label. To turn on or turn off a specific label, toggle the button next to the label. Only turned on labels show up in the quick filter and can be applied to a card.
• Board owner can delete the label by clicking **Delete Label** icon next to the label.

• To filter the cards by labels, type the Label name in the Search bar or click **Add to Filter** icon against the label. Once you filter by the label, you can only see cards with that label.

**Labels on Card Details Page**
When user clicks the card, the card opens with the details of the card. It contains all the applied labels under **Details** tab.

![Card Details Page](image)

Under the **Labels** tab, the toggle button for applied labels is On and Off for the labels that are not applied.
Configure visual task board with swimlanes

Swimlanes enable you to create an environment with horizontal lanes in addition to vertical lanes. Swimlanes use only compact cards in the task board.

Role required: none

You can add swimlanes in the following types of the visual task boards:

- Freeform Board
- Flexible Board
- Guided Board

You can perform following activities when you select swimlanes in visual task boards.

- Name and rename the swimlanes.
- Move the tasks horizontally and vertically from one user to another.
- Drag the cards across swimlanes.
- Reorder swimlanes by dragging them or from Lane Configuration.
• Collapse and expand swimlanes.

1. Navigate to **System Definition > Self-service > Visual Task Boards**.
2. Click **New** and select the board type.
   - Freeform Board
   - Data Driven Board
3. Configure swimlanes in the boards.
   - In a freeform board, activate the swimlanes by sliding the swimlanes toggle in the **Info** tab to the right.

The following figure shows a sample freeform board created with swimlanes.
• In a data-driven flexible board:
  1. Select **None** in **Vertical Lane Field** from the drop-down.
  2. Click **Next** and slide the toggle under the **Info** tab to the right.

The following figure shows a data-driven flexible board created with swimlanes.
In a data driven guided board, select **Vertical Lane Field** and **Swimlane Field** while creating the board.

You can also add swimlanes to the existing guided board by selecting **Swimlane Field** under **Info** tab in the board.
The following figure shows a data driven guided board with swimlanes.
Modify the query or lane field for an existing board

For flexible and guided boards, you can edit the board query or lane field. This ability enables you to change the board contents while preserving the member list, board configuration settings, and, if applicable, Connect Chat conversation history.

Inform the board members that you plan to change the board query or lane field. If you or any members have manually sorted cards within a lane, the order may be reset.

Role required: none but you must be the board owner

The board query consists of filter conditions that determine which tasks the board tracks. For example, you might edit the query so the board shows only active incidents, rather than all incidents.

The lane field is the field on the underlying table that defines the lanes. For example, you might change the lane field so the lanes represent incident states, rather than assignees. This change is called a lane field pivot. Lane field pivots also make it possible to convert a flexible board to a guided board or vice versa.

1. Open a task board.
2. Click the board information icon (i) by the board name.
3. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Edit the board query</strong></td>
<td>1. Under <strong>Board Filter</strong>, click <strong>Edit Filter</strong> to open the condition builder.</td>
</tr>
<tr>
<td></td>
<td>2. Add and remove conditions as needed to edit the query.</td>
</tr>
<tr>
<td></td>
<td>3. Click <strong>Save</strong>.</td>
</tr>
<tr>
<td><strong>Change the lane field</strong></td>
<td>1. Click the <strong>Lane Field</strong> picker and select a field or the <strong>None</strong> option.</td>
</tr>
<tr>
<td></td>
<td>Guided boards have the <strong>Lane Field</strong> set to a field, such as <strong>State</strong>. Flexible boards have the <strong>Lane Field</strong> set to <strong>None</strong>. You can change the <strong>Lane Field</strong> value accordingly to change the board type.</td>
</tr>
<tr>
<td></td>
<td>2. In the confirmation dialog, click <strong>OK</strong>.</td>
</tr>
</tbody>
</table>

The board reloads to reflect the changes.

Configure WIP Lane Limit

You can set a limit to the number of cards added to a lane. If the limit is not set, any number of cards can be added to a lane by default.

Role required: admin
1. Open the Visual Task Board.
2. **Click**

    on the lane header.

3. Select **Set Lane Limit. Set Lane Limit for <name of the lane>** window appears.

4. Enter the number you want to set for the specific lane. Leave blank, if you want set no limit to the lane.

5. **Click Save.**

The number appears on the lane header.

If the number of cards exceeds the set limit, the Red symbol appears on the lane header for all the board members.

If a card is moved to a lane with exceeded WIP lane limit, the error message appears on the top of the page. The member who moves a card to the lane with exceeded limit can view the error message.

### Configure the card limit for Visual Task boards

Freeform and Data Driven boards can display up to 1,000 cards by default. You can change the default card limit by adding a property.

Role required: admin

You can set card limit for both Freeform board and Flexible and Guided board in Data Driven board.

1. **Add a new system property** with the following field values.

```
<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.vtb.board_max</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
</tbody>
</table>
```

2. Set the **Value** to the maximum number of cards allowed for each board.

**Note:** Performance degradation may occur if you set the **Value** to a number greater than 1,000, especially on tablet devices.

### Configure the task board card view

Configure the fields that appear in a card on a task board.
Role required: admin

1. Navigate to the form you want to configure fields for.
2. Right-click the header and select **Configure > Form Layout**.
3. Under the Form View section, select the VTB view.
   You may need to create a VTB view for the form. For more information, see *Create and delete views*.
4. Select the fields to appear on the card by adding or removing the fields from the **Selected** column. You can also adjust the order they appear on the form by moving the fields up or down.

**Workflow**

Workflow provides a drag-and-drop interface for automating multi-step processes across the platform. Each workflow consists of a sequence of **activities**, such as generating records, notifying users of pending approvals, or running scripts. The graphical Workflow Editor represents workflows visually as a type of flowchart. It shows activities as boxes labeled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

**Parts of a workflow**

Workflows consist of these parts.

**Properties**

Specify configuration settings such as the workflow name, the table whose records the workflow acts on, and the conditions under which to run it.
Activities
Specify the sequence of operations the workflow performs such as generating records, notifying users of pending approvals, or running scripts.

Transitions
Specify the conditions under which to run an activity.

Exit conditions
Specify the conditions under which to run a transition.

Contexts
Store historical runtime information about a specific workflow run in a Workflow Context record.

Versions
Store historical design information about a specific workflow in a Workflow version record.

Workflow life cycle
A workflow starts when a triggering event occurs. Common triggers include a record being inserted into a specific table, or a particular field in a table being set to a specified value. For example, you might create a workflow that runs whenever a user requests approval for an item they want to order from the catalog. You can also schedule workflows to run periodically or call them from scripts such as business rules.

When an activity completes, the workflow transitions to the next activity. An activity might have several different possible transitions to various activities, depending on the outcome of the activity. Continuing the example above, if the user's request is approved, the activity might transition to an activity that notifies someone to order the item. If the user's request is denied, the activity might transition to notifying the user that their request has been denied.

The graphical Workflow Editor represents workflows visually as a type of flowchart. It shows activities as boxes labelled with information about that activity and transitions from one activity to the next as lines connecting the boxes.

At each step in a workflow:
1. An activity is processed and an action defined by that activity occurs.
2. At the completion of an action by an activity, the workflow checks the activity's conditions.
3. For each matching condition, the workflow follows the transition to the next activity.

When the workflow runs out of activities, the workflow is complete. The Workflow Context stores the execution history of the activities and transitions run. The Workflow Version stores the design history of the activities, transitions, and exit conditions available to run.

Workflow properties
The workflow properties specify when to run a workflow and what records it acts on. For more information about workflow properties, see Workflow properties.

Workflow activities
A workflow activity contains instructions that are processed by the workflow.
Activities can include running scripts, manipulating records, waiting for a set period of time, or logging an event. Workflow conditions determine whether or not the activity is performed. Activities can be added, removed, or rearranged. Transitions can be drawn between activities.

This is an activity that triggers a notification:

Sample activity

Workflow runs activities as the user session that starts them. Workflows started from record operations will run activities as the user session that performed the record operation. Workflows started from schedules or restarted from timers run activities as the System user. Workflows started from script calls run activities as the user session that started the script.

For more information on available activities and their behaviors, see Workflow activities.

Transitions

After the workflow condition is evaluated, the workflow transition determines which activity is performed when the workflow condition is met.

This is a transition that always leads from the Change Approved script to the Change Task activity:

Sample transition
Exit conditions

After a workflow activity is performed, the workflow condition is evaluated to determine which transition is activated.

The condition determines behavior based on a change being approved or rejected:

![Exit conditions diagram]

Sample exit conditions

Workflow example

During workflow editing or while an unpublished workflow is running, only the person who checked out the workflow can view the changes.

After a workflow is published, it is available to other users. The workflow moves through the process as defined in the Workflow Editor. The entire workflow is represented in one screen. For example, this is the Standard Change workflow:
Sample change workflow

Workflow editor

The Workflow Editor is an interface for creating and modifying workflows by arranging and connecting activities to drive processes.

You can manage multiple workflows in the same screen, create custom workflow activities, and use existing activities as data sources. Users with the workflow_creator role can create workflows. Users with the workflow_admin role can create, modify, delete, and publish workflows.

To open the Workflow Editor, navigate to Workflow > Workflow Editor. For information about using the editor, see Create a workflow.
Welcome screen

The editor opens with the Welcome page, which displays a list of active, published workflows. From this tab, you can open existing workflows, create new workflows, and open help resources related to workflow.
Published: Click to view list of published workflows
Checked Out: Click to view list of workflows checked out to current user
Help: Click to view links to help resources for workflow

Workflow button
Click to create a new workflow

Palette tabs
Workflows: Workflow activities and workflows you can use as subflows.
Core: Available workflow activities appropriate for the selected workflow. Contents can include activities provided by the base system and those purchased with orchestration.
Packs: Orchestration activity packs downloaded from the ServiceNow® App Store, organized by vendor and scope. Custom activities and workflows that you scope also appear as packs. Only visible if the orchestration plugin is installed.
Custom: Orchestration custom activities available. Only visible if the orchestration plugin is installed.
Data: Activities in the current workflow that output data. You can use these activities as data sources for other activities. Only visible if the orchestration plugin is installed.

Note: If your workflow welcome page does not look like this example, you may have customized the workflow welcome page before upgrading to Orlando. You can update the workflow welcome page to the latest version by editing the UI pages.

Navigate to System UI > UI Pages > Workflow Editor welcome. In the UI page record for workflow_editor_welcome, scroll to the Versions related list. Select the row for the version corresponding to the upgrade to Orlando, right-click and select Revert to this version.

Workflow canvas
After you open or create a new workflow, the system displays the workflow canvas. On the canvas you interact with the Workflow Editor through several different elements: the canvas itself, the canvas tabs, the title bar, the palette, and the palette tabs.

The drawing canvas is where you add activities and configure transitions for checked out workflows. Add an activity by dragging it from the palette to the workflow in the canvas. For more information, see Create a workflow.

• Canvas tabs: Contains tabs for accessing workflows being edited or created.
- **Title bar**: Displays the workflow name and status. Provides a menu and controls for configuring, testing, and validating workflows.
- **Canvas**: Provides the working surface for creating new workflows or editing existing ones.
- **Palette tabs**: Contains tabs for accessing activities being edited or created.
- **Palette**: Contains all available workflow activities and existing workflows you can use as subflows. Drag activities and subflows to the canvas to create new workflows or edit existing ones.
**Workflow palette**

The default workflow palette contains workflow activities and existing workflows you can use as subflows.

The basic workflow palette contains these tabs:

- **Workflows**: Displays existing workflows and provides controls for creating new ones.
- **Core**: Displays baseline workflow activities available to all systems and Orchestration activities (when Orchestration is activated).

**Workflows tab**

The **Workflows** tab lists existing workflows that you can edit or use as subflows in other workflows. Double-click a workflow to open it in the canvas. To add a workflow as a subflow, drag it to another workflow in the canvas. Click the + icon to create a new workflow.

**Core tab**

The **Core** tab contains the standard activities available by default to all workflows and any activities purchased with Orchestration, organized by category. Click the arrow icons to expand or collapse the activity lists under each category. To add an activity to a workflow, drag it to the canvas. For more information, see *Add an activity to a workflow*. 
Workflow editor title bar

When a workflow is opened in the canvas, the title bar displays the workflow title and the workflow status in italics. Possible states are Checked out by <name> and Published.
Workflow editor title bar

Controls on the right side of the title bar manage the workflow.

- **Workflow Properties**: Opens the current workflow's properties form.
- **Start**: Runs the workflow. This control is only available for workflows running on the Global table that are accessible from all application scopes. To test workflows that are on other tables, insert a record into that table that meets the condition of the workflow.
- **Validate**: Tests the workflow prior to publication. Validation detects potential problems that can prevent the workflow from publishing or cause the workflow to fail. For more information, see *Workflow Validation*.
- **Help**: Opens documentation to help you create the workflow.

Workflow menu

Click the menu icon in the title bar for additional options to configure the workflow.
Accessing the workflow menu

These menu options are available:

<table>
<thead>
<tr>

**Workflow editor keyboard navigation**

The platform includes accessibility features that support Web Content Accessibility Guidelines (WCAG) 2.0 level A and make the interface accessible to users with disabilities.

These features improve the user experience when accessing platform functions with screen readers and keyboard navigation. In general, you use the following set of standard keyboard navigation functions:

- Press **Tab** to navigate major groupings in a pre-defined sequence. This usually includes moving between standard interface controls (fields and lists) in a module, or between records within a tab.
- Press **Shift Tab** to move backwards in a pre-defined sequence.
- Use arrow keys (left, right, up, down) to navigate between individual elements within a group. This usually includes moving between tabs, or between available selections within a specific control (for example, within a list).
Press **Enter** to select a control or tab, or enter text within a control.

The Workflow Editor is constructed in a unique manner. It includes a series of main (left) panel tabs, a series of side (right) panel tabs, and a drawing canvas for workflow creation or editing. As such, it has its own unique set of keyboard accessibility functions and commands.

**Welcome page keyboard commands**

Use keyboard commands to navigate and operate the Workflow Editor Welcome page.
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| Navigate to main content (left) panel, and select a workflow | 1. After accessing the Workflow Editor from a menu, press **Tab**.  
| | **Skip to Main Content** appears in the upper left corner.  
| | 2. Press **Enter** to position the cursor in the first record displayed in the **Published** tab.  
| | 3. Press **Tab** to navigate down the listing of workflow records.  
| | Press **Enter** to select and open a workflow record in the Workflow drawing canvas. |
| Select a checked out workflow or a help function in main content panel | 1. After accessing the Workflow Editor from a menu, press **Tab** until the **Published** tab is highlighted.  
| | **Note:** Do not select or **.**  
| | 2. Press the right or left arrow keys to navigate between the **Published**, **Checked Out**, or **Help** tabs.  
| | 3. Press **Tab** to navigate across the columns and down the listing of checked out workflow records or help selections.  
| | Press **Enter** to select and open a checked out workflow record in the Workflow drawing canvas, or open a help selection (work or orchestration videos, documentation, community discussions, knowledge base, or live feed). |
| Create a workflow | 1. After accessing the Workflow Editor from a menu, press **Tab** until **New Workflow** is highlighted.  
<p>| | 2. Press <strong>Enter</strong> to open <strong>New Workflow</strong> |</p>

<tr>
<td>Set general workflow properties</td>
<td>1. Press <strong>Tab</strong> until is highlighted.  2. Press <strong>Enter</strong> to open <em>Workflow Properties</em>.</td>
</tr>
</tbody>
</table>

**Navigate from activity box to activity box.**

Simply press **Tab** or use the arrow keys (right, left, up and down) to navigate from activity to activity within the workflow.

**Note:** Depending on the complexity and number of activity boxes in the workflow, the sequence of navigation is not always predictable. Depending on how you are navigating within the workflow, the navigation sequence is generally (but not always) row-by-row, and focus is usually placed on the nearest activity box.
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
</table>
| **Modify a selected activity.** | 1. Navigate to the activity box, then press **Enter** to select it and place it in Edit mode. When you select an activity box, it appears as highlighted.  
2. Once in Edit mode, use **Tab** to move around within the activity box to change or access elements such as:  
   - Activity Properties
   - Title
   - Node context menu
   - Delete Node
   - Condition Properties
   - Node conditional context menu
   - Node conditional port options  
3. Press **Enter** to select an element, or press **Esc** to escape an element without making changes. |
| **Add a condition to an activity.** | 1. Within an activity box, select **Always** to access **Condition Properties**.  
2. In **Condition Properties**, specify the conditions for the activity. |
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a connection from a condition on one activity to</td>
<td>1. Within an activity box, select <strong>Node conditional context menu</strong> (&lt;). 2. Select <strong>Link to...</strong> to create a connection to the next activity box that follows, or select <strong>Delete</strong> to delete an existing connection.</td>
</tr>
<tr>
<td>the next activity that follows</td>
<td></td>
</tr>
<tr>
<td>Add a core or custom activity</td>
<td>1. Within an activity box, select <strong>Node conditional port options</strong> (&lt;). 2. Select <strong>Add Core Activity</strong> to access Workflow Activity Definitions to add a new core activity, or select <strong>Add Custom Activity</strong> to add a custom activity to the workflow.</td>
</tr>
<tr>
<td>Move an activity box</td>
<td>1. Press <strong>Tab</strong> to navigate to the activity box, enter press <strong>Enter</strong> to select it. 2. Use the arrow keys to move the activity box. To move the activity box one pixel at a time, press <strong>Shift</strong> while using the arrow keys.</td>
</tr>
<tr>
<td>Validate a workflow</td>
<td>1. Press <strong>Tab</strong> until ✅ is highlighted. 2. Press <strong>Enter</strong> to validate the workflow. You can also select <strong>Validate</strong> from the Workflow Actions menu.</td>
</tr>
<tr>
<td>Run a workflow</td>
<td>1. Press <strong>Tab</strong> until 🎁 is highlighted. 2. Press <strong>Enter</strong> to run the workflow.</td>
</tr>
</tbody>
</table>

**Note:** If the workflow is tied to a database table, this function is disabled. The workflow runs when the proper table conditions are activated (for example, insertion of a new record into the table).
<table>
<thead>
<tr>
<th>Task or Action</th>
<th>Keyboard Commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>Close workflow drawing canvas</td>
<td>1. Press Tab until (on the right side of the tab that contains the name of the workflow) appears.</td>
</tr>
<tr>
<td></td>
<td>2. Press Enter to close the canvas.</td>
</tr>
<tr>
<td>Publish a workflow</td>
<td>1. Press Tab until the context menu (is highlighted.</td>
</tr>
<tr>
<td></td>
<td>2. Press Enter to open the context menu.</td>
</tr>
<tr>
<td></td>
<td>3. Use the down arrow key to move to the Publish command, then press Enter to select it.</td>
</tr>
<tr>
<td>Jump to Top</td>
<td>After tabbing through the entire workflow, appears at the bottom of the listing. Press Enter to jump to the top of the Workflow drawing canvas.</td>
</tr>
</tbody>
</table>

**Workflow management**

Create, edit, validate, and publish workflows to automate multi-step processes across the platform. Understand workflow activities and variables and how to use them effectively. Take a deeper look at how workflows are constructed, validated, and used.

**Create a workflow**

Automate a multi-step process by creating a workflow with the Workflow Editor.

- You must have the workflow_admin or workflow_creator role to use the Workflow Editor.
- If you are designing the workflow as part of an update set process, see *Workflow movement with update sets* before creating the workflow.

1. Navigate to **Workflow > Workflow Editor**.  
The Welcome tab of the Workflow Editor opens.
2. On the Workflows tab in the palette, click **New Workflow**.

Welcome
A simplified version of the New Workflow form opens.

3. Fill in the Name and Table fields

4. (Optional) Add a Description.

5. (Optional) Do one of the following:
   a) If the Conditions UI section is displayed, specify a Condition if needed and edit the fields. (The Conditions UI section shows only if the selected table supports conditions for launching workflows. For example, if you select the sc_req_item table, conditions are not applicable and the Conditions UI section is not displayed.)

   b) If the Stages UI section is displayed, check that the State rendering and Stage order fields contain the correct information. (The Stages UI section shows only if the selected table supports stages. For example, if you select the sc_req_item table, the Stages UI section is displayed.)

6. Click Submit.

The new workflow is created with the Begin and End activities connected by a single transition.

7. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.

   For more information, see Work on workflows.

8. To change advanced settings for the workflow, click the Properties icon 🔄. If you make changes, click Update.

**Workflow properties**

In the properties of a workflow, you can configure settings such as its application scope, start conditions, schedule, inputs, stages, and run time metrics. You can also view information such as the workflow author, version, and history.

When you create a new workflow, the following fields are available in the dialog box:

- Name
- Table
- Description
- If condition matches
- Condition
If you click **Diagrammer view**, in **Related Lists**, the following UI sections are available in the dialog box:

- General
- Conditions
- Inputs
- Activities
- Application
- Schedule
- Stages
- Estimated Runtime

### General

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name to identify the workflow.</td>
</tr>
<tr>
<td>Table</td>
<td>The table for the workflow to run on. Workflows that run on specific tables can still interact with other tables. Select <strong>Global (global)</strong> to run the workflow on all tables. <strong>Note:</strong> The list shows only tables and database views that are in the same scope as the workflow. Also, all users who edit the workflow must have access to the necessary tables and domains.</td>
</tr>
<tr>
<td>Checked out</td>
<td>(Read-only) When the workflow was checked out. Automatically set by the <strong>Checkout</strong> action in the workflow menu.</td>
</tr>
<tr>
<td>Checked out by</td>
<td>(Read-only) The user who has this workflow checked out. This value is automatically set by the <strong>Checkout</strong> action in the workflow menu.</td>
</tr>
<tr>
<td>Published</td>
<td>(Read-only) Check box to indicate whether the workflow has been published. Automatically set by the <strong>Publish</strong> action in the workflow menu.</td>
</tr>
<tr>
<td>Description</td>
<td>The purpose of the workflow.</td>
</tr>
</tbody>
</table>

### Conditions

Create conditions to trigger the workflow. The Conditions section does not appear if you select a table, such as `sc_req_item`, that does not require a condition.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| If condition matches              | When the condition evaluates to true, the workflow launches an active context:  
  - **None**: The workflow is not automatically started by the workflow engine. To run this workflow, write a script to start the workflow.  
  - **Run the Workflow**: The default value. The workflow engine starts the workflow if the information in the Condition field matches a record that is inserting into the table.  
  - **Run if no other workflows match yet (deprecated)**: The workflow only runs if no other workflows are running on the execution thread that started this workflow. Avoid using.  
  - **Run if no other workflows matched**: The workflow only runs if no other workflows are running on a specific record. For example, there are four workflows inserted into the Incident table, which have a condition such as short_desc contains test. A new workflow, which has If condition matches is set to Run if no other workflows match yet, only runs if none of the four workflows have started running on the Incident record. |
| Condition                         | A condition builder for specifying workflow conditions that trigger the behavior selected from the If condition matches list.                                                                                                                                                                                                            |
| Order                             | Numeric value that determines the order of the workflow, relative to other workflows. Workflows are evaluated in order from the lowest order number to the highest. A workflow runs if it is the first to match conditions.                                                                                                                                                        |

**Inputs**

The Inputs section lists all the activities in the current workflow that input data, the data type, and the default value. The Inputs section is only available after a workflow has been created. To create a variable, click **New**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Displayed column label. Localized depending on user locale.</td>
</tr>
<tr>
<td>Reference</td>
<td>Input field from another table.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type. For example, integer or string.</td>
</tr>
<tr>
<td>Default value</td>
<td>Value used if you do not provide a value.</td>
</tr>
</tbody>
</table>
Activities

The Activities section enables you to set activity pinning and maximum activity count.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity pinning</td>
<td>List of options that control updates to custom activities at the workflow level. Pinning protects custom activities from being updated automatically when downloaded from the ServiceNow Store. For more information, see Workflow activity pinning. The possible options are:</td>
</tr>
<tr>
<td></td>
<td>• Set by activity: Allows all activities in the workflow to use their own pinning settings. This is the default pinning option.</td>
</tr>
<tr>
<td></td>
<td>• Pin all activities: Pins all activities in the workflow to their current version.</td>
</tr>
<tr>
<td></td>
<td>• Unpin all activities: Allows all activities in the workflow to be updated.</td>
</tr>
<tr>
<td>Max activity count</td>
<td>The maximum number of activities performed by the workflow. This value is used to prevent infinite loops and is set to 100 by default. When the stated maximum count is reached, the workflow is canceled. If this field is blank, the maximum count is set to -1, and the workflow is canceled.</td>
</tr>
</tbody>
</table>

Application

The Application section enables you to see application scope and scope restrictions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>(Read-only) Scope of this activity. For more information, see Application Scope.</td>
</tr>
<tr>
<td>Accessible from</td>
<td>Scope restrictions for this workflow. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>• All application scopes: Workflow is accessible to all application scopes.</td>
</tr>
<tr>
<td></td>
<td>• This application scope only: Workflow access is limited to the scope named in the Application field.</td>
</tr>
<tr>
<td></td>
<td>For more information see Workflow scope.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Delivery based on           | The schedule type for this workflow. Possible types are:  
   • **User-specified duration**: Duration based on a user-specified value. This is the default schedule type.  
   • **Relative duration**: Duration calculated from a preconfigured schedule, such as **8-5 weekdays**. |
| Expected time               | User-defined interval. This field is visible when the schedule type is **User-specified duration**.                                       |
| Schedule                    | Preconfigured schedule that determines when this workflow runs.                                                                           |
| Timezone                    | Time zone for this instance.                                                                                                               |

### Stages

The Stages section appears if you select a table with **Type = Workflow**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stage</td>
<td>Displays the workflow stage progress on the selected table. Optionally, select <strong>Stage rendering</strong> and <strong>Stage order</strong> schemes to customize the appearance of the stage field. The default values cover typical scenarios.</td>
</tr>
<tr>
<td>Stage rendering</td>
<td>The renderer to use when displaying stage icons on a form or list view. For more information about renderers, see <strong>Workflow stage renderers</strong>.</td>
</tr>
<tr>
<td>Stage order</td>
<td>The order of workflow stages when you view a workflow field in a list. Select <strong>Computed</strong> to let the workflow engine compute the stage order from the order of execution in the workflow. Select <strong>User Specified</strong> to use the <strong>Order</strong> field from that Workflow stages.</td>
</tr>
<tr>
<td>Name</td>
<td>The name of the stage as it appears in workflow fields.</td>
</tr>
<tr>
<td>Duration</td>
<td>Time allocated for the specific stage.</td>
</tr>
<tr>
<td>Order</td>
<td>The order of workflow stages when you view a workflow field in a list. Select <strong>Computed</strong> to let the workflow engine compute the stage order from the order of execution in the workflow. Select <strong>User Specified</strong> to use the <strong>Order</strong> field from that Workflow stages.</td>
</tr>
<tr>
<td>Value</td>
<td>The value of the stage when it is referenced from elsewhere in the system, such as in a script.</td>
</tr>
</tbody>
</table>
Estimated Runtime

The Estimated Runtime section opens the controls for configuring the ERT for the workflow. Core workflows included in the base system are not configured for estimated run time by default. All new workflows are configured with default ERT values automatically. You can edit existing run time estimates or configure new ones for any existing workflow. For details about how estimated run times are configured and calculated, see Workflow run time metrics.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requires ERT</td>
<td>Check box to indicate that this workflow requires an estimated runtime configuration. You can use the ERT calculations to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. By default, new workflows require an ERT.</td>
</tr>
<tr>
<td>Estimated Run Time</td>
<td>The initial estimate for the workflow’s run time.</td>
</tr>
<tr>
<td>Number of data points</td>
<td>(Read only) The number of times the system has compared the estimated run time to an actual run time result.</td>
</tr>
<tr>
<td>Outlier Percentage Threshold for ERT</td>
<td>(Required) The percentage deviation from the estimated run time that identifies an outlier workflow run time. The system uses a default value of 20. For more information, see Outlying workflow run times.</td>
</tr>
</tbody>
</table>

Create a workflow from a table

Automate a multi-step process by creating a workflow from the list view of any table that supports workflows.

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

1. Open a table, such as Incident or Problem, in list view. For example, navigate to Incident > Open.
2. Right-click in the column header and select Configure > Workflows.
The Workflow Versions on that table appear in a list.

3. Click New.
   The Workflow Version opens in New Workflow view. The Table field is filled in with the table you selected in step 1 and is read-only.

4. Enter Name.
5. (Optional) Enter Description.
6. (Optional) Edit conditions fields as necessary.
7. Click Submit.
   The new workflow is added to the Workflow Versions list.
8. Click the workflow Name.
   The new workflow is created with the Begin and End activities connected by a single transition.
9. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users. For more information, see Work on workflows.

10. (Optional) To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

Create a workflow for a new service catalog item
When you create a new service catalog item, you can create a new corresponding workflow at the same time.

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

1. Navigate to Service Catalog > Catalog Definitions > Maintain Items.
2. At the top of the form, next to Catalog Items, click New.

   The Catalog Item form opens.

3. Add a Name.
4. Next to the Workflow field, click the lookup icon.
5. Next to Workflow at the top, click New.
The Workflow version dialog opens in the New Workflow View. The **Table** field is set to **Requested Item (sc_req_item)** and is read-only.

6. Add a **Name**.
7. (Optional) Add a **Description**.
8. (Optional) Change the stage information as necessary.
9. Click **Submit**.
The new workflow is created with the Begin and End activities connected by a single transition.

10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Work on workflows.
11. To change advanced settings for the workflow, click the Properties icon.
12. Click Update.
   If you close the Workflow Editor, you can see the Catalog Item record. Note that the workflow is added to the Workflow field. The Show Workflow and Information icons appear next to the Workflow field. Hover over the information icon to view a read-only summary of the workflow.

Create a workflow for an SLA Definition
Automate a multi-step process by creating a workflow from an SLA definition.

- If you are designing the workflow as part of an update set process, see Workflow movement with update sets before creating the workflow.

1. Open a list of SLA definitions. For example Facilities > SLA Definitions or Service Level Management > SLA Definitions.
2. At the top of the form, next to SLA Definitions, click New.
3. Select Contract SLA or Service Offering SLA.
   The SLA Definition or Service Offering SLA form opens.
4. Next to the Workflow field, click the lookup icon.
5. Next to Workflow at the top, click New.
The Workflow Version dialog shows in the New Workflow view. The Table field is set to SLA Definition (contract_sla) or Service Offering SLA (service_offering_sla) and is read-only.

6. Enter Name.
7. (Optional) Enter Description
8. (Optional) Edit conditions fields as necessary.
9. Click Submit.

The new workflow is created with the Begin and End activities connected by a single transition.
10. Finish creating the workflow by adding activities, validating, and publishing so the workflow is available to other users.
   For more information, see Work on workflows.

11. (Optional) To change advanced settings for the workflow, click the Properties icon. If you make changes, click Update.

Ending workflows with multiple branches

A workflow is complete when it reaches the End activity, even if there are still active branches of the workflow in progress. To ensure that both branches are completed, add a Join activity to resolve the branches.

For example, the following figure shows a workflow with two branches that execute independently. When Task 1 and Task 2 of Branch B are completed, the workflow is marked complete even if the Branch A tasks are not completed.

Workflow with uncompleted branch

For both branches to complete, add a Join activity to resolve the branches. When one branch reaches the join, the workflow waits for the other branch. When both branches are complete, the workflow reaches the end. The Incomplete condition of the a Join activity is met only if one of the branches cannot be completed.
Workflow with completed branches

Work on workflows
To complete a workflow, you add workflow activities, validate the workflow, and publish it.

Add a workflow activity
Activities determine the functionality of the workflow.
Role required: workflow_admin, workflow_creator, or admin
When they are created, all workflows contain Start and End activities.
For more information, see Workflow activities.

1. Open a workflow.
2. Check out the workflow.
3. Drag a workflow activity from the Activities menu into the workflow body.
4. Populate the Workflow Activity form that appears.

Validate a workflow
You can manually validate a workflow from the Workflow Editor. You can generate a workflow validation report from the Workflow Version form.
Role required: workflow_admin, workflow_creator, or admin
Running a workflow on a new node automatically attempts to validate the workflow. If validation is successful, the system updates the workflow version record to indicate the workflow has been validated and marks the record as updated by the user who ran the workflow.
1. Open the workflow to validate in the Workflow Editor.
   When the workflow is loaded, the workflow validator icon appears in the toolbar.
2. Click the validator icon to run a series of validation tests on the current workflow version and generate a report.
3. Complete the following steps to generate a workflow validation report from the Workflow Version form
   a) Navigate to **Workflow > Administration > Workflow Versions**, and select a workflow to validate.
   b) Under **Related Links**, click **Validate Workflow**.

**Publish a workflow**

When a workflow is complete, publish the workflow so that it is available to all users.

Before you publish a workflow, validate it to test it for issues that might cause it to fail, such as missing subflows or disconnected transitions. For more information, see **Workflow validation**.

Role required: workflow_admin, workflow_creator, or admin
To publish a workflow:

1. Navigate to **Workflow > Workflow Editor**.
2. Open the workflow that you want to publish.
3. In the title bar, click the menu icon and select **Publish**.

If you published a new version of workflow, the changes are not applied to running *workflow contexts*. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the new version.

**Determine whether a workflow can run**

A workflow can run only if a checked out version is available to the user who has it checked out, and a valid, published version is available for all users with permission to run it.

Role required: workflow_admin, workflow_creator, or admin

1. In the navigation filter, enter `wf_workflow.list`, and then open one of the workflows.
2. In the **Versions** related list, check for all of the following conditions:
   a) There is only one workflow version in a state of **Checked out** and **Checked out by**.
   b) There is only one version and it is not checked out. This version must be both **Active** and **Published**.
      You may need to personalize the list and add the **Active** column.
   c) If there are multiple versions, only one is **Published**.

These checks determine the only two conditions under which a workflow can run:

- A checked out version of a workflow is available for the user who has it checked out.
- A valid, published version of a workflow is available for all users who have permission to run the workflow.

Main flows containing subflows that do not meet one of these two conditions are not permitted to execute against a current record transaction. Instead, a critical log entry detailing the subflow state is added to the Workflow Context record. To enable the workflow to execute on the next appropriate transaction, remove the subflow from the main flow or modify the published and active states of the subflow.

**Edit a published workflow**

You can edit a published workflow after you check it out.

Role required: workflow_admin, workflow_creator, workflow_publisher, or admin

**Note:** You cannot check out or delete workflows that are associated with a read-only application file.

To check out a workflow:

1. Navigate to **Workflow > Workflow Editor**.
2. Open the workflow that you want to edit.
3. In the title bar, click the menu icon and select **Checkout**.

   A new *version of the workflow* is created and assigned to you.

   If you are in a different domain than the published workflow, the new workflow version is *created in your domain*. 
After you finish editing the workflow, validate and publish the workflow to make the new version available to other users.

Copy a workflow between two application scopes

Application scoping protects applications by identifying and restricting access to application files and data. You can copy a workflow created in one application scope (for example, Test) to another (Production) as needed.

Role required: admin
1. On the Home page, click located next to the logged in user name.
2. In the Developer tab, in the Application field, select the application scope (for example, Test) in which you want to operate the Now Platform.
3. Close the System Settings page.
4. Navigate to Workflow > Workflow Editor.
5. Create a workflow in the Workflow Editor. For more details, see Create a workflow.
6. In the Workflow Editor, click

7. In the Application tab, Application is set to the current application scope selected in System Settings.
8. In Accessible from, select All application scopes if the workflow is available to all application scopes, or select This application scope only if it is only available to, and accessible in the current application scope only.
Only those workflows that are accessible from all application scopes can be copied to another application scope.
9. Go back to the Homepage, click

10. In the Developer tab, in the Application field, select the application scope (for example, Production) to which you want to copy the workflow.
11. Navigate to Workflow > Workflow Editor.
12. Refresh the page, then open the same workflow you created.
    An Out of scope workflow, workflow belongs to <scope name> scope message appears, where <scope name> is the application scope in which the workflow was originally created.
13. In the Workflow Editor, click
    
14. Select Copy.
    The Workflow Name dialog appears:
a) In **Workflow Name**, type the new name for the copied workflow.

b) Click **OK**. The system creates a workflow in the current application scope.

15. In the Workflow Editor, click

16. In the **Application** tab, **Application** is set to the current application scope.

17. In **Accessible from**, select **This application scope only** if to make the newly copied workflow a private one that cannot be accessed from outside current scope.

18. Click **Update**.

A new workflow record is created in the selected application scope and marked as private if designated as one in the Workflow Editor.

**Workflows used as subflows**

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The **Workflows** tab in the Workflow Editor contains a list of the workflows available for use as subflows.
Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a **Loading** message. If you place an inactive subflow into a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.

**Workflow with active subflows**

**Subflows and the Create Task activity**

If a workflow contains a **Create Task** activity that has executed on the current record, additional task activities in the workflow might not execute as expected.

This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the **Create Task** activity again, the system reopens the first task activity instead and does not create an additional task.

**Note:** An alternative to creating duplicate subflows that use the **Create Task** activity is to add a **Run Script** activity to the workflow that creates a task with a script.
The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a **Create Task** activity more than once. This allows the workflow to create additional tasks.
Running different subflows containing the Create Task activity

Pass a variable from a workflow to a subflow

Use this process to pass variables from a parent workflow to a subflow.

Role required: workflow_admin, workflow_creator, or admin

**Note:** You can also use the Return Value activity in the subflow to return values to the parent workflow. Make sure to have a Return Value on every ending transition path.

1. Prepare the subflow to accept variables from the parent workflow by defining the inputs.
2. Include the subflow in the parent workflow and connect the inputs to the parent workflow variables.

**Note:** You cannot pass variables to a subflow that runs on the Requested Item (sc_req_item) table.

Define inputs for a subflow

Define the input variables for a workflow to request from parent workflows when it is launched as a subflow.

All inputs are stored in the Variables (var_dictionary) table.

1. In the editor, open and check out the workflow.
2. In the title bar, click the menu icon and select **Edit Inputs**.
3. In the Workflow Inputs window, click **New**.
4. Populate the record with the definition of the variable, including the column name, the label that is displayed to the user, and the type of field.

5. **Click Submit.**

**Invoke a subflow in a workflow**

Use this procedure to add a subflow to a workflow.

1. In the Workflow Editor, open and check out the parent workflow.
2. Drag the subflow from the **Workflows** tab to the parent workflow.
3. In the New Activity dialog box, define the variables defined by the subflow's **Inputs**.
   
   These fields can accept both static values or variables in the following format:
   
   $$\text{${variable\_name}$}$$

4. **Click Submit.**

   The workflow triggers the subflow at the appropriate time and passes the variables as indicated by the **Inputs** definition.

**Prepare a subflow**

Review the process of preparing a subflow for use in a parent workflow, and for preparing the parent workflow to use a subflow.

1. In the editor, open and check out the workflow that you want to use as a subflow.
2. In the title bar, click the menu icon and select **Edit Inputs**.
3. In the Workflow Inputs window, click **New** in the **Variables** list.
4. Add a new variable depending on the type of values that it is going to store.

   The following example sets up a string value.

5. Click **Submit**.
6. Close the **Workflows Inputs** dialog.
7. Create a **Run Script** activity on the subflow.

   - Set the value from the parameter to a field on the current form. This is important because
     the **Notification** activity can only pull values from the current variable and not from the
     newly added variable. The following example sets the value in the **Description** field.

     ```plaintext
     current.description = workflow.inputs.bluesubvariable;
     ```

   - Create a new field on the request form but do not display the field. This serves as
     temporary storage.
8. Create a **Notification** activity on the subflow. Use `${description}` in the subject to return the value from the field.
This is what the subflow would look like:
Prepare a workflow to use a subflow
After you create a subflow, use this procedure to prepare the parent workflow.

1. On the parent workflow, create a variable similar to what you did on the subflow, but name it something different.

   In the following example, the variable is named **Blue Main Variable**.

2. Click **Submit**.

3. Insert a **Run Script** activity to return the value from a field to the newly created variable.

   In this example, the value of the **Short Description** field is returned and given to the newly created variable.

   ```javascript
   workflow.scratchpad.blumainvariable = current.short_description;
   ```
4. Click **Submit**.

5. In the subflow activity, set the **Blue Sub Variable** to pass the `bluemainvariable` to the `bluesubvariable`.

    `${workflow.scratchpad.bluemainvariable}`

This is what the main workflow looks like:
Using variables in a workflow

Within workflow there are several different types of variables that are available.

Some variables define, describe, or compose the pieces of the workflow (such as workflow activities). Some variables are available specifically to facilitate the execution of a workflow (such as scratchpad variables). Some variables define, describe, or compose the data records being manipulated by the workflow process (for example, the elements of a Glide Record that are defined in a dictionary.xml file describing a record, such as an incident).

Activity variables

Activity variables are properties specifically associated with a workflow activity.

These are the inputs that appear on the activity definition when a specific activity is dragged onto the workflow canvas. These variables are properties that define, compose or describe the workflow activity, or the work it is designed to perform.

Activity variables are declared in a related list within the Workflow Activity Definition.

To add, view, or modify a variable:

1. Navigate to Workflow > Activity Definitions.
2. Select a workflow activity, such as Approval - User.
3. In the Activity Variables section or tab, add, view, or modify the variables. Activity variables are defined using the same fields as Dictionary records.

Note: If defining a new activity variable that is dependent on another activity variable, put the prefix 'vars.' before the name of the parent activity variable. For example, if the child field is dependent on a field named parent, put the value vars.parent in the Dependent field.

To control the visibility of an activity variable on the workflow canvas after the activity has been dragged to the canvas, use a UI policy on the wf_activity table.

To access the variables or assign values to these variables within the workflow activity, use the vars variable of the workflow activity.

activity.vars.variable_name = new_variable_value

Workflow input variables

Workflow variables are external values that are passed into and referenced by a workflow during its execution.

Workflow variables can be declared externally in a script and passed into a main workflow or they can be declared within a main workflow and passed as inputs to a subflow.

Note: There is a specific kind of input variable for any workflow that is declared against the table Requested Item (so_request_item). To understand the use of these variables see Workflow catalog variables.

Workflow variables are declared in a form available from the Workflow Editor gear menu.

To add, view, or modify a variable:

1. Navigate to Workflow > Workflow Editor.
2. Edit and checkout a workflow.
3. Select the Workflow Activities menu and select Edit Inputs.
4. Select an existing variable or click **New**.

   Note the **Column name** field. Use this value when accessing the variable from a script.

   Workflow variables do not appear on the workflow canvas, they are only available for view from the Workflow Activity menu.

   The input variables are available to use in scripts. To access an input variable from a script:

   ```javascript
   var input = workflow.variables.variableName //get the workflow variable identified by column name.
   ```

**Assigning values to variables from outside of workflow**

After being declared in a workflow, values can be assigned to the variables from where the workflow is kicked off.

The following example demonstrates how a workflow variable's value can be set in a script include, business rule, or UI action:

```javascript
//Declare an instance of workflow.js
var wf = new Workflow() //Get the workflow id
var wfId = wf.getWorkflowFromName( "Workflow Name" ) ;
//Start workflow, passing along name : value pair(s) for mapping to variable
//where input_var_name is the name of the variable declared in gear menu
//and input_var_value is whatever that value should be for this execution of workflow
wf.startFlow (wfId , null , "Workflow Name" , {input_var_name : input_var_value }) ;
```

Another example that demonstrates a more readable way of passing multiple variables involves declaring an object, adding the names/values to the object, and passing it:

```javascript
//Declare an instance of workflow.js
var wf = new Workflow() //Get the workflow id
var wfId = wf.getWorkflowFromName( "Workflow Name" ) ;
//Start workflow, passing along object containing name/value pairs mapping to inputs expected by the workflow
var vars = { } ;
varys. input_var_name1 = input_var_value1 ;
varys. input_var_name2 = input_var_value2 ;
//add as many variables as your workflow is expecting, then pass the object
wf.startFlow (wfId , null , "Workflow Name" , vars ) ;
```

**Assigning Values for Subflow Inputs from inside of a Main Workflow**

If a workflow that accepts inputs is called from within another workflow, those input values can be set from the workflow canvas within the UI of the workflow activity. Each input variable declared for a subflow will have a text box input area displayed on the activity. Within these text boxes, the variables can be set with any value either from the scratchpad or from within the current record.

For more information, see *Workflows used as subflows*.
Reading the Value of a Workflow Input Variable

The value of a Workflow input variable is accessible anywhere within the workflow that accepts javascript by dot walking the current workflow object:

```javascript
var readValue = workflow.inputs.variable_name;
```

Workflow scratchpad variables

Store and share string-based variables as name-value pairs between workflow activities. The scratchpad is global to the instance of the running workflow and as such, is available equally to all activities.

Declaration

The scratchpad itself is automatically available to an executing workflow and requires no specific declaration. Variables are declared and stored in the scratchpad simultaneously by referencing it. For example:

```javascript
workflow.scratchpad.variableName = variableValue;
```

Display

View activity scratchpad values from the Workflow Activity History Scratchpad (wf_history_scratchpad) table. Workflow Activity History Scratchpad is also an embedded list in Workflow Activity History records.
Sample Workflow Activity History Scratchpad records
Access and Assignment

Use standard JavaScript object notation to access or assign scratchpad values. For example, use this format to assign a particular scratchpad variable value.

```
workflow.scratchpad.variableName = variableValue;
```

Use this format to assign a JavaScript variable to a scratchpad variable.

```
var myValue = workflow.scratchpad.variableName;
```

Current variables

Current is the database GlideRecord that kicked off the workflow, either by association to the table in the Workflow properties table or by being associated with a catalog item.

Declaration

Variables in current are the columns that are defined in the dictionary.xml file that support the database record. There is no way at runtime to add variables to the current record.

Display

Variables of a current record are displayed on the Glide Forms and Lists throughout the applications that use them.

Access and Assignment

To access the variables or assign values to the variables within the workflow activity, get the value from the current record by referencing the Glide Element.

```
var myVarValue = current.getElement(nameOfTheField);
```

or

```
var myVarValue = current.fieldName;
```

or

```
current.variableName.setValue( "A Variable Value" );
```

Workflow catalog variables

Workflows that are associated with the Requested Item [sc_req_item] table have a specific type of workflow input.

The inputs into this workflow are essentially question:answer pairings that, when associated with a specific catalog task, become options on the task form. These options are generated by that catalog task activity within a workflow.
Scope
For the purposes of Service Catalog and workflow, a variable’s scope determines its availability to a catalog task activity within a workflow. You can define variables as global or catalog item-specific. When a variable is associated to a catalog item and the workflow generating the catalog task is associated to the catalog item, the variable scope determines which variables are available for mapping within the catalog task activity in a workflow. If a workflow is associated with Requested Item (sc_request_item), and is not specifically associated with a catalog item, any catalog variable with a blank Cat Item field value is available to all catalog task activities within the workflow.

Declaration
You can declare requested item catalog variables at the catalog item level or at a global level.

You can declare global catalog variables using the Workflow Editor context menu.

Also see, Global variable declaration option 2.

1. Navigate to Workflow > Workflow Editor.
2. Open and check out a workflow that runs against the Requested Item (sc_req_item) table.
3. Click the menu icon and select Edit Catalog Variables.
4. Click New to create a new variable or select an existing variable.
5. Select the Global check box.
6. Click Submit.

Global variable declaration option 2
You can declare global catalog variables using the Service Catalog.

1. Navigate to Service Catalog > Item Variables.
2. The list of variables that appears in the workspace has a default filter of Cat Item != <blank>. Change the filter to Cat Item = <blank> and run the query.
   The catalog variables that appear are available to any catalog task that is initiated from within a workflow.
3. Click New to create a new variable.
4. Leave the Cat Item field blank.
5. Select the Global check box.
6. Click Submit.
   Also see, Global variable declaration option 1.

Catalog item specific variable declaration option 1
You can declare a catalog item-specific variable.

These variables are only available to the catalog item referenced in the Cat Item field on the variable record.

1. Navigate to Service Catalog > Catalog Variables > Item Variables.
   Note the list of variables that appears in the workspace has a default filter of Cat Item != <blank>.
2. Enter or select a catalog item in the Cat Item reference field.
   Selecting a Cat Item restricts the scope and availability of the catalog variable to that specific catalog item.
3. Click Submit.
   Also see, Catalog item specific variable declaration option 2.
Catalog item specific variable declaration option 2
You can declare a catalog item-specific variable directly from a catalog item record.

Creating a catalog variable in this way automatically sets the Cat Item reference to the catalog item selected.

1. Navigate to Service Catalog > Catalog Definitions > Maintain Items.
2. Select or create a catalog item.
   Note the Variables related list. All variables declared using this related list have a Cat Item reference value of the current catalog item.
3. From the Variables related list, click New.
4. Ensure that the Cat Item field correctly references the catalog item previously selected or created.
5. Go to or open the Question section or tab.
6. Add a Question.
7. Add a Name.
   Variable names should not include white space and cannot begin with a number.
8. Click Submit.
   Also see, Catalog item specific variable declaration option 1.

Display
Catalog specific item variables are visible in several places depending on where in the process the variable is viewed.

Declaration can happen and variables can be seen from within the menu, inside both the Maintain Items module and in the Item Variable modules of the Service Catalog.

Within a workflow, the Catalog Specific Item variables are available to the Catalog Task activity in the form of a slushbucket at the bottom of the Catalog Task activity. Item variables that are selected, are the question and answer pairs that will appear on the task that is generated by that instance of Catalog Task when executing that workflow.

If a workflow is associated with a specific catalog item, the association acts as a filter for item variables that appear in the slushbucket of the Catalog Task activity.

The last place the variables are seen is in the task form that is generated by the Catalog Task Item. The variables selected in the slushbucket are the question and answer pairs that appear to the user on the task form.

Access and assignment
The Catalog Item Variables are available and assigned to a specific Catalog Task activity (thereby to a specific task) using the slushbucket entry of a catalog task.

The user working the task enters the values of the variables.

To access the values of a Catalog Item Variable inside a script:

```javascript
var gr = current; // or create and query a new GlideRecord
var itemVariable = gr.variables[variableName]; //access the service catalog variable identified by the variable name.
var itemVariableValue = itemVariable.getValue();
var itemVariableName = itemVariable.getName();
var itemQuestion = itemVariable.getQuestion(); //All GlideappQuestion API are accessible on itemQuestion
```
Workflow events

The system employs two types of events: registered platform events and workflow events.

Registered platform events

Registered events are created in business rules and are used for such tasks as sending email notifications when records are inserted into the database. Workflow events are registered within workflows only and are not used anywhere else in the platform. Registered platform events can be triggered by a workflow for external use, but cannot be used within a workflow.

Workflow events

Workflow events follow different rules than platform events that are registered using the event registry. Platform events are entered into the Event Registration (sysevent_register) table and are available for platform processes to use. Workflow events are triggered exclusively for the workflow engine and are used only to direct the work of executing workflow contexts. When an event is registered in a workflow, it is attached to a currently executing activity in the registered_events column of the Workflow Executing Activity (wf_executing) table.

Workflow events also can be broadcast to a workflow from any scripting source that has access to the workflow context, such as a script include or a Run Script activity. In this case, the event, such as cancel, is passed to all records in the Workflow Executing (wf_executing) table for a specific context.

Whether by registry or by broadcast, an event is handled by the activity definition associated with the currently executing activity. Each activity definition comes with a set of handlers. For example, most activities come with onExecute, onCancel, and onUpdate event handlers. As an example of a more specific event, the Approval - User activity also comes with onDetermineApprovalState, which is specific to the work of the approval activity.

Multiple parallel events

A single workflow can have multiple event threads running concurrently, such as when a workflow has timers that overlap on separate workflow branches. If any additional thread completes before the first thread, the system stores event information from the additional thread on the Workflow Queued Commands (wf_command) table. After the first thread completes, the system retrieves the information stored by the additional thread and proceeds through the workflow with the event information from each thread.

Workflow events in the base system

Several workflow events are available in the base system.
### Workflow events in the base system

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Purpose</th>
<th>To use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
<tbody>
<tr>
<td>activityComplete</td>
<td>String value used by activity definitions to respond to the <code>onActivityComplete</code> event handler.</td>
<td>Informs records in the Workflow Executing Activity (wf_executing) about the completion of other activities in the same workflow context.</td>
<td>If the activity is allowed to set the boolean value for <code>wf_executing.notify_termination</code>, then set the value to <code>true</code> (<code>activity.notify_termination = true</code>) during the <code>onExecute</code> event.</td>
<td>Workflow Engine, Process Terminations</td>
<td>Current thread, current mutex</td>
<td>Join activity</td>
</tr>
<tr>
<td>otherEvent</td>
<td>String value used by the <code>Join</code> activity to respond to an <code>otherEvent</code>.</td>
<td>Informs records in the Workflow Executing Activity (wf_executing) table about an <code>otherEvent</code> that has completed.</td>
<td>The <code>Join</code> activity transitions from n number of preceding activities. These preceding activities all create a <code>wf_executing</code> record, which causes a check to see if the record already exists. If the <code>Join</code> already exists, then the <code>Join</code> created by the executing transition sets the <code>wf_executing</code> record for deletion.</td>
<td><code>Join activity</code></td>
<td>Current thread, current mutex</td>
<td><code>Join activity</code>, <code>onOtherEvent</code> event handler</td>
</tr>
<tr>

</tr>
<tr>
<td>timer</td>
<td>String value used by workflow activities to respond to a <strong>Timer</strong> activity that has expired.</td>
<td>Allows <strong>wf_executing</strong> records to be informed about a timer activity that has completed and has fired the timer event.</td>
<td>The <strong>Timer</strong> activity schedules a job that calls a script. The script calls <code>fireEvent(wf_executing, timer)</code>.</td>
<td><strong>Timer</strong> activity via a scheduled job</td>
<td>Worker thread, private mutex</td>
<td>Timer activity, <strong>onTimer</strong> event handler</td>
</tr>
<tr>
<td>execute</td>
<td>String value used by workflow activities to respond to a <strong>Timer</strong> activity that has expired.</td>
<td>Informs a record in the <strong>wf_executing</strong> table with the initial state of <strong>Executing</strong> to proceed with its primary work.</td>
<td>The workflow engine, for each transition executed, creates an executing record with a state of <strong>Executing</strong>. Once created, the executing record is put in a queue for processing. For each item in the queue, the Rhino globals are established, the activity definition that drives the executing record is instantiated, and the <code>run()</code> function is called. When the state of a record is <strong>Executing</strong>, this function always calls <strong>onExecute</strong>.</td>
<td>Workflow engine, via the <strong>WFActivity Handler</strong></td>
<td>Current thread, current mutex</td>
<td>All activities, <strong>onExecute</strong> event handler</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>

<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>------------------------------------------------------</td>
<td>----------------------------</td>
<td>--------------------------------</td>
<td>---------------------------------------------------------------------------</td>
</tr>
<tr>
<td>execute (specific to Lock)</td>
<td>String value used by the Lock activity to respond to a waiting lock that is ready to make another attempt to obtain a specific lock. This execute is different than the previous execute because it is called on a separate thread, at specified intervals, and is treated as an outside event.</td>
<td>Informs a Lock activity scheduled a job with a script that uses the workflow script include's fireEvent('execute') method.</td>
<td>Lock activity via a scheduled job</td>
<td>Lock activity</td>
<td>Worker thread, private mutex</td>
<td>Lock activity, onExecute event handler</td>
</tr>
<tr>
<td>determineApprovalState</td>
<td>String value used by approval activities to respond to a change in the overall approval status of the current record.</td>
<td>Informs Approval Coordinator both registers for the event and triggers the event. The child approvals have listeners that determine their approval state.</td>
<td>Approval Coordinator triggers the event during its onExecute event</td>
<td>Approval Coordinator, Approval - User, and Approval - Group</td>
<td>Current thread, current mutex</td>
<td>Approval Coordinator, onDetermineApprovalState event handlers. If the state is anything but Requested, the activity is considered finished, and the approval state (Approved, Rejected, Cancelled) is set to the wf_executing.result column</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
<td>---------</td>
<td>--------</td>
<td>--------</td>
<td>--------</td>
<td>-----------</td>
</tr>
<tr>
<td>cancel (from within activity definitions)</td>
<td>String value used by workflow activities to respond to a request for cancellation.</td>
<td>Informs all wf_executing records in a context that the workflow is being canceled.</td>
<td>The End activity uses the global workflow.broadcastEvent('cancel') to interrupt the currently running wf_executing records. This changes the state of those records to Cancelled.</td>
<td>End activity</td>
<td>Current thread, current mutex</td>
<td>All activities, onCancel event handler</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
<td>Purpose</td>
<td>To use</td>
<td>Source</td>
<td>Thread</td>
<td>Listeners</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
<td>----------------------------------</td>
<td>----------------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td>cancel</td>
<td>String value used by workflow activities to respond to a request for cancellation</td>
<td>This event is the same as the cancel event above and handled the same. However, the management of this event is subtly different. This event informs all <code>wf_executing</code> records in a context that the workflow is being canceled. The event is managed via the <code>onCancel</code> event handler of each executing activity definition, but the event is called differently. In particular, the call to cancel from outside an activity definition is blocked by the current mutex. This is a significant difference in that the event does not interrupt a currently executing activity that is still operating within the parameters of the context.</td>
<td>Any script can call cancel on a known executing context via the workflow script include. For example, <code>var w = new Workflow(); w.cancel(context);</code> //where context is a <code>GlideRecord</code> of the context to be canceled.</td>
<td>Any script include, scheduled job, UI action, or other source</td>
<td>Current thread, private mutex</td>
<td>All activities, <code>onCancel</code> event handler</td>
</tr>
<tr>
<td>Event</td>

<td>-------------------------------------------------------------------------</td>
<td>-------------------------</td>
<td>--------------------------</td>
<td>--------------------------</td>
<td>---------------------------------------------------------------------------</td>
</tr>
<tr>
<td>stop (see End activity)</td>
<td>The End activity checks for this event.</td>
<td>If the stop event is the current event, then the cancel operation of the End activity is bypassed.</td>
<td>Only in the End activity.</td>
<td>Any script can trigger or broadcast the stop event via a script include or workflow Run Script activity</td>
<td>Current thread, current mutex</td>
<td>This event is used by the End activity to exclude the Cancel activity and allow a workflow to end, even if canceled.</td>
</tr>
<tr>
<td>listener</td>
<td>String value that the workflow (subflow) activity triggers as an event.</td>
<td>When a main workflow calls a subflow, the workflow keeps the ID of the subflow's context in the scratchpad. When the subflow is complete, it triggers the listener event via a business rule.</td>
<td>The listener event is passed to the parent context on completion of a subflow and is managed by the onListener action of the workflow activity.</td>
<td>Business rule that is triggered by the update of a workflow that has a parent</td>
<td>Current thread, current mutex</td>
<td>This event is used by a subflow to inform its parent flow that it is complete. The parent workflow will react to this event and continue.</td>
</tr>
<tr>
<td>probe_complete</td>
<td>String value triggered in the workflow by an Orchestration activity indicating that the MID Server has completed a task.</td>
<td>The probe_complete event is triggered from Orchestration sensor processors via the workflow helper function handleEventById.</td>
<td>Event used to restate a workflow that is waiting for the MID Server to process a task or activity</td>
<td>Worker thread, private mutex</td>
<td>Orchestration activities</td>
<td></td>
</tr>
<tr>
<td>pause</td>
<td>String value sent to a workflow from an SLA to pause the Timer activity.</td>
<td>When an SLA is paused, the SLA workflows must be paused if there is a timer running.</td>
<td>Use is exclusive to the SLA timer</td>
<td>SLA</td>
<td>Business rule thread, private mutex</td>
<td>Timer activity</td>

<td>------------------------------------------------------------------------</td>
<td>-------------------------</td>
<td>----------------</td>
<td>------------------------------------------------</td>
</tr>
<tr>
<td>Query</td>
<td>Global event set upon the query of the Glide database that causes the script engine, and through that the workflow engine, to wake up.</td>
<td>Looks to the Workflow Context (wf_context) table to find running workflows that are associated with the current GlideRecord by document ID.</td>
<td>There is no explicit customer-facing use for this in a workflow. It is part of the Glide engine, and with this event, the only thing workflows can do is advance through the next set of transitions.</td>
<td>Workflow Engine, RunEngine</td>
<td>Current thread, current mutex</td>
<td>User action of query of a GlideRecord</td>
</tr>
</tbody>
</table>

**Workflow event-specific functions**

There are several functions that relate specifically to workflow events.
## Workflow event-specific functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Purpose</th>
<th>Use</th>
<th>Thread</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>registerForEvent</td>
<td>Function in the workflow environment that writes events represented as strings to the <code>wf_executing.registered_events</code> field.</td>
<td>The workflow events are just strings. When an activity that has registered for an event executes, a comma-delimited set of events is stored with the Workflow Executing Activity (wf_executing) record. When the event is triggered in the workflow context, the <code>wf_executing</code> table looks for all executing records that contain the string that represents the event in the <code>wf_executing.registered_events</code> field.</td>
<td>The global variable <code>workflow</code> that is available to all Workflow Activity (wf_activity) records is the source of the call. For example, from inside a Run Script activity, a designer can write: <code>workflow.registerForEvent('myEventName');</code></td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
<td>------------------------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>unRegisterForEvent</td>
<td>Function in the workflow environment that removes a string value representing an event that has been written to the wf_executing.registered_events field. When an activity unRegisters for an event, the comma-delimited set of events stored with the Workflow Executing Activity (wf_executing) record is searched, and if that string is found, it is removed.</td>
<td>The workflow events are just strings that are written to the wf_executing.registered_events field.</td>
<td>The global variable workflow that is available to all workflow Activity (wf_activity) records is the source of the call. For example, from inside a Run Script activity, a designer can write: workflow.unRegisterForEvent('myEventName');</td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>fireEvent</td>
<td>Function in the workflow environment that examines the contents of the workflow wf_executing.registered_events field, comparing its contents to the eventName passed in.</td>
<td>The workflow events are just strings that are written to the wf_executing.registered_events field. When fireEvent(eventName) is called by a workflow activity, the workflow engine queues up any executing records that contain the string in the registered field.</td>
<td>The global variable workflow that is available to all workflow Activity (wf_activity) records is the source of the call. For example, from inside a Run Script activity, a designer can write: workflow.fireEvent('myEventName');</td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
<td>--------------------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>fireEvent (eventRecord, eventName)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity (wf_executing) record. The eventRecord is a GlideRecord of the type wf_executing.</td>
<td>This event call expects an onMyEvent event handler in the activity represented in the event record (Workflow Executing Activity (wf_executing) table). When fireEvent (eventRecord, eventName) is called by a workflow activity, the workflow engine queues up the specific executing record with that event and passes the event into the activity definition for the on&lt;eventName&gt; handler to manage. This event is queued up in its own mutex, so the current queue completes before this event is processed.</td>
<td>The workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.fireEvent (executing, eventName);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td>fireEvent (eventRecordSysId, eventName)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity (wf_executing) record. The eventRecordSysId is the sys_id of a GlideRecord of the type wf_executing.</td>
<td>This is the same as the fireEvent above, except that it accepts an ID and returns the Workflow Executing Activity (wf_executing) record.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.fireEvent(executing, eventName);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>fireEvent (eventRecordSysId, eventName, optionalJSONObject)</td>
<td>Function in the workflow environment that sends an event to a specific Workflow Executing Activity (wf_executing) record. The eventRecordSysId is the sys_id of a GlideRecord of the type wf_executing.</td>
<td>This is the same as the fireEvent above, except that it accepts a JSON object as a third parameter. This object can specify any data expressible as JSON. You can also specify additional functionality when creating a workflow activity.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.fireEvent(executing, eventName, JSONobject);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>broadcastEvent (contextId, eventName)</td>
<td>Function in the workflow environment that sends an event to all currently running Workflow Executing Activity (wf_executing) records in a specified context, regardless of their state.</td>
<td>This is the same as the fireEvent above, except that it accepts an ID and returns the Workflow Executing Activity (wf_executing) record.</td>
<td>The Workflow script include contains the call for this. For example, from inside a Run Script activity, a designer can write: var w = new Workflow(); w.broadcastEvent(contextId, eventName);</td>
<td>Current thread, current mutex</td>
<td>Workflow script include</td>
</tr>
<tr>
<td>Function</td>
<td>Description</td>
<td>Purpose</td>
<td>Use</td>
<td>Thread</td>
<td>Source</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------</td>
<td>--------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td>broadcastEvent</td>
<td>Function in the workflow environment that sends an event to all currently running Workflow Executing Activity (wf_executing) records in the current context, regardless of their state.</td>
<td>This should not be confused with broadcastEvent above. This event is only available to current Workflow Executing Activity (wf_executing) records.</td>
<td>This is available only through the global workflow variable of the current context. The following is an example of its use from within an activity definition’s script: workflow.broadcastEvent(eventName)</td>
<td>Current thread, current mutex</td>
<td>Global variable workflow</td>
</tr>
</tbody>
</table>

**Event-specific workflow activities**

The following workflow activities trigger events.
## Event-specific workflow activities

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Description</th>
<th>Purpose</th>
<th>To Use</th>
<th>Source</th>
<th>Thread</th>
<th>Listeners</th>
</tr>
</thead>
</table>
| Create Event    | Requires an event from the event registry rather than a workflow event. This activity is located in the Notification category of the workflow tree. | Fires the notification event specified in the Workflow Activity (wf_activity) table. | 1. Navigate to System Policy > Events > Registry  
2. Create an event.  
3. Navigate to System Policy > Templates and create an email template  
4. Navigate to System Policy > Email > Notifications.  
5. Create a new notification that is triggered by the event you created and sends the template you created.  
6. On the workflow canvas, drag the Create Event activity onto the canvas. | Event Registry     | Triggered in the current thread and handled on the worker thread in notifications. Never processed by a workflow. | On the notification thread, outside of workflow. |

<table>
<thead>
<tr>
<th>Activity Name</th>
<th>Description</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Wait for WF Event</strong></td>
<td>Listens for workflow events, as described in the Workflow Events in the Base System table, and only within the current context. This activity is located in the Conditions category of the workflow tree.</td>
<td>Waits for another transition branch of the current context to trigger an event. Takes an event name as input. When the activity is executed, the specified event name is added to a string array stored in the registered_events column. The values in this column are in a list of all events the activity waits for when it is executing.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Source: The Wait for WF Event activity has a generic onUnhandledEvent that tests the current event against the value that was passed to the event variable. If they match, the Wait for WF Event moves the workflow forward.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Thread: Triggered in the current thread or from a script include. listeners: The onUnhandledEvent of the Wait for WF Event activity</td>
</tr>
</tbody>
</table>

**Workflow stages**

Workflows can indicate workflow progress by updating any field designated as a stage field.

For example, the Incident (incident) table has an Incident state field that indicates progress, but the service catalog uses the Stage field.

To indicate the workflow's progress through the possible stage values, the interface updates the Stage field selected in the workflow properties. Available fields depend on the table used by the workflow. If the field provides a choice list, then the choices are available as stage values for the workflow. If the field is a workflow field, it displays an icon to indicate the workflow's progress, as with the Service Catalog's Stage field.
After stages are added to the workflow, they can be assigned to each workflow activity. If an activity with an assigned stage is encountered when the workflow runs, the workflow engine assigns the stage to the record associated with the workflow context.

For workflows that use the Requested Item (sc_req_item) table, the stage field is automatically set to the `Stage` field of the table and cannot be changed. The stage state displayed for a workflow running on the Requested Item table is based on the state of the workflow activities.

- If an activity is active, then the stage is shown with the state of **In progress**.
- If an activity is in the **Pending** or **Completed** state, the stage reflects this state.
- If an activity is canceled, **Request Cancelled** appears in the `Stage` field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the `Stage` field.

### How stage values are derived

Stage values are derived from various sources in the interface.

**Note:** An updated method for managing workflow stages as a set is also available. For information about grouping and reusing stages, see *Workflow stage sets*.

Stage values are derived from the following sources:

- **Choices for Stage column:** Choices defined for the column selected as the `Stage` column for the workflow.
- **Default stages for table:** Stages defined in the Stage Default (wf_stage_default) table for the table selected.
- **Workflow-specific stages:** Applied only to the workflow for which they were defined in the Workflow Stage (wf_stage) table.
- **Stage values in existing records:** Values from the designated `Stage` column in the table assigned to the workflow are inherited from existing records.

If the stage field for a workflow is the table column named `Stage`, then the progress of the workflow appears in any list view containing the `Stage` column.
Stages in a list

Stage values shown in the list views are accompanied by the state, based on the workflow activities being executed. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with a state of **In progress**. Similarly, if the activity is in the **Pending** or **Completed** state, the stage reflects this state.

**Example**

If the workflow table is Request Item (sc_req_item), then the stage field is automatically set to the **Stage** column of that table and cannot be changed. The following stage values for the request item are displayed in a choice list from the Dictionary Entry (sys_dictionary) table:

- Waiting for Approval
- Fulfillment
- Delivery

In addition, the Request Item table has the following default stages:

- Request Cancelled
- Completed
**Note:** If an activity is cancelled, Request Cancelled appears in the Stage field. The "Cancelled" label set in the wf_stage table is a reserved word, and does not display in the Stage field.

When you edit available activity stages in the Workflow Editor, the list displays the following stage values:

- Waiting for Approval
- Fulfillment
- Delivery
- Request Cancelled
- Completed

The following diagram depicts the process used to gather stage values from the Request Item table to populate the Stages list in workflow activities.
Use workflow stages

You can add or modify workflow stages.

Role required: workflow_admin, workflow_creator, or admin

1. Navigate to Workflow > Workflow Editor.

Note: If you are creating a workflow with a table other than Request Item (sc_req_item), you must select a Stage field in the workflow properties for the workflow to have stages.
2. Create a new workflow by clicking **New** or open an existing workflow.

3. In the Workflow Properties form, if the table is not the Requested Item (sc_req_item) table, select a field to display stages in the **Stage** field property.

   **Available fields** depend on the table selected for the workflow.

4. After assigning a list of stages to the workflow, you can set a stage value in any of the workflow activities that provide a **Stage** field in their dialog box.

   Setting a stage value in a workflow activity tells the workflow engine to assign that stage to the record associated with the workflow context when the activity is encountered during a run.

   When an activity starts with a specified stage, the platform updates the **Stage** field with the current value. In workflows run against the Requested Item (sc_req_item) table, the `sc_req_item.stage` field is defined as a workflow type field.

   When displaying the stages for a workflow on the Requested Item (sc_req_item) table, the stage state is based on the state of the workflow activities. If an activity has a stage specified for it, and the activity is currently active in the workflow, then the stage is shown with an **In progress** state. Similarly, if the activity is in the **Pending** or **Completed** state, the stage reflects this state.

5. To edit the workflow-specific stages for an existing workflow, click the gear icon in the header bar and select **Edit Stages**. Again, these stage values are combined with the choices, defaults, and existing values.
Workflow stages

To optimize the use of stages, you can assign a stage to multiple activities in a workflow. For example, if your workflow uses the following activities to create tasks:

1. Get approval
2. Order equipment
3. Receive equipment
4. Add equipment to CMDB
5. Set up equipment
6. Install software
7. Configure software
8. Deliver to user

The following stages might be used:

- Approval
- Order
- Configure
- Deliver

A good practice is to assign stages to the activities as follows:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Assigned stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Get approval</td>
<td>Approval</td>
</tr>
<tr>
<td>Order equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Receive equipment</td>
<td>Order</td>
</tr>
<tr>
<td>Add equipment to CMDB</td>
<td>Order</td>
</tr>
<tr>
<td>Set up equipment</td>
<td>Configure</td>
</tr>
<tr>
<td>Install software</td>
<td>Configure</td>
</tr>
<tr>
<td>Configure software</td>
<td>Configure</td>
</tr>
<tr>
<td>Deliver to user</td>
<td>Deliver</td>
</tr>
</tbody>
</table>

Examples of stages added to workflow activities

When the Order equipment, Receive equipment, or Add equipment to CMDB activity is active, the Stage display shows that the Order stage is In progress.

Add and translate stages

You can add default stages to use for a table, and stages to existing workflow

Add default stages for a table

You can assign a stage set as a default set to any number of tables.

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to Workflow > Default Stages (by table).
2. Click New.
3. Select a stage Set.
   You can create a new set by clicking New, typing a name, and clicking Submit.
4. Select a corresponding Table.
5. Click Submit.

   The stages in the selected stage set are automatically added to any new workflows that use the corresponding table.

Add a stage to an existing workflow

If a stage required for a workflow has not been imported or is not in the stage set assigned to the workflow table, you can add it to the workflow manually.

1. Navigate to Workflow > Workflow Editor.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select Edit Stages.
4. In the Workflow Stages list, click New.
5. On the Workflow Stage form, fill in the fields as appropriate.

   Do not use a Name or Value field value that already exists in the base system.
### Workflow stage fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the stage as it appears in workflow fields.</td>
</tr>
<tr>
<td>Value</td>
<td>The value of the stage when it is referenced from elsewhere in the system, such as in a script.</td>
</tr>
<tr>
<td>Duration</td>
<td>The default duration for the stage. Currently not used.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
7. Publish the workflow.

**Add a stage to a workflow activity**

After stages are added to a workflow, you can assign them to the workflow activities.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. Double-click the activity.
4. In the **Stage** field on the Activity Properties form, find and select the stage to display when the workflow reaches the activity.
5. Click **Update**.

**Translate workflow stages**

You can provide translations for workflow stage names so the names appear in the language selected for the instance.

The instance must already have language internationalization plugins installed. For more information, see **Activate a language**.

Language-specific text appears in **workflow fields** displayed in a list, **workflow stage sets**, and the Workflow Editor for users with that language selected. Language-specific text does not automatically appear when displaying stages on a form. To translate stages on a form, add translated text to the workflow field choices.

You can add translated text for any language enabled on the instance. For example, to translate workflow stages into French:

1. Set the interface language to **French**.
2. Navigate to **Workflow > Workflow Editor**.
3. Open and check out a workflow.
4. In the title bar, click the menu icon and select **Edit Stages**.
5. Edit the **Name** field for each stage and enter the text to display to French users. Do not change the **Value** field.
6. Confirm that the workflow stages display the French text.

Alternatively, to translate stages for multiple workflows at once, you can directly edit the Workflow Stages (wf_stage) table. For example, to translate workflow stages from multiple workflows into French:

1. Set the interface language to **French**.
2. In the application navigation filter, enter `wf_stage.list`.
3. Edit the **Name** field for each stage and enter the text to display to French users. Do not change the **Value** field.

**Workflow stage sets**

Stage sets are named groups of workflow stages commonly used together. Create a stage set and assign it as a default set to any number of tables. You can import the choice list values of a workflow field as stages for a workflow, and export a stage set to create a new one.

A single stage set usually represents a process, such as the stages required to display the progress of a service catalog request. You can also assign a stage set as the default set for workflows on specific tables.

In an active context, workflow stages provide summary-level feedback about the progress of a workflow. Stage icons display the status of each activity as it is being driven by a workflow. The system updates a **Stage** field, defined in the workflow properties, to indicate the progress of the workflow through the possible stage values.

**Updates to workflow stage values**

During an upgrade, the system makes changes to the **Value** field of records in the Workflow Stage (wf_stage) table.

- All entries are made lowercase.
- All spaces and special characters are replaced with underscores.

These changes support **System localization** and enable workflows to display translated text in the **Stage** field.

*Create a new stage set*

You can create a new stage set by creating a stage set record and adding stage set entries manually.

Create a stage set record only when you want additional stages that are not available on the table by default.

1. Navigate to **Workflow** > **Stage Sets**.
2. Click **New**.
3. Enter a **Name** that indicates the purpose of the stage set. For example, you can create a Requested Item stage set to hold the stages commonly used by inventory tracking workflows or service catalog fulfillment workflows.
4. Click **Submit**.
5. Open the new stage set record.
6. In the **Stage Set Entries** related list, click **New**.
   Each stage set entry can be used as the **Stage** for an activity in a workflow that uses this stage set.
7. Enter a **Name** that indicates the stage name to appear in workflow fields.
8. Enter a **Value** to use when referencing the entry, such as in a script.
9. Click **Submit**.
10. In the **Stage Set Entries** related list, ensure that each entry has a unique **Order** value. Enter a low value for stages that should appear early in the workflow and a higher value for later stages.
The stage set can be added to a workflow or assigned as the default stage set for workflows that are created for a specific table.

**Use a default stage set**

You can assign a stage set as a default set to any number of tables.

The stages in the assigned stage set pre-fill the workflow version stages when you create a new workflow for the associated table.

1. Navigate to **Workflow > Default Stages (by table)**.
2. Click **New**.
3. Select a **Table**.
4. Select the **Set** you want to assign to the selected table.
5. Click **Submit**.

**Import stages from a choice list**

You can import the choice list values of a workflow field as stages for a workflow.

Create a choice list as follows:

- Add a custom field of Type **Workflow** to the table.
- Configure the custom field to use a choice list.
If you are creating a new field, set the **Choice List type** to **Display without --None--** and create the choices for the newly created field.

For more information, see *Create a workflow stage field.*

1. Navigate to **Workflow > Workflow Editor.**
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**
4. In the Workflow Properties dialog box, click the **Stages** tab.
5. From the **Stage field** list, verify that the correct workflow field is selected.
6. In the Related Links section, click **Import Stages from Choice List.**
7. In the dialog box asking you to confirm that you want to import the choice list, click **OK.**
8. Click **Update.**

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

**Export a stage set from a workflow**

You can create a new stage set by exporting the stages from an existing workflow as a set, instead of manually adding stage set entries to a stage set record.

1. Navigate to **Workflow > Workflow Editor.**
2. Open and check out the workflow containing stages that you want to export as a new stage set.
3. In the title bar, click the menu icon and select **Edit Stages** to open the Workflow Stages dialog box.
4. In the Related Links section, click **Export to Stage Set.**
5. Enter a unique **Name** for the new stage set.
6. Click **OK.**

The stage set can be added to a workflow or assigned as the default set for workflows that are created for a specific table.

**Add a stage set to a workflow**

You can add any number of stage sets to an existing workflow.

When multiple stage sets have stage set entries with the same **Value**, the stage appears on the workflow only once.

1. Navigate to **Workflow > Workflow Editor.**
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Edit Stages** to open the Workflow Stages dialog box.
4. In the Related Links section, click **Import from Stage Set.**
5. Select the stage set.
6. Click **Ok.**
7. Import additional stage sets as needed for the workflow.

After you add all necessary stage sets to the workflow, you can add them to the workflow activities. For more information, see *Add a stage to a workflow activity.*

**Create a workflow stage field**

Workflows can provide a summary of workflow progress by updating any field of the **Workflow** type. If the field is a workflow field, it displays an icon to indicate the workflow stage progress.

Role required: admin
In a form, the workflow field displays the current stage as a choice list value.

In a list, the workflow field displays stage icons that represent the series of states, stages, phases, or tasks within a workflow. The stage icons are populated using the activity stages from the associated workflow. For more information, see *Workflow stages*.

To create a workflow stage field:

1. Navigate to **Workflow > Default Stages (by table)**.
2. Right-click near a column header and select **Configure > List Layout**.
3. Create a new field in lower right.
4. On the form view of the table used by the workflow, create a field with the **Type** set to **Workflow**.
   
   For detailed steps, see *Add and customize a field in a table*.
5. Click **Save**.
6. Right-click the field label and select **Configure Dictionary**.
7. Open a dictionary entry.
8. In the Choice List Specification section of the Dictionary Entries form, select **Dropdown with -- None--** from the **Choice** list.
9. Click **Update**.
10. To ensure that the workflow field properly displays stages on the form, define a choice for each workflow stage.

   - To create workflow stages using a choice list that already has choices, you can import the stages from the choice list. A stage is created for each choice defined for the **Stage field** selected in the workflow properties. For detailed steps about importing a choice list, see **Import stages from a choice list**.
   - The **Value** of each choice must match the **Value** of the corresponding workflow stage.
   - Do not use spaces in the **Value** field for either choices or stages. Use underscores in place of spaces.
   - Make the choice list read-only. If a user changes the stage value for a record from the choice list rather than allowing the workflow to control the value, the workflow-driven, legacy, and linear renders may not work as intended. You can also use business rules or events to ensure the workflow progresses accordingly.

   For detailed steps on defining choice lists, see **Define an option for a choice list**.
11. To see workflow stages as icons, add the field to the list layout of the workflow table.
For detailed steps, see *Configure the list layout.*

After you create or update the workflow field:

- Unless the workflow uses the Requested Item (sc_req_item) table, ensure that the workflow field is selected from the **Stage field** list in the workflow properties. For detailed steps, see *Select a stage field.* If a workflow uses the Requested Item table, the stage field is automatically set to the **Stage** field of the table and cannot be changed.
- Work through the workflow. Any other updates made to the workflow field, such as updates from business rules or other scripts, can interfere with displaying workflow stages.

**Select a stage field**

A **Stage field** allows the workflow context to show additional workflow information, such as the stage name and the estimated completion time for an activity.

Ensure that the workflow field you want to use as the stage field is configured to properly display stages. For detailed steps, see *Create a workflow stage field.*

Unless the workflow uses the Requested Item (sc_req_item) table, you can specify which field from the workflow table is the stage field. For workflows that use the Requested Item (sc_req_item) table, the stage field is automatically set to the **Stage** field of the table and cannot be changed.

To add or edit a workflow stage field:

1. Navigate to **Workflow > Workflow Editor.**
2. Create or check out the workflow.
3. In the title bar, click the menu icon and select **Properties.**
4. In the Workflow Properties dialog box, click the **General** tab.
5. In the **Table** list, verify that the table containing the workflow field is selected.
6. Click the **Stages** tab.
7. From the **Stage field** list, select the workflow field.
8. Click **Update.**

**Display approvers in workflow stage fields**

Enable workflow stage fields to display approvers, change the number of approvers to display, or disable displaying approvers.

**Role required:** admin

By default, only workflow stage fields that use the Workflow-driven renderer can display a list of approvers. Only these **workflow stage renderer** types support displaying approvers.

- Linear renderer
- Main flow renderer
- Workflow-driven renderer

1. Navigate to **Workflow > Administration > Properties.**
   The system displays the Workflow Properties page.
2. Set the following properties.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of approvers to show if approvers are displayed for workflow stages. Only valid for supported list v2 renderers. glide.workflow.renderer.show_approver_limit | Sets the maximum number of approvers to display within a workflow stage field. The system displays an ellipsis character when there are more approvers than the display limit allows.  
- Type: integer  
- Default value: 5 |
| Show approvers when displaying workflow stages with the Linear renderer. glide.workflow.renderer.linear.show_approver | Enables (true) or disables (false) the Linear renderer to display approvers.  
- Type: true | false  
- Default value: false |
| Show approvers when displaying workflow stages with the Main flow renderer. glide.workflow.renderer.mainflow.show_approver | Enables (true) or disables (false) the Main flow renderer to display approvers.  
- Type: true | false  
- Default value: false |
| Show approvers when displaying workflow stages with the Workflow-driven renderer. glide.workflow.renderer.workflowdriven.show_approver | Enables (true) or disables (false) the Workflow-driven renderer to display approvers.  
- Type: true | false  
- Default value: true |

3. Click **Save**.
4. Add stages to workflows that have associated workflow stage fields.

**Note:** If you add stages to a subflow, the parent workflow must also have stages.

5. For each approval activity you want to display approvers, select a **Stage** value.  
For example, the sample workflow **Service Catalog Item Request** has two approval activities. The first **Approval - User** activity has a **Stage** value of **Dept. Head Approval**. The second **Approval - User** activity has a **Stage** value of **CIO Approval**.

The workflow stage field renderers you enabled display approvers up to the approver display limit. For example, a Workflow-driven stage field displays up to five approvers when the workflow reaches an approval stage.

**Workflow stage field icons and tooltips**

A workflow stage field displays icons to indicate the workflow stage.

Based on the stage renderer selected for the workflow, these icons may display a tooltip with additional information.

**Workflow field icons**

<table>
<thead>
<tr>
<th>Icon</th>
<th>Workflow stage</th>
</tr>
</thead>
<tbody>
<tr>
<td>➡️</td>
<td>Current active step</td>
</tr>
<tr>
<td>⬢писыва</td>
<td>Approval pending</td>
</tr>
<tr>
<td>Icon</td>
<td>Workflow stage</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>Approval rejected</td>
</tr>
<tr>
<td></td>
<td>Complete</td>
</tr>
<tr>
<td></td>
<td>Late (Change/Request) or Canceled (Catalog)</td>
</tr>
<tr>
<td></td>
<td>Skipped (Catalog only)</td>
</tr>
</tbody>
</table>

Stage tooltips
Based on the stage renderer selected for a workflow, workflow stage icons may display tooltips with detailed information about a stage.

Stage renderers and tooltip behavior

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Tooltip behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Legacy</td>
<td>When a user points to a stage, the tooltip displays the name of the stage. In the expanded view, the activity status appears in parentheses next to the stage.</td>
</tr>
</tbody>
</table>
## Other renderers

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Tooltip behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>When a user points to a stage, the tooltip displays the name of the stage. If the stage is a gated approval, the tooltip also shows the name of the approver. In the expanded view, the activity status appears in parentheses next to the stage.</td>
<td></td>
</tr>
</tbody>
</table>

If you do not want the approver’s name included in the tooltip, navigate to **System Properties > Service Catalog** and clear the **Show the current pending approver’s name in the stage widget mouseover** check box.

![Tooltip behavior example](image)

**Property for displaying pending approver’s name**

**Workflow stage renderers**

Workflow stage renderers determine how a workflow displays stages in a workflow field.

There are multiple renderers available.

**Note:** Most workflows should use the workflow-driven renderer. This renderer is used by default for all workflows. Use a different stage renderer only after careful consideration and to satisfy specific requirements for how the stages appear.
Workflow-driven

Use the workflow-driven renderer as much as possible. This renderer displays icons for stages using the stage state controlled by the workflow. Icons are displayed in a way that is meaningful for many situations. This renderer can display stages from a main workflow and subflows. The order of the icons is determined by the expected path of the executing workflow. As the workflow progresses, stages on paths that the workflow did not take are removed from the display. Stages from paths other than the expected path are not included unless the workflow follows that path.

The **Stage order** field on the **Stages** tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the **Order** column on the Workflow Stages record

**Note:** If the workflow context for a request item has been deleted, the stages for that request item can no longer be rendered. This stage history is stored on the workflow context.

Main flow

The main flow renderer displays icons for stages defined in the main workflow only. Use this renderer when you do not want to expose the details of the subflows. For example, a single main workflow may run several subflows to handle implementation details. The stages in these subflows do not provide useful information for the user who starts the workflow, but are useful when editing the subflow. In this scenario, using the main flow renderer leads to the best user experience. The stage field displays the high-level process of the workflow without exposing unnecessary details.

The **Stage order** field on the **Stages** tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the **Order** column on the Workflow Stages record

Linear

Linear rendering displays all stage icons from the main workflow and all subflows within a single workflow field on a list or form. It displays icons in a linear sequence regardless of the paths the workflow follows as it executes. This renderer uses stages defined in both the main workflow and any subflows that the main flow launches. The icons appear in the user-specified order. Skipped stages do not appear.

Use this renderer when the workflow stages must display in a consistent order and the actual details of how the workflow runs are less important. For example, a workflow may revisit or revert to previous stages based on one or more **Condition Workflow activities**. Displaying these loops in the stage field does not provide useful information to the user. In this scenario, using the linear renderer leads to the best user experience. The stage field displays the predefined process, including stages from subflows, in a consistent order.

For example, you can create a service catalog workflow that uses a subflow to complete delivery of the requested item. The following images illustrate the main flow and subflow for ordering corporate-branded supplies.
The linear renderer displays all these stages in one workflow field. The parent workflow specifies the Waiting for approval, Fulfillment, and Completed stages. The subflow specifies the Delivery and Waiting for Task, and Delivery OK stages.

**Progress bar**

The progress bar renderer displays a single progress bar instead of a sequence of stage icons. This renderer is particularly useful when you want to display the general progress of the workflow as a percent. Each stage in the workflow controls an equal percentage of the progress bar. For example, if a workflow has 10 stages, reaching each stage causes the workflow field to display an additional 10% of the progress bar. Stage names do not appear in the progress bar.
The progress bar renderer provides a way to display the status of a workflow that has a large number of stages. Other rendering options may provide a better user experience when rendering fewer than four stages in a single workflow.

The **Stage order** field on the **Stages** tab has two options:

- Computed uses the actual workflow path in order
- User-specified uses the order specified in the **Order** column on the Workflow Stages record

---

**Legacy**

The legacy renderer displays stages in the same way as releases prior to Dublin. When an instance is upgraded from a release prior to Dublin, all existing workflows are set to use the legacy renderer. Whenever possible, use a different stage renderer instead. If you want your workflow to maintain pre-Dublin behavior, use the Legacy option. The legacy renderer sometimes assigns incorrect data to and/or reports incorrect data from the workflow stage field. If possible, we recommend all workflows use the Workflow-driven renderer.

With the legacy renderer, you can create and reference a custom workflow field icon set by setting the icons attribute to a new script include. For example, to use the `WorkflowIconsSCR` script include to define which icons to use, add the attribute `icons=WorkflowIconsSCR` to the **Attributes** field of the dictionary entry for the workflow field. To use the default icon display behavior, use the attribute `icons=WorkflowIconsStages`.

The legacy renderer works with all tables except the Requested item (sc_req_item) table. In this case, use the requested item renderer instead.

---

**Requested item**

The requested item renderer functions the same way as the legacy renderer, but is for use with the Requested item (sc_req_item) table.

Only in Now Mobile, default stage renderer is used.

**Select a stage renderer**

In most cases, the default workflow-driven renderer should be used. If you have specific requirements for displaying stages, you can select a different stage renderer.

Consider the following when selecting a stage renderer:

- Use the workflow-driven renderer if possible. This is the default renderer that should be used in most cases.
- Use the legacy renderer only if your instance was upgraded from a release prior to Dublin and you want your workflow to maintain pre-Dublin behavior.

To use linear, main flow, or progress bar rendering, satisfy the following requirements.
## Linear and progress bar renderer requirements

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Linear</strong></td>
<td>• The parent workflow and all subflows must modify the same current record.</td>
</tr>
<tr>
<td></td>
<td>• In the properties for all subflows, the <strong>Stage field</strong> value for all subflows must match that of the parent workflow.</td>
</tr>
<tr>
<td></td>
<td>• The parent flow and all subflows must contain the same stages. Use a stage set to ensure the parent flow and all subflows have the same stages.</td>
</tr>
<tr>
<td></td>
<td>• On the workflow canvas, each workflow needs only the stages used directly by that workflow. It is not necessary to add stages from subflows to activities on the parent flow, or stages from the parent flow to activities on the subflows.</td>
</tr>
<tr>
<td><strong>Main flow</strong></td>
<td>• The workflow contains subflows.</td>
</tr>
<tr>
<td></td>
<td>• You do not want or need to reveal the details about the subflows.</td>
</tr>
<tr>
<td><strong>Progress bar</strong></td>
<td>• The workflow properties must have a <strong>Stage ordering</strong> value of <strong>User-defined</strong></td>
</tr>
<tr>
<td></td>
<td>• There must be workflow stages within the workflow.</td>
</tr>
<tr>
<td></td>
<td>• Because stage names do not appear in a workflow field when using the progress bar renderer, you can simplify stage names to represent a percentage of the workflow. For example, if a process has four main steps, name the workflow stages as 25%, 50%, 75%, and 100%. Enter the numerical value of each stage, such as 25, in the <strong>Value</strong> and <strong>Order</strong> fields.</td>
</tr>
</tbody>
</table>

To select a stage renderer:

1. Navigate to **Workflow > Workflow Editor**.  
2. Open and check out the workflow.  
3. In the title bar, click the menu icon and select **Properties**.  
4. In the Workflow Properties dialog box, click the **Stages** tab.  
5. From the **Stage rendering** list, select a stage renderer.  
   - If you are using two workflows to update two unique workflow fields on a single record, both workflows must use a non-legacy renderer. You can select a different stage renderer for each workflow but do not select **Legacy** for either one.  
   - If you want to use the linear renderer, make sure you select **Linear** in the properties for the parent workflow and all subflows.
6. Click Update.

**Workflow fields with deleted records**

Workflow fields may indicate when a record required by the workflow is deleted.

After a referenced record is deleted, the reference in the primary record is no longer valid. If the stage renderer detects a reference that is no longer valid, the stage field displays a message about the deleted record.

Administrators can restore deleted records. For more information, see Use the Deleted Records module to restore a deleted record.

**Workflows with missing records**

The image shows a list with two workflows. The top request does not have an associated request item. The bottom request has an associated request item, but the item does not have an associated workflow context.

**Workflow validation**

Workflow validation examines different characteristics of a workflow to locate issues that might prevent the workflow from being published or cause it to fail. The validation report summarizes the results of each separate workflow validation.

Validation prevents workflows with critical flaws from executing and resulting in an unstable or incomplete state. There are a number of validators in the base system that notify workflow designers of potential problems. For example, multiple End activities, disconnected transitions, incorrect table references, missing subflows, and dependencies affected by update sets. A workflow validation report displays the results from each validator, including a message explaining what was found. The system automatically validates a workflow when you publish it. You can also run validation on a workflow directly from controls in the Workflow Editor.

**Highlighting critical errors**

The graphical Workflow Editor highlights critical errors when a workflow is loaded. In this example, a subflow is missing and is not available to the parent workflow for the current user. The graphical Workflow Editor indicates the error when the parent workflow loads by highlighting (in red) the
activity that calls the subflow. To correct the error in the parent workflow, click the validate icon in the header bar and inspect the error description in the validation report.

Validations at publishing

If you attempt to publish an invalid workflow or a workflow with potential problems, the system displays an error message and blocks the operation, if necessary. When validation error messages appear, click the validate icon in the graphical Workflow Editor to see the error report.

Validation warning

A validation warning notifies you that a potential problem exists in a workflow but permits you to publish the workflow. Validation warnings appear when:

- You edit and then attempt to publish a workflow that is included as a subflow in another workflow. The system cannot determine how your changes will affect the parent workflow and alerts you of the relationship.
- A workflow activity uses a different table than the table assigned to the workflow. The system alerts you of the potential conflict.

Publish Confirmation

Validation warning. Click the validation button in the toolbar to get details:

Validate Summary - Workflow version contains Warnings - Total checks performed:15 (Info:13 Warn:2, Critical:0)

Publish this workflow with warnings?

Cancel OK

Validation warning
Validation failure

A validation failure notifies you that a critical error has occurred in the workflow that prevents you from publishing the workflow. An example of a critical error is a missing subflow.

Workflow validation report

Validators display three notification levels: CRITICAL, WARN, and INFO. The designer can publish a workflow that returns WARN or INFO level validation, but not a workflow that returns an overall validation level of CRITICAL.
Workflow Validation Report

Validate Summary - Workflow version contains Warnings - Total checks performed:15 (Info:14, Warn:1, Critical:0)

<table>
<thead>
<tr>
<th>Type</th>
<th>Level</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>ValidateLowestCommonTable</td>
<td>Info</td>
<td>The lowest common table in this workflow is</td>
</tr>
<tr>
<td>ValidateTransitionIn</td>
<td>Info</td>
<td>All activities in this workflow have at least one inbound transition.</td>
</tr>
<tr>
<td>ValidateInputVarUpdateSetDependencies</td>
<td>Info</td>
<td>There were no Input Variable Update Set dependency issues found.</td>
</tr>
<tr>
<td>ValidateDanglingTransition</td>
<td>Info</td>
<td>There are no unattached transitions in this workflow.</td>
</tr>
<tr>
<td>ValidateParentFlow</td>
<td>Warn</td>
<td>This workflow version (Item Designer - Approvals) is required as a subflow in 1 other workflows.</td>
</tr>
<tr>
<td>ValidateScriptForCurrentDotUpdate</td>
<td>Info</td>
<td>The JavaScript in this workflow has no instances of 'current.update'</td>
</tr>
<tr>
<td>ValidateWorkflowStoreColumn</td>
<td>Info</td>
<td>Workflow stores are valid</td>
</tr>
</tbody>
</table>

Workflow validation report

Header summary

The header of the validation report summarizes the entire validation run against the specified workflow.

- **Validate Summary**: The overall score reflects the most severe notification level encountered during the validation.
- **Total checks performed**: The total number of validations run is also broken down to show the number at each notification level.

Report columns
The body of the report displays the results of each individual validation check that was performed. The columns are **Type**, **Level**, and **Message**. You can sort and filter these columns as you would any list.

**Workflow termination and external dependencies levels**

<table>
<thead>
<tr>
<th>Name</th>
<th>Implication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Info</td>
<td>Provides information about the current workflow version. An example of an information level message is one that names the lowest common table in the workflow. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Warning</td>
<td>Alerts the user that the validator detected anomalies in the workflow that might compromise its ability to execute. An example of a warning level message is one that alerts you to a missing activity input transition. Workflows at this validation level are considered valid and publishable.</td>
</tr>
<tr>
<td>Critical</td>
<td>Names a workflow element containing a critical error that prevents the workflow from executing successfully. Examples of this are missing or invalid subflows and missing transitions. Workflows at this validation level cannot be published or run in production.</td>
</tr>
</tbody>
</table>

**Message**

The validation message provides a detailed description of the results, including table names, update sets, and other specifics.

For the procedure to validate a workflow and generate a validation report, see [Validate a workflow](#).

**Workflow validator**

ServiceNow offers several workflow validators for workflow designers to test their workflows. This page lists all available workflow validators. See [Workflow validation](#) for information on using workflow validators and the workflow validation report to see the type of information that is returned.

**Hanging workflows and update sets**

<table>
<thead>
<tr>
<th>Hanging Workflows</th>

</tbody>
</table>

**ValidateTransitionOut**
The **ValidateTransitionOut** validator finds activity conditions with no exit transitions.

**Validation summary**

- **Risk**: Activity conditions might not transition to the next activity, which could cause the workflow to hang.
- **Severity Level**: Warning
- **Valid Result**: Valid
- **Valid Message**: All conditions have transitions.
- **Invalid Result**: Invalid
- **Invalid Message**: This workflow contains <condition count> activity conditions without an output transition.
- **Suggested Action**: If this is a conscious design decision, there is no corrective action. Otherwise, find the condition cited in the validator and add an appropriate transition to the next activity.
- **Publishable**: Yes
- **Runnable**: Yes
- **Related Information**: None

**Troubleshooting**

Design choices made when creating a workflow on the canvas might legitimately use an activity without an exit condition. In the first example, the **Notification** and **Timer** activities both execute at the start of the workflow. The **Timer** is the entity that decides when the workflow ends. In this situation, executing the **Notification**, but not transitioning away, keeps the design simple and adds no risk. The validator finds and reports the missing transition from the **Notification** activity as a **Warning** that the designer can ignore.
In the second example, the Notification activity has no exit transition. The designer missed this because of the layout. The transition from the Timer activity passes behind the Notification activity and appears to connect the exit from the Notification activity to the End. In workflows with more than 10 or 15 activities, it might be difficult to see all the transitions clearly. This workflow's designer intended for the Notification activity to transition to the End.

This validator directs the designer to the specific activity and condition that does not have an exit transition. The designer then makes the decision whether or not to respond to the warning.

The ValidateTransitionIn validator finds activities that do not have inbound transitions and cannot execute in the workflow.

Validation summary

- **Risk:** Activities that do not have inbound transitions have no means of being executed in the workflow. If other logic builds from these activities, the workflow could hang, with no means of moving forward.
- **Purpose:** Find activities that do not have inbound transitions.
• **Severity Level:** Warning.
• **Valid Result:** Valid.
• **Valid Message:** All activities in this workflow have at least one inbound transition.
• **Invalid Result:** Invalid.
• **Invalid Message:** This workflow contains <activity count> activity conditions without an input transition.
• **Suggested Action:** Either remove the activities to reduce confusion and make the workflow easier to understand or provide the appropriate inbound transition.
• **Publishable:** Yes
• **Runnable:** Yes
• **Related Information:** None

**Troubleshooting**

Although the activities detected in this validator do no harm to the execution of the workflow, the designer needs to know that there are activities on the canvas that cannot execute and serve no purpose, particularly in a production system. This error is typically caused by a visual misinterpretation of the drawing.

This example workflow appears to be perfectly valid. Under closer inspection, however, we see that the transition from **Set Values** does not stop at **Approval - User** (there is no arrow end). Instead, that transition goes directly to **End**. As a result, **Approval - User** cannot execute. Because there is an activity in the workflow based on the approval's condition routing, it appears that the designer intended for the approval to execute and that a correction is needed.

This validator directs the designer to the specific activity and condition that has no inbound transition. The designer should establish a transition or remove the activity.
**ValidateDanglingTransition**

The **ValidateDanglingTransition** validator finds and reports any transitions that do not terminate on an activity.

**Note:** These transitions are not drawn on the workflow canvas, but are still present in the database.

**Warning:** This is a critical error that prevents a workflow from running.

**Validation summary**

- **Risk:** A workflow with dangling transitions will silently hang a workflow with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Valid Message:** Valid
- **Invalid Result:** Invalid
- **Invalid Message:** Invalid
- **Suggested Action:** Remove or connect the offending transition. Get the source activity name from the validation report details and resolve the issue. Then, run the validation again to test your changes.
- **Publishable:** No
- **Runnable:** No
- **Related Information:** None

**Troubleshooting**

On rare occasions, the destination of a workflow transition becomes null. The workflow canvas shows no evidence of the transition, but at run time, the workflow hangs when it encounters one of these dangling transitions. If the **ValidateDanglingTransition** validator reports this condition at publishing time, it blocks the publication action until the issue is resolved. If this condition is detected on a runtime check, the workflow is not allowed to execute against a current record’s transaction. Instead, the system adds a critical log entry detailing the activity with the faulted transition to the current record’s workflow context. To enable the workflow to execute on the next appropriate transaction, remove the faulted transition from the workflow model.

To find and remove the faulted transition:

1. Make note of the workflow version and activity that contains the faulted transition as indicated in the validator details.
2. Navigate to **Workflow > Administration > Workflow Version**.
3. In the list of workflow versions, select the workflow that has the faulted transition.
4. On Workflow Version form, add the workflow activities related list. Click the menu icon, select **Configure > Related Lists**, move **Workflow Activity-->Workflow Version** from the **Available** list to the **Selected** list, and click **Save**.
5. In the **Workflow Activities** related list, select the activity cited in the validator.
6. In the Workflow Activity form, view the **Workflow Transitions** section or tab and identify the transition in that list that has no value or a null value in the **To** column.
7. Delete this transition.
8. Return to the workflow version and re-run the validation check.

The Critical warning should disappear. The workflow should execute as expected on the next appropriate transaction.

**ValidateSubflows**

The **ValidateSubflows** validator detects any workflows included as subflows that are either inactive, deleted, or not available as a published workflow for the current user.

Any of these conditions cause the workflow to hang when the workflow activity in the main flow is encountered.

![Warning: This is a critical error that prevents a workflow from running.]

**Validation summary**

- **Risk:** A parent workflow that transitions to a deleted subflow hangs indefinitely, with no recovery options.
- **Severity Level:** Critical
- **Valid Result:** Valid
- **Valid Message:** This workflow contains `<count>` valid subflows.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow contains `<invalid count>` invalid subflow(s) of `<total subflow count>` total subflows.
- **Suggested Action:** Remove the link in the parent workflow to the questionable subflow, examine the subflow to ensure that it is valid and published, or that it is checked out to the current user. After making the correction to the state of the subflow, run the validation again to test your changes.
- **Publishable:** No
- **Runnable:** No
- **Related Information:** Workflows used as subflows

**Troubleshooting**

When a workflow runs, regardless of whether it is a subflow or a main flow, the script engine determines which version of a workflow should execute, given the current user and workflow conditions. When a workflow is checked out by the same user who is running the workflow, the checked out version is the version that executes. If the user is not the same person who has the workflow checked out, the published version of the workflow executes. If there is no published workflow, no workflow runs.

One scenario addressed by the **ValidateSubflows** validator is when a workflow:

- Is checked out to User A.
- Is a subflow in a parent workflow being run by User B.
- Has no published alternative to the subflow being run by User B.

When this occurs, the parent workflow runs to the execution of the unpublished subflow and then hangs at that activity, with no means to transition forward. Main flows that encounter this condition in a subflow are not permitted to execute against a current record’s transaction. Instead, a critical log entry detailing the subflow’s state is added to the current workflow’s Workflow Context record. To correct the problem, remove the subflow from the main flow, or...
publish the subflow so it is available to User B. This allows the workflow to execute on the next appropriate transaction.

Another scenario addressed by the ValidateSubflow validator is when a workflow:

- Is a subflow in a parent workflow being run by any user.
- Has no published alternative to the subflow, because the workflow has been deleted or all versions of the workflow are unpublished or inactive.

**Note:** You cannot delete a from a list or form workflow that is a subflow. However, you can create one of these unstable conditions with advanced scripting, SQL options, or incomplete update sets that contain main flows, but not the referenced subflows. When troubleshooting a workflow that triggered this validator, consider the history of the subflow while assessing the error condition.

ValidateScriptForCurrentDotUpdate

The ValidateScriptForCurrentDotUpdate validator finds workflow activities with scripts that use the current.update() function.

Calling current.update() causes significant performance delays in transaction processing and might cause an instance to hang.

**Validation summary**

- **Risk:** At best, a workflow that uses current.update() in scripts experiences degraded performance. In the worst case, the workflow enters an infinite, recursive loop that crashes the server.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** The JavaScript in this workflow has no instances of 'current.update()'.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow uses 'current.update()' in <count of current.update references> JavaScript statements.
- **Suggested Action:** Remove current.update() from the activity scripts cited by this validator. Workflows execute within a transaction, and current is updated, or possibly inserted, at the end of the transaction, as appropriate. There is no need to explicitly update the record during the transaction.
- **Publishable:** Yes
- **Runnable:** Yes

**Problems with current.update() in workflow scripts**

A workflow initiates execution in one of these ways:

- **Script Engine:** If a workflow is assigned to a specific table, and given a run condition, the workflow runs on INSERT.
- **Script:** Any business rule, script include, background script, or client script can initiate a workflow using the workflow script include and calling startFlow().

The workflow engine initiates a workflow based on the matched criteria of the current record being inserted. The transaction for current is managed by the script engine and not the workflow. Workflows that progress on the update() of the current record are not invoked via the workflow engine, but as a call from either a client script or business rule. In either case, the script engine is
invoked, and the current record is put in memory. Edits and modifications to any current fields are made and are available to other activities and scripts that are executed in the same transaction.

When appropriate, other engines that run in sequence with the workflow engine, such as the business rule engine or field normalization, are invoked against the same current record transaction. Any changes made to current through these scripts and activities modify the record in memory. These changing values are available for reference in any other transactions called from activities and scripts in the same INSERT transaction. When all expected changes are executed, the current record is inserted.

When one of these scripts calls `current.update()` on a record that has yet to be inserted, the action forces an unnecessary and error-prone database transaction. If a record is not yet in the database, it cannot be updated. Business rules that trigger on `update()` on a record that is in the process of being inserted can cause a very unstable and potentially infinite looping condition.

### Troubleshooting

This validator detects the use of `current.update()` in any of the editable script fields. Do not call `current.update()` from within a workflow script. In the event of an INSERT or UPDATE of current, the changes made to current are available to all scripts executing in the same transaction, and the script engine stores all changes in the database. Leave the update of current to the engine. Use the scripts only for setting and referencing the current field values.

**ValidateLowestCommonTable**

The **ValidateLowestCommonTable** validator reports the lowest table in the Glide hierarchy that the workflow uses.

For example, the Requested Item (sc_req_item) table is the lowest table in a workflow containing a Catalog Task activity. This information is significant to a designer who wants to change the table against which an existing workflow runs after adding activities to the canvas.

Note: This validator provides information only. It does not indicate an error or warning condition.

### Validation summary

- **Risk:** This validator informs only and has no risk associated with it.
- **Severity Level:** Data/Information
- **Valid Result:** Valid
- **Valid Message:** The lowest common table in this workflow is <<table_name>>.
- **Invalid Result:** N/A (informational only)
- **Invalid Message:** N/A (informational only)
- **Suggested Action:** None
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities

**ValidateTableChange**

The **ValidateTableChange** validator reports any activities in the workflow that are invalid given the table associated with the workflow version.

For example, a workflow version that is associated with the Change Request (change_request) table but has a Catalog Request activity on the canvas is invalid, since the activity is not compatible with the selected table.
Validation summary

- **Risk**: If the current record at runtime does not originate from the table specified by the lowest common table, the activities for the lowest common table cannot set specific values.
- **Severity Level**: Warning if the table that is associated with a workflow is higher in the table hierarchy than the lowest common table required for the workflow activities.
- **Valid Result**: Valid
- **Valid Message**: All activities are valid for the newly selected table
- **Invalid Result**: Invalid Activity
- **Invalid Message**: This workflow contains <count of invalid activities> invalid activities for the newly selected table.
- **Suggested Action**: Make one of these changes:
  - Change the workflow to not require the activities associated with the lowest table reported.
  - Modify the workflow to use a table that contains the lowest common table in its hierarchy.
  - Ensure that the current record meets the requirements of the at-risk activities.
- **Publishable**: Yes
- **Runnable**: Yes
- **Related Information**: Workflow activities

Troubleshooting

Navigate to **Workflow > Administration > Activity Definitions**. Note the **Table** column in the list. Each activity that is not global is associated with a table.

When you select a table in the Workflow Properties form, the activity menu presents only activities that are compatible with the selected table. Associating a table with a workflow activity enables the system to make certain decisions about the activity that affect value comparison, condition routing, or the setting and getting of field values in the current record.

When a workflow is set to the Global (global) table, it is possible that the process executing the workflow ensures that the current record meets the requirements of the activities identified by this validator. In that case, the activity still works as expected. If that assurance cannot be guaranteed by the user process, do not use the activity identified by the validator without assigning a table that meets the requirements of all the activities on the canvas.

This validation check ensures that the table specified by all the activities in a particular workflow is included in the hierarchy of the table selected for the workflow.

The **ValidateParentFlow** validator reports any workflows that use the workflow as a subflow.

Validation summary

- **Risk**: There is no risk in a workflow being a subflow. This is only a warning that other workflows are at risk from dramatic changes to a subflow.
- **Severity Level**: Warning
- **Valid Result**: Valid
- **Valid Message**: Currently <workflow version name> is not a subflow.
- **Invalid Result**: None
- **Warning Message**: This workflow version (<workflow version name>) is required as a subflow in <workflow version count> other workflows.
• **Suggested Action:** Exercise caution when modifying things like input parameters and return values to assure that parent workflows are not adversely affected.

- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflows used as subflows

## Troubleshooting

The system warns the workflow designer at publishing time and during validation that a workflow is a subflow. This warning reminds the designer that changes to the current workflow have the potential to affect workflows cited in the validation report or other workflows already running in production. Regardless of how simple the change to a workflow that is a subflow, thoroughly test all parent flows cited in this validation report before publication.

When a workflow is a subflow, changes that can cause it to become invalid include:

- Changing the data types of *input variables*. Verify that all parent workflows cited in this validation report can pass the correct value type.
- Adding input variables. Verify that all parent workflows cited in this validation report are able to pass all variable values into the subflow.
- Changing or removing the return value of a workflow. Verify that any changes to the return value of a workflow are compatible with the requirements of all the parent flows.
- Changing the table on which the workflow runs. Verify that the table selection is compatible with all parent flows.

**Note:** To delete a workflow that is a subflow, first remove the dependency by removing the subflow from all parent flows cited in this validation report. After the dependencies are cleared, a user with the proper role can delete the subflow.

---

### ValidateSingleEnd

The **ValidateSingleEnd** validator finds and identifies multiple *End* activities in a single workflow.

Multiple *End* activities in a workflow might be intentional and have no affect on the workflow, or might be a mistake that the designer needs to correct.

## Validation summary

- **Risk:** If the execution paths to the *End* activities are not mutually exclusive, then the first *End* encountered completes the workflow and cancels all other executing activities.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** This workflow contains 1 End activity.
- **Invalid Result:** Invalid Activity
- **Invalid Message:** This workflow contains <count of ends> End activities.
- **Suggested Action:** Remove extraneous *End* activities that are not intended as part of the design.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** None
Troubleshooting

As soon as an **End** activity is encountered in the workflow, the workflow completes even if there are other viable execution paths leading to a second **End** activity that is still executing. Those executing activities are canceled as part of the **End** activity’s clean up actions. Therefore, the results of designing workflows with multiple **Ends** must be carefully considered.

In the case of large workflows, it is often more intuitive to read the workflow when there are multiple **End** activities. In the following example, the paths to the two **Ends** are mutually exclusive execution paths. If this was a large workflow, with many activities between **Branch** and the second **End**, the value of the multiple ends becomes apparent. Tracing a **No** response from **User is invalid** to a single **End** behind 33 other activities would be significantly more difficult. There is no risk in this workflow design because there is no reason for other activities to execute if the **End** after the **Notification** activity terminates the workflow.

Mutually exclusive execution paths

The next example has multiple **End** activities in execution paths that are not mutually exclusive. A **Yes** response from **User is valid** causes the **Set Values** activity to finish immediately. By reaching its **End** activity first, this execution path cancels the **Approval for Apps** and the **DB Task** activities, which might not be the desired outcome. If the paths are all expected to complete before **End**, the activities should come to a **Join** (as in the previous example) that transitions to a single **End**.
Mutually inexclusive execution paths

Note: To add the second End, right-click to copy the original End activity and paste it onto the canvas. In most cases, a single End is the best and most reliable way to ensure that all activities expected to execute prior to workflow completion, do so successfully.

ValidateUpdateSetDependencies
The ValidateUpdateSetDependencies validator identifies all the subflows called in the current workflow and determines if any of those subflows are being edited in a different (in progress) update set.

This warning informs the user that this workflow and one or more of its dependencies are being actively modified in a way that will not deploy concurrently to another instance without additional effort.

For information about update sets, see Create and select an update set.

Validation summary

- Risk: If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as to common or expected values, can make the two workflows incompatible.
- Severity Level: Warning
Valid Result: Valid
Valid Message: There were no Update Set dependency issues found.
Invalid Result: Invalid
Invalid Message: This workflow has dependent workflows that are in a different update set.
Suggested Action: Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:

- Ensure that all update sets migrate concurrently.
- Prior to deploying the main flow update set, merge the dependencies into one update set before completing that update set.

Publishable: Yes
Runnable: Yes
Related Information: Workflow movement with update sets

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

- A published subflow is in a different update set than the parent workflow and that update set is In progress.
- A subflow is checked out by another user, who is working in a different update set than the current user.

Note: This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all subflows being used by the current workflow that are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

User A:
1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the String type in Workflow A to a Reference/User type.
4. Publishes Workflow A, causing an entry into Update Set A.

User B:
1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.
**Risks**

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

**Possible solutions**

**Solution 1**

Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.

1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   - This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances.

**Solution 2**

Move dependent workflows between update sets.

1. Identify the update set containing the main workflow to be migrated.
2. Navigate to **System Update Sets > Local Update Sets**.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the **Customer Updates** related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the **Update set** field.
   - If this field is not on the Customer Update form, configure the form and add the field.
6. Click **Update**.
   - The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.

**ValidateUpdateSetParentDependencies**

The **ValidateUpdateSetParentDependencies** validator identifies all the workflows that call the current workflow as a subflow and determines if any of those parent workflows are being edited in a different update set that is in progress.

This warning informs the user that this workflow and one or more workflows that depend on this workflow are being actively modified in a way that will not deploy concurrently to another instance without additional effort.
Validation summary

- **Risk:** If a parent workflow is edited in one update set and its dependent subflow is edited in another, the two workflows might not be compatible when moved to a different instance. Making independent changes, such as editing common or expected values, can make the two workflows incompatible.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Update Set dependency issues found.
- **Invalid Result:** Invalid
- **Invalid Message:** This workflow has dependent workflows that are in a different update set.
- **Suggested Action:** Modify and deploy both workflows in the same update set. If you must modify dependencies in separate update sets, use one of these methods:
  - Ensure that all update sets migrate concurrently.
  - Prior to deploying the main flow update set, merge the dependencies into one update set before setting that update set to complete.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow movement with update sets

Troubleshooting

A workflow is added to an update set only when the workflow is published. This validator issues a warning when either of the following conditions exist:

- A published subflow is in a different update set than the parent workflow and that update set is In progress.
- A subflow is checked out by another user, who is working in a different update set than the current user.

**Note:** This validator does not look for update sets that have been closed. It looks only at update sets that are In progress or at the update sets of all parent workflows that call the current workflow and are checked out to users who are working in a different update set.

Example

Following is an example of an at-risk development scenario in which two users create dependencies between workflows in different update sets.

**User A:**
1. Sets Update Set A to the current update set.
2. Checks out Workflow A.
3. Changes the return value of the **String** type in Workflow A to a **Reference/User** type.
4. Publishes Workflow A, causing an entry into Update Set A.

**User B:**
1. Sets Update Set B to the current update set.
2. Checks out Workflow B.
3. Includes Workflow A as a subflow.
4. Uses the user reference return value from Workflow A as an approval assignment.
5. Publishes Workflow B, causing an entry into Update Set B.

Risks

- User B moves Update Set B to a different instance that has an older version of Workflow A. The return value is not a user reference, which causes the outcome of Workflow B to be different than it was when tested in development.
- User B moves Update Set B to a new instance that does not have a version of Workflow A. Workflow B experiences a validation failure at runtime and cannot execute. A log entry is added to the workflow log of the current record.

Possible solutions

Solution 1
Migrate the parent workflow and all dependent workflows to a new instance together using the same update set.
1. Set the update set to the one you want to migrate to new instances.
2. Check out and republish the workflows that need to be included.
   - This action forces an entry into the current update set.
3. Complete the update set with all dependencies.
4. Follow standard procedures for migrating update sets to local instances. For information about update sets, see System update sets.

Solution 2
Move dependent workflows between update sets.
1. Identify the update set containing the main workflow to be migrated.
2. Navigate to System Update Sets > Local Update Sets.
3. Find and select the update set that contains the dependencies to the main workflow.
4. In the Customer Updates related list, select the workflow version of the subflow you want to move.
5. Select the update set containing the parent workflow in the Update set field.
   - If this field is not on the Customer Update form, configure the form and add the field.
6. Click Update.
   - The base system moves the dependent subflow to the update set selected.
7. Repeat steps 4-6 to add additional dependent subflows to the parent flow update set.
ValidateInputVarUpdateSetDependencies

The ValidateInputVarUpdateSetDependencies validator examines update sets to ensure that workflow input variables for a given workflow have not been deleted in different update sets than those currently In progress.

Validation summary

- **Risk:** Workflows and their input variables are not moved together in a single update set. The deletion of input variables is captured in a different update entry. If these two entries are not in the same update set, the workflow execution can be unstable.
- **Purpose:** Determine whether input variables that belonged to this workflow were deleted in a different update set.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** There were no Input Variable Update Set dependency issues found.
- **Invalid Result:** Invalid
- **Invalid Message:** There are input variables that have been deleted and logged in a different update set.
- **Suggested Action:** If the deletion is not intended to be separate from the workflow, ensure that both update sets are committed concurrently to the new instance, or merge both payloads into a single update set.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow movement with update sets

Troubleshooting

Workflow input variables get individual entries in the Customer Update related list in the current user's update set. This validator reports to the user when workflow input deletions have happened in an update set other than the current user's update set.

Follow the instructions for Input variable removal when the validator issues this warning.

ValidateWorkflowEndStages

The ValidateWorkflowEndStages validator checks that in workflows with stages, the end activity of the workflow has a stage named Complete or Completed.

If the workflow has stages associated with it, but does not have the completed stage on the end activity, then the stage indicator will not show that the workflow completed.

Validation summary

- **Risk:** The stage indicator will not show the workflow is completed.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow end stages are valid.
- **Invalid Result:** invalid
- **Invalid Message:** End activity A found with invalid stage 'S.'
- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes
• Related Information: Workflow activities

Troubleshooting

Check the workflow for an end activity. Ensure that this activity assigns a stage named Complete or Completed.

ValidateWorkflowStageColumn
The ValidateWorkflowStageColumn validator detects and reports when the stage field (stage column) for a workflow is not correct or is unusable.

Validation summary

• Risk: The stage indicators may not display appropriate information.
• Severity Level: Warning
• Valid Result: Valid
• Valid Message: Workflow stage values are valid.
• Invalid Result: Warning
• Info Summary: Stage warnings found.
• Invalid Messages:
  • Table T does not have a column named C.
  • Workflow for table T has stages, but no stage column.
  • Table T has a stage column ‘C,’ but no stages are set by activities.
  • Workflow on table T has stage column ‘C’ that is not type=workflow.

• Suggested Action: If this is not by design, make the appropriate changes.
• Publishable: Yes
• Runnable: Yes
• Related Information: Workflow activities, Workflow stages

Troubleshooting

To check the stage column:
1. Open and check out a workflow.
2. Open the workflow version properties dialog by clicking the menu icon and selecting Properties.
3. View the Stages tab or section.
4. Check that the assigned stage column is actually a column in the table to which the workflow is associated.
5. Check that the column is type=workflow.

Tip: Stage columns should not be choice lists. If they are, the list appears read-only in form views, since changing that column value outside the workflow engine does not ensure safe tracking of stage states.

ValidateWorkflowStateValues
The ValidateWorkflowStateValues validator checks a number of stage aspects in workflow activities for correctness.
This validator has multiple possible error messages.

**Validation summary**

- **Risk:** The stage indicators may not display appropriate information.
- **Severity Level:** Warning
- **Valid Result:** Valid
- **Valid Message:** Workflow stage values are valid.
- **Invalid Result:** invalid
- **Warning summary:** Stage warnings found.
- **Invalid Messages:**
  - Stage with empty name is not allowed.
  - Stage with empty value is not allowed.
  - Cannot have more than one stage with the same name: x.
  - Cannot have more than one stage with the same value: y
- **Suggested Action:** If this is not by design, make the appropriate changes.
- **Publishable:** Yes
- **Runnable:** Yes
- **Related Information:** Workflow activities

**Troubleshooting**

Use the following procedure to troubleshoot this validator:

1. Open and check out a workflow.
2. Open the list of stages for the workflow by clicking the menu icon and selecting **Edit Stages**.
3. Check the names and values.
   
   Ensure that the names and values are unique and are not empty.
4. If the same stage name or value appears more than once, remove one of the rows. It is then very important to go through the workflow and reassign stages in the activities that used the removed stage.
Workflow Stages

Validate Workflow State Values

Tip: Make a list of which activities assign which stages.

Workflow concepts

You can do many things using the Workflow Editor.

- Modify core activities and exit conditions.
- Create custom activities and reuse the data for other workflows.

See Orchestration activity designer.
- Download activity packs from the ServiceNow Store and create packs for upload.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
- Edit workflows graphically.
- Define transitions between workflow activities.
- For the table that corresponds to the workflow, customize business rules.
- Summarize workflow progress through stages.
- Validate workflows to identify potential problems.
- Publish workflows for other users.
- Edit multiple tables without needing to directly modify them.

**Workflow versions**

To prevent users from making changes to a workflow that affect other users of the system, workflows must be checked out before they can be edited.

Only one user can check out a workflow at a time. When a workflow is checked out, changes apply only to the user who has the workflow checked out. Other users can continue to use the published workflow. After the changes are complete, the workflow can be published so that it is available to all users.

**Note:** Because each workflow has a unique sys_id, different workflows can have the same name. This is typically expected in a domain-separated environment where users in different companies cannot see each other's workflows because they are in different domains. However, this can lead to confusion in other environments. In general, give each workflow a unique name to prevent workflow designers from making changes to the wrong workflow.

When a new version of an existing workflow is published, the changes are not applied to running workflow contexts. Any currently running workflow context continues using the workflow version that was available when the workflow started. The next time the workflow runs, it uses the updated, published version.

**Workflow scope**

Workflow application scope determines the access that an application has to the information in a workflow, specifically to the data contained in the activities in that workflow.

When a workflow is created, it inherits the application scope from the gear menu for the logged in user. This scope cannot be changed in the Workflow Editor. When the workflow executes, it runs in this scope and can only be called from a different application if the workflow’s accessibility setting permits access to all scopes (public). Otherwise, the workflow’s application scope is private to the application.

**Note:** Any script that is created in the Workflow Editor, such as an advanced script in an If activity, runs in the scope of the workflow. All core activities provided in the base system or for Orchestration run in the scope of the workflow.

Custom activities run in their own scope, even if it is different from that of the workflow. The scope of a custom activity can be private or public. Any script that runs inside a custom activity with a scope can only access outside artifacts that are within the scope of that activity or artifacts that are configured to run in any scope. Conversely, an outside artifact can only access the script inside that private activity if the outside artifact is running in the same scope. Activities with public scopes can interact with outside artifacts in any application scope.

You can use private activities as part of a workflow that has a public application scope. These activities are protected from reaching outside of the workflow or from being reached from outside

the workflow. For details about setting application scoping for custom activities, see the field description table for the appropriate activity template.

**Note:** Custom activities uploaded to the ServiceNow Store must be configured as accessible to all application scopes.

### Workflow scope restrictions

There are some restrictions to public and private application scopes.

During runtime, publicly scoped workflows can access other application resources, as long as these resources are set to be accessible to all application scopes. Privately scoped workflows in a private application scope can only access resources private to its scope. Due to scope access boundaries, any privately scoped workflows that make calls out to other scoped resources fail with either an exception or a hung activity while waiting for returned results. This occurs when making calls to these common global resources:

- ECC queues
- Tasks
- Approvals
- Events
- SLA timers
- Timers
- Script includes
- Business rules
- Workflow APIs

As you design workflows, validate the visibility and accessibility of all resources prior to deployment.

See *Application scope*.

For information on how to configure the scope for a workflow, see *Workflow properties*.

### Domain separation and Workflow

This is an overview of domain separation and the Workflow application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: Standard**

- Includes *Basic* level
- Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another. Business logic:
Overview

When domain separation is enabled, workflows and workflow activities inherit the domain of the user who publishes or creates them.

How domain separation works in the Workflow application

While workflows are managed by multiple tables, only the following tables are used for domain separation features:

- **Workflow (wf_workflow)** and **Workflow Version (wf_workflow_version)**: used for delegated administration or process separation.
- **Workflow Context (wf_context)**: used for data separation.

**Note:** The Workflow Version table (wf_workflow_version) table does not contain a domain field; Workflow Version records inherit their domain from the parent Workflow record.

The Workflow Editor displays a workflow's domain in the title bar after the workflow name.

Workflows and delegated administration

Delegated administration allows child domains to inherit workflows from higher up the domain hierarchy and to override them with domain-specific versions if necessary.
Workflow and delegated administration

Workflow records in the Workflow (wf_workflow) and Workflow Version (wf_workflow_version) tables are considered processes. A user in a child domain may check out but not copy a workflow from a parent domain. When a user in a child domain checks out a workflow from a parent domain, the system creates a version of the workflow in that user’s domain. This new version is a unique record in the Workflow (wf_workflow) table. After the user publishes this new workflow, other users
in the child domain use the new workflow, which overrides the workflow from the parent domain. The original workflow in the parent domain is no longer visible to users in the child domain.

For example, a managed service provider (MSP) hosts ITSM services for several companies, including ACME and Initech, on a single instance. As administrators, the MSP creates a Change Request - Emergency workflow that applies to all domains because it was created in the TOP domain, which is the highest domain in the domain hierarchy. This workflow overrides the global Change Request - Emergency workflow and specifies that emergency change requests require approval from the CAB approval group. Because of delegated administration, every domain in the hierarchy sees and uses this workflow. Now suppose the ACME domain requires a different approval policy where emergency change requests require approval from the emergency CAB approval group. The MSP creates another version of the Change Request - Emergency workflow in the ACME domain. This workflow overrides the version in the TOP domain and only applies to users in the ACME domain.

Workflow permissions

When a user starts a new workflow, the workflow runs with that user's domain and credentials. The workflow preserves a user's domain and credentials until an activity causes the workflow to wait, such as an approval activity waiting for approval or rejection. When the stopped workflow resumes, such as when a user approves a request, the workflow uses the credentials of the approving user, but continues to run within the domain of the original user.

Workflows and data separation

Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain.
Workflow and data separation

Workflow records in the Workflow Contexts (wf_contexts) table are considered data. Data separation restricts workflow contexts to users who are either in the same domain of the workflow or are members of a parent domain. While a user in a parent domain can see running workflows...
in a child domain, a user in a child domain cannot see running workflows in a parent domain. If necessary, administrators can use visibility or contains domains to expand who can see domain-specific data.

For example, when an ACME user requests something from the service catalog, a Service Catalog Request workflow context is created in the ACME domain. Similarly, a service catalog request from an Initech user creates a workflow context in the Initech domain. An MSP user in the TOP domain can see both workflow contexts because it is the parent domain for both the ACME and Initech domains. However when an ACME or Initech user logs in, data separation prevents them from seeing each other’s service catalog requests. This is expected behavior because each workflow context contains data specific to that domain, such as the item requested and the request’s approval history.

**Workflow engine operation order**

The workflow engine runs in a predefined order relative to business rules and database operations. It caches commonly-used published workflows to improve performance.

The *Run after bus. rules run* workflow property defines if a workflow is **Default** or **Deferred**.

The diagram below shows the workflow engine order of operations and when Default and Deferred flows are executed. For a more general overview of engine operation order, see [*Execution order of scripts and engines*](#).
Before business rules (order <1000)
Do not use current.update() here

Default workflows
Do not use current.update()

Before business rules (order >=1000)
Do not use current.update()

Database operation (insert, update, delete)
The current record is inserted or updated at the end of the database operation.

After business rules (order <1000)
Use current.update() if there is no deferred workflow

Deferred workflows
Do not use current.update()
Workflow caching

The workflow engine caches commonly-used published workflows to improve performance. Caching significantly reduces the number of database queries per workflow. By default, the engine caches up to 300 unique workflow versions. Caching very large workflows may reduce this number as the cache size cannot exceed the Java Virtual Machine (JVM) heap size.

To change the maximum number of cached workflow versions, navigate to Workflow > Administration > Properties and modify the value of the The max number of models that will be concurrently held in the LRU cache (glide.workflow.model.cache.max) property. You must restart the instance to apply this change.

Workflow tables

For full flexibility, workflows store information over a number of different tables. Usually tables containing workflow information are not edited one-by-one. Instead, use the Workflow Editor to edit workflows. The following lists are provided for reference purposes.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflows</td>
<td>A renderer widget for a stage column. Stage renderers are written in Jelly as a UI Macro. The default is Workflow-Driven; it covers most workflow related stage scenarios.</td>
</tr>
<tr>
<td>Column Renderer (column_renderer)</td>
<td>Tracks different versions of element definitions (wf_element_activity).</td>
</tr>
<tr>
<td>Version (wf_versionable)</td>
<td>The master records of workflows.</td>
</tr>
<tr>
<td>Workflow (wf_workflow)</td>
<td>History of workflows run and the triggering record. Workflow Binding records prevent the system from running workflows again when the associated Workflow Context record has been deleted.</td>
</tr>
<tr>
<td>Workflow Binding (wf_workflow_binding)</td>
<td>Individual instances of a workflow being used.</td>
</tr>
<tr>
<td>Workflow Context (wf_context)</td>
<td>Synthetic “current” records for workflows that run on Global.</td>
</tr>
<tr>
<td>Workflow Execution (wf_workflow_execution)</td>
<td>Connections of workflows to subflows.</td>
</tr>
<tr>
<td>Workflow Instance (wf_workflow_instance)</td>
<td>Particular versions of a workflow, either published versions or versions that have been checked out.</td>
</tr>
<tr>
<td>Workflow Version (wf_workflow_version)</td>
<td>Custom activity definitions.</td>
</tr>
<tr>
<td>Activity Designer (wf_element_activity)</td>
<td>Variables for activities.</td>
</tr>
<tr>
<td>Activity Variables (wf_activity_variable)</td>
<td>Activities as they are being used in workflows.</td>
</tr>
<tr>
<td>Workflow Activity (wf_activity)</td>
<td>Definitions of activities that can be used in a workflow.</td>
</tr>
<tr>
<td>Workflow Activity Definition (wf_activity_definition)</td>
<td></td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Workflow Executing Activity (wf_executing)</td>
<td>Individual instances of activities being performed in active contexts.</td>
</tr>
<tr>
<td>Workflow components</td>
<td></td>
</tr>
<tr>
<td>Element Provider (wf_element_provider)</td>
<td>Template definitions for custom activities.</td>
</tr>
<tr>
<td>Group approval (sysapproval_group)</td>
<td>Group-level approvals.</td>
</tr>
<tr>
<td>Variable (item_option_new)</td>
<td></td>
</tr>
<tr>
<td>Workflow Condition (wf_condition)</td>
<td>All of the defined conditions in workflows.</td>
</tr>
<tr>
<td>Workflow Element Definition (wf_element_definition)</td>
<td>Parent table for activity definitions.</td>
</tr>
<tr>
<td>Workflow Estimated Runtime Configuration (wf_estimated_runtime_config)</td>
<td>Runtime performance data for completed workflows.</td>
</tr>
<tr>
<td>Workflow Queued Command (wf_command)</td>
<td>Temporary internal storage for workflows that are currently executing.</td>
</tr>
<tr>
<td>Workflow SC Variable (wf_variable)</td>
<td>The Service Catalog variables for a workflow.</td>
</tr>
<tr>
<td>Workflow Schedule (wf_workflow_schedule)</td>
<td>Definitions of the times to run specific workflows.</td>
</tr>
<tr>
<td>Workflow Transition (wf_transition)</td>
<td>All of the defined transitions in workflows.</td>
</tr>
<tr>
<td>History</td>
<td></td>
</tr>
<tr>
<td>Workflow Activity History (wf_history)</td>
<td>The history of executed activities.</td>
</tr>
<tr>
<td>Workflow Log Entry (wf_log)</td>
<td>All of the events and history of the workflow.</td>
</tr>
<tr>
<td>Workflow Transition History (wf_transition_history)</td>
<td>The history of executed transitions.</td>
</tr>
<tr>
<td>Stages</td>
<td></td>
</tr>
<tr>
<td>Stage Default (wf_stage_default)</td>
<td>Definitions of default stage fields for tables to use.</td>
</tr>
<tr>
<td>Stage Set (stage_set)</td>
<td>A named set of stages that can be used to populate workflow stages for multiple workflows.</td>
</tr>
<tr>
<td>Stage Set Entry (stage_set_entry)</td>
<td>The stages that belong to a named stage set.</td>
</tr>
<tr>
<td>Stage Set for Table (stage_set_table)</td>
<td>Defines a relationship of a stage set to a table so that the stage set can be used as the default stages when a new workflow is created for the table. This replaces the wf_default_stage table and is the view that shows when you click Default Stages (by table) in the menu.</td>

</tbody>
</table>

**Workflow administration**

Tailor workflows exactly the way you want them.
## Workflow roles

Certain roles are required to use workflows.

### Workflow roles

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity creator (activity_creator)</td>
<td>Creates and edits custom workflow activities, reuses custom activity data, and manages activity packs downloaded from the ServiceNow Store.</td>
</tr>
<tr>
<td>Web service administrator (web_service_admin)</td>
<td>Accesses and uses REST and SOAP messages in the Orchestration activity designer. Creates and edits custom activities that use the REST web service and SOAP web service templates.</td>
</tr>
<tr>
<td>Workflow administrator (workflow_admin)</td>
<td>Creates, edits, publishes, and deletes graphical workflows.</td>
</tr>
<tr>
<td>Workflow creator (workflow_creator)</td>
<td>Creates new graphical workflows.</td>
</tr>
<tr>
<td>Workflow publisher (workflow_publisher)</td>
<td>Publishes graphical workflows.</td>
</tr>
</tbody>
</table>

### Administering workflow contexts

The workflow context performs the activities and transitions defined in the workflow with the new record as current.

Workflow in ServiceNow names a running workflow a Workflow Context. The Workflow Context maintains the state of the overall process in the Workflow Context record. The Workflow Context maintains the state of the individual activities as they execute in a series of related lists. These lists maintain the state of currently executing activities, the result of finished activities, and the execution path the workflow took through the process model.

The Workflow Context canvas provides a visual representation of the execution path the workflow took through the process model. The state of each activity (finished, executing, cancelled, error)
is represented using the color palette. The executed paths are represented in the color blue; the non-executed paths are represented in grey. Active and historic workflow contexts, as well as the activities within them, can be viewed using the Live Workflows section of the Workflow application menu.

Viewing a workflow context

Workflow contexts can be found in two places:
- From the Workflow Context related link on the form of the task being powered by the workflow.
- By navigating to Workflow > All Contexts and selecting an active context.

Displaying workflow progress

Two related links on the Workflow Context form allow you to view the progress of a workflow in different formats.
- Show Timeline displays the workflow context as a timeline.
- Show Workflow displays the workflow context in the graphical Workflow Editor.

Graphical interface

To view the workflow context in the graphical Workflow Editor interface, click the Show Workflow link from either the workflow context record or the current record.
Show workflow

In the top right hand corner are two controls:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>🔄</td>
<td>Refreshes the workflow context.</td>
</tr>
<tr>
<td>🔄❓</td>
<td>Displays a key of the colors used in the workflow to denote the state of activities and transitions:</td>
</tr>
</tbody>
</table>
Execution order

View tooltip text in the workflow context graphical view to see the execution order of individual activities.

In Workflow > Live Workflows > Active Contexts or All Contexts, Open the context you want to examine. Click Show Workflow, and point to a finished or executing activity. The tooltip shows error data, execution time, and the order in which the activity executed in the workflow. Use this data to help troubleshoot activities in an error state.
Cancel a workflow

Canceling a workflow stops the workflow from executing and sets the workflow context State to Canceled. To cancel an executing workflow, you can use the cancelContext(context) script. You can define an on Cancel script to clean up unresolved workflow activities.

Canceling a workflow attempts to stop the workflow gracefully by injecting a cancel command into the workflow engine.

1. Navigate to Workflow > Active Contexts.
2. Select a workflow context record.
3. Select the Cancel related link.
   A confirmation window appears.

Execution order workflow
4. Click OK. The Wait for Cancel window appears. The workflow engine attempts to cancel the workflow gracefully.

5. Click Force cancel to interrupt the thread the workflow is actively executing or click Continue waiting to continue waiting for the workflow to cancel gracefully.
Warning: Whenever possible, allow a workflow to cancel gracefully. Forcing a workflow to cancel can leave related workflows and scripts in an unresolved state. You can use an on-cancel script to clean up unresolved artifacts from a cancelled workflow.

Cancel a workflow with the `cancelContext(context)` script
To cancel an executing workflow, you can use the `cancelContext(context)` script. This script can be useful in cases where a workflow must be canceled in response to an event or where a user must manually cancel a workflow.

For more information, see the API reference.

Define an on-cancel script
Canceling a workflow can leave records or scripts in an unresolved state. For example, canceling a service catalog workflow may leave catalog items in the requesting user’s cart. An administrator can specify an On-cancel script that runs when the workflow transitions to the Canceled state. This script can notify users, log information, or resolve the state of any scripts run within a workflow activity. The `sys_id` of the workflow context is available in this script using the `context_sys_id` variable.

On-cancel scripts run asynchronously from the global scope. Your instance workload determines when the system schedules and runs the on-cancel script.

Important: Since the system runs on-cancel scripts from the global scope, they cannot call or run scoped script includes.

1. Navigate to Workflow > Workflow Versions.
2. Select a workflow version that you have checked out.
   Workflow versions that are not checked out are not editable.
3. Edit the On-cancel script field.
   You may need to configure the form to add this field.
4. Click Update.

   This example script adds a comment to a Requested Item (sc_req_item) record indicating the workflow for that request has been canceled.

   ```javascript
   var grContext = new GlideRecord("wf_context");
   grContext.get(context_sys_id);
   var grReq = new GlideRecord("sc_req_item");
   // The current record may not exist, make sure it exists before modifying it.
   if (grReq.get(grContext.id)) {
     grReq.comments = "The workflow processing this item was Canceled. Contact your system administrator for further information."
     grReq.update();
   }
   ```

Scheduling a workflow
In addition to being run based on conditions, workflows can also be scheduled to perform at a particular time, similar to a scheduled job.
Scheduled workflows do not have a defined current record and do not run on specific records within a table. Due to this behavior, certain activities that depend on a current record, such as Create Task or Catalog Task are unavailable on scheduled workflows. If your workflow requires one of these activities, consider using a scheduled job that inserts a record to start the workflow instead of using a scheduled workflow.

To schedule a workflow, navigate to Workflow > Scheduled Workflows and click New. Populate the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the scheduled workflow.</td>
</tr>
<tr>
<td>Workflow</td>
<td>Select an existing published workflow to be triggered at the specified date, time, or interval.</td>
</tr>
<tr>
<td>Active</td>
<td>If selected, the scheduled workflow will be triggered at the appropriate time.</td>
</tr>
<tr>
<td>Application</td>
<td>Specifies the type of application, such as Global.</td>
</tr>
<tr>
<td>Run</td>
<td>A choice list to determine when the workflow should be triggered. Options are:</td>
</tr>
<tr>
<td></td>
<td>• Daily: At a particular hour every day.</td>
</tr>
<tr>
<td></td>
<td>• Weekly: On a particular day of the week.</td>
</tr>
<tr>
<td></td>
<td>• Monthly: On a particular day of the month</td>
</tr>
<tr>
<td></td>
<td>• Periodically: After every set duration.</td>
</tr>
<tr>
<td></td>
<td>• Once: At one specific date and time.</td>
</tr>
<tr>
<td>Time</td>
<td>For daily/weekly/monthly scheduled workflows, the time of day to run the workflow.</td>
</tr>
<tr>
<td>Day</td>
<td>For weekly scheduled workflow, the day of the week to run the workflow. For monthly scheduled workflows, the day of the month to run the workflow.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>For periodical workflows, the interval between workflows, beginning from the Starting date and time.</td>
</tr>
<tr>
<td>Starting</td>
<td>For periodical workflows, the first date and time to run the workflow. For scheduled workflows run once, the date and time to run the workflow.</td>
</tr>
</tbody>
</table>

**Workflow movement with update sets**

The system tracks workflows in update sets differently than other records because workflow information is stored across multiple tables.

Changes made to a workflow version are not added to the update set until the workflow is published, at which point the entire workflow is added into the update set. Update sets store workflows as a single Workflow (wf_workflow) record and only retain the latest version with the update type of Workflow.

For information about update sets, see System update sets.

**Workflow update set migration use case - simple**

Create a new workflow with no dependencies and then migrate the workflow in an update set.
1. User A selects Update Set A.
2. User A creates a new workflow called Workflow A.
3. User A publishes Workflow A.
   A customer update set record is added to Update Set A containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
4. User A completes Update Set A and migrates it to the production instance.
5. Update Set A commits successfully.
6. Workflow A works as expected.

**Workflow update set migration use case - subflow dependency (success)**
Successfully edit and migrate an existing workflow and its dependent subflow.
1. User A selects Update Set B.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.
   Assume that Workflow B was previously published and migrated to the production instance.
4. User A publishes Workflow A.
   A customer update set record is added to Update Set B containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
5. User A completes Update Set B and migrates it to the production instance.
6. Update Set B commits successfully.
7. Workflow A works as expected with Workflow B as a subflow.

**Workflow update set migration use case - subflow dependency (failure)**
Edit and migrate an existing workflow from a test instance to a production instance that fails to run on the production instance because of a missing dependent subflow.
1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B to Workflow A.
   Assume that Workflow B was previously published, but has not been migrated to the production instance.
4. User A publishes Workflow A.
   A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
   Notably absent from Update Set C is the subflow called Workflow B. Workflow B was published before User A selected Update Set C.
5. User A completes Update Set C and migrates it to the production instance.
6. Update Set C commits with warnings.
7. Workflow A is invoked on the production instance with the following results:
Workflow A fails the runtime validation check and is prevented from running on the production system. The system adds to the workflow context a workflow log entry detailing the cause of the failure, notably the absence of a dependent workflow.

To learn more about the validation checks on workflow dependencies and update sets see ValidateUpdateSetDependencies.

Workflow update set migration use case - subflow dependency (risk)

Multiple users migrate a workflow from a test instance to a production instance without proper coordination. This use case can succeed, but only when each user understands the dependencies and properly migrates the dependent parts of the workflow to the new instance.

This example does not represent an update set failure, although update sets are most often blamed in this use case. Validation increases the visibility of workflow dependencies across multiple update sets and provides designers with better information. In most cases, the warnings do not prevent an action, but only identify risk. The designer is responsible for taking action on advice given in the validation checks.

1. User A selects Update Set C.
2. User A checks out Workflow A.
3. User A adds a subflow called Workflow B that returns a User ID.
   
   **Note:** Assume that Workflow B was previously published and migrated to the production instance.
4. User A uses the return value of Workflow B to generate approvals.
5. User B selects Update Set D.
6. User B checks out Workflow B (the subflow in Workflow A).
7. User B modifies the return value of the workflow by changing it from a User ID to a String Message.
8. User A publishes Workflow A.
   
   **Note:** A dialog box displays warnings associated with Workflow A and encourages User A to validate the workflow before publishing.
9. User A cancels publishing and validates Workflow A.
10. User A is warned that Workflow B was modified by a user in a different update set.
11. User A ignores this warning and publishes Workflow A.
   
   **Note:** A customer update set record is added to Update Set C containing an XML payload, including the published Workflow A and all activity dependencies. The XML payload also contains the workflow input variables associated with the workflow.
12. User A completes Update Set C and migrates it to the production instance.
13. Workflow A is invoked on the production instance and runs successfully using the older version of Workflow B already on the system.
14. User B publishes Workflow B.

**Note:** User B is not warned of the Update Set C dependency, because the update set is no longer In progress. However, User B is informed via a dialog box that there are...
warnings associated with the workflow version and is instructed to validate Workflow B. If User B cancels publication and validates the workflow, User B is warned that there are workflows that use Workflow B as a subflow. Knowing the return value was changed, User B should test those workflows as well. See ValidateUpdateSetDependencies to understand the parameters of update set warnings.

15. User B finally publishes Workflow B.

**Note:** A customer update set record is added to Update Set D containing an XML payload, including the published Workflow B and all activity dependencies.

16. User B completes Update Set D and migrates it to the production instance.
17. Update Set D commits without warnings.
18. Workflow A is invoked on the production instance and fails to run successfully, because the return value of Workflow B no longer generates a User ID.

**Input variable movement**

You can add input variables to existing workflows and add them to update sets. When you submit the new variables, an entry is made into the current update set that reflects the addition of a variable to the Variables (var_dictionary) table. Unlike the workflow version that only writes to the update set when the workflow is published, the variables write individual update entries into the currently selected update set immediately upon submission.

**Input variable movement use case - two input variables**

An existing workflow already contains two input variables.

1. User A checks out the workflow.
2. User A adds two input variables.
   ServiceNow adds to the current update set one customer update record for each new variable.
   The current workflow now has 4 input variables: the two that were present prior to check out and the two new ones.
3. User A publishes the workflow.
   There are now three related customer update records: two for new variables, and one for the published workflow. The XML payload of the new workflow version now includes all input variable database entries. So while the two original input variables do not have individual customer update records, all four variables are migrated to the local instance with the payload of the newly published workflow version.
4. Verify variables included in a specific workflow.
5. User A completes the update set.
6. Adding Input Variables - Success
   User A migrates and commits the update set to a local instance where the original workflow version had previously been committed.
   - The two existing input variables are already present because of the earlier version.
   - The system adds the two new input variables when the user commits the update set.
   - The system preserves the two legacy input variables on the instance receiving the update set. The update set does not overwrite these variables.
The new published workflow version uses all four variables.
The user tests the new workflow version and it runs as expected.

**Verify variables included in a specific workflow**
You can verify the variables that are included in a specific workflow.

1. Navigate to **System Update Sets > Local Update Sets**.
2. Select the active update set.
3. Select the customer update entry for the workflow.
4. View the **XML Payload**.
5. Search for the name of one of the columns or search for var_dictionary.

There is one var_dictionary entry for each input variable.

**Input variable removal**
Deleting workflow input variables, like insert and update actions, creates a customer update record in a user's current update set.

These deletions migrate to a new instance with the update set, regardless of whether the workflow that owns the input variables is published in the same update set. Plan carefully and use caution when editing a workflow and selecting update sets.

**Input variable removal risk**
An existing workflow already contains two input variables.

1. The workflow was migrated to a production instance with the two variables.
2. On a development instance, User A selects Update Set A and checks out the workflow.
3. User A removes one input variable and all references to it in the workflow.

    The system enters into Update Set A one customer update record reflecting the deletion of the input variable. No record is added for the new workflow version which no longer depends on the input. This does not happen until the workflow is published.

4. User A continues working on other features in Update Set A that need to be moved to production.
5. User A completes Update Set A and migrates it to the production instance without publishing the workflow.

    The update set entry that deletes the workflow input variable now applies to the production instance. The prior version of the workflow is running on this instance and still references the missing variable.

**Input variable removal solution**
When editing workflows, particularly when deleting input variables, be sure to use a single update set for all variable editing and workflow publishing.

If necessary, merge the update set into a more general set targeted for deployment after the workflow is published. For information about update sets, see **System update sets**.

**Note:** If a workflow version is already running on a production system and input variables are deleted from a newer version, those deletions could affect transactions already running against the earlier version. Use extreme caution when deleting workflow input variables and plan the migration carefully.
Input variable removal prevention
Prior to publishing a workflow version, the system validates the workflow model to assist the designer in planning for deployment.

This validation warns of critical errors that can prevent a workflow from running successfully, but also warns of dependencies and conflicts in update sets. See ValidateUpdateSetDependencies for more details.

Avoiding duplicate workflows
Update sets manage the published state of all versions of a workflow prior to committing the workflow version on a local instance.

The last version of a workflow committed as an Insert or Update using an update set becomes the currently published version, regardless of the publishing sequence for the workflow versions.

Commit a workflow in an update set
Follow the steps in this page to commit a workflow in an update set.

1. Workflow A - Version 1 is created and published in Update Set A.
2. Update Set A is completed and migrated to a local instance.
3. When the update set is committed, the system sets all prior versions of Workflow A to published = false.

   In the first migration, there are no prior versions.
4. Workflow A - Version 1 becomes the only published version of the workflow.

Update set migration example
It is not possible to have multiple published versions as a result of update set commits. However, this does not eliminate risk, and care should be taken when migrating update sets.

Consider this example:

1. Workflow A - Version 1 is migrated and committed to the production instance.
2. Update Set B is created.
3. Update Set C is created.
4. Workflow A - Version 2 is published in Update Set B.
   A customer update record is added to Update Set B with the Version 2 payload.
   A customer update record is added to Update Set B with the Version 1 workflow left unpublished.
5. Update Set B is completed.
6. Workflow A - Version 3 is published in Update Set C.
   A customer update record is added to Update Set C with the Version 3 payload.
   A customer update record is added to Update Set C with the Version 2 workflow left unpublished.
7. Update Set C is completed.
8. Update Set C is migrated and committed to the production instance.

Workflow A - Version 1 is set to unpublished.
Workflow A - Version 2 update is skipped since Update Set B, which contains Version 2, was never migrated.
Workflow A - Version 3 is committed and becomes the only published version of the workflow.
Update set migration risk
Update Set B is migrated and committed to the production instance.

1. Workflow A - Version 3 is set to unpublished.
3. Workflow A - Version 2 is committed and becomes the only published version of the workflow.
   The workflow has gone back a version, perhaps unintentionally. The regressed version becomes the currently published version.

Workflow timelines

The system provides a timeline view of history activities associated with a workflow context.

Timelines display a linear calendar of activities, such as tasks and approvals, defined by their start and end dates. Each activity on the timeline is represented by a span, which is displayed as a horizontal, colored bar. Each span has a label and a tooltip that contains additional information about the activity. The left pane displays all the activities in the context (or contexts) in an expandable hierarchy. You can change the timeline's perspective for a more granular view of the data.

**Note:** Workflow timelines reflect context history only and are not real-time gauges of workflow activity.

Use a timeline

By default, the timeline displays all activities and transitions requested when first opened.

Collapse any part of the hierarchy in the activity pane and the timeline adjusts automatically. Date/time and duration controls enable you to scale the timeline to view all the elements at once. To display a timeline, click a UI action within a Workflow Context record.

1. Navigate to Workflow > Live Workflows > Active Contexts.
2. Select a context.
3. In Related Links, click Show Timeline to display the timeline for the entire context.
   The timeline opens with all activities expanded and the view set to Max, which displays the entire timeline at the width of the pane. The title of the timeline is in the form Workflow context: <context name>, Requested Item: <requested item number>.
4. Use the Range Selectors at the top of the timeline to change the perspective.

The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, click Max.

5. Use the starting and ending calendar fields to select the timeline perspective.

These fields control the same perspective as the slider at the bottom of the timeline.

6. Use the pink slider at the bottom of the timeline to change the perspective.
1. Move the slider from right to left to view all the spans on a long timeline.

2. Adjust the end points of the slider to make arbitrary changes to the magnification. A narrow slider zooms in on the spans and provides a more detailed view of complex timelines. A wide slider pulls the view out and makes more of the timeline visible on the screen.

7. To focus the timeline view on selected activities, expand or collapse the activity tree. Spans not visible in the activity tree are not shown in the timeline pane.

8. Hover over an activity span to display a tooltip with information about the activity. This action highlights the activity in the activity pane.
9. Hover over the transition between two activities to highlight the activity and the predecessor activity in the activity pane.

10. Double-click a span to display a history record for that activity. History records shows information such as the **State** and the starting and ending times.
Timeline for a selected activity

You can display a partial workflow timeline.

1. Navigate to Workflow > Live Workflows > Active Contexts.
2. Open a Workflow Context record.
3. On the Workflow Activity History related list, select one or more individual activities.
4. Click Show Timeline from the action menu.
   
   The resulting view is a snapshot of the timeline, showing only the selected activities and their transitions, if any.
5. Collapse the tree to confine the view even further.
6. To view a timeline displaying activities from different contexts:
   You might use this feature to display a subflow’s context with the parent workflow context.
   
1. Navigate to Workflow > Live Workflows > History.
2. Select individual history items from the list.
3. Select the Show Timeline option from the actions menu.

   History items are arranged in a hierarchy in the activities pane under their contexts. The timeline title is Multiple Contexts. The timeline draws only the activities and relationships of the history items selected.

View subflows in a workflow timeline

In a workflow timeline, subflow spans appear as a different color than the activities of the main workflow.
Workflow timeline subflow

Workflow error handling

The personalized JavaScript that users create in workflow activity variables is vulnerable to run-time syntax errors. Available error information is available in a tooltip when you point to a workflow activity in an error state.

In the base system, workflow activities do not provide condition routing on the error state. As a result, the workflow progresses based on the state of the current record. For example, a workflow contains an Approval - User activity that uses an advanced script to add additional approvers. A syntax error in the script results in no approvers being added. Because a state of no approvers is a valid return, even without the syntax error, the approval activity is skipped and the workflow progresses along a positive path. However, this might not be a valid response for the workflow designer who does not want the workflow to progress along the positive path without approvers.

Workflow error handling detects and logs syntax errors and provides a state that the workflow designer can use to add error conditions to the workflow. Use error handling to locate syntax errors in advanced script fields for these workflow activities:

- Approval - User
- Approval - Group
- Catalog Task
- Create Task
- If
- Run Script
- Notification

Workflow error tracking features

Error handling provides visual cues within the workflow, such as error descriptions for activities in pop-ups, and detailed log records.

Banners

Look for an activity with a red banner, indicating that a syntax error has occurred in a script field. All activities that provide error handling, with the exception of Catalog Task and Create Task, display a red banner for this error.

![Switch][1]

Check assignment group

Always

Tooltips

Point to the activity displaying a red banner to view information about the error. A tooltip shows the State and Result of the activity and provides a brief Fault Description (except for task activities). Note that this approval continued as skipped despite the error given in the fault description. See Workflow error handling for the information available to each activity.
Execution order

Tooltip text in the Workflow Context graphical view displays the execution order of individual activities, which assists in troubleshooting.

To view the order in which a workflow activity was executed:

1. Navigate to Workflow > Live Workflows > Active Contexts or All Contexts.
2. Open the context you want to examine.
3. Click Show Workflow.
4. Hover the cursor over a finished or executing activity.

A tooltip appears showing error data, execution time, and the order in which that activity executed in the workflow. You can use this data to help troubleshoot activities in an error state.
Workflow log

View the log in the Workflow Context form for more information about the syntax error in the activity. Since task activities do not display a red banner when a syntax error has occurred, you must view the log if you suspect the workflow has not run properly. Examine the error description in the log, and then inspect the script in the activity named in the log.

To view the activity by name, navigate to Workflow > Administration > Properties and enable the Log workflow debug messages property.
In this example, an SSH activity named File Read specifies an invalid MID Server.

If the credentials used by an activity in the workflow fail, and the activity cannot authenticate on the target, a message describing the failure appears in the **Workflow Log** related list. The message displays the target IP address and the credential details.
Credential debugging in the workflow log

Create an error condition exit

An administrator can reroute the workflow when a script error occurs by creating an error condition exit for specific activities within the workflow. This allows the workflow to process script errors in a predictable way and not create undesirable results.

1. Open and check out a workflow.
2. Right-click in the top portion of the activity for which you want to create an error exit.
3. Select Add condition from the context menu.
4. Add a condition exit with the following values:
   - Name: Error
   - Condition: activity.state=='faulted'
5. Click Submit.
The Error exit appears on the activity.

6. Connect the Error exit to another activity for handling the error state, such as Notification or Log Message.

Reconfigure an approval condition

Approval activities react differently to script errors than the other activities.

Approval activity script errors can prevent an approval from being processed successfully. This, in turn, can cause the approval to complete as Skipped, which can appear to be an Approved state. To prevent this from happening, reconfigure the Approved exit as follows:

1. Open an approval workflow and make sure it is checked out.
2. On an approval activity, double-click the Approved exit.
3. Add the following script to the Condition field:
   ```
   && activity.state != 'faulted'
   ```
   This prevents the activity from continuing down the normal path in an error state and ensures that Skipped or Approved is the desired state.
4. Click Update.

Workflow run time metrics

You can enable the collection of workflow run time metrics to determine whether workflows are performing as expected or consuming additional resources.

Outlying run times for a workflow are identified by comparing actual run times to an outlier range calculated with the outlier threshold and estimated run time defined in the workflow properties. You can monitor the results of these metrics on the Workflow Operations Dashboard and custom homepages with workflow gauges.

Enable workflow run time metrics

Provide an estimated run time that can be compared to actual workflow run times.
For baseline workflows, you must also manually enable the collection of run time metrics. The system automatically enables the collection of run time metrics for new workflows.

1. Navigate to **Workflow > Workflow Editor**.
2. Open and check out the workflow.
3. In the title bar, click the menu icon and select **Properties**.
4. In the Workflow Properties dialog box, click the **Estimated Runtime** tab.
5. To enable the collection of run time metrics, check that the **Requires ERT** option is selected.
6. Open a configuration from the **Estimated Run Time** column.
7. In **Estimated Run Time**, enter an initial estimate for the workflow’s run time.
   - The system compares this initial estimate to actual run time results to create outlier reports. The system can automatically update this field in certain circumstances. Workflow designers can also manually update this field.
8. In the **Outlier Percentage Threshold for ERT** field, enter the percentage deviation from the estimated run time that identifies an outlier workflow run time.
   - The system uses a default value of 20.
9. Click **Update**.

### Outlying workflow run times

Workflow run times are identified as outliers when they are longer or shorter than the outlier range that is computed for the workflow.

The outlier range is automatically computed with the **Estimated Run Time** and **Outlier Percentage Threshold for ERT** values in the workflow properties. These values are used in the following formulas.

#### Formulas for computing workflow outlier ranges

<table>
<thead>
<tr>
<th>Value computed</th>
<th>Computation used</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outlier Value</td>
<td>Estimated Run Time * (Outlier Percentage Threshold for ERT / 100)</td>
<td>10 seconds * (20 / 100) 10 seconds * 0.2 = 2 seconds</td>
</tr>
<tr>
<td>Outlier Range</td>
<td>(Estimated Run Time - Outlier Value) to (Estimated Run Time + Outlier Value)</td>
<td>(10 seconds - 2 seconds) to (10 seconds + 2 seconds) = 8 to 12 seconds</td>
</tr>
</tbody>
</table>

When a workflow runs within the outlier range, its estimated run time is automatically updated.

If a workflow has an outlying run time, it appears in any outlier workflow gauges on the Workflow Operations Dashboard and custom home pages.

### Workflow estimated run time updates

When a workflow runs within the outlier range, its estimated run time is automatically updated. The estimated run time is updated with the cumulative moving average of the latest run time value in relation to previous run times. The computed value is rounded to the nearest second and stored as a *GlideDateTime*.

For example:

<table>
<thead>
<tr>
<th>Data point</th>
<th>Latest value</th>
<th>Cumulative running average (CRA)</th>
<th>CRA after rounding to the nearest second</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10 seconds</td>
<td>10 seconds</td>
<td>10 seconds</td>
</tr>
<tr>
<td>2</td>
<td>12 seconds</td>
<td>11 seconds</td>
<td>11 seconds</td>
</tr>
</tbody>
</table>
## Data point

<table>
<thead>
<tr>
<th>Data point</th>
<th>Latest value</th>
<th>Cumulative running average (CRA)</th>
<th>CRA after rounding to the nearest second</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>9 seconds</td>
<td>10.333 seconds</td>
<td>10 seconds</td>
</tr>
</tbody>
</table>

<i>Note:</i> Because the system rounds to the nearest second, the calculation is less precise with short durations.

You can also manually update the estimated run time in the workflow properties.

### Workflow pause utility

Workflow Pause Utility provides functionality you can use to pause or resume all workflow contexts, a subset of qualified workflow contexts, or individual workflow contexts. You designate the data and time of day at which the paused workflows should resume, and can manually resume individual workflows as needed.

Once activated, the Workflow Pause Utility plugin (com.glideapp.workflow.pause) updates several tables when you pause or resume workflows. Each table stores specific data related to each paused or resumed workflow.

#### wf_pause_request

Records every workflow pause request. The system automatically updates and inserts records in this table whenever you pause workflow contexts. It tracks user-specified resume time, whether the pause request is still active, and the total number of workflow activities that paused or resumed.

#### wf_pause_status

Records the status of each workflow context you pause. When you pause workflow contexts, the plugin waits until the current executing activity finishes, and pauses it before the next activity starts. It tracks the specific activity on which the workflow context was paused and whether it has resumed. If the workflow is paused, it tracks the time at which it is scheduled to resume.

#### wf_pause_group_request

Pauses the specific set of workflow contexts you designate using filtering in Group Pause Requests. You can manually pause all currently active workflows by clicking the Pause All check box.

#### wf_pause_snapshot

Before pausing and after resuming a workflow, the table records a snapshot of the current state of the workflow context. The table also records the state of the currently executing activity on the paused workflow context.

### Use examples

When you take down an instance for maintenance, you can pause all or selected active workflow contexts, and then resume them after you complete the maintenance.
You have an integration workflow context that hits an internal service that is down for maintenance. You can pause all instances of that workflow context from progressing to the next activity, allowing time for the internal service to be restored. Then, the paused workflow contexts can be resumed.

**Activate workflow pause utility**

You can activate the Workflow Pause Utility plugin (com.glideapp.workflow.pause) if you have the admin role. This plugin may include demo data and activates related plugins if they are not already active.

Role required: Workflow_admin or workflow_publisher, workflow_creator

1. Navigate to **System Definition > Plugins**.

   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   ```
   Note: To redirect to the legacy list view for plugins, click the link.
   ```

   ![Note](image)

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.

   ![Activate Plugin](image)

   - To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the Activate/Update related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.
4. If demo data is available and you want to install it, click Load demo data.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
5. Click Activate.

Pause and resume individual workflows

To pause individual workflow contexts, specify the date and time of day at which the workflow context should resume. When a workflow context is paused, the system saves basic information about the pause request, such as the resume date and time, in the wf_pause_request table. A workflow context automatically resumes at a specified date and time of day, but paused workflow context can be manually resumed as needed.

Role required: Workflow_admin or workflow_publisher, workflow_creator

Install and activate the Workflow Pause Utility plugin.

1. Navigate to Workflow > Live Workflows > Active Contexts.
2. Select the individual workflow context you are pausing.
   Workflow Context appears.
3. In Related Links, click Pause.
   A Workflow Pause Inputs dialog appears.
4. In the Workflow Pause Inputs dialog:
   a) Click to select the date, and enter the time of day (in hours, minutes, and seconds) at which the workflow should resume. You can select the current date or future date, but you must enter a time of day in the future.
   For example, to pause the workflow context at 13:30:00 (1:30 pm), select the date from the calendar, and then enter 13, 30, and 00 into the respective Time: fields.
   b) Click when finished.
   c) The selected date and time of day appear in the Resume At field.
   d) Click OK to return to Workflow Contexts.
   The selected workflow is now paused. Use Workflow pause request to monitor its status.
5. Paused workflows resume on the date and time of day specified in the Resume At field. To manually resume a currently paused workflow context:
a) Navigate to Workflow > Live Workflows > Active Contexts.
b) Select the individual workflow context you are pausing.
Workflow Context appears.
c) In Related Links, click Resume.

Pause and resume all or multiple workflows

Use Workflow Pause Group Requests to pause, or resume, groups of workflows, or all active workflows. If pausing a group of workflows, use filtering functions to select the workflows. If pausing all active workflows, select the Pause All check box to indicate that all currently active workflows should be paused.

Role required: Workflow_admin or workflow_publisher, workflow_creator

Install and activate the Workflow Pause Utility plugin.

1. Navigate to Workflow > Operations > Group Pause Requests.
   Workflow Pause Group Requests appears and displays existing workflow pause group requests.
2. Click New.
   Workflow Pause Group Request appears, and assigns a workflow pause group request ID.
3. To pause all active workflows, select Pause All, then click Update. To pause a filtered group of active workflow contexts, skip this step.
   All currently active workflow contexts in the instance are paused until you resume them. Use Workflow pause request to monitor their status.
4. To pause a filtered group of active workflow contexts, use the Filter field, specify the conditions for the search, then click Update.
   Workflow Pause Group Requests appears, and displays the results of the workflow group search. It assigns a workflow pause group request ID and indicates if the group is active (true = paused) or inactive (not yet paused).
5. To update, resume or delete a specific workflow pause group request, select it.
   Workflow Pause Group Request appears, and displays the selected workflow pause group request.
6. If the selected workflow pause group request is active (paused), and you do not want to pause it, click Do Not Pause Incoming Workflows. If the selected workflow pause group request is inactive (not yet paused), click Pause to pause it.
7. For the paused workflow group request, use the Resume At field to specify the date and time of day at which the paused workflow contexts should resume.
   a) Click
      
      to select the date, and enter the time of day (in hours, minutes, and seconds) at which the workflow contexts should resume. You can select the current date or future date, but you must enter a time of day in the future.
      For example, to pause the workflow context group at 13:30:00 (1:30 pm), select the date from the calendar, and then enter 13, 30, and 00 into the respective Time: fields.
   b) Click
      
      when finished.
c) The selected date and time of day appear in the Resume At field.
d) Click OK to return to Workflow Pause Group Request.

8. Click Submit.
9. Paused workflow contexts automatically resume on the date and time of day specified in the Resume At field. To manually resume currently paused workflow contexts:
   a) Navigate to Workflow Pause Group Requests.
   b) Select the workflow pause group request to resume.
      Workflow Pause Group Request appears.
   c) Click Resume, and then click Update.

10. Workflow Group Pause Request also contains the following information fields.

    Workflow group pause request form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Indicates if workflow group is paused.</td>
</tr>
<tr>
<td>Completed Resume Activity Count</td>
<td>Number of resumed workflow context activities that are completed.</td>
</tr>
<tr>
<td>Filter</td>
<td>Standard filtering fields used to specify the conditions for selection of a group of workflow contexts.</td>
</tr>
<tr>
<td>Log</td>
<td>Activity work notes generated by the group pause request.</td>
</tr>
<tr>
<td>Not Transitioned Workflow Count</td>
<td>Number of workflow contexts that were not transitioned when the group pause request was placed. When a group pause request is placed, the affected workflow contexts are paused before start of the next activity.</td>
</tr>
<tr>
<td>Resume Act Count</td>
<td>Number of workflow context activities resumed after the group pause completed.</td>
</tr>
<tr>
<td>Pause Act Count</td>
<td>Number of paused workflow context activities.</td>
</tr>
<tr>
<td>Requester Name</td>
<td>Name of the person requesting the workflow context pause.</td>
</tr>
<tr>
<td>Pause percentage</td>
<td>Total percentage of workflow contexts that are paused.</td>
</tr>
<tr>
<td>Resume Percentage</td>
<td>Total percentage of workflow contexts that have resumed.</td>
</tr>
<tr>
<td>Total Workflow Count</td>
<td>Total number of workflows matching the specified filter conditions that are being paused.</td>
</tr>
<tr>
<td>Paused Workflow Count</td>
<td>Number of current paused workflow contexts.</td>
</tr>
</tbody>
</table>

Monitor workflow pause requests

You can monitor the status of workflow pause requests using Workflow Pause Request.
Role required: Workflow_admin or workflow_publisher, workflow_creator
You must install and activate the Workflow Pause Utility plugin.

   Workflow Pause Requests appears and displays existing workflow pause requests.
2. Select the workflow pause request.
   Workflow Pause Request appears, and displays the selected workflow pause request.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Req Number</td>
<td>Unique assigned pause request number.</td>
</tr>
<tr>
<td>Completed Resume Activity Count</td>
<td>Number of workflow context activities resumed after the pause completed.</td>
</tr>
<tr>
<td>Pause Active</td>
<td>Selected indicates the workflow context is currently paused. Cleared indicates it is not.</td>
</tr>
<tr>
<td>Transitioned During Pause</td>
<td>Number of workflow contexts that transitioned when the pause request was placed. When a pause request is placed, the affected workflow contexts are paused before start of the next activity.</td>
</tr>
<tr>
<td>Workflow Context</td>
<td>Reference number for the paused workflow context.</td>
</tr>
<tr>
<td>Log</td>
<td>Activity work notes generated by the group pause request.</td>
</tr>
<tr>
<td>Paused Act Count</td>
<td>Date and time of day (h:m:s) at which the paused workflow context is resuming.</td>
</tr>
<tr>
<td>Requester Name</td>
<td>Name of the person who requested the workflow pause.</td>
</tr>
<tr>
<td>Resume Act Count</td>
<td>Number of workflow context activities resumed after the pause completed.</td>
</tr>
<tr>
<td>Resume At</td>
<td>Date and time of day (h:m:s) at which the workflow contents are scheduled to resume.</td>
</tr>
<tr>
<td>Table</td>
<td>Related record table name.</td>
</tr>
<tr>
<td>Application</td>
<td>Application in which the workflow context is executing.</td>
</tr>
<tr>
<td>Exec Act Count</td>
<td>Number of activities executing when the workflow context was paused.</td>
</tr>
<tr>
<td>Group Pause Request</td>
<td>Reference number for the associated group pause request, if any. Appears only if pause request was the result of a group pause request.</td>
</tr>
<tr>
<td>Is Workflow Complete</td>
<td>Selected indicates the workflow context is complete. Cleared indicates it is not.</td>
</tr>
<tr>
<td>Is Workflow Stuck</td>
<td>Selected indicates the workflow context is stuck. Cleared indicates it is not.</td>
</tr>
<tr>
<td>State</td>
<td>Current state of the workflow context - Paused or Resumed.</td>
</tr>
</tbody>
</table>
### Encrypted workflow scratchpad

The Encrypted Workflow Scratchpad plugin (com.snc.encrypted.scratchpad) provides encrypted scratchpad support for workflow context and workflow executing activities.

The platform supports encryption on most fields, and workflows can execute on tables with encrypted fields. Encrypted data is typically stored in the workflow scratch pad for workflows that execute using encrypted fields and must access this data after processing an approval, timer, or create task activity.

Data in the workflow scratchpad is not encrypted by default. The Workflow engine supports scratchpad encryption and executing activity records only when the Encrypted Workflow Scratchpad plugin is activated. Once activated, data stored in the wf_context and wf_executing scratchpads is protected by a private workflow engine encryption context, and is prevented from being stored in plain text.

### Activate encrypted workflow scratchpad

Activate the Encrypted Workflow Scratchpad plugin (com.snc.encrypted.scratchpad) if you have an admin role.

**Role required:** admin

The Encrypted Workflow Scratchpad plugin must be activated via a ServiceNow Technical Support request. You should activate and thoroughly test the plugin in a non-production instance. Only after you satisfied with the results should you activate it in a production instance.

When activating it in a production instance, you should pick a low transactional volume time to do so. Prior to its activation, first activate the Workflow Pause Utility (com.glideapp.workflow.pause), and then pause all active workflows. Refer to [Workflow pause utility](#). After activating the Encrypted Workflow Scratchpad plugin, resume all paused workflows.

Encrypted Workflow Scratchpad activates these related plugins if they are not already active.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Encryption Support</td>
<td>Allows text fields and attached files to be encrypted.</td>
</tr>
<tr>
<td>(com.glide.encryption)</td>
<td></td>
</tr>
</tbody>
</table>

1. Navigate to **System Definition > Plugins**.

   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   - If you’re certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.
   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.
        If your plugin requires dependent plugins, they’re activated automatically when you activate your plugin if they’re not active already.
     4. If demo data is available and you want to install it, click Load demo data.
        Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
     5. Click Activate.

Once you install and activate the plugin, resume all paused workflows. Refer to Pause and resume all or multiple workflows.
Troubleshoot workflows

Troubleshooting tools for workflows enable administrators to isolate execution paths, compare contexts, and track incomplete activities.

The workflow timeline provides a visual representation of the workflow, including transitions and the elapsed time for each activity. A troubleshooting tool for highlighting execution paths helps users perform forensics on a workflow. The highlighting feature can group multiple execution paths in various colors and can isolate rollback processing. Use the workflow highlighter to isolate incomplete tasks and approvals. You can also enable a workflow performance timing feature to troubleshoot slow workflows.

Execution path troubleshooting in timelines

Use the controls in a workflow timeline to isolate specific execution paths or compare multiple execution paths over time.

Timelines show how the activities in the workflow progressed in relation to one another over time. Isolate execution paths and follow transition lines between subflows and the main flow. Processing times provide a view of the workflow that you cannot get from the workflow diagram. Tooltips give precise information about each activity, such as duration.
Execution history table

Highlight execution paths and rollbacks to locate activities that may have been left in an unresolved state.

Rollbacks, cancels, and deletions during the execution of a workflow can prevent some activities from fully completing. Use highlighting in the execution history table to determine which activities in the workflow were left in an unresolved state.

1. Run the workflow.
2. Navigate to Workflow > All Contexts.
3. Select a context to troubleshoot.
4. In the Workflow Context form, select the Workflow Activity History related list.
5. Right-click an activity and select Workflow Debug > Toggle Execution Path Highlighting from the context menu.

All activities in that execution path are highlighted in a color selected by the platform. The debug path shows all activities that completed successfully during the workflow.

6. Right-click a rollback activity and select Workflow Debug > Toggle Rollback Highlighting from the context menu.

The platform highlights the rollback path (restarted activities) in a different color. Each color represents a group of activities that were part of the same rollback execution. The highlighting includes the activity that initiated the rollback. If you right-click an activity that was not part of a rollback, no rows are highlighted.

Note: The rollback activity itself appears in both execution path and rollback highlighting.
7. To remove highlighting, right-click in the list and select an option to clear execution path or rollback highlighting.

You can clear individual rollback paths or all rollback highlighting.

**Use the Workflow Operations Dashboard**

On the Workflow Operations Dashboard, view and add widgets to help you monitor workflows. Review the performance of workflows and determine which workflows must be improved.

Role required: workflow_admin

The different levels of access are:

- **View**: View the dashboard and refresh report widgets.
- **Customize**: Refresh, add, delete, and rearrange widgets.

On the Workflow Operations Dashboard, you can click widget elements to view the records they represent. You can also add new report widgets that are not displayed by default.

1. **To view the Workflow Operations Dashboard**, navigate to **Workflow > Operations > Workflow Operations Dashboard**.

   The default reports on the dashboard include:
   - Workflow contexts providing run time metrics
   - Active workflows started during a specified time period
   - Workflows run between yesterday and today
   - Workflows by state for the current month
• Aged workflow contexts for the past month

2. To find and add more widgets, click the Add Content icon ( ) in the upper left corner of the dashboard.

If a workflow consistently appears as an outlier and there is no error causing the run time values, you can use its historical run time values to calculate a new estimated run time value. Then update the estimated run time in the workflow properties.

**Workflow gauges**

Multiple gauges are available to help you review the performance of workflows. You can add these gauges to the Workflow Operations Dashboard or custom homepages.

<table>
<thead>
<tr>
<th>Content</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ERT Dashboard Controls &gt;</strong></td>
<td></td>
</tr>
<tr>
<td>Outlier Finished Workflows for ERT (Percentage Outlier)</td>
<td>Identifies workflows that finished, but did not finish within estimated runtime (ERT) values. Enter an outlier percentage to see workflows that ran outside the specified runtime range.</td>
</tr>
<tr>
<td>Outlier Long Running Workflows for ERT (Percentage Outlier)</td>
<td>Displays workflows running longer than the configured runtime threshold.</td>
</tr>
<tr>
<td><strong>Workflow Dashboard &gt;</strong></td>
<td></td>
</tr>
<tr>
<td>Workflows Without Current Record</td>
<td>Displays workflow contexts that do not have an associated current record.</td>
</tr>
<tr>
<td><strong>Gauges &gt; Workflow Context</strong></td>
<td></td>
</tr>
<tr>
<td>Number of Active Workflows Started Hourly Over Time (Yesterday)</td>
<td>Displays the total number of running workflows per hour over a given time period. By default, it displays the number of workflows that ran per hour over the previous day (yesterday).</td>
</tr>
<tr>
<td>Outlier Finished Workflows Not Cumulated to ERT</td>
<td>Displays workflow contexts that are finished outside the estimated runtime outlier value and not cumulated to estimated run time value.</td>
</tr>
<tr>
<td>Running Workflow Contexts</td>
<td>Displays the total number of running workflows.</td>
</tr>
<tr>
<td>Successfully Finished Workflows Cumulated to ERT</td>
<td>Displays the total number of successfully completed workflows whose running duration is cumulated to the estimated run time value.</td>
</tr>
<tr>
<td>Workflows by State (This Month)</td>
<td>Displays the total number of workflows run in a month grouped by the current state.</td>
</tr>
<tr>
<td>Aged Workflow Contexts (Running Since Last Month)</td>
<td>Displays the total number of workflow contexts running for a given period of time by workflow name. By default, it displays the total number of workflow contexts running over the last month.</td>
</tr>
</tbody>
</table>
### Workflow performance timing

The workflow engine can generate detailed performance timing data that is useful for troubleshooting slow workflows.

An administrator must enable this functionality.

When workflow performance timing is enabled, the workflow engine tracks key performance data, including various execution speed metrics. The Workflow Timing (wf_workflow_timing) table stores the data, with a record for each workflow context. The workflow timing record is updated when the workflow engine completes the workflow, waits for an activity to complete, or otherwise exits the workflow execution.

### Workflow estimated run time properties

Administrators can enable the collection of workflow run time metrics by setting Estimated Run Time (ERT) properties.

Administrators can use ERT metrics to determine if workflows are running longer or shorter than expected and to identify errors in workflow processing. The system displays run time metrics on the Workflow Operations Dashboard.

### Enable workflow performance timing

Workflow performance timing is disabled by default. You can create a system property to enable it.

**Role required:** admin

Add a system property with the following specifications.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.workflow.show_timing</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

### Workflow activities

Workflow activity properties reference

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals. Activities can succeed or fail, which can result in actions performed by other activities.

For information about configuring different types of activities, click an activity name in the list below or see [*Workflow activities reference*](#).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Core activities provided in the base system

- Approval and rollback workflow activities
- Condition Workflow activities
- Notification workflow activity
- Notify workflow activities
- Subflow activities
- Task workflow activities
- Timer workflow activities
- Utility workflow activities

Activities provided with Orchestration

The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities
- PowerShell activities
- Puppet activities

Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow Orchestration activity designer. For information about the templates Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see Orchestration custom activity templates.

Workflow activities reference

Workflow activity reference, organized by category.

Each activity performs a different task, such as running a script, sending notifications, or requesting approvals.

Workflow runs activities as the user session that starts or advances them. Workflows started from record operations will run activities as the user session that performed the record operation. Workflows started from schedules or restarted from timers run activities as the System user. Workflows started from script calls run activities as the user session that started the script.

Approval and rollback activities

Approval and rollback activities generate and manage approvals. Not all workflows can include approval activities. For more information, read Approval and rollback workflow activities.

Note: Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.
Approval and rollback activities

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Action workflow activity</td>
<td>The Approval Action activity performs an approval action on the current task.</td>
</tr>
<tr>
<td>Approval Coordinator workflow activity</td>
<td>The Approval Coordinator activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more Approval - User, Approval - Group, and/or Manual Approval activities.</td>
</tr>
<tr>
<td>Approval - Group workflow activity</td>
<td>The Approval - Group activity creates approval records for each member of a specified group.</td>
</tr>
<tr>
<td>Approval - User workflow activity</td>
<td>The Approval - User activity creates one or more individual user approvals.</td>
</tr>
<tr>
<td>Generate workflow activity</td>
<td>The Generate activity immediately creates task or approval records from any task or approval activities placed after the Generate activity in the workflow path. These pre-generated tasks and approvals start when the task and approval activities are reached during flow execution. This allows a task to have a set of associated pre-generated sequential tasks or approvals, but still require them to be completed in order.</td>
</tr>
<tr>
<td>Manual Approvals workflow activity</td>
<td>The Manual Approvals activity watches and manages any approvals that users add manually outside of the workflow process. This activity only selects approvals that are in the Not requested state.</td>
</tr>
<tr>
<td>Rollback To workflow activity</td>
<td>The Rollback To activity transitions directly to the activity specified by the outgoing transition line arrow.</td>
</tr>
</tbody>
</table>

Condition activities

Condition activities provide conditional branching and logical operation functionality for workflows.

Note: Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>If workflow activity</td>
<td>The If activity checks a condition or script to determine if a Yes or No transition should be taken.</td>
</tr>
<tr>
<td>Switch workflow activity</td>
<td>The Switch activity checks if the value of a passed field or variable is equivalent to one of several case values.</td>
</tr>
<tr>
<td>Wait for condition workflow activity</td>
<td>The Wait for condition activity causes the workflow to wait at this activity until the current record matches the specified condition.</td>
</tr>
<tr>
<td>Wait for WF Event workflow activity</td>
<td>The Wait for WF Event activity causes the workflow to wait at this activity until the specified event is fired.</td>
</tr>
</tbody>
</table>
Notify activities

Notify workflow activities manage calls and SMS messages in Notify.

### Activity

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forward call workflow activity</td>
<td>The Forward Call activity forwards a Notify call to an E.164-compliant phone number.</td>
</tr>
<tr>
<td>Input workflow activity</td>
<td>The Input activity creates a phone menu by presenting a list of options on a Notify call.</td>
</tr>
<tr>
<td>Hangup workflow activity</td>
<td>The Hangup activity disconnects an active Notify phone call.</td>
</tr>
<tr>
<td>Play workflow activity</td>
<td>The Play activity plays a sound file on a Notify call.</td>
</tr>
<tr>
<td>Record workflow activity</td>
<td>The Record workflow activity records audio from a user on a Notify call.</td>
</tr>
<tr>
<td>Reject workflow</td>
<td>The Reject workflow activity rejects an incoming Notify call.</td>
</tr>
<tr>
<td>Say workflow activity</td>
<td>The say workflow activity allows you to play a message, using text to speech, on a Notify call.</td>
</tr>
<tr>
<td>Forward to notify client workflow activity</td>
<td>The forward to notify client workflow activity connects a phone call to a Notify WebRTC client.</td>
</tr>
<tr>
<td>Call workflow activity</td>
<td>The Call activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.</td>
</tr>
<tr>
<td>Join conference call workflow activity</td>
<td>The Join Conference Call activity connects an incoming or outgoing call to a Notify conference call.</td>
</tr>
<tr>
<td>Send SMS workflow activity</td>
<td>The send SMS workflow activity to send short text messages using Notify to users’ phones. This workflow activity can be added to any table.</td>
</tr>
<tr>
<td>Queue workflow activity</td>
<td>The Queue activity places an active Notify call in a queue.</td>
</tr>
</tbody>
</table>

Notification activities

Notification workflow activities notify users of events that occur during the workflow.

### Activity

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Event workflow activity</td>
<td>The Create Event activity adds an event to the event queue, but does not immediately fire the event.</td>
</tr>
<tr>
<td>Notification workflow activity</td>
<td>The Notification activity sends an email or SMS message to specified users or groups.</td>
</tr>
</tbody>
</table>
Subflow activities

Subflow activities run and manage workflows from a parent workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parallel Flow Launcher workflow activity</td>
<td>The <strong>Parallel Flow Launcher</strong> activity launches multiple subflows in parallel.</td>
</tr>
</tbody>
</table>

Task activities

Task activities create and modify workflow tasks.

**Note:** Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add Worknote workflow activity</td>
<td>The <strong>Add Worknote</strong> activity adds text to the <strong>Worknotes</strong> field of the current incident record.</td>
</tr>
<tr>
<td>Attachment Note workflow activity</td>
<td>The <strong>Attachment Note</strong> activity adds an attachment to the current record.</td>
</tr>
<tr>
<td>Catalog Task workflow activity</td>
<td>The <strong>Catalog Task</strong> activity creates a service catalog task record.</td>
</tr>
<tr>
<td>Create Task workflow activity</td>
<td>The <strong>Create Task</strong> activity generates a record on any of the tables that extend Task (task).</td>
</tr>
</tbody>
</table>

Timer activities

Timer activities pause workflows for set periods of time.

**Note:** Timer activities run as the System user because the system scheduler advances the workflow.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLA Percentage Timer workflow activity</td>
<td>The <strong>SLA Percentage Timer</strong> activity pauses the workflow for a duration equal to a percentage of an SLA.</td>
</tr>
<tr>
<td>Timer workflow activity</td>
<td>The <strong>Timer</strong> activity pauses the workflow for a specified period of time.</td>
</tr>
</tbody>
</table>
Utility activities

Utility activities provide controls over the path of the workflow, and other useful tools.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch workflow activity</td>
<td>The <strong>Branch</strong> activity splits the workflow into multiple transition paths from a single activity.</td>
</tr>
<tr>
<td>Join workflow activity</td>
<td>The <strong>Join</strong> activity unites multiple execution paths into one transition.</td>
</tr>
<tr>
<td>Lock workflow activity</td>
<td>The <strong>Lock</strong> activity prevents other instances of this workflow from continuing past this activity until the lock is released.</td>
</tr>
<tr>
<td>Log Message workflow activity</td>
<td>The <strong>Log Message</strong> activity writes a message to the workflow log.</td>
</tr>
<tr>
<td>Log Trace Message workflow activity</td>
<td>The <strong>Log Trace Message</strong> activity writes a trace message to the workflow log.</td>
</tr>
<tr>
<td>REST Message legacy workflow activity</td>
<td>The legacy <strong>REST Message</strong> activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.</td>
</tr>
<tr>
<td>Return Value workflow activity</td>
<td>The <strong>Return Value</strong> activity returns a value to a parent workflow, when run from a subflow.</td>
</tr>
<tr>
<td>Run Script workflow activity</td>
<td>The <strong>Run Script</strong> activity runs the specified script in the scope of the workflow version.</td>
</tr>
<tr>
<td>Set Values workflow activity</td>
<td>The <strong>Set Values</strong> activity sets values on the current record when the workflow quiesces or ends.</td>
</tr>
<tr>
<td>SOAP Message legacy workflow activity</td>
<td>The legacy <strong>SOAP Message</strong> activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.</td>
</tr>
<tr>
<td>Turnstile workflow activity</td>
<td>The <strong>Turnstile</strong> activity limits how many times a workflow can pass through the same point.</td>
</tr>
<tr>
<td>Unlock workflow activity</td>
<td>The <strong>Unlock</strong> activity releases a lock that was previously placed by the <strong>Lock</strong> activity.</td>
</tr>
</tbody>
</table>

Activities provided with Orchestration

The following activities are included with Orchestration.

- Active Directory activity pack
- Orchestration activities
- PowerShell activities
- Puppet activities

Templates provided for creating custom activities

If Orchestration is active on your system, users with the proper roles can create custom activities using the ServiceNow **Orchestration activity designer**. For information about the templates...
Orchestration provides for creating custom activities that you can upload to the ServiceNow Store, see Orchestration custom activity templates

Approval and rollback workflow activities

Approval and rollback activities generate and manage approvals.

Approval and rollback activities are not available in some workflows.

- With two exceptions, approval and rollback activities are only available when the workflow runs on a table that extends Task. The exceptions are the Approval - User and Approval Action activities, which are available globally.
- Approval and rollback activities are available only if approval engines are turned off for the table on which the workflow runs. If approval engines are enabled for the table, approval activities appear greyed out and cannot be selected. To learn more about how workflow and approval engines interact, read Approval workflow activities and approval engines.

Approval Action workflow activity

The Approval Action activity performs an approval action on the current task.

Use this activity to mark the current task record as approved or rejected.

| Note: When an Approval Action activity is used to mark a task approved, the activity marks all pending approvals as No Longer Required. This activity behaves differently from Set Values or Run Script when used to set the Approval field's value. |

Results

The result value of the activity is the final approval disposition selected by the approver. The result value can be Approved or Rejected. A workflow designer can assign a result value using the activity.result variable from within a script field of the activity.

Input variables

Input variables determine the initial behavior of the activity.

Approval Action activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>The action to perform on the task. Options are:</td>
</tr>
<tr>
<td></td>
<td>- Mark task approved</td>
</tr>
<tr>
<td></td>
<td>- Mark task rejected</td>
</tr>
<tr>
<td></td>
<td>- Mark task requested</td>
</tr>
<tr>
<td></td>
<td>- Disregard pending approvals: the system sets approval records to no longer required and marks the activity as approved.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition runs after this activity.
Note: Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

### Approval Action activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to move to the next workflow step.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

#### Approval Action activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

### Approval Coordinator workflow activity

The **Approval Coordinator** activity creates an approval whose outcome depends on the outcome of one or more child activities, including one or more **Approval - User**, **Approval - Group**, and/or **Manual Approval** activities.

Note: This activity is only available when the workflow runs on a table that extends Task.

To create an **Approval Coordinator** activity, first drag the activity onto the workflow canvas, causing the activity form to display. On the activity form, fill in the appropriate fields, then click **Submit**.

After you click **Submit**, the activity appears on the workflow canvas. From there, specify the child activities by clicking the links that appear on the body of the activity.

When the **Approval Coordinator** activity completes, all pending approvals that were created by any of the **Approval Coordinator** approval activities are immediately set to **No Longer Required**.

If a single user is called as an approver twice by the same workflow, such as when a single user is...
both a product approver and an executive approver, any approvals for that user after the first are skipped.

Results

The result value of the **Approval Coordinator** activity depends on the approval actions taken by the approvers and the approval conditions specified in the **Wait for** field. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

Input variables

Input variables determine the initial behavior of the activity.

**Approval Coordinator activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for</td>
<td>Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Any child activity to be approved</strong>: Any child activity (User, Group, or Manual Approval) that completes with a result of approved causes the <strong>Approval Coordinator</strong> activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>- <strong>All child activities to be approved</strong>: All child activities of the <strong>Approval Coordinator</strong> activity must complete with a result of approved to cause the <strong>Approval Coordinator</strong> activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>- <strong>The first approval or rejection from any child activity</strong>: The first child activity that completes with a result of approved or rejected causes the <strong>Approval Coordinator</strong> activity to complete with the same result.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Condition based on script</strong>: Call a script to determine how to manage an approval or rejection.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>When a rejection occurs</td>
<td>Specify what the coordinator should do when it sees a rejection from any one of the child activities. Options are:</td>
</tr>
</tbody>
</table>
| Only appears if **Wait for** is set to **All child activities to be approved** or **Any child activity to be approved**. | - **Reject the approval**: Immediately complete the Approval Coordinator activity with a result of **rejected**.  
- **Wait for other responses before deciding**: Wait until we get other responses from other child activities before making an approval or rejection decision.  
This allows users to change their minds until a decision is made.  
In addition, if **Wait for** is set to **Any child activity to approve** then a single child activity completion with a result of **approved** will cause the Approval Coordinator activity to complete with a result of **approved** even if other child activities have completed with a result of **rejected**. |
| Approval script | If the **Wait for** variable is set to **Condition based on script** this script is called to determine how to handle an approval or rejection. The script needs to set the variable **answer** to **approved** or **rejected** to indicate the overall approval status for this approval. When called, the following variable is available to the script: |
| Only appears if **Wait for** is set to **Condition based on script**. | counts.total = total number of child approval activities that are part of this approval  
counts.approved = # of child approval activities that approved so far  
counts.rejected = # of child approval activities that rejected so far  
counts.requested = # of child approval activities that are pending approval |

**Conditions**

The conditions determine which transition runs after this activity.

**Note:** Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.
Approval Coordinator activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the Wait for rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the Wait for rules.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

**Approval Coordinator activity states**

<table>

<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Approval - Group workflow activity**

The Approval - Group activity creates approval records for each member of a specified group.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

The group approval is approved or rejected based on the user approvals, according to the logic specified in the Wait For field.

**Results**

The workflow designer can assign a result value using activity.result from within a script field of the activity. By default, the result value is the final approval disposition. This disposition depends on the approval actions taken by the approvers and the approval conditions specified in the Wait for or When Anyone Rejects fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled
Input variables

Input variables determine the initial behavior of the activity.

**Approval - Group activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - Group When</td>
<td>Specify when this activity generates a group approval record.</td>
</tr>

<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Wait for</td>
<td>A choice between different approval logics to determine which individual approvals or rejections result in approval or rejection of the activity’s approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>An approval from each group:</strong> Any user from each group can approve and the first approval from each group causes the activity to complete with a result of <strong>approved</strong> (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• <strong>An approval from any group:</strong> Any user from any group can approve and the first approval from any group causes the activity to complete with a result of <strong>approved</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>An approval from everyone from all groups:</strong> All users from all groups must approve to cause the activity to complete with a result of <strong>approved</strong> (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>• <strong>First response from each group:</strong> The first approval or rejection from any user in each group is used to indicate the state of the group approval (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>Indicate what happens when any user rejects their approval request. Options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reject the approval:</strong> Immediately complete the activity with a result of <strong>rejected</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>First response from any group:</strong> The first approval or rejection from any user in any group causes the activity to complete with a result of <strong>approved</strong> or <strong>rejected</strong>.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Condition based on script:</strong> Each time a user approves or rejects, the <strong>Approval script</strong> is called to determine if the activity should complete.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Approval script</td>
<td>If the <code>Wait for</code> variable is set to <strong>Condition based on script</strong> this script is called to determine how to handle an approval or rejection. The script needs to set the variable <code>answer</code> to approved or rejected to indicate the overall status for this approval. This script is responsible for setting the approval state for each group that is part of this approval activity before returning the overall approval state for all of the groups. When called, the following variables are available to the script for all the groups that are part of this approval activity:</td>
</tr>
<tr>
<td></td>
<td><code>counts.total = total number of groups that are part of this approval</code></td>
</tr>
<tr>
<td></td>
<td><code>counts.approved = # of groups that approved so far</code></td>
</tr>
<tr>
<td></td>
<td><code>counts.rejected = # of groups that rejected so far</code></td>
</tr>
<tr>
<td></td>
<td><code>counts.requested = # of groups that are pending approval</code></td>
</tr>
<tr>
<td></td>
<td><code>counts.not_requested = # of groups that are not pending approval</code></td>
</tr>
<tr>
<td></td>
<td><code>counts.not_required = # of groups that approval is not required</code></td>
</tr>
<tr>
<td></td>
<td>And for each group:</td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].total = total number of users that are part of this group's approval</code></td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].approved = # of users that approved so far</code></td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].rejected = # of users that rejected so far</code></td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].requested = # of users that are pending approval</code></td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].not_requested = # of users that are not pending approval</code></td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].not_required = # of users that approval is not required</code></td>
</tr>
<tr>
<td></td>
<td><code>groups[group_id].approvalIDs[state] = array of user ids that are at the specified approval state</code></td>
</tr>
</tbody>
</table>

Note: Iterate the groups using:
for (var id in groups) {
var group = groups[id];
...

Note: Get group object using the following code (to get things like the group name being iterated on):

```javascript
function fncGetGroupObj(sidGroupApproval) {
var objGroupApproval = new GlideRecord('sysapproval_group');
objGroupApproval.get(sidGroupApproval);
var objGroup = new GlideRecord('sys_user_group');
objGroup.get(objGroupApproval.assignment_group.sys_id);
return objGroup;
}
```
### Field: When anyone rejects

A choice between different approval logics to determine which individual rejections result in rejection of the activity’s approval. Options are:

- **Reject the approval**: Immediately complete the activity with a result of rejected.
- **Wait for other responses before deciding**: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.

*Note:* If **Wait for** is set to **Anyone to approve**, then a single approval causes the activity to complete with a result of approved, even if one or more users reject.

### Approval - Group Schedule

Specify how workflow calculates the approval record’s expected start date and due date. Once you’ve made a selection for ‘Due date based on’, and ‘Schedule based on’, the appropriate fields will display.

<table>
<thead>
<tr>
<th>Due date based on</th>
<th>Select how workflow determines the task’s duration, due date, and schedule.</th>
</tr>
</thead>
<tbody>
<tr>
<td>A user specified duration</td>
<td>The duration is based on a user specified value.</td>
</tr>
<tr>
<td>A relative duration</td>
<td>The duration is calculated from a relative duration (such as End of Next Business Day).</td>
</tr>
<tr>
<td>A date/time or duration field</td>
<td>The duration is based on the value of a field on the current record.</td>
</tr>
<tr>
<td>Script</td>
<td>The duration is returned by a script.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Duration</th>
<th>The specific number of days and hours.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only appears when Due date based on is set to A user specified duration</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Relative duration</th>
<th>The general number and length of business days.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only appears when Due date based on is set to A relative duration</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Due date field</th>
<th>The date/time or duration field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only appears when Due date based on is set to A date/time or duration field</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Due date script</th>
<th>The script that sets ‘answer’ to the number of seconds for the duration.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only appears when Due date based on is set to Script</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Schedule based on          | The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:  
  - **This workflow's schedule**: The schedule uses workflow context date, time, and an optional **Time zone based on** value.  
  - **A specific schedule**: The schedule uses a pre-defined **Schedule** and an optional **Time zone based on** value.  
  - **A schedule field**: The schedule uses a value from a table and an optional **Time zone based on** value. |

<table>
<thead>
<tr>
<th>Schedule</th>
<th>The predefined <strong>Schedule</strong> from a list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Schedule field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.</td>
</tr>
</tbody>
</table>
| Time zone based on         | The time zone for calculating the duration. The time zone may be based on:  
  - **No time zone**: Default. Workflow uses the GMT time zone.  
  - **A specific time zone**: A specific **Time zone** that you choose from a choice list.  
  - **A time zone field**: A **Time zone field** to track time duration from a field on the form. |

<table>
<thead>
<tr>
<th>Time zone</th>
<th>Select the time zone you want from the choice list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time zone field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.</td>
</tr>
</tbody>
</table>

| Approval - Advanced        | If desired, write a script for determining additional users to request approvals from.                                                       |

| Advanced                   | Select this check box to write a script for determining additional users to request approvals from. Use the **Additional groups script** to customize group approvals. |
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Additional groups script     | If the **Advanced** check box is selected, this script is called to determine any additional group approvals to be created. The script needs to set the variable `answer` to a comma-separated list of group ids or an array of group ids to add as approver groups. For example:  

```javascript
answer = [];
answer.push('id1');
answer.push('id2');
``` |

---

### Conditions

The following conditions determine which transition runs after this activity.

**Note:** Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

#### Approval - Group activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

---

### States

The activity state tells the workflow engine what to do with the activity.

#### Approval - Group activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>State</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

### Approval - User workflow activity

The **Approval - User** activity creates one or more individual user approvals.

#### Results

The result value is the final approval disposition. This disposition depends on the approval actions take by the approvers and the approval conditions specified in the **Wait for** or **When Anyone Rejects** fields. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled

#### Input variables

**Approval - User activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval - User When</td>
<td>Specify when this activity generates a user approval record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditions which, if met, cause the individual approval to be generated. If the conditions are not met, the approval is skipped.</td>
</tr>
<tr>
<td>Approval - User Approvers</td>
<td>Specify the users whose approval will be requested.</td>
</tr>
<tr>
<td>Users</td>
<td>The users for the approval. Use the tree icon to select user reference fields from the current record to create approvals, such as ${assigned_to}. If no user is selected, the activity automatically sets the approval to Approved.</td>
</tr>
</tbody>
</table>

**Note:** Workflow only manages approval records generated by the Approval User activity. After starting the workflow, newly added approvals do not affect the workflow context.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Groups</td>
<td>Groups whose members should also receive approvals. Note that this is different than the Approval - Group activity, which creates a group approval in addition to the individual approvals. The tree icon can be used to select group reference fields from the current record to create approvals, such as <code>${assignment_group}</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Approval - User Condition</td>
<td>Specify how the activity decides to approve or reject the approval, based on the responses from individual approvers.</td>
</tr>
<tr>
<td>Wait for</td>
<td>A choice between different approval logics to determine which individual approvals result in approval of the activity's approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Anyone to approve:</strong> Any user can approve and the first approval causes the activity to complete with a result of approved.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Everyone to approve:</strong> All users must approve (see below for how a rejection is handled).</td>
</tr>
<tr>
<td></td>
<td>- <strong>First response from anyone:</strong> The first approval or rejection from any user causes the activity to complete.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Condition based on script:</strong> Each time a user approves or rejects, the Approval script is called to determine if the activity should complete.</td>
</tr>
<tr>
<td>When anyone rejects</td>
<td>A choice between different approval logics to determine which individual rejections result in rejection of the activity's approval. Options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Reject the approval:</strong> Immediately complete the activity with a result of rejected.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Wait for other responses before deciding:</strong> Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.</td>
</tr>
</tbody>
</table>

**Note:** Note that if Wait for is set to **Anyone to approve** then a single approval will cause the activity to complete with a result of approved even if one or more users reject.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Column</td>
<td>A string field for the name of the approval field on the table the workflow is running on. The default value is <strong>approval</strong>, which is the field on the Task table.</td>
</tr>
<tr>
<td>Note:</td>
<td>Use the field’s name, not its label.</td>
</tr>
<tr>
<td>Note:</td>
<td>If using any custom approval column fields and approval column journals, use Set Value activities in the workflow to set the custom Approval column fields.</td>
</tr>
<tr>
<td>Approval Journal Column</td>
<td></td>
</tr>
<tr>
<td>Approval Script</td>
<td>If the Wait for variable is set to <strong>Condition based on script</strong> this script is called to determine how to handle an approval or rejection. The script needs to set the variable answer to approved or rejected to indicate the approval status for this approval. When called, the following information is available:</td>
</tr>
<tr>
<td></td>
<td>```</td>

</tr>
</tbody>
</table>

Generate workflow activity

The Generate activity immediately creates task or approval records from any task or approval activities placed after the Generate activity in the workflow path. These pre-generated tasks and approvals start when the task and approval activities are reached during flow execution. This allows a task to have a set of associated pre-generated sequential tasks or approvals, but still require them to be completed in order.

Note: This activity is only available when the workflow runs on a table that extends Task.

By default, the workflow does not create any tasks or approvals until it reaches them in the workflow.

The Generate activity follows all transitions through the workflow to each activity. For each activity:

- If it is a task activity, creates the task and sets:
  - The State to Pending
  - The Expected Start Date
  - The Due Date
Note: Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

- If it is an approval activity, creates the approvals and sets:
  - The approval **State** to **Not Requested**
  - The **Expected Start Date**
  - The **Due Date**

Note: Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

Expected start dates and due dates are calculated based on the **Expected Duration** of all of the tasks and approvals between the **Generate** activity and the activity being updated. In the case of a branched path (between a **Branch** and **Join** activity), the longer duration will be used for any post-branch activities.

The **Generate** activity can be used more than once, and any tasks or approvals will be refreshed with updated information. This is useful in situations where the list of approvers or other important information is still editable while the workflow is in process and it may be necessary to update or correct the generated approvals or tasks.

To exclude a set of activities from the **Generate** activity, select the **Skip during generate** check box on any condition and its transitions will not be followed during the generate process. By default, the following conditions have the **Skip during generate** check box selected:

- **Rejected** (for any of the approval activities)
- **No** condition of **If** activity
- **Continue** condition of **Turnstile** activity
- **Incomplete** condition of **Join** activity

**Input variables**

Input variables determine the initial behavior of the activity.

**Generate activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate approvals</td>
<td>If selected, approvals are created when running the <strong>Generate</strong> activity. If cleared, the approvals are used to compute their estimated duration, but no approvals are created.</td>
</tr>
<tr>
<td>Generate tasks</td>
<td>If selected, tasks are created when running the <strong>Generate</strong> activity. If cleared, the tasks are used to compute their estimated duration, but no tasks are created.</td>
</tr>
</tbody>
</table>
States

The activity state tells the workflow engine what to do with the activity.

Generate activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is executing.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>

Example

![Workflow diagram](image)

Generate workflow

In this example, the following approvals are generated:

- Approval-2
• Approval-3

Approval-4 is skipped since the Rejected condition of Approval-3 has Skip during generate selected.

Here is an example of using the Generate activity that describes the expected start and due dates:

<table>
<thead>
<tr>
<th>Task</th>
<th>Expected Start Date</th>
<th>Reason</th>
<th>Due Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task 2 (1 day)</td>
<td>Jan. 2, 2016</td>
<td>Task 1 is 1 day</td>
<td>Jan. 3, 2016</td>
</tr>
<tr>
<td>Task 4 (1 day)</td>
<td>Jan. 3, 2016</td>
<td>Task 3 is 2 days</td>
<td>Jan. 4, 2016</td>
</tr>
<tr>
<td>Task 5 (1 day)</td>
<td>Jan. 4, 2016</td>
<td>Task 4 ends the latest before the Join</td>
<td>Jan. 5, 2016</td>
</tr>
</tbody>
</table>

Notice that Task 5 starts on Jan. 4, 2016 since the longest path (based on due dates) to the Join is Task 3/Task 4.

Manual Approvals workflow activity

The Manual Approvals activity watches and manages any approvals that users add manually outside of the workflow process. This activity only selects approvals that are in the Not requested state.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

If there are no pending manual approvals when this activity executes, the activity immediately completes with a result of approved. This activity does not create approval records. Use this activity to pause the workflow when a user adds a manual approval to a record with an associated workflow, and it is in the Not requested state. The workflow waits for the approval to be closed before proceeding.
Results

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. By default, the result value of the activity is the final approval disposition determined by the approval actions take by the approvers. Possible result values are:

- Approved
- Rejected
- Deleted
- Cancelled
- Error

Input variables

Input variables determine the initial behavior of the activity.

**Manual Approvals activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Wait for                  | Indicate what to wait for to indicate that the approval activity is approved or rejected. Options are:  
  - Any manual user or group approval: Any user can approve and the first approval causes the activity to complete with a result of **approved**.  
  - All manual user or group approvals: All users must approve (see below for how a rejection is handled).  
  - The first response from any manual approval: The first approval or rejection from any user causes the activity to complete. |
| When anyone rejects       | Indicate what happens when any user rejects their approval request. Options are:  
  - Reject the approval: Immediately complete the activity with a result of **rejected**.  
  - Wait for other responses before deciding: Wait until we get other responses before making an approval or rejection decision. This allows users to change their mind until a decision is made.  
  - In addition, if `Wait for` is set to **Anyone to approve** then a single approval will cause the activity to complete with a result of **approved** even if one or more users reject. |
Note: Approval activities run as the user whose actions match the approve or reject conditions the workflow was waiting for and advances the workflow.

**Manual Approvals activity conditions**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approved</td>
<td>The users from the groups have approved the request based on the <strong>Wait for</strong> rules.</td>
</tr>
<tr>
<td>Rejected</td>
<td>The users from the groups have rejected the request based on the <strong>Wait for</strong> rules.</td>
</tr>
</tbody>
</table>

**States**

The activity state tells the workflow engine what to do with the activity.

**Manual Approvals activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Rollback To workflow activity**

The **Rollback To** activity transitions directly to the activity specified by the outgoing transition line arrow.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

**Rollback To** determines which activities to reset based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, not the execution order. **Rollback To** then marks all the approvals that have transitioned between the rollback and the transitioned to activity as **Not Yet Requested** and the tasks as either **Open** or **Pending**.

Use the **Rollback To** activity for all workflows in which multiple rollbacks are required. **Rollback To** has no variables.

**Conditions**

The conditions determine which transition runs after this activity.
Rollback To activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>The event or condition that causes the approval to revert to the previous workflow step.</td>
</tr>
<tr>
<td>Error</td>
<td>The event or condition that generates an error.</td>
</tr>
<tr>
<td>Skipped</td>
<td>The event or condition that allows a skipped approval.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Rollback To activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine starts the <code>execute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Rollback To behavior

The **Rollback To** activity transitions directly to the activity specified by the transition line arrow.

Use the **Rollback To** activity for all workflows that use multiple or nested rollbacks. **Rollback To** resets the targeted task (the direct transition) to **Open**. All tasks that have executed between the **Rollback To** activity and the targeted task (rolled back task) are set to **Pending**.

(0) Begin

(1) Log Message

(2) Task 1

(3) Task 3

(4) Task 2

(5) Timer

(6) Approval 1

(7) Roll back to first task

(8) Task 1

(9) Task 2
(10) Approval 1
(11) Log approval
(12) Join
(14) Send email
(15) End

Rollback to workflow

Transition history

The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:

(8) Task 1: reset to Open
(9) Task 2: reset to Pending
(10) Approval 1: reset to Not Yet Requested

Rollback To workflow transition

Rollback To activity
When conditions in a workflow trigger a Rollback To activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to Not Requested.
- Tasks are reset to either Open or Pending. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.
A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The Rollback To activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

**Condition Workflow activities**

Condition activities provide conditional branching and logical operation functionality for workflows.

*If workflow activity*

The If activity checks a condition or script to determine if a Yes or No transition should be taken.

If the workflow creator specifies both the **Condition** and the **Advanced** script, both must evaluate successfully for activity to take the Yes transition.

**Results**

The workflow designer can assign a result value using activity.result from within the **Script** field on the activity record. By default, the result value of the activity is the final result of the condition or script specified. Possible result values are:

- Yes
- No

**Input variables**

The following variables determine the behavior of the activity.

**Note:** Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

**If activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>If specified and the current record matches the condition, the Yes transition is taken.</td>
</tr>
<tr>
<td>Advanced and Script</td>
<td>To specify a script, select the Advanced check box. You may then enter a script that is evaluated. If your script sets the variable answer to yes, then the Yes transition is taken. Otherwise, the No transition is taken.</td>
</tr>
</tbody>
</table>

**Conditions**

The following conditions determine which transition comes after the activity.
If activity conditions

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Taken when the condition, if specified, matches and the Advanced script, if specified, returns yes.</td>
</tr>
<tr>
<td>No</td>
<td>Taken when either the condition does not match or the Advanced script, if specified, returns no.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

If activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Switch workflow activity

The Switch activity checks if the value of a passed field or variable is equivalent to one of several case values.

The switch activity behavior is similar to a switch statement in Java.

When creating a switch activity, select a Variable or Field to check against activity conditions for a matching field value. When the value passed in this variable or field matches the value defined in the Condition field of the activity condition, the workflow progresses through that activity condition.

Note: Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

Results

The variable or field selected in the Variable or Field activity variable determines the possible result values.
Input variables

The following variables determine the behavior of the activity.

Switch activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select Variable or Field as the type of value to check against available conditions. This selection sets the label and available options for the other field.</td>
</tr>
</tbody>
</table>
| Variable or Field| Select the source of the value compared against the switch activity conditions. The field label and available options depend on the Type selection.  
  • Variable: select any service catalog variable.  
  • Field: select any field from the Table defined in the workflow properties. |

States

The activity state tells the workflow engine what to do with the activity.

Switch activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the onExecute function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Example

You can create a switch activity that sets different field values on an incident based on the Assignment group of the incident record.
Switch activity example

The **Field** selected is the incident **Assigned to** field.
Switch activity Field

If the value of the Assigned to field of the workflow-triggering incident is Service Desk or Field Services, the workflow populates values on the incident record before continuing. If the Assigned to value is Hardware, the workflow continues without populating any field values.

Condition type (Standard, Else, or Error) is used. For more information, see Manage workflow activity conditions.
The **Wait for condition** activity causes the workflow to wait at this activity until the current record matches the specified condition.

The workflow evaluates the **Wait for condition** activity each time the current record is updated. Use this activity to pause a workflow indefinitely until a particular criteria is met by a record update. To pause a workflow for a timed duration see **Timer workflow activities**.

For workflow to consider the condition met, all conditions specified – whether in the builder or in a script – must be true.

**Note:** A **Wait for condition activity** should only be used to wait for an external event such as a record update, and not one from a workflow setting a value. If you have a workflow
setting a value and want to wait for that same field to be seen as 'changed,' try inserting a one-second timer.

Results

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. The activity transitions when the result value is true.

Input variables

The following variables determine the behavior of the activity.

**Note:** Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td>The workflow is paused at this activity until this condition matches the current record.</td>
</tr>
<tr>
<td>Condition script</td>
<td>If specified, the workflow is paused at this activity until this script sets the answer variable to true.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

*Wait for WF Event workflow activity*

The *Wait for WF Event* activity causes the workflow to wait at this activity until the specified event is fired.
Use this activity to wait for another activity to fire an event. Events from other activities are fired in a script using the workflow.fireEvent('eventName') API call.

Results

The workflow designer can assign a result value using `activity.result` from within a script field of the activity. This activity transitions when the specified event fires.

Input variables

The following variables determine the behavior of the activity.

**Note:** Condition activities run as the user whose actions match the conditions the workflow was waiting for and advances the workflow.

### Wait For WF Event activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for Event</td>
<td>An event name to trigger the workflow.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

### Wait For WF Event activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine ignores the activity until a specific event to restart the activity is fired.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Notify workflow activities

Notify workflow activities manage calls and SMS messages in Notify.

All Notify workflows that manage a phone call must run on the `notify_call` table. Call-related Notify activities can be added only to workflows where the `Table` field value is `Notify Call (notify_call)`.

You can identify if an outbound call was answered by a human or by an answering machine from within a Notify workflow by evaluating the `current.is_human` variable, such as with an If workflow...
activity. This variable is set by the telephony provider when an outbound call is answered. This variable is always true for inbound calls.

**Note:** Do not add a **Timer** activity between multiple Notify activities that interact with active phone calls.

**Important:** When creating a Notify workflow, set the workflow **If condition matches** field to **-- None --**. Notify controls which workflow to run based on the configured number groups.

**Forward call workflow activity**
The **Forward Call** activity forwards a Notify call to an E.164-compliant phone number.

If the person receiving a forwarded call hangs up, the **forward call** activity completes and transitions to the next activity. Any further Notify activities in the workflow run for the caller only.

**Input variables**

Input variables determine the initial behavior of the activity.

### Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone number to call</td>
<td>Enter the phone number to forward the call to.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait for the call to be answered before hanging up.</td>
</tr>
<tr>
<td>Record</td>
<td>Select this check box to record the conversation.</td>
</tr>
</tbody>
</table>

**Conditions**

The conditions determine which transition comes after this activity. The **forward call** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the phone number to call is invalid.

**Input workflow activity**
The **Input** activity creates a phone menu by presenting a list of options on a Notify call.

**Input Variables**

Input variables determine the initial behavior of the activity.

### Input Variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Finish key</td>
<td>Specify the key a caller can press on their phone when finished selecting a menu option.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Specify the amount of time to wait before closing the menu automatically when the caller does not select a menu option.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to build the phone menu, instead of using the activity conditions.</td>
</tr>
</tbody>
</table>

**Script**

Define the script to build the phone menu. The script must specify an `answer` variable as a JavaScript object with the following format:

```javascript
answer = {
  "1": {
    "play": "https://some_url.com/options/one.mp3",
    "myCustomData": "some data here"
  },
  "2": {
    "play": "https://some_url.com/options/two.mp3",
    "myCustomData": "some other data here"
  },
  "3": {
    "speak": "type 4 to speak to a representative",
    "language": "en-US",
    "myCustomData": "some more data here"
  }
};
```

The script may specify either a text-to-speech string and language code or the URL of a prerecorded message for each entry. You can also add optional attributes to store related information, such as `myCustomData` in the example above.

---

**Note:** The script object continues to support `say` attribute for backward compatibility.

---

**Conditions**

The conditions determine the transition that comes after this activity.
The **input** activity does not specify any conditions by default. You must define conditions to build the phone menu. Each condition is one option on the phone menu. Notify reads the text from each condition **Name** to the caller, up to 100 characters per condition.

You can specify a language for each condition by prefixing the message with the language code, in the format `xx-XX:<Message>`. For example, add `fr-CA:` for Canadian French. Available languages are stored on the Notify Language (notify_language) table.

The condition that the activity transitions through depends on the digits entered by the caller. Set the condition **Condition value** to `parseInt(workflow.scratchpad.digits) == <expected digits>`. For example, to transition through a condition when the caller presses the number 3, set the **Condition** to `parseInt(workflow.scratchpad.digits) == 3`.

You can add an error condition to this activity. The activity transitions through the error condition if the advanced script returns an invalid value, or if the text to say for a condition is empty.

**Scratchpad Entries**

The activity uses the workflow scratchpad to write persistent values.

<table>
<thead>
<tr>
<th>Entry</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.digits</td>
<td>The digits entered by the caller, as a string.</td>
</tr>
<tr>
<td>workflow.scratchpad.menu&lt;activity name&gt;</td>
<td>The entire <strong>answer</strong> variable, if using the advanced script option. You can access this menu from other activities after this activity successfully executes. For example, if the activity name is <code>choices</code>, you can access values from the menu using</td>
</tr>
<tr>
<td></td>
<td>var previousActivity = &quot;choices&quot;;</td>
</tr>
<tr>
<td></td>
<td>var choicesMenu = workflow.scratchpad.menu[previousActivity];</td>
</tr>
<tr>
<td></td>
<td>var menuItem = choicesMenu[workflow.scratchpad.digits];</td>
</tr>
<tr>
<td></td>
<td>// Selects the menu item based on the caller's input.</td>
</tr>
<tr>
<td></td>
<td>var selectedValue = menuItem.myCustomData; //get the custom data for the selected menu item.</td>
</tr>
</tbody>
</table>

**Hangup workflow activity**

The **Hangup** activity disconnects an active Notify phone call.

You can use the **hangup** activity to disconnect only calls that have been answered. Use the **reject** activity to disconnect calls that have not been answered.

**Play workflow activity**

The **Play** activity plays a sound file on a Notify call.
## Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL of a sound file to play. If the URL is inaccessible, or if the audio file mime type is not supported by the telephony provider, the play activity is skipped.</td>
</tr>
<tr>
<td>Loop</td>
<td>Enter the number of times the sound file should play.</td>
</tr>
</tbody>
</table>

## Conditions

The conditions determine which transition comes after this activity. The play activity does not specify any conditions by default.

You can create an error condition to handle errors with the sound file. The activity transitions through the error condition if the specified sound file is not available, or has an unsupported mime type. Supported mime types are listed on the Notify Audio MIME Types (notify_mime_type) table.

*Record workflow activity*

The **Record** workflow activity records audio from a user on a Notify call.

**Note:** The Record workflow activity records Notify call but not the Notify conference call. To record the Notify conference call, you can set the **Record** activity variable on the **Join Conference Call** workflow activity.

## Input Variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max duration (in seconds)</td>
<td>Enter the maximum duration, in seconds, allowed for a recording.</td>
</tr>
<tr>
<td>Timeout (in seconds)</td>
<td>Enter the amount of time to wait before ending a recording automatically when the caller is silent.</td>
</tr>
<tr>
<td>Finish Key</td>
<td>Specify the key a caller can press on their phone to end the recording.</td>
</tr>
</tbody>
</table>

## Scratchpad Entries

The activity uses the workflow scratchpad to store persistent values.
The **record** activity adds the **recording** variable to the workflow scratchpad. This variable stores metadata about the recording, such as URL, ID, and duration. You can access the following values from this variable.

**Values written to scratchpad**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>recording.recordingDuration</td>
<td>The duration of the recording, in seconds.</td>
</tr>
<tr>
<td>recording.from_number</td>
<td>The caller’s phone number, including country code.</td>
</tr>
<tr>
<td>recording.notify_number</td>
<td>The Notify phone number used to respond to the call, including country code.</td>
</tr>
<tr>
<td>recording.recordingID</td>
<td>The ID used by the telephony provider to identify the recording.</td>
</tr>
<tr>
<td>recording.recordingURL</td>
<td>The URL from the telephony provider to access the recording.</td>
</tr>
</tbody>
</table>

**Reject workflow**
The **Reject** workflow activity rejects an incoming Notify call.

You can use the **reject** activity to disconnect only calls that have not yet been answered. Use the **hang up** activity to disconnect calls that have been answered.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reason</td>
<td>Select a reason for rejecting the call, such as <em>busy</em>.</td>
</tr>
</tbody>
</table>

**Say workflow activity**
The **say** workflow activity allows you to play a message, using text to speech, on a Notify call.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text to say</td>
<td>Specify the text to read.</td>
</tr>
<tr>
<td>Language</td>
<td>Select the language and locale to use when reading text.</td>
</tr>
</tbody>
</table>
**Variable** | **Description**
---|---
Advanced | Select this check box to use a script to define the language and message, instead of using the **Text to say** and **Language** values.

Script | Define a script to set what text is read on the call. The script must return a string that defines the language and the text to read. For example, to play an English-language message, return `{language: 'en-US', text: 'Text to read'}`.

---

**Forward to notify client workflow activity**

The **forward to notify client** workflow activity connects a phone call to a Notify WebRTC client.

**Input variables**

Input variables determine the initial behavior of the activity.

**Input variables**

| Variable | Description |
---|---|
User | Select the user to connect the call to. |
Advanced | Select this check box to use a script to determine which client to connect to, instead of using the **User** variable. |
Script | Define a script that controls which client to connect to. This script should return a GlideRecord for a single User (sys_user) record. |
Timeout (in seconds) | Enter the amount of time to wait for the call to be connected before hanging up. |
Record | Select this check box to record the call. |

**Conditions**

The conditions determine which transition comes after this activity. The **Forward to Notify Client** activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if there is an issue with the Notify client.

**Call workflow activity**

The **Call** activity makes outbound phone calls using a Notify workflow. This workflow activity can be added to any table.

**Input variables**

Input variables determine the initial behavior of the activity.
### Input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notify Number</td>
<td>The Notify phone number to make the call from. When you initiate a call, the outgoing call workflow for the number group associated with this number runs.</td>
</tr>
<tr>
<td>Phone number to call</td>
<td>The E.164-compliant phone number to call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use a script to determine number to call, and the Notify number to call from instead of using the Phone number to call and Notify Number variables.</td>
</tr>
<tr>
<td>Script</td>
<td>Define a script that controls which number to call. This script should return a string listing the Notify number sys_id, as well as the phone number to call, such as <code>{notify_number: 'sys_id', phone_number: '+316...'}</code></td>
</tr>
</tbody>
</table>

### Conditions

The conditions determine which transition comes after this activity. The call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the call could not be set up due to invalid data returned by the advanced script.

**Join conference call workflow activity**

The Join Conference Call activity connects an incoming or outgoing call to a Notify conference call.

Notify includes the workflows Notify: (Re)join Conference Call and Notify: Join Conference Call Via SMS to demonstrate how to use the join conference call activity to connect inbound and outbound calls, and inbound SMS messages to a conference call.

### Input variables

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record</td>
<td>Select this check box to record the conference call.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to display advanced configuration options.</td>
</tr>
<tr>
<td>Script</td>
<td>Specify advanced configuration options using JavaScript, such as if the new participant should be muted upon joining the conference call. You can access values from the workflow scratchpad.</td>
</tr>
</tbody>
</table>
Conditions

The conditions determine which transition comes after this activity. The join conference call activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the conference_call scratchpad variable is not set.

Scratchpad entries

The activity uses the workflow scratchpad to read persistent values.

Values read from scratchpad

<table>
<thead>
<tr>
<th>Scratchpad variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workflow.scratchpad.conference_call</td>
<td>A GlideRecord for a single conference call record. A call processed by this activity is added to this conference call. If this value is not specified, the join conference call activity will log an error. When initiating an outgoing call workflow using the Notify API call(String notifyPhoneNumber, String toPhoneNumber, GlideRecord conferenceCall) method, this scratchpad value is set automatically to the conference call GlideRecord. For incoming call workflows, or workflows initiated using a different mechanism, you must explicitly set this scratchpad value.</td>
</tr>
</tbody>
</table>

Enable the hangupOnStar attribute

System administrators can enable the hangupOnStar attribute and use it in the Join Conference Call workflow activity. When hangupOnStar is enabled (set to true), participants in a conference call can press the * button to disconnect from the call. Control is returned to the workflow, which can be used to trigger customer-defined actions.

To enable the hangupOnStar attribute:
1. Navigate to Workflow > Administration > Workflow Versions.
2. Open the Notify: (Re)join Conference Call workflow.
3. Click the Show Workflow related link.
4. To modify the workflow, click the Workflow Actions icon and click Checkout.
5. Open the Join Conference Call workflow activity.
6. Enable the Advanced check box to display the Script field.
7. Set the hangupOnStar attribute to true. The default setting is false.
8. Click Update.
9. Click the Workflow Actions icon and click Publish to save the changes.
Send SMS workflow activity

The **send SMS** workflow activity to send short text messages using Notify to users’ phones. This workflow activity can be added to any table.

**Input variables**

Input variables determine the initial behavior of the activity.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From</td>
<td>Select the Notify phone number to use to send the SMS message.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to use JavaScript to determine which numbers to send the message to, and the Notify number to use to send the message.</td>
</tr>
<tr>
<td>To</td>
<td>Select any number of users to send the message to. The user record must have a E.164-compliant phone number or notification device configured for SMS messages.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>Select any number of groups to send the message to. All members of that group with an E.164-compliant phone number or SMS notification device receive the message.</td>
</tr>
<tr>
<td>Message</td>
<td>Enter the message to send. You can add field values from the current record by using the <strong>Select variables</strong> box. You can also add values from the workflow scratchpad. If a field and a scratchpad variable have the same name, the field value is used. Because you can use variables in this message, it is not possible to determine the length of the message at design time. If the activity sends a message that is longer than supported by the telephony provider, the message is truncated and the instance logs a warning.</td>
</tr>
<tr>
<td>To (script)</td>
<td>Enter a script to determine which numbers to send the message to, and the Notify number to use to send the message. The script should return a JavaScript object with the format <code>{notify_number: '\'...sys_id...\', users: [...], groups: [...], numbers: [...]}</code>. Specify the users or groups to send the message to as an array of sys_id values. Specify other numbers as an array of E.164-compliant phone numbers. This field appears only if <strong>Advanced</strong> is selected.</td>
</tr>
</tbody>
</table>
Conditions

The conditions determine which transition comes after this activity. This activity does not specify any conditions by default.

You can add an error condition to this activity. The activity transitions through the error condition if the Notify number used to make the call is not configured correctly or unable to send SMS messages, or if an error occurs while sending the SMS.

Queue workflow activity
The Queue activity places an active Notify call in a queue.

Add the Queue activity to a workflow on the Notify Call (notify_call) table to put the current call on hold. This activity does not specify any input variables.

The queue that the call is added to is given a random ID.

Workflow notification activities

Notification workflow activities notify users of events that occur during the workflow.

Create Event workflow activity
The Create Event activity adds an event to the event queue, but does not immediately fire the event.

The event processor typically processes the event within one minute. This activity triggers any business rules or email notifications that would normally be triggered by the event.

Results

Finished: the activity added the event to the event queue.

Input variables

Create Event activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event name</td>
<td>The name of the event to create. From the Event Name lookup list, select the event to add to the queue. If the event requires parameters, specify them in the Parameter script field.</td>
</tr>
<tr>
<td>Parameter 1</td>
<td>The first parameter of the event.</td>
</tr>
<tr>
<td>Parameter 2</td>
<td>The second event parameter.</td>
</tr>
</tbody>
</table>

Note: If this parameter is a string value, it must be within quotes (" ").
Notification workflow activity
The Notification activity sends an email or SMS message to specified users or groups.

Input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Addressees</td>
<td></td>
</tr>
<tr>
<td>To</td>
<td>The users who will be recipients of the email.</td>
</tr>
<tr>
<td>To (groups)</td>
<td>The members of the groups that will be recipients of the email.</td>
</tr>
<tr>
<td>Advanced</td>
<td>If selected, the script in the To (script) field is called to specify additional recipients of the email.</td>
</tr>
<tr>
<td>To (script)</td>
<td>If Advanced is selected, this script is called and should set the variable answer to a comma-separated list of user or group sys_ids that you want to add as recipients of the email.</td>
</tr>
<tr>
<td>Message</td>
<td></td>
</tr>
<tr>
<td>Subject</td>
<td>The subject line of the email.</td>
</tr>
<tr>
<td>Message</td>
<td>The email body that is sent.</td>
</tr>
<tr>
<td></td>
<td>To include the value of a field in the message body, place the cursor at the point in the text where you want the field's value inserted. Then click the + icon next to Fields and select the field you want.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the run function of the activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>

Timer workflow activities

Timer activities pause workflows for set periods of time.
**SLA Percentage Timer workflow activity**

The **SLA Percentage Timer** activity pauses the workflow for a duration equal to a percentage of an SLA.

A workflow must run on the Task SLA table to use this activity.

**Note:** Timer activities run as the System user because the system scheduler advances the workflow.

### Results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The activity successfully reached the specified duration</td>
</tr>
<tr>
<td>Cancelled</td>
<td>The activity or workflow was canceled before the timer reached the specified duration</td>
</tr>
</tbody>
</table>

### Input variables

Input variables determine the initial behavior of the activity.

**SLA Percentage Timer activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percentage</td>
<td>The duration to pause the workflow for, as a percentage of the current SLA</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.

**SLA Percentage Timer states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The activity is in this state very briefly while initializing, after which it immediately changes to Waiting.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine waits until the SLA reaches the specified percentage. The engine then transitions the workflow to the next activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
</tbody>
</table>
### Timer workflow activity

The **Timer** activity pauses the workflow for a specified period of time.

This duration can be an absolute time value or a relative value based on a defined *schedule*. It is best to adjust the **Duration** so the workflow can progress in a timely manner. To pause a workflow indefinitely until a condition is met, see *wait for condition*.

**Note:** Timer activities run as the System user because the system scheduler advances the workflow.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

### Results

**Timer activity results**

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td>The activity successfully reached the specified duration.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>The activity or workflow was canceled before the timer reached the specified duration.</td>
</tr>
</tbody>
</table>

### Input variables

Input variables determine the initial behavior of the activity.

**Timer activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer based on</td>
<td>How the timer duration is computed. The options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>A user specified duration</strong>: The duration is based on the <strong>Duration</strong> fields, such as days and hours.</td>
</tr>
<tr>
<td></td>
<td>- <strong>A relative duration</strong>: The duration is based on the <strong>Relative duration</strong> (such as End of Next Business Day) and <strong>Wait</strong> fields.</td>
</tr>
<tr>
<td></td>
<td>- <strong>A date/time or duration field</strong>: The duration is based on the <strong>Field</strong> value and the <strong>Wait</strong> field.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Script</strong>: The duration is based on a script that returns the number of seconds.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>

<td>The pre-defined Schedule from a list.</td>
</tr>
<tr>
<td>Schedule field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.</td>
</tr>
<tr>
<td>Timer Time Zone</td>
<td>The time zone for calculating the duration. The time zone may be based on:</td>
</tr>
<tr>
<td>Time zone based on</td>
<td>- No time zone: Default. Workflow uses the GMT time zone.</td>
</tr>
<tr>
<td></td>
<td>- A specific time zone: A predefined Time zone.</td>
</tr>
<tr>
<td></td>
<td>- A time zone field: A Time zone field to track time duration from a field on the form.</td>
</tr>
<tr>
<td>Time zone</td>
<td>The predefined time zone.</td>
</tr>
<tr>
<td>Time zone field</td>
<td>A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog.</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity.
**Timer activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The Timer activity is in this state very briefly while initializing, after which it immediately changes to Waiting.</td>
</tr>
<tr>
<td>Waiting</td>
<td>The workflow engine waits until the timer reaches the specified duration. The engine then transitions the workflow to the next activity.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

**Example**

You can use a **Timer** activity to pause the workflow until the end of the business day.
Timer example

In this example, the script evaluates the time between the `now` variable and the `eod` variable. The `eod` variable is defined, in 24 hour time, as 4:00 PM. The script then sets the `answer` variable to the difference between these variables, in seconds, and logs a message.

```javascript
// get now and calc end of day (4:00pm)
var now = new Date();
var eod = new Date();
eod.setHours(16);
eod.setMinutes(0);
eod.setSeconds(0);
answer = (eod.getTime() - now.getTime()) / 1000;
```
Task workflow activities

Task activities create and modify workflow tasks.
Task activities are only available when the workflow runs on a table that extends Task.

Add Worknote workflow activity

The Add Worknote activity adds text to the Worknotes field of the current incident record.

A workflow must run on the Incident table to use this activity.

Note: Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Input variables

Add Worknote activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work Note</td>
<td>The text to add to the incident record.</td>
</tr>
</tbody>
</table>

Attachment Note workflow activity

The Attachment Note activity adds an attachment to the current record.

Note: This activity is only available when the workflow runs on a table that extends Task.

This activity allows the use of irregular HTML tags to reference attachments, specifically the [code] tag. Entries in a journal field that use irregular HTML do not work if the glide.ui.allow_deep_html_validation property is true. This property is set to false by default.

Note: Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Results

- Finished: the activity added the attachment to the record.

Input variables

The following variables determine the behavior of the activity.

Attachment Note activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field</td>
<td>When this activity runs, it makes a note on the current record that a file has been attached. Specify the field on the current record in which you want this note to appear. The options are: none (defaults to Work Notes)  Additional Comments  Work notes</td>
</tr>
<tr>
<td>Attachment note information</td>
<td></td>
</tr>
<tr>
<td>Attachment Name</td>
<td>When this activity runs, it creates a .txt file with the name you specify in this field.</td>
</tr>
<tr>
<td>Attachment Data</td>
<td>The content of the .txt file attachment. It can be in plain text or use variables to extract specific data from a table.</td>
</tr>
</tbody>
</table>

**Catalog Task workflow activity**

The **Catalog Task** activity creates a service catalog task record.

**Note:** This activity is only available when the workflow runs on a table that extends Task.

A user must complete the catalog task. This activity is available only for workflows running on the Catalog Request Item (sc_req_item) table.

**Note:** Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

**Results**

You can assign a result value using `activity.result` from within a script field of the activity. The final State value of the catalog task record determines the result value for the Create Task activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

**Input fields**

The values you enter in the following fields determine the behavior of the activity.
## Catalog task activity information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Catalog Task Activity Settings</strong></td>
<td></td>
</tr>
<tr>
<td>Task Table</td>
<td>The table on which this activity runs. In most cases, leave set to the default value: (sc_req_item).</td>
</tr>
<tr>
<td>Priority</td>
<td>The value you want assigned to the <strong>Priority</strong> field for the new task.</td>
</tr>
<tr>

</table>
| Schedule based on           | The basic schedule the timer uses to count working hours. If a schedule is specified, the duration will only be considered for times that are specified on the schedule. For example, if the duration is 2 hours and the workflow begins at 4:00pm on a schedule that is 8am - 5pm, then it ends at 9:00am the next day. The options are:  
  - This workflow’s schedule: The schedule uses workflow context date, time, and an optional Time zone based on value.  
  - A specific schedule: The schedule uses a predefined Schedule and an optional Time zone based on value.  
  - A schedule field: The schedule uses a value from a table and an optional Time zone based on value. |
| Schedule                     | The predefined Schedule from a list.                                                                                                          |
| Schedule field              | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. |
| Time zone based on          | The time zone for calculating the duration. The time zone may be based on:  
  - No time zone: Default. Workflow uses the GMT time zone.  
  - A specific time zone: A specific Time zone that you choose from a choice list.  
  - A time zone field: A Time zone field to track time duration from a field on the form. |
| Time zone                   | Select the time zone you want from the choice list.                                                                                           |
| Time zone field             | A date and time or duration field for the schedule, that is associated with the table. Valid fields appear in blue on the Select the element from a tree dialog. |
States

The activity state tells the workflow engine what to do with the activity.

Catalog Task activity states

<table>

<td>The activity finished running. See the result value for the outcome of the activity.</td>
</tr>
<tr>
<td>Cancelled</td>
<td>This activity, or the workflow that contains this activity, was canceled.</td>
</tr>
<tr>
<td>Error</td>
<td>A JavaScript error occurred. Review the logs for error details.</td>
</tr>
</tbody>
</table>

Create Task workflow activity

The Create Task activity generates a record on any of the tables that extend Task (task).

Note: This activity is only available when the workflow runs on a table that extends Task.

If the Wait for completion check box is selected, the workflow context waits for a user action on the task, such as Complete or Incomplete, and then progresses based on the user action.

Note: Task activities run as the user whose actions complete the task the workflow was waiting for and advances the workflow.

Results

You can assign a result value using activity.result from within a script field of the activity. By default, the final State value of the task record determines the result value for the Create Task activity. Possible result values are:

- Closed complete
- Closed incomplete
- Closed skipped
- Deleted
- Cancelled

Input variables

The following variables determine the behavior of the activity.
Create Task activity input variables

<table>
<thead>
<tr>
<th>Field</th>

</tbody>
</table>

Utility workflow activities

Utility activities provide controls over the path of the workflow, and other useful tools.

Branch workflow activity

The Branch activity splits the workflow into multiple transition paths from a single activity.

To add a transition path, drag the Branch activity onto the canvas. When the Branch activity properties form displays, click Submit to add the activity to the canvas. Once the activity is on the canvas, right click in the activity body, then click Add Condition.

All transitions from this activity execute concurrently. This activity provides a single Always condition. You can draw any number of transitions from this condition. Using this activity is equivalent to drawing multiple transitions from a single condition of another activity.

Branching can affect the behavior of rollback activities. See Rollback To activity for more information.

Join workflow activity

The Join activity unites multiple execution paths into one transition.

Use this activity to cause a workflow to wait for all activities in multiple paths to finish before continuing. If multiple concurrent workflow paths meet without a Join activity, any subsequent activities execute twice.

To add Join to the canvas, click Submit. On the canvas, connect incoming transitions from each activity you want to act as a predecessor to the Join activity. Then connect outgoing transitions to the two exit conditions: Complete and Incomplete.

Results

Provide an Incomplete transition out of a Join whenever it is possible for any predecessor activities to follow a transition path that does not lead to the Join activity.
Join activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete</td>
<td><strong>Join</strong> exits along the Complete path when the system has determined that all predecessor activities have completed and transitioned to the <strong>Join</strong>.</td>
</tr>
<tr>
<td>Incomplete</td>
<td><strong>Join</strong> exits along the Incomplete path when the system determines that at least one predecessor activity completed but transitioned along a path that bypassed the <strong>Join</strong> activity.</td>
</tr>
</tbody>
</table>

**Lock workflow activity**

The **Lock** activity prevents other instances of this workflow from continuing past this activity until the lock is released.

Several instances of the same workflow may run concurrently. For example, if a workflow is triggered when a record is added to a particular table and multiple records are added one after the other, that workflow will be triggered multiple times: once by each record insertion. In such cases, you can use the lock activity to ensure that this instance of the workflow has completely finished one or more activities before any other instance of the workflow can proceed.

A workflow can explicitly release a lock with the **Unlock** activity. The lock may also be released when the **Max duration** is reached.

When an instance of the workflow reaches the **Lock** activity, it attempts to obtain a lock using the key specified in the lock activity. If another instance has already obtained the lock and has not yet released it, this lock attempt fails. The instance continues trying to obtain the lock until **Max attempts** has been reached.

**Note:**

We recommend placing a one-second timer activity before the lock activity. This helps prevent a rare condition in which the lock activity may not be able to distinguish one workflow instance from another. This condition can occur because the entity owning the lock is not the specific workflow instance, but rather the code-execution thread in which that instance is running. In most cases, each workflow instance runs on a different thread, but adding a timer activity ensures that this is the case.
Example of Lock Activity Preceded by Timer Activity

Since a **Lock** activity can only temporarily prevent processing of other workflow instances, do not add activities that cause the workflow to wait between a **Lock** and **Unlock** activity block. This
may cause the **Unlock** activity to be unable to acquire the lock to release it and instead take 60 seconds to complete. Restricted wait activities include:

- Approval activities
- Task activities
- Timer activities
- Wait for condition activity
- Wait for WF Event activity

### Results

**Lock activity results**

<table>
<thead>
<tr>
<th><strong>Result</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>The activity successfully obtained a lock. This instance of the workflow can proceed past this point, but other instances cannot until the lock is released.</td>
</tr>
<tr>
<td>Failure</td>
<td>After attempting to obtain the lock <strong>Max attempts</strong> times, the activity could not obtain the lock.</td>
</tr>
</tbody>
</table>

### Input variables

Input variables determine the initial behavior of the activity.

**Lock activity input variables**

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Key</td>
<td>A unique mutex key. The <strong>Unlock</strong> activity uses this key to release the lock.</td>
</tr>
<tr>
<td>Max. duration</td>
<td>The maximum time the lock persists. The lock is released after it reaches this duration. Releasing a lock this way is equivalent to running the <strong>Unlock</strong> activity.</td>
</tr>
<tr>
<td>Lock attempts</td>
<td><strong>Specifying how the activity behaves if the lock attempt is denied. If the final lock attempt fails, the activity state will be set to ‘timeout’ and the activity result will be set to ‘failed’.</strong></td>
</tr>
<tr>
<td>Max. attempts</td>
<td>Specify the maximum number of times the activity may attempt to obtain the lock.</td>
</tr>
<tr>
<td>Delay between attempts</td>
<td>The amount of time required after a failed lock attempt before another lock attempt is allowed.</td>
</tr>
</tbody>
</table>
States

The activity state tells the workflow engine what to do with the activity.

**Lock activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The workflow engine is waiting to obtain a lock.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully obtained the lock.</td>
</tr>
<tr>
<td>Timeout</td>
<td>The activity could not obtain a lock within the number of attempts specified by the Max. attempts input variable.</td>
</tr>
</tbody>
</table>

Log Message workflow activity

The **Log Message** activity writes a message to the workflow log.

Use this activity to add entries to the workflow's log for debugging or tracing purposes.

**Input variables**

Input variables determine the initial behavior of the activity.

**Log Message activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message</td>
<td>The message to log. This variable can be a string or a JavaScript expression that evaluates to a string.</td>
</tr>
</tbody>
</table>

Log Trace Message workflow activity

The **Log Trace Message** activity writes a trace message to the workflow log.

The trace message includes the activity name, the event that invoked the workflow, and the table of the current record. There are no variables or conditions. To log other data, use the Log Message workflow activity activity.

REST Message legacy workflow activity

The legacy **REST Message** activity enables an administrator to override the REST endpoint or supply the variables configured in the REST Message module.

This activity is deprecated in the Orlando release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the Orchestration REST Activity templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must re-activate the activity.

The **REST Message** activity executes a dead link REST function (POST, PUT, GET, or DELETE) on an endpoint using values defined in the function record.

**Note:** If you want to use a MID Server to send the REST message, the MID Server must be accessible by the instance and configured to use SSH.
## Input variables

### REST Message activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rest Message Name</td>
<td>Name of the REST message to run. This is a reference field to the REST Message (sys_rest_message) table (System Web Services &gt; Outbound &gt; REST Message).</td>
</tr>
<tr>
<td>REST Message Function</td>
<td>Function to call that is defined in a REST message function. This is a reference field to the HTTP Method (sys_rest_message_fn) table (System Web Services &gt; Outbound &gt; REST Message). Available functions are put, post, get, or delete. You can edit functions in the HTTP Methods related list in each REST Message record.</td>
</tr>
<tr>
<td>REST Endpoint</td>
<td>REST endpoint to use instead of the Endpoint defined in the HTTP Method record. Leave this field blank to use the defined endpoint in the REST Message Function record.</td>
</tr>
<tr>
<td>Rest Message Variables</td>
<td>Values to use for variables defined in the HTTP Method record. Use the following format for the string: name1=value1, name2=value2, ... For example, use name=${nameValue}, id=${idValue} where name and id are function variables. If either the variable name or value contains a comma or equal sign, escape those characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>Check this box if you want to use a MID Server to send the REST message. A MID Server might be necessary to reach an endpoint within a firewall or a subnetwork that is not visible from the instance. If this check box is selected, but no MID Server is defined in the MID Server field, the workflow automatically attempts to find a MID Server based on IP range and the REST capability.</td>
</tr>
<tr>
<td>MID Server</td>
<td>Name of the MID Server to use. This field is available when Use MID Server is selected. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
</tbody>
</table>
### Field ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sensor Script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full response body from the <code>activity.output</code> variable.</td>
</tr>
</tbody>
</table>

**Return Value workflow activity**

The **Return Value** activity returns a value to a parent workflow, when run from a subflow.

This activity has no variables or conditions. For more information, see [Workflows used as subflows](#).

Use this activity within a subflow to store data that the parent flow can access. The **Return Value** activity adds the data from the subflow’s `value` variable to the parent workflow’s **scratchpad**.

**Scratchpad entries**

The activity uses the workflow scratchpad to read and write persistent values.

**Return Value activity scratchpad entries**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The activity writes the value from the subflow’s <code>value</code> variable to the parent workflow’s scratchpad. The parent workflow activity that runs the subflow includes a <code>Map return value to variable</code> that defines where the parent workflow stores the returned data. This data can be scalar, a stringifiable JavaScript object, or an expression that evaluates to a stringifiable JavaScript object.</td>
</tr>
</tbody>
</table>

**Run Script workflow activity**

The **Run Script** activity runs the specified script in the scope of the workflow version.

**Note:** All changes to `current` are automatically updated. There is no need to call `current.update()`.

**Input variables**

Input variables determine the initial behavior of the activity.

**Run Script activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Script to execute.</td>
</tr>
</tbody>
</table>

**Set Values workflow activity**

The **Set Values** activity sets values on the current record when the workflow quiesces or ends.
Input Fields

The values you enter in the following fields determine the behavior of the activity.

**Set Values Activity Input Fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set these values</td>
<td>From the list on the left, select the field on the current record whose value you want to set when the workflow quiesces or ends. In the user-input field to the right, select or enter the value to which you want that field set.</td>
</tr>
</tbody>
</table>

**Note:** Avoid setting the same fields from different Set Values activities. The workflow only sets the value specified by the last Set Values activity run before quiescing or ending.

**Note:** Using the Set Values activity to set the Approval field on a task does not cancel pending approvals. To approve a task in a workflow, use the Approval Action activity instead.

**SOAP Message legacy workflow activity**

The legacy SOAP Message activity uses SOAP messages defined in the System Web Services plugin and can call the messages using a MID Server.

This activity is deprecated in the Orlando release and no longer shows up in the Workflow canvas for new workflow development. New workflows should use the Orchestration SOAP Activity templates instead.

Existing workflows using it will continue to work as designed. To edit this activity in an existing workflow, you must re-activate the activity.

**Input variables**

**SOAP Message activity input variables**

<table>
<thead>
<tr>
<th>Field</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOAP Message</td>
<td>soap_message</td>
<td>The SOAP Message defined under the System Web Services plugin's Outbound SOAP Message (sysSoapMessage) table. (System Web Services &gt; Outbound &gt; SOAP Message)</td>
</tr>
<tr>
<td>SOAP Message Function</td>
<td>soap_message_function</td>
<td>The function to call that is defined in the SOAP Message. Functions are listed in the SOAP Message Functions related list in each SOAP Message record.</td>
</tr>
<tr>
<td>Field</td>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SOAP Endpoint</td>
<td>soap_endpoint</td>
<td>Endpoint to use instead of the SOAP endpoint value in the SOAP Message Function record. Leave this field blank to use the defined endpoint in the SOAP Message Function record.</td>
</tr>
<tr>
<td>Variables</td>
<td>variables</td>
<td>Variables to substitute into the SOAP Envelope defined in the SOAP Message Function record. Use this format for the string: name1=value1, name2=value2, . . . If either the name or value contains a comma or equal sign, escape these characters with a backslash.</td>
</tr>
<tr>
<td>Use MID Server</td>
<td>use_midserver</td>
<td>Check box for using a MID Server to send the SOAP message. A MID Server might be necessary to reach an endpoint within a firewall or a sub-network that is not visible from the instance. If this check box is selected (true), but no MID Server is defined in the MID Server field, Workflow automatically attempts to find a MID Server.</td>
</tr>
<tr>
<td>MID Server</td>
<td>midserver</td>
<td>Name of the MID Server to use. This field appears when you select the Use MID Server check box. The workflow ignores this parameter if the use_midserver parameter is disabled.</td>
</tr>
<tr>
<td>Sensor Script</td>
<td>sensor_script</td>
<td>The script to execute after the request has been made and a response has been received. You can access the full XML response body from the activity.output object.</td>
</tr>
</tbody>
</table>

**Turnstile workflow activity**

The **Turnstile** activity limits how many times a workflow can pass through the same point.

Use this activity to prevent infinite loops. This activity is useful alongside the **Rollback To workflow activity** activity.
Results

You can assign a result value using the `activity.result` variable from within a script field of the activity. By default, the activity script evaluates if the activity should continue to iterate or stop.

### Turnstile activity results

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>The <strong>Allowed iterations</strong> value is greater than the number of times the workflow accessed this activity.</td>
</tr>
<tr>
<td>Cancel</td>
<td>The workflow accessed this activity more times than the <strong>Allowed iterations</strong> value.</td>
</tr>
</tbody>
</table>

Input variables

Input variables determine the initial behavior of the activity.

### Turnstile activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allowed iterations</td>
<td>Number of times the workflow can pass through this activity before the turnstile ends the loop.</td>
</tr>
</tbody>
</table>

Conditions

The conditions determine which transition comes after this activity.

### Turnstile activity conditions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continue</td>
<td>If the workflow has returned to this point an amount of times less than the allowed iteration.</td>
</tr>
<tr>
<td>Cancel</td>
<td>If the workflow has returned to this point an amount of times more than the allowed iteration.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

### Turnstile activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Executing</td>
<td>The workflow engine knows to start the <code>onExecute</code> function of the activity.</td>
</tr>
</tbody>
</table>
Unlock workflow activity

The Unlock activity releases a lock that was previously placed by the Lock activity.

To release a lock, specify the same lock key that was specified in the Lock activity. If the Lock activity had a Duration specified, and that duration has already passed, the lock will already be released.

Input variables

Input variables determine the initial behavior of the activity.

Unlock activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock key</td>
<td>The Mutex key that releases the lock. This key must match the key specified by a Lock activity. For more information, see Lock activity.</td>
</tr>
</tbody>
</table>

States

The activity state tells the workflow engine what to do with the activity.

Unlock activity states

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Finished</td>
<td>The activity successfully released the lock.</td>
</tr>
</tbody>
</table>

Subflow activities in workflow

Subflow activities run and manage workflows from a parent workflow.

The Parallel Flow Launcher subflow activity is available.

Parallel Flow Launcher workflow activity

The Parallel Flow Launcher activity launches multiple subflows in parallel.

Workflows running in parallel execute simultaneously and may complete in any order. The activity can launch a single subflow or multiple subflows as needed. You can manage the input values and values returned for each subflow.
**Note:** The Parallel Flow Launcher activity waits until all subflows are completed before proceeding. If any subflow does not finish, the activity waits indefinitely.

**Note:** Do not launch a large number of subflows with the Parallel Flow Launcher activity. If overused, this activity can overburden the instance. For launching very large numbers of subflows, consider putting the Parallel Flow Launcher inside a loop controlled by a turnstile or other conditional activity and having it do batches.

### Activity variables

Activity variables determine the initial behavior of the activity.

#### Parallel Flow Launcher activity input variables

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parallel Flow Launcher configuration</td>
<td>A unique name for the activity.</td>
</tr>
<tr>
<td>Name</td>
<td>The stage to display when the workflow reaches the activity.</td>
</tr>
<tr>
<td>Stage</td>
<td>Inputs to the subflows to run. Specify an array of name: value pairs for each input defined in the workflow being launched. The name and data type of each input variable entered must match those used by the subflow that this activity launches. For a detailed example, see Parallel Flow Launcher Example.</td>
</tr>
<tr>
<td>Inputs</td>
<td>The workflow to run.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Check Advanced, to enter a script that uses a WorkflowCoordinator object to manage the subflows. When you check Advanced, a text box appears where you can enter a script that specifies a unique workflow for each set of input variables. See WorkflowCoordinator object for more information.</td>
</tr>
<tr>
<td>Count</td>
<td>If not specified by an input set, Count determines the number of subflows executed in parallel from this activity. If the Advanced option is not selected, ensure that this field is populated with a valid number.</td>
</tr>
<tr>
<td>Max flows</td>
<td>The maximum number of workflows this activity can launch. If this value is a positive integer, it overrides the max parameter used in the WorkflowCoordinator constructor.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Max simultaneous</td>
<td>The maximum number of parallel workflows this activity can run at one time. If this value is a positive integer, it overrides the poolsize parameter used in the WorkflowCoordinator constructor.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Parallel Flow Launcher Process</td>
<td></td>
</tr>
<tr>
<td>Process flow complete</td>
<td>To specify a script that runs after each subflow completes, check <strong>Process flow complete</strong>. If you check this field, a text box labelled <strong>Flow complete</strong> appears, where you can enter the script to run.</td>
</tr>
<tr>
<td>Flow complete</td>
<td>The script that runs each time a subflow finishes. This field is available when the <strong>Process flow complete</strong> option is selected.</td>
</tr>
<tr>
<td></td>
<td>The same script functions and variables available in other workflow scripts, such as those in the Run Script activity, are available here. For more information, see Completed subflow values in scripts.</td>
</tr>
<tr>
<td></td>
<td>The variable &quot;flow&quot; is available to this script. It is an object that contains the following information about the flow that is finishing:</td>
</tr>
<tr>
<td></td>
<td><strong>flow.output (String):</strong> The value that the subflow returns to the parent if it executed a Return Value activity before ending.</td>
</tr>
<tr>
<td></td>
<td><strong>flow.index (Number):</strong> The zero-relative index of the subflow that finished.</td>
</tr>
<tr>
<td></td>
<td><strong>flow.contextId (String):</strong> The sys_id of the workflow context for the completed subflow.</td>
</tr>
<tr>
<td></td>
<td><strong>flow.inputs (Object):</strong> The inputs that were passed to the subflow when its context was created and started.</td>
</tr>
<tr>
<td></td>
<td><strong>flow.status (String):</strong> The final state of the context. This corresponds to the state column in the subflow context record, which has possible values of executing, finished, cancelled, or faulted. (Since the flow is completed, it cannot be executing at this point.)</td>
</tr>
</tbody>
</table>

### States

The activity state tells the workflow engine what to do with the activity. To view an activity’s state, point to the activity. A pop-up window shows the **State** and **Result** of the activity. If the activity is in an error state, the pop-up window provides a brief **Fault Description**.

**Parallel Flow Launcher activity states**

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waiting</td>
<td>The activity is waiting for all subflows to finish. All subflows have started and some may have finished.</td>
</tr>
<tr>
<td>Finished</td>
<td>The activity successfully completed all of the subflows.</td>
</tr>
<tr>
<td>Error</td>
<td>The activity encountered an error.</td>
</tr>
</tbody>
</table>
WorkflowCoordinator object
A WorkflowCoordinator object specifies which subflows to run and the input variables to pass to those subflows.

When using a WorkflowCoordinator object, you can create a Parallel Flow Launcher activity that launches multiple subflows. When using the activity without a WorkflowCoordinator object, you can only launch a single subflow multiple times. Use one of the following methods to specify a WorkflowCoordinator object for the activity when the Advanced activity input variable is selected.

- Reference a workflow scratchpad variable that contains an existing WorkflowCoordinator object. To save a WorkflowCoordinator object to the scratchpad, call the save(variableName) function on the WorkflowCoordinator object. You can reference the object using the value passed in the variableName parameter. For example, you can create a WorkflowCoordinator object in a Run Script activity, save the object using <object>.save('coord'), and then call this object by entering coord in the Workflow activity variable of a subsequent Parallel Flow Launcher activity.

- Define the WorkflowCoordinator within the Workflow activity variable. Add the javascript: identifier at the beginning of the script. The Parallel Flow Launcher example shows how to use a WorkflowCoordinator object in this way.

- Create a factory class to define the WorkflowCoordinator object. The system does not provide a factory class for WorkflowCoordinator by default.

Completed subflow values in scripts
The Parallel Flow Launcher activity exposes additional variables you can use in scripts.

Additional variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coordinator</td>
<td>The WorkflowCoordinator used when running the subflows. You can use this variable in the Finished script to perform any final operations. Additionally, you can use the WorkflowCoordinator in a later workflow activity by passing the activity name or sys_id to the WorkflowCoordinator.load('&lt;Activity&gt;') function. For example, to load the WorkflowCoordinator object from a Parallel Flow Launcher activity called Launch Subflows, enter var coord = WorkflowCoordinator.load('Launch Subflows'); in a later activity.</td>
</tr>
</tbody>
</table>
Variable | Description
--- | ---
flow | The subflow launched by the activity that completed most recently. You can use this variable in the **Flow complete** script to perform any post-processing operations on each subflow. To get a complete subflow from a coordinator object, use `var flow = coord.getFlow(I);` where `I` is the numeric index of the subflow based on the order it was launched.

These values are available from the completed subflow:

- **index**: the numerical index of this subflow based on the order it was launched
- **workflow**: the sys_id or name, depending on which you passed to the WorkflowCoordinator constructor, of the workflow used for this subflow
- **inputs**: any input values provided to the launched subflow
- **status**: status of the subflow context
- **output**: the value returned by the subflow
- **contextId**: the sys_id of the workflow context for the subflow

**Parallel Flow Launcher example**

This example shows how to use the **Parallel Flow Launcher** activity with an array of input values and with a WorkflowCoordinator object.

**Sample workflow**

This example shows a SQL-based web server with four application nodes. A single subflow runs to provision the database, and multiple parallel subflows each configure an application node. Finally, a separate set of parallel subflows configures the nodes to use a load balancer and sets up the server DNS.
Provision the application nodes

The first Parallel Flow Launcher activity launches the Provision Node subflow four times. The activity passes a unique IP address to each subflow from an array in the Inputs variable. The scripts defined in the Flow complete and Finished script variables write log messages regarding the status of the subflows.
Activity Properties: Parallel Flow Launcher

Name: Provision application nodes

Stage:

Inputs: [u_host: '192.168.0.10], [u_host: '192.168.0.20], [u_host: '192.168.0.30], ...

Advanced:

Workflow: Provision Node

Count:

Max flows: 25

Max simultaneous: 5

Process flow complete:

Flow complete:

```
1 // To access the flow that completed, use the 'flow' variable.
2 //
3 // var flowOutput = flow.output;
4 //
5 workflow.debug("Provision Node Finished. Context: " + flow.contextId);
```

Process finished:

Finished script:

```
1 // To access the set of completed workflows use the 'coordinator' variable.
2 //
3 // var flowResult = coordinator.getFlow(1).output;
4 //
5 workflow.debug("All Nodes Provisioned");
```
Add nodes to the load balancer

The second **Parallel Flow Launcher** activity uses WorkflowCoordinator objects to specify which subflows to run. The `coordinator` variable stores the completed flow information from the previous **Provision Nodes** activity. The script then retrieves the IP address and port for each node that was provisioned. The `coord2` WorkflowCoordinator object runs the Add Node to Load Balancer subflow once for each node, using the retrieved IP address and port information as input variables. Finally, the `coord2` WorkflowCoordinator object runs the SetupDNS subflow once to configure the load balancer.

```javascript
javascript:
var coordinator = WorkflowCoordinator.load('Provision Nodes');
var coord2 = new WorkflowCoordinator(
    workflow: 'Add Node to Load Balancer'
);
for (var i = 0; i < coordinator.getNumFlows(); i++) {
    var ip = coordinator.getInput(i).ip;
    var port = coordinator.getInput(i);
    coord2.add(
        ip: ip,
        port: port
    );
} 
var loadBalancerIP = '10.0.20.10';
coord2;
```

Specifying which subflows to run

Workflows used as subflows

A workflow can launch another workflow as an activity.

The parent workflow triggers the subflow and then waits for the subflow to complete before continuing. Run the workflow validation tool prior to publishing to detect missing subflows and other dependency problems, such as those involving update sets.

The **Workflows** tab in the Workflow Editor contains a list of the workflows available for use as subflows.
Workflows available to use as subflows

Make sure that the selected subflow is active. If the subflow is inactive, the main workflow will hang with a **Loading** message. If you place an inactive subflow into a workflow, the subflow appears with a red banner, indicating that it cannot run. An active subflow is highlighted in blue when selected.
Subflows and the Create Task activity

If a workflow contains a Create Task activity that has executed on the current record, additional task activities in the workflow might not execute as expected.

This can happen when the same subflow containing a Create Task activity runs more than once in a parent flow. When the subflow reruns and attempts to execute the Create Task activity again, the system reopens the first task activity instead and does not create an additional task.

Note: An alternative to creating duplicate subflows that use the Create Task activity is to add a Run Script activity to the workflow that creates a task with a script.
The same create task activity runs twice in a workflow

In this configuration, the workflow does not run the same subflow containing a Create Task activity more than once. This allows the workflow to create additional tasks.
Running different subflows containing the Create Task activity

View workflow activity descriptions

Tooltips are available for workflow activities to help you understand how to use each activity.

1. To view an activity description in the Workflow Editor, point to the icon for the activity in the palette.
2. To modify activity descriptions, navigate to Workflow > Administration > Activity Definitions and edit the Description field.

Note: To view more information about an activity, double-click the activity on the canvas and then click the help icon in the title bar of the Activity Properties window.

Elements in workflow activity definitions

Each activity can specify a number of elements that control the behavior of the activity or are controlled by the activity.

Not all activities specify all possible elements. See Workflow activities for links to the activities provided by default. Each activity description includes a detailed explanation of the specific elements offered by that activity.
## Workflow activity elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Results</td>
<td>The possible <code>activity.results</code> value. The activity result usually determines which condition the activity transitions through.</td>
</tr>
<tr>
<td>Scratchpad entries</td>
<td>Scratchpad variables the activity depends on to run, or variables the activity writes to the scratchpad.</td>
</tr>
<tr>
<td>Input variables</td>
<td>Values that control the behavior of the activity. Fields to set these values appear on the Activity Properties form when a new activity is added to a workflow. See <code>Activity variables</code> for more information.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Determines which transition the activity follows after completing. See <code>Manage workflow activity conditions</code> for more information.</td>
</tr>
<tr>
<td>States</td>
<td>Determines how the workflow handles the record being executed.</td>
</tr>
</tbody>
</table>

## Add an activity to a workflow

Available activities are displayed in the Core, Packs, and Custom tabs in the Workflow Editor palette.

1. In the Workflow Editor, check out a workflow.
2. To add a workflow activity, drag it from the Core, Packs, or Custom tab to the canvas and drop it on a transition line in the workflow body.

   The transition turns blue when it is connected to the new activity. The designer adds the activity to the flow at that point and displays the property form for the new activity.

   If an activity is greyed out, approval engines are enabled for the table on which the workflow runs. To use the activity, turn approval engines off for the table.
Unavailable activities and approval engines

3. Create any additional conditions needed for the activity and ensure that all exits are connected.

4. Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that can cause a workflow to hang.

**Note:** All activity descriptions have a Table value. If this value is Global, the activity is available for use with any workflow regardless of the table selected in the workflow properties. Activities that identify a specific table appear in the palette only if the table configured for the workflow matches or extends the table identified in the activity.
Adding an activity to a workflow

Duplicate a workflow activity
You can duplicate an activity used in a workflow, including all the configured properties.

1. Right-click the activity and select **Copy Activity** from the context menu.
   The system automatically duplicates the activity, but does not create transitions.
2. Double-click the copy and configure the properties appropriately.
3. Drag the activity to a location in the workflow.
4. Add **transitions**.
Manage transitions between workflow activities

Transitions define the processing path of the workflow, depending on conditions defined in each activity.

All conditions in an activity must have a transition and all transitions must have a connection to another activity or to the End activity.

**Note:**

Run the workflow validation tool prior to publishing to detect missing or disconnected transitions that could cause a workflow to hang.

1. Add transitions to the workflow using either of these methods:
   - Drag and drop an activity directly onto a transition line to connect it to the adjacent activities. The transition line turns blue when the connection is made. The system updates the transitions automatically to reflect the new sequence.
Drag the activity to an open area in the canvas and create the transitions manually. Click the yellow square on the right side of the activity condition and drag a connector to the next task.
2. You can draw multiple transitions from the same activity condition if the activity executes concurrently.

3. To remove a transition, click to highlight it, and then press Delete.

**Custom activity transitions**

Controls on the Approval - User activity enable an administrator to add additional workflow transitions to the activity other than the default transitions of Approved or Rejected.

Transitions defined using this method do not become a permanent feature of the Approval - User activity. After a new transition is configured, that transition must be applied manually to subsequent instances of the activity, where desired.

**Manage workflow activity conditions**

Activities contain default conditions that determine which transitions are followed.

For example, the Approval - User activity has two conditions, Approved and Rejected.
You can use a JavaScript condition check to create custom conditions on Core workflow activities. (Custom activities do not support this feature.)

1. Right-click the activity and select **Add Condition** from the context menu.
2. In the New Workflow Condition dialog box, fill in the fields as appropriate (see table).

### New Workflow Conditions form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The label that is displayed on the workflow.</td>
</tr>
<tr>
<td>Activity</td>
<td>Name of the activity for which this condition is submitted. This value is populated automatically by the system.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief description of this condition.</td>
</tr>
<tr>
<td>Condition</td>
<td>A JavaScript condition check. The following variables are available:</td>
</tr>
<tr>
<td></td>
<td>- <code>current</code>: Current record that the workflow is running against.</td>
</tr>
<tr>
<td></td>
<td>- <code>activity.result</code>: Result value set by the activity upon completion.</td>
</tr>
<tr>
<td></td>
<td>- <code>activity.vars</code>: Variables associated with the Workflow Executing Activity record. Used for advanced condition checks.</td>
</tr>
<tr>
<td>Skip during generate</td>
<td>If selected, the Generate activity does not follow this transition to generate approvals or tasks.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
4. To change the order in which conditions appear on the workflow activity, right-click the activity and select **Reorder Conditions**.
   
   A dialog box appears, with a list of the available conditions.
List of conditions in the current activity

5. Drag the conditions to a new position in the list.
6. Click OK.

**Activity result value**

The result value specified by an activity controls the condition through which the activity transitions.

Use the result value as part of the Condition field in the activity. For example, if the Condition field of an Approval - User activity contains `activity.result == 'rejected'`, the activity transitions through that condition when a rejection is received from the approver. Result values are set in the Script field of the activity definition.

**Edit the workflow activity properties form**

Customize which workflow variables appear on an activity properties form and how the variables are arranged on the form.

1. Navigate to Workflow > Administration > Activity Definitions.
2. Scroll to the activity that you want to work with and click the activity name.
3. On the Workflow Activity Definition form, click the Edit Variables Layout related link.
4. On the Form Design page for the Activity Properties form, add and remove activity variables. The activity variables appear as separate items that you can rearrange on the form.

For more details on using the form design interface, see Using the form designer.
Using workflow approval activities and rolling back workflows

When you work with approvals, you need to understand how approval activities interact with approval engines, how to correct a skipped approval workflow activity, and how rollbacks work.

Approval workflow activities and approval engines

Approvals can be managed by approval activities or approval engines, but not both. Approval activities can be used if approval engines are not turned on for the table associated with the workflow.

Approvals can be managed by approval activities or approval engines, but not both. Trying to use both can cause a range of issues. Approval activities are not available (greyed out) in the palette if approval engines are used on the specified table. If you hover over a greyed out approval activity in the palette, a comment with more information is provided. For more information about approvals and approval engines, see Approvals.

Unavailable approval activities

To turn approval engines off for the table, navigate to the System Properties > Approval Engines and change the setting for the table to Turn engines off.
### Turn off approval engines

### Correct a skipped workflow approval activity

While a workflow is in an active context, an approval activity can skip to the next activity.
An approval activity might skip for the following reasons:

- The approval user or group is missing or invalid (for example, sys_id).
- The approval user or group became inactive after the approval record was created.
- The activity is a *dot-walked* field, such as current.opened_by.department.manager, and it has a missing or invalid approval user or group.
- The business rule on the table that is associated with the workflow is invalid.

To correct a missed approval activity:

1. Navigate to **Workflow > Live Workflows > All Contexts**.
2. Click the date and time in the **Started** column for the workflow that is incorrectly processing approval activities.
3. In **Related Links**, click **Show Workflow**.
4. Review the portion of the workflow that executed, and then do one or more of the following:
   - Verify that after approval, the workflow progressed to the next activity. If a workflow failed to progress, check the business rules. For more information, see [Debugging business rules](#).
   - Point to each processed approval activity to find activities where the **State** is **Finished** and **Result** is **Skipped**.
5. Navigate to **Workflow > Workflow Editor** and open the workflow.
6. Double-click the skipped approval activity.
7. Click **Users** or **Groups**.
8. Assign an active user or group for the approval activity. For more information, see [Workflow error handling](#).

**Rollback To activity**

When conditions in a workflow trigger a **Rollback To** activity, the workflow moves processing backward to a specified activity in the workflow and resets certain activities that have already executed back to their original state. This is useful when handling an unexpected failure or as part of a programmed logical flow.

When an activity is reset during a workflow rollback, the following happens:

- Approvals are reset to **Not Requested**.
- Tasks are reset to either **Open** or **Pending**. A rollback workflow path cannot create new tasks.

Activities that perform external system operations, such as deleting a file or sending an email, are not rolled back. Only approval and task activity states are reset.

A workflow can contain a single rollback, multiple rollbacks, or nested rollbacks in more complex workflows. The **Rollback To** activity resets activities based on the actual workflow sequence (transition line attachments) of activities between itself and the transitioned to activity, rather than using the execution order to determine where processing should restart.

**Rollback To behavior**

The **Rollback To** activity transitions directly to the activity specified by the transition line arrow.

Use the **Rollback To** activity for all workflows that use multiple or nested rollbacks. **Rollback To** resets the targeted task (the direct transition) to **Open**. All tasks that have executed between the **Rollback To** activity and the targeted task (rolled back task) are set to **Pending**.

(0) Begin

(1) Log Message

(2) Task 1
(3) Task 3
(4) Task 2
(5) Timer
(6) Approval 1
(7) Roll back to first task
(8) Task 1
(9) Task 2
(10) Approval 1
(11) Log approval
(12) Join
(14) Send email
(15) End
The state of (3) Task 3 does not change, since this activity does not directly transition from the rollback target activity. To see what activities were rolled back, select the Workflow Transition History related list and look at the Rolled back column.

The Rollback To activity (7) updates the following activities:

(8) Task 1: reset to Open
(9) Task 2: reset to Pending
(10) Approval 1: reset to Not Yet Requested
Using variables in Notify workflow activities

Certain Notify workflow activities support variable substitution for reading text to callers.

Certain Notify workflow activities allow you to use variables, such as those from the workflow scratchpad, to determine the activity behavior. Each activity supports a maximum of 20 variables. The following activities allow variable substitution:

<table>
<thead>
<tr>
<th>Activity</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Say</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Input</td>
<td>Supports variable substitution in the Text field only.</td>
</tr>
<tr>
<td>Play</td>
<td>Supports variable substitution in the URL field only.</td>
</tr>
</tbody>
</table>
 Scratchpad variables

You can call variables from the workflow scratchpad or the activity scratchpad using the syntax `${variable_name}`. You do not need to include either workflow.scratchpad or activity.scratchpad before the variable name. For example, to use the variable `activity.scratchpad.langCode = 'en-US'`, call `${langCode}` within the activity. If the scratchpad does not contain the specified variable, the variable evaluates to an empty value.

You can get values from objects on the scratchpad using the format `${object.value}`. For example, you can get the name of a user object, such as `workflow.scratchpad.user = {name:'john.smith'}` by calling `${user.name}`.

The digit variable

The Input activity exposes the `${digit}` variable. Use this variable in each condition presented by the activity. The number read to the user is determined automatically by each condition. The caller can press that number to cause the activity to transition through that condition.

Use multiple timer activities in one workflow

Workflow timer activities store data independently of each other in an activity-specific scratchpad.

Previously, all timer activities in a workflow accessed a single, shared scratchpad, which could lead to conflicts when adding multiple timer activities to one workflow.

Timer scratchpads entries hold these values:

- `workflow.scratchpad.endTime`
- `workflow.scratchpad.realStartTime`
- `workflow.scratchpad.retroactiveSecsLeft`

Publish a custom workflow activity

When a user creates a custom activity and saves or submits it, that activity appears in the Custom and Packs tabs of the designer palette, but is only visible to the user who created it.

When configuration is complete, the user clicks Publish, which makes the activity accessible to other users on the instance with the workflow_admin or activity_creator role. Published activities are available for upload to the ServiceNow Store, can be added to workflows, and can be edited by any user with the proper roles.

To edit a published activity, click Checkout. When an activity is checked out by a user, only that user can modify it. The fields of a checked out activity are read-only for all other users. When the checked out activity has been modified successfully, the user publishes it again. The system adds a new version of this activity to the Custom tab in the Workflow Editor palette.

**Note:** Activities you create and publish are only visible in the Packs tab if they were created in the current application scope.
Locked versions

Problems can arise if an activity version is checked out by a user and not checked back in, for example, when the user is sick or leaves the company. An activity in this state cannot be checked out for update.

A user with the admin role can return a locked activity to a published state. The administrator opens the locked activity from the Custom tab of the Workflow Editor, selects the checked-out version, and selects **Force Checkout**, and then **Publish**.

Workflow activity pinning

Workflow administrators can pin a custom activity to prevent the system from automatically updating that activity when a new version is downloaded from the ServiceNow Store.

You can pin or unpin individual activities or set pinning within workflow properties that controls the versions used for all the activities in that workflow. This can result in two workflows using different versions of the same activity.

**Note:** Activity pinning and unpinning applies to the custom activities downloaded from the ServiceNow Store only, and does not apply to newly published activity definitions made locally on your instance. To make use of these locally updated custom activities, you must check out your workflow and manually add the activities.
