Now Platform capabilities

Digitize your workflows and run them at scale by using the core capabilities of the Now Platform®. When you activate and configure these features, you can create custom business logic, manage and secure data, and build alternate user interfaces.
Digitize your workflows with the Now Platform

Use native platform intelligence to predict, prioritize, and proactively manage the work that matters most for your own organization.

*View and download the full infocard for a highlight of Now Platform capabilities features.*

Automate work with Flow Designer

Turn business processes into digital workflows to deliver more intuitive experiences by extending ServiceNow solutions or building new workflow apps with no-code development tools.
Connect your enterprise with IntegrationHub

Connect your systems and apps using Now Platform APIs and tools. Use the ServiceNow Store to get access to an entire ecosystem of innovation for enterprise software.
Create engaging app experiences with Service Portal
With Service Portal, you can deliver your apps to employees through a portal that they can access from any device, at any time.

**Improve agent efficiency with Agent Workspace**

Solve issues faster with a workspace that is built to facilitate resolutions. From a single view, agents get full context and AI-assisted recommendations to resolve issues quickly. Agents can communicate with customers from the same interface while reviewing issues.

**Get started**

- Learn how to build your first flow. See *Getting started with flows*
- Review the list of available IntegrationHub spokes. See *IntegrationHub available spokes*
- Learn how to build your first portal. See *Understanding Service Portal*
- Learn how to set up and use Agent Workspace. See *Exploring workspace*

Advanced Work Assignment

Use the ServiceNow® Advanced Work Assignment (AWA) feature to automatically assign work items to your agents, based on their availability, capacity, and optionally, skills. AWA pushes work to qualified agents using work item queues, routing conditions, and assignment criteria that you define. Agents see their assignments in their Agent Workspace inbox.
Customers use different channels to request service, for example, chats, cases, or incidents. Requests from customers create task or interaction records that store information about these objects, called work items.

AWA automatically routes work items to queues that focus on certain types of support, using criteria (such as priority or customer status) that you provide. Queues can be defined based on need or type, for example product or critical cases. You also identify the agent groups responsible for work in the queue. AWA then applies assignment rules that you set and uses agent availability, capacity, and skills (if defined) to assign work to the most qualified agent.

**Advanced Work Assignment components**

**Service channels**

A means of providing customer service. AWA offers base system channels for chats, cases, incidents, and walk-up centers. For each channel, you can set attributes such as agent capacity and utilization conditions to control the work handled in the channel.
Work items
A single piece of work to be handled by an agent from start to completion. For example, one chat or one case are objects that are routed and assigned to agents.

Work item queues
A queue stores a specific type of work item for a service channel. AWA admins can create queues that focus on certain types of support within the channel, such as VIP customers or critical cases. AWA routes work items to queues based on specific conditions or requirements that you define, such as customer status, or region. Groups assigned to each queue handle the incoming work items. Once work items are placed in a queue, AWA can then assign items to available agents based on assignment rules and agent availability and capacity.

Assignment groups
Agents belong to specific groups that are organized by the type of work assigned to them. You provide details about an assignment group including the name and description, manager, and group email. You can also set up roles, groups and group members, queues, and agent capacity overrides for agents in an assignment group.

Assignment rule
Criteria that determines how work items are pushed to the appropriate agent within a qualified assignment group.

Agent capacity
The maximum number of work items on a particular service channel that an agent may actively work on at one time.

Agent availability
States that indicate agent presence and whether the agent is available for work or is busy or offline. AWA uses the agent availability state to determine if an agent is able to receive work.

Inbox layout
A configuration tied to a service channel that defines which fields of a record representing a work item are shown in agent inboxes. A layout defines what the agent sees in Agent Workspace.

Advanced Work Assignment roles
AWA adds the following roles for users who configure, manage, and receive work assignments.

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWA administrator</td>
<td>Admin role for the AWA feature. Configures and administers across all channels.</td>
</tr>
<tr>
<td>(awa_admin)</td>
<td></td>
</tr>
<tr>
<td>AWA manager</td>
<td>Manager role for the AWA feature. Monitors performance of agents across all service channels.</td>
</tr>
<tr>
<td>(awa_manager)</td>
<td></td>
</tr>
<tr>
<td>AWA agent</td>
<td>Agent role for the AWA feature. Handles customer interactions and manages workload across multiple service channels.</td>
</tr>
<tr>
<td>(awa_agent)</td>

Basic process for configuring AWA

Users with the awa_admin role determine:

- What to route – Configure the base service channels to be used.
- Where to route – Define the work item queues and the routing rules, execution order, work item sort order, and strategy.
- How to assign work items – Define the assignment rules that determine the work items pushed to agents.
- What the agent sees – Set the inbox card layouts and presence (availability) states that agents use in their Agent Workspace inbox.

For details on the AWA components and related configuration, see these sections.

- Get started with Advanced Work Assignment
- Service channels
- Work item queues
- Work assignments
- Using Agent Affinity
- Agent Inbox controls
- Create or modify a work item size override
- Out-of-the-box Performance Analytics Solutions for Advanced Work Assignment

Get started with Advanced Work Assignment

To implement Advanced Work Assignment, complete these initial configuration and setup steps.

Role required: awa_admin and admin

1. Activate the Advanced Work Assignment plugin for your instance.
2. Activate related AWA plugins to enable base system service channels and the Performance Analytics Solution for AWA. For example, activate the Agent Chat plugin to enable the Chat service channel and Agent Chat in Agent Workspace.
3. Configure the service channels that you activated.
   - Create or modify an inbox layout.
   - Override agent capacity as needed.
4. Create agent groups to which work items are assigned.
5. Create work item queues for your service channels.
   - Define the pools of agents eligible for assignment (eligibility assignment).
   - Set the sort order for work items in the queue.
6. Configure the work assignment rules used to push work to the appropriate agents.
7. Set the controls that agents use to manage their availability states and assignments in Agent Workspace.
   - Create or update the presence states that agents use to indicate their availability.
   - Create or update the reasons that agents use to decline work assignments.
Activate Advanced Work Assignment

You can activate the Advanced Work Assignment plugin (com.glide.awa) if you have the admin role.

Role required: admin

Advanced Work Assignment activates the Skills Management (com.snc.skills_management) plugin to implement user and group skills.

### Plugins for Skills Management

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skills Management (com.snc.skills_management)</td>
<td>Implements user and user group skills. Based on the same principles of roles management, which uses inheritance between user groups.</td>
</tr>
</tbody>
</table>

1. Navigate to **System Definition > Plugins**.
   
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in **Request a plugin**.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.
To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

Activate the related AWA plugins to enable the appropriate service channels and the Analytics and Reporting Solutions for Advanced Work Assignment.

**Activate related plugins for Advanced Work Assignment**

After activating the Advanced Work Assignment plugin, activate related AWA plugins to enable other base system service channels and the Performance Analytics Solutions dashboard for AWA. You must have the admin role to activate these additional plugins for AWA. For details, see **Activate a plugin**.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent Chat (com.glide.interaction.awa)</td>
<td>Enables the Chat service channel in AWA and chat messaging in Agent Workspace. Includes default configuration data for chats, including demo data.</td>
</tr>
<tr>

<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Advanced Work Assignment for CSM (com.snc_csm.awa)</td>
<td>Enables the Case service channel in AWA. Includes configuration data supporting routing, queuing, and assignment of CSM cases.</td>
</tr>
<tr>
<td>Advanced Work Assignment for Incidents (com.snc.incident.awa)</td>
<td>Enables the Incident service channel in AWA. Includes a default configuration to support AWA for incidents.</td>
</tr>
<tr>
<td>Walk-up Experience (com.snc.walkup)</td>
<td>Activates the walk-up contact service channel for prebuilt tech lounges. Enables an IT organization to support online and offsite checkin.</td>
</tr>
<tr>
<td>Performance Analytics Content Pack – Advanced Work Assignment</td>
<td>Activates the Performance Analytics Content Pack for AWA. Provides base system KPIs.</td>
</tr>
</tbody>
</table>

**Migrate from Connect Support to Advanced Work Assignment and Agent Chat**

Agent Chat (live chat) is the real-time messaging system that agents use in Agent Workspace to interact with customers. To migrate from Connect Support, use AWA to create the chat queues used for routing chat work items to agents and the Chat Setup form to configure Agent Chat.

Role required: admin

1. Activate the Advanced Work Assignment and Agent Chat plugins if they are not currently active.
2. If needed, review your existing Connect Support chat queues and determine whether you want to create a similar set of queues for the Chat service channel in AWA.

   **Note:** You cannot use your Connect Support chat queues in AWA. Chat queues for Connect Support are stored in the Chat Queue (chat_queue) table, while chat queues for AWA are stored in the AWA Queue (awa_queue) table.

3. In AWA, **configure the Chat service channel** and **create the associated chat queues**.
4. In the Chat Setup form, specify Agent Workspace as the fulfiller interface for live chat.
   a) Navigate to **Collaboration > Chat Setup**.
   b) In the **Global Fulfiller UI** choice list or the **Fulfiller UI** choice list for CSM or ITSM, select Agent Workspace.
   c) Click **Update**.

**Components installed with Advanced Work Assignment**

Several types of components are installed with activation of the Advanced Work Assignment plugin, including tables, user roles, and scheduled jobs.

**Note:** The Application Files table lists the components installed with this application. For instructions on how to access this table, see **Find components installed with an application**.

Demo data is available for this feature.

Domain separation in Advanced Work Assignment

This overview describes domain separation in the Advanced Work Assignment feature. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes **Basic** level
- Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application.

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another. Business logic:

Overview

Advanced Work Assignment enables the automatic assignment of work items to qualified agents using work item queues defined for specific service channels. Service providers (SPs) can create domain-specific queues by specifying a particular domain as a queue routing condition.

How domain separation works in Advanced Work Assignment

When an instance has a domain hierarchy where users and groups belong to different domains, you may need to restrict the visibility of work items to certain agents in a domain. You may also need to ensure that work items are routed to agents in the proper domain. AWA admins can configure service channels and associated work item queues to:

**Route work by domains**

To push work items to agents in domains where only certain tasks or interactions are visible to them, use a routing condition that routes those items to the appropriate queues. For example:

- To restrict a queue to only items that match exactly to a particular domain X, specify this condition: **(Domain) (is) (X)**
- To route all work items in domain X and its child domains to a queue, use the **Domain Path** field and specify a condition such as: **(Domain Path) (starts with) (!!!/!!#/)**
Assign work to agents in the appropriate domain

To assign work items to agents in the appropriate domain, ensure that the assignment groups specified in the queue Eligibility Assignment pools have agents that belong to the domains where they can see the work items routed to the queue.

If a mismatch occurs, and agents in an eligible assignment group cannot see a work item in a queue, AWA may temporarily assign an item to an agent. However, before the item is moved to the agent’s inbox, AWA automatically rejects the assignment with the reason No access. AWA reassigns the work item to a different agent who might have access. If none of the available agents can see the work item, the item could be rejected multiple times.

Warning: The item can get stuck in the queue until the AWA admin corrects the eligible assignment configuration.

Service channels

Provide customer support for your full range of incoming work by automatically routing work to agents through service channels.

A service channel is a means of assigning a specific type and scope work to agents. You can configure base system service channels to set the context and service channel attributes that define the work handled in the channel, or you can create your own custom service channel.

Advanced Work Assignment provides several service channels from which work items originate. These channels are:

<table>
<thead>
<tr>
<th>Service channel</th>
<th>Description</th>
<th>Plugin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat</td>
<td>Used to route and assign chat interactions</td>
<td>Included with the Agent Chat (com.glide.interaction.awa) plugin</td>
</tr>
<tr>
<td>Case</td>
<td>Used to route and assign customer service cases</td>
<td>Included with the Customer Service (com.sn_customerservice) plugin</td>
</tr>
<tr>
<td>Incident</td>
<td>Used to route and assign incidents</td>
<td>Included with the Advanced Work Assignment for incidents (com.snc.incident.awa) plugin</td>
</tr>
<tr>
<td>Walk-up</td>
<td>Used to route requests from a walk-up contact channel</td>
<td>Included with the Walk-up Experience (com.snc.walkup) plugin</td>
</tr>
</tbody>
</table>

You can also set up a custom service channel to address work that is not supported in the base system channels. For more information, see Set up a custom service channel.

For each service channel, you set attributes such as:

- Agent capacity: amount of work that can be handled by the agents supporting the channel.
- Filters: conditions that filter the type of work handled in the channel.
- Utilization: conditions that determine when work items are generated.

For each service channel, you also:

- Create the agent inbox card layout used in Agent Workspace.
- Set capacity overrides for specific agents.
- Review and modify associated work item queues. For the Chat service channel, you can create queues using the Queues related list.

**Service channel capacity and utilization**

In Advanced Work Assignment, capacity is the number of work items automatically assigned to agents supporting a service channel. Utilization is the condition that identifies the work item states supported in the channel.

Agents have an assigned capacity for each service channel. This capacity is based on the default capacity set for the channel. The agent capacity for one service channel (for example, chat) does not interfere with the capacity on other service channels (for example, case or incident). Admins can set the **Default capacity** for a channel on the Service Channel form. This setting applies to all agents supporting the channel.

Managers can override the default capacity for:

- Individual agents, by using the Agent Capacity Override related list on the Service Channel form.
- Groups of agents, by using the Agent Capacity Override related list on the Group form.

If an agent already has a capacity override, setting the override again updates the existing capacity for that agent. Override capacity is stored in the Agent Capacity (awa_agent_capacity) table.

**Inbox layout**

The inbox layout determines the information shown on work item cards displayed in an agent’s inbox.

The AWA admin (awa_admin) can configure layouts that represent items in an agent inbox. The configuration allows agents to see the most important attributes by service channel work items. The fields specified on the inbox layout determine the information displayed for a work item.

Each base system service channel provides preconfigured inbox layouts for work items. The AWA admin can view and edit these layouts and also create new layouts.

Up to five fields can be shown in the card layout:

- Fields can be added from the table that the service channel points to.
- Fields are dot-walkable.
- The first field added to the layout becomes the title field on the card.

**Layout example**

For chats that do not have either a contact or consumer, the layout includes only the chat subject. You control the display of the **Time to accept** count (timer) and the **Reject** button through the agent assignment rules.
Configure a service channel

Modify or create a service channel that is used in Advanced Work Assignment. You can specify additional conditions to filter the work items that are handled in the channel, change agent capacity (workload) for the channel, set the inbox layouts that your agents use in Agent Workspace, and view associated work item queues.

Role required: awa_admin or admin

If you activate the corresponding plugins, AWA provides base system channels for the following services:
- Chats (com.glide.interaction.awa)
- Cases (com.snc_csm.awa)
- Incidents (com.snc.incident.awa)
- Walk-up interactions (com.snc.walkup)

For each channel, you can change certain default settings, such as the default capacity (workload) for agents. You can also use the related lists to review associated queues, define the associated inbox layouts (work item cards) that are displayed in Agent Workspace, and override the agent capacity value.

You can also create a service channel record from the Service Channel module, but you need to create a queue, assignment rule, and eligible assignment pool to route work through the service channel. For more information, see Set up a custom service channel.

1. Navigate to Advanced Work Assignment > Service Channels.
   - To create a service channel, click New.
   - To modify a service channel, select the service channel record to be updated.

2. On the form, fill in the fields.
## Service Channel form

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name of the selected base system service channel to be configured:</td>

<td>- For walk-up: State is not On Hold, Closed Complete, or Closed Abandoned</td>
</tr>
</tbody>
</table>

3. **Click Update.**
   The channel is added to or updated in the Service Channels (awa_service_channel) table.

   - **Override the agent capacity** for selected agents or groups.
   - **Create or modify an inbox layout** for the service channel.
   - **Configure agent assignment rules** for the channel.
   - **Define agent pools eligible for assignment.**
   - **Create or modify a work item queue** for the channel.
   - **Create or modify a work item size override** for the channel.

**Set up a custom service channel**

Set up a custom service channel to expand the type and scope of work that is routed automatically to your agents.

- Select the table that you want to use to route work to agents automatically. Only Task (task) and Interaction (interaction) tables are supported.
- Ensure that the form layout for the selected table is configured for the workspace view. Record types without a workspace view appear as read-only in Agent Workspace. For more information, see *Set up forms in Workspace.*
- If you want to open a record in AWA for a table that extends another table that has a service channel defined, ensure that the workspace view for that table has already been defined.
- Assign the awa_agent and workspace_agent roles to whichever agents are receiving work items in Agent Workspace from your custom service channel.

Role required: awa_admin or admin

You can create a service channel record from the Service Channel module, but you need to create a work item queue, assignment rule, and eligible assignment pool to route work through
the service channel. You also need to configure the custom service channel to make it available in an agent's inbox in Agent Workspace.

1. Navigate to Advanced Work Assignment > Service Channels, and then click New.
2. Complete the service channel fields, and then click Submit.
   For more information, see Configure a service channel.
3. Create an assignment rule.
   For more information, see Configure agent assignment rules.
4. Create a work item queue for your service channel.
   For more information, see Create a work item queue.
5. On the form for the work item queue that you created, go to the Assignment Eligibility related link and create an eligible assignment pool.
   Make sure to associate your assignment rule to the eligible assignment pool.
   For more information, see Define agent pools eligible for assignment.
6. Make your service channel available in Agent Workspace.
   a) Navigate to Advanced Work Assignment > Presence States, and then open Available.
   b) On the form, move your custom service channel to the Selected list.
   c) Select Active option (if not already selected).
   d) Click Update.
7. Optional: Create or modify the inbox card layout to show the most important information from a work item.
   For more information, see Create or modify an inbox layout.

Your custom service channel routes work to agents. In Agent Workspace, the service channel appears as an available service channel in the agent inbox.

**Tutorial: Set up a custom service channel for change requests**

Learn how to configure Advanced Work Assignment to automatically assign change requests to agents. Use this tutorial as a guideline to help you understand how service channel records, queues, and assignment rules work together to create a custom service channel.

In this tutorial, you learn how to set up a custom channel that:

- Assigns new change requests to whichever Change Management agent has the most capacity
- Populates the assignee's agent inbox in Agent Workspace with change requests from the queue
- Displays the change request number, short description, and type on the inbox card
- Enables the agent to accept or reject change requests

For information on setting up custom service channels, see Set up a custom service channel.

Before you begin:

- Ensure that the form layout for the Change Request table is configured for the workspace view; otherwise, work items from the Change Request service channel appear as read-only in Agent Workspace. For more information, see Set up forms in Workspace.
- Assign the awa_agent and workspace_agent roles to the Change Management group so that members can open work items in Agent Workspace.
Create a service channel to route requests
Create a service channel in Advanced Work Assignment so that you can route change requests to agents.

Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Service Channels, and then click New.
2. On the form, fill in the fields.
   - Name: Change Request
   - Inbox Order: 100
   - Table: Change Request (change_request)
   - Active: Selected
   - Utilization condition: (Active) (is) (true)
3. Click Submit.

Create an assignment rule for change requests
Create an assignment rule in Advanced Work Assignment that assigns change requests to agents who are available to do the tasks.

Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Assignment Rules, and then click New.
2. On the form, fill in the fields.
   - Name: Change Request Assignment Rule
   - Assign by: Most Capacity
   - Allow agents to reject: Selected
3. Click Submit.

Create a queue to route new change requests
Create a work item queue in Advanced Work Assignment that routes new change requests through the service channel that handles change requests.

Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Queues, and then click New.
2. On the form, fill in the fields.
   - Name: Change Management
   - Service channel: Change Request
   - Condition mode: Simple
   - Work item routing condition: (State) (is) (New)
3. From the form context menu, click Save.

Create an assignment pool of agents
Create an eligible assignment pool in Advanced Work Assignment that receives overflow work items, just in case you need more help from other agents to handle change requests.

Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Queues, and then open the Change Management queue.
2. On the form, go to the Assignment Eligibility related list and click New.
3. On the form, fill in the fields.
   - Agent assignment rule: Change Request Assignment Rule
• Groups: Change Management

4. Click Submit.

Make your service channel available in Agent Workspace
Make your service channel available in Agent Workspace so that agents can receive change requests in their inbox.
Role required: awa_admin or admin
1. Navigate to Advanced Work Assignment > Presence States, and then open Available.
2. On the form, move Change Request to the Selected list.
3. Select Active (if not already selected).
4. Click Update.

Customize how change requests appear in an agent inbox
Customize how change requests appear in an agent inbox so that agents receive enough information to decide whether to accept or reject the work item.
Role required: awa_admin or admin
1. Navigate to Advanced Work Assignment > Service Channels and open the Change Request service channel record.
2. On the Change Request service channel form, go to the Inbox Layouts related list and open Default Change Request layout.
3. On the form, fill in the fields.
   • Field 1: Number
   • Field 2: Short description
   • Field 3: Type
4. Click Update.

When you create a new change request, the item is routed through the Change Request service channel and assigned to the agent in the Change Management assignment group who is available to receive the change request. When the assignee checks their agent inbox, the change request appears with the option for the agent to either reject or accept the work item.
Create or modify an inbox layout

Create or modify the card layout for inbox items for a given service channel. Card layouts are displayed in the agent inbox view of Agent Workspace.

Role required: awa_admin or admin. Users with the awa_manager or agent role can review inbox layouts.

Cards represent work items in an agent’s inbox in Agent Workspace. Each channel has a default layout for these cards, which can display up to five fields from the related table record. Use the Inbox Layout form to change a default layout, such as the name, short description, and the specific fields displayed on the card, for example channel and contact or consumer name. You can also specify certain conditions that determine when the card layout is used.

1. Navigate to Advanced Work Assignment > Service Channels and select the service channel to be updated.
2. In the Service Channel form, click the Inbox Layouts related link.
   - To create a layout, click New.
   - To modify a layout, select the layout to be updated.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the inbox layout.</td>
</tr>
<tr>
<td>Service channel</td>
<td>The name of the selected service channel.</td>
</tr>
<tr>
<td>Short description</td>
<td>The description of the inbox layout.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the layouts appear in the agent inbox.</td>
</tr>
<tr>
<td>Field</td>
<td>Definition</td>
</tr>
<tr>
<td>------------</td>
<td>----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Condition</td>
<td>A condition that determines when this layout is used. Use the condition builder to specify a condition that must evaluate to true to apply the layout.</td>
</tr>
<tr>
<td>Card layout</td>
<td>Example card layout.</td>
</tr>
<tr>
<td>Field 1</td>
<td>The field from the table for the channel, for example the Interaction (interaction) table for the chat service channel. Select the field or select None to remove an existing field.</td>
</tr>
<tr>
<td>Field 2</td>
<td>The field from the table for the channel, for example the Interaction (interaction) table for the chat service channel. Select the field or select None to remove an existing field.</td>
</tr>
<tr>
<td>Field 3</td>
<td>The field from the table for the channel, for example the Interaction (interaction) table for the chat service channel. Select the field or select None to remove it.</td>
</tr>
<tr>
<td>Field 4</td>
<td>The field from the table for the channel, for example the Interaction (interaction) table for the chat service channel. Select the field or select None to remove it.</td>
</tr>
<tr>
<td>Field 5</td>
<td>The field from the table for the channel. For example, the Interaction (interaction) table for the Chat service channel. Select the field or select None to remove it.</td>
</tr>
</tbody>
</table>

4. Click **Submit** for a new layout or **Update** to modify a layout. The layout is added to or updated in the Inbox Layout (awa_inbox_layout) table.

As needed:
- **Override the agent capacity** value for selected agents or groups.
- **Create or modify a work item queue** for the channel.

**Override agent capacity for selected agents**

Change the default number of work items that an agent can handle for a service channel.

Role required: awa_manager, awa_admin, or admin

To change the capacity for selected agents, use the **Agent Capacity Override** related list for the service channel. To change the capacity for one or more members of a selected group, use the **Agent Capacity Override** related list for the group (**Advanced Work Assignment > Groups**).

1. Navigate to **Advanced Work Assignment > Service Channels** and select the desired service channel.
2. In the **Agent Capacity Override** related list, click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Channel</td>
<td>Name of the selected channel.</td>
</tr>
<tr>
<td>Override Capacity</td>
<td>Number of work items that the selected agents can handle.</td>
</tr>
</tbody>
</table>
### Create or modify a work item size override

Create a work item size override if you want Agent Affinity to calculate an agent's workload using a work item size other than the default.

Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Service Channels and select the desired service channel.
2. On the form, select the Work Item Size Override list.
   - To create an override, click New.
   - To modify an existing override, select the override that you want to update.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the override.</td>
</tr>
<tr>
<td>Service Channel</td>
<td>Service channel that is assigned to the override.</td>
</tr>
<tr>
<td>Override Size</td>
<td>Size to use instead of the default.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which Advanced Work Assignment considers this size override.</td>
</tr>
<tr>
<td>Condition mode</td>
<td>Type of condition for routing work items using this size override:</td>
</tr>
<tr>
<td></td>
<td>- Simple: Specify a routine condition using the condition builder.</td>
</tr>
<tr>
<td></td>
<td>- Advanced: Specify a JavaScript scripted condition.</td>
</tr>
</tbody>
</table>

4. Click Submit.
   The selected agents and their associated capacity values are listed in the Agent Capacities table.

If you are configuring a service channel, you can [create or change an inbox layout](#) for the channel.
### Work item queues

In Advanced Work Assignment, queues store a specific type of work item for a service channel. You define the queues that AWA uses to route work items, based on specific routing conditions or requirements that you provide, such as product or customer attributes. For each queue, you also assign the agent groups handling the incoming work items.

AWA administrators can create or modify queues based on customer need. As part of creating or modifying a queue, the awa_admin identifies some information about the queue, including the service channel to which the queue belongs.

The awa_admin can select a schedule that defines when the queue is available and identify a time limit within which an agent should accept a work item in the queue. If the selected service channel is Chat, the awa_admin creates the chat messages that are displayed to users.

Routing conditions identify the work items that are routed to a queue. Create routing conditions in one of two ways:

- **Simple**: use a condition builder to select routing conditions. The fields available for selection are based on the selected service channel.
- **Advanced**: use a JavaScript script to identify routing conditions.

The awa_admin can also create a queue without routing conditions so that work items are not routed to that queue automatically. Customers can manually assign work items to the queue or assign work items using assignment tools such as matching rules or Flow Designer.

When a case in a queue is assigned manually, the case is removed from the queue. The state of the work item is set to **Canceled** and the cancellation reason is set to **Manually assigned**.

### Configure routing rules that use chat context variables

You can specify routing rules that use chat context variables in the condition builder. You define chat context variables in Chat Setup. These variables can store contextual information that can be used in routing conditions that control where chat work items are routed.

For example, you can define chat context variables to store user responses from pre-chat surveys. If you store these responses in chat context variables, such as a user’s department or a product name, you can specify the context variables in queue routing conditions to direct where the live chat is routed. When you specify a routing condition using the condition builder, you can dot walk to the Context fields. In the fields menu, select **Show Related Fields** and open the fields menu again to select **Context # Interaction Context fields**.
You can then select from the available chat context variables in the condition builder. For example, choosing `csp_category` becomes `Context.csp_category`.

**Assign pools of agents eligible to work on a queue**

Assign one or more agent groups to a queue using the **Eligibility Assignment** related list. These groups are eligible to receive work items from the queue, which allows work to get prioritized to eligible agents.

Select an agent assignment rule and any eligibility time constraints for each group. The eligibility time constraints are used to determine when the next pool of agents is eligible for assignment. For example, you can assign one group to handle work items immediately and a second group to handle the overflow from the first group after work items sit in the queue for a specified amount of time.

*Note:* If no groups are assigned to a queue, work items can be routed to the queue but Advanced Work Assignment does not assign them.

**Create a sort order for a queue**

Use the **Work Item Sort Order** related list to create one or more sort conditions for work items in a queue. For each sort condition, specify a field from the selected service channel table and the direction to sort, either ascending or descending. Items in the queue are sorted and assigned to agents based on these conditions.

**Create a work item queue**

Define or modify a queue so that you can determine which specific work items are routed automatically to agents through a given service channel.

Role required: `awa_admin` or `admin`
Depending on the service channel, additional configuration options are available. For example, in the chat channel you define the standard messages displayed during a chat session with a user.

1. Navigate to **Advanced Work Assignment > Queues**.
   - To create a queue, click **New**.
   - To modify a queue, select the queue record to be updated.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the queue. A default queue may be available for the service channel you activated through the AWA-related plugins.</td>
</tr>
<tr>
<td>Service channel</td>
<td>Channel to which the queue belongs. For the chat channel, define the standard messages displayed to chat users in the Chat Messages section.</td>
</tr>
<tr>
<td>Active</td>
<td>Option indicating whether the queue is enabled.</td>
</tr>
<tr>
<td>Short description</td>
<td>Brief explanation of the queue.</td>
</tr>
<tr>
<td>Schedule</td>
<td>Support schedule that defines when the queue is available.</td>
</tr>
<tr>
<td>Order</td>
<td>During routing, the order in which AWA considers the routing condition for this work item queue, in comparison to other queues.</td>
</tr>
<tr>
<td>Target wait time</td>
<td>Estimated time (Days or Hours, minutes, seconds) allotted for an agent to accept an item in the queue.</td>
</tr>
<tr>
<td>Max Wait Time</td>
<td>Maximum amount of time that an agent has to accept or reject a chat request. After time runs out, the requester receives the <strong>No Agents Available Message</strong> that is defined in Chat Setup.</td>
</tr>
</tbody>
</table>

Note: The Max Wait Time field is available after you associate the queue to the chat service channel.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>Type of scoped application.</td>
</tr>
<tr>
<td>Routing Condition</td>
<td>Option that indicates a routing condition is to be applied to the queue. If checked, define the <strong>Condition mode</strong> and <strong>Work item routing condition</strong>.</td>
</tr>
<tr>
<td>Condition mode</td>
<td>Type of condition for routing work items in the queue.</td>
</tr>
</tbody>
</table>

- Simple: Specify a routing condition using the condition builder.
- Advanced: Specify a JavaScript scripted condition.
### Field | Definition
--- | ---
Work item routing condition | Condition that applies to routing work items to this queue. Use the condition builder to select routing conditions. The fields available for selection are based on the selected service channel. For the chat service channel, you can specify chat context variables in the condition builder by *dot-walking* to related context fields. For example, if you defined chat context variables that store pre-chat routing information, you can dot walk to those chat context variables in the condition builder. You can use the variables in routing conditions to specify where chats are routed.

Script | JavaScript condition statement that specifies the work items to be routed to the queue. The condition must evaluate to true.

Chat Messages | For the chat service channel.

Question | Initial phrase that users see when they start a new chat in the queue. For example: How can we help you?

Confirm problem | Message to users acknowledging the chat request. For example: Thank you for contacting support. Someone will be with you shortly to assist you.

Initial agent response | Message that users see when an agent accepts a chat. For example: Thank you for contacting support. I am looking into your question now and will be with you shortly.

### 3. Click **Submit** for a new queue or **Update** to modify the queue.

The queue is added to or updated in the Queues (awa_queue_list) table.

As needed:
- Define the **Assignment Eligibility**.
- Optionally define the **Work Item Sort Order**.
- Optionally define the **Set Agent Affinity rules**.

### Define agent pools eligible for assignment

Specify pools of agents eligible to receive overflow work assignments for a queue. An eligible assignment pool can consist of one or more groups of agents available to work on items in the queue. This feature enables AWA to find a qualified agent from a wider pool of agents.

Role required: admin

Use the **Assignment Eligibility** related link to expand the pool of agents eligible to work on items in the queue when other agents are busy or unavailable. For each agent pool, select...
the assignment rule that determines the assignment eligibility. If you do not define an eligible assignment pool for a queue, work items are routed to the queue but AWA does not assign them.

1. Navigate to **Advanced Work Assignment > Queues** and in the Queues (awa_queues) table, click the queue to update.
2. To create an assignment pool, go to the **Assignment Eligibility** related link.
   - To create a new eligible assignment pool, click **New**.
   - To modify the assignment eligibility for a pool of agents, select the pool to be updated.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent assignment rule</td>
<td>The name of the rule that determines how work items are to be assigned. Select an assignment rule from the list.</td>
</tr>
<tr>
<td>Eligible at</td>
<td>The length of time in seconds before AWA considers the next set of agents for assignment.</td>
</tr>
<tr>
<td>Groups</td>
<td>The set of groups eligible for assignment.</td>
</tr>
<tr>
<td></td>
<td>- Click the lock icon to unlock it and select the agent groups in the eligible assignment pool.</td>
</tr>
<tr>
<td></td>
<td>- Click the lock icon to lock it.</td>
</tr>
</tbody>
</table>

4. Click **Submit** to create the eligible or **Update** if modifying an eligible assignment pool. The Queues (awa_queues) table is updated with the eligible assignment pool.

**Set work item sort order**

Specify the order in which work items in a queue are sorted.

Role required: awa_admin or admin

1. Navigate to **Advanced Work Assignment > Queues > Module** and select the queue.
2. Click the **Work Item Sort Order** related list and click **New**.
3. In the Work Item Sort Order form, select:
   a) **Field**: The field to be used for the sort. The fields are from the table for the associated channel. For example, the fields available for the chat service channel are from the Interaction table.
   b) **Sort Direction**: The order in which work items are sorted. Select either Ascending (smallest to largest or oldest to newest) or Descending (largest to smallest or newest to oldest).
   c) **Order**: The value of the **Order** value relative to other items in the queue.
4. Click **Submit**.

**Tutorial: Route interactions by context**

Learn how you can configure Advanced Work Assignment to route conversations to agents according to the context of the conversation.

Activate the Customer Service Management Demo Data (com.snc.customerservice.demo) plugin.
A basic understanding of context variables is required. For more information on context variables, see Virtual Agent scripts.

Role required: awa_admin or admin

The **What can we help you with?** record producer is available by default with the Customer Service Management Demo Data (com.snc.customerservice.demo) plugin. In the record producer, chat requesters can specify one of three issue categories that they need help with:

- Product
- Billing
- Order

Whichever category they select passes a value through the `liveagent_csp_category` context variable. Learn how to create queues that route conversations to agents according to the values passed through this context variable.

**Create a queue for product issues**

Create a queue for the Chat service channel that routes product issues.

1. Navigate to **Advanced Work Assignment > Queues**, and then click **New**.
2. Enter the following information in the fields listed:
   - Name: Product Support
   - Service channel: Chat
   - Condition mode: Advanced
3. In the **Script** field, enter this script:

   ```javascript
   (function executeCondition(/* glide record */ current) {
       var contextTable = current.getValue('context_table');
       var interactionBlobRecord = new GlideRecord(contextTable);
       interactionBlobRecord.addQuery('sys_id', current.getValue('context_document'));
       interactionBlobRecord.query();

       if(interactionBlobRecord.next()){
         var jsonBlob = JSON.parse(interactionBlobRecord.getValue('value'));
         if(jsonBlob.liveagent_csp_category == 'product')
           return true;
       }
       return false;
   })(current);
   ```
4. Click **Submit**.

**Create a queue for billing issues**

Create a queue for the Chat service channel that routes billing issues.

1. From the Queues list view, click **New**.
2. Enter the following information in the fields listed:
   - Name: Billing Support
   - Service channel: Chat
   - Condition mode: Advanced
3. In the **Script** field, enter this script:

   ```javascript
   (function executeCondition(/* glide record */ current) {
       var contextTable = current.getValue('context_table');
       var interactionBlobRecord = new GlideRecord(contextTable);
   ```
interactionBlobRecord.addQuery('sys_id',current.getValue('context_document'));
interactionBlobRecord.query();

if(interactionBlobRecord.next()){
    var jsonBlob = JSON.parse(interactionBlobRecord.getValue('value'));
    if(jsonBlob.liveagent_csp_category == 'billing')
        return true;
    return false;
}
)(current);

4. Click Submit.

Create a queue for order issues

Create a queue for the Chat service channel that routes order issues.

1. From the Queues list view, click New.
2. Enter the following information in the fields listed:
   - Name: Order Support
   - Service channel: Chat
   - Condition mode: Advanced
3. In the Script field, enter this script:

   (function executeCondition(/* glide record */ current) {
       var contextTable = current.getValue('context_table');
       var interactionBlobRecord = new GlideRecord(contextTable);
       interactionBlobRecord.addQuery('sys_id',current.getValue('context_document'));
       interactionBlobRecord.query();

       if(interactionBlobRecord.next()){
           var jsonBlob = JSON.parse(interactionBlobRecord.getValue('value'));
           if(jsonBlob.liveagent_csp_category == 'order')
               return true;
           return false;
       }
   })(current);

4. Click Submit.

Work assignments

After routing work items to the appropriate queues and corresponding agent groups, Advanced Work Assignment pushes work to the most qualified agent using the assignment criteria that you specify.

Administrators can choose to push work items to agents based on one of these assignment rules:

- Most capacity: This option pushes work to agents that have the most capacity (availability for work) for a given channel. For example, suppose that two available agents, John and Beth have different capacities. John has capacity for three chats, but Beth has capacity for two chats and is currently working on one chat. AWA assigns the next work item to John since he has the most capacity.
- Last assigned: This option pushes work to the agent who has gone the longest without a work assignment in the service channel. If more than one agent has the same spare capacity in a service channel, AWA creates and assigns the next work item to the agent who has gone the longest without work in the service channel.
In addition to selecting the assignment rule, AWA admins can also determine whether:

- Agents can reject work items
- A timer is used to set a timeout period (the length of a time that an agent has to reject or accept a work item)
- Agent skills are to be considered in assignment

**Assignment process**

When an agent is available, AWA:

- Checks the queue priority and gets an item from the queue with the highest priority. AWA also reviews items that have timed out or have been rejected by agents.
- Identifies the eligible assignment pool. The eligibility assignment pool widens the group of agents who are eligible to work on an item.
- Determines the available agents based on their presence state, the assignment rule selected (most capacity or last assigned), and also skills, if defined. Agents have spare capacity when they decline, transfer, or complete a work item. For example, after an agent transfers a chat, the agent has additional capacity.
- Pushes the item to the inbox of most qualified agent (the timer begins).

**Skill-based work assignment**

In AWA, you can enable skill-based assignment and if needed, make skill assignment mandatory. The basic process for setting up skills involves the following steps:

1. Identify agents that have specific skills (for example, a foreign language or expertise in a certain area such as network routers) and assign the skills to those agents using the Skills Management feature.
2. Make the agents members of the assignment groups for the work item queues involving those skills.
3. Create an assignment rule in AWA that enables mandatory skill handling for the specific skills.
4. Create the work item queue with a routing condition that includes the specific skill, and include the appropriate group in the eligible assignment pool.
5. Create a scripted business rule that includes the skill in the table associated with the relevant service channel (for example, the Case table).

During work assignment, AWA routes and assigns work items that require the mandatory skills to the Agent Workspace inbox of the most qualified agent.

**Configure agent assignment rules**

Set the criteria for assigning work items to agents. Choose the assignment rule that considers the agent with the most capacity or the agent who has gone the longest without work. Select the timeout period for rejecting work items and indicate whether agent skills are to be considered during assignment.

- A basic understanding of the Skills Management feature is recommended.
- If you want agent skills to be considered when work is routed to the appropriate agents, define the skills for your agents or groups. When you enable the skill handling options in
the Assignment Rules form, AWA assigns the users in groups with the appropriate skills to corresponding work items.

- You can use rules to identify skills and assign it to work items. For more information on defining and assigning skills for work items, refer to Using rules to identify skills for work items

Role required: admin or awa_admin

1. Navigate to Advanced Work Assignment > Assignment Rules.
   - To create a new rule, click New.
   - To modify a rule, select the layout to be updated.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the assignment rule.</td>
</tr>
<tr>
<td>Application</td>
<td>The name of the application to which this assignment rule belongs. The default application is Global.</td>
</tr>
<tr>
<td>Short description</td>
<td>A brief description of the assignment rule.</td>
</tr>
<tr>
<td>Assign by</td>
<td>The type of assignment. Select one of the following:</td>
</tr>
<tr>
<td></td>
<td>- Last Assigned: Routes a work item to the agent who has gone the longest without being assigned work.</td>
</tr>
<tr>

<tr>
<td></td>
<td>- Timeout presence state: The agent availability state after the timeout occurs: Available, Away, or Offline.</td>
</tr>
</tbody>
</table>

| Skill handling | Check boxes that enable skill-based work assignments:                     |
|               | - Enable skills: Route work items to agents with the appropriate skills.  |
|               | - Enforce mandatory skills: Route work items to agents with mandatory (required) skills. |
3. Click Submit for a new rule or Update if modifying the rule. The assignment rule is added to or updated in the Assignment Rules (awa_assignment_rule) table.

Tutorial: Assign work to agents by skill

Learn how you can configure Advanced Work Assignment to route cases to agents who speak German. Use this tutorial as a guideline to help you understand how you can route work items to agents according to their designated skills.

Before you begin:
- Activate the Skills Management (com.snc.skills_management) plugin.
- A basic understanding of the Skills Management feature is required.
- To have skills automatically assigned to cases, consider activating the Skill Determination (com.snc.skill_determination) plugin.
- Create a group of users who work in customer support.
- Assign the awa_agent and workspace_agent roles to the customer support group.

Create a skill

Create a “German” skill.
Role required: skill_admin or admin

1. Navigate to Skills > All Skills, and then click New.
2. Enter the following information in the fields listed:
   - Name: German
   - Active: Selected
3. Click Submit.

Create an assignment rule

Create an assignment rule that routes cases according to skills.
Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Assignment Rules, and then click New.
2. Enter the following information in the fields listed:
   - Name: Case Assignment Rule with Skills
   - Assign by: Most Capacity
   - Enable skills: Selected
   - Enforce mandatory skills: Selected
3. Click Submit.

Create a queue

Create a queue where you can route work to agents who have the German skill.
Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Queues, and then click New.
2. Enter the following information in the fields listed:
   - Name: German Cases
• Service channel: Case

3. Click Submit.

Define assignment eligibility

Define who is eligible to receive cases from the German Cases queue.
Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Queues, and then open the German Cases queue.
2. On the form, go to the Assignment Eligibility related link and click New.
3. In the Agent assignment rule field, select Case Assignment Rule with Skills.
4. In the Groups field, select your customer support group.
5. Click Submit.

Cases that require German speakers are routed to users in your customer support group who have the German skill.

Using Agent Affinity

Agent Affinity is an Advanced Work Assignment feature that lets you assign work items by an agent’s work history, related task, or account team affinity.

Advanced Work Assignment assigns work items to agents by their availability, capacity, and skills. You can use Agent Affinity to customize this AWA assignment process and identify the agent best suited for the work item. Agent Affinity ensures that the same agent is assigned to a similar work item instead of orienting a new agent every time.

Note: Agent Affinity rules do not override assignment eligibility or constraints that are specified on AWA assignment rules.

The types of affinities are:

Historical
Identifies the best agent based on the agent’s history of serving the same customer.

Related task
Identifies the best agent based on the agent’s past assignments of related tasks.

Account team
Identifies the best agent based on the agent’s responsibility or role in the account team.

Note: Account team affinity is available only to Customer Service Management (CSM) customers.

Affinity rules are associated with AWA queues. Up to three rules can be associated with each queue. The affinity order determines how the assignment engine ranks the agents. The agent with the higher order affinity rule is considered as the best agent first.

The following example shows how AWA uses Agent Affinity to determine the best agent for a work item. In this example, AWA is configured to use all three affinities in this order: related task affinity, account team affinity, and historical affinity. George Warren, who is a customer at the Boxeo company, has a router problem. George previously contacted support to report an issue. That
case was assigned to agent Ned. The primary support agent for Boxeo is agent John. Within the past seven days, another agent, agent Beth, addressed a chat with Boxeo.

The next time George initiates a customer service chat from the case page, the case is automatically added as a related task to the chat interaction. Agent Affinity uses the related task affinity to look for an agent who has fulfilled past assignments for a related task. Because agent Ned was assigned to a related task on the record, AWA assigns the work item to agent Ned if he is available and has the capacity.

Example of related task affinity

If agent Ned is unavailable or doesn't have the capacity, AWA uses the account team affinity. AWA looks for another agent based on an agent's responsibility or role in the account team. Because agent John is the primary support agent for the Boxeo company, AWA assigns the work item to Agent John if he is available and has the capacity.
**Example of account team affinity**

If agent John is not available, AWA uses the historical affinity and looks for an agent that has recently interacted with the company. This information is stored on the Agent Affinity screen. Because agent Beth addressed a chat with Boxeo within the past seven days, AWA assigns the work item to agent Beth if she is available and has the capacity.
Activate Agent Affinity

You can activate the Agent Affinity plugin (com.glide.awa.agent_affinity) if you have the admin role. This also activates the Advanced Work Assignment plugin.

Role required: admin

1. Navigate to System Definition > Plugins.

   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

   ![You have been redirected to All Applications. To see the Plugins list click here](image)

2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.

   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.

   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.
To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

**Configure Agent Affinity rules**
Create or modify the Agent Affinity rules that route work items in Advanced Work Assignment.
Role required: awa_admin or admin
1. Navigate to **Advanced Work Assignment > Settings > Agent Affinity Rules**.
   - To create a new affinity rule, click **New**.
   - To update an existing affinity rule, click the affinity rule.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the affinity rule.</td>
</tr>
<tr>
<td>Service channel</td>
<td>Service channel that the rule applies to.</td>
</tr>
<tr>
<td>Application</td>
<td>Name of the application.</td>
</tr>
</tbody>
</table>
**Set Agent Affinity rules**

Specify the Agent Affinity rules to determine the order in which work items in a queue are sorted.

Role required: awa_admin or admin

1. Navigate to **Advanced Work Assignment > Settings > Queues** and select the queue.
2. Click the Agent Affinity related list.
   - To create a new Agent Affinity rule mapping, click **New**.
   - To modify an existing Agent Affinity rule mapping, select the mapping to be updated.
3. On the form, fill in the fields.

   **Agent Affinity Rule Mapping form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent Affinity Rule</td>
<td>Agent Affinity rule to be used for the sort.</td>
</tr>
<tr>
<td>Order</td>
<td>Value of this rule relative to the other rules in the queue. Rules are ordered from lowest to highest so a rule with an order of 100 is considered before a rule with an order of 200.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
   
   You can specify a maximum of three Agent Affinity rules per queue.

**Deactivate Agent Affinity**

Deactivate Agent Affinity if you do not want Agent Affinity to assign work assignments to agents.
Role required: awa_admin or admin

1. In the navigation filter, enter sys_properties.list. The entire list of properties in the System Properties (sys_properties) table appears.
2. In the Search field, enter glide.awa.agent_affinity.enabled.
3. Click glide.awa.agent_affinity.enabled.
4. On the system property screen, change Value from true to false and click Update. Agent Affinity is now deactivated.

Agent Inbox controls

Control certain elements of the agent experience in Agent Workspace. Define the agent presence (availability) states and the work item rejection reasons used by agents to decline work assignments in their Agent Workspace inbox.

Agent presence states

Agent availability in Agent Workspace Inbox

AWA admins can define the presence states that agents choose in their inbox to indicate their availability. The default states are:
- Available: Solid green bubble indicates that the agent is available to receive work.
- Away: Solid yellow bubble indicates that the agent is not available to receive work.
- Offline: Solid grey bubble indicates that the agent is not available to receive work.

AWA developers with the awa_integration_user role can also use JavaScript or REST APIs to get or set agent presence and agent channel availability. For more information, see
- Agent Presence API (REST APIs)
- Agent - Global (JavaScript APIs)
Agent rejection controls

AWA admins can give agents the option to reject work assignments and specify the reason for rejecting it. The **Reject** button displays on work assignment cards. When an agent rejects an assignment, a pop-up window enables the agent to select a reason for declining the work item.

Configure agent presence states

Create or modify the availability states that agents use to indicate whether they can receive work or are offline or away. Agents set these states in their Agent Workspace Inbox.

Role required: awa_admin or admin. Users with the awa_manager and awa_agent roles can review the presence states.

The default presence states are Available, Away, and Offline. For the Available state, be sure to enable it (using the Active check box) so that AWA can route work to agents.

1. Navigate to **Advanced Work Assignment > Presence States**.
   - To create a new presence state, click **New**.
   - To update an existing presence state, click the presence record.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the presence state, for example: Out of office. The default presence states are Available, Away, or Offline.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box for enabling this presence state for agents.</td>
</tr>
</tbody>
</table>

**Note:** For the default Available state, be sure to enable this **Active** check box so that work items are routed to available agents. If the **Active** state is not enabled, AWA does not route work items to agents.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available to receive work items</td>
<td>Check box for indicating that agents can handle work items in this presence state. If the presence state is Away or Offline, this box is not selected.</td>
</tr>
<tr>
<td>Service channels</td>
<td>The service channels that can use this presence state. To select a service channel, move the channel name from the <strong>Available</strong> list to the <strong>Selected</strong> list.</td>
</tr>
<tr>
<td>Description</td>
<td>A brief description of the state.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which this state is displayed in the agent inbox.</td>
</tr>
<tr>
<td>Show channels</td>
<td>Check box that enables you to restrict the service channels in which agents can update their presence using this state. When you select this field, the <strong>Restrict agent update</strong> field is displayed.</td>
</tr>
</tbody>
</table>
Restrict agent updates

The service channels in which agents cannot use this state to update their presence. Click the lock icon and select the appropriate channels. When you complete your selections, click the lock icon to lock the field.

Apply to all groups

Check box that indicates all groups can use this presence state. To specify only certain groups that can use this presence state, unselect this check box to display the Apply to groups list.

Apply to groups

The selected groups that can use this presence state. To select a group, move the group name from the Available list to the Selected list.

3. Click Submit for a new presence state or Update if modifying an existing presence state. The presence state is added to or updated in the Presence States (awa_presence_state) table. The presence state is also listed in the Availability section of the Agent Workspace Inbox for the agents belonging to the groups and channels that use this state.

Configure reasons for rejecting work items

Define the reasons that agents can use to decline work assignments that they receive in their Agent Workspace inbox. A reject reason can apply to all service channels or a single channel that you specify.

Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Reject Reasons.
   - To create a new rejection reason, click New.
   - To update an existing rejection reason, click the reason record.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the reason for rejecting work items.</td>
</tr>
<tr>
<td>Agent selectable</td>
<td>A check box that indicates the reject reason is selectable by agents in their Agent Workspace Inbox.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which the reject reasons are listed in the agent inbox.</td>
</tr>
<tr>
<td>Apply to all service channels</td>
<td>A check box that indicates the reject reason applies to all service channels. To make the reason available to a single channel, unselect this check box and in the Service channel field, select the appropriate channel.</td>
</tr>
</tbody>
</table>
### Field Definition

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service channel</td>
<td>A list for selecting the service channel to which the reject reason applies. This field is displayed when <strong>Apply to all service channels</strong> is not enabled.</td>
</tr>
</tbody>
</table>

3. Click **Submit** for a new reason, or if changing an existing reason, click **Update**. The rejection reason is added to or updated in the Reject Reasons (awa_reject_reason) table.

### Reassign rejected or timed-out work items

Configure whether rejected work items can be reassigned to the agent who rejected it.

**Role required:** admin

1. Navigate to **Advanced Work Assignment > Settings > Reject Reasons**.
2. Click the reason record you want to change.
3. On the form, configure the **Reassignable** field:
   - If you want to be able to reassign the work item to the agent who rejected it, select the **Reassignable** field.
   - If you do not want to be able to reassign the work item to the agent who rejected it, unselect the **Reassignable** field.

### Management

Configure Advanced Work Assignment properties using the Management menu options.

Only users with awa_manager privileges can access the Management menu options.

### Operations dashboard

Enable managers to monitor Operation (operation) work items so that their agents can better support customer needs.

This dashboard is available in the Advanced Work Assignment content pack. For information on activating the content pack, see *Analytics and Reporting Solutions for Advanced Work Assignment*. 
Advanced Work Assignment dashboard for Operations

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
## Use case

This dashboard provides support managers with an overview of incoming work items and the availability of agents to handle them. Managers can monitor these daily trends to determine if adjustments should be made to the routing criteria, agent capacity values, and other settings that determine how work is pushed to agents.

## Indicators

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Work Items</td>
<td>Total number of interaction work items that were created today. The goal for this indicator is to minimize the number of interaction work items that agents receive.</td>
</tr>
<tr>
<td>Accepted Work Items</td>
<td>Percentage of interaction work items that agents have accepted.</td>
</tr>
<tr>
<td>Exceeding Target Work Items</td>
<td>Percentage of interaction work items that have exceeded the target wait time.</td>
</tr>
<tr>
<td>Rejected Work Items</td>
<td>Percentage of interaction work items that agents have rejected.</td>
</tr>
<tr>
<td>Timed Out Work Items</td>
<td>Percentage of interaction work items that timed out.</td>
</tr>
<tr>
<td>Weekly Trends</td>
<td>Number of work items in each of the following states for the past week:</td>
</tr>
<tr>
<td></td>
<td>- New</td>
</tr>
<tr>
<td></td>
<td>- Exceeding Target</td>
</tr>
<tr>
<td></td>
<td>- Abandoned</td>
</tr>
<tr>
<td></td>
<td>- Rejected</td>
</tr>
<tr>
<td></td>
<td>- Timed Out</td>
</tr>
</tbody>
</table>

## Breakdowns

To analyze data according to different categories, select a breakdown from the dashboard menu:

- Service Channel
- Queue
- Assignment Group
For more information on analyzing data with breakdowns, see *Using breakdowns on dashboards.*

**Reports**

<table>
<thead>
<tr>
<th>Title</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accepted Work Items - Last Hour</td>
<td>Single</td>
<td>Number of Interaction work items that agents have accepted in the past hour.</td>
</tr>
<tr>
<td>Abandoned Work Items - Last Hour</td>
<td>Single</td>
<td>Number of Interaction work items that agents have abandoned in the past hour.</td>
</tr>
<tr>
<td>Average Wait Time - Last Hour</td>
<td>Single</td>
<td>Average amount of time that customers have spent waiting for an agent response in the past hour.</td>
</tr>
</tbody>
</table>

**Check for an agent’s presence and capacity**

View a list of agents in Advanced Work Assignment, their presence status, and capacity for each of the agent’s service channels to see which agent can handle a case. This list is filtered across different teams, channels in teams, and channels dashboards.

Role required: awa_admin or admin

1. Navigate to **Advanced Work Assignment > Agent Presence and Capacities.**
2. In the list, check which agent is available to handle a case:

**AWA Agent Presence and Capacities form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent</td>
<td>Name of the agent.</td>
</tr>
<tr>
<td>Field</td>
<td>Definition</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Current presence state</td>
<td>Presence state that is currently assigned to the agent.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time that this agent was last updated.</td>
</tr>
<tr>
<td>Channel</td>
<td>Service channel that is assigned to the agent.</td>
</tr>
<tr>
<td>Capacity in use</td>
<td>Current workload of agent.</td>
</tr>
<tr>
<td>Capacity</td>
<td>Maximum capacity that the agent can handle.</td>
</tr>
</tbody>
</table>

### Check unassigned interactions

View a list of unassigned interactions in Advanced Work Assignment from chat and phone that are currently waiting in the queue and are not assigned to any agents. You can use this list to debug, implement advanced work assignments, or determine why certain work items are not being assigned.

Role required: awa_manager or admin

1. Navigate to **Advanced Work Assignment > Unassigned interactions**.
2. In the list, check the unassigned interactions:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Interaction number.</td>
</tr>
<tr>
<td>Type</td>
<td>How the interaction began (for example, chat, phone, or walk-up).</td>
</tr>
<tr>
<td>Created</td>
<td>Date that the interaction was created.</td>
</tr>
<tr>
<td>Opened for</td>
<td>Name of the user starting the interaction.</td>
</tr>
<tr>
<td>Account</td>
<td>Name of the company that is associated with the interaction.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User that is assigned to the interaction.</td>
</tr>
<tr>
<td>State</td>
<td>Status of the interaction.</td>
</tr>
<tr>
<td>Queue</td>
<td>Queue that is assigned to the interaction.</td>
</tr>
<tr>
<td>Offered on</td>
<td>Date that the interaction was first offered to an agent.</td>
</tr>
<tr>
<td>Rejected</td>
<td>Interaction that was rejected by the agent.</td>
</tr>
<tr>
<td>Timed Out</td>
<td>Interaction that has exceeded the timeout specified in assignment rule.</td>
</tr>
<tr>
<td>Exceeded Queue Target Wait Time</td>
<td>Interaction that has waited longer than the target wait time of the queue.</td>
</tr>
</tbody>
</table>

### Check unassigned task work items

View a list of unassigned task work items in Advanced Work Assignment, such as cases and incidents, that are currently waiting in the queue and are not assigned to any agents. You can use this list to debug, implement advanced work assignments, or determine why certain work items are unassigned.
Role required: awa_manager or admin

1. Navigate to Advanced Work Assignment > Management > Unassigned Task Work Items.
   - To create a task, click New.
   - To modify an existing task, select the task to be updated.

2. On the form, fill in the fields.

   **Work Item form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Whether the task is still being worked on or is complete.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Task name.</td>
</tr>
<tr>
<td>Offered on</td>
<td>Date that the task was first offered to an agent.</td>
</tr>
<tr>
<td>State</td>
<td>List that shows the status of the task:</td>
</tr>
<tr>
<td></td>
<td>- Accepted</td>
</tr>
<tr>
<td></td>
<td>- Cancelled</td>
</tr>
<tr>

<td>- Pending Accept</td>
</tr>
<tr>
<td></td>
<td>- Queued</td>
</tr>
<tr>
<td>Assignment rule</td>
<td>Rule that assigns cases that meet the matching rule criteria to a</td>
</tr>
<tr>
<td></td>
<td>customer service agent.</td>
</tr>
<tr>
<td>Exceeded Queue Target</td>
<td>Task that has waited longer than the target wait time of the queue.</td>
</tr>
<tr>
<td>Wait Time</td>
<td></td>
</tr>
<tr>
<td>Rejected</td>
<td>Task that was rejected by the agent.</td>
</tr>
<tr>
<td>Timed Out</td>
<td>Task that has exceeded the timeout specified in the assignment rule.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>User assigned to the task.</td>
</tr>
<tr>
<td>Document ID</td>
<td>Document ID assigned to the task.</td>
</tr>
<tr>
<td>Previous Work Item</td>
<td>Reference to a previous work item for the same Document ID.</td>
</tr>
<tr>
<td>State changed on</td>
<td>Date that the task state was most recently changed.</td>
</tr>
<tr>
<td>Cancelled reason</td>
<td>Reason that the task was canceled:</td>
</tr>
<tr>
<td></td>
<td>- Disqualified from service channel</td>
</tr>
<tr>
<td></td>
<td>- Manually assigned</td>
</tr>
<tr>
<td></td>
<td>- Time out</td>
</tr>
<tr>
<td></td>
<td>- Transfer was cancelled or rejected</td>
</tr>
<tr>
<td>Is Dismissed</td>
<td>Whether the task has been dismissed.</td>
</tr>
<tr>
<td>Work Item Size</td>
<td>Amount of an agent’s capacity that is used if this task is assigned.</td>
</tr>
<tr>
<td>Wait time</td>
<td>Length of time the task has waited in the queue before being assigned.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Group that is assigned to the task.</td>
</tr>
<tr>
<td>Document table</td>
<td>Document table that is assigned to the task.</td>
</tr>
<tr>
<td>Queue</td>
<td>Queue that is assigned to the task.</td>
</tr>
</tbody>
</table>

3. Click **Submit** to create the task or **Update** to modify the task.
Using Advanced analytics to access AWA dashboards

With advanced analytics, you can view cards that represent the Advanced Work Assignment dashboards that you have access to. You can also see a dashboard picker, which lets you view the cards for all the dashboards in a group. You can then search and choose a dashboard from a list.

Navigate to Advanced Work Assignment > Management > Advanced Analytics.

The advanced analytics for the dashboards lets you see the dashboards in one of these categories: by default, the Recent category is selected when you visit the advanced analytics for the dashboards.

- Recent shows up to nine dashboards that you have visited recently. The most recent are shown first.
- Owned by me shows the dashboards that you have created and those dashboards to which you have been assigned ownership.
- Shared with me shows the dashboards which have been shared with you as a user, or member of a group or role.
- All shows all the dashboards that you have access to.

Note: The category that you choose limits the dashboard groups and individual dashboards that you see when you choose from the Groups list and the Dashboard Picker field. If no dashboards in the incident group have been shared with you, and you select Incident from the Groups list, then the overview displays a note that no dashboards match your search.

All tabs except for the Recent tab are sorted in ascending order by:

1. Dashboard group — Order
   
   The owner of the dashboard can specify an order number in the dashboard group’s form. This field is optional.

2. Dashboard group — Name

3. Dashboard — Order
   
   The owner of the dashboard can specify an order number in the dashboard’s form. This field is optional.

4. Dashboard — Name

Using Advanced Analytics tiles

Tiles on Advanced Analytics show thumbnails of the widgets on the dashboard, the dashboard group, your level of access on the dashboard, the name of the dashboard, and the owner of the dashboard. Dashboard access levels are Owner, Editor, and Viewer. For more information, see Share a responsive dashboard.
**Note:** If you can't view a dashboard widget, you'll see a message that prompts you to contact the administrator. You may not be able to view a dashboard widget because of wrong configuration settings, access restrictions, or because there is no data to display.

**Using the Advanced Analytics Groups list**

The advanced analytics screen defaults to showing only the AWA-related dashboards. You can see other dashboards by changing the Groups list to show only those dashboards in another single group. The **Groups** list shows all dashboard groups without applying ACL rules. You may see dashboard groups in this list that have not been explicitly shared with you.

Click **New** to create a responsive dashboard.

**Create or modify groups for Advanced Work Assignment queues**

Create or manage groups that have associated Advanced Work Assignment queues. Groups are sets of users who share a common purpose. By creating these groups, information that is displayed in AWA is limited to only users that are in AWA groups.
Role required: awa_manager or admin

1. Navigate to Advanced Work Assignment > Management > Groups.
   - To create a group, click New.
   - To modify a group, select the group you want to update.

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the group.</td>
</tr>
<tr>
<td>Description</td>
<td>Helpful information about the group.</td>
</tr>
<tr>

<td>lookup icon, only the members in the parent group are available. The</td>
</tr>
<tr>
<td></td>
<td>members of the child group are not available.</td>
</tr>
<tr>
<td>Updated</td>
<td>Date and time that this group was last updated.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Enable logging for Advanced Work Assignment

Enable logging to monitor AWA routing and assignment.

Role required: awa_admin or admin

1. In the navigation filter, enter sys_properties.list.
2. In the System Property (sys_properties) table, click New and add the     com.snc.awa.syslog.enabled property:
   - Name: com.snc.awa.syslog.enabled
   - Description: Log AWA work item routing and assignments in the system log.
   - Type: true | false
3. Set the Value to true.
4. Click Submit.

Logging for the AWA assignment engine is enabled in the syslog table.
5. To view the system log, navigate to System Logs > System Log > All and perform a search where the Source is AdvancedWorkAssignment.

Analytics and Reporting Solutions for Advanced Work Assignment

Analytics and Reporting Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Enabling Performance Analytics Solutions

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

**Note:** Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.

To enable a solution for Advanced Work Assignment, an admin navigates to System Definitions > Plugins and activates the Performance Analytics - Content Pack - Advanced Work Assignment plugin.

Advanced Work Assignment dashboard for interactions

Enable managers to monitor Interaction (interaction) work items so that their agents can better support customer needs.

This dashboard is available in the Advanced Work Assignment content pack. For information on activating the content pack, see Analytics and Reporting Solutions for Advanced Work Assignment.

</tr>
</tbody>
</table>

**Breakdowns**

Breakdowns divide information into different categories. To analyze data according to different categories, select a breakdown from the dashboard menu:

- Service Channel
- Queue
• Assignment Group

For more information on analyzing data with breakdowns, see *Using breakdowns on dashboards.*

### Reports

<table>
<thead>
<tr>
<th>Title</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accepted Work Items - Last Hour</td>
<td>Single</td>
<td>Number of interaction work items that agents have accepted in the past hour.</td>
</tr>
<tr>
<td>Abandoned Work Items - Last Hour</td>
<td>Single</td>
<td>Number of interaction work items that agents have abandoned in the past hour.</td>
</tr>
<tr>
<td>Average Wait Time - Last Hour</td>
<td>Single</td>
<td>Average amount of time that customers have spent waiting for an agent response in the past hour.</td>
</tr>
</tbody>
</table>

**Advanced Work Assignment dashboard for tasks**

Enable managers to monitor Task (task) work items so that their agents can better support customer needs.

This dashboard is available in the Advanced Work Assignment content pack. For information on activating the content pack, see *Analytics and Reporting Solutions for Advanced Work Assignment.*
Advanced Work Assignment dashboard for Tasks

End users and roles

<table>
<thead>
<tr>
<th>End user and goal</th>
<th>Required role</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWA administrator: Configures Advanced Work Assignment to best fit the business needs of customer service.</td>
<td>awa_admin</td>
</tr>
<tr>
<td>AWA manager: Identifies the areas of concern for routing and assignment of work items across service channels.</td>
<td>awa_manager</td>
</tr>
</tbody>
</table>
### End user and goal

<table>
<thead>
<tr>
<th>End user and goal</th>
<th>Required role</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent manager: Manages agents or agent groups. The agent manager needs to know what agents are working on in order to make sure customer needs are being met.</td>
<td>sn_customerservice_manager</td>
</tr>
<tr>
<td>Performance Analytics administrator: Ensures that business managers are making the best use of Performance Analytics solutions.</td>
<td>pa_admin or pa_viewer</td>
</tr>
</tbody>
</table>

### Use case

This dashboard provides support managers with an overview of incoming work items and the availability of agents to handle them. Managers can monitor these daily trends to determine if adjustments should be made to the routing criteria, agent capacity values, and other settings that determine how work is pushed to agents.

### Indicators

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Work Items</td>
<td>Total number of Task work items that were created today. The goal for this indicator is to minimize the amount of Task work items that agents receive.</td>
</tr>
<tr>
<td>Accepted Work Items</td>
<td>Percentage of all Task work items that agents have accepted.</td>
</tr>
<tr>
<td>Exceeding Target Work Items</td>
<td>Percentage of all Task work items that have exceeded the target wait time.</td>
</tr>
<tr>
<td>Rejected Work Items</td>
<td>Percentage of all Task work items that agents have rejected.</td>
</tr>
<tr>
<td>Timed Out Work Items</td>
<td>Percentage of all Task work items that timed out.</td>
</tr>
</tbody>
</table>
| Weekly Trends | Number of work items in each of the following states for the past week:  
  - New  
  - Exceeding Target  
  - Rejected  
  - Timed Out |

### Breakdowns

To analyze data according to different categories, select a breakdown from the dashboard menu:

- Service Channel
- Queue
• Assignment Group

For more information on analyzing data with breakdowns, see *Using breakdowns on dashboards.*

**Reports**

<table>
<thead>
<tr>

</tbody>
</table>

**Agent Workspace**

A workspace is a graphical user interface that puts multiple tools on one page. ServiceNow workspaces are designed for tier 1 agents who solve internal or external customer issues.

Workspaces include all the tools that agents need to find, research, and resolve issues. ServiceNow provides different Agent Workspaces for different issue types. For example, agents using IT Service Management Workspace (ITSM) track and resolve IT issues. Agents using Customer Service Management Workspace (CSM) resolve external customer cases, such as sending a piece of computer hardware to fulfill a customer's request.

**Agent Workspace in action**

Here's how agents use Agent Workspace.

**Key features**

**Single-pane view**

Agents can see all details that are related to an issue in one place.
**Integrated communication channels**

Agents can communicate in real time with customers by chat or phone in the same interface.
Agent assistance

Agents can close cases and incidents faster with AI-assisted recommendations.
Get started

Select a tile to get started.

- **EXPLORE**
  - Agents and system administrators go here to learn about Workspace.

- **DEVELOP**
  - Developers go here to create custom components that go into Workspace.

- **SET UP**
  - System administrators go here to set up Workspace.

- **USE**
  - Agents go here to learn how to use Workspace.

Exploring workspace

Get an overview of workspace so you can understand how to set it up and use it for your organization.
Workspace landscape

Agent Workspace is a single-pane view that tier 1 agents use to respond to all task types, view the full context of an issue, and get relevant recommendations to resolve issues.

With Agent Workspace, agents can have multiple issues open at the same time in a tabbed format. Agents can quickly move between each issue without going to a different screen. They can use the ribbon to get useful, high-level information about an issue and use the activity stream to communicate with requesters or view a history of agent and requester interactions. The sidebar on the right automatically provides recommendations that help agents resolve issues.

Agents use the following views in workspace:

- **Landing page**—The first page that an agent sees when opening Agent Workspace shows which issues the agent can work on. For example, the agent can look at the landing page to see the number of open issues and the work that is assigned to the agent.
- **List view**—A filtered list of all records in the database that agents use to see, for example, all cases, only open cases, and only their cases. Agents use this view to find issues to work on.
- **Record view**—The view that agents use to work on issues. This view includes in-depth record information and suggestions about how to resolve issues and communicate with requesters.

Agent Workspace task flow

An agent uses Agent Workspace to find an issue to work on and to solve it. To do that, the agent:

1. Clicks the home (🏠) or list (📑) icon to find an issue to work on.
2. Clicks one of the issues on a landing page or in list view to open the issue in record view where the agent works on the issue.

Agents spend most of their time solving issues in record view.
01
Click to start

02
Finish
Agent Workspace community

See questions and answers about Agent Workspace in the Agent Workspace forum.

Workspace types

All Agent Workspaces enable agents to find issues, solve them, and communicate the solutions to requesters. Each workspace is tailored to the kind of issue that the agents work on. ServiceNow supports the following workspaces:

- **Customer Service Management Agent Workspace (CSM)**—Agents support external customers through communication channels such as chat, telephone, and email.
- **IT Service Management Agent Workspace (ITSM)**—Agents assign, resolve, and escalate internal incidents.
- **IT Operations Management (ITOM)**—Managers monitor the health of the IT network and the services that it supports.
- **Vendor Manager Workspace (VM)**—Agents manage and monitor vendor performance and vendor-related information.
- **Field Service in CSM Agent Workspace (FS)**—Agents help resolve tasks that need to be performed locally.
- **Survey Designer**—Survey administrators use Survey Designer to create pre-chat surveys for gathering information used to route requesters to qualified agents.

Domain separation

Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

This application does not support domain separation. For more information, see [Application support for domain separation](Application support for domain separation).

Browser support for workspaces

Do not use Internet Explorer 11 to access any workspaces. Internet Explorer 11 is not supported. See [KB0683275](KB0683275) for more information on Internet Explorer 11, and see [Browser support](Browser support) for more information about supported browsers that you can use across the platform.

- **Agent**—[Start using your workspace](Start using your workspace)

Components installed with Agent Workspace

The complete installation of Agent Workspace includes not only the plugin, com.agent.workspace, but also tables and user roles.
Plugins installed

By default, Agent Workspace (com.agent_workspace) is active for all instances. For a list of all the additional plugins installed, search for “workspace” in the list of plugins.

Tables installed

The following table shows many of the tables that get installed with Agent Workspace.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workspace Global Search Configuration (sys_aw_global_search_config)</td>
<td>Provides the default search settings for global search in Agent Workspace</td>
</tr>
<tr>
<td>Workspace Form Header (sys_aw_form_header)</td>
<td>Defines the fields that appear in the header for a form</td>
</tr>
<tr>
<td>My Workspace List (sys_aw_my_list)</td>
<td>Enables agents to create their own filtered list in Agent Workspace</td>
</tr>
<tr>
<td>Workspace List (sys_aw_list)</td>
<td>Creates filtered lists for users in Agent Workspace from this table</td>
</tr>
<tr>
<td>Workspace List Category (sys_aw_list_category)</td>
<td>Creates categories to organize filtered lists for Agent Workspace</td>
</tr>
<tr>
<td>Workspace Settings (sys_aw_master_config)</td>
<td>Accesses global search settings and assigns a service catalog for Agent Workspace</td>
</tr>
<tr>
<td>Workspace New Menu Item (sys_aw_new_menu_item)</td>
<td>Determines the records that agents can create from the New Record menu in Agent Workspace</td>
</tr>
<tr>
<td>Ribbon Settings (sys_aw_ribbon_setting)</td>
<td>Determines the ribbon components that appear in a ribbon</td>
</tr>
</tbody>
</table>

Next

Set up your workspace.

Developing components for Workspace

Develop custom components to add to your Workspace using the Now® Experience UI Framework and the Now® Experience CLI.

Components are reusable building blocks that you use to create a custom user interface. The Now® Experience Design System comes with a set of customizable components that you can drag-and-drop into your custom Workspace UI. Develop your own components if you can’t find what you need in the Now® Experience Design System library.

To see the Now® Experience Design System library, visit the ServiceNow® Developer Site.
Benefits of creating custom components

Communicating with customers through multiple channels can be time consuming. To be efficient in these omni-channel interactions, your agents need a single view of customer information to reduce context switching between multiple tools. By developing custom components for Workspace, your team can bring communications from multiple channels into one interface. Developing custom components lets you:

- Personalize a Workspace according to your agent and company needs.
- Make your agents more effective and reduce context switching with quick access to important data and information.
- Accommodate your company’s unique omni-channel environment using APIs to consolidate your data.

For example, you might want to create a component that displays the cases associated with an SLA, or that tracks the active chats in a particular queue. You can use the Now® Experience UI Framework and the Now® Experience CLI to develop the component you need, and access data from your platform using the *Http Effect API*.

What to know before you begin

Before you start designing and building your component, make sure you have:

- Some general knowledge of web component concepts, development, and design.
- JavaScript knowledge to define the component behavior.
- Knowledge of Node Package Manager (npm).
- A Workspace to add the component to.
- The most recent version of Node.js installed on your local machine. For more information, see, *Node.js*.

Now® Experience UI Framework

The Now® Experience UI Framework is a JavaScript framework that lets you extend your apps and build web components that are reusable throughout your applications. Using the Now® Experience UI Framework lets you:

- Create a single component to use in multiple places across your applications.
- Encapsulate the component’s scope to prevent conflicts with other code.
- Add properties, slots, and actions to your component, allowing users to customize the component every time they use it in a Workspace.

For more information, see the ServiceNow® Developer Site.

Now® Experience CLI and development flow

The Now® Experience CLI is a command-line tool that lets you develop custom components using the Now® Experience UI Framework. With the Now CLI, you can:

- Create the set of files required to develop a component, or *project scaffolding*.
- Start a local development server to test your component.
- Build a component project and deploy it to a ServiceNow instance.
Visual Studio Code extension

Optionally develop custom component on your local machine using the ServiceNow Extensions for Visual Studio Code extension. With this extension, you can use Visual Studio Code JavaScript language features to reduce development time and improve code quality.
For more information, see ServiceNow Extensions for Visual Studio Code.

Adding components to a Workspace

Once deployed to your instance, you can add components to Workspace in three ways.

Add a component to a Workspace modal

Use a UI action to launch a custom Now component in a modal so an agent doesn’t have to navigate to a different screen to accomplish a task. For more information, see Render a Now component in a modal.

Add a component to a Workspace landing page using UI Builder

Use the UI Builder to create custom landing pages for your agents. UI Builder is a drag-and-drop tool that lets you visually arrange workspace components. For more information, see Creating custom landing pages for workspaces.
Configure properties in the now-ui.json file to use deployed components in the UI Builder. See Add a component to UI Builder.

Add a component to a Workspace record view

You can add custom or standard components to the component area in the Workspace record view. For more information, see Set up Record View in workspace.

Application scope

When you deploy a Now Experience UI Framework component, it deploys into a scoped application on the instance. You can provide an application scope for the component to use as a namespace identifier. Use the namespace identifier guidelines for application development on the instance. For more information, see Application scope.

When reserving an application scope, follow these requirements:

- Maximum: 18 characters.
- Case: snake case.
- Format: x_customerprefix_componentname, where:
  - customerprefix is the value in the glide.appcreator.company.code system property on your instance.
  - componentname is the value provided in the component’s name parameter when you created the project.

If you do not provide an application scope when creating your component project, the Now CLI creates one for you.
Alternatively, you can add a value to the scopeName parameter in the now-ui.json file. For more information, see Change a component’s application scope.
Reference guide

To see the Now CLI reference guide, visit the Developer Site.

Set up your environment

Prepare your local environment by installing the Node.js JavaScript runtime environment, Node package manager (npm), and the Now® Experience CLI. These tools enable you to develop and build components locally and deploy them to your instance.

The Now CLI only supports these operating systems.

- Windows 10
- MacOS Yosemite and later
- Linux CentOS v7.5

1. Install the most recent LTS version of Node.js. npm automatically installs as part of the Node.js package.
   
   Node.js is a JavaScript runtime environment that enables you to execute JavaScript locally. npm is the default JavaScript package manager for Node.js. For more information, see Node.js and npmjs.com.

2. Install the Now® Experience CLI.
   
   a) Open your system’s command line tool.
   
   b) Execute the following command.

   ```bash
   npm install --global @servicenow/cli@orlando
   ```

Set up your project

Create the component project and the set of files required to develop a component. You can connect to your instance and create an application scope for your component, or you can reserve a scope to verify later.

Set up your environment.

1. If you are developing components in online mode, log into your instance. Otherwise, you can log in before deploying the component to your instance.
   
   a) Open your system’s command line tool and execute this command.

   ```bash
   now-cli login
   ```

   Pass in values for these parameters.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Target ServiceNow instance. Only supports HTTPS protocol.</td>
</tr>
<tr>
<td>method</td>
<td>Authentication method to use. Default: basic.</td>
</tr>
<tr>
<td>username</td>
<td>User name to log in to the ServiceNow instance.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>password</td>
<td>User password to log in to the ServiceNow instance.</td>
</tr>
</tbody>
</table>

```
now-cli login --host http://myinstance.servicenow.com --method basic  
   --username username --password password
```

2. Create a folder for your project and point your system’s command line tool to the folder.

3. Create the component project and all the files required to build a component.
   a) From the folder you created, execute this command.

```
now-cli project
```

Pass in values for these parameters:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Required. The project name. Must be a valid and unique npm package name.</td>
</tr>
<tr>
<td>description</td>
<td>The project description to be available in the npm registry and the package.json list in your instance.</td>
</tr>
</tbody>
</table>
| scope   | Suggested application scope to assign to this project and its components. If provided, the instance validates the name. Use the namespace identifier guidelines for application development on the instance. For more information, see Application scope.
   Maximum: 18 characters.
   Case: snake case.
   Default: x_customerprefix_componentname, where:
   - customerprefix is the value in the glide.appcreator.company.code system property on your instance.
   - componentname is the value provided in the component's name parameter when you created the project.
   Alternatively, you can add a value to the scopeName parameter in the now-ui.json file. For more information, see Change a component’s application scope.
| offline | When true, creates and scaffolds a component while disconnected from your instance. Skips validation of the given scope name.  |
   Default: false

```
now-cli project --name @myorg/movie-quotes --description 'A web component that prints movie quotes.'
now-cli project --name @myorg/hello-world --scope x_myorg_helloworld --offline```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
4. Run the following command to install the npm dependencies.

```bash
cnpm install
```

**Develop a component.**

**Use a proxy server with Now® Experience CLI**

Use a proxy server with the Now CLI to define a separate data source for your component. When using a proxy server, the instance forwards Now CLI requests to the proxy server.

**Set up your environment.**

1. In your component directory, open the `now-cli.json` file.

2. Update the `proxy` object.

```json
{
  development: {
    proxy: {
      headers: {
        Authorization: "Basic <username:password>"
      },
      origin: "http://myinstance.servicenow.com",
      port: 3000,
      proxies: []
    }
  }
}
```

Update the following parameters with your proxy information.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>development.proxy.headers</td>
<td>Headers to append to your proxied request.</td>
</tr>
<tr>
<td>development.proxy.headers.Authorization</td>
<td>Authentication header to add to the proxied request. Enter your Base 64-encoded username:password here.</td>
</tr>
<tr>
<td>development.proxy.origin</td>
<td>Host to open a proxy with (your instance host address).</td>
</tr>
<tr>
<td>development.proxy.port</td>
<td>The port the proxy runs on.</td>
</tr>
<tr>
<td>development.proxy.proxies</td>
<td>URL glob patterns to pass to the proxy server.</td>
</tr>
</tbody>
</table>

3. Save the file.

**Develop a component.**

**Develop a component**

Add your component code and test it using a local development server.

- **Set up your environment**
- **Set up your project**

For a tutorial on developing a counter component, visit the Developer Site.

1. In your project directory, navigate to `src/<component-name>/index.js`. This is the primary code file for a component.
2. Add your component code.

```javascript
import {createCustomElement} from '@servicenow/ui-core';
import snabbdom from '@servicenow/ui-renderer-snabbdom';
import styles from './styles.scss';

const view = (state, {updateState}) => {
  return (  
    <div>Hello World!</div>
  );
};

createCustomElement('hello-world', {  
  renderer: {type: snabbdom},  
  view,  
  styles
});
```

3. Optionally add inner components.

An inner component is a component included in another component. For example, a card component might include a separate button component. The button component becomes an inner component that you must import, install, and define in the card component project.

a) Install the inner component package by executing the install command using your system's command line tool:

```
npm install @servicenow/<now-inner-button>
```

b) Add an import statement to the top of your index.js file:

```
import '@servicenow/<now-inner-button>';
```

c) Use the inner component in your index.js file:

```
<now-inner-button label="Click Me" />
```

d) List the inner component in the components.[component-name].innerComponents array in the now-ui.json configuration file.

```
{
    "components": {  
        "now-chart-timeseries": {  
            "innerComponents": [  
                "now-inner-button"
            ],
        }
    }
}
```

4. Run the development server command to view your component in a test browser.

```
now-cli develop
```

Pass in values for these parameters.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>entry</td>
<td>Path to the test module in your component project. Default: example/index.js.</td>
</tr>
<tr>
<td>open</td>
<td>Opens the default browser and navigates to the test page. Default: false.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>port</td>
<td>Port where the development server runs. Default: 8081.</td>
</tr>
<tr>
<td>host</td>
<td>Host address to use if you want your local development server to be accessible externally by others. Typically set to 0.0.0.0</td>
</tr>
</tbody>
</table>

```bash	now-cli develop --entry example/hello.js --open --port 3000
```

**Deploy a component to an instance.**

**Add a component to UI Builder**

Set properties in a configuration file to add your component to the UI Builder in your instance.

- **Set up your environment**
- **Set up your project**
- **Develop a component**

1. In your project directory, open `now-ui.json`.
2. Add the `components.[component-name].uiBuilder` object to the file. This object adds the component to the UI Builder.

   This object includes these key-value pairs:

<table>
<thead>
<tr>
<th>Key</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>components.(component-name).uiBuilder</td>
<td>Object</td>
<td>Object that adds the component to UI Builder.</td>
</tr>
<tr>
<td>components.(component-name).uiBuilder.label</td>
<td>String</td>
<td>Required. The display name of the component in UI Builder.</td>
</tr>
<tr>
<td>components.(component-name).uiBuilder.icon</td>
<td>String</td>
<td>Required. The name of the icon that appears in UI Builder. View the list of available icons on the <a href="#">Developer Portal</a>.</td>
</tr>
</tbody>
</table>

```json
{
  "components": {
    "card": {
      "uiBuilder": {
        "label": "Card",
        "icon": "chat-fill",
        "description": "A visual card format for a record."
      }
    }
  }
}
```

3. If your component includes properties, add the `components.[component-name].properties` array to the file. This adds the properties as configuration options for the component in UI Builder.

   This object includes these key-value pairs:
<table>
<thead>
<tr>
<th>Key</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>components.(component-name).properties</td>
<td>Array &lt;Object&gt;</td>
<td>An array of objects that includes all the properties of the component and all relevant information about those properties.</td>
</tr>
<tr>
<td>components.(component-name).properties().name</td>
<td>String</td>
<td>Name of the property in your component's code.</td>
</tr>
<tr>
<td>components.(component-name).properties().label</td>
<td>String</td>
<td>Display name of the property to display in UI Builder, if applicable.</td>
</tr>
<tr>
<td>components.(component-name).properties().description</td>
<td>String</td>
<td>A short description of what the property does or how to use it.</td>
</tr>
<tr>
<td>components.(component-name).properties().readOnly</td>
<td>Boolean</td>
<td>When true, prevents a user from configuring the property in UI Builder. Default: false.</td>
</tr>
<tr>
<td>components.(component-name).properties().required</td>
<td>Boolean</td>
<td>When true, the user must configure the property. Default: false.</td>
</tr>
<tr>
<td>components.(component-name).properties().defaultValue</td>
<td>String</td>
<td>The default value when the user does not provide one.</td>
</tr>
<tr>
<td>components.(component-name).properties().associatedTypes</td>
<td>Array</td>
<td>Describes where in the UI Builder toolbox the component appears. Value must be &quot;global.core&quot;.</td>
</tr>
<tr>
<td>components.(component-name).properties().typeMetadata</td>
<td>Object</td>
<td>Extra configuration data that some data types require, such as reference properties and choice lists.</td>
</tr>
</tbody>
</table>

```json
{
   "components": {
      "properties": [
         {
            "name": "backgroundColor",
            "label": "Background Color",
            "description": "Background Color",
            "readOnly": false,
            "required": false,
            "defaultValue": "lightgray"
         },
         {
            "name": "cardType",
            "label": "Type of card",
            "description": "Type of card",
            "readOnly": false,
            "required": false,
            "defaultValue": ""
         }
      ]
   }
}
```

4. Save the file.

Deploy a component to an instance.
Deploy a component to an instance

Deploy your component to display in your instance as an application plugin. If you developed the component offline, you must login and verify your chosen scope name.

- **Set up your environment**
- **Set up your project**
- **Develop a component**

1. If you developed the component offline, log in to your instance.
   a) Open your system’s command line tool and execute this command.

   ```bash
   now-cli login
   ```

   Pass in values for these parameters.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Target ServiceNow instance. Only supports HTTPS protocol.</td>
</tr>
<tr>
<td>method</td>
<td>Authentication method to use. Default: basic.</td>
</tr>
<tr>
<td>username</td>
<td>User name to log in to the ServiceNow instance.</td>
</tr>
<tr>
<td>password</td>
<td>User password to log in to the ServiceNow instance.</td>
</tr>
</tbody>
</table>

   ```bash
   now-cli login --host http://myinstance.servicenow.com --method basic --username username --password password
   ```

2. Deploy the component to your instance.
   a) Open your system’s command line tool and execute this command.

   ```bash
   now-cli deploy
   ```

   Pass in values for these parameters.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>open</td>
<td>When true, opens the default browser and navigates to UI Builder in your instance. Default: false</td>
</tr>
<tr>
<td>force</td>
<td>Deploys component changes and overwrites any existing component records. Default: false.</td>
</tr>
</tbody>
</table>

   ```bash
   now-cli deploy --open
   ```

Navigate to your instance and add your component to a modal or a landing page. See rendering a Now component in a modal or creating custom landing pages for workspaces.
Change a component's application scope

Change a component's application scope if you encounter scope issues when deploying your component to an instance. For example, you may have set an application scope that is already in use or invalid while creating a component in offline mode.

- Set up your environment
- Set up your project

1. In your project directory, open `now-ui.json`.
2. Update the `scopeName` key with the desired scope name.
   
   Use the namespace identifier guidelines for application development on the instance. For more information, see Application scope.

   When reserving an application scope, follow these requirements:
   - Maximum: 18 characters.
   - Case: snake case.

   ```json
   "scopeName": "x_customerprefix_componentname"
   ```

3. Deploy your component. See Deploy a component to an instance.

Setting up workspace

Set up Agent Workspace for agents, so that they can find, work on, and resolve issues efficiently.

Your job is to make the work your agents do as easy as possible. When configuring workspace, you set up all the tools that agents need to complete their work and eliminate anything extraneous.

Browser requirements

ServiceNow workspaces do not support mobile devices, and, starting with the Orlando release, Internet Explorer, or Microsoft Edge. Instead, use Microsoft Edge-Chromium or one of the other supported browsers listed in Generally supported browsers. See the Internet Explorer 11 Performance (KB0683275) article in HI for more information.

Different ways to set up workspace components

Agent Workspace provides the following ways that you can access configuration settings:

- Application navigator—Navigate to configuration pages using the application navigator, for example, Workspace Experience > Forms > Ribbon Settings.
- Workspace—In workspace, in the menu under your profile image, you see the following menu items:
Configure workspace—Opens the workspace configuration page where you can set up list categories, list filters, landing pages, the record types that agents can create. You also configure the modules that appear on the far left of the screen, such as Home ( ) and Lists ( ).

Configure page—Provides shortcuts to configuration settings that are based on the page content. This option only works when you are in record view.

The instructions in this documentation use the application navigator.

**Setting up workspace**

You can set up Agent Workspace either by:

- Following the Agent Workspace Guided Setup.
  
  The guided setup walks you through a sequence of tasks that helps you set up Agent Workspace. To start with Agent Workspace Guided Setup, navigate to **Workspace Experience > Agent Workspace Guided Setup**.

- Using the instructions in the following sections.
The following sections provide more details than the guided setup about how to set up workspace components. To start, go to **Start here to set up your workspace.**

**Note:** After completing the setup procedures in this guide, your workspace may have a few additional setup procedures that are unique to your workspace. Return to your product documentation, such as the Customer Service Management (CSM) documentation, and complete those procedures.

**Start here to set up your workspace**

Set up user roles, global search, and service catalogs to give agents the correct permissions, source documents, and catalogs that they need to resolve issues.

Role required: workspace_admin

The following configurations pertain to features that are not visible in the landing pages, list view, and record view user interfaces.

1. Activate the plugins for your product.

   ITSM plugins are active by default. If you’re using another workspace, such as CSM, you must activate its plugins.

   a) Navigate to **System definition > Plugins.**
   
   b) In the search bar, enter your product name.
   
   c) Click **Install** for the plugins that are related to your product.

   For more information, see **Activate the plugins for your product.**

2. To assign roles to people in your organization, use the following table. How you assign your agents to these roles is beyond the scope of this documentation.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workspace agent</td>
<td>Required to use Agent Workspace. The itil and sn_esm_agent for CSM roles also contain this role.</td>
<td>None</td>
</tr>
<tr>
<td>(agent_workspace_user)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Workspace list administrator</td>
<td>Required to create list categories and to create and assign filtered lists. This is an elevated role. For more information on elevated roles, see Elevated privilege.</td>
<td>agent_workspace_user</td>
</tr>
<tr>
<td>(workspace_list_admin)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Workspace administrator</td>
<td>Required to configure Agent Workspace.</td>
<td>form_admin</td>
</tr>
<tr>
<td>(workspace_admin)</td>
<td></td>
<td>chat_admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>template_editor</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ui_action_admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>personalize_form</td>
</tr>
<tr>
<td></td>
<td></td>
<td>interaction_admin</td>
</tr>
<tr>
<td></td>
<td></td>
<td>workspace_list_admin</td>
</tr>
</tbody>
</table>

3. Identify a source of information that agents use when doing searches in Agent Workspace.

   a) Navigate to **Workspace Experience > Administration > Search Sources.**
   
   b) Click **New** or open an existing record to edit.
   
   c) On the form, fill in the fields.
### Search Source form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the search source. This name appears as a search category in the workspace search.</td>
</tr>
<tr>
<td>ID</td>
<td>String. A unique identifier for the search source.</td>
</tr>
<tr>
<td>Roles</td>
<td>Permission level that an agent must have for Workspace to use this search source. Leaving this field empty means that Workspace can use this search source for all agents. Use this field to limit the information returned according to the person doing the search.</td>
</tr>
<tr>
<td>Search page template</td>
<td>Script that specifies the look of the search page.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
</tbody>
</table>

d) Under the **Data Source** tab, fill in the fields.

### Data Source tab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is scripted source</td>
<td>Check box that displays fields to enter scripts for defining data sources.</td>
</tr>
<tr>
<td>Data fetch script</td>
<td>Field that only appears when you select <em>Is scripted source</em>. Enter a script that returns the data that global search can use in searches.</td>
</tr>
<tr>
<td>Facet generation script</td>
<td>Field that only appears when you select <em>Is scripted source</em>. Search facets work like the filters that you see on online retail sites. Facets enable users to refine search results by adding additional filters to the result set. For more information, see <a href="#">Enable search facets</a>.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that the search pulls information from. For example, the search might pull in information from Knowledge (kb_knowledge) or Users (sys_user).</td>
</tr>
<tr>
<td>Conditions</td>
<td>Search filter that limits the records that are returned in the search. For example, you could limit the search to return only the published and valid knowledge articles.</td>
</tr>
<tr>
<td>Primary display field</td>
<td>Record field to appear first in search results.</td>
</tr>
<tr>
<td>Display fields</td>
<td>Selection mechanism to specify which record fields appear in search results.</td>
</tr>
<tr>
<td>Paginate results</td>
<td>Toggle that adds page numbers to search results.</td>
</tr>
</tbody>
</table>

e) Click **Update**.

f) Under the **Facets** tab, click **New** and then fill in the form to specify the filters that agents can apply to search results.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the facet header.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the search source. This value is read-only.</td>
</tr>
<tr>
<td>Selection type</td>
<td>Type of user selection allowed:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Single</strong>: Only one filter value can be selected at a time. For example, if a facet is created for the <strong>Assigned to</strong> field, the agent can select <strong>Fred Luddy</strong> or <strong>Beth Anglin</strong>, but not both at the same time. Before filtering for a new value, the agent must first clear the current value.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Multiple</strong>: Multiple filter values that can be selected at the same time. For example, if a facet is created for the <strong>Assigned to</strong> field, the agent can select both <strong>Fred Luddy</strong> and <strong>Beth Anglin</strong>. Because mutli choice results in an OR query, records that are assigned to either Fred Luddy or Beth Anglin appear.</td>
</tr>
<tr>
<td>Active</td>
<td>Whether the filter option appears in search results.</td>
</tr>
<tr>
<td>Use mapped facet filters</td>
<td>Maps a facet to a query condition, such as (Updated) (After) (Last week). When selected, the <strong>Fields</strong> and <strong>Sort</strong> fields are removed from the form. After saving, you can define filters in the Facet Filters related list.</td>
</tr>
<tr>
<td>Order</td>
<td>Defines the display order when multiple facets are defined.</td>
</tr>
<tr>
<td></td>
<td>If some facets do not have an order value defined, facets with an order defined display first. Facets without an order defined appear alphabetically.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that the query is created for. This value is read-only and is defined by the table that is used in the search source.</td>
</tr>
<tr>
<td>Field</td>
<td>Field that end users can filter search results by. For example, if <strong>Active</strong> is selected, the use can filter search results by true or false.</td>
</tr>
<tr>
<td></td>
<td>Only fields of the following types are supported: True/False, Choice, Decimal, Floating Point Number, Integer, IP Address, Long, Reference, String, String (Full UTF-8), and URL.</td>
</tr>
<tr>
<td>Sort</td>
<td>Order in which filter options appear.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Ascending</strong>: Sorts filter options from A to Z when alphabetical, and from lowest to highest when numerical. This is the default option.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Descending</strong>: Sorts filter options from Z to A when alphabetical, and from highest to lowest when numerical.</td>
</tr>
</tbody>
</table>

4. Optional: Configure the global search.
Global search is the field at the top of Agent Workspace that enables agents to search across all records.

Global search

a) Open the Settings menu by clicking your profile image.
b) Select Configure Workspace.
c) In Global Search Data Config, click the search icon (🔍) and specify a search configuration, or, to create a new configuration, click New and fill in the form.

**Search Context Configuration form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Configuration name.</td>
</tr>
<tr>
<td>Application ID</td>
<td>Name of the application this configuration is meant for.</td>
</tr>
<tr>
<td>Search Results Limit</td>
<td>Maximum number of search results that are returned by global search.</td>
</tr>
<tr>
<td>Suggestions limit</td>
<td>Maximum number of type-ahead suggestions that appear as agents type.</td>
</tr>
</tbody>
</table>

d) In Global Search View Config, click the search icon (🔍) and specify a view configuration, or, to create a new configuration, click New and fill in the form.

**Global Search Configuration Settings form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Configuration name.</td>
</tr>
<tr>
<td>Recent Items count</td>
<td>Number of recently selected search results that appear in the global search field. The default is 5.</td>
</tr>
<tr>
<td>Recent terms count</td>
<td>Number of recently searched terms that appear in the global search field. The default is 5.</td>
</tr>
<tr>
<td>Recent TTL (days)</td>
<td>Time To Live, which is the length of time in days that recently searched terms and recently selected search results remain in the search history. The default is 30.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of this global search. Typically, leave the value as Global.</td>
</tr>
<tr>
<td>Tab drill-down items per page</td>
<td>Number of search results that appear at one time when you view search results for a specific search category. The default is 25.</td>
</tr>
<tr>
<td>Tab overview items per section</td>
<td>Number of items that appear in the search results by section. The default is 10.</td>
</tr>
</tbody>
</table>

e) Select the Search enabled check box to use the search parameters that you configured.
The **Active** check box must also be selected for all of the parameters on the Workspace form to take effect.

f) Click **Update**.

**Note:** If any access control lists (ACLs) are configured to prevent users from accessing information, the search results show a message about security constraints. For more information on limiting access using ACL rules, see *Access control list rules*.

5. Optional: Associate a Service Catalog with Agent Workspace and add items to it.

A service catalog lists items that an agent can send to a requester, for example, a keyboard, desk chair, phone, and so on. Your implementation of Agent Workspace may or may not require that agents have access to a service catalog. If you associate a service catalog with Agent Workspace, all agents have access to it. For more information about adding a service catalog to Workspace or to add items to a catalog, see *Assign a Service Catalog to Workspace*. Agents typically use service catalogs in the contextual side panel to resolve requester issues.

- Optionally, **brand your workspace** with your company logo and colors.
- If your agents use a service catalog to send items to requesters, **assign a service catalog to your workspace**.
- **Set up a landing page**, which is the page agents typically see when opening your workspace.

### Brand your workspace

Customize the look of your workspace with your company's logo and up to two brand colors.

**Role required:** `workspace_admin`

You can replace the ServiceNow logo with your company's logo and use your company's colors to brand the look of your workspace.

1. **Open the workspace that you want to brand.**

   - To brand a workspace that's already open, open the Settings menu by clicking your profile picture and selecting **Configure workspace**.

   - Navigate to **Work Experience > Administration > All Workspaces** and click a workspace.

2. On the Workspace form, enter hex values using the format `#FFFFFF` as color values for **Brand color 1** and **Brand color 2**.

   **Brand color 1** specifies the color of the branding bar above the Workspace. **Brand color 2** appears in the heading of the Settings menu and in the left, side pane that contains the icons.
for home ( ), and list ( ). Workspace automatically applies different intensities of the colors in different places.

3. **Upload an image for your custom logo by clicking **Click to add** next to **Custom Logo**.**

   The image can be no larger than 120 kb. It displays 24 pixels high with a maximum width of 400 pixels. Supported file types include .jpg, .png, .bmp, .gif, .jpeg, .ico, and .svg.

4. **Optional: To revert to the original colors and ServiceNow logo, remove the colors that are specified for **Brand color 1** and **Brand color 2** and delete the uploaded image.**

   **Set up the landing page for your agents,** which is the page they see first when using your workspace.

### Assign Service Catalog to a workspace

Assign Service Catalog to a workspace to let agents find and order catalog items to fulfill customer requests.

**Role required: workspace_admin**

Service catalogs give agents a way of ordering items to fulfill customer requests. The following image shows categories of items that an agent can order from a service catalog.
You can create service catalogs and fill them with only the items that agents should have access to. For information about creating a service catalog, see Service Catalog.

Catalog items can appear in Agent Assist recommendations.
Agent Assist

1. Navigate to Service Portal > Portals.
2. Click a portal, for example, Service Workspace Portal.
   Alternately, you can create a new portal. For more information, see Create a portal.
3. In the related lists, click the Catalogs tab and click a catalog, for example, Service Catalog.
4. Optional: On the Catalog form, make a catalog active by selecting the Active check box.
5. Optional: In the related lists, click the Categories tab to see the categories of items in the catalog.
6. Optional: In the related lists, click the Catalog Portal pages tab to set up the catalog pages. For more information, see Set up catalog portal pages.
7. Optional: In the related lists, click the Sites tab to select which catalogs are supported within the content management system (CMS) sites.
   When your organization uses a CMS as well as a service catalog, you can select which catalogs are supported. For more information, see Manage catalogs in CMS sites.
8. Optional: In the related lists, click the Catalog Items tab to see the items in the catalog.
9. Optional: To add items to the catalog, click New.
   a) On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the item.</td>
</tr>
<tr>
<td>Catalogs</td>
<td>Catalog(s) that the item will be added to.</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Type of item, for example, office, software, and laptops.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the item appear in the catalog(s).</td>
</tr>
</tbody>
</table>

b) On the related lists, click the **Item Details** tab and enter a short and long description of the item.

c) On the related lists, click the **Picture** tab to upload a picture of the item.

d) On the related lists, click the **Pricing** tab to enter the price of the item.

e) Optional: Click **Try it** to view how the item will appear in the catalog.

f) Click **Submit**.

10. Click **Update**.

*Set up the landing page for your agents*, which is the page they typically see first when using your workspace.

**Create a workspace**

Create your own workspace to simplify the workflow of custom tasks in your organization.

Role required: admin

ServiceNow provides many versions of Agent Workspace, such as ITSM Agent Workspace and Customer Service Management Agent Workspace. Instead of using one of these workspaces, you can create your own.

1. Open Guided Application Creator by navigating to **System Applications > My Company Applications** and click **Create New**.

2. Follow the guided setup instructions to create a workspace.

   For more information, see **Guided Application Creator**.

*Add workspace modules* to your workspace or *set up a landing page for your agents*, which is the page they typically see first when using your workspace.

*Set up new workspace modules* Create workspace modules to access large groups of functionality, for example, displaying lists of records, or landing pages.

- You *created a workspace.*
- Role required: workspace_admin

When you create your own workspace, you can create workspace modules, which are accessed by the icons that appear in the left panel of workspace. Workspace can display up to seven icons in the left panel.
You cannot change the workspace modules for workspaces provided by ServiceNow. But you can create modules that display Now components for workspaces you create.

1. Navigate to **Workspace Experience > Workspaces > Administration > All Workspaces** and click a workspace you created.
2. In your workspace, click your profile image and then, on the menu, select **Configure Workspace**.
3. On the **Workspace Modules** tab, click **New** to create a new application module for your workspace.
4. On the form, fill in the fields.

**Workspace Module**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>Unique identifier and the name of this workspace module.</td>
</tr>
<tr>
<td>Label</td>
<td>Module name that appears in the tooltip for the module’s icon and on tabs identifying your workspace module.</td>
</tr>
<tr>
<td>Icon</td>
<td>Image to use in the user interface for the workspace module, for example, the inbox icon ( ). Clicking the icon displays the module’s Now components.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>In a tabbed workspace, <strong>Type</strong> dictates how the module opens in the primary tab. In a non-tabbed workspace, the module is the first breadcrumb.</td>
</tr>
<tr>
<td></td>
<td>- Full—Entire page displays in the primary tab.</td>
</tr>
<tr>
<td></td>
<td>- Master detail—Layout is composed of left and right columns where items in the left column remain on the screen, but the items in the right column change according to the items selected in the left column. For example, the inbox, on the left, shows the option to accept or decline a chat, and, after accepting the chat, the record associated with the chat displays in the right column. See the image in the following example.</td>
</tr>
<tr>
<td></td>
<td>- Window—Popover or pop-up.</td>
</tr>
<tr>
<td>Content component</td>
<td>Now component that appears when an agent clicks the icon for this workspace module. This field appears on the Module Content tab, which does not appear when <strong>Type</strong> is Window.</td>
</tr>
<tr>
<td>Detail component</td>
<td>Now component that appears as the master detail in a <strong>Master detail</strong> layout. This field appears on the Module Detail View tab, which only appears when <strong>Type</strong> is <strong>Master detail</strong>.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of this workspace module. Global is the default.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Name of the workspace this workspace module applies to.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the workspace module icon appear or not. When not selected, the icon doesn’t get loaded onto the page when the page loads.</td>
</tr>
<tr>
<td>Hide Until Ready</td>
<td>Toggle to hide this workspace module in the user interface. When selected, the icon loads when the page does but the icon remains hidden until a component dispatches a specific action to the browser. The component documentation should specify the action.</td>
</tr>
<tr>
<td>Order</td>
<td>Placement of the icon in the vertical list of workspace module icons. The lower the number, the higher the icon appears in the column.</td>
</tr>
<tr>
<td>Required system properties</td>
<td>System properties that must be true for this module to render.</td>
</tr>
<tr>
<td>Roles</td>
<td>Role the user must have for the workspace module to appear in the workspace.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

The new workspace module appears in the list of workspace modules and in the workspace, for example, the last line in the following figure.
The following example shows the **master detail** module type with the left column as the master and the right column as the detail of the selection in the master column.
Set up a landing page for your agents, which is the page they typically see first when using your workspace.

Setting up landing pages in a workspace

Set up the landing pages that were supplied with workspace or create landing pages starting with a blank page to show agents the issues that need to be resolved.

Landing pages are the pages that agents see when they open their workspace. The pages typically include:

- Performance Analytics and Reports (PAR) analytic widgets, for example, the number of open issues
- Lists of records, for example, all records that are assigned to the agent
Every workspace should have at least one landing page. You can either:

- Use the supplied landing pages or modify them
- Create a landing page starting from a blank page using UI Builder.

Creating custom landing pages for workspaces

Use the User Interface Builder (UI Builder) to create custom landing pages for your agents.

UI Builder overview

UI Builder is a drag-and-drop tool that enables you to arrange workspace components to create custom landing pages. To build a page, all you have to do is:

1. Drag components from the **Add component** tab on the Page management pane onto the pane in the middle of UI Builder called the Stage.
2. Select each component that you dragged into the Stage. Then, in the Configuration pane, enter configuration values for each selected component.
You can add, remove, and group components to create a landing page that contains the important information you want agents to see when they open their workspace.

Create custom components for workspace

To see how to create custom components for workspace, including landing pages, see Developing components for Workspace.

Plugin

The Now Experience UI Builder requires the com.sn_ui_builder plugin, which comes by default on new and upgraded instances.
Constraints

- The domain separation for Now Experience UI Builder landing pages is the same as the workspace's.
- The Now Experience UI Builder does not work on the mobile platform.
- Now components cannot talk to one another.

Next steps

Use the tutorial to get familiar with UI Builder.

**UI Builder tutorial**
Learn how to use UI Builder to create a custom landing page.

Role required: workspace_admin or ui_builder_admin

Before you create your landing page, let’s see how UI Builder works by exploring an existing landing page.

1. Navigate to **Workspace Experience > Administration > All Workspaces** and click a workspace to open it.
2. If the page that opens is not editable, click the **here** link in **To edit this record click here** to make the page editable.
3. Click **Open in UI Builder**.
4. In the Page management pane, on the **Pages** tab, click the **Incident Overview** landing page.

This landing page appears in the Stage pane. Notice the **Status** and **Application** fields above the Configuration pane. The **active** status means that the landing page is currently being used. The **Application** field shows that the landing page is being used by ITSM Agent Workspace. If you clicked:

- **Deactivate**, the status would change to **Inactive** and the landing page would no longer display in workspace.

  **Deactivate** button would be replaced by the **Activate** button, which would enable you to publish the landing page in workspace.

  You typically deactivate landing pages when you’re working on them. For example, to update the current landing page, you could:

  1. Clone your current landing page.
  2. Work on it in the inactive state.
  3. Make the updated version **Active**.
  4. Make the original version **Inactive**.

- **Save** button, you would save any changes you made to the landing page. If the **Status** is:

  - **Active**, the changes appear immediately in workspace.
  - **Inactive**, the changes are saved but not published.

5. Click the components and see how the configuration parameters change in the Configuration pane.

6. Click **Happening Now**.
The container becomes visible around the four, smaller components. **Happening Now** is the container's label. Look in the Configuration pane under **Label**. Containers are how you group other components.

7. With the container still highlighted, slide the **Show border** slider to the right.
   A border appears, which shows the container.

8. Slide the **Can collapse** slider to the right.
   
   A caret icon (↑) appears above the container. An agent can click the caret to collapse the container and everything in it.

9. On the top right of the Configuration pane, click the right arrow (>) to collapse the pane.

10. In the Stage pane, click the container and then click its configuration icon ().

    ![Image of Happening Now container](image)

The Configuration pane reopens.

You also notice the move icon (drag) that you can use to drag a component around. Don't do that yet.

The **Collapsed** slider in the Configuration pane means that the container starts out collapsed and appears as a downward arrow (▼) that an agent can click to expand the container.

Now that you have seen how to use the different parts of the interface, let's see how to create a landing page.

Create new landing page tutorial
Create a new landing page.

1. On the **Pages** tab, click the plus icon (+) to open a new landing page.
You can also create a new page by clicking Page actions > +New page.

2. On the OK. Let's get some general info for this page modal, enter the name of your landing page and click Create landing page.

This title appears above the Stage but not on your landing page.

Add and configure components tutorial
Add and configure components on a landing page.

1. Click the +Add component tab and drag an image component into the Stage pane.

   Parameters for the image appear in the Configuration pane.

2. Drag a data visualization component far below the image and drop it.

   The component does not appear in the Stage pane.

3. Drag a data visualization component over the image component but do not drop it. Move the data visualization component around the edges of the image component.
The side of the image component highlights when you move the data visualization component over it.

4. Hold the data visualization component over the left side of the image and drop it.
   The data visualization component appears to the left of the image component.

5. Click and then grab the move icon above the data visualization component and drag it over the bottom edge of the image component and drop it.
Now, you know how to move a component on the landing space. The data visualization component is blank. Let’s fill it so it’s visible.

   A type-ahead list of possible entries appears.
7. Click Open incidents by Priority in the list.
   That report opens in the component.
8. In the Configuration pane, delete Open incidents by Priority and in the PA Widget field, type incident.
   A type-ahead list of possible entries appears. These entries are Performance Analytics (PA) widgets.

   You can only put one data visualization in the component. So, you can either display a report or a PA widget but not both. If you put entries for both a report and a PA widget, UI Builder only displays the report.

   You now know how to add and arrange components on a landing page. Let’s now see how to group them.

Group and arrange components tutorial
Group and arrange components on a landing page.

1. Click Page actions, select Delete page, and then confirm the deletion.
2. Select the data visualization component, click the trash icon (🗑️) and then the delete check mark icon (✓) above the component to remove it.

   You have now deleted components on a landing page. If you like, you can also remove the image component.
3. Drag a container component into the Stage pane.
4. In the Component pane, enter a value in the Label field for the container and push the Show border slider to the right so you can see the container.
5. In the Label field, add a title to the container, for example, Important lists.
6. Drag a list component into the container.
7. In the Component pane, in the Table field, enter a value for the table where the list of records comes from, for example, incident.
8. Drag another list component into the container.

   You can drop the list inside or outside of the container. Drop it inside the container.
9. In the Component pane, in the **Table** field, enter a value for a different table where the list of records comes from, for example, task.

You now have two list components inside a container component, which has a label that describes the lists.

10. Continue adding components inside or outside of the container and using the move icon to drag the components around so that you can get used to adding, deleting, moving, and grouping components.

11. **Click Save.**

If you were making a real landing page, you’d also click **Activate**. Because you’re not making a real landing page in this tutorial, let’s delete this practice landing page.

Delete a landing page tutorial

Delete a landing page.

1. On the **Pages** tab, select your landing page.

2. Under **Page actions**, click **Delete page**.

You now have an idea how to use UI Builder. You’re ready to **create your first landing page**.

Create a custom landing page in UI Builder

Create a custom landing page to show agents the important tasks they can undertake.
Role required: workspace_admin or ui_builder_admin

A landing page is an agent’s initial view of their workspace. Fill the landing page with the minimal amount of information that your agents need so that they can start working on the most important tasks. Your instance should have at least one landing page.

1. Navigate to Workspace Experience > Administration > All Workspaces and click a workspace.
2. If the page that opens is not editable, click the here link in To edit this record click here.
3. Click Open in UI Builder.
4. To create a landing page, do one of the following:
To do this task | Do this
---|---
Create a landing page starting with no components | 1. Click *Page Actions* and select *+New Page*. You can also click the plus icon (+) on the *Pages* tab.

2. On the modal, in *Enter the name of your landing page*, enter the name of the new landing page.

3. In the *Application* field, specify what applications that you want this new landing page to appear in.

4. In the *Protection* field, specify a policy. *None*—Enables anyone to view and modify the landing page. *Read-only*—Enables anyone to view but not modify the landing page. *Protected*—Prevents everyone but you from viewing or modifying the landing page. In all of these options, the page creator, can view and modify the landing page.

5. Click *Create copy*.

**Copy a landing place to use as a starting point for a new landing page**

| 1. Click *Pages* and click the landing page that you want to copy.  
| 2. Click *Page Actions* and select *Copy Page*.  
| 3. On the modal, in *Enter the name of your landing page*, enter the name of the new landing page.  
| 4. In the *Application* field, specify what applications that you want this new landing page to appear in.  
| 5. In the *Protection* field, specify a policy. *None*—Enables anyone to view and modify the landing page. *Read-only*—Enables anyone to view but not modify the landing page. *Protected*—Prevents everyone but you from viewing or modifying the landing page. In all of these options, the page creator, can view and modify the landing page.  
| 6. Click *Create copy*.  

5. Click *Save*.

In the following example, you can see the two places that the value, *My first landing page*, for *Enter the name of your landing page* appears, and where the value for *Application*, *Agent Workspace*, appears.
Now that you’ve created a landing page, you can add components to it.

Add components to a landing page in UI Builder

Drag and drop components into the Stage pane to create a landing page.

- You must have created a landing page.
- Role required: workspace_admin or ui_builder_admin

You add components to landing pages by dragging and dropping components from the +Add component tab into the Stage pane.

1. Navigate to Workspace Experience > Administration > All Workspaces and click a workspace to open it.
2. If the page that opens is not editable, click the here link, in To edit this record click here.
3. Click Open in UI Builder.
4. In the Page management pane, on the Pages tab, click the landing page that you want to add components to.
5. Click the +Add component tab to open the list of components that you can add to your landing page.
6. Add components by dragging one component at a time from the +Add component tab into the Stage pane.

When you drag a component, click it first to select it. A box appears around the component when it’s selected. When you drop components into the Stage pane, make sure to point to a component that’s already on the landing page. Highlights appear where you can drop the component. For more information about dragging and dropping, see the tutorial.
You can add these components:

- **Container**—Container in which you can group other components, for example, a heading and two data visualization reports. For more information, see Container component in UI Builder.

- **Data visualization**—Prepared reports or Performance Analytic (PA) widgets. These values can be updated periodically. For more information, see Data Visualization component in UI Builder.

- **Image**—Image. For more information, see Image component in UI Builder.
• Rich text—String to use anywhere on the landing page. For more information, see *Rich Text component in UI Builder.*
• Heading—String to use as the title of a landing page. For more information, see *Heading component in UI Builder.*
• List—List of records that come from a single table. For more information, see *List component in UI Builder.*

7. Optional: To remove a component from your landing page:
   a) Click the component and click the trashcan icon that appears.

   ![Trashcan Icon]

   b) Confirm the deletion by clicking the check mark icon in the *Delete element?* pop-up window.

   ![Check Mark Icon]

8. Optional: To move a component, click it, use your mouse to grab the move icon, and drag the component to a new location.

9. Click each component in the Stage pane and enter values for the component properties that appear in the Configuration pane.

View all
For descriptions of component properties, see the Component reference for UI Builder.

10. Click Save.
11. Click Activate when you’re ready to use the landing page.

Update a landing page’s name in UI Builder
Update a landing page’s name to better reflect its purpose.

Role required: workspace_admin or ui_builder_admin

You can revise the name of your landing page but not its properties, such as the application associated with the landing page. The landing page name does not appear on the landing page itself. It only appears above the Stage pane and on the Pages tab in UI Builder, as shown in the following figure. To put a name on your landing page, add a heading component.

1. Navigate to Workspace Experience > Administration > All Workspaces and click a workspace.
2. If the page that opens is not editable, click the here link in To edit this record click here.
3. Click Open in UI Builder.
4. In the Page management pane, on the Pages tab, click the landing page that you want to modify.
5. Click Page Actions and select Edit page properties.
6. In Enter the name of your page, revise the name of the landing page.
This image shows that the new landing page's name is **My revised name**.

7. Click **Update**.

/Delete a landing page in UI Builder
Delete a landing page when it's no longer needed.

Role required: workspace_admin or ui_builder_admin

1. Navigate to **Workspace Experience** > **Administration** > **All Workspaces** and click a workspace.
2. If the page that opens is not editable, click the **here** link in **To edit this record click here**.
3. Click **Open in UI Builder**.
4. In the Page management pane, on the **Pages** tab, click the landing page that you want to delete.
5. Click **Page Actions** and select **Delete page**.
6. Confirm the deletion.
Component reference for UI Builder

The information in the following sections helps you to understand the parameters for the Now components that are used in UI Builder.

Container components in UI Builder

Use a container component in UI Builder to group other, similar components, such as multiple data visualization components. You can add a title to a container to help agents understand the reason for the grouping.

You can insert any component into a container component. The container has a label that helps agents understand the grouping of the other components. In the following example, the container contains two data visualization components.
The following table explains the container component parameters.

**Container component parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component name</td>
<td>Name that appears in the component controls above a component in the Stage pane. The maximum number of characters is 18.</td>
</tr>
<tr>
<td>Label</td>
<td>String that appears as a title for the container. In the previous image, see ‘Container label here.’</td>
</tr>
<tr>
<td>Type</td>
<td>Style component. Use the <strong>Visualizations</strong> type to darken the container, which makes the components inside it stand out.</td>
</tr>
<tr>
<td>Type</td>
<td>Style component. Use the <strong>Neutral-1</strong> type to darken the container. Use the <strong>Neutral-0</strong> type to prevent the container from being darkened. Both values override the <strong>Visualizations</strong> type.</td>
</tr>
<tr>
<td>Show border</td>
<td>Toggle to show or hide an outline around a component. The container border is darker and thicker than the other component borders.</td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Can collapse</td>
<td>Toggle to enable/disable a component to collapse. When enabled, a caret icon ( ▼ ) appears in the component that a user can click to collapse the component.</td>
</tr>
<tr>
<td>Collapsed</td>
<td>Toggle to start or not-start the component in a collapsed state. When enabled, the collapsed component appears as a downward arrow ( ▼ ) on the landing page.</td>
</tr>
</tbody>
</table>

#### Data visualization components in UI Builder

Add a prepared report or a Performance Analytics (PA) widget to your landing page using a data visualization component. Reports and widgets provide overview information about tasks.

When you drag a data visualization component icon ( ▼ ) into the Stage pane, the component is empty. You must select a prepared report or a Performance Analytic (PA) widget to fill the component. You can only display one report or one widget in a data visualization component. If you specify a report and a PA widget, only the report appears. The reports and widgets can be refreshed periodically on a landing page.

To display prepared reports or PA widgets, enter text in the respective field and make a selection. The following image shows the type-ahead feature of the text entry fields.

The following image shows the **Opened Incidents this month by Priority** report in a data visualization component.
The following table explains the data visualization component parameters.

### Data visualization component parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component name</td>
<td>Name that appears in the component controls above a component in the Stage pane. The maximum number of characters is 18.</td>
</tr>
<tr>
<td>Optional Widget Label</td>
<td>Title for the widget or report. In the previous image, see, 'My title goes here.'</td>
</tr>
<tr>
<td>Report</td>
<td>List of prepared reports that can go into a data visualization component. Begin typing in the field to see report titles.</td>
</tr>
<tr>
<td>PA Widget</td>
<td>List of PA widgets that can go into a data visualization component. Begin typing in the field to see widget titles.</td>
</tr>
<tr>
<td>Single score live updates</td>
<td>Toggle to enable/disable live updating of:</td>
</tr>
<tr>
<td></td>
<td>- Reports—Only counters, for example, the number of open tasks. This feature does not work if the report contains a calculation, such as a sum or average.</td>
</tr>
<tr>
<td></td>
<td>- PA widgets—Only automated, non-scripted indicators.</td>
</tr>
<tr>
<td>Size Variant</td>
<td>Size of the report or PA widget. <strong>Auto</strong> changes the size of the report or widget responsively, depending on the width of the landing page in a browser. The other values set the size regardless of the size of the landing page.</td>
</tr>
<tr>
<td>Bordered</td>
<td>Toggle to show/hide a line around the component.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Refresh Interval (minutes)</td>
<td>How often, in minutes, UI Builder refreshes the report and widget values in this component. <strong>Single score live updates</strong> might update a value before the refresh interval.</td>
</tr>
</tbody>
</table>

**Heading components in UI Builder**

Add a title to your landing page using a header component.

The image shows the heading, My Heading, as the title for a landing page.

The following table explains the heading component parameters.

**Heading component parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component name</td>
<td>Name that appears in the component controls above a component in the Stage pane. The maximum number of characters is 18.</td>
</tr>
<tr>
<td>Label</td>
<td>Text of the heading.</td>
</tr>
<tr>
<td>Style</td>
<td>Size of the heading text.</td>
</tr>
<tr>
<td>Disable text wrap</td>
<td>Toggle to wrap or not wrap the heading text. If you set the heading text not to wrap and the heading is wider than the landing page, UI Builder truncates the end of the heading and appends an ellipsis. If the user widens the landing page, more of the heading text appears.</td>
</tr>
<tr>
<td>Hide bottom margin</td>
<td>Toggle to show or hide a blank line below the heading text.</td>
</tr>
</tbody>
</table>
Image components in UI Builder

Add images to your landing page with an image component.

When you drag the image component icon into the Stage pane, a stock image appears that you can change and resize. You can change the stock image by supplying your image’s URL.
The following table explains the parameters of the image component.

### Image component parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component name</td>
<td>Name that appears in the component controls above a component in the Stage pane. The maximum number of characters is 18.</td>
</tr>
<tr>
<td>Alt Text</td>
<td>HTML Alt element that labels images so they are WCAG compliant.</td>
</tr>
<tr>
<td>Image URL</td>
<td>URL for the image.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| **Fit**   | Image size control.  
|           | - **Expand to fill** zooms in or out on the image in both X and Y axes proportionally so the image fills the container.  
|           | - **Stretch to fit** zooms in on the image so it fills the container but the image does not expand proportionally.  
|           | - **Keep original size** displays the image in its original size, which may be larger or smaller than the container. |
| **Position** | Location of the image in the container. For example, **Bottom-right** places the image at the bottom-right of the container. This parameter only works when the image is smaller than the container. |
| **Height** | Height of the image measured by the number of pixels high. If this height is shorter than the image height, the parameter cuts off the top of the image. The width is not reduced proportionally. |

**List components in UI Builder**  
Use a list component to add lists to your landing page.

When you drag the list component icon (List) into the Stage pane, a sample list appears. List components have the following parts:
The following table explains the list component parameters. Use the previous image for the location of the parameter values in the list component.

<table>
<thead>
<tr>
<th>List component parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>Component Name</td>
</tr>
<tr>
<td>List Title</td>

Rich text components UI Builder
Add text to your landing page with a rich text component to explain parts of your landing page, for example, "Tackle these priority 1 incidents first."

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide Empty State Image</td>
<td>Toggle to show or hide the image that appears when filter conditions prevent any records from appearing in the list. The intention is to show a response so agents realize that the list is empty. You cannot change the image.</td>
</tr>
</tbody>
</table>

The following table explains the rich text component parameters.

**Rich text parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component name</td>
<td>Name that appears in the component controls above a component in the Stage pane. The maximum number of characters is 18.</td>
</tr>
<tr>
<td>HTML</td>
<td>HTML editor that you use to enter text.</td>
</tr>
</tbody>
</table>
Set up supplied landing pages in workspace

Set up pre-configured reports and relevant data for agents on the landing page to help agents quickly find issues to resolve.

Role required: workspace_designer

The landing page is an agent’s initial view of Agent Workspace. Your instance should have at least one landing page, depending on the features and products you have. Landing pages are configurable and consist of a layout with containers and widgets that appear on the page. You can use any of the supplied landing pages without modifications or you can clone a landing page and make updates for your installation.

**Note:** Widgets, such as reports, that appear on a landing page must be pre-configured. If you need to configure a widget, see *Performance Analytics and Reporting for Workspace*.

You can include these components on a landing page:

- Lists—Display a filtered list of records.
- Single Score—Displays the number of records in a filtered list.
- Time Series/Trend By—Displays a graph of record values over time.
To design your own landing page and add custom components to it, see Creating custom landing pages.

1. Navigate to Workspace Experience > Landing Pages.
2. Optional: Click a landing page to modify.
   If the landing page form is read-only, click here in To edit this record click here.
3. Optional: Create a new landing page in one of the following ways:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a new landing page based on an existing page</td>
<td>Select a landing page. If the landing page form is read-only, click here in To edit this record click here. You can modify this landing page and save it under a different name to create a new landing page that is based on this one.</td>
</tr>
<tr>
<td>Create a landing page</td>
<td>Click New.</td>
</tr>
</tbody>
</table>

4. On the form, fill in the fields.

**UX Custom Content Extension form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Landing page name.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the page shows. If you set up multiple landing pages, the page with a lower value takes precedence over the pages with higher values.</td>
</tr>
</tbody>
</table>

**Note:** If there are permissions on any active page, an agent sees the page with their group or role set. The permissions takes precedence over a user who sees a page without permissions that is the lowest order.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applicability</td>
<td>If applicability is for any page or a specific page.</td>
</tr>
<tr>
<td>Applicable Page Registry</td>
<td>Page in the UX page registry. Select Agent Workspace. This field only appears when you set Applicability to Specific Page.</td>
</tr>
<tr>
<td>Application</td>
<td>Name of the application that this landing page applies to. For example, if this value is ITSM Landing Pages, this landing page applies only to ITSM.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that you select to determine whether the landing page appears. A page that is not active does not appear.</td>
</tr>
<tr>
<td>Optional Page Title</td>
<td>Title to display on the page.</td>
</tr>
<tr>
<td>Available Child Slots</td>
<td>Pre-defined named location for child elements.</td>
</tr>
<tr>
<td>Layout</td>
<td>Pre-defined list of containers to define the number of slots (columns) that display on a layout.</td>
</tr>
</tbody>
</table>

5. Right-click anywhere on the top banner and click **Save**.
6. Put containers on your landing page.
   Containers hold the components on your landing page. You set up the containers on the landing page before putting components into them.
   a) On the **UX Page Elements** tab, click **New Container**
   b) On the form, fill in the fields.
## UX Page Element form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the container.</td>
</tr>
<tr>
<td>Component</td>
<td>Name of the container component.</td>
</tr>
<tr>
<td>Parent element</td>
<td>Landing page that this container is on.</td>
</tr>
<tr>
<td>Border</td>
<td>Option to select a border around your container.</td>
</tr>
<tr>
<td>Can Collapse</td>
<td>Toggle to enable agents to collapse this container on the landing page.</td>
</tr>
<tr>
<td>Optional Container Title</td>
<td>Title to display on the container.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of styling for your visualization. You can choose the default styling (no background color) or visualization styling (gray background).</td>
</tr>
<tr>
<td>Collapsed</td>
<td>Toggle for the initial state of the container. Select this option to collapse the container when the landing page opens.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the container appears in on the landing page. The lower the value means the higher it appears on the landing page.</td>
</tr>
<tr>
<td>Available Child Slots</td>
<td>Pre-defined list of containers to define the number of slots (columns) that appear in a layout.</td>
</tr>
<tr>
<td>Layout</td>
<td>Column layout on the page. Valid values depend on the value of Available Child Slots. The total number of columns on a page is 12. For example, if you choose Container - 3 Up for Available Child Slots, the Layout value enables you to specify the width of the three columns.</td>
</tr>
</tbody>
</table>

**c)** Click **Submit**.

You’ve created a container to put your landing page components in.

7. Add components to the containers on your landing page.

   a) On the **UX Page Element Permissions** tab, click **New Visualization**.

   b) On the form, fill in the fields.

## UX Page Element form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of your component.</td>
</tr>
<tr>
<td>Component</td>
<td>Name of the visualization component.</td>
</tr>
<tr>
<td>Parent element</td>
<td>Container that this component goes into.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the component shows in the container if there's more than one component.</td>
</tr>
</tbody>
</table>
Field | Description
---|---
Report | Report that you want to render in the container, for example, *Open problems older than 30 days* or *Transactions by month for Last 12 months.*
| Note: You must select either a Report or PA Widget, but you can’t display both in a single container. If you define both, only the report displays.
is_realtime | Toggle to update the Report or PA Widget values in real time.
PA Widget | PA Widget that you want to render in the container, for example, a single score or a time series.
| Note: You must select either a Report or PA Widget, but you can’t display both in a single container. If you define both, only the report displays.
Optional Widget Label | Title to display with the PA widget.
Size Variant | Size of the PA Widget. Choosing a size depends on how many containers are on the landing page and what you want to emphasize.
| Note: Not all sizes apply to all widgets.
Border | Toggle to put a border around the report or PA widget.
Refresh Interval | Number of minutes before the values of this component refresh. The interval begins when an agent navigates away from a landing page and ends when they come back to the landing page.
| Note: There is no auto-refresh, but an agent can click the browser’s refresh button at any time.
Visualization SysID | Designated ID for the widget.
Report Type | Type of report that renders.

c) Click Submit.

8. Configure permissions for agents to access the landing page:
a) On the UX Page Element Permissions tab, click New.
b) On the page, fill in the form.

UX Page Element Permissions form

Field | Description
---|---
Element | Value of *Optional Page Title.*
Role | Role that an agent must have to see this landing page.
Group | Group that an agent must belong to in order to see this landing page.
Any page element (including subelements) can have a restriction to a given set of roles or groups. If no element permissions are set on roles or groups, all agents see the element. If some element permissions are set, an agent needs just one role or group assignment to see the element.

c) Click **Submit**.

9. To see your landing pages:
   a) Under your profile picture, click **Configure Workspace**.

   ![Configure Workspace](image)

   **Configure Workspace** enables you to set up list categories, list filters, landing pages, the record types that agents can create, and the modules that appear in the pane on the far left of the screen.

   b) On the Workspace form, click the **Landing Pages** tab.

   *Set up lists* for your agents so they can find additional issues to work on.

**Set up landing page permissions**

Set up permissions for landing pages so that people see the landing pages suited to their roles or the groups they belong to.

Role required: workspace_admin or ui_builder_admin

When you have multiple landing pages associated with a workspace, several factors determine which one shows. One factor is the order of the landing page; the one that shows is the one that has the lowest value for **Order**.

<table>
<thead>
<tr>
<th>Name</th>
<th>Active</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incident Overview (enabled for UI Builder)</td>
<td>true</td>
<td>200</td>
</tr>
<tr>
<td>Default Landing Page (enabled for UI Builder)</td>
<td>true</td>
<td>1,000</td>
</tr>
</tbody>
</table>
The second factor is permissions, which are based on roles and groups. You can set permissions on landing pages so they only appear if the user either has the required role or belongs to a specified group. For example, you might set permissions for managers to see one landing page and agents to see another. If permissions prevent a landing page from displaying, the next landing page in **Order** displays.

1. Navigate to **Workspace Experience** > **Administration** > **Landing pages** and click the landing page you want to set permissions on.
2. On the UX Page Element Permissions tab, click **New**.
3. On the form, fill in the fields.

### UX Page Element Permissions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element</td>
<td>Landing page name.</td>
</tr>
<tr>
<td>Role</td>
<td>Role, if any, a user must have to see the landing page. Click the search icon and select a role.</td>
</tr>
<tr>
<td>Group</td>
<td>Group, if any, a user must belong to to see the landing page. Click the search icon and select a group.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of these landing page permissions. Global is the default.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
5. Repeat the procedure starting with step 2 to add other roles or groups that restrict who can see the landing page.

Even though multiple landing pages might have the same **Order** value, users may see different landing pages based on their roles or the groups they belong to.

### Setting up list view in a workspace

The list view displays filtered lists of records, such as All tasks, Open tasks, and My tasks. By setting up list categories and filtered lists, you help your agents quickly find the records they need to work on.

Agents use the list view to see records that they want to work on. To get to the list view, they click the list icon (({...})) in the navigation bar. When an agent clicks a record in list view, the record opens in record view.

**Note:** In a typical situation, if you click a field in a record in a list of records, that record opens. If the field is clickable (a reference, document ID, or URL), however, clicking it does not open the record. Instead, it opens the record or URL that the clickable field points to.

### List types

The list pane in Agent Workspace has the following sections:
- **Lists**—Lists created by the system administrator that are visible to all agents. Includes list categories and filtered lists that system administrators can assign to agents by role or assignment group.

  To learn what system administrators can configure in the Lists tab, see *Set up list categories*.

- **My Lists**—Lists that are created by agents that are not visible to other agents.

  To learn what agents can configure in My Lists, see *Create a filtered list in a workspace*.

---

**What to configure in lists**

*Create list categories*

Create categories for lists, such as All cases, My cases, and Open cases. You must create a list category before you can create a list filter. List categories are names only and not clickable. List categories do not appear unless they contain filtered lists.

*Create filtered lists*

Create a subset of all the records in the database, such as All cases, My cases, and Open cases. Filtered list names are clickable.

*Highlight list fields*

Highlight record fields in list view to call attention to them.

*Speed up loading large lists*

Remove the list pagination to improve the performance when loading large lists.

*Create custom list operations*

Use an action to create a button that performs a function on the records in the list. For example, you can create a button that assigns a selected record to an agent.
Set up field lengths for exports to Excel

Set up the maximum number of characters that are exported in condition fields to prevent the truncation of values.

Next

Click the component to set up next.

- **List category**—A name for a group of filtered lists. You must create a list category before you create a filtered list. The list category is not clickable.
- **Filtered list**—A subset of the tables in the database. You must create a list category before you create a filtered list. If you don’t create a filtered list, the list category will not show in the Lists tab.
- **Highlighted fields**—Calls attention to fields in list view.

Set up list categories in a workspace

Create list categories in a workspace to group records so that agents can find the records they need to work on.

To create list categories, you need the elevated workspace_list_admin role. If you have the workspace_list_admin role, you can elevate your privileges using the Profile Settings menu. For more information on how to get an elevated role, see Elevated privilege.

List categories group records that your agents need to do their work. Agent Workspace provides many list categories but you might create additional categories to benefit your agents. The categories are associated with database tables, for example, incidents, cases, tasks, and service level agreements (SLAs).
List categories appear in the list pane, as shown in the following image, but they do not retrieve records when you click them. The filtered lists under the categories do retrieve records. When you create a list category, you must add list filters to it or the category doesn’t appear.

![Image of list categories](image_url)

**Note:** The opening of the video shows a user who is accessing list categories through the application navigator. As of Orlando, that module is no longer in the application navigator. The rest of the video, however, shows how to create list categories. Next, see the following procedure to learn how to access list categories.

1. In your workspace, click your profile image and then on the Settings menu, select **Configure Workspace**.

![Configure Workspace](image_url)

2. On the **Workspace List Categories** tab, click **New**.
3. On the form, fill in the fields.

**Workspace list**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Category name. The title usually applies to a table of records, for example, Users, or Cases.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the list category appears in the list pane. Lower numbers appear first. For example, a list category with an order of 100 appears above a list category with 200.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the list category appear or disappear in the list pane. Note: A category does not appear if it does not have an associated filtered list, even if you select Active.</td>
</tr>
<tr>
<td>Description</td>
<td>Rationale for creating the category.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

A new list category appears in the list pane.

![New list category](image)

5. See your list categories:
   a) Under your profile image, click **Configure Workspace**.
b) On the Workspace form, click the **Workspace List Categories** tab.

You must set up a filtered list in the category that you created in order for the category to appear.

**Set up filtered lists in a workspace**

Set up filtered lists to group records that help agents do their work more efficiently. Example groupings are Active Cases, My Cases, and All cases.

Before you can create a filtered list you must **Create a list category** for the filtered list to go under.

List filters display a subset of the records in a table. For example, in the Incident category, a filtered list might only display the records in the Incident table that have the status **open**. You might call that filtered list, Open Incidents.

List filters, as shown in the following image, appear as subsections under list categories in the list pane. When clicked, list categories do not display lists of records, but list filters do. Set up list filters that agents need to do their work. For example, you can set up list filters for Open Incidents, High Priority Incidents, and My Incidents.
1. In your workspace, click your profile image and on the Settings menu, select **Configure Workspace**.

2. On the **Workspace Lists** tab, click **New**.

   **Note:** If you don’t see the **New** button, click the cog icon (⚙️) and then select **Developer > Agent Workspace**.

3. On the form, fill in the fields.

   **Note:** The **Role required** value in the video says `workplace_list_admin` but the correct role is `workspace_list_admin`.
### List filter form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List name</td>
<td>Name for the list filter that appears in the list pane. Choose one or two words that agents can easily understand, for example, Open incidents.</td>
</tr>
<tr>
<td>Category</td>
<td>Category that a list filter appears under in the list pane. The category must already exist.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that you want to retrieve records from. For example, a list filter about open incidents should retrieve records from the incidents table.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace that the list filter appears in.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Restrictions that apply to the list of records that appear with this list filter. For example, Active is true means inactive records do not appear. For more information on creating a filter, see Create a filter.</td>
</tr>
<tr>
<td>Columns</td>
<td>Columns that appear in the filtered list.</td>
</tr>
<tr>
<td>Groups</td>
<td>List of users who can view the list. Add any group to limit the list access to just that group. For example, you might add Customer Service Support. You can add more than one group to the list. If you do not add a group, any user who can access Agent Workspace can access the list.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles that can view this list filter. Remove clutter from agents’ workspaces if they don’t need this list filter. If you don’t add a role, this list filter appears for all agents.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope that the filter applies to. Global means that you can use this filter for all applications.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which the list filter appears under the list category in the list pane. Lower numbers appear above list filters with lower numbers. For example, a list filter with an order of 100 appears above a list filter with 200 under a list category.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the list filter appear or disappear in the list pane.</td>
</tr>
</tbody>
</table>

For example, the following filtered list, named Open, displays only active incidents.
4. Click **Submit**.
   The list filter appears in the list pane under the category that you specified. Using the example in the previous step, the list filter, **Open**, appears under the **Incidents** list category.

5. To see your filtered lists:
   a) Under your profile picture, click **Configure Workspace**.
b) Click the **Workspace Lists** tab.

- **Highlight fields that appear in list view** to call agents’ attention to them, for example, when priority is critical.
- If you are finished setting up list components, you can now set up the components in the **record view**.

**Highlight list fields in a workspace**

Use colors to highlight list fields so that you can call an agent’s attention to them.

Role required: workspace_admin

Highlighted list fields appear colored and optionally, have a leading bullet.

<table>
<thead>
<tr>
<th>Number</th>
<th>Opened</th>
<th>Short description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INC0000002</td>
<td>2019-05-29 16:07:12</td>
<td>AGAIN UPDATED</td>
</tr>
<tr>
<td>INC0000031</td>
<td>2019-05-09 17:18:03</td>
<td>UPDATED VIA MULTI-EDIT</td>
</tr>
</tbody>
</table>

The setup involves specifying the field that gets highlighted and the condition that triggers the highlighting.
ServiceNow Orlando Now Platform capabilities

Available colors are:

- Critical
- High
- Warning
- Moderate
- Positive
- Info
- Low

Workspace does not support highlighting the following field types:
- Reference
- URL
- Document IDs

1. Navigate to **Workspace Experience > Administration > Highlighted Values** and click **New**.
2. On the form, fill in the fields.

### Highlighted Value form

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the table that contains the fields you want to highlight.</td>
</tr>
<tr>
<td>Field</td>
<td>Name of the field that you want to highlight if the triggering conditions are met.</td>
</tr>
</tbody>
</table>
The **Field** value can be unrelated to the condition that triggers the highlighting. In the following example, if the **Caller** is Fred Luddy, workspace highlights the **Priority** field, not the **Caller** field.

<table>
<thead>
<tr>
<th>Table</th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Priority</td>
</tr>
<tr>
<td>Application</td>
<td>Global</td>
</tr>
</tbody>
</table>

3. Right-click the header and click **Save**.
   
   You’ve specified the field where the highlights appear. Now, it’s time to specify the conditions that trigger the highlighting.

4. In **Highlighted Value Conditions**, click **New**.

5. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Highlighted Value Condition form</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Conditions</td>
</tr>
<tr>
<td>Status</td>
</tr>
<tr>
<td>Show Icon</td>
</tr>
<tr>
<td>Field</td>
</tr>
<tr>
<td>------------------</td>
</tr>
<tr>
<td>Value Override</td>
</tr>
<tr>
<td>Application</td>
</tr>
<tr>
<td>Order</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

In the following example, the highlighting was triggered on the **Priority** field because the priority value was critical.

<table>
<thead>
<tr>
<th>Number</th>
<th>Opened</th>
<th>Short description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INC0000002</td>
<td>2019-05-29 16:07:12</td>
<td>AGAIN UPDATED</td>
</tr>
<tr>
<td>INC0000031</td>
<td>2019-05-09 17:18:03</td>
<td>UPDATED VIA MULTI-EDIT</td>
</tr>
</tbody>
</table>

7. Optional: Click **New** on the Highlighted Value Conditions related list and create another condition for highlighting the same field.

For example, highlight the **Priority** field that is associated with the Incident table when the **Priority** value is “critical,” or when the **Caller** value is “Fred Luddy.” The conditions are ranked according to the **Order** value. Workspace evaluates the lowest value first.

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Order</th>
<th>Show Icon</th>
</tr>
</thead>
<tbody>
<tr>
<td>Priority = 1 - Critical</td>
<td>30</td>
<td>true</td>
</tr>
<tr>
<td>Caller = Fred Luddy</td>
<td>50</td>
<td>true</td>
</tr>
</tbody>
</table>

8. Optional: Remove the highlighting from a filtered list that would otherwise have highlighting.

When setting up highlighting for a table, all filtered lists that are associated with the table display highlighted fields unless you disable highlighting for specific filtered lists.

a) In your workspace, click your profile image and then on the Settings menu, select **Configure Workspace**.
Set up the components in record view.

**Speed up how fast lists load in workspace**

Speed up how fast lists load by removing the calculation of the total number of records in a list.

Role required: workspace_admin

Calculating the total number of records to be included in a list that’s filtered from large tables can take a long time. After calculating the number of records, workspace calculates the number of pages those records fill and displays the page count.

To load lists faster, you can remove the page calculation for all or only specified filtered lists. When you remove the calculation, the total record count is not displayed and workspace removes the go-to-end-of-list icon (→).

1. In your workspace, click your profile image and then, on the Settings menu, click **Configure Workspace**.

2. Click **Configure List Attributes**.

3. To omit the page calculation, in the **Omit Count** column, either:

b) Click **Configure List Attributes**.

c) In the Disable Highlighted Values column, either select the check box in the title bar of a list category to remove highlighting from all fields in the associated list category, or select the filtered list in each list category where you want to hide the highlighting.
Select the check box in the title bar of a list category to remove the pagination calculation for all filtered lists in the associated list category.
Select the filtered lists in each list category where you want to omit the page calculation.

4. Click **Save**.

Create custom list operations in a workspace

Create an action that enables agents to perform functions on the records in the list. For example, you can create a button that assigns a selected record to an agent.

Role required: workspace_admin

A list action appears as a button in list view.

<table>
<thead>
<tr>
<th>Number</th>
<th>Opened</th>
<th>Short description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INC0010111</td>
<td>2019-07-22 14:04:57</td>
<td>ATF : Test1</td>
</tr>
</tbody>
</table>

When clicked, the button dispatches a predefined action in Agent Workspace. You can create list actions to:
- Create a new record (client action)
- Assign a record to the user (client side action)
- Group actions, such as selecting multiple records and deleting them (server side action)
- Edit a record. Agents can click a button to open a side panel in list view to edit record details while still in list view.
1. Navigate to **Workspace Experience > Actions & Components > List Actions** and click **New**.
2. On the form, fill in the fields.

### Action Assignment form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Name of the list action. Typical names are Edit, Create New, and Update.</td>
</tr>
<tr>
<td>Action name</td>
<td>Name that describes what you’re adding.</td>
</tr>
<tr>
<td>Implemented as</td>
<td>Action type. Select <strong>Client action</strong>. The list action takes place on the client side, such as dialing a phone number, opening a record, or opening a form to edit a record.</td>
</tr>
<tr>
<td>Specify UI component</td>
<td>Component to add in the UI for this action. Shown only when implemented as is UI component. Click the magnifying glass icon (🔍) and select the component to add as a list action.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Specify client action</td>
<td>Action taken by the client when an agent clicks the action icon. Shown only when implemented as is Client action. Click the magnifying glass icon (🔍) and select the client action to add as a related list.</td>
</tr>
<tr>
<td>Button type</td>
<td>Primary green button, such as <strong>New</strong> in the following image. The secondary button is gray.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that displays when an agent points their mouse at the icon.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of this component.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace that this component belongs in, for example, Agent Workspace, ITSM, CSM, and so forth.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that this component is tied to. When a record from this table is open, this list action appears.</td>
</tr>
<tr>
<td>View</td>
<td>Set of visual configurations. This value is typically <strong>Workspace</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the icon for this list action appear.</td>
</tr>
<tr>
<td>Order</td>
<td>Integer that governs the placement of this icon in the list of list actions. A lower number means that it is higher in the list. The typical practice is to make these numbers hundreds, for example, 100, 200, 300, and 400, so you can put new icons between existing ones in the future.</td>
</tr>
</tbody>
</table>

3. Under **Related Links**, click **Advanced view**.
4. In the value field, specify the action that the button takes.
5. Optional: On the **Conditions** tab, use the condition builder to create filters that prevent the list actions from appearing in workspace.
   For example, you may hide a button to create a new record for specific tables or if the user has the wrong permissions.
6. Optional: On the **Confirmations Settings** tab, select the **Confirmation Required** check box if you want to display a pop-up window that asks the agent to confirm the use of this list action.
7. Optional: On the **Action Exclusion** tab, click **New** to exclude child tables from inheriting this list action, or this table from inheriting components from a parent table.
   a) On the form, fill in the fields.

**Action Exclusion form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action assignment</td>
<td>Function the action performs, such as, <strong>create new</strong> or <strong>agent assist</strong>. Click the magnifying glass icon (🔍) and select an action assignment.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that is associated with this component. Every time Agent Workspace opens a record from this table, this component's icon appears in the Related Items menu.</td>
</tr>
</tbody>
</table>
b) Click Submit.

8. Click Update.

Set up the condition field length in exports

Set up the maximum number of characters that can be exported in condition fields to prevent truncated values.

Role required: admin

This setup only pertains to exporting condition field types, for example, SLA definition.

The default number of characters in the condition field types that you can export to Microsoft Excel spreadsheets is 80. If your data contains longer values, you can use the glide.ui.export.choice_list_max_characters system property to increase the number of characters exported. This property has no effect on the length of condition field values in tables.

1. In the navigation filter, enter sys_properties.list.
2. In the Name field, search for and click glide.ui.export.choice_list_max_characters in the list of system properties.
3. In the System Property form, in the Value field, set the maximum number of characters to export in condition fields.

Set up the components in record view.

Set up Record View in workspace

Set up the components in the Workspace Record View to optimize the user interface where agents do most of their work.
After agents select a record to work on in List View or on a Landing Page, the record displays in Record View.

In this view, agents get record details, can assign records to themselves, get information about resolving the issue, and communicate resolutions with the requester. As system administrator, your job is to optimize the information presented in Record View so the agents can complete their work easily.

Adding custom components

Each component area in Record View comes with standard components that you configure. In the following component areas, you can also add custom components using the Now component library:

- Ribbon
- Contextual Side panel
- Related lists
- Related items
- List action
- Field decorator
Now component are the building blocks of Workspace, such as lists, PAR scores, and containers. For more information about custom components, see *Developing components for Workspace*.

**Configuring Record View components**

Click a component to set it up.

<table>
<thead>
<tr>
<th>Tabs</th>
<th>Ribbon</th>
<th>Activity Stream</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notifications</td>
<td>Related Items Menu</td>
<td>Contextual Side Panel</td>
</tr>
<tr>
<td>Form Header</td>
<td>Form pane</td>
<td></td>
</tr>
<tr>
<td>UI Actions</td>
<td>Actions &amp; Components</td>
<td></td>
</tr>
</tbody>
</table>
Select the records agents can create in Workspace

Enable agents to create the records they need so they can do their work in Agent Workspace.

Role required: workspace_admin

Agents access open records by clicking tabs above the Form Header. Agents create new records by clicking the plus (+) icon. You set up the tables agents can insert new records into.

Create a record

By default, agents only create records in the Interaction table. These records store information about interactions, such as phone or chat conversations between agents and customers. Agents typically create incidents or problems out of those conversations. As the previous image shows, the agent can only create records in the Interaction and Incident tables.

The new record appears in a new tab. In this way, agents can jump between open records just by clicking tabs. The tabs in this image show two incident records are already open. Your job is to set up the correct list of tables agents can insert records into. Agents must have create permissions on those tables.

1. Navigate to **Agent Workspace > New Record Menu**.
2. In the New Record Menu Items form, click **New**.
3. In the New Record form, fill in the values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table that contains the records you want to give agents access to, for example, Incident or Case.</td>
</tr>
<tr>
<td>Workspace settings</td>
<td>Workspace the agents are working in.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of this setting’s applicability. Global means that all workspaces can use this setting.</td>
</tr>
<tr>
<td>Order</td>
<td>Placement of this table in the list of tables in the list under the plus (+) icon. Lower numbers appear higher in the list. The list appears when you hover over the plus (+) icon.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the table appear (selected) or not in the list of tables under the plus (+) icon.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
5. To see the records your agents can open:
   a) Under your profile picture, click **Configure Workspace**.
b) On the Workspace form, click the **New Record Menu Items** tab.

If you added the Incident table and made the **Order** value for the Incident table lower than the **Order** value for the Interaction table, Incident appears above Interaction in the list of records an agent can create.

Click a component to set it up.

<table>
<thead>
<tr>

Set up forms in Workspace

Select the fields that appear in form pane to help agents do their work.

Role required: workspace_admin

The form pane in Agent Workspace displays detailed information stored in the selected record.

Each record contains more fields than can reasonably fit on the screen. Your job is to display only the fields the agents need. You perform this task for each table the agent can access. For example, form panes show the same fields for all incident records, which is likely different from the fields displayed for all case records. You can tell which tables the agents have access to by looking at the list under the plus (+) icon.

The fields displayed in forms can vary by the agent's role.

**Note:** Agent Workspace does not support the display of all fields that might be in a record. For more information about supported fields, see Supported fields in Workspace form panes.

1. Navigate to Agent Workspace > New Record Menu.
2. Click your avatar.
4. In the configuration form, move fields into or out of the **Selected** column using the arrows between the **Available** and **Selected** columns.

The fields in the **Selected** column appear in the form pane. For a description of some of the fields, see *Supported fields in Workspace form panes*.

Available items that appear in green followed by a plus (+) sign represent related tables. To access the fields on these tables, use dot-walking.
5. Use the up and down arrows to the right of the Selected column to move highlighted fields up or down in the column.

6. In the View name list, select the workspace you're configuring, for example, Workspace_itil. These views correspond to agent roles.

7. Optional: Add a field to the Selected column that's not in the Available column.
   a) Under Create new field, fill in the fields.
Create new field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the new field.</td>
</tr>
<tr>
<td>Type</td>
<td>Data type of the values in the field.</td>
</tr>
<tr>
<td>Field length</td>
<td>Maximum length of the string value, if you select String as the Type. This field does not display for other types.</td>
</tr>
</tbody>
</table>

b) Click Add.

8. Click Save.

Note: Do not add the same field to more than one section of a form unless the field displays read-only data. Having two or more instances of an editable field can cause data loss and prevent the proper functioning of UI and data policies.

The following image shows the addition of the Category and Subcategory fields in the form pane.

Hide some of the fields displayed in forms based on an agent's permissions or set up a different component.
Click a component to set it up.

<table>
<thead>
<tr>
<th>Tabs</th>
<th>Ribbon</th>
<th>Activity Stream</th>
</tr>
</thead>
<tbody>
<tr>
<td>Notifications</td>
<td>Related Items Menu</td>
<td>Contextual Side Panel</td>
</tr>
<tr>
<td>Form Header</td>
<td>Form pane</td>
<td></td>
</tr>
<tr>
<td>UI Actions</td>
<td>Actions &amp; Components</td>
<td></td>
</tr>
</tbody>
</table>
Hide fields from agents in Workspace

Specify the fields that display in the form pane depending on the agent’s role. Only display the fields in the form pane agents need to do their work.

Role required: workspace_admin

By default, agents see all of the record fields configured to display in the form pane. You can hide fields from agents according to their role. Hiding field values de-clutters the form pane for them.

1. Navigate to Workspace Experience > Forms > Workspace View Rules.
2. Click New.
3. In the Workspace View Rule form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the rule. Typically, the name expresses what agents are affected by the rule and what privileged information they are allowed to see.</td>
</tr>
<tr>
<td>Table</td>
<td>Table this rule applies to. You can define view rules only at the table level and only once per table.</td>
</tr>
<tr>
<td>View</td>
<td>Select the form view to render for the conditions set. A view defines the elements that appear when an agent opens a form or list. The view corresponds to an agent’s role.</td>
</tr>
<tr>
<td>Application</td>
<td>Application this rule applies to. Global means the rule applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace affected.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make this rule active (selected) or not.</td>
</tr>
</tbody>
</table>

4. Optional: On the Conditions tab, select the roles people must have in order to see the field. Use the role selection picker:
In the following example, only an admin or agent_admin will see the State field in the form pane if the State is New. Everyone will see the State field in the form pane if the State field has a different value.

5. Click Submit.

Users with the specified roles can see the fields for the specified table.

If there are multiple Workspace View Rules in place, the rule with the lower execution order applies. If the execution order is the same for multiple rules, the first rule created applies.

Set up form annotations to highlight form fields, or set up a different component.

Click a component to set it up.

Set up form views based on Agent roles

Set different form views for different agent roles to display on the fields the agent needs to see.

Agent roles can be based on permission levels or products, for example, CSM (for cases) or ITSM (for incidents). A workspace view is configured for each type of agent. Views use the following role-based hierarchy to determine which form the agent sees in Agent Workspace.

Any view/role combination that results in the Default form view is read-only.

<table>
<thead>
<tr>

**Set up form annotations**

Highlight form elements by displaying blocks of colored text or separators between form elements.

**Role required:** admin

Form annotations are colored lines or colored lines of text that you can insert between fields in the form pane.

1. Navigate to a form.
2. Click the context menu icon

   ( )

   and select **Configure > Form Layout**.

3. Under **Form view and section**, select a section.
4. In the Available list, double-click *Annotation* to move it to the **Selected** list.
   
   The Annotation Details section appears.
5. Place it above the field to annotate.
6. In Annotation Details, select the type of annotation. The available types of annotations include Info Box Blue, Info Box Red, Line Separator (any text you add appears beneath the line), Section Details, Section Separator, and Text.
7. Select either Plain Text or HTML for the data type and enter the annotation in the text box. All valid HTML tags are supported. For example, select the Text annotation type, the HTML data type, and enter `<span style="color:red">Select the primary location:</span>`. The text appears red on the form.

8. Click Save.

Click a component to set it up.

Set up form headers in workspace

Configure the primary field and secondary values in form headers so that agents can quickly orient themselves to an issue.

Role required: workspace_admin

Form headers provide an overview of the record. They have two lines:

- Primary field—The top line that serves as the title for the page, such as Laptop won’t boot, as shown in the following image. Typically, this is the value of the Short Description field in the record.
- Secondary value—The line below the primary field consists of read-only, name-value pairs of important record information, such as Priority: 5 - Planning. Workspace displays up to the first seven, non-null secondary fields. You can highlight these fields and make them appear conditionally. If you do not have the required role, you would not see the associated secondary value. You can set conditions that have to be met for a secondary value to appear, for example, Active=true.

![Form header example](image)

Form header

Your job is to set up what appears in the primary and secondary fields for your agents.

Child tables inherit form header configurations from their parent tables. Form header configurations on a child table take precedence over parent table configurations. For example, if the Incident table does not have a form header configuration, the table inherits all form header configurations from its parent, the Task table.

1. Navigate to Forms > Form Headers and click New.
2. On the form, fill in the fields.

### Workspace Form Header New Record form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table that is associated with this form header. Whenever an agent selects a record from this table, this form header appears.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Primary field</td>
<td>Field that appears on the top of the form header and acts like the title of the record. Normally, the field is unique and descriptive, such as short description. This field helps the agent understand what the record is about.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of this setting’s applicability. Global means that all workspaces can use this setting.</td>
</tr>
<tr>
<td>Ignore Highlight</td>
<td>Toggle to turn off (selected) highlighting in the form header for fields configured to be highlighted.</td>
</tr>
</tbody>
</table>

3. In the Secondary fields related list, click New.
4. On the form, fill in the fields.

### Secondary values form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Secondary fields that appear in the form header whenever records from this table are open.</td>
</tr>
<tr>
<td>Field</td>
<td>Secondary field’s name.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the secondary fields appear in the form header.</td>
</tr>
<tr>
<td>Order</td>
<td>Arrangement of secondary fields. A lower number means that it is further left in the row of fields.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Filters that can hide the secondary field. For example, the Field value, Closed By appears only if the condition Active is false.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles that a user must have for the secondary fields to appear. Click the lock icon and select the roles.</td>
</tr>
</tbody>
</table>

5. Click Submit.
6. To add additional secondary values, click New and fill out the table again.

Highlight values in the form header to call agents’ attention to them or set up a different component.

Click a component to set it up.

Highlight values in the form header
Highlight secondary field values in the form header in Agent Workspace to alert agents to important information.

Role required: admin

Highlighted secondary-field values appear with a background color in the form header.

To configure highlights, you specify the fields in tables that should appear highlighted when displayed in the secondary fields of a form header. In that way, whenever any agent accesses a record from the specified table, the configured secondary fields appear highlighted.

1. Navigate to **Agent Workspace** > **Highlighted Values** and click **New**.
2. On the form, fill in the fields.

   **Highlighted Value form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table that contains the field that you want to highlight in the form header.</td>
</tr>
<tr>
<td>Field</td>
<td>Field that you want to highlight.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.
4. In the Highlighted Values list, click the record you just created.
5. In the Highlighted Value Conditions related list, and click **New**.
6. On the form, fill in the fields.

   **Highlighted Value Condition form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Condition builder where you can set the conditions for your highlighted value to display.</td>
</tr>
<tr>
<td>Status</td>
<td>Background color. Each status has its own color, for example, Critical displays a red background, Moderate displays a purple background, and Info displays a blue background.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Show icon</td>
<td>Toggle that makes a small circle display in addition to the background</td>
</tr>
<tr>
<td></td>
<td>coloring.</td>
</tr>
<tr>
<td>Value Override</td>
<td>Text that renders instead of the Status value. For example, instead of</td>
</tr>
<tr>
<td></td>
<td>“Critical,” you can display, “Address this immediately.” You can reference</td>
</tr>
<tr>
<td></td>
<td>a text value using {{value}}.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope that contains the record.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the highlighted values are evaluated.</td>
</tr>
</tbody>
</table>

**Configure a highlighted value**

Configure a highlighted value for the **Priority** field in problem records when the priority is 1 - **Critical**. Select the Incident table and the **Priority** field when creating this highlighted value.

In the Highlighted Value Conditions, set the conditions to be **Priority** is 1 - **Critical** and **Status** **Critical** and check **Show icon**.

The highlighted value renders for this configuration:

---

**Employee payroll application server is down.**

<table>
<thead>

**Disable tagging**

Prevent agents from tagging records in Agent Workspace.

Role required: admin

Tags are text labels that agents add to records to organize them. The Tag icon appears in the Form Header.

For more information about using tags, see *Tag records in Workspace*.

To prevent agents from tagging records on an entire instance, in the `glide.ui.show.form_tags_bar` system property, set `Type = true | false` and `Value = false`. The Tag icon doesn’t appear on records stored in the instance.

Click a component to set it up.

Set up ribbons in workspace

Set up ribbons in Agent Workspace to help agents quickly scan relevant information about a record, such as the record’s time line, a customer summary, and record SLAs.

Role required: workspace_admin

Ribbons provide contextual information about the record displayed in the form. Ribbons do not display by default. Each ribbon can have multiple components and each can occupy a configured amount of screen space. You cannot configure what is in each ribbon component. Ribbon components include:

- **Customer360**—Provides contact information about the account, contact, or consumer in the record.

![Customer360](image)

- **Timeline**—Shows an at-a-glance overview of the activities associated with the record, for example, was there a lot of activity early on and then things went quiet for a while? Were there long delays in communications between the agent and the customer’s response? On the right side, the timeline shows how long the agent spent working on the case (With Agent) and how long the agent has waited for info from the customer (With Customer). A case is considered to be with the agent when it is in the **New**, **Open**, or **Closed** state. A case is considered to be with the customer when it is in the **Awaiting Info** or **Resolved** state.

![Timeline](image)

- **Active SLA**—Provides a countdown to the time when the record violates SLA standards.

![Active SLA](image)
Ribbon

You associate ribbons with tables. Only one ribbon can be associated with a table. Whenever an agent selects a record from a table associated with a ribbon, the ribbon appears. If the agent then selects a record from a table not associated with a ribbon, the ribbon disappears.

You add components to ribbons one at a time. To add multiple components to a ribbon, repeat the following procedure multiple times, each time adding a different component. You must also repeat the following procedure for each table you want to associate with a ribbon.

1. Navigate to **Workspace Experience > Forms > Ribbon Settings**.
2. Click **New**.
3. On the New record form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Label that describes this ribbon setting. It often includes the table associated with this ribbon.</td>
</tr>
<tr>
<td>Ribbon component</td>
<td>Component to add to the ribbon, including Customer360, Timeline, Active SLA or a custom ribbon component. You can only add one component at a time. To make a second component appear in the ribbon, repeat this procedure and add a different component.</td>
</tr>
<tr>
<td>Table</td>
<td>Table associated with this ribbon. Any time an agent selects a record from this table, the ribbon appears with this component.</td>
</tr>
<tr>
<td>Width</td>
<td>Number of columns the component occupies in the ribbon. The width of the page is 12 columns. When using multiple components, the total combined width of all the components must equal 12 or less.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of this ribbon. Global means the ribbon works with all applications.</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workspace</td>
<td>The workspace that uses this ribbon configuration. If this field is empty, the ribbon configuration applies to all workspaces. The Workspace field is empty by default.</td>
</tr>
<tr>
<td>Order</td>
<td>Location of this component in the ribbon. Ordering the components goes from left to right. For example, if you associated three components with a table, the component with the lowest order would be on the left and the component with the highest order would be on the right.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to turn this component on/off in the ribbon for this table.</td>
</tr>
<tr>
<td>Inherit</td>
<td>If set to true, the ribbon configuration can be inherited by child tables. For this to be effective, a child table should not have any configured ribbon settings. The Inherit field is false by default.</td>
</tr>
</tbody>
</table>

4. Right-click the header and select Save.
If the Ribbon component is either Customer360 or Timeline, the Ribbon Component Attributes form appears so you can specify the values that go into the component. Other ribbon component type attributes are not configurable.

5. Optional: Add a custom component to the ribbon.
   a) Click the magnifying glass icon (🔍) next to Ribbon component.
   b) In the Ribbon Components form, click New.
   c) In the form, fill in the fields.

   **Ribbon Component**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the Now component.</td>
</tr>
<tr>
<td>UX Component</td>
<td>Click the magnifying glass icon (🔍), in the Application column, find components associated with Agent Workspace and select one. Alternative, click New to associate a script with a new component you've written and then add that in the UX Component field.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the Now component.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
</tbody>
</table>

   d) Click Submit on the Ribbon Components form.
   e) Click Submit on the New record form to add the Now component to the ribbon.

6. In the Ribbon Component Attributes form, fill in the values. The form depends on the Ribbon component.
   a) If your Ribbon component is Customer360, fill in the form.

   The values specify the source and the kind of the information displayed in this component.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary user</td>
<td>Table column in the <strong>Primary reference table</strong> to use when retrieving name and contact information for this component, for example, <strong>Assigned to</strong> or <strong>Caller</strong>. If this value is missing in the table, Agent Workspace inserts the values specified in <strong>Secondary user</strong>.</td>
</tr>
<tr>
<td>Primary reference table</td>
<td>The table that stores information for the <strong>Primary user</strong> field.</td>
</tr>
<tr>
<td>Primary fields</td>
<td>Table column values in the <strong>Primary reference table</strong> displayed in this component, for example, name, email, phone number, etc.</td>
</tr>
<tr>
<td>Secondary user</td>
<td>Table column in the <strong>Secondary reference table</strong> to use when retrieving name and contact information for this component if the value is missing for the <strong>Primary user</strong>. For example, <strong>Assigned to</strong>. If this value is missing in the table, Agent Workspace inserts the values specified in <strong>Tertiary user</strong>.</td>
</tr>
<tr>
<td>Secondary reference table</td>
<td>The table that stores information for the <strong>Secondary user</strong> field.</td>
</tr>
<tr>
<td>Secondary fields</td>
<td>Table column values in the <strong>Secondary reference table</strong> displayed in this component, for example, name, email, phone number, etc. when Agent Workspace uses the <strong>Secondary user</strong>.</td>
</tr>
<tr>
<td>Tertiary user</td>
<td>Table column in the <strong>Tertiary reference table</strong> to use when retrieving name and contact information for this component if the value is missing for the <strong>Secondary user</strong>. For example, <strong>Assigned to</strong>. If this value is missing, no information displays in this component.</td>
</tr>
<tr>
<td>Tertiary reference table</td>
<td>The table that stores information for the <strong>Tertiary user</strong> field.</td>
</tr>
<tr>
<td>Tertiary fields</td>
<td>Table column values in the <strong>Secondary reference table</strong> displayed in this component, for example, name, email, phone number, etc. when Agent Workspace uses the <strong>Tertiary user</strong>.</td>
</tr>
</tbody>
</table>

b) If your **Ribbon component** is **Timeline**, specify the role of the person who works on the task summarized in the record.

Generally, the fulfiller is the agent, for example, **sn_esm_agent**. The fulfiller role is different for different versions of Agent Workspace, for example, ITSM and CSM. The timeline shows activities performed by the fulfiller and requester. You can configure the fulfiller and requester labels in the time line using the Resolution Shaper. The **Fulfiller Label** in the Resolution Shaper Config form should match the **Fulfiller role** attribute. For example, if the **Fulfiller role** is set to **sn_esm_agent**, which is an agent role, the **Fulfiller Label** should refer to an agent. For more information about the resolution shaper configuration, see **Customer service case timeline**.

7. Click **Submit**.

The ribbon appears when an agent selects a record from the specified table. Each component is filled with the information specified in the ribbon component attributes.
Form ribbon

8. Optional: Repeat this procedure if you want to add a different component to the same ribbon, or if you want to add a ribbon to a different table.

Click a component to set it up.

Set up the Related Items menu in workspace

Set up the items that are related to the open record so that agents can get a better understanding of the record and its impact.

Role required: admin

Related items appear like tabs above the form pane. There are three types of items:

- Details—Fields from the open record. You can specify which fields appear.
- Related items—Components other than lists that are related to the open record. Typically, this tab shows Now components. For example, you might create cards with record fields to appear in the form pane.
- Related lists—Lists that are related to the open record. These lists are tables of records.

The following example shows an incident record. The Impacted Services related list shows a list of services that are impacted by this incident. The Child Incidents related list show incidents that are related to this one.

The highlighted section in this image is called the Related Items menu.

You set up related lists for each table. For example, the related lists that are displayed are the same for all incident records. The related lists that are displayed are the same for all case records but are likely different from those displayed for incident records.

1. Navigate to the table that you want to create a related list for. For example, in the navigation filter, enter Incident to set up related lists for all incident records.
2. Click any of the records to open it.
3. Right-click the menu icon ( '"') and navigate to Configure > Related List.
4. On the Configuring related lists form, move the fields that you want in the related lists section from the Available column to the Selected column.
5. Optional: Select a field in the Selected column and use the vertical arrow heads on the right to move the field in the list order.
6. Click Save.
7. Optional: Change the order of the items in the Related Items menu.
   By default, Details appears on the left.
   a) Navigate to Workspace Experience > Forms > Workspace View Rules and click New.
   b) On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the order of lists in the Related Lists menu for all records in Table.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that this order of lists pertains to. Whenever a record from this table opens, this form defines the order of the lists in related lists.</td>
</tr>
<tr>
<td>View</td>
<td>View that is shown when the conditions are met. Use Workspace.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace that this rule applies to.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to turn on (selected) and off this rule.</td>
</tr>
</tbody>
</table>

   c) On the Conditions tab, specify the role users must have and the record field conditions that must be met for this reordering to appear.
      For example, you can select the condition State is resolved.
   d) To order the items in the Related Items menu, on the Form Tabs tab, clear the Default Tab Order check box, click the lock icon ( "") next to Tab Order.
      You can then reorder the items in the Related Items menu by selecting the lists that you want to move. Then, use the up and down arrow to move them.
   e) Click Submit unless you want to select which item in the Related Items menu appears in the form pane when record view opens.
      If you do want to choose what appears in the form pane when record view opens, right-click the top banner, click Save, and proceed to the next step.

The following example shows that Details is no longer on the left.
8. Optional: Specify which item in the Related Items menu appears in the form pane when record view opens.

By default, the left-most item is in focus when a record opens. You can, however, put a different item in focus.

a) Navigate to Workspace Experience > Forms > Workspace View Rules and click the workspace view rule that you want to edit.

b) On the Form Tabs tab, open the Default Tab Focus list and select the item that should be in focus when an agent opens a record in the table that is specified in this rule.

c) Click Submit.

The following image shows that Impacted Services/CIs rather than the Affected CIs is in focus when the record opens.

9. Optional: Automatically jump to a section in the form pane when conditions are met.

By default, when Details is in focus in the Related Items menu, the first section opens. You can, however, set conditions for the Details to open on a different section. Details usually displays many sections in the form pane that require scrolling to reach. If there is a typical work pattern for agents, you can save agents' time by automatically scrolling to the relevant
section when conditions are met. For example, when the condition, **State is On hold**, is true, automatically scroll to the tenth section in **Details** because that is a section that agents need for their resolution notes.

a) Navigate to **Workspace Experience > Forms > Workspace View Rules** and click the workspace view rule that you want to edit.

b) On the **Form Settings** tab, click **New**.

c) On the form, fill in the fields.

### Workspace Default Form Section form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this configuration where a specified section in <strong>Details</strong> automatically appears instead of the first section.</td>
</tr>
<tr>
<td>Order</td>
<td>Sequential order this rule is evaluated in when there are multiple rules. The lower the <strong>Order</strong> value means that it's evaluated in the sequence sooner.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle that turns on this customization.</td>
</tr>
<tr>
<td>Form Section</td>
<td>Section of <strong>Details</strong> that opens in the form pane instead of the first section.</td>
</tr>
</tbody>
</table>

d) Optional: In **Conditions**, add conditions that limit when the specified section in **Form Section** opens first.

e) Click **Submit**.

10. Optional: **Create an Add button** so agents can add records to the related lists.

Click a component to set it up.

- **Tabs**
- **Notifications**
- **Form Header**
- **UI Actions**
- **Ribbon**
- **Related Items Menu**
- **Form pane**
- **Actions & Components**
- **Activity Stream**
- **Contextual Side Panel**
Set up adding records to a related list
Create an Add button so agents can add records to a Related List.

Role required: workspace_admin

You can create an Add button that enables agents to add records to lists. Currently, this functionality only supports many-to-many tables. In the following example, we use the task_location tables and create the Add button for incidents. So, when you open a incident, you can click the new related list, Affected Locations, to see incidents (tasks) that occurred at the same location. Many incidents might occur at one location, and one incident might involve many locations.

The general procedure is to add the Related List, Affected Locations that is associated with the many-to-many table, task_location, and then create a Workspace Action to create the Add button that adds, in our example, locations to an incident.

When an agent clicks Add, a modal opens showing the agent locations he or she can add to the incident.

To understand the following example, enter task_location.list in the Filter Navigator to show the task_location table.
The table shows the associations between the location (cmn_location) and task (task) tables. In the example, there are none.

1.  **Add a new Related List, Affected Locations, which opens with incident records.**
   a)  Open an incident by navigating to **Incident > Open** and click an incident.
   b)  Confirm that you're in the Workspace View by right-clicking the menu icon and selecting **View and Workspace**.
   c)  Set up a related list for the Incident table by right-clicking the menu icon and selecting **Configure and Related Lists**.
   d)  On the Configuring related lists on Incident form, in **View name**, select **Workspace**.
   e)  Select **Affected Locations** and use the arrows to move it into the **Selected** column. The task_location value is called **Affected Locations**.
   f)  Click **Save**.

   You've added **Affected Locations** as a related list for all incident records.

2.  **Use a Workspace Action to create an Add button that enables agents to add locations to an incident.**
   a)  Navigate to **Workspace Experience > Actions & Components > Related List Actions** and click **New**.
   b)  On the form, fill in the fields.
### Action Assignment

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Label that appears on the button in the Related Lists area. Make this Add. In the previous image, the Add button will appear next to the New button.</td>
</tr>
<tr>
<td>Action name</td>
<td>The name for this record that appears in the list of related list actions, Workspace Experience &gt; Actions &amp; Components &gt; Related List Actions.</td>
</tr>
<tr>
<td>Implemented as</td>
<td>Select UI Component because you are creating a button.</td>
</tr>
<tr>
<td>Specify UI component</td>
<td>Select sn-multi-record-associator.</td>
</tr>
<tr>
<td>Button type</td>
<td>Select Primary. Primary buttons are green. Secondary buttons are gray.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that appears when agents hover a mouse over the UI component.</td>
</tr>
<tr>
<td>Description</td>
<td>Verbose description of this Workspace Action.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace this UI component appears in.</td>
</tr>
<tr>
<td>Table</td>
<td>A many-to-many table. The table name must begin with m2m. In our example, select task_location.</td>
</tr>
<tr>
<td>View</td>
<td>Select workspace.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to turn on (selected) and off this UI component.</td>
</tr>
<tr>
<td>Order</td>
<td>The sequence order in which this UI component appears in a horizontal list of UI components. The lower the value, the further left the location.</td>
</tr>
</tbody>
</table>

c) Under Related Links, click Advanced view to give the component the properties it needs to function.

d) On the Component Attributes tab, fill in the fields.

### Component Attributes

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>Name that appears on the top of the modal when you click the Add button.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>extensionPoint</td>
<td>In our example, leave this blank. This field filters the list in the modal. When an agent clicks Add, every possible association is shown between the cmn_location and task tables. This field prevents some of those associations. To learn how to create an extension point, see Using extension points to extend application functionality.</td>
</tr>
<tr>
<td>userGivenTable</td>
<td>Table that appears in the modal. In our example, we want to open the locations agents can add, so select cmn_location.</td>
</tr>
<tr>
<td>referencedfieldName</td>
<td>The field displayed in the modal from the userGivenTable. In our example, enter location (lowercase). To find the field name, right-click the Location field title on the many-to-many table form.</td>
</tr>
<tr>
<td>parentFieldName</td>
<td>The name of the field you’re making the reference from, in this example, it’s task. To find the field name, right-click the field title.</td>
</tr>
<tr>
<td>columns</td>
<td>Comma-separated list of columns you want displayed in the modal. For example, in the cmn_location table, you might want name and city. So, enter name, city.</td>
</tr>
<tr>
<td>view</td>
<td>The view of the list. Do not add a value; the default view is fine.</td>
</tr>
</tbody>
</table>

e) Click **Update**.
You’ve created an Add button that shows up in the Related Lists area when an incident record opens.

3. Make sure the Add button appears and works.
   a) Open an incident by navigating to Incident > Open and clicking an incident.
   b) Click the Affected Locations Related List.
      You should see the Add button in Related Lists.
   c) Click Add.
      A modal appears.

   d) Select several check boxes to add those addresses to the incident record and then click Add.
      The addresses you selected appear in Affected Locations.
e) Enter `task_location.list` in the Filter Navigator to show the `task_location` table. The new locations should appear in the table.

Click a component to set it up.

<tr>
<td>Action name</td>
<td>Name that describes what you're adding.</td>
</tr>
</tbody>
</table>
| Implemented as      | • UI component—Displays an icon in a field, form, list, or related list to perform a function, such as adding an attachment to a record, adding a component in the contextual side panel, displaying a form for users to fill out, or searching for a record.  
  • Client action—Takes action on the client side, such as dialing a phone number, opening a record, or opening a form to edit a record. There are a preset number of client actions, such as call number, remove notification, and show notifications. You cannot create new ones. Use this option, for example, with a phone number field to enable the agent to dial a phone number by clicking the icon. The client actions that come with Agent Workspace have handlers in the browser that carry out the actions.  
  • Server script—Executes a script on the server, for example, to assign a record to someone, or delete a record. Use this option whenever your action involves changing the database. |
| Specify UI component| Click the magnifying glass icon (🔍) and select the component to add to the contextual side panel. |
| Icon                | Icon to use on the right side of the contextual side bar that agents click to use this component. |
3. In the related lists, click **Advanced view**.

4. Optional: On the **Conditions** tab, use the condition builder to create filters that prevent the component’s icon from appearing in the Contextual Side panel.

5. Optional: On the **Confirmations Settings** tab, select the **Confirmation Required** check box if you want to display a pop up that asks the agent to confirm the use of this component.

6. Optional: On the **Action Exclusion** tab, click **New** to exclude children table from inheriting this component in the Contextual Side panel, or from this table inheriting components from a parent table.

Components in the Contextual Side panel appear according to the records open in Agent Workspace. Child tables inherit these components by default. You can prevent that from happening.

   a) On the form, fill in the fields.

   **Action Exclusion form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action assignment</td>
<td>Click the magnifying glass icon (🔍) and select an action assignment, which specifies the</td>
</tr>
<tr>
<td>Table</td>
<td>Table associated with this component. Every time Agent Workspace opens a record from this table, this component's icon appears in the Contextual Side panel.</td>
</tr>
<tr>
<td>Exclude this table</td>
<td>Toggle to prevent this <strong>Table</strong> from inheriting this component from its parent table.</td>
</tr>
<tr>
<td>Exclude all child tables</td>
<td>Toggle to prevent child tables of <strong>Table</strong> from inheriting this component in the Contextual Side panel.</td>
</tr>
</tbody>
</table>

   b) Click **Submit**.

7. Click **Update**.
Click a component to set it up.

<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Implemented as            | • UI component—Displays an icon in a field, form, list, or related list to perform a function, such as adding an attachment to a record, adding a component in the contextual side panel, displaying a form for users to fill out, or searching for a record.  
  • Client action—Takes action on the client side, such as dialing a phone number, opening a record, or opening a form to edit a record. There are a preset number of client actions, such as call number, remove notification, and show notifications. You cannot create new ones. Use this option, for example, with a phone number field to enable the agent to dial a phone number by clicking the icon. The client actions that come with Agent Workspace have handlers in the browser that carry out the actions.  
  • Server script—Executes a script on the server, for example, to assign a record to someone, or delete a record. Use this option whenever your action involves changing the database. |
| Specify UI component      | Shown only when Implemented as is UI component. Click the magnifying glass icon (🔍) and select the component to add as a related list. |
| Specify client action      | Shown only when Implemented as is Client action. Click the magnifying glass icon (🔍) and select the client action to add as a related list. |
| Icon                      | Icon to use in the Related Items section that agents click to use this component.                                                             |
| Tooltip                   | Text that displays when and agent hovers a mouse over the icon.                                                                               |
| Description               | Short description of this component.                                                                                                         |
| Application               | Application that this component applies to. Global means that the component applies to all applications.                                     |
| Workspace                 | Workspace this component belongs in, for example, Agent Workspace, ITSM, CSM, and so forth.                                               |
| Table                     | Table this component is tied to. When a record from this table is open, this component can appear as a related list.                          |
| View                      | A set of visual configurations. This value is typically Workspace.                                                                           |
| Active                    | Toggle to make this component active as a related list.                                                                                      |
| Order                     | An integer that governs the placement of this icon in the list of related lists. The lower the number, the higher in the list. The typical practice is to make these numbers hundreds, for example, 100, 200, 300, and 400, so you can put new icons between existing ones in the future. |

3. In the related lists, click **Advanced view**.
4. Optional: On the **Conditions** tab, use the condition builder to create filters that prevent the component's icon from appearing in the related lists.
5. Optional: If **Implemented as is Server Script**, on the **Server Script** tab, add the server script.
6. Optional: On the **Confirmations Settings** tab, select the **Confirmation Required** check box if you want to display a pop up that asks the agent to confirm the use of this component.
7. Optional: On the Action Exclusion tab, click **New** to exclude children table from inheriting this component as a related list, or from this table inheriting components from a parent table.
   a) On the form, fill in the fields.

   **Action Exclusion form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action assignment</td>
<td>Click the magnifying glass icon (🔍) and select an action assignment, which specifies the table associated with this component. Every time Agent Workspace opens a record from this table, this component’s icon appears in the Related Items list.</td>
</tr>
<tr>

<td>Toggle to prevent this <strong>Table</strong> from inheriting this component from its parent table.</td>
</tr>
<tr>
<td>Exclude all child tables</td>
<td>Toggle to prevent child tables of <strong>Table</strong> from inheriting this component in the list of Related Items.</td>
</tr>
</tbody>
</table>

   b) Click **Submit**.

8. Click **Update**.

Click a component to set it up.

- **Tabs**
- **Notifications**
- **Form Header**
- **UI Actions**
- **Ribbon**
- **Related Items Menu**
- **Form pane**
- **Actions & Components**
- **Activity Stream**
- **Contextual Side Panel**
Set up a notification in workspace

Send notifications to an agent or a small group of agents when there are updates to important records.

Role required: workspace_admin or notification_provider_admin

When you configure a workspace notification, you determine the following:

- Who receives the notification
- When users receive the notification

The information that is displayed in each notification follows a default format that you can't configure. For more information on the default formats, see Default notification formats.

You can configure up to five workspace notifications per table.

**Important:** Workspace notifications can be sent to a maximum of five users. They are intended to direct an individual agent or small group of agents to a record rather than notify a broad distribution list.

1. Navigate to System Notification > Provider > Notifications, and then click New.
2. On the form, fill in the fields.

### Notifications form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the notification.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to receive notifications about.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the notification.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the notification. The notification is active by default.</td>
</tr>
<tr>
<td>Triggered By</td>
<td>System action that triggers the notification. You can send the notification after a record is changed or after an event is triggered.</td>
</tr>
<tr>
<td>Inserted</td>
<td>Option to send the notification after a record is inserted. This field appears when you select Record Change in the Triggered By field.</td>
</tr>
<tr>
<td>Updated</td>
<td>Option to send the notification after a record is updated. This field appears when you select Record Change in the Triggered By field.</td>
</tr>
<tr>
<td>Event</td>
<td>Event that triggers the notification. For example, to send a notification after an incident is closed or resolved, you would select the incident.inactive event. By default, this event is logged in the system each time a user resolves or closes an incident.</td>
</tr>
</tbody>
</table>

**Note:** You can select only an event that shares the same table as the notification.

This field appears when you select Event in the Triggered By field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Filter to specify the table records that users receive notifications about. For example, to send notifications about top-priority incidents, you would select Incident (incident) in the Table field and set the conditions to (Priority) (is) (1 - Critical).</td>
</tr>
<tr>
<td>Users</td>
<td>Users who receive the notification.</td>
</tr>
<tr>
<td>Users in fields</td>
<td>Record fields that include users who receive the notification. For example, to send the notification to the record assignee, select Assigned to.</td>
</tr>
<tr>
<td>Is originating user included?</td>
<td>Option to include the user who changed the record or triggered the event.</td>
</tr>
</tbody>
</table>

3. Click **Submit and Add Content**.

4. Select **Workspace** as the content type for your notification.

5. On the form, fill in the fields to define the notification content.

6. Click **Submit**.

After the notification is triggered, it is sent to recipients who aren't currently looking at the target record. A user clicks the notification to link directly to the record.
The notification tray can contain up to one notification per record. If the same record is updated twice in one day, the first notification is removed with the arrival of the second notification.

Users can customize their notifications using the workspace settings. These options appear only after you’ve configured an active notification.

If a user isn't receiving notifications as expected, check that notifications are enabled in the workspace settings.

Click a component to set it up.

</tbody>
</table>
Default notification formats
After you configure a workspace notification, the information that is displayed in the notification follows a default format that you can’t configure. Learn about the default notification formats so that you can know what information is being sent to notification recipients.

There are notification formats for three different use cases in workspace:

- Someone assigns a record to an agent
- Someone updates a field in a record
- Someone updates multiple fields

Each format uses the display value of the target record. A display value is a field value that the system displays to represent the record that was updated. For example, in Incident (incident) records, the display value is the incident number by default.

To set a new display value for a record, follow the steps in Select a field as the table display value.

Newly assigned record

When someone assigns a record to an agent, the notification contains the following information:

- Display value of the assigned record
- Priority of the record
- Short description of the record

The notification displays up to two lines of the short description. If the short description doesn’t fit inside the notification, the system appends an ellipsis (…) at the place where the short description is cut short.

Single field update

When someone updates a field in a record, the notification contains the following information:

- Name of the user who updated the field
- Name of the field that the user updated
- Display value of the updated record
- Priority of the updated record
- Short description of the updated record
The notification displays up to two lines of the short description. If the short description doesn't fit inside the notification, the system appends an ellipsis (…) at the place where the short description is cut short.

**Multiple field updates**

When someone updates multiple fields in a record, the notification contains the following information:

- Name of the user who updated the fields
- Display value of the updated record
- Priority of the updated record
- Short description of the updated record

The notification displays up to two lines of the short description. If the short description doesn't fit inside the notification, the system appends an ellipsis (…) at the place where the short description is cut short.

**Set up the Contextual Side panel in workspace**

The Contextual Side panel provides agents with tools to research and resolve problems. The different components provide the agents with different types of help.
The Contextual Side panel is where agents research and resolve issues. Agents click the icons to open the following tools:

- **Agent Assist**
  - Automatically displays search results based on the short description. Also displays similar, resolved issues so the agent can determine if the solution applies in this case. Agent Assist takes advantage of artificial intelligence.

- **Attach**
  - Enables the agent to attach content found in the Knowledge Base in a response to the requester in the Activity Stream. This feature does not require configuration.
• **Template**

—Populates the Activity Stream with standard content related to resolving the issue. Good templates save the agent time by eliminating repetitive work.

• **Now components**—The building blocks of Agent Workspace, for example, lists, PAR scores, and so forth.

• **Components you design**—You can create your own Agent Workspace components.

Agent Workspace comes preconfigured with components in the Contextual Side panel but *you can add more*. Each component can appear for all tables or you can set up a component to display only when an agent opens records from specific tables.

Side panel components are responsive, so you can widen the side panel to, for example, make it easier to read a Knowledge Base article.
Next

- Add a custom component to the Contextual Side panel
- Set up templates that fill in form fields for agents
- Set up Agent Assist that provides recommended solutions to issues presented in the open record.

Add custom components to the Contextual Side panel
You can add or remove components in the Contextual Side panel. These components help agents resolve customer issues they're working on.
Role required: admin

Agent Workspace comes preconfigured with components in the Contextual Side panel but you can add more. Each component can appear for all tables or you can set up a component to display only when an agent opens records from specific tables. The following image shows Agent Assist in the Contextual Side panel.

Components already available to put in the Contextual Side panel are:

- Agent Assist
- Attachments
- Templates
In the following procedure, you create a Workspace Action that displays an icon in the Contextual Side panel, which opens a component in the panel.

1. **Navigate to Workspace Experience > Actions & Components > Contextual Side panel Items** and click **New**.
   
   The Action Assignments form lists the components that appear in the form side panel depending on the table the open record belongs to. For example, you can set up Agent Assist differently for every table.

2. On the form, fill in the fields.

   **Action Assignment form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Name that appears on the component you're adding to the Contextual Side panel.</td>
</tr>
<tr>
<td>Action name</td>
<td>Name that appears for this record in the list of action assignments: Workspace Experience &gt; Actions &amp; Components &gt; Contextual Side panel Items</td>
</tr>
<tr>
<td>Implemented as</td>
<td><strong>UI component</strong> is the only valid selection. A UI component displays an icon in a field, form, list, or related list to perform a function, such as adding an attachment to a record, adding a component in the form side panel, displaying a form for users to fill out, or searching for a record.</td>
</tr>
<tr>
<td>Specify UI component</td>
<td>Click the magnifying glass icon (🔍) and select the component to add to the form side panel. For example, to add an additional Agent Assist, select <strong>now-agent-assist</strong>.</td>
</tr>
<tr>
<td>Icon</td>
<td>Icon to add to the right side of the form side bar that agents click to use this component.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that displays when an agent hovers a mouse over the icon.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of this component.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace this component belongs in, for example, Agent Workspace, ITSM, CSM, and so forth.</td>
</tr>
<tr>
<td>Table</td>
<td>Table this component is tied to. When a record from this table is open, this component can appear in the form side panel.</td>
</tr>
<tr>
<td>View</td>
<td>A set of visual configurations. This value is typically Workspace.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make this component active in the form side panel.</td>
</tr>
<tr>
<td>Order</td>
<td>An integer that governs the placement of this icon in the list of Contextual Side panel icons. The lower the number, the higher in the list. The typical practice is to make these numbers hundreds, for example, 100, 200, 300, and 400, so you can put new icons between existing ones in the future.</td>
</tr>
</tbody>
</table>

3. Right-click the top banner and select **Save**.

4. In the related lists, click **Advanced view**.

5. Optional: On the **Conditions** tab, use the condition builder to create filters that prevent the component's icon from appearing in the form side panel.

6. Optional: On the **Confirmations Settings** tab, select the **Confirmation Required** check box if you want to display a pop up that asks the agent to confirm the use of this component.
7. Optional: On the Action Exclusion tab, click New to exclude children tables from inheriting this component in the Contextual Side panel, or this table inheriting components from a parent table.

Components in the Contextual Side panel appear according to the records open in Agent Workspace. Child tables inherit these components by default. You can prevent that from happening.

   a) On the form, fill in the fields.

   Action Exclusion form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action assignment</td>
<td>Click the magnifying glass icon (🔍) and select an action assignment, which specifies the</td>
</tr>
<tr>
<td>Table</td>
<td>Table associated with this component. Every time Agent Workspace opens a record from this table, this component’s icon appears in the Contextual Side panel.</td>
</tr>
<tr>
<td>Exclude this table</td>
<td>Toggle to prevent this Table from inheriting this component from its parent table.</td>
</tr>
<tr>
<td>Exclude all child tables</td>
<td>Toggle to prevent child tables of Table from inheriting this component in the Contextual Side panel.</td>
</tr>
</tbody>
</table>

   b) Click Submit.

8. Click Update.

Click a component to set it up.

- Activity Stream
- Contextual Side Panel
Set up templates in the Contextual Side panel

Reduce an agent's time responding to requesters by automatically filling in record fields using a template.

Role required: admin

You associate templates with tables. Whenever an agent works on a record from that table, the agent can click a template to fill fields in the form. For example, you might create a High Priority template for the problem table. Whenever agents work on a problem, if they click the template, it sets the **Urgency** field in the problem record to **High**.

1. Navigate to **System Definition > Templates**.
2. Click **New**.
3. On the form, fill in the fields.

**Template form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this template.</td>
</tr>
<tr>
<td>Table</td>
<td>Table that this template applies to. Select <strong>Global</strong> to make the template available for use with all tables.</td>
</tr>
</tbody>
</table>

**Note:** The table list shows only the tables and database views that are in the same scope as the template.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Option for making the template available for use. A template must be active to be used.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User</td>
<td>User who can configure and apply the template. If you define a user, no other users can see the template unless you select the <strong>Global</strong> option.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>Group whose members can configure and apply the template. If you define a group, no other groups can see the template unless you select the <strong>Global</strong> option.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>Option for allowing any user who can access the templates to view and apply this template.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short description</td>
<td>Description of the template.</td>
</tr>
</tbody>
</table>

**Note:** Adding content to this field does not add that content to the **Short description** field of the forms that use this template.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Template</td>
<td>Content that automatically populates records that are based on this template. Select a field from the specified table in the left column and then enter the data to automatically populate in the right column.</td>
</tr>
</tbody>
</table>

**Note:** Even though you can select dot-walked fields in the template, they do not apply to fields that are on the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link element</td>
<td>Template that links a child table with the template for the parent table. In the template for the child table, set the value to the field that references the parent table. After you set the value, the child template is explicitly linked to the parent table. Note: This field does not appear by default. Configure the template form to add the field.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

You can also create a template by saving a form. For more information, see *Create a template by saving a form*.

Set up **Agent Assist** so agents receive recommendation for issues presented in the open record. Or, set up a different component.

Click a component to set it up.

Set up Agent Assist

Set up Agent Assist to give agents automatic search results that show possible solutions for records they open. Agent Assist is pre-configured to search Incident, Problem, Change, Knowledge, and Case tables for solutions. You can set up Agent Assist to search additional information sources.

- Role required: workspace_admin
- The ITSM plugin, com.snc.agent_workspace.itsm, must be activated on your instance.

Clicking the graduation cap icon (🎓) in the Contextual Side panel makes Agent Assist appear. Agent Assist uses contextual search and, optionally, machine learning to surface recommendations based on Knowledge base articles, catalog items, as well as related incidents, cases, problems, and questions relevant to a record an agent is working on.

When an agent opens a record, Agent Assist does an automatic search based on a field in the record, typically the short description field. Each search result appears in a card.
Email server is down.

Priority: 1 - Critical
State: New
Category: Software

Contact type: -- None --
State: New
Impact: 1 - High
Urgency: 1 - High
Priority: 1 - Critical
Assignment group
Assigned to

Short description
Email server is down.
Search results typically return multiple cards. You configure the card content, which might be record fields or a custom message. You also configure the card’s heading. To improve recommendations, set up Predictive Intelligence, which has a separate subscription fee.

You set up Agent Assist for every table your agents can access. You can even set up more than one Agent Assist for each table. Each of those Agent Assists would search a different repository of information.

For each Agent Assist, you specify the source of the information to search. A typical implementation just searches Knowledge Base articles, which includes community articles (once called Social Q&A). You can also search a service catalog if your agents order items to fulfill requests, for example, sending a keyboard to a requester. You can also use Additional Resources, which are tables your agents need to access, for example a table of incidents.

Agent Assist, represented by the graduation cap icon (🎓) in the Contextual Side panel, is the workspace version of Contextual Search. So, the setup for Agent Assist is almost identical to Contextual Search. To get set up information in addition to that provided in this topic, see Contextual search.

1. Optional: Modify the information sources Agent Assist can search.
   Agent Assist has default information sources it searches. You can modify those sources by defining new search contexts.
2. Navigate to Contextual Search > Table Configuration and click New.
3. In the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the table name associated with this Agent Assist, for example, Incident (incident).</td>
</tr>
<tr>
<td>UI type</td>
<td>Select Workspace.</td>
</tr>
<tr>
<td>Search context</td>
<td>Click the Lookup icon (🔍) and select a search context. Search contexts are the groups of Searchers used as information sources for Agent Assist searches. Searchers are information sources, such as Knowledge, Catalog, and Pinned. If you associate more than one Agent Assist to one table, the search contexts must be different. For more information, see Contextual Search &gt; Search Contexts, or Define a search context.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Title</td>
<td>Title that appears at the top of Agent Assist. The default is Agent Assist.</td>
</tr>
<tr>
<td>Enable related search box</td>
<td>Toggle that shows or hides the search box in Agent Assist. Agents use this box to enter new search terms to find solutions. Otherwise, the agent would have to change the text in the field Agent Assist bases its search on, for example, Short Description. This field is read-only when the UI type is Workspace.</td>
</tr>
<tr>
<td>Show searcher first</td>
<td>Toggle to display searcher resources before additional resources in the search context. In general, select this check box. Searcher resources are information sources, such as Knowledge Base articles and catalog items. Additional resources are tables that you give agents access to in order to resolve problems, such as closed incidents, resolved problems, and employee records.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications. This field is read-only.</td>
</tr>
<tr>
<td>Limit</td>
<td>Maximum number of search results returned.</td>
</tr>
<tr>
<td>Results per page</td>
<td>Number of results to display per page.</td>
</tr>
<tr>
<td>Allow search with empty search text</td>
<td>Toggle to specify whether the search runs when there is no search text. There is no search text when there is no Search Field specified or there is a Search Field specified but it is empty. You might, for example, want the search field in Agent Assist to be empty so that an agent can enter an employee's name to display their records. To look up employee records, it wouldn't make sense to run a sample search on an arbitrary employee. Search Field is the field in the open record Agent Assist uses as search criteria. The default is Short description. You configure this value in the following steps.</td>
</tr>
<tr>
<td>When to display</td>
<td>Conditions that must be satisfied for Agent Assist to appear. For example, set (Active) (is) (true) to make Agent Assist appear only when the open record is active.</td>
</tr>
<tr>
<td>Search as</td>
<td>Enables agent to search based on the value of a field in the open record, for example, Caller. Use this when an agent fills out forms on behalf of a customer. On the tab, select Enable search as. In the Search as field list, select the field in the open record to use as the person doing the search.</td>
</tr>
</tbody>
</table>

4. Right-click the top banner and click **Save**.
The Search Fields, Filter Configurations, Email Configurations, and Search Action Configurations related lists appear.

5. Optional: On the Search Fields tab, click New to make Agent Assist search on a field different from the default, Short description.

6. Optional: On the Filter Configurations tab, click New to create conditions that statically or dynamically change the search results that appear in Agent Assist.

An example of a static condition is setting the condition for the Category field to equal Software. In this case, for all search results returned, Agent Assist only shows the ones where the Category field is Software.

You can also create dynamic filters, which are filters based on fields in the form pane. For example, only show knowledge articles that have the same category as the current incident. If an agent changes the value of a dynamic field in the form pane, Agent Assist automatically does another search based on the updated value.

a) On the Filter Configurations tab, click New.

b) In Resource configuration, click the search icon (🔍) and select the source of information you want to use in Agent Assist searches.

c) Click Submit.

The Filter Configurations tab appears again with the name of the source of information you selected to put conditions on.

d) Click the name of the source of information.

The Filter Configuration form appears.

e) In the Filter Conditions Related Links, click New.

f) On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short description</td>
<td>Short description of this conditional filter.</td>
</tr>
<tr>
<td>Compare</td>
<td>Select what is being compared between the Field to compare and Compare to fields.</td>
</tr>
<tr>
<td>Include if blank</td>
<td>Toggle that includes (check box selected) search results if a record's field value specified in Field to compare or Compare to is empty. For example, if the condition is to only show a record if the Category value is Software, if a record in a search result has no value for Category, this toggle specifies whether or not to include the search result.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field to compare</td>
<td>A field in the <strong>Query table</strong> you want to use as a filtering condition. For example, you might want to compare the field value for <strong>Category</strong> in all of the search results against some field in the open record, which is defined in <strong>Compare to</strong>. The Query table is the table of search results.</td>
</tr>
<tr>
<td>Operator</td>
<td>Relationship between Field to compare and Compare to that triggers the condition. For example, if you use equals (=), Agent Assist only shows search results when the Field to compare, for example, Category, equals the value in the <strong>Category</strong> field in the open record. If the <strong>Category</strong> in the open field is Software, only search results that have the Category value Software appear in Agent Assist.</td>
</tr>
<tr>
<td>Compare to</td>
<td>A field in the <strong>Current form</strong> you want to filter by. For example, if you use Category, only search results that have the same <strong>Category</strong> value as in the open record appear in Agent Assist. If an agent revises the value in this field, Agent Assist automatically performs a new search based on the updated value in this field.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to turn on (selected) or off this filter condition.</td>
</tr>
</tbody>
</table>

---

**g)** Optional: If the filter conditions in the previous step were insufficient to create the filter you want, write a script that selectively hides Agent Assist search results. Select the **Scripted filter** check box and enter a script in the **Script** field.

For example, to only show incidents where the **Category** is Software, use the static filter:

```javascript
(function(current, query_table){
    /**
     * current: A GlideRecord representing the Form or Record producer.
     * query_table: The table to apply the filter on.
     */
    query_table.addActiveQuery();
    query_table.addQuery('category','software');
    // Return the encoded query
    return query_table.getEncodedQuery();
})(current, query_table);
```

To make the filter dynamic, use `getValue()` in a similar script:

```javascript
(function(current, query_table){
    /**
     * current: A GlideRecord representing the Form or Record producer.
     * query_table: The table to apply the filter on.
     */
    query_table.addActiveQuery();
    query_table.addQuery('category',current.getValue('category'));
    // Return the encoded query
    return query_table.getEncodedQuery();
})(current, query_table);
```
The method only shows search results where the **Category** field value is the same as the one in the open record. So, if the agent changes the field value, Agent Assist automatically performs a new search using the updated field value. In this case, the condition is not based on a single (static) **Category** value.

7. Optional: On the **Email Configurations** tab, select **New** to send a pre-written email notification, such as incident closed, to a user named in a record field, such as **Assigned to**.

8. Optional: On the **Search Action Configurations** tab, you can see the actions an agent can take with the search result, for example, **Attach**, **Flag**, **Full View**, and **Helpful**.

9. Click **Update**.

10. Optional: **Set up Predictive Intelligence**.
    Predictive Intelligence is an add-on subscription that provides highly accurate solution recommendations automatically.

11. Optional: **Set up more than one Agent Assist for a table**.

Click a component to set it up.

- **Tabs**
- **Notifications**
- **Form Header**
- **UI Actions**
- **Ribbon**
- **Related Items Menu**
- **Form pane**
- **Actions & Components**
- **Activity Stream**
- **Contextual Side Panel**
Set up Agent Assist information sources

Set up the information sources Agent Assist searches to provide your agents with recommended solutions.

Role required: workspace_admin

Agent Assist comes with default information sources it searches. You might change the information sources to provide more relevant information. Some of the resources Agent Assist can search include:

- Knowledge base
- Service catalogs
- Tables
- Record producers

These information sources are grouped as follows:

- Searchers—Catalog, Knowledge base, Pinned, SocialQA, and discussions. You cannot add to these. You can see the full list by navigating to Contextual Search > Searchers.
- Additional Resources—Tables that can be queried. You cannot add to these. You can see the full list by navigating to Contextual Search > Additional Resources.
- Search contexts—Combines Searchers and Additional Resources as a single information source to search.

1. Navigate to Contextual Search > Search Contexts and click New.
2. In the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Search Context name.</td>
</tr>
<tr>
<td>Short description</td>
<td>Describes this Search Context.</td>
</tr>
<tr>
<td>Searcher</td>
<td>The group of Searchers to use as sources material for searches.</td>
</tr>
<tr>
<td>Searcher text</td>
<td>Label for search results</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make this Search Context active.</td>
</tr>
<tr>
<td>Enable wildcard searches</td>
<td>Toggle to make the regex asterisk (*) valid. * can represent any alphanumeric character in a search term. The recommendation is to enable this option.</td>
</tr>
<tr>
<td>Search on tab</td>
<td>This field is not used by Agent Assist in workspace.</td>
</tr>
</tbody>
</table>

3. Right-click the top banner and select Save.
5. In the slushbucket, select items in the Collection column and use the arrowheads to move them to the Additional Resource Configurations List column to add the items as source of information for Agent Assist to search.
6. Click Save.
7. Optional: On the Record Producer Configurations tab, click New to add Record Producers to the resources Agent Assist searches.

A Record Producer is a type of catalog item that enables end users to request a task, such as Reboot Windows Server, Password reset, or Replace printer toner. A Record Producer produces a record, for example, a case that embodies the task.
a) On the **Record Producer Configuration** form, select the Record Producer to add to the search resources and click **Submit**. For information about creating a Record Producer, see *Create a record producer*.

8. Optional: On the **Table Configurations** tab, click **New** to add tables for Agent Assist to search. On the Table Configuration form, select the table to add as a search resource, and optionally, conditions that prevent using this additional resource. For help filling out the form, see this step in *Set up Agent Assist*.

**Set up Agent Assist.**

Set up Predictive Intelligence in Agent Assist

Set up Predictive Intelligence to use machine language to research and create recommendations for issue resolutions automatically. Agent Assist works without Predictive Intelligence, which is an upgrade.

- Role required: admin
- Plugins required: com.snc.contextual_search, com.glide.platform_ml, com.snc.contextual_search.ml - Enables customers to leverage machine-learning algorithms for searching with Contextual Search.
- **Implement the initial setup and configuration** for Predictive Intelligence on your instance.
- Prediction Intelligence subscription.

Agents use AWA to manually look up similar issues, related Knowledge Base articles, and related solutions. The pro version of AWA, powered by Predictive Intelligence, does all of that automatically.

When an agent opens a record, Agent Assist with Predictive Intelligence:

1. Looks for similar records.
2. Finds what is common among those records, such as a recommendation code of all the records point to the same Knowledge base article.
3. Displays the solutions as recommendations in AWA.
The top line beside the magnifying glass icon (🔍) shows the text researched, which is configurable but typically it’s the short description field in the open record. Agent Assist presents one or more recommendations. Agents can click the article to read more. To use the recommendation, agents click a link, which, in this example is **Link to Problem**. Links include:

- **Attach**—Attach the Knowledge Base article to the record and include the attachment in the Activity Stream.
- **Propose major incident**—Because many records report the same incident, the recommendation is to escalate the priority of fixing the issue.
- **Link to change**—Because many records appear to report the same problem because of a recent change, such as a software release, associate this record with the change, and propose the solution the similar records used.
- **Link to problem**—Associate this record with a common problem and propose the solution similar records used.

The following modules work together to configure predictions:

- **Predictive intelligence and similarity** (**Predictive intelligence > Similarity > Solution Definitions**)—A solution definition specifies what commonalities you’re looking for in records, for example, all point to the same Knowledge Base article, or all incidents are related to the same software upgrade.
• Trend definitions (Similarity Analyzer > Trend definitions)—Defines how many records that have something in common constitute a trend, for example, six or more records pointing to the same Knowledge Base article constitutes a trend.

1. Define the commonalities you’re looking for.
   a) Navigate to Predictive intelligence > Similarity > Solution Definitions) and click New.
   b) On the Solution Definition form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solution template</td>
<td>Template for this form. Select the option that describes your commonality. Similar template is the most generic template. Similar Incidents Template looks for incident records with similar short descriptions. Major Incident Template looks for incident records with similar short descriptions in the past 15 minutes.</td>
</tr>
<tr>
<td>Word Corpus</td>
<td>Text that displays in Agent Assist that relates to the commonality defined in this form.</td>
</tr>
<tr>
<td>Table</td>
<td>Table to look in for records.</td>
</tr>
<tr>
<td>Fields</td>
<td>One or more fields in the records to examine for common values.</td>
</tr>
<tr>
<td>Filters</td>
<td>Conditions that specify the commonality, for example, State is not Resolved + Severity is High + Short description contains build.</td>
</tr>
<tr>
<td>Processing Language</td>
<td>Agent’s language.</td>
</tr>
<tr>
<td>Training Frequency</td>
<td>Suggestion how often to retrain the model so it doesn’t go stale. This value is not enforced and does not automatically retrain the model.</td>
</tr>
<tr>
<td>Refresh Frequency</td>
<td>Frequency used to run the model on the records to find commonalities.</td>
</tr>
<tr>
<td>Label</td>
<td>Solution template name.</td>
</tr>
<tr>
<td>Name</td>
<td>Read only</td>
</tr>
<tr>
<td>Table to compare</td>
<td>Table to look in for similar records.</td>
</tr>
<tr>
<td>Fields to compare</td>
<td>Fields in records to look in for similar values.</td>
</tr>
</tbody>
</table>

2. Specify what constitutes a trend.
   a) Navigate to Contextual Search > Agent Assist > Trend Definitions and click New.
   b) On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Trend name, for example, Common Change because you’re looking for a similar change among records.</td>
</tr>
<tr>
<td>Table</td>
<td>Table the records come from that have been defined as having values in common.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Trend type</td>
<td>Commonality the trend is defined by. Options include:</td>
</tr>
<tr>
<td></td>
<td>• Common value—If more than the threshold number of records in the Table have the same value, it’s a trend. For example, if six or more records have the same resolution code, it’s a trend.</td>
</tr>
<tr>
<td></td>
<td>• Common reference—If more than the threshold number of records in the Table have the same reference to another table, it’s a trend. For example, if at least the threshold number of records refer to the same Knowledge Base article, it’s a trend.</td>
</tr>
<tr>
<td></td>
<td>• Common condition—If records have at least the threshold number of matching conditions, it’s a trend. You might define six conditions for records. Threshold is the number of those conditions that should match to be considered a trend. For example, to detect major incidents, the conditions might be impact is high, creation date is within the past six hours, plus four more conditions. If records have at least the threshold number of matching conditions, there’s a trend, for example, at least four of the six conditions must match for there to be a trend.</td>
</tr>
<tr>
<td>Common field</td>
<td>Field in the table record to examine for common values.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Trend ID</td>
<td>Read only</td>
</tr>
<tr>
<td>Order</td>
<td>Sequence order in which Agent Assist evaluates this trend. Trends are evaluated in order from the lowest to highest Order value.</td>
</tr>
<tr>
<td>Threshold</td>
<td>Minimum number of records having this commonality. For example, if the value is 10, then 10 or more records must have the commonality to be considered a trend.</td>
</tr>
<tr>
<td>Condition</td>
<td>Specifies when to show the notification, for example, State is not Resolved + Severity is High + Short description contains build. This field only appears when the Trend Type is Common Condition. You can create a condition that if this record was linked to a problem, you don’t want to link it back to that problem.</td>
</tr>
<tr>
<td>Reference type</td>
<td>Many-to-many (M2M) reference or one-to-one reference. An M2M reference is that many incidents can relate to a single record, and many records can relate to a single incident. Simple reference means there’s a direct relationship between cause and change.</td>
</tr>
<tr>
<td>M2M table</td>
<td>The many-to-many join of two tables. The table name must begin with m2m, for example, m2m_kb_task. This field only appears when the Trend type is Common reference.</td>
</tr>
<tr>
<td>M2M from field</td>
<td>Specifies which field is referring to another table. This field only appears when the Trend type is Common reference.</td>
</tr>
<tr>
<td>M2M to field</td>
<td>Specifies which field is being referred to from another table. This field only appears when the Trend type is Common reference.</td>
</tr>
</tbody>
</table>
The following example says that a trend is defined by 6 or more (Threshold) resolution codes (Common field) having the same value (Trend type) in the incident table (Table).

![Trend Definition Common Change](image)

At this point, you've defined what a trend is. You haven't yet defined what action to take when there is a trend.

c) Click Submit.

3. Match solution definitions with trends.
In other words, if Trend A happens, recommend Solution A.

a) Navigate to Agent Assist Recommendations and click New to connect solution definitions with a trend definitions.

b) On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Agent Assist Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Table Configuration</td>
</tr>
<tr>
<td>Source type</td>
</tr>
<tr>
<td>Solution Definition</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Order</td>
</tr>
</tbody>
</table>

c) Right-click the form and click Save.

d) On the Trend Recommendations related list, click New to associate a trend with the Solution Definition.

e) On the form, fill in the fields.
## Trend Recommendation

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Trend name.</td>
</tr>
<tr>
<td>Agent Assist Recommendation</td>
<td>Prefills with the value you specified for the recommendation name.</td>
</tr>
<tr>
<td>Trend definition</td>
<td>Select the trend definition you want to associate with this <strong>Solution Definition</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>If you have multiple trends associated with this <strong>Solution Definition</strong>, the priority of this trend in that list. The lower the number, the higher it appears in the Related list.</td>
</tr>
<tr>
<td>Recommendation title</td>
<td>Recommendation title that appears in Agent Assist.</td>
</tr>
<tr>
<td>UI type</td>
<td>In the recommendation that displays in Agent Assist, display the record or a message, which you will enter.</td>
</tr>
<tr>
<td>Primary Action</td>
<td>Select the Workspace Action to take, for example, <strong>Link to Problem</strong>.</td>
</tr>
<tr>
<td>Additional Actions</td>
<td>Additional Workspace Actions to take. Click the lock icon (🔒) and then the Workspace Action icon (🔧) and use the slushbucket to select the actions to take. This field only displays with <strong>UI type</strong> is <strong>Record display</strong>.</td>
</tr>
<tr>
<td>Recommendation message</td>
<td>Enter the message you want displayed in the Primary Action area of Agent Assist. This field only appears when <strong>UI type</strong> is <strong>Message display</strong>.</td>
</tr>
<tr>
<td>Display Condition</td>
<td>Optionally specify conditions when this trend should use this <strong>Solution Definition</strong>.</td>
</tr>
</tbody>
</table>

The following examples show when **UI type** is **Message display** and **Record display**.

| Message display | Record display |
f) Click Submit.

- Common change (Name)
- Across similar records (found in step 1) in the Incident table (Table)
- Looking for a common reference (Trend Type), meaning the Analyzer is looking at a reference field to another record
- Looking for a simple style reference (Reference type) meaning the Analyzer is looking for a direct relationship between the incident and the change (Change is a parent of Incident)

Configure other components in the Contextual Sidebar or click a component in the following list to set it up.

Click a component to set it up.

</table>
Set up multiple Agent Assists

Set up multiple Agent Assists per table so that your agents can use Agent Assist to search through different sources of information to find solutions related to records in the same table. For example, for records from the problem table, one Agent Assist might search through employee records, another Agent Assist might only search through Knowledge and the Service Catalog.

Role required: workspace_admin

You can combine multiple information sources that get searched in one Agent Assist. If you want to restrict access to some of the information sources, you can set up multiple Agent Assists for each information source, and grant permissions accordingly. For example, if you want to restrict some agents from seeing employee records, create an Agent Assist that uses employee records as an information source but restrict the permissions of who can use that Agent Assist.

Agent Assist appears as an icon in the Contextual side panel. The following example shows two Agent Assists that are represented by two graduation cap icons (🎓). You get to choose the icon for the second Agent Assist.

1. Create an action that adds an additional Agent Assist to the Contextual side panel for a table that is already set up for Agent Assist.
   To see how, go to Add custom components to the Contextual Side panel. After completing these steps, you should have an icon for your new Agent Assist in the Contextual side panel, as shown in the previous image, but when you click it, nothing appears. The next steps make the icon bring up the second Agent Assist in the Contextual side panel.
   
   Note: Make sure that the Action name of the second Agent Assist is different from the Action name of the first Agent Assist. If the Action name is the same, the second Agent Assist gets overwritten.

2. Navigate to Contextual Search > Table Configuration and click New to create a new table configuration for the same database table that you created an action for in the previous step.
   To see how to set up and save a table configuration, see Set up Agent Assist.
3. With the table configuration for the second Agent Assist displaying, copy the sys_id by right-clicking the heading bar and clicking Copy sys_id. You will use this value in the following steps.

Alternately, you can copy the sys_id in the URL.

4. Navigate to Workspace Experience > Actions & Components > Contextual Side panel and click the action that you created to display the second Agent Assist.

5. On the Action Assignment page, under the related links, click Advanced View.

6. On the Component Attributes tab for cxsTableConfig, enter the sys_id value of the table configuration that you copied in the previous steps.

7. If you add an Agent Assist, you must add model fields.
   a) Right-click the top banner and navigate to Configure > Form Layout.
      The Configuring Action Assignment form appears.
   b) In the form, move Model Fields Required from the Available column to the Selected column and click Save.
   c) Click the lock icon (🔒).
   d) Add these model fields: isNewRecord, sysid, table, fields.

8. Click Update.

9. To check the functioning of the second Agent Assist:
   a) Navigate to Workspace Experience > Workspaces > Agent Workspace Home.
   b) Open a record from the table that you associated with two Agent Assists.
   c) In the Contextual side panel, click the two Agent Assist icons that you created.

Click a component to set it up.

Personalize Agent Assist search results

Base Agent Assist search results on a field in a record to return results for someone other than the agent.

Role required: admin

You can specify a field in a record as the person doing an Agent Assist search. When you identify that field, Agent Assist watches it and automatically changes the search results if the value of that field changes. You might watch such a field, for example, if agents create cases on behalf of customers or employees. Entering a customer's identity in that field in the form pane returns Agent Assist search results that match the customer instead of the agent. Common fields that Agent Assist watches are Caller and Assigned to.

1. Navigate to Contextual Search > Table Configuration.
2. Open any record where the UI type is Workspace.
3. Select the Enable search as check box to make Agent Assist use the value of a field for the searcher's identity.
4. In the Search as field list, select the field in the record to use as the person doing the search.
   Search results for the user that you defined in the Search as field appear in a separate tab next to the search results for the current user.
5. Click Submit.

This option appears in Agent Assist as a slider that an agent can use to search while impersonating the user configured in the previous step. For example, the following image shows the value for Caller in the record used as the person doing the search.

Click a component to set it up.

Set up lookup and verify in Workspace

Configure a Consumer lookup or Contact lookup so that agents can easily verify the consumer or contact information.

- Requires the com.snc.sn_lookup_and_verify_config plugin
- Role required: workspace_admin

When talking with a customer, agents often want to verify who they’re talking to. Lookup and verify pulls up customer information so the agent can ask the customer for personal data, such as a home address, to verify the identity of the person on the phone.

Two lookup and verify configurations are provided: one for contacts and one for consumers. You can configure settings in these configurations to control the type-ahead search and the information displayed in the search results and the verification card.

1. Navigate to Workspace Experience > Lookup and Verify > Configuration.
2. Select a configuration from the list.
3. Select the Active option.
   A configuration must be active for the related UI action to appear on the interaction record.
4. Optional: In the Minimum characters to start typeahead search field, enter the minimum number of characters that you want for your search.
   For example, if the minimum number is 1, type ahead starts searching after the first character an agent enters. If the minimum number is 4, the search starts after the agent enters a fourth character. Too few characters might delay character entry as a search happens. Too many characters reduces the benefits of type-ahead searches.
5. In the Max result count list, set the maximum number of search results up to a maximum of 10.
6. Configure the Search results tab:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary field</td>
<td>Select the name of the field that you want an agent to see in the search results list.</td>
</tr>
<tr>
<td>Secondary fields</td>
<td>Unlock to access the Secondary fields and move a secondary field from the Available list to the Selected list. Lock when done.</td>
</tr>
</tbody>
</table>

7. Configure the Verification card tab.
   Unlock to access the Display fields and move a field from the Available list to the Selected list. Lock when done.
8. Click Update to save the configuration.

Click a component to set it up.

Verify Contact and Verify Consumer UI action client script

The lookup and verify feature uses a client script for the Verify Contact and Verify Consumer UI actions.

The main function that calls the lookup and verify modal has been changed in the Orlando release. The `g_csm.lookupAndVerify` function call was replaced by `g_modal.sn_lookup_verify.lookupVerify`. The call back handling has also changed.

If you modified the lookup and verify UI action script in the Madrid or New York releases, you need to modify the script for the Orlando release. It is not updated automatically during the upgrade to Orlando. You can use the examples below to make the necessary changes.

**Client script for the Verify Contact UI action (Orlando)**

```javascript
function onClick(g_form) {
    if (!g_form.isVisible("contact")) {
        var msg = "You do not have permissions to verify the contact.";
        getMessages([msg], function(messages) {
            g_form.addErrorMessage(messages[msg]);
            return;
        });
    }

    var title = "Verify Contact";
    var confirm_title = "Done";
    var cancel_title = "Cancel";
    getMessages([title, confirm_title, cancel_title], function(messages) {
        var lookupConfig = {
            configID: '0a20d0c9b360230001f3d43c6a8dc0a',
            selectedEntityTableName: 'customer_contact',
            selectedEntitySysID: g_form.getValue('contact'),
            selectedEntityDisplayVal: g_form.getDisplayValue('contact'),
            modalTitle: messages[title]
        };

        g_modal.sn_lookup_verify.lookupVerify({
            title: messages[title],
            confirmTitle: messages[confirm_title],
            cancelTitle: messages[cancel_title],
            params: lookupConfig,
            disabledPrimaryButtonOnLoad: true,
            size: 'lg'
        }).then(function(confirm) {
            var data = confirm.data;
            var verifiedSysId = data.sysId;
            g_form.setValue('account', '');
            g_form.setValue('contact', verifiedSysId);
            g_form.setValue('verified', 'true');

            var ga = new GlideAjax('global.CSManagementUtils');
            ga.addParam('sysparm_name', 'getGlideRecordData');
            ga.addParam('sysparm_table_name', 'customer_contact');
            ga.addParam('sysparm_sys_id', verifiedSysId);
            ga.addParam('sysparm_fields', "account");
            ga.getXML(function(serverResponse){
```

                        params.sysparm_parent_table = "interaction"
                    }
                    params.sysparm_parent_sys_id = g_form.getSysId();
                    g_service_catalog.openCatalogItem(result.table, result.sysId, params);
                }
            });
});
Set up Activity Stream in Workspace

Set up the options of how agents can interact with Activity Stream to make their job easier.

Role required: workspace_admin

Activity Stream enables agents to communicate with requesters and make internal notes about the work done on a record. Internal notes are only visible to fellow agents. External comments are visible to agents and requesters.

In Activity Stream, agents can embed knowledge articles, import solutions from Agent Assist, and ask requesters for more information.
You can set system properties that give agents the option of using a:

- Rich text editor.
  The rich text editor includes the formatting icons for bold, italics, underlining, font, and so forth, as shown in the following image.
- Single box or separate text boxes to enter internal and external comments
  The following image shows the single-box option.
The following image shows separate, stacked boxes for internal and external communication.
Once you use system properties to enable these options, the sliders in the configuration menu appear.

1. In the Filter Navigator, enter `sys_properties.list`. The list of system properties displays.

2. To give agents the option of having separate boxes for internal and external communications, search for and set the `glide.ui.activity.journal.stacked` property to True.

3. To give agents the option of using a rich text editor instead of a plain text editor in Activity Stream, search for and set the `glide.ui.journal.use_html` property to True. The default is False.

Click a component to set it up.

Set up custom UI actions in Workspace

Set up UI actions to customize Workspace for your organization. UI actions include custom buttons, menu items and limiting access to forms based on a user’s role.

Role required: workspace_admin

UI actions appear either as form buttons or list items in the UI action menu.

Each workspace comes preconfigured with UI actions. You can, however add to or remove preconfigured UI actions.

You can hide UI Actions for people who do not need to take action on records. For more information, see Hide the Details tab and UI Actions.

1. Navigate to System Definition > UI Actions and click New.
2. In the form, fill in the fields.

<table>
<thead>
<tr>
<th>Name</th>
<th>UI action name. This appears in the workspace UI, for example, Assign incident to me.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table the UI action applies to. Every time an agent displays a record from this table, this UI action appears.</td>
</tr>
<tr>
<td>Order</td>
<td>Placement in the horizontal list of UI actions. From left to right, the Order numbers go from small to large.</td>
</tr>
<tr>
<td>Action name</td>
<td>Equivalent of Name that appears in logs and table columns, for example, assign_incident_to_me</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make the UI action appear.</td>
</tr>
<tr>
<td>Show insert</td>
<td>Toggle to insert the record change into the Table.</td>
</tr>
<tr>
<td>Show update</td>
<td>Toggle to show the update in the Table.</td>
</tr>
<tr>
<td>Client</td>
<td>Toggle to make the system check for client-side scripts. The default is server-side scripts. Use the GlideAgentWorkspace API in a script to open a specified record an Agent Workspace tab.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>
| List style        | - Primary—Colors the UI Action blue.  
- Destructive—Colors the UI Action red.  
- Unstyled—Does not color the UI Action. |

3. Optional: To create a server-side script that implements the UI action, enter the script in the **Script** field.

For example, if you want to include the caller name and the short description in an incident that is created from an interaction record, you could use the following script that uses **GlideRecord**

```javascript
if(current.update()){
    var inc = new GlideRecord("incident");
    inc.newRecord();
    inc.caller_id = current.opened_for;
    inc.short_description = current.short_description;
    action.openGlideRecord(inc);
}
```

The system ignores any client scripts that are included in this field. You can only use the workspace client script field for client scripts.

4. Optional: To create a client-side script that implements the UI action, see **Supported client script types and APIs** and also, **Service Portal and client scripts**

5. In the **Workspace** tab, select **Workspace Form Button** to make the UI action appear on the line of UI actions, or **Workspace Form Menu** to make it appears as a list item in the menu list.

- **Workspace Form Button** to make the UI action appear on the list of UI actions.
- **Workspace Form Menu** to make the UI action appear as a list item in the menu associated with UI actions.

6. Optional: In the **Workspace Client Script** field, create a workspace-specific client script. Workspace has similar client scripting limitations as Service Portal. For example, to open a form by clicking it, you could add the following client script:

```javascript
function onClick(g_form) {
}
```

7. In the **Requires role** tab of the workspace section, add any roles that you want to limit access to the UI action to.

8. Click **Submit** or **Update**.

Click a component to set it up.

<table>
<thead>
<tr>

<td>Actions &amp; Components</td>
<td></td>
</tr>
</tbody>
</table>
Render a Now component in a modal

Use a UI Action to launch a custom Now component in a modal so an agent doesn't have to navigate to a different screen to accomplish a task.

Role required: workspace_admin

Launch a custom component in a modal so an agent doesn't have to leave the current screen. For example, you can launch a modal that contains contact information about the customer named in an open record so an agent can ask callers to confirm their identity. The following example shows a list in a modal.

1. Develop and deploy a custom component to your instance. For more information, see Developing components for Workspace.
2. Create an entry in the Registered Scripting Modal.
   a) In the Filter Navigator, enter `sys_aw_registered_scripting_modal.list` to open that table.
   b) Click New.
c) Use the search icon (🔍) to select a component, in this case, use `sn-workspace-header`.

d) Enter the name of the API, in this case `showHeader`.

e) **Public API** gets auto-populated:

![Image of UI with selected component and API]

f) Click **Save**.

3. **Author your UI Action to render your component in a modal.**

a) Create a new UI Action for the appropriate table and on the **Workspace** tab, select either **Workspace Form Button** or **Workspace Menu Button** depending on how and where you want the UI Action to appear. For information on creating a UI Action, see *Set up UI Actions in Workspace*.

![Image of UI with options for Workspace Form Button and Menu Button]

When you select one of the check boxes, the **Workspace Client Script** text box appears.

b) Enter the following code in the **Workspace Client Script** text box:

```javascript
function onClick(g_form) {
  g_modal.global.showHeader({
    title: 'Test custom modal',
    confirmTitle:'YES',
    params: {
      primaryValue: 'THIS IS A PRIMARY VALUE',
      secondaryItems:{},
    }
  }).then(function(result){
    alert('confirm:'+result);
  }, function(error) {
    alert('cancel:'+error);
  });
}
```
4. Now test the UI Action by opening a record in Workspace from the table you selected when creating this UI Action. The UI Action should appear in the Form pane.

Close tab and save-and-close tab UI Actions

Use the `closeRecord()` method to close a tab, or save and close a tab.

Role required: admin

You can use the `closeRecord()` method to author a UI Action that closes a tab.

1. Follow the instructions on Set up custom UI actions in Workspace to set up a client-side UI Action.

2. In the Workspace Client Script field, add the following client script UI Action to close a tab.

```javascript
function onClick(g_form) {
    g_aw.closeRecord();
}
```

3. In the Workspace Client Script field, add the following client script UI Action to save the contents of the tab and close it.

```javascript
function onClick(g_form) {
    g_form.save().then(function() {
        g_aw.closeRecord();
    });
}
```

Customizing workspace

Customize your workspace forms, fields, lists, and related lists without writing custom scripts or learning APIs.

You can create actions and components in workspace that perform an action, such as dialing a phone number, adding a Now component to the Contextual side panel, deleting a related list, or adding a record to the database. Adding actions and components as icons in workspace enables your agents to perform actions while remaining in workspace rather than opening new browser windows. For example, you can create an action that pops up a modal with a caller’s personal information so an agent can verify the caller’s identity instead of making the agent open a new window with the caller’s information to accomplish the same task. You can create all of these actions with little or no scripting.

Action types

There are three action types:

- **UI component**—Places a Now component in workspace, for example, an Agent Assist component in the Contextual side panel.
- **Client action**—Dispatches an action that the browser carries out. Workspace supplies a limited number of client actions, including dialing a phone number, opening a record, opening a form to modify record content, and opening a URL.
- **Server script**—Executes a script on the server to change the database, for example, to assign a record to someone, to delete a record, or to add a record.
**Action locations**

Actions can only appear in a limited number of locations in workspace. For example, list view has only one action, called a list action, that can only appear above the list.

```
<table>
<thead>
<tr>
<th>Number</th>
<th>Opened</th>
<th>Short description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INC0010111</td>
<td>2019-07-22 14:04:57</td>
<td>ATF : Test1</td>
</tr>
</tbody>
</table>
```

The actions in record view can only appear in the following locations:

- Field decorator—Displays an icon in one or more fields in an open record. An agent can click these icons, for example, to call a phone number or display additional information.
- Related list action—Displays a button in the Related Items menu. Examples include adding or removing a related list.
- Contextual side panel items—Appears as an icon in the Contextual side panel. By clicking the panel, an agent can make a Now component appear in the Contextual side panel. For example, an agent can display additional Agent Assists in the Contextual side panel.
- Related items—Appears as an entry in the Related Items menu. The entry works like a tab and sits, by default, between Details and related lists. Related lists act like tabs that display information from tables that are related to the open record. Related items make any Now component appear in the form pane.

This figure shows the only places where actions can appear in record view.
Creating actions

To learn how to create actions in all of the workspace locations, see the following links:

- List action
- Contextual side panel
- Related lists
- Related items
- Field decorator

Using supplied Actions & Components

The workspace interface incorporates the following Actions & Components.

### Actions & Components supplied with your instance

<table>
<thead>
<tr>
<th>Action</th>
<th>Action is available on</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent Assist</td>
<td>Form</td>
<td>Adds the information in the form to Agent Assist.</td>
</tr>
<tr>
<td>Assign to Me</td>
<td>List, Related List</td>
<td>Assigns a record to the user.</td>
</tr>
<tr>
<td>Attachments</td>
<td>Form</td>
<td>Adds an attachment to a record in a form.</td>
</tr>
<tr>
<td>Call Number</td>
<td>Field</td>
<td>Calls the phone number in the field.</td>
</tr>
<tr>
<td>Create New</td>
<td>List</td>
<td>Creates a new record in the list.</td>
</tr>
<tr>
<td>Create New</td>
<td>Related list</td>
<td>Creates a new record in a related list.</td>
</tr>
<tr>
<td>Delete</td>
<td>List, Related List</td>
<td>Deletes a record from a list.</td>
</tr>
<tr>
<td>Edit</td>
<td>List</td>
<td>Opens a modal to edit a record.</td>
</tr>
<tr>
<td>Open Record</td>
<td>Field</td>
<td>Opens a record in a new sub-tab.</td>
</tr>
<tr>
<td>Reference Search</td>
<td>Field</td>
<td>Opens a modal to enable users to search a reference table.</td>
</tr>
<tr>
<td>Templates</td>
<td>Form</td>
<td>Opens a template on a form.</td>
</tr>
</tbody>
</table>

### Action & Component tables

**Note:** Declarative Action is the previous name for Actions & Components.
<table>
<thead>
<tr>
<th>Name</th>
<th>Permissions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Declarative Action Model Field</td>
<td>Read-only for Admin</td>
<td>Represents a field in a specific model. A model can have multiple fields.</td>
</tr>
<tr>
<td>(sys_declarative_action_model_field)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Declarative Action Definition</td>
<td>Read-only for Admin</td>
<td>Accumulates all the declarative actions.</td>
</tr>
<tr>
<td>(sys_declarative_action_definition)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Declarative Action Assignment</td>
<td>Admin only</td>
<td>Defines where and when a declarative action runs.</td>
</tr>
<tr>
<td>(sys_declarative_action_assignment)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Declarative Action Group</td>
<td>Admin only</td>
<td>Allows associating multiple declarative actions into a group. This action is only supported for the list model.</td>
</tr>
<tr>
<td>(sys_declarative_action_group)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Set up custom actions on record fields in Workspace*

Set up using a value in a reference field to take action. For example, add an icon in a field with a phone number to dial that phone number. Or, add an icon in a reference field that opens a user record in a tab.

Role required: admin

A field decorator is an icon that’s added to a reference field in the Form pane that an agent can click to perform some action. Workspace supports up to three decorators per field.

The objective in setting up Workspace Action field decorators is to enable agents to do things on one page that otherwise would require opening additional pages. For example, instead of opening another page to display the record of the user named in an incident, the agent just clicks the Workspace Action field decorator in the **Caller** field to open the user record in a tab.
The field action, Open Record, must exist as a Workspace Action definition before you create a new action assignment. The icon, icon-user, must be an icon available in your instance.

1. Navigate to Workspace Experience > Actions & Components > Field Decorators. A list of existing field decorators appears.
2. Click New.
3. On the form, fill in the fields.

The following table adds a field decorator icon to URL fields. When agents click the icon, the URL opens.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action label</td>
<td>Name of the field decorator, for example, Open a URL. You can use double braces, {{}}, to insert values in the text at runtime, for example, {{count}}. For example, you can show the number of records an agent selects using braces.</td>
</tr>
<tr>
<td>Action name</td>
<td>Name that appears for this record in the list of action assignments: Workspace Experience &gt; Actions &amp; Components &gt; Field Decorators, for example, open_a_url.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Implemented as</td>
<td><strong>Client Action</strong> is the only valid selection for field decorators. The field decorator appears as an icon in a field, form, list, or related list. When clicked, the decorator performs an action, such as calling a phone number, opening a record, updating content, or opening a URL. <strong>UI component</strong> is a UI element that you can place in many areas in Workspace. <strong>Client Action</strong> dispatches an action specified in <strong>Specify client action</strong>. <strong>Server Script</strong> take actions on the server changing database records, such as adding, removing, or modifying them.</td>
</tr>
<tr>
<td>Specify client action</td>
<td>Click the magnifying glass icon (🔍) and select the action to take. To open a URL, select <strong>Open URL</strong>. This field only appears when implemented as is <strong>Client Action</strong>. You cannot add custom actions to this list.</td>
</tr>
<tr>
<td>Specify UI component</td>
<td>Click the magnifying glass icon (🔍) and select the component to add. This field only appears when Implemented as is <strong>UI Component</strong>.</td>
</tr>
<tr>
<td>Decorator applies to</td>
<td><strong>Field type</strong> means the decorator appears for all fields of this type. <strong>Specific field</strong> means the decorator appears only when the field you specify opens. Many specific fields are of the same field type. For example, select <strong>Field type</strong> to apply this field decorator icon to all URL fields.</td>
</tr>
<tr>
<td>Field type</td>
<td>Select the field type where you want the field decorator to appear, for example, <strong>Reference</strong>. Many fields are of type <strong>Reference</strong>. As another example, to dial a phone number, select <strong>Phone Number</strong>. This field, <strong>Field type</strong> only appears when <strong>Decorator applies to</strong> is <strong>Field type</strong>.</td>
</tr>
<tr>
<td>Field name</td>
<td>Select the field where you want the field decorator to appear. The choices of fields depends on the value of <strong>Table</strong>. For example, select <strong>Date</strong>. This field only appears when <strong>Decorator applies to</strong> is <strong>Specific field</strong>.</td>
</tr>
<tr>
<td>Icon</td>
<td>Clickable icon that appears in the field specified by <strong>Field type</strong> or <strong>Field name</strong> that initiates the action.</td>
</tr>
<tr>
<td>Tooltip</td>
<td>Text that displays when and agent hovers a mouse over the icon.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of this component.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that this component applies to. Global means that the component applies to all applications.</td>
</tr>
<tr>
<td>Workspace</td>
<td>Workspace this component belongs in, for example, Agent Workspace, ITSM, CSM, and so forth.</td>
</tr>
<tr>
<td>Table</td>
<td>Table this component is tied to. When a record from this table opens, the field decorator appears in the field(s) specified by <strong>Field type</strong> or <strong>Field Name</strong>. The default is Global. You can leave the default value so that the field decorator icon appears for any open record that has the field specified by <strong>Field type</strong>. If you specify a table, then only when records from that table are open can the field decorator icon appear.</td>
</tr>
<tr>
<td>View</td>
<td>A set of visual configurations. This value is typically Workspace.</td>
</tr>
<tr>
<td>Active</td>
<td>Toggle to make this field decorator appear (selected) or not.</td>
</tr>
</tbody>
</table>
4. Right-click the top banner and select **Save**. Related links appear.

5. Optional: On the **Action Exclusion** tab, click **New** to exclude children tables from inheriting this component in the Contextual Side panel, or this table inheriting components from a parent table.

Components in the Contextual Side panel appear according to the records open in Agent Workspace. Child tables inherit these components by default. You can prevent that from happening.

   a) On the form, fill in the fields.

   **Action Exclusion form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action assignment</td>
<td>Click the magnifying glass icon (🔍) and select an action assignment, which specifies the component.</td>
</tr>
<tr>
<td>Table</td>
<td>Table associated with this component. Every time Agent Workspace opens a record from this table, this component's icon appears in the Contextual Side panel.</td>
</tr>
<tr>
<td>Exclude this table</td>
<td>Toggle to prevent this <strong>Table</strong> from inheriting this component from its parent tables.</td>
</tr>
<tr>
<td>Exclude all child tables</td>
<td>Toggle to prevent child tables of <strong>Table</strong> from inheriting this field decorator.</td>
</tr>
</tbody>
</table>

   b) Click **Submit**.

6. Under **Related Links**, click **Advanced view**.

   Up to this point, you have not specified the URL you want to open when an agent clicks the field decorator icon. This is the task you perform in **Advanced view**.

7. On the **Action Attributes** tab, in **Payload Map**, select the action attribute you want to define. In this example, select **url**.

8. In the value field, enter the URL to open.

9. Optional: On the **Conditions** tab, in **Script Condition**, enter a script that can hide the field decorator.

10. Optional: On the **Conditions** tab, in **Client Conditions**, specify conditions on the client that would hide the field decorator.

   Client conditions are reevaluated whenever an agent makes a change in a list of records. For example, you might hide the button for a list action until an agent selects one or more records in a list. The client condition, then, is "count is greater than zero," where count is the number of records selected.

11. Optional: On the **Conditions** tab, in **Record Conditions**, specify a field and a value such that if an open record has a field with that value, the field decorator icon would not appear.
12. Optional: On the **Conditions** tab, in **Required Roles**, specify roles an agent must have to see the field decorator.

13. Optional: On the **Confirmations Settings** tab, select the **Confirmation Required** check box if you want to display a pop up that asks the agent to confirm the action to be taken by the field decorator.

14. Click **Update**.

The field decorator icon appears in all record fields of type reference for all of the tables you specified in **Table**. Clicking an icon would open the URL specified in the **Payload Map**.

---

**Setting up phones in workspace**

Enable agents to receive and make phone calls with requesters.

When you connect workspace to your telephony system, agents can make and receive calls with requesters. When receiving calls, workspace automatically creates an interaction record, which an agent uses to enter the details of the phone call request.

workspace displays a phone icon (**phone**) that agents use to accept and make phone calls. The icon displays a number when phone calls are waiting to be answered. Agents set their status to **Available** or **Away** to allow or prevent phone calls from being routed to them.
The phone interface is integrated into workspace so agents can talk while working onscreen with all of other features provided by workspace.

Next

Set up **Phone integration.**

**Agent Workspace phone integration with OpenFrame and computer telephony integration (CTI)**

OpenFrame and CTI enable third-party phone integrations for phone use for agents in Agent Workspace.
• OpenFrame enables CTI with third-party telephony service providers (TSPs) such as Twilio.
• CTI integrates with the Now Platform and the TSPs to support incoming and outgoing calls.

When you integrate OpenFrame and CTI with a TSP, agents in Agent Workspace can use:

• An embedded softphone to place and receive customer calls.
• Click-to-call capability from phone number fields on forms and the Customer 360 ribbon component.
• Contextual identification for incoming calls.
• An additional window that contains contextual links in the softphone window and open related records.

OpenFrame and CTI can also integrate with the Interaction Management System (IMS), which enables you to manage the life cycle of the phone interaction. With this integration, incoming and outgoing calls create phone interaction records.

Use embedded softphones with Agent Workspace
Configure Agent Workspace to support embedded softphones so that agents can receive incoming calls and place outgoing calls.

Incoming calls

Agents receive incoming calls in the OpenFrame window. Contextual information, such as the account, contact, consumer, and case number, is displayed in the window.

Agents click links from the contextual information in the OpenFrame window to open the corresponding records in Agent Workspace. Agents can open the forms in primary or child tabs depending on the workspace tab configuration.

• With Interaction Management System (IMS) integration, these records open as sub-tabs to the interaction record.
• Without IMS integration, these records open as primary tabs.

For more information, see the OpenFrame overview.

Outgoing calls

Agents can place outgoing calls from phone number fields on a form or from the ribbon on the Case form.

By clicking these phone fields, agents see the OpenFrame window, where they can place a call to the number which shows on-screen.

Integration with Interaction Management System (IMS)
With OpenFrame, computer telephony integration (CTI), and IMS integration, incoming and outgoing calls create interaction records.

Receive incoming calls through Agent Workspace

When an agent answers an incoming call from the OpenFrame window, an interaction record opens in a parent tab in the New state with the Channel field set to Phone.

If available for your installation, the account information, the contact information, or the consumer information, is added to the interaction record. The case number is also added to the record if the caller provides it to the agent. If an agent clicks a link in the OpenFrame window,
such as the account, contact, consumer, or case number, the corresponding record opens in a sub-tab under the interaction record.

The call forwards to an agent. The interaction record is assigned to the agent and the state is set to Pending Acceptance. The interaction record is displayed in the agent’s workspace and includes any details that are provided by the customer.

The agent can accept or reject the call:
- If accepted, the interaction record state is set to Work in Progress.
- If rejected, the interaction record state is set to Closed Complete.
- If the call is not picked up or the caller hangs up before the agent can pick up, the interaction state is set to Closed Complete.

When a call is ended, a phone log record is created for the interaction and the interaction record state is set to Closed Complete.

**Make outgoing calls through Agent Workspace**

For outgoing calls, the `sn_openframe.create_interaction` property determines whether or not an interaction record is created.

When an agent places an outgoing call using a click-to-call enabled phone field, the system gathers contextual information about the call, including the account, contact, or consumer details.

If the `sn_openframe.create_interaction` property is set to true:
- An interaction record is created in the Work in Progress state. The record is populated with the contextual information and is assigned to the agent.
- The interaction record and relevant information is passed to OpenFrame.
- CTI receives the interaction, initiates the call, and manages the interaction life cycle.
- If the outgoing call is unanswered, the interaction record is set to Closed Complete.

If the `sn_openframe.create_interaction` property is set to false:
- The contextual information is passed to OpenFrame.
- CTI receives the contextual information and initiates the call.

**Transferring calls to other agents**

If an agent transfers a call to another agent, the interaction record is also transferred and a transfer record is created. The call is shown in the OpenFrame window in the new agent’s workspace. The interaction record is assigned to the new agent in the Pending Acceptance state and is displayed in the agent’s workspace. The state changes to Work in Progress when the agent accepts the call.

**Integration with Interactive Voice Response (IVR)**

With IVR integration, an interaction record is created as soon as the caller connects and receives an IVR message. The selections made by the caller are captured and added to the interaction record. If the caller enters a case number, the case is added as a related record on the interaction.
Setting up chat in workspace

Enable agents to chat with requesters. Automatically route incoming chat requests to appropriate agents.

Workspace enables agents to interact directly with requesters using chat. The chat system starts with virtual chat, which is autonomous chat powered by artificial intelligence. A requester can request to chat with a live agent through virtual chat. That chat is called Agent Chat.

Virtual chat conducts a survey before and after the Agent Chat. The pre-survey gets preliminary information about the requester to aid in the chat session. The post-chat survey gets feedback on the requester's satisfaction with the agent who helped.

Workspace displays a chat inbox icon (Inbox) that agents use to enter chats. Agents set their status to Available or Away to open or close their inbox for chat requests. The icon displays numbers when chats are waiting to be answered.

The chat interface is integrated into workspace so agents can chat while working onscreen with all of other features provided by workspace.
Routing chats

Requesters start chats with virtual chat. When they request to chat with a live agent on Agent Chat, their request goes into a queue controlled by Advanced Work Assignment (AWA), which routs chats to different agents based on availability, queue length, and expertise.

Next

Set up:

- Agent chat
- Advanced Work Assignment
Agent Workspace Advanced Work Assignment (AWA)

AWA automatically routes work items to agents when you set the criteria for the agent’s availability, capacity, and skills. With AWA, agents can access their work item assignments from their Agent Workspace inboxes.

AWA uses service channels to organize incoming work items, such as chats, cases, and incidents. AWA routes these work items to specific work item queues, such as the product chat, billing chat, VIP chat, critical cases, and IT support queues. You can set the capacity for an agent, which is the number of work items on a particular service channel that an agent may actively work on. You can set assignment rules to determine how AWA routes work items to a group of agents. If an agent rejects a work item, the item is rerouted to another agent.

Note:
The Advanced Work Assignment plugin is required for Agent Workspace.
AWA Configuration Components

Service channels

Agents receive work items through service channels, which are preconfigured work channels. You can customize the channel conditions, define the inbox layout for agents, create additional queues, and set the capacity for specific agents. Agent Workspace includes two preconfigured service channels, Chat and Case.

Work items

Each work item is a single piece of work that is handled by an agent, such as an incoming chat or case. Work items come through a work item queue, which has definable schedules, target wait times, and routing conditions.

Assign Groups

You can use assignment groups to group agents and provide details regarding the name and description, manager, and group email. You can use the related lists to set up roles, groups and group members, queues, and agent capacity overrides for the agent pool.

Assignment Rules

Assignment rules determine how work items, such as cases, chats, or incidents, are routed to an assignment group. You can set the criteria to assign work items to agents and create custom assignment rules to determine work item assignment and handling. You can define agent skills by using the Skills Management feature.

Agent Presence States

An agent presence state indicates if an agent is online and available to receive incoming work items or whether the agent is away or offline. You can create or modify these availability states for agents.

Reject Reasons

You can define the reasons that agents use to reject a work item, such as out to lunch or on a break.

Workspace Agent Chat

Configure Workspace Agent Chat to enable customers to ask questions and receive information by chatting with a live agent. Through Agent Chat, agents communicate with customers, create incident or case records, or transfer chats to another agent or queue.

Agent Chat uses a persistent widget for chat conversations on any portal page of the portal that you’re using. You can establish assignment rules to enable chat conversations to reach the best agent available who has the capacity and skills to handle the job. The agent can transfer the chat to another agent if necessary. Agents can use response templates to enable reusable, consistent messages to requesters.

Set up Workspace Agent Chat

Configure Workspace Agent Chat to enable live agent chat with customers. Through Agent Chat, agents interact with customers, create incident or case records, or transfer chats to another agent or queue.

Configure the following before starting this task:
- Install the Agent Chat plugin, com.glide.interaction.awa.
- In Advanced Work Assignment:
  - Configure service channels.
- Define **work item queues**.
- Set up **work assignments**.
- Update agent **Live Feed profiles** to display agent names and avatars in the chat client.

Watch this video to get started with Workspace Agent Chat:

**Role required:** workspace_admin

In addition to specifying the fulfiller interface for chat, use Chat Setup to do the following:

- Activate or disable live chat (enabled by default).
- Control the display of agent names and avatars in the chat window.
- Activate the display of the estimated wait time for live chat support (transfer from the virtual agent to a live agent).
- Set the system messages that are displayed when a live agent transfer occurs.

Chat Setup also includes the Context related list for defining chat context variables that can be used in Virtual Agent topic scripts or in chat-related features. For example, you can use chat context variables to pass certain information from the topic to share with the live agent or control how bot conversations are routed to live agents. For details on using Live Agent and context variables, see **Virtual Agent scripts**.

**Note:** All contexts are accessible via script, but only the **queue** context can be modified by a script.

1. **Navigate to** Collaboration > Chat Setup.

**Note:** The Collaboration module is unrelated to the Collaboration plugin.

2. **On the form, fill in the fields.**

<table>
<thead>
<tr>
<th><strong>Chat Setup form</strong></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>

<td>Message that users see when a live agent is not available. For example: “No agents are available at the moment. Please try again later.”</td>
</tr>
</tbody>
</table>
You're almost done with Agent Chat configuration. From here, **Define and publish chat context variables** to capture information that can be used in other chat-related features.

Your final step is to enable the chat client on your end user portal, which is commonly called the Service Portal. After completing this step, you're done configuring Agent Chat.

Two options are available for setting the Service Portal chat client for Virtual Agent and Live Agent:

- **Set up a Service Portal Agent Chat Configuration**: Define a configuration that enables the chat client to persist across all portal pages for selected portals. End users can engage in chat on any portal page in specified portals.
- **Configure the legacy Service Portal widget for Virtual Agent**: Add the Legacy Virtual Agent Service Portal widget to a single, selected portal page, from which your end users run the chat client.

### Idle live chats

The system automatically checks live chat sessions every two minutes (through the Idle Chat Time Task) to ensure that chat sessions are still active. If requesters don't respond within 180 seconds (three minutes) during an active chat session, the session becomes idle. They receive a reminder message that tells them that the conversation is timing out and asks if they're still there.

After requesters receive the idle chat reminder message, they must respond within 180 seconds (three minutes) after receiving the idle chat reminder message. If they don't respond, the system automatically cancels (times out) the chat session.

If needed, you can change the idle chat reminder message and the default times for the system to display the reminder message and close an idle chat.

#### Change the idle chat reminder message

The default idle chat reminder message displayed to requesters is: **The conversation is timing out, are you still there?**

You can modify the default message by updating the `com.glide.cs.idle_chat_reminder_message` property.

1. In the navigation filter, enter `sys_properties.list`.
2. Open the `com.glide.cs.idle_chat_reminder_message` property.
3. In the **Value** field, enter the new reminder message to be displayed.
4. Click **Update**.

#### Change the idle chat timeout properties

Modify the idle chat timeouts by adding these properties to the System Property (`sys_properties`) table and changing the default values:
Idle chat timeout properties

<table>
<thead>
<tr>
<th>Name</th>

<td>Set the number of seconds before an idle chat is cancelled (times out).</td>
</tr>
<tr>
<td></td>
<td>* Type: Integer</td>
</tr>
<tr>
<td></td>
<td>* Default value: 360 seconds (six minutes after the requester’s last response)</td>
</tr>
</tbody>
</table>

Chat surveys in Agent Chat
Display conversational questionnaires to your end users to gather important information from them, before and after they chat with a live or virtual agent. For example, you can run pre-chat surveys to collect preliminary information about your requesters and use that information to route chats to appropriate live agents. Use post-chat surveys to get user feedback on their experience with your support agents.

How chat surveys work
Instead of using forms to collect information from your requesters, you can create different questionnaires that run in the chat client to capture preliminary user information or post-chat feedback. The questions in this pre-chat survey example ask users to identify their service issue and to provide additional details.
Example pre-chat survey conversation

Survey administrators and administrators use Survey Designer to:

- Build survey content: Survey Designer provides various controls for defining survey questions. The example above shows the choice list control, which displays a list of items that your users can choose from. Each survey question has corresponding properties that you can set to manage survey behavior. For instance, you can make a survey response mandatory. If you make a survey response optional, users can skip the question in the survey. You can also configure your survey so that an introductory note starts the survey and an end note displays after users finish the survey.
- (Optional) Save certain survey responses as chat context: When defining your survey, you can map a particular survey question to a chat context variable so that survey responses are stored...
in the context variable. You can then use these variables to route chats to live agents in certain queues (specify the chat context variables in routing conditions) or to the virtual agent.

After creating the surveys, administrators configure the surveys to run as conversations in the chat client. The chat client renders the chat survey as a live chat conversation.

What to do next

Setting up chat surveys involves these main steps:

1. **(Optional) Define chat context**
   Use the Chat Setup form to set live agent controls and define the chat context variables for storing survey responses.

2. **Create your chat surveys**
   In Survey Designer, build your conversational questionnaires for gathering pre-chat information and post-chat feedback from your requesters. If you defined chat context variables to store certain survey responses, you can map the appropriate survey question to the corresponding chat context variable.

3. **Define pre-chat survey configurations**
Determine the pre-chat questionnaire to be presented to your requesters based on conditions that you apply.

4. **Define post-chat survey configurations**

Control the post-chat questionnaire displayed to your requesters to gather feedback on their experience with live agents.

Create conversational chat surveys

Use Survey Designer to build conversational questionnaires for gathering pre-chat information and post-chat feedback from end users. These questionnaires run in the chat client for Virtual Agent and Agent Chat.

- Identify the information that you want from your requesters, such as their name or email address. If you’re collecting pre-chat information, determine whether certain survey responses should be stored as chat context variables so that you can use that information for topic discovery or routing chats to certain work item queues. Before you build your survey, define and publish chat context variables for storing responses to certain survey questions. You’ll map these chat context variables to the appropriate questions in your survey.
- Role required: survey_admin or admin

You define, configure, and publish conversational questionnaires (surveys) using Survey Designer. You can use various survey controls to define the content of your questionnaires. For details on the survey controls available, see Survey designer elements and also the Survey question data types to see how the controls are rendered in the survey. For example, the Choice control provides a multiple choice selection to your users.

The survey controls map to corresponding Virtual Agent Designer input controls that render the survey as a conversation in the chat client. For examples on how Virtual Agent Designer input controls are rendered in run-time conversations, see Virtual Agent Designer user input controls. The following table identifies the survey controls supported in Virtual Agent Designer.

Survey Designer controls | Comparable Virtual Agent Designer user input controls
---|---
Template | Not supported

1. Navigate to **Survey > Survey Designer**.
2. Click the **Configuration** tab and configure the survey. For details on survey configuration, see **Configure a survey in the survey designer**.
   
   As you configure your survey:
   - If you want an introduction note and end note to begin and end your survey, enter your content in the **Introduction** and **End note** fields.
   - Select the **Chat Survey** option to enable conversational questionnaires. This option also enables the display of the **Context** option in the Properties form for each survey control.
   - Click **Save**.

3. Click the **Design** tab and give your survey a **Name**. In this step you'll define your survey questions. For more information, see **Create a question in the survey designer**.
   
   As you design your survey questions:
   - To create a question, drag a data type icon from the Controls palette and drop it into the category container. Give each question a **Name** and click the gear icon to open the Properties form for the control.
   - In the Properties form, complete the fields as needed to define the control.
   - If you enable the **Mandatory** option, users are required to answer the survey question. If you leave this field blank, users can skip the question in the survey.
   - If you want to store the user response to this question, enter the chat context variable in the **Context** field.
   - Click **Save**.

4. After you finish defining the questions in your survey, click **Preview** to review your survey.
5. When you are satisfied with the Survey, click **Save and Publish**.
   
   Your survey is listed in the Assessment Metric Types (**asmt_metric_type**) table.

Define the pre-chat and post-chat survey configurations that control the surveys to be presented to your requesters.

**Define pre-chat survey configurations**

Determine the pre-chat questionnaire to be presented to your requesters based on conditions that you apply.

- Create your **pre-chat surveys** in Survey Designer.
- Role required: admin

You can apply different questionnaires to collect pre-chat information from your requesters. You can use the survey information to route chats to the appropriate live agent (if using Advanced Work Assignment), or to the virtual agent.

1. Navigate to **Collaboration > Pre-Chat Survey**.
2. In the Chat Surveys (**sys_cs_survey**) table, select **New**.
3. Complete the form.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
| Condition mode| Type of condition to be used to control the conversational survey presented to requesters.  
|               | - Simple: Specify a condition using the condition builder.  
|               | - Advanced: Specify a JavaScript scripted condition.                        |
| Condition     | Condition that controls when the survey configuration is used. Use the condition builder to select the conditions to be applied. |
| Script        | JavaScript condition statement that specifies the condition for using this pre-chat survey. The condition must evaluate to true. |
| Survey        | List of the pre-chat surveys available. Choose the survey to be presented to the requester. |

4. Click Submit.

When a requester completes the pre-chat survey, the user is transferred either to a live agent if Agent Chat is set as the fulfiller interface or a virtual agent if Virtual Agent is set as the fulfiller. The user’s pre-chat responses are stored as context in the chat interaction record.

Define the post-chat survey configurations that determine the post-chat survey to be applied to the appropriate queue in Advanced Work Assignment.

**Define post-chat survey configurations**

Control the post-chat questionnaire displayed to your requesters to gather feedback on their experience with live agents. You configure the post-chat surveys to be used for specific chat queues defined in Advanced Work Assignment.

- Activate the Agent Chat plugin (com.glide.interaction.awa) if Advanced Work Assignment is not already installed. In AWA, configure the Chat service channel and work item queues.
- Determine the post-chat survey to be displayed to your requesters.
  - Review the existing chat surveys available in the Assessment Metric Types (asmt_metric_type) table by navigating to Survey View > View Surveys. You can use a predefined feedback survey, such as the survey for Virtual Agent feedback (a predefined Virtual Agent setup topic).
  - Or, you can create a new post-chat survey using Survey Designer. For details, see Create conversational chat surveys.
- Role required: awa_admin or admin

1. Navigate to Advanced Work Assignment > Settings > Queues.
2. Select the queue (in the Chat service channel) to which the post-chat survey configuration applies.
3. Go to the Post Chat Survey related link and click New.
4. Complete the form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this post-chat survey configuration.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that enables this post-chat survey configuration.</td>
</tr>
<tr>
<td>Order</td>
<td>Number that indicates the order in which survey configurations are run. If there are multiple chat survey configurations, the system runs the first survey found, from lowest to highest order.</td>
</tr>
<tr>
<td>Show Summary</td>
<td>Survey option that asks requesters if they want to see a summary of the survey responses they entered.</td>
</tr>
</tbody>
</table>
| Condition mode | Type of condition that determines the conversational survey presented to requesters.  
|              | · Simple: Specify a condition using the condition builder.  
|              | · Advanced: Specify a JavaScript scripted condition.                      |
| Condition   | Condition that determines the conversational survey displayed to requesters. Use the condition builder to select the conditions to be applied. The fields available for selection are based on the Chat service channel. |
| Script      | JavaScript condition statement that specifies the condition for using this chat survey. The condition must evaluate to true. |
| Survey      | List of the chat surveys available. Choose the post-chat survey to be presented to your requesters. |

5. Click **Submit**.

When a live agent ends the chat session, the post-chat survey (configured for the chat queue) is presented to the requester. When the requester submits the post-chat survey, the chat session ends for the requester. The Interaction Related Records list stores the post-survey chat survey results and creates a related record that links the assessment to the live agent (fulfiller).

**Quick actions in Workspace Agent Chat**

Set up shortcuts in Workspace Agent Chat so agents can work more efficiently with their customers.

**Using quick actions**

In Agent Workspace chat, an agent can insert a quick action in any of the following ways:

- Enter a command after the forward slash (/).
- Click the lightning bolt icon and select a quick action from the menu.
- If available, click the quick action button on the toolbar.

For example, an agent can transfer a conversation to another queue by entering `/t :q` in the message input field.
An agent can also initiate a queue transfer by clicking the lightning bolt icon and then selecting `/tq` from the menu.
Initiate a queue transfer from the quick action menu

Alternatively, an agent can transfer to another queue by clicking the arrow button on the toolbar.
An agent can view context relevant to a chat interaction. An agent can use a context quick action to show a card with context variables: sysparm_portal, sysparm_page, table, sys_id, and sysparm_language. This quick action can be initiated by an agent by typing `/context` in the message input field.
Parameters

Some quick actions require a secondary menu so that agents can further control the quick action. For example, after an agent initiates a queue transfer, the agent needs to select which queue to transfer to. The items that appear on the secondary menu are called parameters.

The following figure shows that, after an agent inserts a quick action to transfer to another queue, the agent sees a list of available queues. The default parameters for the quick action are queues that are available to agents.
To create a quick action that requires a secondary menu, you must define parameters for the quick action. For more information, see Define a quick action parameter for Agent Workspace chat.

Default quick actions

The following quick actions are available by default with Agent Workspace chat:

<table>
<thead>
<tr>
<th>Command name</th>
<th>Toolbar button</th>
<th>Action</th>
<th>Default parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>tq</td>
<td>➔</td>
<td>Transfers the conversation to another queue.</td>
<td>Available queues</td>
</tr>
<tr>
<td>ta</td>
<td>👤</td>
<td>Transfers the conversation to another agent.</td>
<td>Available agents</td>
</tr>
<tr>
<td>r</td>
<td></td>
<td>Uses response templates to insert as text in a conversation.</td>
<td>Available response templates</td>
</tr>
</tbody>
</table>

Activation information

To enable your agents to use quick actions, you must activate the Agent Chat (com.glide.interaction.awa) plugin, which is required for chat in Agent Workspace.
As of the New York release, quick actions replace Connect actions in Agent Workspace chat.

If you activated the Agent Chat (com.glide.interaction.awa) plugin prior to New York, your Connect actions are no longer available in Agent Workspace chat. You may need to create new quick actions.

Create a quick action for Agent Workspace chat

Create a quick action so that agents can use shortcuts for performing actions in Agent Workspace chat.

Role required: admin

1. Navigate to Quick Actions > Actions, and then click New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the quick action.</td>
</tr>
<tr>
<td>Active</td>
<td>Option for activating the quick action.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the quick action.</td>
</tr>
<tr>
<td>Command Name</td>
<td>Text that triggers the quick action when entered after the forward slash (/) in a conversation.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Work item that the quick action is available for. Filter the table that you select in the Table field to qualify a certain kind of work item.</td>
</tr>
<tr>
<td></td>
<td>For example, to make the quick action available only for conversations that are assigned to Beth Anglin, you would first select the Interaction (Interaction) table in the Table. Then, in the Applies to field, you would create the following filter: (Assigned to) (is) (Beth Anglin).</td>
</tr>
<tr>
<td>Table</td>
<td>Work item table that the quick action is available for.</td>
</tr>
</tbody>
</table>

**Note:** Quick actions are supported only in the Interaction (Interaction) table.

<table>
<thead>
<tr>
<th>Apply to all groups</th>
<th>Option for making the quick action available to all user groups.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply to groups</td>
<td>List of which groups can use the quick action. This field appears only if you clear the Apply to all groups option.</td>
</tr>
</tbody>
</table>
### Script

JavaScript code to control what the quick action does.

In this script, you have access to:
- The `record` variable, which for Agent Workspace chat is the Interaction (interaction) record
- The `params` array, if you defined quick action parameters

If provided, all free-form text entered after all the other parameters are captured as the last item in the `params` array.

Set the value of `answer` as follows:

```javascript
answer = {
  success: <Boolean>,
  message: <success_or_error_message>
};
```

**Note:** If you do not script a message, the agent receives a default message instead.

### Application

Application scope of the quick action.

---

3. **Click Submit.**

If your quick action requires a secondary menu, define a quick action parameter so that agents can further control the quick action. For more information, see [Define a quick action parameter for Agent Workspace chat](#).

Optionally, you can make the quick action available in Agent Workspace chat as a button. For more information, see [Configure a quick action button for Agent Workspace chat](#).

**Define a quick action parameter for Agent Workspace chat**

Define a quick action parameter to allow agents to further control a quick action in Agent Workspace chat.

**Role required:** admin

1. Navigate to **Quick Actions > Parameters**, and then click **New**.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the parameter.</td>
</tr>
<tr>
<td>Action</td>
<td>Quick action that uses the parameter.</td>
</tr>
<tr>
<td>No Matching Results Message</td>
<td>Message to agents if no records match the record query. If you do not create a No Matching Results Message, a default message is provided.</td>
</tr>
<tr>
<td>Display value field</td>
<td>Field from the parameter record that appears in Agent Workspace chat. This field appears when you select Basic in the Query mode field.</td>
</tr>
<tr>
<td>Query mode</td>
<td>Type of query. You can select Scripted or Basic. To query records with a script, select Scripted. To query records by whichever table that you specify in the Table name field, select Basic.</td>
</tr>
</tbody>
</table>
ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table name</td>
<td>Table to query for parameters. This field appears when you select Basic in the Query mode field.</td>
</tr>
<tr>
<td>No Results Message</td>
<td>Message to agents if there are no available records to query. If you do not create a No Results Message, a default message is provided.</td>
</tr>
<tr>
<td>Value field</td>
<td>Field from the parameter record that agents can enter in Agent Workspace chat to invoke the parameter item. For example, to transfer a conversation to Beth Anglin, an agent would enter /ta &quot;beth.anglin&quot;. In this case, the User ID field in the User (sys_user) record is the Value field. This field appears when you select Basic in the Query mode field.</td>
</tr>
<tr>
<td>Query Script</td>
<td>JavaScript code to determine which records qualify for your parameter. You are given a query variable that represents the search query that the agent provided. Set the value of the answer variable as follows:</td>
</tr>
<tr>
<td></td>
<td>answer = { items: [ { value: &lt;value&gt;, displayValue: &lt;displayValue&gt; } ] };</td>
</tr>
<tr>
<td></td>
<td>The array of items should contain objects with a value and a displayValue.</td>
</tr>
<tr>
<td>Note: This field shows only if you select Scripted in the Query mode field.</td>
<td></td>
</tr>
<tr>
<td>Application</td>
<td>Application scope of the parameter.</td>
</tr>
<tr>
<td>Order</td>
<td>Order that the parameter is available for the quick action.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Configure a quick action button for Agent Workspace chat

Configure a quick action button so that agents can perform actions in Agent Workspace chat with a single click.

Role required: admin

The toolbar of the Agent Workspace chat window contains three buttons. By default, clicking the left button

(_ATTACH_FILE) attaches a file in a conversation, clicking the center button

(QUEUE_TRANSFER) initiates a queue transfer, and clicking the right button

(AGENT_TRANSFER) initiates an agent transfer. You can't configure the left button, but you can assign different quick actions to the center and right buttons. However, you can't change the button icons.
1. Navigate to **Collaboration > Chat Setup.**
2. Go to the Quick Actions for Workspace Actions related list and select a button to configure.
   - To configure the arrow button
     
     open **arrow-right-outline**.
   - To configure the add user button
     
     open **user-plus-outline**.
3. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quick Action</td>
<td>Quick action that is inserted when you click the button.</td>
</tr>
<tr>
<td>Icon</td>
<td>Button icon that appears on the toolbar of the Agent Workspace chat window.</td>
</tr>
<tr>
<td>Order</td>
<td>Position of the button on the toolbar. If the value is 100, the button</td>
</tr>
<tr>
<td></td>
<td>appears at the center of the toolbar. If the value is 101, the button</td>
</tr>
<tr>
<td></td>
<td>appears at the right side of the toolbar. You can't change the button icon.</td>
</tr>
</tbody>
</table>

4. Click **Update**.

**Display chat context variables**

Activate context quick actions to enable agents to view context relevant to a chat interaction. When launched in a chat display cards show: `sysparm_portal, sysparm_page, table, sys_id, or sysparm_language`.

Role required: admin

Context quick actions are a default quick action, but require activation.

1. Navigate to **Quick Actions > Actions**.
2. Set the **Active** field to true under **Get Chat Context Variables**, or use the list editor to set the quick action to active.

**Using workspace**

Use workspace to find and resolve internal or external requester issues.

The following video shows an example of how to resolve an incident using workspace.

Your general workflow using workspace is:

1. Find an issue to work on.
2. Work on the issue to find a solution.

3. Communicate the resolution to the requester.

Get started using workspace by working through some tutorials.

Getting started using workspace

Use the tutorials to walk through many parts of workspace that you’ll use on a regular basis. The following tutorials are included for you to get a sense of how workspace works:

- Work on issues that are already in the database.
- Work on issues that come in through phone calls or chats.

Once you complete both tutorials, you should have a feeling for what workspace does. The topics after the tutorials provide detailed instructions about how to use all of the functionality in workspace.

Workspace tutorial for agents starting with a record

Perform the steps in this tutorial to get an idea how you can use workspace when you begin with a task already stored in the database.

Role required: agent

This tutorial starts with finding a task to work on that is already in a record in the database. The other tutorial starts with answering a phone call or chatting with a requester.

You use workspace to:

1. Find a task to work on.
2. Do research to resolve the task.
3. Communicate the solution to the requester or enter notes for yourself and other agents that document your progress in finding a solution.

The following graphic provides a very quick overview of finding and solving an issue.
Make your life easier, create a dashboard

Did you know you can create a dashboard version of this home page? You can also add multiple tabs. Flexible sharing lets any user view a dashboard.

This tutorial starts with you working on a record that’s in the database. Other ways you might start include receiving phone calls or chatting with requesters. The next tutorial shows how to begin work in those cases.

1. Open your workspace by navigating to **Workspace Experience** > **Administration** > **All Workspaces**.

![Workspace Experience Screenshot]

**Note:** In the previous image, you can see **Agent Workspace Home** in the application modules. You can click that to open Agent Workspace. The following steps are for you if you’re using a different workspace.

2. Click the name of your workspace and then under Related Links, click **Open workspace**. Your workspace opens.

3. Log into your workspace.
The first thing to do is find out what to work on. You can do that by looking at what’s on the landing page, as shown in this image. Or, you can go directly to the list of open issues to solve. Let’s see how to do both.

4. On the landing page, let’s say you want to look at the P1 incidents that haven’t been solved. Click the box, **Open P1 Incidents**.

A list of P1 incidents open.
Open P1 Incidents

This display is called List view. It's a list of records, in this case, incident records. Normally, you'd click one of the records to open it. Before you do, let's see how else you can start from a list to find a task to work on.

5. Click the list icon ( ) in the left, edge menu.

In the Lists tab, you see the groups of records you can open as lists. For example, you could open All problems or All change requests.

6. In the Lists tab, under Incidents, click Open.

A list of open incidents appears. Let's find out what the problem is and solve it.

7. Click an incident.

The record opens in what is called Record view.
Email server is down.

Notes

Watch list

Work notes list
From top to bottom, here’s what to notice:

- This record is on a tab labeled INC000905. You can open other incidents without closing this one. How? Click the list icon ( ) and click another incident. You can always jump from record to record by clicking the tabs.
- The form header shows the record’s short description, “Email server is down.” The form header is like the title of the incident record.
- Underneath that title in the form header is high-level information, including the importance of the task (Priority), whether it’s been worked on (State), and the kind of incident this is (Category).
- On the bottom-left, the Details tab shows a lot of details in the record. This section is called the form pane. Notice that you can scroll this section. You can enter information in this section, for example when you get additional information from the requester.

We’ll get to the other things you see in the next steps. But basically, the Activity pane is where you communicate with the requester or make notes to yourself or other agents about your progress in dealing with this incident. On the far right, the Contextual Side panel is where you do your research to find solutions for the task at hand.

8. Click through the tabs to the right of the Details tab to get information related to the open record, such as the service level agreement (Task SLAs) for this task, continuous integrations (Affected CIs) that might be affected, services impacted by the incident, related incidents, outages, and so on.

These items that work like tabs are called the Related items menu.

9. Let’s say you want to work on this incident. Click Assign to me.

10. Let’s solve the issue. Scroll down the stack of cards in Agent Assist, which is on the right side. If you don’t see a card that suggests a solution, you could enter a search term beside the search icon ( ). Notice that workspace automatically entered the value of the Short Description field from the record in the search field and used that to search.

11. It looks like the card, Reboot Windows Server, might be the solution you want. Click the card. Agent Assist gives you the opportunity to order a reboot.
12. Click **Helpful** to provide guidance to the predictive intelligence software that this was a good solution for this incident.

13. Click **Order** to issue a change request to reboot the Windows server. Notice a new tab appears as a child tab of the same incident tab. These child tabs enable you to accomplish multiple tasks on one screen. All of the child tabs relate to the same incident, which is shown on the tab at the top.

14. If you were really solving this issue, you’d click **Submit** and then click the option to save the change request. The system would then create the change request, which someone would then perform.

15. Document what you’ve done. In **Activity**, in the **Compose** field, click **Comments** and enter a note to the requester explaining what you did.
Click Post Comments.
Agent Workspace sends your comment to the requester and also adds it to the Activity Stream, which is the history of communications and actions you've taken.
17. Click **Work notes (Private)**, enter a comment, and click **Post Comments** to save information that’s only seen by fellow agents. You might use this internal commenting feature if you’ve not completely resolved an issue but want to document what you’ve done for other agents or yourself when you come back to the issue later.

18. If you haven’t resolved the issue but want to save your progress, click **Save**.

19. If you’ve resolve the issue, click **Resolved**.

The incident no longer appears in the list of open records.

You’ve walked through finding and solving an incident that was in the database. Next, walk through **solving an issue that comes in through a phone call or a chat**.

**Workspace tutorial for agents starting with a chat**

Walk through this tutorial to get an idea how you can use workspace when you receive a task by phone or chat.

**Role required:** agent

This tutorial starts with an agent working on a request that started with a chat. The workflow would be almost identical if the issue started with a phone call.

1. Open your workspace by navigating to **Workspace Experience > Administration > All Workspaces** and clicking the name of your workspace.
2. Click the name of your workspace and then under Related Links, click **Open workspace**.
3. Log into your workspace.
4. Click the inbox icon ( lãi ) and set your status to **Available**.

The green circle at the top left of the icon shows your status is **Available**. A number appears at the top, right of the icon when there are one or more chats available to answer.

5. Click the inbox to open a chat.

You’re given the opportunity to accept the chat.

The **Time to accept** counter shows how much time you have to accept the chat. When the counter reaches zero, the chat opportunity disappears from your inbox.

6. Click **Accept**.

The chat pane appears and workspace automatically creates an interaction record, assigns it to you, and enters it in the database.
7. Chat with the requester to find out what the issue is.

**Create New Interaction**

**Details**

**Interaction**

- Number: IMS0000225
- State: New
- Type: Chat
- Assigned to: John Jason
- Account: Boxeo

**Verified**

**Short description**

Router issue

9. Optional: You can verify the customer's information by clicking the Verify contact or Verify customer UI action button.

**Note:** Not all workspaces have these buttons.

A modal appears that displays personal information about the contact or customer. You can ask the requester for this information to confirm their identity.
10. Optional: You can transfer the chat to another agent who has more experience with the issue.
   
a) From the Action toolbar in the Active chat panel, click the Transfer Agent icon ( ).
   
b) In the Transfer to Agent window, select the agent to receive the chat and enter a message to that agent.

**Note:** Only the current owner of a chat may transfer the chat to another agent. The transfer button is otherwise disabled.
The transferred chat is listed in the Queues panel for the receiving agent. The receiving agent can accept or decline the transfer request. When the agent accepts the request, you get a confirmation.

11. After chatting, you might decide to create an incident out of this interaction record. Click **Create incident** to create an incident and transfer the information from the interaction to the incident record.
The incident is automatically assigned to you.

12. Click **Save** to save the incident.

13. Look at the information in the ribbon to get information about the requester and the record.

14. Click several of the items in the related items menu to see what other records might be linked to the one that's open.

For example, clicking **Outages** shows related system failures, and **Child incidents** shows incidents related to this one.

15. Use **Agent Assist** to research the incident.

   If the suggestions in Agent Assist don't provide answers for the incident, enter a search term.
16. Document what you've done. In Activity, in the Compose field, click Comments and enter a note to the requester explaining what you did.
17. Click **Post Comments**.

Agent Workspace sends your comment to the requester and also adds it to the Activity Stream, which is the history of communications and actions you’ve taken.
18. Click Work notes (Private), enter a comment, and click Post Comments to save information that’s only seen by fellow agents. You might use this internal commenting feature if you’ve not completely resolved an issue but want to document what you’ve done for other agents or yourself when you come back to the issue later.

19. Click Save or Resolve, depending on whether or not you’ve completed your work on this incident.

You’ve walked through answering and solving an incident reported in a chat. Before you tackle your first, real task, you can customize your workspace.

**Customize workspace**

Customize Workspace to display the components you want to see.

Role required: agent

You can hide some workspace components if you don’t intend to use them. You can always un-hide them in the future. The following image gives you the layout of the Record view, which is where you do most of your work and can customize the most features.
Click your profile image and expand the settings menu.
Pushing the sliders to the right displays the component. Pushing the sliders left hides the component. The following steps explain each slider.

a) Push the **Show Ribbon** slider to the right to display the ribbon.

The ribbon provides high-level information related to the open record, including the requester’s contact information, timeline of agent-requester interactions, issue SLA, and, potentially, custom components created by your system administrator. Your system administrator configures which ribbon elements appear.

b) Push the **Show Sidebar** slider to the right to display the Contextual side panel.
The Contextual side panel automatically provides suggestions for resolving issues, enables you to search for additional solutions, attaches solutions to your comments in the Activity Stream, and saves you time by using templates to fill out record fields with standard values. Make sure this slider is turned on.

c) Push the **Wrap list text** slider to the right to wrap text onto the next line for record fields in List view.

Wrapped text makes the columns narrower in List view. The following image displays wrapped text:
### Table of Records

<table>
<thead>
<tr>
<th>Number</th>
<th>Opened</th>
<th>Short description</th>
<th>Caller</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>INC0010112</td>
<td>2019-07-29 11:48:43</td>
<td>Assessment : ATF Assessor</td>
<td>survey user</td>
<td>5 - Planning</td>
</tr>
<tr>
<td>INC0010111</td>
<td>2019-07-22 14:04:57</td>
<td>ATF : Test1</td>
<td>System Administrator</td>
<td>5 - Planning</td>
</tr>
<tr>
<td>INC0009009</td>
<td>2018-08-30 01:06:16</td>
<td>Unable to access the shared folder.</td>
<td>David Miller</td>
<td>4 - Low</td>
</tr>
<tr>
<td>INC0009005</td>
<td>2018-08-31 21:35:21</td>
<td>Email server is down.</td>
<td>David Miller</td>
<td>1 - Critical</td>
</tr>
<tr>
<td>INC0009001</td>
<td>2018-09-11 20:56:26</td>
<td>Unable to post content on a Wiki page</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following image displays unwrapped text:

- **d)** Push the **Show Banners** slider to the right to display notifications. Notifications display when updates occur to records you’re working on.
Regardless of whether you display notification banners, you can access your notifications by clicking the notification icon in the top, right of workspace.

2. Set up the Compose editor, which is what you use to communicate with requesters and to enter internal notes for fellow agents about work you’ve done on a record.
   a) Configure the composition editor in Activity Stream by clicking the configuration icon.
b) Push the Rich Text Editor slider to the right to use the rich text editor.

The rich text editor includes formatting icons for bold, italics, underlining, font, and so forth, as shown in the previous image at the top of each text field.

c) Push the Stacked View slider to the right to display two text-entry boxes, one to enter comments for external requesters and one to enter internal notes for yourself and fellow agents, as shown in the previous image.

Internal notes are only visible to you and fellow agents. External comments are visible to agents and sent to requesters. The following image shows the unstacked view, which is a single, text entry box with tabs to enter external comments and internal, work notes.
The pros and cons of these views:

- The stacked view might make it clearer whether you're entering comments for fellow agents or external requesters.
- The unstacked view consumes less space in Activity Stream.
- The stacked view enables you to copy and paste a message and send it to internal and external audiences.

3. Click one of the icons ( ) at the bottom of workspace to select whether you want to display only the Form pane, only the Activity Stream, or both (the default).

- Form pane only icon ( )—Workspace displays the Form pane but not the Activity Stream to create a wider view of the Form pane. The Form pane displays details of the open record.
- Form pane and Activity Stream icon ( )—Workspace displays both the Form pane and Activity Stream in equally-sized panes. You can drag the boundaries of the panes to resize them. This setting is the default.
- Activity Stream only icon ( )—Workspace displays the Activity Stream but not the Form pane to create a wider view for the Activity Stream. The Activity Stream enables you to communicate with requesters and to make internal notes about the work done on the open record.

You can click these icons at any time to change the display.
4. Set up chat notifications.
   a) Click the inbox icon ( ).
      The Inbox pane appears.
   b) Click the gear icon ( ).
      The configuration sliders appear.
Desktop Notifications are text boxes that temporarily appear on the screen. Regardless of the settings, when something is in the inbox, a circle appears to the top, left of the inbox icon, and the number of items in the inbox to the top right. The color of the circle matches the agent’s status. For example, when an agent is Available, the circle is green.

c) Set the sliders accordingly for audio alerts and desktop notifications.

Now that you’ve done the tutorials and customized workspace, learn the different ways to find issues to work on.

Finding issues to work on

Use workspace to find the issues to work on.
The first step in your workflow is finding issues to solve. You can find issues to work on in the following ways:

- **Landing page**—Provides a high-level overview of tasks that need to get done.
For more information, see Use the landing page to find issues to work on.

- **List view**—Displays lists of records to work on. Records are grouped by the table they’re in, for example, Task, SLA, Incident.

Clicking a link takes you to the record so you can work on it. You get to list view by clicking the list icon (List). For more information about list view, see Use lists to find work to do.

- **Chat inbox**—Interact in real time with requesters using chat. Accepting a chat request automatically creates a record for you to record the work you do to solve the issue. You get to chats by clicking the agent inbox icon (Inbox). For more information about chatting with requesters, see Getting work from chats.

- **Phone inbox**—Interact in real time with requesters by phone. Accepting a phone call automatically creates a record for you to record the work you do to solve the issue. You answer and make phone calls by clicking the phone icon ( ). For more information about using phones in workspace, see Get work by phone in workspace.

- **Share a record**—See a record another agent is working on so you can help. You can share the current state of your workspace by sharing its URL. For more information, see Sharing workspace views.

Next

Learn how to use the landing page to find work to do.
Use the landing page to find issues to work on

Use the landing page to get an overall view of work that needs to get done.

Role required: agent

The landing page is the first page you land on when opening a workspace. It can contain high-level information, such as unassigned, high-priority tasks, or tasks assigned to you. For example, the following landing page shows unassigned, high-priority cases, such as open P1 incidents. The page also shows tasks assigned to you under **My Work**.

Landing pages are configurable by your system administrator so yours might look different.

1. Navigate to **Workspace Experience** > **Workspaces** and click your workspace.
   
   Your landing page opens.

2. Click any of the links on the landing page to select an issue to work on.
   
   If you click a group of records, such as, open P1 incidents, list view opens and you see a list of P1 incidents that you can choose to work on. If you click the link to a specific record, such as INC0018313, that record opens in record view.

Learn how to **find work do to in list view**. Once you click a record in a list, it opens in record view.
Use lists to find work to do

Use lists in workspace to see high-priority issues and which issues are assigned to you.

To get to list view, click the list icon (≡).

You see two tabs of lists: Lists and My Lists. The system administrator creates the list categories in Lists. You create the list categories in My Lists.

List categories

List categories in the previous image are Tasks, SLAs, and Incidents. List categories are not clickable and therefore serve mainly as headings for the list filters beneath them. For example, under the list category, Tasks, are the list filters, My Work and My Group’s Work.
Your system administrator sets up the list categories, which typically correspond with the tables in the database. For example, all incidents are stored in the incident table. All interactions are stored in the interaction table. The list categories your system administrator chooses to display in list view correspond to the kinds of issues you work on. If you work on incidents, your system administrator shows incidents in the Lists column. If you work on cases, the Lists column shows cases.

You can use the up arrowhead icon

\[\wedge\]

to display the list filters under each list category. Clicking the down arrowhead icon

\[\wedge\]

collapses the list categories to make it easier to scroll through the list categories.

You cannot have a list category without list filters.

**List filters**

List filters are the subsections under list categories. In the previous image, under Tasks, you see My Work and My Group's Work. Each list filter provides a helpful grouping of records typically from one table. For example, My Cases enables you to quickly find cases assigned to you. Your system administrator creates the list filters.

Clicking a list filter opens the corresponding list of records in list view. A list filter must belong to a list category in the Lists tab.
My Lists

Any lists that you create appear in this section. Lists in this section are only visible to you. For more information about creating your own list categories and list filters, see Create My Lists in workspace.

Next

Learn how to work with lists in list view.

Work with lists in workspace
Open a list of records in workspace so you can choose one to work on.

Role required: agent_workspace_user

List view enables you to see high-level information for all records in a list filter. Normally, clicking a field in a record in a list opens that record. If the field is clickable (a reference, document ID, or URL), clicking it does not open the record, it opens the record or URL that the clickable field points to.

Last refreshed indicates how long ago the values in the list were last refreshed. To refresh the values, refresh the page.
Each list has an associated URL. You can bookmark a list to enable quick access to it. Here's how to open a list to find records you want to work on.

1. Click the list icon ( ).
2. Find a list category that contains the records you want to work on, for example, Tasks.
3. Click one of the list filters under it.

   For example, under Tasks, you might click on a list filter called My Work. That would open up a list of task records assigned to you. The list filter title and the number of records in the list appear at the top of the list. In the previous image, the All list contains 8383 records.
4. Optional: To preview a record before opening it, move your mouse over a record and click the information icon.

   A side panel opens that shows the record.
5. Optional: To move to a different page of records, click a page number or one of the arrows to move forward or backwards a page, or to the first or last page of records.

   Showing 1-20 of 39
6. Optional: To change the number of records displayed on a page, click the number beside rows per page and select a number from the menu.

   Click a record number to open it.
7. Optional: To export the records in a list in one of the following formats: CSV, XLSX, JSON, or PDF, click the gear icon and select Export.

   Now that you know how to open a list and the records in it, find out how to edit records in list view. Edit records in list view
   Make updates to a record directly from a list, without leaving the list.
Role required: agent_workspace_user

You can revise one or more records while in list view. To learn more about a record before editing it, view and revise it in record view.

1. Revise a single record from a list.
   a) Click the Open Preview icon

   The record opens.

<table>

   Short description
   
   Description

   ![Edit fields]

   c) Revise the values in the fields and click Update.

Now that you know how to edit a record in list view, find out how to sort and filter the records displayed in a list.
Sort records in lists

Sort the records displayed in list view to more easily find the records you want to work on.

Role required: agent_workspace_user

Filtered lists can contain thousands of records. Sorting them by field values can help you find the records you want to work on. You can sort the entire list based on any of the columns in the list.

1. To change the field the records are sorted by, double click a column heading.

   An arrowhead icon appears to the right of the column heading you clicked and workspace sorts the list of records based on the values in that column. An arrowhead pointed down means the values are sorted from highest to lowest values.

2. Optional: To reverse the sorting order, click the arrowhead icon so the arrowhead reverses direction.

Instead of sorting records, you might want to filter the records to reduce the number of records displayed in list view.

Filter records in lists

Filter the records to reduce the number of records displayed in list view so you can find the records you want to work on.

Role required: agent_workspace_user

Filtering removes records from a list so you can view only those records you’re interested in working on.

Workspace provides the following ways of filtering records displayed in a list:

- Use the filter icon ( ▼ ).
- Filter directly in the list using the column heading.
- Filter directly in the list using the values in the columns.

1. To filter out records using the filter icon ( ▼ ):
   a) Click the filter icon ( ▼ ).
   b) Click Advanced View.
   c) Use the condition builder to specify the conditions one or more field values must meet for a record to appear in the list.
      For example, (Active)(is)(true), and (Urgency)(is)(1- High).
   d) Optional: To add more conditions, click New Criteria and supply a condition.
   e) Click Update.
The list filter icon shows the number of conditions that apply to the current list.

2. **Filter records based on field values displayed.** You can work directly with list columns to filter out records.
   a) Click the **More UI Actions** icon to the right of a column heading.
   b) Click the downward pointing arrowhead icon and select a filter condition, such as `is not`, `starts with`, or `contains`.
   c) Enter the field value to filter the list on the bottom line and click **Apply**.

In the following example, the only records that appear have **Caller** values that start with **David**.
Note: Not all field types support column filtering. You can use the **Advanced Filter** panel and condition builder to create a filter for those field types.

d) If the values come from the sys_choice table, the possible values (choices) appear with boxes beside them.
If there are more than ten fields, workspace displays a Filter, as shown here, so you don’t have to scroll to find a field value. If there are less than ten choices, there’s no entry filter under Filter.

You can click All to select all of the fields or None to uncheck all of the fields. All selects all of the field values that meet the filter conditions, not just those shown in the pop up. Likewise, None unchecks all of the fields that meet the filter conditions, not just those shown in the pop up. You can combine these functions. For example, you can filter on
Windows and select All, and then filter on 2000 and select None and wind up with rows that contain Windows but not Windows 2000.

You cannot configure the number of fields (10) that makes the Filter entry field appear.

e) Optional: To remove the filter and restore all of the records, click the More UI Actions icon
   and click Clear.

3. Filter out records based on field values.
   This feature is similar to the one in the previous step but you can’t enter a term to filter the records.
   a) Click a field in record.
   b) Click the More UI Actions icon
      ( ).

   c) To remove all records that don’t have the same field value, click Show Matching.
   d) To remove all records in the list that have the same field value, click Filter Out.
      By default, a column sorts in an ascending order unless the column data type is a date.
      Dates sort in a descending order.

Instead of filtering records, you might like to group records in list view.

Group records in lists
   Group the records displayed in list view to more easily find the records you want to work on.

Role required: agent_workspace_user

You can group records that have the same values in a column so you can see similar records.

1. Move the mouse over a column heading and click the More Options icon
   ( ).

2. Click the first option, Group by <column-heading-name> where <column-heading-name> is the name of the column you’re clicking in.
The records are grouped based on the values in the selected column.

3. Open a group by clicking its arrowhead icon.

4. Optional: To ungroup the records, mouse over the same column heading, click the More Options icon and click **Ungroup by <column-heading-name>**.
Create My Lists in workspace

Create your own filtered lists in workspace to monitor your issues, tasks, or problems, under My Lists.

Role required: agent_workspace_user

You might like to create different groupings of records than those provided by your system administrator under the Lists tab. For example, you might like to group all records that pertain to incidents associated with a specific company. You use condition builder to create filters that then appear in your My Lists tab. Those lists are only visible to you. To access your lists, click My Lists.

As you can see, My Lists does not have list categories, only list filters.

1. Navigate to Workspace Experience > Workspaces and click your workspace.
   Your workspace opens.
2. Click My Lists.
3. Click +New list.
4. On the form, fill in the fields.
   
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the filtered list.</td>
</tr>
<tr>
<td>Table</td>
<td>Table the records come from.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Filters that select the records from the table to include in the list. Select the conditions required for records to appear in My Lists. For example, click Add Filter Condition and then select [Company] (is) (ACME Austrailia).</td>
</tr>
<tr>
<td>Columns</td>
<td>Record fields to include in list view. Click the lock icon (🔒) and select the fields to include in list view.</td>
</tr>
</tbody>
</table>
   
5. Click Save.
   The list appears on the My Lists tab.
6. Optional: To change the order of your lists, click Reorder, then drag each list into the order that you want and click Done.
7. Optional: To modify or delete any of your lists, click the gear icon (⚙️) and select one of the following:
   
   Rename
Enables you to rename a list.

**Personalize Columns**

Enables you to alter the columns that are displayed in the list.

**Save**

Saves the current list and underlying filters.

**Save as**

Saves and renames the current list and underlying filters under **My List**.

**Export**

Export **My List** in a variety of formats.

**Delete**

Removes a list from **My List**.

---

**Get work by phone in workspace**

Use workspace to make inbound and outbound telephone calls if your instance is integrated with your telephony system.

Role required: agentworkspace_user

You can do the following with the Agent Workspace phone:

- Make an outgoing call
- Receive an incoming call
- Transfer a call to another user within the system
- Place a call on hold or on mute
- Set your availability status

1. Do one of the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Click the phone icon in the main navigation bar.</td>
<td>Enter the phone number in the <strong>Number</strong> field and click <strong>Call</strong>.</td>
</tr>
<tr>
<td>Click the phone icon next to the Contact or Consumer fields on the form.</td>
<td>For your contacts who may have multiple phone numbers:</td>
</tr>
<tr>
<td></td>
<td>· If only one phone field is populated, a call is placed to that number.</td>
</tr>
<tr>
<td></td>
<td>· If you see a dialog box that displays more than one number, click the number that you want and then close the dialog box.</td>
</tr>
</tbody>
</table>

2. Click **End** to end the call.

---

**Getting work from chats**

Use the agent inbox to manage your incoming work items, such as chats, cases, and incidents.

To open the agent inbox, click the **Inbox** icon in the navigation bar.
Inbox responsibilities

<table>
<thead>
<tr>
<th>Agent responsibilities</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monitor your inbox</td>
<td>Use designated service channels to route work items to available agents, such as incoming chat requests, case assignments, and incidents.</td>
</tr>
</tbody>
</table>
| Start a chat session   | Accept a chat from your inbox. You have a time limit to accept a chat before it reroutes to another agent. The chat associates to an interaction record that captures the conversation and work done during the session. During a chat session, you can:  
  - Add attachments using the Action toolbar.  
  - Transfer the chat to another agent.  
  - Add another agent to the chat.  
  - Perform other support tasks, such as create an incident or case.  
  - Use workspace tools, such as the ribbon to glance at information or the activity stream to review related work. |

Agent inbox navigation

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(A) Agent inbox</td>
<td>Display the queues that are assigned to you, the number of active chats in each queue, and the average wait time for chats in the queue.</td>
</tr>
<tr>
<td>(B) Active chat panel</td>
<td>Display your active chat session. Chat actions appear beneath the chat and allow your agents to attach a file, add an agent, transfer the chat, and more.</td>
</tr>
<tr>
<td>(C) Interaction record</td>
<td>Display the interaction record (IMS). The IMS initiates from a chat or phone call and lists the initial information about the customer and the communication. You can archive this interaction as a log of communication, or you can create an incident or a case that is based on the customer needs.</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Attachments panel</td>
<td>Add attachments to the interaction. For example, you can add supporting information to a customer issue. If templates are available, they appear in the template section of this panel.</td>
</tr>
</tbody>
</table>

**Accept a chat session**

Begin a conversation with a customer by selecting a chat queue in the chat session. You can work on multiple chats in different queues simultaneously.

Role required: agent_workspace_user

1. Navigate to **Agent Workspace Home > Inbox**.
2. From your inbox, accept or reject a chat.

You are automatically connected to the first customer in the chat queue, which is the oldest request in the queue. The Active Chat panel displays a pre-chat message acknowledging the customer chat request. You can review the customer information before you enter a response in the Active Chat panel.

In the chat workspace, an interaction parent tab with a details child tab open for the session. The details child tab offers more information on the chat request and provides contextual options for performing related operations during the chat session.

3. Use chat tools for managing the chat and contextual options to perform related tasks.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manage your chat</td>
<td>Do the following actions from the Actions toolbar:</td>
</tr>
<tr>
<td></td>
<td>• Add an attachment.</td>
</tr>
<tr>
<td></td>
<td>• Transfer a chat to another queue.</td>
</tr>
<tr>
<td></td>
<td>• Transfer a chat to another agent.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Perform additional support tasks</td>
<td>Engage in other support work during the chat session by using the contextual options in the Details tab. For example, you can:</td>
</tr>
<tr>
<td></td>
<td>· Update chat information.</td>
</tr>
<tr>
<td></td>
<td>· Create a new case or incident.</td>
</tr>
<tr>
<td></td>
<td>From the sub-tab, you can select other contextual options to work on a resolution for the case or incident. For example, you might need to escalate the issue.</td>
</tr>
<tr>
<td></td>
<td>· Choose a related task in the More options (....), such as send email.</td>
</tr>
<tr>
<td></td>
<td>· Search for relevant information in the knowledge base using Agent Assist.</td>
</tr>
</tbody>
</table>

4. In the Details tab of the interaction, end the chat session by clicking Close. Ending the chat saves the conversation history and closes out the interaction. You can also end a chat by closing the tab. If you end the chat this way, you lose all of the conversation history and you cannot save the information in the interaction record.

Transfer a chat to another queue
Route a chat to another queue. Any agent who belongs to the associated queue can accept the chat.

Role required: agent_workspace_user

1. From the Action toolbar, click the Transfer to Queue icon ( ).
2. In the Transfer to Queue panel, select the queue to transfer the chat to.

When you transfer a chat, the interaction record for the chat is marked as closed complete, and the chat is added to the selected queue. When a receiving agent accepts the transfer, that agent sees the conversation and the chat history in the Active Chat panel. By transferring a chat, you also open a new interaction.

Transfer a chat to another agent
Route a chat to another agent in the same chat assignment group.

Role required: agent_workspace_user

1. From the Action toolbar in the Active chat panel, click the Transfer Agent icon ( ).
2. In the Transfer to Agent window, select the agent to receive the chat.

Note: Only the current owner of a chat may transfer the chat to another agent. The transfer button is otherwise disabled.
The transferred chat is listed in the Queues panel for the receiving agent. The receiving agent can accept or decline the transfer request.

Add an attachment to a chat
Chat agents can add attachments, such as documents and image files, to the conversation.
Role required: agent_workspace_user
- From the Action toolbar, click the Attachment icon (_attach) to upload an attachment to the case.

Change your status in the chat panel
Change your status while you are on a break or offline so no new chats are assigned to you. When you return, you can update your status to let everyone know you are back.
Role required: agent_workspace_user
1. Navigate to Agent Workspace Home > Chat.
2. In the chat panel, from the status list, select your current status.
   - Available: You are available to receive new chats.
   - Away: You are not available to receive new chats.
   - Offline: You are not available to receive new chats.

Adjust your status depending on your availability.
Set up a new chat or work item alert
Set up an audible alert to notify you when a new chat or work item arrives in your Agent Workspace inbox.
- Install the Agent Chat plugin (com.glide.interaction.awa).
Role required: agent
1. In your Agent Workspace inbox, click the settings icon.
2. To receive an audible alert for new items in your inbox, toggle **Inbox Audio Alerts**.
3. To receive an audible alert for new chats in your inbox, toggle **Chat Audio Alerts**.

   **Note:** Only agents who are subscribed to the corresponding service channel can toggle the settings.

Monitor chat conversations
Managers can view ongoing chat conversations and join them to assist agents and requesters in Workspace Agent Chat.

Role required: awa_manager
1. Navigate to **Lists > Interactions > Active Chat Interactions**.
2. Select an active chat interaction from the list.
3. In the Active Chat panel, click **Join**.
   
   A notification lets the agent and requester know that you’ve entered the chat. Messages that you submit are visible to the agent and requester.

   **Note:** Your presence is not known until you join a chat.

Interaction records in Agent Workspace
Using an interaction record, agents can create or reference customer information from a customer contact. Agents can then decide if the conversation is an incident, case, or request.

An interaction represents a request for assistance made through a chat, phone call, or walk-up. Interactions can be routed to queues for assignment or assigned to agents directly. Support agents can create cases, requests, or incidents from the interaction. Interactions can also be used to capture one-and-done type requests where an agent might not want to create associated tasks.

</tr>
</tbody>
</table>

Interactions are logged. You can see them in the Related Lists of the interaction.

### Create a problem from an interaction

You can create a problem record directly from an Interaction when the customer makes contact regarding an issue and you need to investigate.

- Role required: agent_workspace_user or admin
- Activate the Problem Management Best Practice — com.snc.best_practice.problem plugin
- Select the **Allow Problem creation from Interaction** (glide.problem.interaction.allow_create) problem property

**Note:** The Interaction feature is a more efficient way to create a problem from an interaction than the New Call feature from Service Desk Call (com.snc.service_desk_call) plugin that you might have used previously.

1. Navigate to **Workspace Experience > Workspaces > Agent Workspace Home**.
2. Click the list icon (``) and click the Interaction list.
3. Click the interaction record from which you want to create a problem.
4. On the interaction page, click the more actions icon

![more actions icon](image)

and select **Create Problem**.

5. On the form, fill in the fields.

### Problem form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Auto-generated. Number that identifies the problem record.</td>
</tr>
<tr>
<td>First reported by</td>
<td>Task that first identified this problem.</td>
</tr>
<tr>
<td>Category and Subcategory</td>
<td>Group to which the problem belongs to such as software or hardware. After selecting the category, select the subcategory, if applicable.</td>
</tr>
<tr>
<td>Service</td>
<td>Business service that the problem applies to.</td>
</tr>
<tr>
<td>Configuration item</td>
<td>Configuration item (CI) that the problem applies to. The CI class of the selected configuration item identifies the type of problem, for example, hardware, network, or database.</td>
</tr>
<tr>
<td>State</td>
<td>State management process. The field value changes as the problem proceeds from one state to another state. The states available are: New, Assess, Root Cause Analysis, Fix in Progress, Resolved, and Closed.</td>
</tr>
<tr>
<td>Impact</td>
<td>Effect that the problem has on business operations, for example, Major revenue loss.</td>
</tr>
<tr>
<td>Urgency</td>
<td>Extent to which the problem resolution can bear delay.</td>
</tr>
<tr>
<td>Priority</td>
<td>How quickly the service desk should address the problem. The Priority field is automatically set to the Impact and Urgency values.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Group to which the problem is assigned.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>Problem coordinator to whom the problem is assigned. If an assignment rule applies, the problem is automatically assigned to the appropriate user or group.</td>
</tr>
<tr>
<td>Problem statement</td>
<td>Brief description of the problem.</td>
</tr>
<tr>
<td>Description</td>
<td>Detailed description of the problem.</td>
</tr>
<tr>
<td>Notes</td>
<td>Work notes list users who receive notification when work notes are added to the problem.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Informative notes about the work performed on the problem.</td>
</tr>
</tbody>
</table>

**Note:** To access the new state management process, activate the Problem Management Best Practice — Madrid (com.snc.best_practice.problem.madrid) plugin.

**Note:** Activate the Problem Management Best Practice — Madrid (com.snc.best_practice.problem.madrid) plugin.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analysis Information</td>
<td>Method used to overcome the issue if no resolution is available yet.</td>
</tr>
<tr>
<td>Workaround</td>
<td>The cause of the problem.</td>
</tr>
<tr>
<td>Cause notes</td>
<td>The cause of the problem.</td>
</tr>
<tr>
<td>Resolution information</td>
<td></td>
</tr>
<tr>
<td>Resolved</td>
<td>Auto-generated. Date and time when the user resolved the problem.</td>
</tr>
<tr>
<td>Resolved by</td>
<td>Auto-generated. The user who resolved the problem.</td>
</tr>
<tr>
<td>Fix notes</td>
<td>How the problem was fixed.</td>
</tr>
<tr>
<td>Auto-generated information</td>
<td></td>
</tr>
<tr>
<td>Opened</td>
<td>Auto-generated. Date and time when the user opened the problem.</td>
</tr>
<tr>
<td>Opened by</td>
<td>Auto-generated. User who opened the problem.</td>
</tr>
<tr>
<td>Confirmed</td>
<td>Auto-generated. Date and time when the issue was confirmed as a problem.</td>
</tr>
<tr>
<td>Confirmed by</td>
<td>Auto-generated. User who accessed the issue and confirmed that it was a problem.</td>
</tr>
</tbody>
</table>

6. Click **Save**.
   A problem record is created and the record appears in the Related tasks related list on the Interaction form.

### Create a standard change from an Interaction
Create a standard change record directly from an Interaction Management to implement a pre-approved, low-risk change without having to go through the Change Management module to implement it.

Role required: agent_workspace_user or admin

1. Navigate to **Agent Workspace > Agent Workspace Home**.
2. Open the interaction record from which you want to create a standard change.
3. On the Interaction form, click the more actions icon
   ![more actions icon](image)
   and then click **Create Standard Change**.
4. On the New Catalog Item page, select the standard change and click **Submit**.
   A standard change is created and the record appears in the Related tasks related list on the Interaction Management form.

### Getting notifications in workspace
You can receive workspace notifications to get immediate updates about records you’re working on without leaving workspace.

Notifications present updates about records you’re working on or being assigned to regardless of whether or not the record is open in workspace. For example, a notification might show that you’ve been assigned in incident.
You can click the notification to open the record.

You can open all of your notifications by clicking on the notifications tray icon ( ).

The badge number indicates the number of unread notifications.

Workspace deletes notifications after seven days.

**Working on issues in workspace**

Use the following sections to discover answers to the issues you’re dealing with in an open record.
Depending on the issue at hand, you might be ordering a hardware component for a requester, issuing a server restart to solve an issue, or creating and assigning an incident record to remedy a software issue.

When you use the landing page or list view to open a record, workspace provides a lot of information about the record. Here's how you might look at the different parts of workspace to understand and resolve an issue.
1. In the Form Header, read the record's short description, priority, status, and issue category.
2. In the Ribbon, read about the requester, how long the issue has been open, and what the SLA is in solving the issue.

3. In the Form pane, on the **Details** tab, scroll through detailed information about the issue.

4. In the Related Items menu, click the tabs to see information related to the open record, such as related incidents. The information appears in the Form pane.

5. In the Contextual side panel, read the search results automatically pulled up by Agent Assist that might help solve the issue.

6. In the Activity Stream, read about the history of actions you or other agents have taken in solving this issue.

7. In the Compose section of the Activity Stream pane, write a comment to the requester or make notes to yourself and other agents about your progress in resolving the issue.

Next

Now that you understand how to look through the parts of workspace to get contextual information about an issue, let’s see how to **find a solution**.

**Finding solutions using Agent Assist**

Agent Assist is a search engine that helps you find the information you need to resolve issues. Agent Assist appears in the Contextual side panel by default and when you click the graduation cap icon (🎓). It’s possible for you to have icons for more than one Agent Assist. If so, each one would search a different set of information sources.

When you open a record, Agent Assist automatically does a search based on a field in the open record. The field value used for the search term is configurable by your system administrator but it’s typically the value for the record’s short description field. The following figure shows the search results for the short description, "HDMI port is not working." Search results return as cards. In the following example, the card returned links to an article with the title, HDMI port is not working on my PC, and that was updated 14 days ago. The following figure also shows there are two different Agent Assists available using the differently-colored graduation caps.
The default number of search results is 10. If there are more than 10 results, the number appears as 10+. Agent Assist is pre-configured to search the Incident, Problem, Change, Knowledge, and Case tables for solutions. Your system administrator can configure Agent Assist to search additional information sources, such as the service catalog.

You can use Agent Assist in the following ways to find solutions to the record you opened:

- Click a card to go to the search result.
  The search result might provide the answer you need, which you can then send to the requester using the Compose editor in Activity Stream.

- Enter a new search term in the search field next to the search icon ( ) to get different search results.
  If the search results automatically displayed don’t show appropriate results, enter a new search term to get better search results.

- Filter the search results.
  By default, Agent Assist returns search results from all of its information sources. You may get too many results. To see the search results from a subset of those information sources, click the configuration icon ( ) and then click an information source.
Send a solution to the requester by clicking a link in the card.

The following example shows a link, **Link to Problem**, that, when clicked, adds the link to a similar problem in the *Compose editor* that you can then send to the requester.
• If the card is an article, click the card and then the Attach link to send the article to the requester.

For more information, see Send an article to a requester.

• If the card links to an item in the service catalog, click the card to order the item.

For more information, see Order a catalog item for a requester.

• Click a different Agent Assist icon and repeat the search.

If you have more than one Agent Assist in the Contextual side panel, each one searches through a different set of information resources. Your system administrator configures the icon to click for additional Agent Assists.

• If your system administrator enables Search as on your instance, you can change search results by changing field values in the form pane.

On the Details tab, you may be able to replace the value for Caller, for example, to change the search results based on that value. For example, if you create cases on behalf of customers or employees, entering a customer’s identity in the Caller field in the form pane returns Agent Assist search results, for example 401k information, that match the customer instead of the you.

• Place a catalog order by clicking a catalog item shown on a card.

• Add a knowledge article to the Compose editor by clicking the Attach icon (_attach_20) in Agent Assist.

**No search term**

Your system administrator can configure Agent Assist to conduct a search without using a search term. The search result is all records from a particular information source, such as employee records. You then can get the record of a particular employee by entering the employee’s name in the search field.

**Create a record in workspace**

Create a record in workspace from the Record tab menu or from a list.

Role required: agent_workspace_user
You might create a record to capture work you’re doing. For example, after a phone call, you might create an interaction or incident record. In the record, you capture the information you obtained in the phone call.

The kinds of records you can create is configured by your system administrator. The default is an interaction record. If you place your mouse over the plus sign icon, the list of records you can create appears.

1. Click the plus sign icon.

Notice that the record type appears when you place your mouse over the icon.

If you can only create one type of record, a blank form of the record appears. If your system administrator configured workspace so you can create multiple record types, workspace displays a list of those record types. You then select the type you want to create and that blank record type appears.

2. On the form, fill in the fields and click **Save**.

**Global search in workspace**

Search across all cases, incidents, problems, knowledge articles, community questions, and change requests to find answers.

**Global search feature**

Search results include all of the items the search term appears in, for example, in the short description, content, or attached files. By default, global search results can include:

- Cases
- Customers or Users
- Now Community Questions
- Incidents
- Change Requests
- Problems
- Knowledge Articles

To enter search terms, click the search icon and enter the search term in the text box.
Search results appear in a separate tab. Links lead to a record or a list of records.

Searching for a customer or user

You can search for a requester by name, for example, Fred:

Global search results show the number search results by category:
Clicking **Users** shows the search results for users that have the name *Fred*:

<table>
<thead>
<tr>
<th>Incidents</th>
<th>14</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change Request</td>
<td>19</td>
</tr>
<tr>
<td>Problems</td>
<td>1</td>
</tr>
<tr>
<td>Requests</td>
<td>3</td>
</tr>
<tr>
<td>Users</td>
<td>2</td>
</tr>
</tbody>
</table>

**Searching for a case or incident**

You can use case or incident numbers to search for specific cases or incidents. Or, you can search using other values related to the cases or incidents. In the previous example, if you click **Incidents**, workspace displays all of the incidents that have the name *Fred* in one or more record fields.
Getting or adding information to a record

Use the form pane to discover detailed information about a record, information related to the open record, and to make entries in the record.

Getting detailed record information

To get detailed record information about a record, click the Details tab. The contents, which appear in the form pane, are many of the fields in a record. Your administrator configures which fields you see.
You can vary the width of the form pane by dragging the right side of it.

You can scroll through all the fields or jump to a section in the Detail tab. To jump to a section, click the menu icon (≡) to the left of the record type to display the sections in the form pane. Click the section title you want to jump to. For example, in the following image, if you click Notes, the record fields scroll up to the Notes section.
Getting information related to the open record

The Related items menu provides tabs that display information related to the open record.

Click these tabs to understand what this record might be affecting. For example, clicking **Impacted Services** displays the services affected by the incident in the open record. For more information, see [Get information related to the open record](#).

Adding information to a record

When working on a record, you might add or revise some of the fields in the record. You can do that on the **Details** tab. For example, on the **Details** tab, you might change the **Urgency** value of the record to **1 - late**, or, after solving an issue, enter a resolution summary in the **Resolution notes** section. After entering or changing information in the form pane, click **Save**.

Updating records using templated information

Select one of the templates to add standard information to open records to save yourself some work.

Role required: agent_workspace_user

Templates set field values in the open record to the values specified in the template. For example, the major incident template might set the Impact field in the open record to 1 - High, and the Urgency field to 1 - High. Templates reduce the work you have to do and make actions taken more consistent.

1. In Agent Workspace, open an existing record.
2. In the Contextual side panel, click the template icon.

The available templates appear.
3. From the list of templates, select a template to apply to the open record.

Field values included in the template automatically populate the record in the **Details** tab of the form pane. Workspace provides a pop up of the updated fields.

4. Optional: To undo the changes that were made in the open record when you selected the template, navigate away from the form without saving.

5. Fill in the remaining fields in the **Details** tab of the Form pane.

6. Click **Save** to save your progress or **Resolve** to mark the issue as resolved.

*Communicate your progress or the solution* with the requester.

*Getting information related to the open record*

Use related items to gather information about and to enter information into the open record.
The items in the Related items menu behave like tabs. When you click one, the corresponding content appears in the form pane. Workspace underlines the item that’s active in the form pane. What items appear in the menu, what order they’re in, and which one opens automatically are configurable by your system administrator.

The items contain information related to the record open in the form pane. You click the different items to get contextual information. For example, if the open incident is about a failed service, you might click **Impacted Services/CIs** to see if other services are also down. If the incident is a power outage, you might click **Outages** to see if there are outages in other locations.

The **Details** item usually displays first by default. It is the only item that contains details of the open record. It also provides text fields that you can edit. For example, when you solve an issue, you should enter the resolution description in the section, **Resolution notes**. Your system administrator determines which fields from a record appear in the form pane.

Your configuration of workspace might include the following related items.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>Detailed information about the open record and text fields for you to enter information. The system administrator specifies the record fields that appear in the form pane. You use this item to read about the open record and to make entries in the record.</td>
</tr>
<tr>
<td>Task SLAs</td>
<td>Service level agreements (SLAs) for a task. Expected deadlines for resolving a task of this type.</td>
</tr>
<tr>
<td>Item</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Affected CIs</td>
<td>Configuration items (CIs) related to an incident. Often, an incident is related to one or more specific configuration items (CIs). If the configuration management database (CMDB) is populated, the CI records hold valuable information to help resolve incidents. You can associate configuration items to an incident to see how the incident affects dependent CIs.</td>
</tr>
<tr>
<td>Impacted Services/ CIs</td>
<td>Services and configuration items (CIs) affected by this incident.</td>
</tr>
<tr>
<td>Child incidents</td>
<td>Child incidents are incidents related to the parent incident, the incident open in record view. All work notes or comments in a parent incident are copied into a child incident. When a parent incident is resolved, the child incidents are resolved.</td>
</tr>
<tr>
<td>Outages</td>
<td>Service outages related to the incident open in record view.</td>
</tr>
<tr>
<td>User's Calls</td>
<td>The <strong>User’s Calls</strong> related list displays historical calls between a requester and Service Desk agents. This feature is available to the users who has the Service Desk Call plugin (com.snc.service_desk_call) already activated.</td>
</tr>
<tr>
<td>Note</td>
<td>The customer name in the <strong>Opened for</strong> field in Interaction is matched with the <strong>Caller</strong> field in Service Desk calls and records are retrieved based on the number of days mentioned in the interaction property Number of days (integer) for which past user call records are retrieved. The default value is seven (7). A setting of zero (0) disables this feature. (glide.new_call.interaction.records_age).</td>
</tr>
<tr>
<td>User’s Task</td>
<td>When a requester contacts an agent through chat, phone call, request, or walk-in, the <strong>User’s Task</strong> related list shows the agent all of the other tasks (incident, problem, change request, request, and so on) that have been created for the requester. For example, if a requester calls about the status of a request that was made the previous day, the <strong>User’s Task</strong> related list shows the request. Workspace includes the other tasks in the <strong>User’s Task</strong> related list when the value for the <strong>Opened for</strong> field in the interaction record matches the:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Caller</strong> field in an incident record</td>
</tr>
<tr>
<td></td>
<td>• <strong>Opened by</strong> field in a problem record</td>
</tr>
<tr>
<td></td>
<td>• <strong>Requested by</strong> field in a change record</td>
</tr>
<tr>
<td></td>
<td>• <strong>Requested for</strong> field in a Service Catalog record</td>
</tr>
</tbody>
</table>

**Sharing workspace views**

Send a workspace view to another agent so he or she can look at the same information in workspace.

There may be times when you’re working on a record and want to share what you’re looking at with your manager or a fellow agent. To do that, copy the workspace URL in your browser and send it. The person can open the URL and see exactly what you’re seeing in workspace.

**Add records to related lists**

Add records to a related list to provide information related to an incident.

Role required: agent

If there is an **Add** button on your Related Items menu, your system administrator has made it possible for you to add records to related lists. You’d do this when you find a record that’s related to the one that’s open. For example, if the open record is about a power outage in one location, if there’s a power outage in a second location, you might add it to the related list of the first record.
Note: Not all workspaces have the Add button. It’s added by your system administrator.

When you open an incident, you can add locations that are associated with the incident. For example, let’s say that a power outage occurred in a location. You might find additional locations with the same power outage that you can add to the original incident report.

1. Navigate to Incident > Open and click an incident to open it.
2. In the Affected Locations related list, click Add to associate records with the incident you selected.
3. In the pop-up modal, select the records that you want to add to the open incident.
   The record data is read-only. Selecting the check box in the table heading selects all of the records in the modal and gives you an option of selecting all of the records in the list. Records that are selected on one page remain selected as you move onto another page.

4. In the modal, click Add.
The addresses that you selected appear in the Affected Locations related list. They are added to the cmn_location table and are associated with this incident.

Group and find records using tags in workspace

Add tags to records to group and organize them.
Role required: agent

Tags are labels you can add to records. The tag icon (○) appears next to the primary value in the form header.

Tags enable you to group and organize records. You create the tag name, which should name the reason for the tag. You can make the tags visible to everyone, some people, or just yourself. The visibility setting specifies who can use the tags to search for records.

An unfilled tag icon

(○) means that no tags have been assigned to the record. When tags are assigned and they’re visible to you, the tag icon is filled (●).
After tagging records, you can use the tags to search for records in the global search field or using the filter icon

1. Navigate to any open record in a workspace.

   For example, click the list icon ( ), click a list filter, such as Open incidents, and click a record.

2. Click the Tag icon ( ) next to the primary value in the form header.

3. In Add Tag, enter a tag name. The tag name should reveal the organization principal of the tag, for example, all records stemming from a particular incident.

4. Click Enter to save the tag with the record. You can add more tags. The tag visibility setting defaults to private, which means the tag is only visible to the person who created the tag. So, only that person can use the tag to search for records labeled with that tag.

5. To change the visibility setting of the tag, click the tag and change the Viewable by setting:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Me</td>
<td>Tag is visible only to the person who created the tag. Only that person can use the tag to search for records. This setting is the default.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Groups and Users</td>
<td>Tag is visible to specific groups or users. You can specify the groups and users who can view this tag.</td>
</tr>
<tr>
<td>Everyone</td>
<td>Tag is visible to everyone.</td>
</tr>
</tbody>
</table>

Note: This visibility setting is only available to an admin or tags_admin role.

A record can have multiple tags and each can have a different visibility setting.

6. Optional: To remove a tag from a record, click a filled tag icon to open the list of tags, then click the X next to the tag you want to remove.

7. Optional: Search for your tag using the global search field.

Communicating with requesters and agents using Compose

You use Compose to communicate with requesters and to enter comments about the work that you do on issues that only fellow agents can read.

Composing comments

After researching an issue, you might want to get more information from a requester, communicate a solution, or write an internal note to yourself or other agents to record your
progress in solving an issue. To do that, you use the **Compose** feature. How you enter comments or work notes depends on the configuration.

- If you use a single text field, you click **Comments** or **Work Notes**, enter your comment in the text field, and click **Post Comments**.

  Use the **Comments** text field to communicate with external requesters. Use the **Work Notes** field to document your progress on an issue. Work notes are not sent to external requesters. The notes are visible only to you and other internal personnel, such as fellow agents who might also work on the issue.

- In stacked view, where there are two text fields, enter text in the appropriate field and click **Post Comments** or **Post Work notes (Private)**.

If you configured **Compose** to use the rich text editor, you can use the icons at the top of the field to stylize the text.
With the rich text editor, you can paste an image directly into the text field.

When you post your comment in **Compose**, the comment moves into the Activity Stream, which preserves the entire communication history.
Other communications

In addition to sending comments to requesters, you can also:

- Use the attachment feature (🔗) in the Contextual side panel, for example, to add a knowledge article to a comment.
- Click the links in some of the cards in Agent Assist that, for example, add a knowledge article to a comment.
Configuring Compose

You can configure Compose to appear as a single text field or two text fields. You configure Compose by clicking the configuration icon (ALLERY_ICON). For more information, see Customize workspace.

Writing Knowledge articles to share solutions

To share a solution you’ve found with the community of workspace users, you can create and publish a knowledge article. The Knowledge Management Service Portal enables users to view knowledge bases and articles. It is available by default. For more information about creating, editing, and viewing articles, see Knowledge article authoring in Agent Workspace.

Send an article to a requester

Use Agent Assist to send articles to requesters to solve their issues.
Role required: agent_workspace_user
Agent Assist search results can include links to knowledge articles that you can send to a requester.

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Open an incident record in list view.
3. In the Agent Assist panel, click a search result that is an article.
4. Click the **Attach** link to send the article to the requester.

5. In the pop-up, enter a message to the requester and click **Attach Article**.
Order a catalog item for a requester

Order a catalog item for a requester from Agent Assist search results.

Role required: agent_workspace_user

1. Navigate to Agent Workspace > Agent Workspace Home.
2. Open an incident record in list view.
3. In the Agent Assist panel, click a search result that is a catalog item.
4. Click the catalog item, and then click Order.
5. Specify the details of the catalog item in the form, such as the number of gigabytes a laptop should have.
Ordering the catalog item creates a service catalog request.

**Common Service Data Model**

The Common Service Data Model (CSDM) is a standard and consistent set of terms and definitions that span and can be used with all ServiceNow® products on the Now Platform®. These definitions form the basis for the CSDM framework.
About the CSDM

The CSDM definitions enable service reporting, and provide prescriptive guidelines for service modeling within the Configuration Management Database (CMDB).

The CSDM data model is a CMDB framework that supports multiple configuration strategies. The data model includes guidelines for using base system tables and relationships. Many ServiceNow products depend on data within this data model.

Benefits of using the CSDM

You can use the CSDM as a blueprint to map your IT services to ServiceNow. The CSDM is a CMDB-based framework that identifies where to place data for the products you're using. Also, the CSDM is the standard for all ServiceNow products that use the CMDB. Following the CSDM framework ensures that the data that your ServiceNow application requires maps correctly to the appropriate CMDB tables.

If you don't follow this standard, you may not receive the full benefit of the ServiceNow platform.

CSDM and reports

You can use the CMDB query builder to create reports showing CMDB configuration items (CIs) and their relationships.

Most of the CSDM follows the CMDB data model, which includes the following components:

- Business capability
- Business application
- Information object
- Application service
- Service
- Service offering

Additional information about CSDM

You can find additional information about the CSDM on the Community Forum.

Common Service Data Model conceptual model

The Common Service Data Model (CSDM) is a framework or blueprint that you can follow when you set up your ServiceNow® application. Following this model ensures that the data for that application maps correctly to the appropriate tables.

The following figure illustrates the CSDM conceptual model. The figure also defines each of the domains in the CSDM framework, and shows how each domain works together to manage your ServiceNow applications and services.
Common Service Data Model

Manage Technical Services

Business Service Portfolio: Hierarchical collection of business services (products & services) that define strategic business value and facilitate the management of their lifecycle.

Business Service: Published to business users and it typically underpins one or more business capabilities. Business services are often orderable by business users. Business users are able to select the desired offering and service commitment (SLA) and purchase options.

Business Service Offering: Differentiation of the bundle of services into options, including location, geography, pricing, availability, capability, etc., with business onboarding (OMNIA) and packaging options.

Request Catalog: Consumable catalog view of available business & technical products, services, service commitment options, and offerings.
Domains in the CSDM conceptual model

The CSDM conceptual model contains these domains: Design, Manage Technical Services, Sell/Consume, and Manage Business Services.

Each domain in the CSDM conceptual model is associated with one or more products, services, or service types, which you can extend as needed.

Services and service types

A service enables you to achieve the outcomes that you want with minimal risks and without incurring costs. This definition is consistent with the base definition of “service” in ITIL v3 and IT4IT. Services typically have three components: the interaction, the offering, and the service system.

Base system service types

ServiceNow includes these base system service types which you can extend to align with the service types in your organization.

- Business services
  Business services are associated with business users. Business services are typically lower-level leaf nodes of business capabilities in a structured hierarchy.

- Technical services
  Technical services are associated with service owners. Technical services are typically lower-level leaf nodes of one or more business or application services in a structured hierarchy.

- Application services
  Application services are logical representations of a deployed application stack.

Note: For more information about leaf nodes and structured hierarchies, see Design domain.

Common Service Data Model domains

The Common Service Data Model (CSDM) contains the Design, Manage Technical Services, Sell/Consume, and Manage Business Services domains. Each domain is associated with one or more products or services.

Design domain

The Design domain is one of the domains in the Common Service Data Model (CSDM). The Design domain represents the tables currently used by ServiceNow® Application Portfolio Management (APM).
Design domain

While the Design domain represents the tables currently used by APM, these tables are not operational. Because these tables are not operational, you can’t select them for Incident Management and Change Management.

The Design domain includes the following tables:

- Business capability (cmdb_ci_business_capability) table
- Business application (cmdb_ci_business_app) table
- Information object (cmdb_ci_information_object) table

While you’re not required to use APM to use these tables, you can use APM to rationalize and manage your business applications.

The typical users are capability owners and application owners.

Business capability

A business capability is a high-level capability that your organization must do to complete a business model or fulfill a mission. A business capability is typically associated with performing specific tasks needed to achieve one or more business outcomes. Business capabilities are often listed as verbs (for example, manage financials or provide IT support services).

Create relationships between CIs

Establish a relationship between the following configuration items (CIs):

- The business capability and the business application (for visualization and reporting purposes).
- The business application and the application services.

These relationships enable you to:

- Determine the risks involved in using these business capabilities.
- Assess services based on their relationships to business capabilities and business applications.

An accurate service model that includes these relationships can serve as the foundation for strategically aligned architectural decisions.
Business capabilities are recorded in the \texttt{cmdb_ci\_business\_capability} table.

**Business capabilities represented in a hierarchy**

You can represent business capabilities in a hierarchy that includes a parent business capability and one or more lower-level (child) capabilities. These lower-level capabilities are called “leaf nodes.” Leaf nodes are represented by numeric values, such as 1.0 for the parent and 2.0 through 6.0 for the leaf nodes.

**Note:** If a business capability hierarchy requires more than six levels, consider using multiple business capabilities.

Use the Business Capability form to create, modify, and extend business capabilities.

Business capability form

If you add, update, or delete a capability at a leaf node, update the levels of all the capabilities for the leaf nodes in that hierarchy, as applicable.

To update the capabilities, click the **Update Capability Level** and **HierarchyID** related link in the Business Capability form. Updating the capabilities ensures that the capability map reflects the change. When you're updating business capabilities, note the following guidelines:

- When adding a capability, the hierarchy level is automatically assigned based on the parent capability level.
- If the parent capability is updated in the hierarchy, the levels of all its leaf node capabilities are recalculated.
- The total number of leaf node levels can’t exceed six in the hierarchy.
- Only leaf node-level capabilities or capabilities without leaf node levels can be deleted.
• Don’t create circular relationships. For instance, when creating a parent capability, a leaf node capability can’t be its parent.

**Business application**

A business application represents the software and infrastructure (for example, the titles catalog) used to provide a business function.

Business applications increase productivity and perform other business functions, such as accounts payables, accounts receivables, and general ledger.

A business application can:

• Span multiple environments (for example, Development, Test, or Production).
• Span geographies (for example, Americas, the Asia Pacific Japan (APJ), or regions (for example, Europe, the Middle East, and Africa (EMEA)).

Use the Business Application form to add the applications that your organization uses.
You can enter the details of a business application by using the Business Application form. Alternatively, you can import the list of applications from a spreadsheet or a third-party tool. To import data, define a data source and a transform map, and run or schedule an import. Although not required, you should use a business application.

**Create relationships between the business application and other CIs**

A business application is a manually managed CMDB CI class. Because the business application is a manually managed CI class, you must manually create the required relationships. For example, you must create relationships between the business application and other CIs, such as the instances of the application services in use.

*i Note: If needed, you can integrate or connect two or more applications to establish their relationship.*

Creating relationships also enables you to relate business applications to infrastructure CIs, such as databases and web servers. Using APM, you can add any business application for which you must track costs, usage, business value, functionality, and risks.

**Information object**

An Information object is part of the information portfolio and the business application references the information object.

The information object is a CI that displays information in an organized form. An information object describes the type of data (or the information) that the application receives from the database.

Information objects are mapped to the information object table (cmdb_ci_information_object) in the CMDB.

You can use the information object table to identify the types of data a business application uses including highly sensitive data such as:

- Personally Identifiable Information (PII)
- Payment Card Industry Data Security Standard (PCI DSS) data
- Health Insurance Portability and Accountability Act (HIPAA) data

**Manage Technical Services domain**

The Manage Technical Services domain is one of the domains in the Common Service Data Model (CSDM). This domain represents the tables currently used by ServiceNow® IT Operations Management (ITOM), such as Service Mapping and Discovery.

While you aren’t required to use Service Mapping and Discovery to use the tables, these two ServiceNow products let you manage configuration items (CIs) and their relationships.

The CIs in this domain are the discovered items, such as installed applications, servers, and network components.

The Manage Technical Services domain also represents the portfolio of technical services in use. These services are operational, which means that you can select them for Incident Management and Change Management.

The typical users are application service owners and technology service owners.

**Manage technical services domain**

The tables in the Manage Technical Services domain represent the technology that your business sells or consumes in the provider view. The domain includes the following tables:

- Application service (cmdb_ci_service_discovered) table
  - This table is a base system table available with London and later releases.
- Technical service
- Technical service offering

**Application service**

An application service is a logical representation of an application stack in use. Using application services, you can view maps and change history for services. If you're using Event Management, you can monitor service performance and identify health issues for application services.

Application services are the entry points for Service Mapping. Application services are mapped to the CMDB (cmdb_ci_service_discovered) table and they're layered beneath a business or technical service.

Application services are key relationship entities for IT Service Management (ITSM), IT Operations Management (ITOM), IT Business Management (ITBM), and Customer Service Management (CSM). Application services include relationships between business applications, business services, technical services, applications, and infrastructure CIs. You can expose an application service by using the related business or technical service offering.

Application services are key relationship entities for IT Service Management (ITSM), IT Operations Management (ITOM), IT Business Management (ITBM), and Customer Service Management (CSM). Application services include relationships between business applications, business services,
technical services, applications, and infrastructure CIs. You can expose an application service by using the related business or technical service offering.

Application services include relationships between applications, infrastructure CIs, technical services, and technical service offerings.

**Application**

An application is any program or module used to complete a specific function. An application defines behavior and is associated with a specific function. Applications are typically discoverable instances and provide a specific set of functions for one or more services. ServiceNow limits applications to those applications on a single host. This limitation ensures that the applications are uniquely identified during discovery.

Also, there's a one-to-many (and not a one-to-one) relationship between the application and the application service. A single installed application, such as a database instance, may support multiple application services.

The application table (cmdb_ci_appl) is not an inventory or portfolio of your applications. Inventory or application portfolio objects belong in the business application table (as documented in Design domain).

The application table and extended tables contain those uniquely discovered instances of code in use on the host.

Applications are considered infrastructure CIs.

**Infrastructure CIs**

Infrastructure CIs are managed physical and logical components.

A CI may be a single module, such as a server, database, or a router. A CI may also be a complete system (for example, a web server, database, or infrastructure.)

The underlying infrastructure components or CIs can be complicated. The complexity increases as data structures are layered on top of those physical CIs. For that reason, you should work with a business relationship manager or enterprise architect to define the various business capabilities and business applications.

**Technical services**

Technical services are associated with service owners and are typically layered beneath one or more business or application services.

When you use technical services, you can view and manage the technology that you provide to the business. If you're using Event Management, you can monitor service performance. You can also use Event Management to identify health issues for related infrastructure CIs and application services.

Technical services are mapped to the (cmdb_ci_service) table and are classified as “technical services.”

Event Management-enabled technical services are mapped to the (cmdb_ci_query_based_service) table. A technical service may have one or more technical service offerings.

**Technical service offerings**

Technical service offerings (SO) divide technical services into these options:

- Location or geography
- Environment
You can use the technical service offering to set different levels of performance and select features for a given technical service.

Technical service offerings typically have the following components:

- One or more service commitments:

  A service commitment defines the service delivery obligations agreed to between the consumer and the provider.

  Service commitments uniquely define the level of service in terms of availability, criticality, scope, pricing, and other factors. For example, an organization may offer two levels of support for an application service, as described below:

  - Support for a production-related offering: Provides a high level of availability and criticality for production instances. Includes a 5-minute response time guarantee of 24-hours, seven days per-week.
  - Support for a non-production-related offering: Provides limited availability and criticality for non-production instances. Includes a 60-minute response time guarantee between 8:00 a.m. and 5:00 p.m., Monday through Friday.

- A service offering subscription that records which users have access to an offering.

The technical service offerings are mapped to the (service_offering) table, are classified as "technical service," and are derived from the service. The technical service offering is based on how the parent serves a specific technical need. Every operational technical service should have at least one technical service offering.

Beginning with the New York release, you can request technical service offerings through the Request Catalog.

Sell/Consume domain

The Sell/Consume domain is one of the domains in the Common Service Data Model (CSDM). The Sell/Consume domain represents the tables currently used by ServiceNow® Service Portfolio Management (SPM) and Customer Service Management.

You're not required to use SPM or CSM to use the referenced tables. However, using these ServiceNow products enables you to manage workflows and report service-related data.

Sell/Consume domain
The Sell/Consume domain also represents the portfolio of business services that may sell or consume elements of the Manage Technical Services domain.

**Note:** Beginning with the New York release, you can request business services through the Request Catalog.

The Sell/Consume domain includes the following tables:
- Business service portfolio (service_portfolio) table
  The business service portfolio table is not a Configuration Management Database (CMDB) table.
- Business service (cmdb_ci_service) table
- Business service offering (service_offering) table

You can select the tables in the Sell/Consume domain to use with Incident Management and Change Management.

The typical user is the business relationship manager.

**Business service portfolio**

At the highest level, a portfolio is a collection of services, products, projects, or applications. You can use it to group and manage items for a business. You can group items by:

- Objective
- Capability
- Organization (for example, enterprise resource planning (ERP) or financial management)
- Geography

A business service portfolio is a hierarchical collection of business services. The business service portfolio contains products and services. You can use these products and services to define strategic business objectives and manage the life cycle of those services.
**Business service**

A business service is associated with business users and is typically layered beneath one or more business capabilities.

Business users can use the Request Catalog to order business services, service offerings, and service commitment levels. The business services are mapped to the (cmdb_ci_service) table and are classified as “business services.”

A business service may contain one or more business service offerings.

**Business service offerings**

Business service offerings are the starting point for configuring SPM. Business service offerings consist of one or more service commitments. These service commitments define the level of service in terms of availability, scope, pricing, and other factors. For example, an organization may offer two levels of desktop support:

- A “standard” offering of upgrades and virus protection.
- An “executive” offering with the standard commitments plus a response time guarantee. For example, this offering could be a response time of 30 minutes between the hours of 8:00 a.m. and 5:00 p.m., Monday through Friday.

Business service offerings have the following characteristics:

- Business service offerings divide the service into capability, availability, pricing, and packaging options. You can use the service offering to set different levels of performance and features for a given service.
- Business service offering commitments define the agreed-upon service delivery obligations. Service offering subscriptions record which users have access to an offering.
- Business service offerings are the specific ServiceNow records that identify the specific business area and the entity where the service is delivered. Some business services and service offerings depend on the application service.
- Business service offerings are derived from the service and are refined depending on how the parent serves a specific business need.

**Note:** You should have at least one service offering for each operational business or technical service.

You can view your business service offerings on the IT Portfolio Services form.

**IT Portfolio Services form**
Business service offerings typically have different Service-Level Agreements (SLAs). Without a business service offering, your SLAs remain at a process level only. For example, the SLA stays at a P1 incident or a minor change, and doesn't refer to the service offering affected.

You can represent business services and offerings in the service catalog (by catalog items) and make them available for consumers.

**Manage Business Services domain**

The Manage Business Services domain is one of the domains in the Common Services Data Model (CSDM). This domain represents portions of the other CSDM domains: Design, Manage Technical Services, and Sell/Consume.

Think of the Manage Business Services domain as a layer on top of the CSDM conceptual model. This domain incorporates portions of the other CSDM domains.

Manage business services domain

The typical user for this domain is the service owner.

The service owner may be responsible for more services than just the services in the Sell/Consume domain. For example, the service owner for Human Resources (HR) may be financially responsible for the business application that provides HR services.

Also, the service owner for HR may need to manage the HR application instances (known as application services). The service owner may also be accountable for the impact the application has on the business. Because of these additional responsibilities, CSDM lets service owners oversee the business applications and their deployed instances. This visibility lets service owners accurately gauge their responsibilities.
Apply Configuration Management Database (CMDB) data

The Common Service Data Model (CSDM) is a ServiceNow® Configuration Management Database (CMDB)-based framework that you can use to map your IT services. To use the CSDM framework, you must have the required CMDB data.

Not all ServiceNow® products use the CMDB. However, to use the CSDM framework, the CMDB data is required. To apply the CMDB data to your operations, use one of the following ServiceNow products:

- Service Portfolio Management (SPM)
- Incident Management
- Change Management
- Product Management

SPM

For SPM, multiple data elements are populated. These populated data elements enable you to organize your services, and provide data for supporting IT Service Management (ITSM) and managing vendor performance.
The following figure identifies the data elements populated or related to SPM:

Data related to

- Subscription "Subscribed by"

SPM-related data includes the following:
- Subscription "Subscribed by"
Subscriptions include the names of subscribers affected by an incident or change. The “Subscribed by” table identifies the affected subscribers. The affected users are displayed in the following related lists and corresponding tables:

- Service Subscriptions by Company: (service_subscribe_company) table
- Service Subscriptions by Department: (service_subscribe_department) table
- Service Subscriptions by Group: (service_subscribe_sys_user_grp) table
- Service Subscriptions by Location: (service_subscribe_location) table
- Service Subscriptions by User: (service_subscribe_sys_user) table

- Service Level Agreement (SLA)
An SLA is a commitment type for business service offerings. The SLA is important for ITSM and for managing vendor performance.

- Version
The applications included in the application services should be application-version specific. The version maps to the attribute `version`. You can use multiple versions of an application.

- Environment
Environment is used by Incident Management and Change Management, and is found on the technical service offering and application service.

Some service offerings identify the environment of the offering, such as production and non-production (DEV, QA, or UAT). The environment maps to the attribute `used_for`. If you don't want to use the non-production attribute, you can filter it out from Incident Management and Change Management.

- Service Level Objective (SLO)
An SLO is a commitment type for technical service offerings. The SLO is important for ITSM and for managing vendor performance.

- Business criticality
Business criticality is used by Incident Management and Change Management, and is found on the business service offering. The business criticality maps to the attribute `business_criticality`. A business service can have multiple offerings, each with different criticalities.

- Design criticality
Design criticality identifies how the application should be used and is found on a business application. The design criticality maps to the attribute `business_criticality`.

The application owner determines the design criticality. The design criticality aligns with the technical service offering commitments. Together, the design criticality and the technical service offering commitments should align with the business criticality consuming the application service.

- Location or geography
Technical service offerings and application services identify the location where their network is managed. Identifying the location is especially important when there are multiple and international locations. For example, one offering or application service could be in Japan while another could be in the UK. The location or geography maps to the attribute `location`.

Incident Management and Change Management

Know where to find your critical data. This essential knowledge helps reduce mean time-to-resolution of incidents and eliminates change-related outages.
The following figure identifies the data elements available for use by ITSM:

Data related to ITSM

Data related to ITSM includes the following:

- Subscription "Subscribed by" table
Subscriptions include the names of subscribers affected by an incident or change. The “Subscribed by” table identifies the affected subscribers. The affected users are displayed in the following related lists and corresponding tables:

- Service Subscriptions by Company: (service_subscribe_company) table
- Service Subscriptions by Department: (service_subscribe_department) table
- Service Subscriptions by Group: (service_subscribe_sys_user_grp) table
- Service Subscriptions by Location: (service_subscribe_location) table
- Service Subscriptions by User: (service_subscribe_sys_user) table

- Business approver
  A business approver is used by Change Management and is found on the business service offering. The business approver maps to the attribute approval_group.

- Technical approver
  A technical approver is used by Change Management, and is found on the technical service offering. The technical approver maps to the attribute approval_group.

- Environment
  Environment is used by Incident Management and Change Management, and is found on the technical service offering and application service.
  Some service offerings identify the environment of the offering, such as production and non-production (DEV, QA, or UAT). The environment maps to the attribute used_for. If you don’t want to use the non-production attribute, you can filter it out from Incident Management and Change Management.

- Business criticality
  Business criticality is used by Incident Management and Change Management and is found on the business service offering. The business criticality maps to the attribute business_criticality. A business service may have multiple offerings, each with different criticalities.

- Technical assignment group
  A technical assignment group is used by ITSM for routing of change and change-related tasks. The technical assignment group is included in the technical service offerings. The technical assignment group maps to the attribute assignment_group.
  You can synchronize with the CIs that the offerings manage. When you synchronize this way, you reduce the amount of effort required for managing your CIs manually. You may have thousands and possibly millions of CIs.

- Technical support group
  A technical support group is used by Incident Management, and is found on the technical service offerings. The technical support group maps to the attribute support_group.

Note: You may be using the assignment_group attribute instead of the support_group attribute. It’s OK to use the assignment_group attribute but only if the data is the same data used in routing of change and change-related tasks.

Product Management

Starting with the New York release, the CSDM uses product models to identify product management functions. Application Portfolio Management (APM) uses software models in their technology portfolio to calculate management risks. The New York release introduces a new
model type called the service model. CSDM hopes to expand the capabilities of product models to match the capabilities of the software model.

The following figure identifies the data elements related to Product Management:

Data related to Product Management

Data related to Product Management includes the following:

- **Service model**

  The service model is a critical component of Customer Service Management (CSM). The model attribute on service-related CIs, such as business service, service offerings, and technical service, is populated with the related service model.
The service model object has a version, manufacturer, product owner, and more meta data. The service model enables the use of service as a product that a service offering sells.

- **Software model**
  
  APM uses the software model found through Service Mapping. The service mappings then create the application services which populate the related lists. APM uses the related lists to identify any life-cycle risks for the software in use, including any that may not have publisher support in the future.

- **Hardware model**
  
  The hardware model is automatically populated when discovered by Discovery.

- **Product Model**
  
  The product model is the base product model table the business application uses.

### Request Catalog

A Request Catalog is a list of business and technical products, services, service commitment options, and offerings that you can order. Catalogs enable you to order and manage your available products and services.

Catalogs (such as the Human Resources (HR) service catalog) help manage services that a user can access. Catalogs are the starting point for accessing available services, and contain catalog items.

### Catalog items

A catalog item is an item or a service that you can request from the catalog. A service can contain multiple catalog items (for example, the employee onboarding catalog). Catalog items are listed on the service portal and are available to the users who need them (either through subscription or job responsibility). Each catalog item is linked to one service offering.

### Common Service Data Model-to-Configuration Management Database (CMDB) mapping

The objects in the Common Service Data Model (CSDM) must map to the tables in the physical model, configuration items (CIs), and classes in the ServiceNow® Configuration Management Database (CMDB).

The following figure shows how the objects in the CSDM conceptual model map to the tables in the physical model and CI classes in the CMDB.
<table>

</table>
For more information about the relationships between CSDM domains, see Configuration Item relationships in the Common Service Data Model.

Configuration Item relationships in the Common Service Data Model

For configuration management to be the most effective, establish relationships between the objects and configuration items (CIs) in the conceptual Common Service Data Model (CSDM).

Not all objects in the CSDM conceptual model are Configuration Management Database (CMDB) tables, and not all the objects have relationships. You may need to create the required relationships.

The following figure illustrates the required relationships between the objects in the CSDM conceptual model:
<table>
<thead>
<tr>
<th>From</th>

</tbody>
</table>

CSDM relationships
Several ServiceNow® products, such as Application Portfolio Management (APM), depend on the preceding relationships. For example, business application “consumes” application service.

These relationships are critical. Without them, some features, such as the Technology Portfolio Management risk assessment, don’t work.

Also, the relationships commonly created as part of Service Mapping and Discovery are the standard for infrastructure CIs. If you map the elements manually, think about the way Discovery would treat the discovered CIs as you continue.

**Common Service Data Model framework implementation stages**

When you implement the Common Service Data Model (CSDM) framework, use a phased approach. Implement CSDM in stages that ServiceNow® calls crawl, walk, run, and fly. Each stage builds on the previous one.

Each implementation stage focuses on specific areas and information types, and provides specific benefits. Start with Stage 1: crawl, and complete each phase in order.
Stage 1: crawl

This stage focuses on goals you can achieve with IT Service Management (ITSM). Start by focusing on applications and the application-related data in these areas and tables:

- **Business application (cmdb_ci_business_app) table**
  
  A business application is a base system Configuration Management Database (CMDB) table that stores your inventory, application portfolio, and their metadata.

  This table is not an operational configuration item (CI), which means you can’t use it in Incident Management and Change Management.
- **Application service (cmdb_ci_service_discovered) table**
  An application service is a base system CMDB table that identifies the related business application in use.
  You may have several application services representing each deployment based on the environment (development, QA, production) and location or geography (North America, Asia Pacific).
  The application service is typically what the caller identifies when they report an issue with an application.
  The application service ties all the elements of the CSDM together where applications are present.

- **Application (cmdb_ci_appl) table**
  An application is a base system CMDB table that represents the discoverable instance of an application: code related to a process in use on a host. Discovery creates and maintains this table.
  The application may be identified as the root cause of an incident. However, if you're not using Event Management, the application may not be the initial cause.
  If you're using Discovery, applications are automatically related to their host, which provides an impact hierarchy from server-to-host applications.
  Because of the high level of complexity involved, don't try to manually populate the application table.

Future products and product enhancements depend on the data populated in each of these tables.

**Benefits of stage 1: crawl**

The crawl stage focuses on these base system CMDB tables:

- **Business application (cmdb_ci_business_app) table**
- **Application service (cmdb_ci_service_discovered) table**
- **Application (cmdb_ci_appl) table (discoverable)**
- **Server/host (discoverable)**

The crawl stage has the following benefits:

- Provides the minimum CMDB requirements required to provide Incident Management and Change Management.
- Serves as a foundation for using Application Portfolio Management (APM).
  When you use APM, your business application data is in the right place in the CMDB, which makes setting up APM faster.
- Serves as a foundation for using Service Mapping.
  When you use CMDB, your application service data is populated and ready to use for mapping the entry points.
- Lets you manage the life cycles and versions of the technologies that underlie the business applications you're using.
  When you use CMDB and Software Asset Management (SAM) Professional, you can identify outdated or at-risk software.
Stage 2: walk

Applications that you’re using, and the network infrastructure, need someone to manage and support them. This stage focuses on doing that management. The following ServiceNow tables identify the technology provider:

- Technical service (cmdb_ci_service) table, or (cmdb_query_based_services) table for Event Management.

  This base system CMDB table identifies the provider of the technology that your business consumes.

- Technology service offering (service_offering) table

  Technical service offerings may be further divided as follows:

  - Location and geography
  - Environment (production or non-production)
  - Pricing
  - Availability
  - Support group (for Incident Management)
  - Technical approval group (for Change Management)
  - Packaging options (commitments)

The technical service offering comes from the service. The technical service offering is refined based on how the parent serves a specific technical need. Every operational technical service should have at least one technical service offering.
**Benefits of stage 2: walk**

The walk stage focuses on these additional base system CMDB tables:

- Technical service (service table with a service classification of “technical service”)
- Technical service offering (service offering with a service classification of “technical service”)
The walk stage provides the following benefits:

- Facilitates managing the discovered infrastructure CIs. Manually managing the metadata on these CIs, such as support group and technical approval group, can be involved. By identifying the technical service offering that manages these CIs, you can:
  - Configure ServiceNow to populate and synchronize this metadata onto the related child objects.
  - Eliminate the manual effort of maintaining the metadata on thousands of CIs.
- Establishes a view of those CIs, applications, and technology owners.
  The technology owners are the users your technical team members support. You can see the specific support assignments, which you can change as needed based on your support structure, operational-level agreements (OLAs), and commitments.
  Also, this view enables you to formalize for your process for supporting applications and technology owners.
- Serves as a foundation for using Service Portfolio Management (SPM).
  When you use SPM, your service data are in the right place in the CMDB.
- Enables you to order technology service offerings through the Request Catalog. You can also automate ordering these offerings as needed to enhance the request workflow and update or create related CIs.

Note: The Request Catalog is not a CMDB table.

- Serves as a foundation for Information Technology Operations Management (ITOM) products, such as CMDB and Discovery.

Stage 3: run

When you use ITSM, you must understand the impact that a technology can have on your business. For example, your business may:

- Consume the technology provided
- Sell the technology (as is the case with Customer Service Management (CSM))
- Sell and consume the technology

This stage focuses on the relationship between the technology and the business that sells or consumes (or does both) for that specific technology. ServiceNow has these components that identify that relationship:

- Business service portfolio (service_portfolio) table
  A business service portfolio is a hierarchical collection (not a CMDB table) of business services (products and services) that define a business objective.
- Business service (cmdb_ci_service) table
  The business service table is a base system CMDB table. This table identifies a business objective that uses (and depends on) the infrastructure that technology uses.
  This dependency means that the business service must sell or consume that infrastructure.
- Business service offering (service_offering) table
  Business service offerings are the starting point for configuring SPM. Business service offerings consist of one or more service commitments. These service commitments uniquely define the level of service in terms of availability, scope, pricing, and other factors.
The business service offering comes from the service. The business service offering is fine-tuned based on how the parent serves a specific technical need.

Every business service should have at least one business service offering.

**Benefits of stage 3: run**

The run stage focuses on these components:

- Business service portfolio (service_portfolio) table
- Business service (cmdb_ci_service) table; (service classified as a “business service”)
- Business service offering (service_offering) table; (service offering classified as a “business service”)

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The run stage provides the following benefits:

- **Impact assessment for Incident Management and Change Management.**
  Within an incident or change, you can identify the impacted business, assuming relationships exist between the selected CI and the impacted businesses.

- **A foundation for using SPM in the Service Owner Workspace.** Service owners can monitor service portfolios and understand service-related information including:
  - Trends
  - Improvement initiatives
  - Service performance
  - Outage monitoring

- **A foundation for ITSM capabilities.**
  This foundation populates the related “Subscribe by” table on a service offering to identify the business and subscribers affected.

Business service offerings can identify subscribers by:

- User
- Company
- Location
- Department
- Group

### Stage 4: fly

Reaching this stage means that you’ve accomplished all or most of the earlier stages. The fly stage completes the remaining elements of CSDM:

- **Request catalog**
  Beginning with the New York release, you can request services through the Request Catalog.

  **Note:** The Request Catalog is not a CMDB table.

- **Business capability**
  A business capability is a high-level capability that your organization must complete for its business model. Or a capability your organization must complete it to fulfill its mission. You can use these capabilities to rationalize and prioritize the cost of business applications and business services.

- **Information object**
  An information object is part of the information portfolio. The business application references the information object. You can use the information object table to identify the types of data that a business application uses, including highly sensitive data such as:

  - Personally Identifiable Information (PII)
  - Payment Card Industry Data Security Standard (PCI DSS) data,
  - Health Insurance Portability and Accountability Act (HIPAA) data

You may need to implement the information object table as part of an earlier stage and not wait until the fly stage. Your business requirements determine the right stage for implementing this table.
Benefits of stage 4: fly

The fly stage focuses on these components:

- Business service portfolio (service_portfolio) table
- Business service (cmdb_ci_service) table; (service classified as a "business service")
- Business service offering (service_offering) table; (service offering classified as a "business service").

The fly stage provides the following benefits:

- A foundation for using APM capabilities.

You can use the APM capabilities to rationalize your business applications. Ask questions such as the following:

- Are you spending too much on your business capabilities?
- Are you spending too little on your business capabilities?
• Should you increase the amount you spend on emerging business capabilities?

• A foundation for using APM with SPM capabilities.
  
  You can use APM with SPM capabilities to rationalize your business services and related offerings. Ask questions such as the following:
  
  • Are you spending too much or too little on services?
  • Are you spending too little or too little on services?
  • Are they the right services compared to emerging capabilities?

• A foundation for using ITSM capabilities.
  
  Starting with the New York release, you can use the Request Catalog to relate a service offering to a catalog item. You can also enhance the request workflow to automatically populate the “Subscribe by” table.

  Note: The Request Catalog is not a CMDB table.

• If your environment has a combination of CIs from each of the CSDM domains, this stage provides away to manage business services.

• A way to identify the types of data that may be contained in or used by your business applications. The information object table helps you see what’s in your information portfolio.

Migrate to the Common Service Data Model framework

When you begin using the Common Service Data Model (CSDM) framework, you must complete several tasks to ensure that your application migrates successfully to the new framework. These tasks ensure that your data resides in the required locations in the ServiceNow® Configuration Management Database (CMDB).

Role required: admin

To reduce the risk of making mistakes, migrate your applications carefully, and keep the following points in mind:

• Many of the CSDM-related tables for your ServiceNow products have only been available for a short time, and you may not be familiar with them. See the documentation for your ServiceNow product to learn about any of the tables that are unfamiliar to you.

• You may be using customized or non-conforming CMDB tables.

  You can keep using these tables. However, if you do, you may not get the full benefit of the ServiceNow products.

Manage the attributes you are using

Rationalize your custom attributes. Decide if you must keep all customizations. Delete the attributes that you don’t use or use only rarely. If there’s a better way to address a use case rather than using an attribute, consider deleting those attributes as well.

Organize your custom attributes into the following categories:

• Best Practice: Does not have a related base system attribute but you want to use it.

• Keep: Does not have a related base system attribute but it’s required for a unique use case.

• Refactor: Does have a base system attribute or a capability that can be migrated.

• Do Not Need (DNN): This customization is no longer needed.

Consider the related dependencies
Moving the configuration items (CIs) to a new table doesn't automatically move the related dependencies. Identify the related dependencies. To identify the related dependencies, use the script called "Migrating into CSDM identifying table dependencies" available on the ServiceNow Community.

After running the dependency script and evaluating the data, you have a better idea of the effort required for migrating your data. Decide if you need all referenced reports, rules, and scripts. Then decide what you want to migrate and make a migration plan.

The script doesn't move your data or their dependencies. It simply identifies the dependencies. Refactor them as part of the migration.

The following figure illustrates the migration workflow.

Migration workflow

To migrate your data from one table or class to another, complete the following steps:

1. Back up your data.
   Export your data (with all attributes) to Excel and keep the file in a secure location.
   **Note:** Have a contingency plan in case issues arise.

2. Map the attributes.
   Identify the table where you want your data to go. Make sure that destination table has the required base system attributes. Rationalize your custom attributes. Decide if you must keep all customizations.

3. Move the configuration item (CI) from one class to another.
4. Refactor the attributes.
   Solidify the data model and get the data ready for migration.
   Make sure you have completed the attribute mapping-related tasks in step 2. Remember to categorize your attributes (Best Practice, Keep, Refactor, DNN) and refactor your data as needed.

5. Migrate the data.

   Note: Make sure that you have a valid and recent backup. Do another backup, if necessary. You lose any customized or base system attributes not in the same table hierarchy.

Keep these points in mind as you proceed:
- Migrate your CIs to the new class. Migrating your CIs to the new class moves the CI and all its related objects, incidents, and changes to the new table.
- Start with a few CIs and increase the number when you feel comfortable.

6. Remediate your table dependencies:
   a) Modify reports to use the new table.
   b) Migrate business rules and scripts, if needed.
   c) Update table references, as needed.

7. Reload data into the new attributes using the backup that you made earlier.

8. Validate all data and dependencies.

You’ve successfully migrated your application to the CSDM framework, and your data resides in the required locations in the CMDB.

**Common Service Data Model use cases**

Guidelines for using the Common Service Data Model (CSDM) with your ServiceNow® applications.

The Orlando release includes CSDM use cases for a number of ServiceNow applications. Each use case is documented separately.

**About CSDM use cases**

A CSDM use case:
- Shows you how to do a specific activity.
- Lists the in-scope and out-of-scope activities.
- Details the tables and configuration items (CIs) associated with the use case.
- Describes the benefit (value proposition) of the use case.

Along with this information, a CSDM use case typically provides one or more of the following:
- The CSDM table to be populated: The platform tables to populate to support the use case.
The CSDM data to be identified: The data required in the platform tables to support the use case.
The CSDM data that the ServiceNow product uses: The way the ServiceNow product uses the Configuration Management Database (CMDB) data.
FAQs: The set of frequently asked questions associated with the use case.

Common Service Data Model use case: Application Portfolio Management

Guidelines for using the Common Service Data Model (CSDM) with ServiceNow® Application Portfolio Management (APM).

With APM, you can identify redundancies, monitor costs, or make other management decisions based on the needs of your business. The domains of the Common Service Data Model conceptual model help you with these tasks.

The CSDM provides additional value to APM in the following areas:

- Application assessment
  For more information about measuring the usability, cost, quality, performance, and risk of applications, see Application assessment.

- Business capability management
  For more information about using capability mapping to establish a configuration item (CI) relationship between the business capability and the business applications, see Management of business capability.

- Information/Information portfolio
  For more information about the information portfolio and the information portfolio model, see Information portfolio.

- Technology portfolio management
  For more information about technology portfolio management and how it relates to business applications, see Technology Portfolio Management.

The ServiceNow products that gain value from this use case include:

- APM
  Enables enterprise architects to:
  - Learn about the ServiceNow model
  - Identify the model elements
  - Understand model relationships

- IT Service Management (ITSM)
  Emphasizes that ITSM services have contextual relationships with the:
  - Business
  - Applications
  - Information
  - Technologies that underpin those services

- Information Technology Operations Management (ITOM): Illustrates the business context for the Application Services, hardware, and software being managed

- Governance, Risk, and Compliance (GRC): Enables auditors to use business applications and information objects to scope audits, measure risks, and manage audit activities.
- Software Asset Management (SAM): Identifies the impact that the software and hardware life cycles have on the business applications and business services.

**Use case details**

**Use case scope**

Understand the CIs and the platform data you need to:
- Identify redundancies
- Monitor costs
- Make other management decision

The CIs and platform data varies based on the needs of your business.

**Desired outcome**

Determine which CSDM tables you need to support the following APM functions:
- Application assessment
- Business capability management
- Information portfolio
- Technology portfolio management

**Activities in scope**

- Using APM.
- Referencing Service Mapping data.
- Referencing (SAM) Professional data
- Using the CMDB framework as documented in the *Apply Configuration Management Database (CMDB) data.*

**Activities not in scope**

- Implementing APM
- Implementing SAM Professional
- Implementing Service Mapping or Discovery
- Configuring non-base systems
  - Non-base systems may be referred to in the use case, but they are out-of-scope.
- Using other ServiceNow products, such as ITSM, ITBM, and ITOM.

**CSDM elements used by APM**

APM references the following CSDM elements:
1. Business Capability (cmdb_ci_business_capability) table
2. Business Application (cmdb_ci_business_app) table
3. Information Object (cmdb_ci_information_object) table
4. Application Service (cmdb_ci_service_discovered) table
5. Service (cmdb_ci_service) table

The Service table uses the service classification attribute to identify the types of services. These types of services include business service, technical service, or application service.
The following figure highlights the CSDM elements used by APM. The numbers correspond to the specific element.

**APM elements of the CSDM**

**Elements used from other ServiceNow products**
This use case uses elements from the following ServiceNow products:

- APM: Application Service Software Models (sn_apm_tpm_service_software_model) table
- SAM Professional: Software Model Lifecycles (sam_sw_model_lifecycle) table

**Elements used from APM**
APM relies on the tables listed in the "CSDM elements used by APM" section. Also, the APM portal organizes the information in the following portfolios:

1. Business portfolio: Displays the number of business capabilities defined by your organization.
These defined capabilities have been assessed or need to be assessed. They include the number of at-risk business applications that support the capabilities.

2. Information portfolio: Captures your organization's assets, including business applications, as information objects. Connecting information objects to your business applications creates an application portfolio that you can use at any time.

The Information Portfolio section of the APM portal shows these totals:

- Data Domains: Number of records in the Data Domain (sn_apm_data_domain) table
- Information Objects: Number of records in the Information Object (cmdb_ci_information_object) table
- Database Instances: Number of records in the Database Instance (cmdb_ci_db_instance) table
- Database Catalogs: Number of records in the Database Catalog (cmdb_ci_db_catalog) table

3. Application portfolio: Tracks the applications that support your business capabilities. You can then manage the applications effectively to fulfill the goals of your organization. Information about the application includes category, manufacturer, and type. Click Applications to view the list of your organization's business applications.

4. Technology portfolio: Uses indicators to measure the usability, cost, quality, performance, and risk of applications.

The following figure is an example of the APM portal.

The numbers correspond to the specific element.
For more information about using the APM portal, see Application Portfolio Management portal.

Other data APM uses
To determine the end-of-life (EOL) impact to business applications and installed instances (application services), APM uses data from the following tables:

- Application Service Software Model (sn_apm_tpm_service_software_model) table
  Your business applications are linked to one or more application services. Each application service can run on one or more technologies or software models.

- Software Model Lifecycles (sam_sw_model_lifecycle) table
  The software model has a sequence of life-cycle stages or phases that span installation through to retirement. These phases are called:
  - Early Adopter
  - Mainstream
  - Declining use
  - Retired

  Business organizations set a date based on that life-cycle phase.
  The software vendor also sets a date based on the life-cycle phases. These phases are called:
  - Pre-release
  - General Availability
  - End of Life
  - Obsolete

  Note: The support from the vendor may vary depending on the life-cycle phase. When the software model reaches the Obsolete phase, the vendor may stop supporting the software.

Frequently asked questions (FAQs)

- What is the difference between a business capability and a business service?
  A business capability is the ability to complete an activity and deliver an outcome. A business service is how value is added, delivered, and consumed, along with performance and cost considerations.

- Is purchasing Software Asset Management Foundation plugin required to receive the benefit of Technology Portfolio Management?
  No. Software Asset Management Foundation plugin provides life-cycle data that the technology portfolio uses.

  However, you can manage that data manually or get it from another source. Both products share the underlying tables, but are independent. You can use them separately.

- How is an application portfolio managed?
  For information about managing your application portfolio, see Application Portfolio Management - Inventory Best Practices.

- What’s the difference between a business application and an application?
Each uses a different table, and each represents different elements.

- **Business application:**
  - Uses the Business Application (cmdb_ci_Business_App) table.
  - Represents the single, logical, construct of the application that comprises application service, environment, software, and hardware in use.

- **Application:**
  - Uses the Application (cmdb_ci_appl) table.
  - Represents the specific version of software in use on a server.

- Are there other FAQs about APM?
  Yes. For other FAQs about APM, see [APM: Application Inventory - Most common questions](#).

### Common Service Data Model use case: Incident Management

Guidelines for using the Common Service Data Model (CSDM) with ServiceNow® Incident Management.

With Incident Management, you can quickly find the data you need to resolve incidents and eliminate any outages. The domains of the [Common Service Data Model conceptual model](#) help you find that information.

The CMDB-based framework available with the CSDM helps you manage incidents in the following ways:

- Determines the impact of the incident on services and service offerings.
- Identifies one or more of the affected or causal configuration items (CIs), and then notify the appropriate support team.
- Lets the stakeholders know if there is a major incident.

The ServiceNow products that gain value from this use case include:

- IT Service Management (ITSM)
- Customer Service Management (CSM)

### Data related to ITSM

Data related to ITSM includes the following:

- Subscription “Subscribed by” table
  Subscriptions include the names of subscribers affected by an incident or change. The “Subscribed by” table identifies the affected subscribers. The affected users are displayed in the following related lists and corresponding tables:
    - Service Subscriptions by Company: (service_subscribe_company) table
    - Service Subscriptions by Department: (service_subscribe_department) table
    - Service Subscriptions by Group: (service_subscribe_sys_user_grp) table
    - Service Subscriptions by Location: (service_subscribe_location) table
    - Service Subscriptions by User: (service_subscribe_sys_user) table

- Business approver
A business approver is used by Change Management and is found on the business service offering. The business approver maps to the attribute `approval_group`.

- **Technical approver**
  
  A technical approver is used by Change Management, and is found on the technical service offering. The technical approver maps to the attribute `approval_group`.

- **Environment**
  
  Environment is used by Incident Management and Change Management, and is found on the technical service offering and application service.

  Some service offerings identify the environment of the offering, such as production and non-production (DEV, QA, or UAT). The environment maps to the attribute `used_for`. If you don't want to use the non-production attribute, you can filter it out from Incident Management and Change Management.

- **Business criticality**
  
  Business criticality is used by Incident Management and Change Management and is found on the business service offering. The business criticality maps to the attribute `business_criticality`. A business service may have multiple offerings, each with different criticalities.

- **Technical assignment group**
  
  A technical assignment group is used by ITSM for routing of change and change-related tasks. The technical assignment group is included in the technical service offerings. The technical assignment group maps to the attribute `assignment_group`.

  You can synchronize with the CIs that the offerings manage. When you synchronize this way, you reduce the amount of effort required for managing your CIs manually. You may have thousands and possibly millions of CIs.

- **Technical support group**
  
  A technical support group is used by Incident Management, and is found on the technical service offerings. The technical support group maps to the attribute `support_group`.

  **Note:** You may be using the `assignment_group` attribute instead of the `support_group` attribute. It's OK to use the `assignment_group` attribute but only if the data is the same data used in routing of change and change-related tasks.
Data related to ITSM

Use case details

Use case scope
Identify the CIs and the service-related information that must be populated on the Incident form. You can use this information for investigating and resolving the incident.

Desired outcome
Determine the impact of an incident and provide all the relevant information to the support teams. This information enables the support team to quickly restore the affected services.

Activities in scope
- Using the base system Incident form.
- Adding the base system attributes to the Incident form, as necessary.
- Using the related lists on the Incident form.
• Using the CMDB framework as documented in *Apply Configuration Management Database (CMDB) data*.

**Activities not in scope**

• Implementing Incident Management.
• Configuring non-base systems.

  Non-base systems may be referred to in the use case, but they are out-of-scope.
• Using other ServiceNow products, such as ITSM, ITBM, and ITOM.

**CSDM elements used by ITSM**

The ITSM Incident form references the following CSDM elements:

1. Service (cmdb_ci_service) table: Uses the service classification attribute to identify business services, technical services, and application services as types of services.
2. Service Offering (service_offering) table: Uses the service classification attribute to identify business services, technical services, and application services as types of service offerings.
3. CIs: Application Service (cmdb_ci_discovered_service) table or any infrastructure CI.

The following figure highlights the CSDM elements used by Incident Management. The numbers correspond to the specific element.
Incident Management elements of the CSDM

CMDB elements used from the Incident form

The Incident form references the following attributes and related lists:

1. **Service attribute**: References the (cmdb_ci_service) table.

   ![Note](https://via.placeholder.com/150)

   **Note**: Earlier releases called this attribute business service.

2. Service offering attribute: References the (service_offering) table (assuming this service offering has a current parent service).

3. Configuration items (CIs) attribute: References the (cmdb_ci) table.

4. Affected (or causal) CIs: References the (task_ci) related list.

5. Impacted services: References the (task_cmdb_ci_service) related list.

The following figure is an example of the Incident Management Incident form. The numbers correspond to the attributes (fields) in the Incident form.
Incident form
You can use the Incident form to determine the impact of the incident and restore the affected services. At the Incident form, complete the following tasks:

1. In the Configuration Item field, enter **Item or Service affected**.
   You can then use this CI to identify details for incident routing using CIs such as **Support Group**. You can also use dependency relationships to determine the incident’s impact.

2. Use the Impacted Services related list to include the services related to the affected CIs.
   These services can include services and service offerings.

3. (Optional) Use the Service and Service Offering fields to narrow the list of CI’s choices.
   Narrowing the list is not part of the base system. To narrow the list, you must configure the Incident form.

**Frequently asked questions (FAQs)**

- Why doesn’t this use case reference business application?
  Business applications are portfolio objects used for designing and planning your enterprise architecture. Business Applications don’t contain attribute-level details such as version, environment, and localization (for any deployments using one or more applications).

- Is the application service an application or a service? Where should it be used on an Incident form?
  Application service is a service type that is a logical representation of an application. You can use the application service CI on the Incident form in few scenarios such as:
  - Scenario 1: The incident is for an application-related issue — On the Incident form, you can enter ‘Application Service’ in the Configuration Item field to represent the application. For example, you can report the Application Service called MyApp 3.0 Production as unavailable.
  - Scenario 2: The incident is for an infrastructure CI that is affecting one or more services — On the Incident form, the Impacted Services/CI related list identifies the Application Service affecting services. For example, the Server OMG124 CI may be identified as affecting the MyApp 3.0 Production and other related services.

**Common Service Data Model use case: Change Management**

Guidelines for using the Common Service Data Model (CSDM) with ServiceNow® Change Management.

With Change Management, you can provide your approval teams with the information they need to review, approve, and route changes effectively. This information helps you reduce the time needed to resolve incidents and eliminate outages that result from the change. The domains of the **Common Service Data Model conceptual model** help you find this critical information.

The CMDB-based framework available with the CSDM helps you manage change in the following ways:

- Determines the impact of the change on services and service offerings.
- Routes changes dynamically.
- Identifies any affected services, notifies affected users, and approves the change.
The ServiceNow products that gain value from this use case and the related product area include the following:

- Change Management: Incidents caused and fixed by Change, and services affected by Change
- ITSM Software Asset Management: Assets updated
- Information Technology Operations Management (ITOM): Configuration items (CIs) updated
- Enterprise DevOps: Change governance for pipeline tool change provided

**Data related to ITSM**

Data related to ITSM includes the following:

- Subscription “Subscribed by” table
  Subscriptions include the names of subscribers affected by an incident or change. The “Subscribed by” table identifies the affected subscribers. The affected users are displayed in the following related lists and corresponding tables:
  - Service Subscriptions by Company: (service_subscribe_company) table
  - Service Subscriptions by Department: (service_subscribe_department) table
  - Service Subscriptions by Group: (service_subscribe_sys_user_grp) table
  - Service Subscriptions by Location: (service_subscribe_location) table
  - Service Subscriptions by User: (service_subscribe_sys_user) table

- Business approver
  A business approver is used by Change Management and is found on the business service offering. The business approver maps to the attribute `approval_group`.

- Technical approver
  A technical approver is used by Change Management, and is found on the technical service offering. The technical approver maps to the attribute `approval_group`.

- Environment
  Environment is used by Incident Management and Change Management, and is found on the technical service offering and application service.
  Some service offerings identify the environment of the offering, such as production and non-production (DEV, QA, or UAT). The environment maps to the attribute `used_for`. If you don’t want to use the non-production attribute, you can filter it out from Incident Management and Change Management.

- Business criticality
  Business criticality is used by Incident Management and Change Management and is found on the business service offering. The business criticality maps to the attribute `business_criticality`. A business service may have multiple offerings, each with different criticalities.

- Technical assignment group
  A technical assignment group is used by ITSM for routing of change and change-related tasks. The technical assignment group is included in the technical service offerings. The technical assignment group maps to the attribute `assignment_group`.
  You can synchronize with the CIs that the offerings manage. When you synchronize this way, you reduce the amount of effort required for managing your CIs manually. You may have thousands and possibly millions of CIs.

- Technical support group
A technical support group is used by Incident Management, and is found on the technical service offerings. The technical support group maps to the attribute `support_group`.

**Note:** You may be using the `assignment_group` attribute instead of the `support_group` attribute. It’s OK to use the `assignment_group` attribute but only if the data is the same data used in routing of change and change-related tasks.
Identify the CIs and the service-related information needed for the Change form. You can use this information for populating and routing a change.

**Desired outcome**

Know the details of the change. Give these details to the approval team so that they can review, approve, and route the change effectively.

**Activities in scope**

- Using the base system Change form.
- Adding the base system attributes to the Change form, as necessary.
- Using the related lists on the Change form.
- Using the CMDB framework as documented in the *Apply Configuration Management Database (CMDB) data*.

**Activities not in scope**

- Implementing Change Management.
- Configuring non-base systems.
  - Non-base systems may be referred to in the use case, but they are out-of-scope.
- Using other ServiceNow products, such as ITSM, ITBM, and ITOM.

**CSDM elements used by Change Management**

The Change form references the following CSDM elements:

1. Service (cmdb_ci_service) table: Uses the service classification attribute to identify business services, technical services, and application services as types of services.
2. Service offering (service_offering) table: Uses the service classification attribute to identify business services, technical services, and application services as types of service offerings.
3. CIs: Application service (cmdb_ci_discovered_service) table or any infrastructure CI.

The following figure highlights the CSDM elements used by Change Management. The numbers correspond to the specific element.
Change Management elements of the CSDM

CMDB elements used from the Change form

The Change form references the following attributes and related lists:

1. Service attribute: References the cmdb_ci_service table

   Note: Earlier releases called this attribute business service.

2. Service offering attribute: References the (service_offering table) (if this service offering has a current parent service)

3. Configuration items (CIs) attribute: References the (cmdb_ci) table

4. Affected (or causal) CIs: References the (task_ci) related list

5. Impacted services: References the (task_cmdb_ci_service) related list

6. Assignment group: May be populated by the referenced CI

The following figure is an example of the Change form. The numbers correspond to the attributes (fields) in the Change form.
### CMDB elements of the Change form

457
Tips for using the Change form

To help you understand the attributes on the Change form, and how the CMDB uses those attributes, consider doing the following activities when you use the Change form.

- Populate the Configuration Item (`configuration_item`) attribute with the target CI for the change activity.
  
  You can then use this CI to identify details for change routing by using “Assignment Group” and “Approval Group”. You can use dependency relationships to determine service impact.
- Populate the Impacted Service (`task_cmdb_ci_service`) related list with the Services that are related to the populated CI. The related services may include services and service offerings.
- (Optional) Use the service and service offering attributes to identify the provider services that manage the selected CI.
- (Optional) Use the Affected CI (`task_ci`) related list to identify the CIs that may be part of this change and the populated CI. You can populate this table dynamically or manually.

**Note:** Populating the Affected CI related list dynamically is not part of the base system. To populate the related list dynamically, you must configure the Change form.

Frequently asked questions (FAQs)

- Why aren't business applications referenced in the change use case?
  
  Business applications are portfolio objects you can use for designing and planning an Enterprise Architecture. Business application portfolio objects don't contain version, environment, and localization details for deployments using one or more applications.
- Who approves a change?
  
  It depends on how you implement Change Management. Once you populate the CIs on the Change form (if there's a relationship between the CI and the impacted services and service offerings), the Approval group approves the change.
- What CI attributes should I use for routing a change?
  
  If you are initiating the change or the change task, use the Assignment Group attribute CI. If you are using build run teams, you could use the Support Group attribute CI for the team assignments.

Common Service Data Model use case: Service Portfolio Management

Guidelines for using the Common Service Data Model (CSDM) with ServiceNow® Service Portfolio Management (SPM).

With SPM, you can:

- Define business services
- Document business services
- Track performance against defined availability commitments
- Relay the performance information in real time to your end users

The domains of the Common Service Data Model conceptual model help you with these tasks. For more information about using SPM, see Understanding Service Portfolio Management. The CSDM provides additional value to SPM by integrating with the following areas:

- Application Assessment
For more information about using the Application Assessment indicators, see ..Application assessment.

- Service Offering Subscriptions.
  For more information on how service owners can subscribe users to service offerings, see ..Service Portfolio Management service offering subscriptions.

- Service Level Management
  For more information about managing your Service Level Agreements (SLAs), see ..Service Level Management for Service Portfolio Management.

- Service Owner Workspace premium experience
  For more information about the premium experience the Service Owner Workspace provides, see ..Service Owner Workspace.

The ServiceNow products that gain value from this use case include:

- Application Portfolio Management (APM): Relates Business Capabilities to Services
- Incident Management and Change Management: Determines the impact to services
- Information Technology Operations Management (ITOM): Determines infrastructure criticality based on the services supported

Use case details

Use case scope

The goal of this use case is to understand how SPM uses CSDM data. This use case helps you:

- Understand the configuration items (CIs) or platform data needed for SPM to create a pipeline of services
- Prevent service duplications
- Identify (and then possibly retire) low-value services

All of these actions help you reallocate your resources.

Desired outcome

Determine which tables in the CSDM model are needed to support the following base system components of SPM:

- Activity
- Availability
- Breached service level agreements (SLAs)
- Customer satisfaction
- Stability

Activities in scope

- Using SPM.
- Using Service Owner Workspace.
- Using the CMDB framework as documented in Apply Configuration Management Database (CMDB) data.

Activities not in scope

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
- Implementing SPM.
- Configuring non-base systems.
  Non-base systems may be referred to in the use case, but they are out-of-scope.
- Using other ServiceNow products, such as ITSM, ITBM, and ITOM.

**CSDM elements used by SPM**

SPM references the following CSDM elements:

1. Service Portfolio (spm_service_portfolio) table
   The Service Portfolio table not a CMDB table but is available in the base system.

2. Service (cmdb_ci_service) table
   Uses the list for the service classification attribute to identify types of services. Choices include business service, technical service, and application service.

3. Service Offering (service_offering) table
   Uses the list for the service classification attribute to identify types of service offerings. Choices include business service, technical service, and application service. These choices should be the same as the type of service.

4. Request Catalog (sc_cat_item) table
   The following figure highlights the CSDM elements used by SPM. The numbers correspond to the specific element.
Elements used from other ServiceNow products

This use case uses elements from the following ServiceNow products:

- Service Catalog: Catalog Items (sc_cat_item) table
  The catalog items are the components of a service portfolio that can be consumed.
- Vendor Manager Workspace plugin
- Financial Management (estimated spend) plugin
- Continual Improvement Management
Displays Continual Improvement Management records in the Service Owner Workspace when the associated forms indicate a related service.

Elements used from SPM

SPM relies on the tables listed in the “CSDM elements used by SPM” section. The Service Owner Workspace also organizes the following information, as it relates to CSDM elements:

1. **Overview**: Displays who owns and manages the service and service offerings. Also displays service offering health and performance metrics for the following:
   - Performance score
   - Customer score
   - Total subscribers
   - Estimated average spend
   - Outages
   - Service offerings

2. **Trends**: Displays service level agreement (SLA) compliance and performance over a specific time frame.

3. **Related Services**: Displays up-stream and down-stream services and service offering dependencies.

4. **Info**: Displays the service description, performance breakdown, scope, and price model, based on what is in the service record.

5. **Improvement initiatives**: Displays all the Continual Improvement Management initiatives associated with the current service or service offering displayed.

The figure below is an example of the Service Owner Workspace. The numbers correspond to the specific CSDM-related elements.
For more information about the key features of the Service Owner Workspace and how to activate it, see ..Service Owner Workspace.

Other data SPM uses

To determine the end-of-life (EOL) impact to business applications and installed instances (application services), SPM does the following:

- SPM integrates with the ServiceNow Service Catalog at the service offering level of the application. This integration lets you use the catalog to choose services or add service catalog items (sc_cat_item).
- SPM integrates with ServiceNow Service Level Management. This integration provides support for SLA commitments.

Frequently asked questions (FAQs)

- What is the difference between a business capability and a business service?

  A business capability is the ability to complete an activity and deliver an outcome. A business service is how value is added, delivered, and consumed, along with performance and cost considerations.

Configuration Management Database

With the ServiceNow® Configuration Management Database (CMDB) application, build logical representations of assets, services, and the relationships between them that comprise the infrastructure of your organization. Details about these components are stored in the CMDB which you can use to monitor the infrastructure, helping ensure integrity, stability, and continuous service operation.

Use core features such as CMDB Health, CMDB Identification and Reconciliation, and CMDB CI Lifecycle Management to monitor and detect health issues, reconcile data integrity issues, and manage data life cycle.

Note: CMDB modules, features, and wizards are not supported on mobile devices. You cannot use a mobile device to access the CI Class Manager, Query Builder, or Duplicate CI Remediator. Or to access or configure CMDB features such as Identification and Reconciliation, CMDB Health, CI Lifecycle Management, baseline CMDB, and proposed changes.

Configuration Management and the CMDB

The Configuration Management data base (CMDB) creates and maintains the logical configurations your network infrastructure needs to support a ServiceNow service.

These logical service configurations are mapped to the physical layout data of the supporting network and application infrastructure in each of your respective domains. They track the physical and logical state of IT service elements and associate incidents to the state of service elements, which helps in analyzing trends and reducing problems and incidents.

The configurations are stored in a configuration management database (ServiceNow CMDB) which consists of entities, called Configuration Items (CI), that are part of your environment. A CI may be:

- A physical entity, such as a computer or router
- A logical entity, such as an instance of a database
- Conceptual, such as a Requisition Service

In each case, there are attributes about the CI that you want to maintain, and there is control you want to have over the CI. There are changes that may need to be made and tracked against the CI. Also, a CI does not exist on its own. CIs have dependencies and relationship with other CIs. For example, the loss of disk drives may take a database instance down, which affects the requisition service that the HR department uses to order equipment for new employees.

It is this relationship data that makes the CMDB a powerful decision support tool. Understanding the dependencies and other relationships among your CIs can tell you, for example, exactly who and what is affected by the loss of that bank of disk drives. When you find out that a router has failed, you will be able to assess the effect of that outage. When you decide to upgrade the processor in a server, you can tell who or what will be affected during the outage.

Configuration items differ from environment to environment because each customer has unique needs. Details about the exact physical attributes of a computer may be needed by one customer, but may represent meaningless data to another. The NOW Platform provides a mechanism to easily define new classes of configuration items and new relationships that may

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
exist between CIs. New classes can be defined that extend other classes. For example, a laptop class exists that extends the computer class. The computer class itself extends the base CI class. Customer class extensions are automatically part of the ServiceNow environment and blend seamlessly into the integration points for other ITIL processes.

You can for example, set the **Used for** attribute in the cmdb_ci_server table to a value such as ‘development’, ‘test’, or ‘production’. These values indicate the environment that the CI is supporting, and serve as a way of tracking a CI through its lifecycle in a changing environment.

**Architecture**

![Architecture Diagram]

**Roles required**

Reading CMDB tables directly requires the cmdb_read role, however accessing the **Configuration** module requires the asset, itil, or itil_admin roles. For viewing CMDB-related records in the user interface, the itil role is usually sufficient. For updating records and for other manipulation of
records, roles with higher credentials are usually required, as noted in each procedure throughout the documentation set.

**Domain separation in Configuration Management Database (CMDB)**

This is an overview of domain separation and the Configuration Management Database (CMDB). Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

**Support level: Standard**

- Includes **Basic** level
- Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another. Business logic:

**Overview**

The following topics provide details about domain separation in Configuration Management (CMDB) modules:

- Domain separation in CMDB Health
- Domain separation in CMDB Query Builder
- Domain separation in CMDB Identification and Reconciliation
- Domain separation in the relations formatter and the CI relationship editor
- CMDB APIs (CMDB SDK)

**ITIL and Configuration Management**

The CMDB has relationships with IT service management processes in the following areas: ITIL incident management, ITIL problem management, ITIL change management, ITIL service catalog management, and financial management.

**ITIL Incident Management**

Configuration management assists **Incident Management** by providing the Service Desk with immediate information on the CIs affected, and more timely resolution of faults by understanding what CIs have been affected and changed.

**ITIL Problem Management**

Configuration Management assists **Problem Management** by linking the CIs affected by problems to the Incident / Problem / Change Management processes, and ensuring the CI status is properly maintained.
**ITIL Change Management**

Configuration Management assists *Change Management* by recording which CIs have been changed and controlling the status of CIs throughout the entire CI lifecycle. Configuration Management ensures that any changes made to CIs are recorded and kept accurate. Configuration Management is also used in the integration of *Change Management with the DiscoverNow Discovery* feature.

**ITIL Service Catalog Management**

With *Service Portfolio Management*, business services in the CMDB can also be managed by the Service Catalog team, and exposed to end users who can then request items from them.

**Financial Management**

With *Cost Management*, costs can be associated with configuration items, so that the cost associated with Configuration Management can be tracked and bundled into expense lines, budgets, or cost centers.

**IT4IT**

*IT4IT* provides reference architecture about the implementation of ITIL strategy. For more information, see the Now Community blog *Running IT as a Business using IT4IT and ServiceNow*.

**ITIL**

The IT Infrastructure Library (ITIL) is an integrated, process-based framework for managing IT services.

It provides guidance for creating and operating a Service Desk that provides efficient communication between the user community and the IT provider. Originally initiated to improve IT service management for the UK central government, it has become a standard for many organizations; public or private sector, large or small, centralized, or distributed.

ITIL provides processes for three service concepts: design, transition, and operation.

## Service design

This guide provides a general overview of ITIL service design concepts.

### Service level management

The service level management process is designed to ensure customer satisfaction within IT service processes. Service level agreements are made between the IT staff and the customers, and the IT desk must monitor their performance as compared to the agreements. In addition, underpinning contracts with external vendors and operational level agreements with internal vendors ensure that these service level agreements are feasible.

### Availability management

The availability management process ensures that availability within a system is kept as close to 100% as possible. By both reacting to past service failures, and planning to avoid future service failures, availability management can greatly increase end-user satisfaction with services.

### Capacity management

The capacity management process is designed to ensure that business services are not made unavailable by over-capacity. By analyzing past failures and planning for growth of demand of services, capacity management can increase end-user satisfaction with services.

### Supplier management

Supplier management is a process that defines and monitors agreements between an IT department and an external supplier.

### Service catalog management

The service catalog provides a front end for customers to request items and services. Service catalog management ensures that this service catalog provides accurate and useful information on the items and services.

### Service transition

This guide provides a general overview of ITIL service transition concepts and how the Now Platform can enable these processes.
Change management

The change management process ensures that standardized methods and procedures are used for efficient and prompt handling of all changes to minimize the impact of change related incidents on service quality. Consequently, change management aims to improve the day-to-day operation of the organization. IT-related changes that may affect one or many customers are tracked with change management. Adding memory to one machine, getting a new server, and installing the latest Windows OS on all PCs are all examples. To find out how the Now Platform implements change management, see Change Management.

Knowledge management

The knowledge management process ensures that important information flows freely throughout the IT organization. Knowledge management keeps the CMDB and knowledge base of an organization up-to-date, and uses a knowledge-centered support approach to reduce repeat incidents and problems. For more information on how the Now Platform implements knowledge management, see Knowledge Management.

Asset management

Asset management enables a process of monitoring processes, organizations, people, information, applications, infrastructure, and financial capital within an organization. This allows the organization to collect accurate records of these business components, making them available for both internal and external auditing processes. To find out how the Now Platform implements asset management, see Asset Management.

Configuration management

Configuration management provides a logical model of the infrastructure or a service by identifying, controlling, maintaining and verifying the Configuration Items in existence. To find out how the Now Platform implements configuration management, see .

Release management

This discipline of IT service management is the management of all software configuration items within the organization. It is responsible for the management of software development, installation and support of an organization’s software products. Software Control & Distribution procedures include the management of the software Configuration Items and their distribution and implementation into a production environment. This involves the definition of a release program suitable for the organization, the definition of how version control is implemented, and the procedures surrounding how software is built, released and audited. To find out how the Now Platform implements release management, visit Release Management.

CMDB schema model

The Configuration Management Database (CMDB) schema model is a series of connected tables that contain all the assets and business services controlled by a company and its configurations. CMDB tables contain information about computers and devices on the network, software contracts and licenses, business services, and so on. The IT desk can use the CMDB to better
understand their network users' equipment, and the relationships between them. The CMDB can also be referenced by other processes within the system.

The CMDB can be populated using the Discovery product. Discovery searches the network for all attached computers and devices, then populates the CMDB with information on each computer/device's configuration, provisioning, and current status. Discovery also reports on any software which is running, and the TCP connections between computer systems, thereby establishing their relationships.

Applications such as Asset Management and Contract Management, operate in conjunction with the CMDB. Asset Management and Software Asset Management link to CMDB all assets, hardware, software, assets in stock, as well as records for manufacturers and vendors. The Contract Management application contains information about contracts, including leases, service contracts, purchase orders, warranties, and software licenses. The Configuration Management Database (CMDB) application has a focus on operation.

For more background information about the CMDB, see the Now Community post at CMDB 101 - What is a configuration management database and why do you need one?.

**CMDB tables**

Key tables in the configuration management database (CMDB):

- The Base Configuration Item (cmdb) table, which is the core CMDB table for non IT CIs (descending classes are non IT CIs).
- The core Configuration Item (cmdb_ci) table, which stores the basic attributes of all the CIs. The admin, itil, or asset user role is required to access this table (descending classes are IT CIs).
- The CI Relationship (cmdb_rel_ci) table, which defines all relationships between CIs.

The Configuration Item table is extended to other tables, such as Database (cmdb_ci_database) and Computer (cmdb_ci_computer). The Computer table is extended to the Server (cmdb_ci_server) table, which is extended to the UNIX Server (cmdb_ci_unix_server) table, and so on.

**Note:** The Base Configuration Item (cmdb) table uses the table per partition extension model, which has different behaviors for replicating and deriving information than other extended tables. See Table extension and classes.

You can use the schema map to view more details of tables and their relationships:

1. Navigate to System Definition > Tables & Columns.
2. Select a table and click Schema Map.
**Schema Map**

**Note:** CIs not extended from the Configuration Item (cmdb_ci) table, are not displayed in Dependency Views maps and in CI relation formatters.

**CI attributes**

Attributes apply to all the CIs in a classification. To change attributes for a CI, you must extend the table and create a new classification for that CI.
The position of a CI in a classification hierarchy is determined by the attributes it shares with the CIs below it. Each time a CI has a single different attribute from its parent, the classification hierarchy branches.

For example, servers have different attributes from computers, which include workstations and laptops. Linux servers and UNIX servers have different attributes from the parent server classification and from each other, so they occupy separate branches in the hierarchy.

**CMDB tables descriptions**

List of all the tables in the CMDB, and for each table, its name, label, and a description of the type of information that is stored in the table.

<tr>
<td>cmdb_ci_batch_job</td>
<td>Batch Job</td>
<td>A computer program or set of programs processed in batch mode.</td>
</tr>
<tr>
<td>cmdb_ci_aws_datacenter</td>
<td>AWS datacenter</td>
<td>Logical representation of an Amazon Web Services datacenter.</td>
</tr>
<tr>
<td>cmdb_ci_azure_datacenter</td>
<td>Azure datacenter</td>
<td>Logical representation of a Microsoft Azure datacenter.</td>
</tr>
<tr>
<td>cmdb_ci_business_process</td>
<td>Business Process</td>
<td>A process that is owned and carried out by the business and contributes to the delivery of a product or business service to a business customer.</td>
</tr>
<tr>
<td>cmdb_ci_chassis_server</td>
<td>Server Chassis</td>
<td>A metal structure that is used to house or physically assemble servers in various different form factors.</td>
</tr>
<tr>
<td>cmdb_ci_cim_profile</td>
<td>CIM Profiles</td>
<td>CIM Profiles (UML).</td>
</tr>
<tr>
<td>cmdb_ci_cim_server</td>
<td>CIM Server</td>
<td>Server hosting CIM profiles.</td>
</tr>
<tr>
<td>cmdb_ci_circuit</td>
<td>Circuit</td>
<td>Electrical circuits information.</td>
</tr>
<tr>
<td>cmdb_ci_cloud_database</td>
<td>Cloud Database</td>
<td>Database which runs on a cloud computing platform.</td>
</tr>
<tr>
<td>cmdb_ci_cloud_ip_address</td>
<td>Cloud IP Address</td>
<td>Web server which runs on a cloud computing platform.</td>
</tr>
<tr>
<td>cmdb_ci_cluster</td>
<td>Cluster</td>
<td>Logical group of computing resources bound together by software in order to function as one logical computing resource.</td>
</tr>
<tr>
<td>cmdb_ci_cluster_node</td>
<td>Cluster Node</td>
<td>Single computing resource which is logically/operationally bound into a cluster.</td>
</tr>
<tr>
<td>cmdb_ci_cluster_resource</td>
<td>Cluster Resource</td>
<td>System object that is a set or grouping of cluster resources that are used to manage events that occur in a clustered environment.</td>
</tr>
<tr>
<td>cmdb_ci_cluster_vip</td>
<td>Cluster Virtual IP</td>
<td>Cluster VIP information.</td>
</tr>
<tr>
<td>cmdb_ci_comm</td>
<td>Communication Device</td>
<td>Communication devices information. A choice list containing devices such as cellphone, phone, conference phone, and Wi-Fi.</td>
</tr>
<tr>
<td>cmdb_ci_computer</td>
<td>Computer</td>
<td>An extension of the Hardware table, capturing computer properties.</td>
</tr>

<tr>
<td>cmdb_ci_config_file</td>
<td>Configuration file</td>
<td>Configuration files which establish the parameters and initial settings for some computer programs.</td>
</tr>
<tr>
<td>cmdb_ci_crac</td>
<td>Computer Room AC</td>
<td>Air conditioning units used to cool data centers.</td>
</tr>
<tr>
<td>cmdb_ci_csu_dsu_network</td>
<td>CSU/DSU</td>
<td>Digital-interface device used to connect networking equipment to a digital circuit.</td>
</tr>
<tr>
<td>cmdb_ci_database</td>
<td>Database</td>
<td>Organized collection of data such as the set of files where data is stored, the reason for a database, and the metadata about the data.</td>
</tr>
<tr>
<td>cmdb_ci_datacenter</td>
<td>Data Center</td>
<td>Facility used to house computer systems and associated components, such as telecommunications and storage systems. It generally includes redundant or backup power supplies, redundant data communications connections, environmental controls (such as air conditioning and fire suppression), and various security devices.</td>
</tr>
<tr>
<td>cmdb_ci_datapower_server</td>
<td>Data Power Hosting Server</td>
<td>Server running IBM DataPower Gateway software.</td>
</tr>
<tr>
<td>cmdb_ci_db_catalog</td>
<td>Database Catalog</td>
<td>Metadata which defines database objects such as base tables, views (virtual tables), synonyms, value ranges, indexes, users, and user groups, for a specific database instance.</td>
</tr>
<tr>
<td>cmdb_ci_db_db2_catalog</td>
<td>DB2 Catalog</td>
<td>Database catalog for DB2 database.</td>
</tr>
<tr>
<td>cmdb_ci_db_db2_instance</td>
<td>DB2 Instance</td>
<td>Instance of a DB2 database.</td>
</tr>
<tr>
<td>cmdb_ci_db_hbase_instance</td>
<td>HBase Instance</td>
<td>Instance of an HBase database.</td>
</tr>
<tr>
<td>cmdb_ci_db_instance</td>
<td>Database Instance</td>
<td>Software and memory used to manipulate data in a database.</td>
</tr>
<tr>
<td>cmdb_ci_db_mongodb_instance</td>
<td>MongoDB Instance</td>
<td>Instance of a MongoDB database.</td>
</tr>
<tr>
<td>cmdb_ci_db_mssql_analysis</td>
<td>SQL Server Analysis Services</td>
<td>Microsoft SQL Server Analysis Services software.</td>
</tr>
<tr>
<td>cmdb_ci_db_mssql_catalog</td>
<td>MSFT SQL Catalog</td>
<td>Database catalog for a specific instance of a Microsoft SQL database.</td>

<td>cmdb_ci_db_mssql_int_job</td>
<td>SQL Server Integration Services Job</td>
<td>Scheduled job to run a SQL Server Integration Service package.</td>
</tr>
<tr>
<td>cmdb_ci_db_mssql_integration</td>
<td>SQL Server Integration Services</td>
<td>MSQl Server Integration Services software.</td>
</tr>
<tr>
<td>cmdb_ci_db_mssql_reporting</td>
<td>SQL Server Reporting Services</td>
<td>SQL Server software used for server-based reporting generation.</td>
</tr>
<tr>
<td>cmdb_ci_db_mssql_server</td>
<td>MS SQL Server</td>
<td>Microsoft SQL Server.</td>
</tr>
<tr>
<td>cmdb_ci_db_mysql_catalog</td>
<td>MySQL Catalog</td>
<td>Database catalog for a specific instance of a MySQL database.</td>
</tr>
<tr>
<td>cmdb_ci_db_mysql_clustermgnodes</td>
<td>MySQLClusterMGNode</td>
<td>MySQL primary administrative interface to a running cluster.</td>
</tr>
<tr>
<td>cmdb_ci_db_mysql_clusternode</td>
<td>MySQLClusterDataNode</td>
<td>Summary table used in the (ndbd) or (ndbd default) sections of a config.ini file for configuring MySQL Cluster data nodes.</td>
</tr>
<tr>
<td>cmdb_ci_db_mysql_instance</td>
<td>MySQL Instance</td>
<td>Instance of a MySQL database.</td>
</tr>
<tr>
<td>cmdb_ci_db_ora_catalog</td>
<td>Oracle Catalog</td>
<td>Database catalog for a specific instance of an Oracle database.</td>
</tr>
<tr>
<td>cmdb_ci_db_ora_instance</td>
<td>Oracle Instance</td>
<td>Instance of an Oracle database.</td>
</tr>
<tr>
<td>cmdb_ci_db_ora_listener</td>
<td>Oracle Database Listener</td>
<td>Process that runs on an Oracle Database Server.</td>
</tr>
<tr>
<td>cmdb_ci_db_postgresql_instance</td>
<td>PostgreSQL Instance</td>
<td>Instance of a PostgreSQL database.</td>
</tr>
<tr>
<td>cmdb_ci_db_syb_catalog</td>
<td>Sybase Catalog</td>
<td>Database catalog for a specific instance of a Sybase database.</td>
</tr>
<tr>
<td>cmdb_ci_db_syb_instance</td>
<td>Sybase Instance</td>
<td>Instance of a Sybase database.</td>
</tr>
<tr>
<td>cmdb_ci_desktop_software</td>
<td>Desktop Software</td>
<td>Software used on desktops and laptops.</td>
</tr>
<tr>
<td>cmdb_ci_dir_policy_server</td>
<td>Policy Server</td>
<td>Policy server, which provides a security component of a policy-based network that provides authorization services and facilitates tracking and control of files.</td>
</tr>
<tr>
<td>cmdb_ci_dir_site_minder_server</td>
<td>Site Minder</td>
<td>Server running SiteMinder software.</td>
</tr>
<tr>
<td>cmdb_ci_directory_ad_forest</td>
<td>AD Forest</td>
<td>Active Directory forest.</td>
</tr>
<tr>
<td>cmdb_ci_directory_ha</td>
<td>HA Proxy</td>
<td>HAPProxy software.</td>
</tr>
<tr>
<td>cmdb_ci_directory_ifp</td>
<td>IIFP</td>
<td>Identity Identification Feature Pack (Active Directory) software.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_directory_server</td>
<td>Directory Server</td>
<td>Server running LDAP software.</td>
</tr>
<tr>
<td>cmdb_ci_disk</td>
<td>Disk</td>
<td>General category of data storage mechanisms.</td>
</tr>
<tr>
<td>cmdb_ci_disk_partition</td>
<td>Disk Partition</td>
<td>Sections of a disk separated so that information in each section can be managed separately.</td>
</tr>
<tr>
<td>cmdb_ci_display_hardware</td>
<td>Display Hardware</td>
<td>Hardware used to display information in visual form.</td>
</tr>
<tr>
<td>cmdb_ci_dns_alias</td>
<td>DNS Alias</td>
<td>Synonym for the host used to resolve DNS addresses.</td>
</tr>
<tr>
<td>cmdb_ci_dns_name</td>
<td>DNS Name</td>
<td>Primary DNS names.</td>
</tr>
<tr>
<td>cmdb_ci_docker</td>
<td>Docker Container</td>
<td>Docker containers (a runtime instance of a docker image).</td>
</tr>
<tr>
<td>cmdb_ci_docker_engine</td>
<td>Docker Engine</td>
<td>Docker software for running and managing Docker containers.</td>
</tr>
<tr>
<td>cmdb_ci_docker_image</td>
<td>Docker Image</td>
<td>Docker images. Ordered collection of root filesystem changes and the corresponding execution parameters for use within a container runtime.</td>
</tr>
<tr>
<td>cmdb_ci_docker_image_tag</td>
<td>Docker Image Tag</td>
<td>Docker tag, which is a label applied to a Docker image in a repository.</td>
</tr>
<tr>
<td>cmdb_ci_docker_local_image</td>
<td>Docker Local Image</td>
<td>Locally managed Docker image.</td>
</tr>
<tr>
<td>cmdb_ci_drs_vm_config</td>
<td>DRS VM Config</td>
<td>Distributed Resource Scheduler (DRS) behavior for the VMs in the vCenter that override the cluster behavior.</td>
</tr>
<tr>
<td>cmdb_ci_ec2_instance</td>
<td>EC2 Virtual Machine Instance</td>
<td>Virtual machine running in the Amazon Elastic Compute Cloud (EC2) platform.</td>
</tr>
<tr>
<td>cmdb_ci_email_server</td>
<td>Email Server</td>
<td>Server running email software.</td>
</tr>
<tr>
<td>cmdb_ci_email_server_jes</td>
<td>JES</td>
<td>Server running JES software (multi-featured hybrid MTA/MDA server).</td>
</tr>
<tr>
<td>cmdb_ci_endpoint</td>
<td>Endpoint</td>
<td>Endpoint, which represents the entry point to a service, a process, or a queue or topic destination in service-oriented architecture.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_environment</td>
<td>Environment</td>
<td>Logical grouping of hardware and software used to develop, test, and deliver computing services. For example: development, test, quality assurance, and production.</td>
</tr>
<tr>
<td>cmdb_ci_esx_resource_pool</td>
<td>ESX Resource Pool</td>
<td>VMware set of physical resources.</td>
</tr>
<tr>
<td>cmdb_ci_esx_server</td>
<td>ESX Server</td>
<td>Physical ESX server running the VMware ESXi operating system.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_cas</td>
<td>Exchange Client Access Server</td>
<td>Server running Exchange software providing client access services.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_edge_transport_server</td>
<td>Exchange Edge Transport Server</td>
<td>Server running Exchange Edge Transport software.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_hub</td>
<td>ExchangeHub</td>
<td>Server running Exchange Hub software.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_hub_transport_server</td>
<td>Exchange Hub Transport Server</td>
<td>Server running Exchange Hub software providing transport services.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_mailbox</td>
<td>Exchange MailBox</td>
<td>Exchange email account.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_mailbox_server</td>
<td>Exchange Mailbox Server</td>
<td>Server running Exchange software providing client access services.</td>
</tr>
<tr>
<td>cmdb_ci_exchange_service_component</td>
<td>Exchange Service Component</td>
<td>Exchange Service Component software.</td>
</tr>
<tr>
<td>cmdb_ci_facility_hardware</td>
<td>Facility Hardware</td>
<td>Base class for hardware used to facilities services such as electric, water, sewer, air, and security.</td>
</tr>
<tr>
<td>cmdb_ci_fc_disk</td>
<td>Fibre Channel Disk</td>
<td>Base table for fibre channel disk.</td>
</tr>
<tr>
<td>cmdb_ci_fc_export</td>
<td>Fibre Channel Export</td>
<td>Storage volume exported by a storage server via Fibre Channel protocol.</td>
</tr>
<tr>
<td>cmdb_ci_fc_port</td>
<td>Fibre Channel Port</td>
<td>Fibre Channel port on a storage server, FC switch, or on a host's HBA.</td>
</tr>
<tr>
<td>cmdb_ci_fddi_network</td>
<td>FDDI Cards</td>
<td>Fiber Distributed Data Interface cards.</td>
</tr>
<tr>
<td>cmdb_ci_file_system</td>
<td>File System</td>
<td>File system information for a server, capturing details such as mount point, capacity, and type of file system.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>------------------------------------</td>
<td>------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_file_system_nfs</td>
<td>NFS File system</td>
<td>Extension of File System, which provides NFS file system information.</td>
</tr>
<tr>
<td>cmdb_ci_file_system_smb</td>
<td>SMB File system</td>
<td>Extension of File System, which provides SMB file system information.</td>
</tr>
<tr>
<td>cmdb_ci_firewall_network</td>
<td>Firewall Hardware</td>
<td>Firewall hardware.</td>
</tr>
<tr>
<td>cmdb_ci_ftp_server</td>
<td>FTP Server</td>
<td>Server providing FTP services.</td>
</tr>
<tr>
<td>cmdb_ci_fuel_tank</td>
<td>Fuel Tank</td>
<td>Fuel tank.</td>
</tr>
<tr>
<td>cmdb_ci_generator_power_eq</td>
<td>Power Generator</td>
<td>Power generator.</td>
</tr>
<tr>
<td>cmdb_ci_group</td>
<td>Group</td>
<td>Logical group of CIs.</td>
</tr>
<tr>
<td>cmdb_ci_hardware</td>
<td>Hardware</td>
<td>Base class for hardware.</td>
</tr>
<tr>
<td>cmdb_ci_hpux_server</td>
<td>HPUX Server</td>
<td>Server running HPUX software.</td>
</tr>
<tr>
<td>cmdb_ci_hub_network</td>
<td>Hub Hardware</td>
<td>Physical network hub.</td>
</tr>
<tr>
<td>cmdb_ci_hvac</td>
<td>HVAC Equipment</td>
<td>Heating, ventilation, and air conditioning equipment.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_cluster</td>
<td>Hyper-V Cluster</td>
<td>Cluster of the Hyper-V servers.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_instance</td>
<td>Hyper-V Virtual Machine Instance</td>
<td>Hyper-V virtual machine instance. This table extends the generic Virtual Machine Instance (cmdb_ci_vm_instance) table.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_network</td>
<td>Hyper-V Virtual Network</td>
<td>Hyper-V virtual network.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_object</td>
<td>Hyper-V Object</td>
<td>Base class for all Hyper-V objects.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_resource_pool</td>
<td>Hyper-V Resource Pool</td>
<td>Hyper-V resource pool.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_rpool_comp</td>
<td>Hyper-V Resource Pool Component</td>
<td>Resource pool component belonging to resource pool.</td>
</tr>
<tr>
<td>cmdb_ci_hyper_v_server</td>
<td>Hyper-V Server</td>
<td>Server running Hyper-V software.</td>
</tr>
<tr>
<td>cmdb_ci_ids_network</td>
<td>Intrusion Detection System</td>
<td>Security intrusion detection systems.</td>
</tr>
<tr>
<td>cmdb_ci_iisdirectory</td>
<td>IIS Virtual Directory</td>
<td>Virtual Directory in IIS Manager.</td>
</tr>
<tr>
<td>cmdb_ci_imaging_hardware</td>
<td>Imaging Hardware</td>
<td>Hardware used to create electronic/physical images.</td>
</tr>
<tr>
<td>cmdb_ci_inetinfo</td>
<td>Inetinfo service</td>
<td>Inetinfo service of IIS application.</td>
</tr>
<tr>
<td>cmdb_ci_inf_software</td>
<td>Infrastructure Software</td>
<td>Base class for enterprise software or programs specifically designed to help business organizations perform basic tasks such as workforce support, business transactions and internal services, and processes.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-------------------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_information_object</td>
<td>Information Object</td>
<td>Types of information that a business application or any other entity handles.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For example: ‘Employee Salary Data’, ‘Employee Personal Data’, and ‘Sales Data’.</td>
</tr>
<tr>
<td>cmdb_ci_installed_bundles</td>
<td>Installed Bundles</td>
<td>Extension of the Virtual Machine Object (cmdb_ci_vm_object) table, which</td>
</tr>
<tr>
<td></td>
<td></td>
<td>represents bundles of installed software.</td>
</tr>
<tr>
<td>cmdb_ci_infra_service</td>
<td>Infrastructure Service</td>
<td>IT services which support providing computing infrastructure.</td>
</tr>
<tr>
<td>cmdb_ci_infra_service_ldap</td>
<td>LDAP Service</td>
<td>Running LDAP service.</td>
</tr>
<tr>
<td>cmdb_ci_ip_address</td>
<td>IP Address</td>
<td>IP address.</td>
</tr>
<tr>
<td>cmdb_ci_ip_device</td>
<td>IP Device</td>
<td>Base class for devices with an IP address.</td>
</tr>
<tr>
<td>cmdb_ci_ip_firewall</td>
<td>IP Firewall</td>
<td>Firewall hardware.</td>
</tr>
<tr>
<td>cmdb_ci_ip_network</td>
<td>IP Network</td>
<td>IP network information capturing details such as subnet, router, and</td>
</tr>
<tr>
<td></td>
<td></td>
<td>router_interface_type.</td>
</tr>
<tr>
<td>cmdb_ci_ip_phone</td>
<td>IP Phone</td>
<td>IP-enabled (VOIP) phone.</td>

<tr>
<td>cmdb_ci_ip_router</td>
<td>IP Router</td>
<td>Specialization of the Network Gear (cmdb_ci_netgear) table.</td>
</tr>
<tr>
<td>cmdb_ci_ip_server</td>
<td>IP Server</td>
<td>Server hardware.</td>
</tr>
<tr>
<td>cmdb_ci_ip_service</td>
<td>IP Service Instance</td>
<td>Base table for IP services running on a server such Unix daemon or Windows service.</td>
</tr>
<tr>
<td>cmdb_ci_ip_switch</td>
<td>IP Switch</td>
<td>Specialization of the Network Gear (cmdb_ci_netgear) table.</td>
</tr>
<tr>
<td>cmdb_ci_iplanet_web_server</td>
<td>Iplanet Web Server</td>
<td>Server running Oracle iPlanet Web Server (OiWS) software.</td>
</tr>
<tr>
<td>cmdb_ci_isam_server</td>
<td>ISAM Server</td>
<td>Server running ISAM software.</td>
</tr>
<tr>
<td>cmdb_ci_iscsi_disk</td>
<td>iSCSI Disk</td>
<td>Host mount of an iSCSI disk.</td>
</tr>
<tr>
<td>cmdb_ci_iscsi_export</td>
<td>iSCSI Export</td>
<td>Storage volume exported by a storage server via iSCSI.</td>
</tr>
<tr>
<td>cmdb_ci_kvm</td>
<td>KVM</td>
<td>Hypervisor that manages kernel-based virtual machines (KVMs).</td>
</tr>
<tr>
<td>cmdb_ci_kvm_network</td>
<td>Network</td>
<td>KVM Virtual network.</td>
</tr>
<tr>
<td>cmdb_ci_kvm_object</td>
<td>KVM Object</td>
<td>Base object for all KVM objects.</td>
</tr>
<tr>
<td>cmdb_ci_kvm_storage_pool</td>
<td>Storage Pool</td>
<td>KVM storage pool.</td>
</tr>
<tr>
<td>cmdb_ci_kvm_storage_volume</td>
<td>Storage Volume</td>
<td>KVM storage volume.</td>
</tr>
<tr>
<td>cmdb_ci_kvm_vm_instance</td>
<td>KVM Virtual Machine Instance</td>
<td>Virtual machine instance running on a KVM hypervisor.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_lb</td>
<td>Load Balancer</td>
<td>Server functioning as a load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_a10</td>
<td>A10 Load Balancer</td>
<td>Server functioning as an A10 load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_ace</td>
<td>ACE</td>
<td>Server functioning as an ACE load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_alteon</td>
<td>Alteon</td>
<td>Server functioning as an Alteon load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_appl</td>
<td>Load Balancer Application</td>
<td>Application that provides load balancing functionality.</td>
</tr>
<tr>
<td>cmdb_ci_lb_backend_server</td>
<td>LB Backend Server</td>
<td>Server functioning as a backend load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_bigip</td>
<td>F5 Big-IP</td>
<td>Server functioning as an F5 Big-IP load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_cisco_csm</td>
<td>Cisco CSM</td>
<td>Server functioning as a Cisco CSM load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_cisco_css</td>
<td>Cisco CSS</td>
<td>Server functioning as a Cisco CSS load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_f5_gtm</td>
<td>F5 BigIP GTM</td>
<td>Server functioning as an F5 BigIP GTM load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_f5_ltm</td>
<td>F5 BigIP LTM</td>
<td>A server functioning as an F5 BigIP LTM load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_haproxy</td>
<td>HAProxy Load Balancer</td>
<td>Server functioning as an HA Proxy load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_isa</td>
<td>ISA Server</td>
<td>Server functioning as an ISA load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_modjk</td>
<td>Modjk Load Balancer</td>
<td>Server functioning as a Cisco CSM load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_modproxy</td>
<td>ModProxy Load Balancer</td>
<td>Server functioning as a ModProxy load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_netscaler</td>
<td>Citrix Netscaler</td>
<td>Server functioning as a Citrix Netscaler load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_network</td>
<td>Network Load Balancer</td>
<td>Server performing network load balancing.</td>
</tr>
<tr>
<td>cmdb_ci_lb_nginx</td>
<td>Nginx Load Balancer</td>
<td>Server functioning as an Nginx load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_pool</td>
<td>Load Balancer Pool</td>
<td>Collection of host-to-port mappings to be balanced.</td>
</tr>
<tr>
<td>cmdb_ci_lb_pool_member</td>
<td>Load Balancer Pool Member</td>
<td>Host-to-port mapping of a request to be balanced.</td>
</tr>
<tr>
<td>cmdb_ci_lb_radware</td>
<td>Radware Load Balancer</td>
<td>Server functioning as a Radware load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb_service</td>
<td>Load Balancer Service</td>
<td>Virtual service that the device balances by forwarding requests to members within a pool.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_lb_template</td>
<td>Load Balancer Template</td>
<td>Load balancer template which contains load balancer-related configuration settings for a specific type of network traffic.</td>
</tr>
<tr>
<td>cmdb_ci_lif</td>
<td>LIF</td>
<td>Logical interface.</td>
</tr>
<tr>
<td>cmdb_ci_lb_vlan</td>
<td>Load Balancer VLAN</td>
<td>Virtual LAN segment.</td>
</tr>
<tr>
<td>cmdb_ci_linux_server</td>
<td>Linux Server</td>
<td>Server running Linux software.</td>
</tr>
<tr>
<td>cmdb_ci_logical_datacenter</td>
<td>Logical Datacenter</td>
<td>VMware vCenter logical datacenter.</td>
</tr>
<tr>
<td>cmdb_ci_lpar</td>
<td>Logical Partition</td>
<td>Logical partition, commonly called an LPAR, is a subset of a computer's hardware resources, virtualized as a separate computer.</td>
</tr>
<tr>
<td>cmdb_ci_lvm_pool</td>
<td>LVM Pool</td>
<td>Linux Volume Manager storage pool.</td>
</tr>
<tr>
<td>cmdb_ci_lvm_pool_member</td>
<td>LVM Pool Member</td>
<td>Linux Volume Manager storage pool member.</td>
</tr>
<tr>
<td>cmdb_ci_mainframe</td>
<td>IBM Mainframe</td>
<td>IBM large-scale computer system.</td>
</tr>
<tr>
<td>cmdb_ci_mainframe_hardware</td>
<td>Mainframe Hardware</td>
<td>The hardware components of a large-scale computer system.</td>
</tr>
<tr>
<td>cmdb_ci_mainframe_lpar</td>
<td>IBM Mainframe LPAR</td>
<td>Logical partition, which is commonly called an LPAR, and is a subset of a mainframes computer's hardware resources, virtualized as a separate computer.</td>
</tr>
<tr>
<td>cmdb_ci_memory_module</td>
<td>Memory Module</td>
<td>Circuit board that provides for memory storage.</td>
</tr>
<tr>
<td>cmdb_ci_mfp_printer</td>
<td>Multi-function Printer</td>
<td>Physical device with scan, copy, and fax capabilities.</td>
</tr>
<tr>
<td>cmdb_ci_microsoft_iis_web_server</td>
<td>Microsoft iis Web Server</td>
<td>Server running Internet Information Services (IIS) for Windows software.</td>
</tr>
<tr>
<td>cmdb_ci_modern_network</td>
<td>Modern Hardware</td>
<td>Physical modern hardware.</td>
</tr>
<tr>
<td>cmdb_ci_mpio_pool</td>
<td>Multipath IO Pool</td>
<td>Multipath IO pool, representing multiple redundant paths to storage.</td>
</tr>
<tr>

<td>Rack</td>
<td>Datacenter racks containing details such as rack units, rack units in use, and power consumption.</td>
</tr>
<tr>
<td>cmdb_ci_raid</td>
<td>RAID</td>
<td>Storage pool using RAID mechanisms to ensure data integrity.</td>
</tr>
<tr>
<td>cmdb_ci_raid_member</td>
<td>RAID Member</td>
<td>Member of storage pool using RAID mechanisms.</td>
</tr>
<tr>
<td>cmdb_ci_resource_group</td>
<td>Resource Group</td>
<td>Resource pool is a logical abstraction for flexible management of resources.</td>
</tr>
<tr>
<td>cmdb_ci_san</td>
<td>Storage Area Network</td>
<td>Network which provides access to block level storage.</td>
</tr>
<tr>
<td>cmdb_ci_san_connection</td>
<td>SAN Connection</td>
<td>Connection in a SAN network.</td>
</tr>
<tr>
<td>cmdb_ci_san_disk</td>
<td>SAN Disk</td>
<td>Base table for the iSCSI Disk (cmdb_ci_iscsi_disk) and the Fibre Channel Disk (cmdb_ci_fc_disk) tables.</td>
</tr>
<tr>
<td>cmdb_ci_san_endpoint</td>
<td>SAN Endpoint</td>
<td>One end of a SAN connection.</td>
</tr>
<tr>
<td>cmdb_ci_san_export</td>
<td>SAN Export</td>
<td>Base table for the iSCSI Export (cmdb_ci_iscsi_export) and the Fibre Channel Export (cmdb_ci_fc_export) tables.</td>
</tr>
<tr>
<td>cmdb_ci_san_fabric</td>
<td>SAN Fabric</td>
<td>Hardware that connects workstations and servers to storage devices in a SAN. Referred to as a “fabric.”</td>
</tr>
<tr>
<td>cmdb_ci_san_zone</td>
<td>SAN Zone</td>
<td>Subset of SAN storage that certain users are restricted to.</td>
</tr>
<tr>
<td>cmdb_ci_san_zone_alias</td>
<td>SAN Zone Alias</td>
<td>Collection of SAN zone members.</td>
</tr>
<tr>
<td>cmdb_ci_san_zone_alias_member</td>
<td>SAN Zone Alias Member</td>
<td>M2m relationship between SAN zone aliases and SAN zone members.</td>
</tr>
<tr>
<td>cmdb_ci_san_zone_member</td>
<td>SAN Zone Member</td>
<td>Ports and devices in a SAN zone.</td>
</tr>
<tr>
<td>cmdb_ci_san_zone_set</td>
<td>SAN Zone Set</td>
<td>Collection of SAN zones.</td>
</tr>
<tr>
<td>cmdb_ci_scanner</td>
<td>Scanner</td>
<td>Hardware used to create digital imagine of paper documents.</td>
</tr>
<tr>
<td>cmdb_ci_server</td>
<td>Server</td>
<td>Base class for all types of servers.</td>
</tr>
<tr>
<td>cmdb_ci_server_snapshot</td>
<td>Server Snapshot</td>
<td>Server snapshot, which is the state of a system at a particular point in time.</td>
</tr>
<tr>
<td>cmdb_ci_service</td>
<td>Business Service</td>
<td>IT Service that directly supports a Business Process (ITIL).</td>
</tr>
<tr>
<td>cmdb_ci_solaris_instance</td>
<td>Solaris Virtual Machine Instance</td>
<td>Virtual machine instance running Solaris software.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_solaris_server</td>
<td>Solaris Server</td>
<td>Physical server running Solaris software.</td>
</tr>
<tr>
<td>cmdb_ci_spkg</td>
<td>Software</td>
<td>Software package information containing details such as version, install count, license count, package name, and key (when SAM enabled).</td>
</tr>
<tr>
<td>cmdb_ci_storage_controller</td>
<td>Storage Controller</td>
<td>Logical device that controls a storage volume or Fibre Channel port.</td>
</tr>
<tr>
<td>cmdb_ci_storage_device</td>
<td>Storage Device</td>
<td>Base table for block storage devices such as DAS, SAN, and NAS.</td>
</tr>
<tr>
<td>cmdb_ci_storage_disk</td>
<td>Storage Disk</td>
<td>Disk installed in a storage server.</td>
</tr>
<tr>
<td>cmdb_ci_storage_export</td>
<td>Storage Export</td>
<td>Base table for the SAN Export (cmdb_ci_san_export) table.</td>
</tr>
<tr>
<td>cmdb_ci_storage_fileshare</td>
<td>Storage File Share</td>
<td>NAS file system on a storage server (an exported file system).</td>
</tr>
<tr>
<td>cmdb_ci_storage_hba</td>
<td>Storage HBA</td>
<td>Host bust adapter for Fibre Channel. The physical device that provides Fibre Channel ports.</td>
</tr>
<tr>
<td>cmdb_ci_storage_pool</td>
<td>Storage Pool</td>
<td>Logical collection of storage.</td>
</tr>
<tr>
<td>cmdb_ci_storage_pool_member</td>
<td>Storage Pool Member</td>
<td>Logical volume in a storage pool.</td>
</tr>
<tr>
<td>cmdb_ci_storage_switch</td>
<td>Storage Switch</td>
<td>Fibre Channel switch.</td>
</tr>
<tr>
<td>cmdb_ci_storage_volume</td>
<td>Storage Volume</td>
<td>Volume on a storage server.</td>
</tr>
<tr>
<td>cmdb_ci_storage_vol_snapshot</td>
<td>Storage Volume Snapshot</td>
<td>Server snapshot is the state of a system at a particular point in time.</td>
</tr>
<tr>
<td>cmdb_ci_subnet</td>
<td>Cloud Mgmt Subnet</td>
<td>Part of a larger network.</td>
</tr>
<tr>
<td>cmdb_ci_sun ldap_dir_server</td>
<td>Sun LDAP Server</td>
<td>Server running Sun ONE Directory Server (LDAP) software.</td>
</tr>
<tr>
<td>cmdb_ci_surge_power_eq</td>
<td>Surger Protection Equipment</td>
<td>Power equipment used to prevent power surges.</td>
</tr>
<tr>
<td>cmdb_ci_tape_server</td>
<td>Server Tape Unit</td>
<td>Hardware for using magnetic tape storage.</td>
</tr>
<tr>
<td>cmdb_ci_tomcat_connector</td>
<td>Tomcat Connector</td>
<td>Software which provides web server plugins to connect web servers with Tomcat and other backends.</td>
</tr>
<tr>
<td>cmdb_ci_translation_rule</td>
<td>NAT</td>
<td>Rules to allow router to remap one network address to another.</td>
</tr>
<tr>
<td>cmdb_ci_ucs_blade</td>
<td>Cisco UCS Blade</td>
<td>Physical Cisco UCS Blade server hardware.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_ucs_chassis</td>
<td>Cisco UCS Chassis</td>
<td>Physical Cisco UCS chassis hardware used to hold Cisco UCS Blade server hardware.</td>
</tr>
<tr>
<td>cmdb_ci_unix_cluster</td>
<td>UNIX Cluster</td>
<td>Set of computers clustered together to present a single Unix server resource.</td>
</tr>
<tr>
<td>cmdb_ci_unix_daemon</td>
<td>UNIX Daemon</td>
<td>Long running Unix background process used to answer requests for services.</td>
</tr>
<tr>
<td>cmdb_ci_unix_server</td>
<td>UNIX Server</td>
<td>Server running Unix software.</td>
</tr>
<tr>
<td>cmdb_ci_ups</td>
<td>UPS</td>
<td>Uninterrupted Power Supply devices.</td>
</tr>
<tr>
<td>cmdb_ci_ups_alarm</td>
<td>UPS Alarm</td>
<td>Uninterrupted Power Supply alarm.</td>
</tr>
<tr>
<td>cmdb_ci_ups_bypass</td>
<td>UPS Bypass</td>
<td>Uninterrupted Power Supply bypass.</td>
</tr>
<tr>
<td>cmdb_ci_ups_input</td>
<td>UPS Input</td>
<td>Electrical input to an Uninterrupted Power Supply device.</td>
</tr>
<tr>
<td>cmdb_ci_ups_output</td>
<td>UPS Output</td>
<td>Electrical output from an Uninterrupted Power Supply device.</td>
</tr>
<tr>
<td>cmdb_ci_ups_power_eq</td>
<td>Uninterruptible Power Supply</td>
<td>Uninterrupted Power Supply devices.</td>
</tr>
<tr>
<td>cmdb_ci_vcenter</td>
<td>VMware vCenter Instance</td>
<td>Installed Instance of VMware VCenter software.</td>
</tr>
<tr>
<td>cmdb_ci_vcenter_cluster</td>
<td>VMware vCenter Cluster</td>
<td>Set of servers that work together while running VMware VCenter software.</td>
</tr>
<tr>
<td>cmdb_ci_vcenter_datacenter</td>
<td>VMware vCenter Datacenter</td>
<td>VMware VCenter data center objects.</td>
</tr>
<tr>
<td>cmdb_ci_vcenter_datastore</td>
<td>VMware vCenter Datastore</td>
<td>VMware VCenter datastore objects containing details such as capacity, freespace, filesystem, and type.</td>
</tr>
<tr>
<td>cmdb_ci_vcenter_datastore_disk</td>
<td>Datastore Disk</td>
<td>Individual VMware VCenter datastore disk.</td>
</tr>
<tr>
<td>cmdb_ci_vcenter_folder</td>
<td>VMware vCenter Folder</td>
<td>VCenter folders, which can be used to group objects of the same type for easier management.</td>
</tr>
<tr>
<td>cmdb_ci_vcenter_network</td>
<td>VMware vCenter Network</td>
<td>VMware vCenter network.</td>
</tr>
<tr>
<td>cmdb_ci_vcenter_object</td>
<td>VMware vCenter Object</td>
<td>Base class for most VMware VCenter objects.</td>
</tr>
<tr>
<td>cmdb_ci_vcenter_server_obj</td>
<td>VMware vCenter Server Object</td>
<td>VMware hypervisor.</td>
</tr>
<tr>

<tr>
<td>cmdb_ci_veritas_disk</td>
<td>Veritas Disk</td>
<td>Physical disk that is controlled by Veritas Volume Manager.</td>
</tr>
<tr>
<td>cmdb_ci_veritas_disk_group</td>
<td>Veritas Disk Group</td>
<td>Collection of disks in Veritas Volume Manager.</td>
</tr>
<tr>
<td>cmdb_ci_veritas_plex</td>
<td>Veritas Plex</td>
<td>Logical partition in Veritas Volume Manager.</td>
</tr>
<tr>
<td>cmdb_ci_veritas_subdisk</td>
<td>Veritas Subdisk</td>
<td>Partition of a Veritas_disk.</td>
</tr>
<tr>
<td>cmdb_ci_veritas_volume</td>
<td>Veritas Volume</td>
<td>Aggregation of plexes.</td>
</tr>
<tr>
<td>cmdb_ci_virtualization_server</td>
<td>Virtualization Server</td>
<td>Base table used by the ESX Server (cmdb_ci_esx_server) table.</td>
</tr>
<tr>
<td>cmdb_ci_virtual_desktop</td>
<td>Virtual Desktop</td>
<td>User's desktop environment (such as icons, wallpaper, windows, folders, toolbars, and widgets) is stored remotely on a server.</td>
</tr>
<tr>
<td>cmdb_ci_virtual_pvt_gateway</td>
<td>Virtual Private Gateway</td>
<td>Two VPN endpoints for automatic failover.</td>
</tr>
<tr>
<td>cmdb_ci_vm</td>
<td>Virtual Machine HyperVisor</td>
<td>Hypevisor software.</td>
</tr>
<tr>
<td>cmdb_ci_vm_instance</td>
<td>Virtual Machine Instance</td>
<td>Generic virtual machines information.</td>
</tr>
<tr>
<td>cmdb_ci_vm_object</td>
<td>Virtual Machine Object</td>
<td>Base class for all VM objects. Parent for all objects such as Hyper-V object and KVM object.</td>
</tr>
<tr>
<td>cmdb_ci_vm_parallels</td>
<td>Parallels</td>
<td>Instance of Parallels software.</td>
</tr>
<tr>
<td>cmdb_ci_vm_template</td>
<td>Virtual Machine Template</td>
<td>Template, which is a master copy of a virtual machine that can be used to create many clones. Base table for all VM templates.</td>
</tr>
<tr>
<td>cmdb_ci_vm_user_credentials</td>
<td>VM User Credentials</td>
<td>Credentials, which are used to authenticate access rights and permissions.</td>
</tr>
<tr>
<td>cmdb_ci_vm_vmware</td>
<td>VMware</td>
<td>VMWare specialization of the Virtual Machine table. No longer used.</td>
</tr>
<tr>
<td>cmdb_ci_vm_zones</td>
<td>Zones</td>
<td>Partitioned virtual OS environment working in a Solaris operating system space.</td>
</tr>
<tr>
<td>cmdb_ci_volume_template</td>
<td>Volume Template</td>
<td>Set of rules that specify one or more capabilities of a storage volume (storage selection and layout rules).</td>
</tr>
<tr>
<td>cmdb_ci_vmware_instance</td>
<td>VMware Virtual Machine Instance</td>
<td>VMware VM instance on VMware hypervisor.</td>
</tr>
<tr>
<td>cmdb_ci_vmware_template</td>
<td>VMware Virtual Machine Template</td>
<td>Master copy of a VMware virtual machine that can be used to create many clones.</td>
</tr>
<tr>

<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_vpc</td>
<td>Virtual Private Cloud</td>
<td>On-demand configurable pool of shared computing resources allocated within a public cloud environment.</td>
</tr>
<tr>
<td>cmdb_ci_vpn</td>
<td>Virtual Private Network</td>
<td>Private network configured to run across a public network.</td>
</tr>
<tr>
<td>cmdb_ci_vpn_connection</td>
<td>VPN Connection</td>
<td>Secure connection to another network over the Internet.</td>
</tr>
<tr>
<td>cmdb_ci_wap_network</td>
<td>Wireless Access Point</td>
<td>Networking hardware device that allows a Wi-Fi compliant device to connect to a wired network.</td>
</tr>
<tr>
<td>cmdb_ci_web_application</td>
<td>Web Application</td>
<td>Client–server software application in which the client (or user interface) runs in a web browser.</td>
</tr>
<tr>
<td>cmdb_ci_web_domino</td>
<td>Lotus Domino HTTP Server</td>
<td>Server running IBM Notes software (formerly Lotus Notes/IBM Domino).</td>
</tr>
<tr>
<td>cmdb_ci_web_service</td>
<td>Web Service</td>
<td>Service offered by an electronic device to another electronic device, communicating with each other via the World Wide Web.</td>
</tr>
<tr>
<td>cmdb_ci_web_site</td>
<td>Web Site</td>
<td>A collection of related web pages.</td>
</tr>
<tr>
<td>cmdb_ci_websphere_cell</td>
<td>Websphere Cell</td>
<td>A logical grouping of IBM Websphere nodes (each of which runs one or more application servers) that are centrally managed.</td>
</tr>
<tr>
<td>cmdb_ci_win_cluster</td>
<td>Windows Cluster</td>
<td>A single (virtual) server composed of one or more physical Windows Servers.</td>
</tr>
<tr>
<td>cmdb_ci_win_cluster_node</td>
<td>Windows Cluster Node</td>
<td>A physical member of the Windows Cluster application.</td>
</tr>
<tr>
<td>cmdb_ci_win_cluster_resource</td>
<td>Windows Cluster Resource</td>
<td>A logical or physical entity managed by the Windows Cluster application.</td>
</tr>
<tr>
<td>cmdb_ci_win_domain_controller</td>
<td>Windows Domain Controller</td>
<td>A server that responds to security authentication requests within a Windows Server domain.</td>
</tr>
<tr>
<td>Table name</td>
<td>Table label</td>
<td>Table description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------------</td>

<tr>
<td>cmdb_ci_win_server</td>
<td>Windows Server</td>
<td>A server running Microsoft Windows Server operating system.</td>
</tr>
<tr>
<td>cmdb_ci_windows_service</td>
<td>Windows Service</td>
<td>A Windows computer program that operates in the background.</td>
</tr>
<tr>
<td>cmdb_ci_zone</td>
<td>Data Center Zone</td>
<td>A specified portion of a data center facility.</td>
</tr>
</tbody>
</table>

**Configuration Item (cmdb_ci) class**

Attributes in the Configuration Item (cmdb_ci) class, which extends the Configuration Item (cmdb) class.

**Attention:** Do not modify any of these attributes in the dictionary. For example, do not modify the type of the location attribute from reference to list. Such modifications may prevent features that use the CMDB, from functioning properly.

**Hardware (cmdb_ci_hardware) class**

Attributes, identification rule, and other important schema structures for the CMDB Hardware (cmdb_ci_hardware) class.
Attributes

The Hardware class adds the following unique attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hardware_status</td>
<td>Status of hardware such as <strong>In Maintenance</strong> or <strong>Retired</strong>. Used to sync status to the Asset class.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>hardware_substatus</td>
<td>Secondary hardware status. Each setting in <code>hardware_status</code> results in a different set of choices available for this field.</td>
</tr>
<tr>
<td>default_gateway</td>
<td>Default gateway that the computer is connected through.</td>
</tr>
</tbody>
</table>

**Key relationship structures**

Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:

- **Serial number:** During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number (cmdb_serial_number) table, with reference back to the Hardware (cmdb_ci_hardware) table.

  - Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).
  - If the system serial number is available, store it in both the Serial Number attribute of the CI and in the Serial Number table.

The Serial Number table is a many to one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number (cmdb_serial_number) table:

- **system:** Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).
- **uuid:** Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.
- **chassis:** Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.
- **bios:** The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.
- **baseboard:** Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM_PhysicalElement, and is sometimes referred to as the 'Motherboard Serial Number'.

- **Network adapter:**

  - Use the Network Adapter (cmdb_ci_network_adapter) class to store network adapters.
  - Set the **Name** attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).
  - Set the **MAC Address** attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros. For example: `f8:f2:1e:00:d4:66`
  - In the CI Relationship (cmdb_rel_ci) table, create an **Owned By::Owns** relationship to the associated Hardware CI. Specify a reference from the Network Adapter (cmdb_ci_network_adapter) table using the CI with a reference to the associated Hardware CI.
- **IP address:**
  - Use the IP Address (cmdb_ci_ip_address) class to store IP addresses.
  - Store an IP address value in the **IP Address** attribute, and in the **Name** attribute (to avoid empty **Name** attributes).
  - Store an IPv4 IP address value using the format `NNN.NNN.NNN.NNN`, with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
  - Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-confirming values should be considered invalid and cleansed to null values.
  - Set the **Netmask** attribute to the IP address.
  - In the CI Relationship (cmdb_rel_ci) table, create an **Owned By::Owns** relationship to the associated Hardware CI.
  - Specify for the IP address a reference to the Network Adapter (cmdb_ci_network_adapter) table using the Configuration Item with a reference to the associated Hardware CI.
  - To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

- **Network adapter and IP address:**
  - Store the MAC address of the network adapter installed on a server, in the Network Adapter (cmdb_ci_network_adapter) class.
  - Store the IP address in the IP Address (cmdb_ci_ip_address) class.
  - Do not store the MAC address or the IP address in the Server (cmdb_ci_server) class.

**Key reference structures**

Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

- **Software and processes running on a server:** The Software (cmdb_ci_spkg) class contains the generic software package that is related to the server CI. The cmdb_sw_instance table instantiates each instance of the software package with:
  - One to one reference back to the Server (cmdb_ci_server) class
  - Many to one reference back to the Software class

These references are stored in the **Installed on** and the **Product Name** reference attributes respectively.

If either the Software Asset Management Foundation (com.snc.sams) or the Software Asset Management (com.snc.software_asset_management) plugin is installed, then store software details in the Software Installation (cmdb_sam_sw_install) table instead of the cmdb_sw_instance table.

- The **Manufacturer** and **Model ID** are reference attributes to the Company (core_company) and Product Model (cmdb_model) tables respectively.
- The **Owned By, Assigned To, Managed By, and Supported By** are reference attributes to the User (sys_user) table. The **Assignment Group** and **Support Group** are reference attributes to the Group (sys_user_group) table.
Identification rule

The base system contains pre-defined identification rules for the Hardware, Computer, and Server classes, which are identical. That identification rule has the following key identifier entries, listed in priority order:

1. Identifier entry which uses lookup-based identification specified with Serial Number (cmdb_serial_number) as the lookup table. The Serial Number table is a many to one reference from Serial Number back to the server CI.

2. Identifier entry specified with the Serial Number attribute in the CI.

3. Identifier entry for the Name attribute. If Serial Number is not available, then the Name (which is the hostname) attribute is used. If both the Serial Number and the Name attributes are provided, then Identification and Reconciliation Engine (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE falls back to using Name.

4. Identifier entry specified for the MAC Address/IP Address attributes in the Network Adapter table. However, do not rely only on the MAC Address/IP Address.

   If both Serial Number and Name are not available, and only MAC Address/IP Address are available, use MAC Address as the name of the CI. Using the MAC Address as the name of the CI ensures that you don’t create an empty CI.

For more information, see CMDB Identification and Reconciliation.

Computer (cmdb_ci_computer) class

Attributes, identification rule, and other important schema structures for the CMDB Computer (cmdb_ci_computer) class.
Attributes

The Computer class adds the following unique attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CD_ROM</td>
<td>Denotes whether a CD ROM exists.</td>
</tr>
<tr>
<td>CD Speed</td>
<td>Speed of CD_ROM.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Chassis type</td>
<td>Type of computer chassis.</td>
</tr>
<tr>
<td>CPU core count</td>
<td>Number of cores per CPU.</td>
</tr>
<tr>
<td>CPU core thread</td>
<td>Number of threads per core.</td>
</tr>
<tr>
<td>CPU count</td>
<td>Number of CPUs.</td>
</tr>
<tr>
<td>CPU name</td>
<td>Name of CPU.</td>

<td>True/False denoting whether the device is running on a virtual machine instance.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reference attribute</th>
<th>Reference to</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU manufacturer</td>
<td>Company (core_company) table</td>
</tr>
</tbody>
</table>

**Schema description**

The CMDB schema model does not separate between servers and computers that are physical and servers and computer that are virtual. Instead, the Computer and the Server classes have a field named IsVirtual. If a computer or server is a virtual instance, set this IsVirtual attribute to true.

As described in the Virtual Machine schema section, to fully model a virtual machine, set the IsVirtual attribute in the Computer or Server CI to true. Create a Virtual Machine Instance (cmdb_ci_vm_instance) record using the BIOS UUID attribute as the key identifier. Then create a Hosted_On relationship between the Virtual Machine Instance record and the Computer or Server instance and set IsVirtual to true.

**Key relationship structures**

Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:
• Serial number: During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number (cmdb_serial_number) table, with reference back to the Hardware (cmdb_ci_hardware) table.
  
  • Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).
  
  • If the system serial number is available, store it in both the Serial Number attribute of the CI and in the Serial Number table.

The Serial Number table is a many to one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number (cmdb_serial_number) table:

• system: Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).

• uuid: Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.

• chassis: Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.

• bios: The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.

• baseboard: Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM_PhysicalElement, and is sometimes referred to as the ‘Motherboard Serial Number’.

• Network adapter:
  
  • Use the Network Adapter (cmdb_ci_network_adapter) class to store network adapters.

  • Set the Name attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).

  • Set the MAC Address attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.

    For example: ‘f8:f2:1e:00:d4:66’

  • In the CI Relationship (cmdb_rel_ci) table, create an Owned By::Owns relationship to the associated Hardware CI. Specify a reference from the Network Adapter (cmdb_ci_network_adapter) table using the CI with a reference to the associated Hardware CI.

• IP address:

  • Use the IP Address (cmdb_ci_ip_address) class to store IP addresses.

  • Store an IP address value in the IP Address attribute, and in the Name attribute (to avoid empty Name attributes).

  • Store an IPv4 IP address value using the format ‘NNN.NNN.NNN.NNN’, with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.

  • Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-conforming values should be considered invalid and cleansed to null values.

  • Set the Netmask attribute to the IP address.

  • In the CI Relationship (cmdb_rel_ci) table, create an Owned By::Owns relationship to the associated Hardware CI.

  • Specify for the IP address a reference to the Network Adapter (cmdb_ci_network_adapter) table using the Configuration Item with a reference to the associated Hardware CI.
- To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

- Network adapter and IP address:
  - Store the MAC address of the network adapter installed on a server, in the Network Adapter (cmdb_ci_network_adapter) class.
  - Store the IP address in the IP Address (cmdb_ci_ip_address) class.
  - Do not store the MAC address or the IP address in the Server (cmdb_ci_server) class.

**Key reference structures**

Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

- Software and processes running on a server: The Software (cmdb_ci_spkg) class contains the generic software package that is related to the server CI. The cmdb_sw_instance table instantiates each instance of the software package with:
  - One to one reference back to the Server (cmdb_ci_server) class
  - Many to one reference back to the Software class

These references are stored in the **Installed on** and the **Product Name** reference attributes respectively.

If either the Software Asset Management Foundation (com.snc.sams) or the Software Asset Management (com.snc.software_asset_management) plugin is installed, then store software details in the Software Installation (cmdb_sam_sw_install) table instead of the cmdb_sw_instance table.

- The **Manufacturer** and **Model ID** are reference attributes to the Company (core_company) and Product Model (cmdb_model) tables respectively.
- The **Owned By, Assigned To, Managed By**, and **Supported By** are reference attributes to the User (sys_user) table. The **Assignment Group** and **Support Group** are reference attributes to the Group (sys_user_group) table.

**Identification rule**

The base system contains pre-defined identification rules for the Hardware, Computer, and Server classes, which are identical. That identification rule has the following key identifier entries, listed in priority order:

1. Identifier entry which uses lookup-based identification specified with Serial Number (cmdb_serial_number) as the lookup table. The Serial Number table is a many to one reference from Serial Number back to the server CI.

2. Identifier entry specified with the **Serial Number** attribute in the CI.

3. Identifier entry for the **Name** attribute. If **Serial Number** is not available, then the **Name** (which is the hostname) attribute is used. If both the **Serial Number** and the **Name** attributes are provided, then Identification and Reconciliation Engine (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE falls back to using Name.

4. Identifier entry specified for the **MAC Address/IP Address** attributes in the Network Adapter table. However, do not rely only on the **MAC Address/IP Address**.
If both **Serial Number** and **Name** are not available, and only **MAC Address/IP Address** are available, use **MAC Address** as the name of the CI. Using the **MAC Address** as the name of the CI ensures that you don’t create an empty CI.

For more information, see *CMDB Identification and Reconciliation*.

**Server (cmdb_ci_server) class**

Attributes, identification rule, and other important schema structures for the CMDB Server (cmdb_ci_server) class.
Attributes

The Server class adds the following unique attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>Type of server, such as production, development, disaster recovery, or user acceptance testing (UAT).</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Firewall status</td>
<td>Internet or intranet facing server.</td>
</tr>
<tr>
<td>Host name</td>
<td>Use the Name attribute to store the host name of the server instead of the Host name attribute.</td>
</tr>
<tr>
<td>Used for</td>
<td>Business service supported by the server, such as production, staging, or quality assurance (QA). This attribute uses the Used for choice list field from the Service (cmdb_ci_service) table.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Reference attribute</th>
<th>Reference to</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disaster backup</td>
<td>Server (cmdb_ci_server) table. Reference to another server that is the backup server for this server.</td>
</tr>
</tbody>
</table>

**Reference classes**

The following reference classes extend the Server class. They do not add any new attributes.

<table>
<thead>
<tr>
<th>Reference class</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmdb_ci_solaris_server</td>
<td>Solaris Server</td>
<td>Server running Oracle Solaris operating system.</td>
</tr>
<tr>
<td>cmdb_ci_lbcisco_csm</td>
<td>Cisco CSM</td>
<td>Cisco Security Manager (CSM) load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_win_server</td>
<td>Windows Server</td>
<td>Server running Microsoft Windows Server operating system.</td>
</tr>
<tr>
<td>cmdb_ci_lbacce</td>
<td>ACE</td>
<td>Cisco Application Control Engine load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lbnetscaler</td>
<td>Citrix Netscaler</td>
<td>Citrix Netscaler load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lbalteon</td>
<td>Alteon</td>
<td>Alteon load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lb</td>
<td>Load Balancer</td>
<td>Generic load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lba10</td>
<td>A10 Load Balancer</td>
<td>A10 load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lbcisco_css</td>
<td>Cisco CSS</td>
<td>Cisco Content Services Switch (CSS) load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_lbcisco_gss</td>
<td>Cisco GSS</td>
<td>Cisco Global Site Selector (GSS) load balancer.</td>
</tr>
<tr>
<td>cmdb_ci_osx_server</td>
<td>OS/X Server</td>
<td>Server running OS/X operating system.</td>
</tr>
<tr>
<td>cmdb_ci_HPUX_Server</td>
<td>HPUX Server</td>
<td>Server running HP-UX operating system.</td>
</tr>
<tr>
<td>cmdb_ci_tape_server</td>
<td>Server Tape Unit</td>
<td>Server using a tape drive.</td>
</tr>
<tr>
<td>cmdb_ci_Server_Hardware</td>
<td>Server Hardware</td>
<td>Server hardware.</td>
</tr>
<tr>
<td>Reference class</td>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------</td>
<td>-----------------------------</td>
<td>--------------------------------------------------------------</td>
</tr>
<tr>
<td>cmdb_ci_datapower_server</td>
<td>Data Power Hosting Server</td>
<td>IBM DataPower hosting server.</td>
</tr>
<tr>
<td>cmdb_ci_net_app_server</td>
<td>Network Appliance Hardware</td>
<td>NetApp hardware.</td>
</tr>
<tr>
<td>cmdb_ci_netware_server</td>
<td>Netware Server</td>
<td>Server running NetWare operating system.</td>
</tr>
<tr>
<td>cmdb_ci_ibm_zos_server</td>
<td>IBM zOS Server</td>
<td>Server running IBM z/OS operating system.</td>
</tr>
<tr>
<td>cmdb_ci_storage_node_element</td>
<td>Storage Node Element</td>
<td>Storage node.</td>
</tr>
<tr>
<td>cmdb_ci_chassis_server</td>
<td>Server Chassis</td>
<td>Server chassis.</td>
</tr>
<tr>
<td>cmdb_ci_lb_network</td>
<td>Network Load Balancer</td>
<td>Network load balancer hardware.</td>
</tr>
<tr>
<td>cmdb_ci_Unix_Server</td>
<td>Unix Server</td>
<td>Server running Unix operating system.</td>
</tr>
<tr>
<td>cmdb_ci_virtualization_server</td>
<td>Virtualization Server</td>
<td>Abstract base table used by Hyper-V Server (cmdb_ci_hyper_v_server) and ESX Server (cmdb_ci_esx_server).</td>
</tr>
<tr>
<td>cmdb_ci_mainframe</td>
<td>IBM Mainframe</td>
<td>Large-scale computer system with high-end capabilities.</td>
</tr>
</tbody>
</table>

**Schema description**

The CMDB schema model does not separate between servers and computers that are physical and servers and computer that are virtual. Instead, the Computer and the Server classes have a field named **IsVirtual**. If a computer or server is a virtual instance, set this **IsVirtual** attribute to **true**.

As described in the Virtual Machine schema section, to fully model a virtual machine, set the **IsVirtual** attribute in the Computer or Server CI to **true**. Create a Virtual Machine Instance (cmdb_ci_vm_instance) record using the BIOS UUID attribute as the key identifier. Then create a Hosted_On relationship between the Virtual Machine Instance record and the Computer or Server instance and set **IsVirtual** to **true**.

**Key relationship structures**

Use the following key relationships as important guidelines when creating Hardware, Computer, or Server CIs:

- Serial number: During CI identification, Identification and Reconciliation Engine (IRE) processes search for a serial number in two locations. One is the CI serial number attribute, and the second one is the Serial Number (cmdb_serial_number) table, with reference back to the Hardware (cmdb_ci_hardware) table.
  - Store any serial number of any type other than System, only in the Serial Number table (and not in the server CI attribute).
  - If the system serial number is available, store it in both the **Serial Number** attribute of the CI and in the Serial Number table.

The Serial Number table is a many-to-one relationship linking back to the server CI. This table has a type field for specifying the type of the serial number (system, uuid, chassis, bios, or baseboard) and storing the actual value itself. Use the following Windows standards for serial number types in the Serial Number (cmdb_serial_number) table:

- **system**: Product identification such as a serial number for software, a die number on a hardware chip, or a project number (for noncommercial products).
- **uuid**: Universally unique identifier (UUID) for the product. A UUID is a 128-bit identifier that is guaranteed to be different from other generated UUIDs.
- **chassis**: Manufacturer-allocated number that is used to identify a physical element. Value is the Serial Number member of the System Enclosure or Chassis structure in the SMBIOS information. This type represents the properties associated with a physical system enclosure.
- **bios**: The assigned serial number of the BIOS. This type represents the attributes of the computer system basic input/output services (BIOS) that are installed on the computer.
- **baseboard**: Manufacturer-allocated number that is used to identify the physical element. This property is inherited from CIM PhysicalElement, and is sometimes referred to as the 'Motherboard Serial Number'.

**Network adapter:**

- Use the Network Adapter (cmdb_ci_network_adapter) class to store network adapters.
- Set the **Name** attribute in the Network Adapter class to be the name of the Network Adapter device (such as eth0, eth1).
- Set the **MAC Address** attribute to be the MAC address value. Format the string with colon separators between octets and lower case hexadecimal characters with padded zeros.
  
  For example: 'f8:f2:1e:00:d4:66'

- In the CI Relationship (cmdb_rel_ci) table, create an **Owned By::Owns** relationship to the associated Hardware CI. Specify a reference from the Network Adapter (cmdb_ci_network_adapter) table using the CI with a reference to the associated Hardware CI.

**IP address:**

- Use the IP Address (cmdb_ci_ip_address) class to store IP addresses.
- Store an IP address value in the **IP Address** attribute, and in the **Name** attribute (to avoid empty **Name** attributes).
- Store an IPv4 IP address value using the format 'NNN.NNN.NNN.NNN', with decimal-based octets and period separators. Non-conforming values should be considered invalid and cleansed to null values.
- Store an IPv6 IP address value using lower case hexadecimal with colon separators. Non-conforming values should be considered invalid and cleansed to null values.
- Set the **Netmask** attribute to the IP address.
- In the CI Relationship (cmdb_rel_ci) table, create an **Owned By::Owns** relationship to the associated Hardware CI.
- Specify for the IP address a reference to the Network Adapter (cmdb_ci_network_adapter) table using the Configuration Item with a reference to the associated Hardware CI.
- To ensure that base system identification rules work properly, also store the IP address in the associated Network Adapter class.

**Network adapter and IP address:**

- Store the MAC address of the network adapter installed on a server, in the Network Adapter (cmdb_ci_network_adapter) class.
- Store the IP address in the IP Address (cmdb_ci_ip_address) class.
- Do not store the MAC address or the IP address in the Server (cmdb_ci_server) class.
Key reference structures

Use the following key references as important guidelines when creating Hardware, Computer, or Server CIs:

- **Software and processes running on a server**: The Software (cmdb_ci_spkg) class contains the generic software package that is related to the server CI. The cmdb_sw_instance table instantiates each instance of the software package with:
  - One to one reference back to the Server (cmdb_ci_server) class
  - Many to one reference back to the Software class

These references are stored in the **Installed on** and the **Product Name** reference attributes respectively.

If either the Software Asset Management Foundation (com.snc.sams) or the Software Asset Management (com.snc.software_asset_management) plugin is installed, then store software details in the Software Installation (cmdb_sam_sw_install) table instead of the cmdb_sw_instance table.

- **The Manufacturer** and **Model ID** are reference attributes to the Company (core_company) and Product Model (cmdb_model) tables respectively.
- **The Owned By, Assigned To, Managed By**, and **Supported By** are reference attributes to the User (sys_user) table. The **Assignment Group** and **Support Group** are reference attributes to the Group (sys_user_group) table.

Identification rule

The base system contains pre-defined identification rules for the Hardware, Computer, and Server classes, which are identical. That identification rule has the following key identifier entries, listed in priority order:

1. Identifier entry which uses lookup-based identification specified with Serial Number (cmdb_serial_number) as the lookup table. The Serial Number table is a many to one reference from Serial Number back to the server CI.

2. Identifier entry specified with the **Serial Number** attribute in the CI.

3. Identifier entry for the **Name** attribute. If **Serial Number** is not available, then the **Name** (which is the hostname) attribute is used. If both the **Serial Number** and the **Name** attributes are provided, then Identification and Reconciliation Engine (IRE) looks first for the Serial Number. Then, if a Serial Number is not found, IRE falls back to using Name.

4. Identifier entry specified for the **MAC Address/IP Address** attributes in the Network Adapter table. However, do not rely only on the **MAC Address/IP Address**.

   If both **Serial Number** and **Name** are not available, and only **MAC Address/IP Address** are available, use **MAC Address** as the name of the CI. Using the **MAC Address** as the name of the CI ensures that you don’t create an empty CI.

For more information, see [CMDB Identification and Reconciliation](https://service-now.com).

**VMware vCenter Object (cmdb_ci_vcenter_object) class**

Attributes, identification rule, and other important schema structures for Virtual Machine related classes.
Schema description

ServiceNow® has an extensive modeling of virtual machines (VMs) environment, with classes such as:

- VMware vCenter Cluster (cmdb_ci_vcenter_cluster)
- VMware vCenter datacenter (cmdb_ci_vcenter_datacenter)
- VMware Virtual Machine Instance (cmdb_ci_vmware_instance)

Virtual machines are modeled just like any other server, but with the `isVirtual` attribute set to `true`. 
VMware vCenter Instance schema structure

In the diagram above, the 'Discovered' virtual server is referred to as the 'Guest' (VM object). Follow the preceding diagram for any further modeling of VMware components.

Key reference structures

The Guest has the following important key reference structures:
• An Instantiates::InstantiatedBy relationship with the cmdb_ci_vmware_instance (which is the VM instance reported by Center).
• A Virtualizes::Virtualized by relationship with ESXi Server (the hardware with the ESXi virtualization software installed).
• Guest (Discovered, VMOBJECT) also has a HasRegistered::RegisteredOn relationship to ESXi Server.

Identification rules

• Guest operating system: Guest operating system is modeled as Server (with IsVirtual set to true) and therefore identification rules follow the rules for the Server class. In most operating systems, BIOS UUID is reported as serial number. It is essential that you follow proper VMware guidelines to ensure that BIOS UUID is not being reused. Having a cloned BIOS UUID causes issues with identification rules.
• VM Instances: IRE uses instance MosRef ID as key identifier.
• ESX Server: Server is modeled as bare metal Server (with IsVirtual set to false) and therefore applies the Server class identification rules.

CMDB CI Class Models store app

Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

CMDB CI Class Models: Release 1.10.0

The CMDB CI Class Models store app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.

What's new in this release

CMDB CI Class Models: Release 1.10.0 adds classes for the following:

- Firewalls
- VMware NSX load balancers

Firewalls

A firewall is a network security system that monitors and controls incoming and outgoing network traffic, based on security policies. Firewalls typically constitute a barrier between an internal network and an untrusted external network, such as the internet. It usually consists of security policies that help secure an organization from external threats and cyber attacks. Firewall vendors may provide a centralized firewall manager to manage many firewall devices and the security policies residing on them. For example, Panorama™ is the centralized management system for Palo Alto Networks firewalls.
**VMware NSX load balancers**

NSX is a network virtualization solution offered by VMware. Among the virtual resources included in the NSX solution are virtual LANs (VLANs), virtual load balancers, virtual routers, switches, and firewalls.

ServiceNow Discovery uses the *VMware NSX load balancer discovery* pattern to find VMware NSX load balancers and their components: Listeners, pools, pool members, and health services.

---

**VMware NSX load balancer classes integrated with the CMDB class hierarchy**

**Classes**

This section lists the classes that the CMDB CI Class Models store app adds or updates.

CMDB CI Class Models: Release 1.10.0 adds the following classes for firewall devices.
## ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firewall Device (cmdb_ci_firewall_device)</td>
<td>IP Firewall (cmdb_ci_ip_firewall)</td>
<td>Network security system that monitors and controls incoming and outgoing network traffic, based on security policies.</td>

CMDB CI Class Models: Release 1.10.0 adds the following classes for the VMware NSX load balancer.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSX Load Balancer (cmdb_ci_nsx_lb)</td>
<td>Load Balancer (cmdb_ci_lb)</td>
<td>The table containing the NSX Load Balancer resources.</td>
</tr>
</tbody>
</table>

### Class columns

The *VMware NSX load balancer discovery* pattern introduces one new table with one identification rule and entry. The table uses only the columns inherited from its parent.

### CMDB CI Class Models: Release 1.8.0

The CMDB CI Class Models store app adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs and discover various technologies and software.
What’s new in this release

CMDB CI Class Models: Release 1.8.0 adds classes for the following:
• OpenStack

OpenStack

OpenStack is a cloud operating system that controls large pools of compute, storage, and networking resources throughout a datacenter. All of these resources are managed and provisioned through APIs with common authentication mechanisms. Other components provide services such as orchestration, fault management, and service management to ensure high availability of user applications. OpenStack is broken up into services to enable you to plug and play components depending on your needs. These components are designed for horizontal scalability, so you can easily add new resources to grow your cloud over time.
OpenStack classes integrated with the CMDB class hierarchy
Classes

The CMDB CI Class Models store app adds or updates the following classes.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpenStack Services (cmdb_ci_cloud_openstack_service)</td>
<td>Virtual Machine Object (cmdb_ci_vm_object)</td>
<td>An OpenStack web service that can be accessed via a URL.</td>
</tr>
<tr>
<td>OpenStack Endpoint (cmdb_ci_cloud_openstack_endpoint)</td>
<td>Virtual Machine Object (cmdb_ci_vm_object)</td>
<td>The access point of a Service.</td>
</tr>
<tr>
<td>OpenStack Domain (cmdb_ci_cloud_openstack_domain)</td>
<td>Virtual Machine Object (cmdb_ci_vm_object)</td>
<td>A collection of users, groups, and projects.</td>
</tr>
</tbody>
</table>

Class Columns

The CMDB CI Class Models store app adds the following columns to the relevant classes.

**OpenStack Services (cmdb_ci_cloud_openstack_service) class**

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>The Service type, which describes the API implemented by the Service. Possible values: Compute, ec2, identity, image, network, or volume.</td>
</tr>
<tr>
<td>enabled</td>
<td>Defines if the service and its endpoints appear in the Service catalog (true/false).</td>
</tr>
</tbody>
</table>

**OpenStack Endpoint (cmdb_ci_cloud_openstack_endpoint) class**

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface</td>
<td>The interface type, which describes the visibility of the endpoint. Possible values: • public - Visible by end users on a publicly available network interface. • internal - Visible by end users on an unmetered internal network interface. • admin - Visible by administrative users on a secure network interface.</td>
</tr>
<tr>
<td>enabled</td>
<td>Defines if the Service and its endpoints appear in the Service catalog (true/false).</td>
</tr>
</tbody>
</table>

**OpenStack Domain (cmdb_ci_cloud_openstack_domain) class**

<table>
<thead>
<tr>
<th>Added columns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Defines if the domain is enabled (true/false).</td>
</tr>
</tbody>
</table>
CMDB CI Class Models: Release 1.6.0

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

Use extension classes

The CMDB CI Class Models app adds classes, columns, and the associated metadata, as related records in the following tables:

- CMDB Class Information (cmdb_class_info): Class descriptions
- Identifier (cmdb_identifier): Identification rules
- Identifier Entry (cmdb_identifier_entry): Identification entries
- CMDB Metadata Hosting Rules (cmdb_metadata_hosting): Dependent relationships

After installation, navigate to Configuration and then click CI Class Manager. Then click Hierarchy in CI Class Manager to display the CI Classes list. This list contains the added classes, such as the Nutanix classes. Select a class to see the corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.

Use extension classes as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover various technologies and software such as the Nutanix Enterprise Cloud software.

Note: Uninstalling the CMDB CI Class Models application might compromise the integrity of the CMDB and result in unexpected behavior.

Internet of Things (IoT)

IoT is a system of interrelated computing devices, mechanical and digital machines, objects, animals or people that are provided with unique identifiers and the ability to transfer data over a network without requiring human-to-human or human-to-computer interaction. The classes added in this release, extend the Data Model to provide a foundation for the representation of IoT CI classes. This foundation underpins workflows for Enterprise Asset Management (EAM), Governance Risk Compliance (GRC), Component Supply Management (CSM), and Field Service Management (FSM) surrounding the management of IoT devices and the transport vehicles that some reside in.
IoT extension classes integrated with the CMDB class hierarchy

AVI Load Balancer

The Avi Vantage platform is built on software-defined principles, enabling a next generation architecture to deliver the flexibility and simplicity expected by IT and lines of business. The Avi
Vantage platform architecture separates the data and control planes to deliver application services beyond load balancing, such as application analytics, predictive autoscaling, and self-service, for app owners in on-premises or cloud environments. The platform provides a centrally managed, dynamic pool of load balancing resources on commodity x86 servers, virtual machines, or containers, to deliver granular services close to individual applications. Providing these services allows network services to scale near infinitely without the added complexity of managing hundreds of disparate appliances.

Avi load balancer classes integrated with the CMDB class hierarchy

**Classes**

The CMDB CI Class Models store app adds or updates the following classes. See the respective class section for further details.

<table>
<thead>
<tr>
<th>Class</th>

CMDB CI Class Models: Release 1.5.0

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

Use extension classes

The CMDB CI Class Models app adds classes, columns, and the associated metadata, as related records in the following tables:

- CMDB Class Information (cmdb_class_info): Class descriptions
- Identifier (cmdb_identifier): Identification rules
- Identifier Entry (cmdb_identifier_entry): Identification entries
- CMDB Metadata Hosting Rules (cmdb_metadata_hosting): Dependent relationships

After installation, navigate to Configuration and then click CI Class Manager. Then click Hierarchy in CI Class Manager to display the CI Classes list. This list contains the added classes, such as the Nutanix classes. Select a class to see the corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.

Use extension classes as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover various technologies and software such as the Nutanix Enterprise Cloud software.

Note: Uninstalling the CMDB CI Class Models application might compromise the integrity of the CMDB and result in unexpected behavior.

Red Hat Virtualization (RHV)

Red Hat Virtualization (RHV) is a virtualization product which is based on the Kernel-based Virtual Machine (KVM) hypervisor. RHV uses the SPICE protocol and Virtual Desktop Server Manager (VDSM) with a RHEL-based centralized management server. RHV solution is based on two primary software components: Red Hat Virtualization Manager (RHV-M) and Red Hat Virtualization Hypervisors or hosts: Red Hat Enterprise Linux or RHV Host (RHV-H).
RHV classes integrated with the CMDB class hierarchy

Classes
The CMDB CI Class Models store app adds or updates the following classes. See the respective class section for further details.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RHV Server</td>
<td>Virtualization Server</td>
<td>The RHV virtualization host.</td>
</tr>
<tr>
<td>(cmdb_ci_rhv_server)</td>
<td>(cmdb_ci_virtualization_server)</td>
<td></td>
</tr>
<tr>
<td>RHV Object</td>
<td>Virtual Machine Object</td>
<td>A base class for other classes to</td>
</tr>
<tr>
<td>(cmdb_ci_rhv_object)</td>
<td>(cmdb_ci_vm_object)</td>
<td>derive from.</td>
</tr>
</tbody>
</table>
### RHV Server

The CMDB CI Class Models store app adds the following columns to the RHV Server (cmdb_ci_rhv_server) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>URL used to access the object.</td>
</tr>
</tbody>
</table>

### RHV Object

The CMDB CI Class Models store app adds the following columns to the RHV Object (cmdb_ci_rhv_object) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href_id</td>
<td>Href ID.</td>
</tr>
<tr>
<td>manager_id</td>
<td>Manager ID.</td>
</tr>
<tr>
<td>url</td>
<td>URL to access the object (used in child classes).</td>
</tr>
</tbody>
</table>
**RHV Manager**

The CMDB CI Class Models store app adds the following columns to the RHV Manager (cmdb_ci_rhv_manager) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>URL of the manager.</td>
</tr>
<tr>
<td>product_name</td>
<td>Product name.</td>
</tr>
</tbody>
</table>

**RHV Cluster**

The CMDB CI Class Models store app adds the following columns to the RHV Cluster (cmdb_ci_rhv_cluster) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cpu_type</td>
<td>CPU type.</td>
</tr>
<tr>
<td>cpu_architecture</td>
<td>CPU architecture.</td>
</tr>
<tr>
<td>ksm</td>
<td>Enabled state of kernel same-page merging (KSM) memory policy.</td>
</tr>
<tr>
<td>fencing_policy</td>
<td>Fencing policy.</td>
</tr>
<tr>
<td>memory_overcommitment</td>
<td>Amount of over-commitment memory allowed on the cluster.</td>
</tr>
<tr>
<td>transparent_huge_pages</td>
<td>Transparent huge memory pages policy.</td>
</tr>
<tr>
<td>ballooning</td>
<td>Memory ballooning for guests.</td>
</tr>
<tr>
<td>compatibility_version</td>
<td>Compatibility version.</td>
</tr>
</tbody>
</table>

**RHV Datacenter**

The CMDB CI Class Models store app adds the following columns to the RHV Datacenter (cmdb_ci_rhv_datacenter) class.

**Note:** This class is being deleted in the CMDB CI Class Models 1.6.0 release.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>quota_mode</td>
<td>Quota mode policy.</td>
</tr>
</tbody>
</table>

**RHV Virtual Machine Instance**

The CMDB CI Class Models store app adds the following columns to the RHV Virtual Machine Instance (cmdb_ci_rhv_vm_instance) class.
<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mgmt_url</td>
<td>Management URL.</td>
</tr>
<tr>
<td>cpu_architecture</td>
<td>CPU architecture.</td>
</tr>
<tr>
<td>delete_protected</td>
<td>Delete protected (true/false).</td>
</tr>
<tr>
<td>ha_priority</td>
<td>HA priority.</td>
</tr>
<tr>
<td>high_availability</td>
<td>High availability (true/false).</td>
</tr>
<tr>
<td>memory_policy_guaranteed</td>
<td>Amount of memory guaranteed (MB).</td>
</tr>
<tr>
<td>memory_policy_max_mb</td>
<td>Maximum memory in the dynamic memory allocation policy.</td>
</tr>
<tr>
<td>multi_queues</td>
<td>Multi queues.</td>
</tr>
<tr>
<td>placement_policy</td>
<td>Placement policy.</td>
</tr>
<tr>
<td>cpu_sockets</td>
<td>Number of CPU sockets.</td>
</tr>
<tr>
<td>stateless</td>
<td>Stateless (true/false).</td>
</tr>
<tr>
<td>storage_error_resume_behaviour</td>
<td>Behavior of a virtual machine that is paused due to storage I/O error. For examples, AUTO_RESUME, LEAVE_PAUSED, and KILL.</td>
</tr>
<tr>
<td>start_time</td>
<td>Start time.</td>
</tr>
<tr>
<td>stop_time</td>
<td>Stop time.</td>
</tr>
<tr>
<td>threads</td>
<td>Number of threads.</td>
</tr>
<tr>
<td>time_zone</td>
<td>Time zone.</td>
</tr>
<tr>
<td>usb</td>
<td>USB enabled state.</td>
</tr>
<tr>
<td>run_once</td>
<td>Run once.</td>
</tr>
<tr>
<td>type</td>
<td>RHV type.</td>
</tr>
</tbody>
</table>

**Nutanix Prism Central**

The Nutanix Prism Central (cmdb_ci_nutanix_prism_central) class has no added columns.

**CMDB CI Class Models: Release 1.4.0**

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.
Use extension classes

The CMDB CI Class Models app adds classes, columns, and the associated metadata, as related records in the following tables:

- CMDB Class Information (cmdb_class_info): Class descriptions
- Identifier (cmdb_identifier): Identification rules
- Identifier Entry (cmdb_identifier_entry): Identification entries
- CMDB Metadata Hosting Rules (cmdb_metadata_hosting): Dependent relationships

After installation, navigate to Configuration and then click CI Class Manager. Then click Hierarchy in CI Class Manager to display the CI Classes list. This list contains the added classes, such as the Nutanix classes. Select a class to see the corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.

Use extension classes as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover various technologies and software such as the Nutanix Enterprise Cloud software.

Note: Uninstalling the CMDB CI Class Models application might compromise the integrity of the CMDB and result in unexpected behavior.

Classes

The CMDB CI Class Models store app updates the following class. See the class section for further details about the updates.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
</table>

Unique Certificate

The CMDB CI Class Models store app changes the Unique Certificate (cmdb_ci_certificate) class as follows:

- The assigned_to attribute now depends on the assignment_group attribute so that users in the assigned_to attribute are filtered based on the specified assignment_group.
- The Certificate Inventory and Management store app populates the Unique Certificate (cmdb_ci_certificate) table. The list view for that class does not have a New button and you can no longer add new records to the table. This is because there are certain fields that are extracted from binary encoded parameters in the certificate which users may not be able to provide. Also, certificates have to be discovered rather uploaded.
- You can no longer add or delete attachments in the Certificate file attribute.

CMDB CI Class Models: Release 1.3.0

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any
other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

**Use extension classes**

The CMDB CI Class Models app adds classes, columns, and the associated metadata, as related records in the following tables:

- CMDB Class Information (cmdb_class_info): Class descriptions
- Identifier (cmdb_identifier): Identification rules
- Identifier Entry (cmdb_identifier_entry): Identification entries
- CMDB Metadata Hosting Rules (cmdb_metadata_hosting): Dependent relationships

After installation, navigate to Configuration and then click CI Class Manager. Then click Hierarchy in CI Class Manager to display the CI Classes list. This list contains the added classes, such as the Nutanix classes. Select a class to see the corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.

Use extension classes as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover various technologies and software such as the Nutanix Enterprise Cloud software.

**Note:** Uninstalling the CMDB CI Class Models application might compromise the integrity of the CMDB and result in unexpected behavior.

**Scoped apps certification classes**

The scoped apps certification classes support certification of scoped apps. With these classes you can pro-actively manage certificates by keeping stakeholders informed about any impending expiries. Use these extension classes to ensure that certificates are monitored and renewed before they expire, to prevent severe outage of production systems.

**Classes**

The CMDB CI Class Models store app adds or updates (by adding new columns) the following classes. See each respective class section for further details about the columns added for each class.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Certificate (cmdb_ci_certificate)</td>
<td>Configuration Item (cmdb_ci)</td>
<td>N/A</td>
</tr>
<tr>
<td>Certificate Domain (certificate_domain)</td>
<td>N/A</td>
<td>Fully qualified domain name.</td>
</tr>
<tr>
<td>Class</td>

</tr>
</tbody>
</table>

**Unique Certificate**

The CMDB CI Class Models store app adds the following columns to the Unique Certificate (cmdb_ci_certificate) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certificate file</td>
<td>Certificate in an encoded form.</td>
</tr>
<tr>
<td>Fingerprint</td>
<td>Hash value of the certificate.</td>
</tr>
<tr>
<td>Fingerprint algorithm</td>
<td>Algorithm used to hash the certificate.</td>
</tr>
<tr>
<td>Is certificate authority</td>
<td>Indicates whether a certificate is a Certificate Authority (CA) or not.</td>
</tr>
<tr>
<td>Is selfsigned</td>
<td>Indicates whether the certificate is self-signed or not.</td>
</tr>
<tr>
<td>Issuer</td>
<td>Entity that has signed and issued the certificate.</td>
</tr>
<tr>
<td>Issuer common name</td>
<td>Common name of the issuer.</td>
</tr>
<tr>
<td>Issuer distinguished name</td>
<td>Distinguished name of the issuer.</td>
</tr>
<tr>
<td>Key size</td>
<td>Size of the key used by the signing algorithm.</td>
</tr>
<tr>
<td>Choices:</td>
<td>• Create priority 1 tasks</td>
</tr>
<tr>
<td></td>
<td>• Create priority 3 tasks</td>
</tr>
<tr>
<td></td>
<td>• Do not create renewal tasks</td>
</tr>
<tr>
<td>Renewal tracking</td>
<td>Indicates whether to create any priority 1 or priority 3 tasks for the expiring certificates.</td>
</tr>
<tr>
<td>Root issuer</td>
<td>Root entity that has signed and issued the intermediate certificate.</td>
</tr>
<tr>
<td>Choices:</td>
<td>• External</td>
</tr>
<tr>
<td></td>
<td>• Internal</td>
</tr>
</tbody>
</table>
### Columns (added)  
**Description**

<table>
<thead>
<tr>
<th>Service type</th>
<th>Indicates whether the certificate is used for external or internal services.</th>
</tr>
</thead>
</table>
| Signature algorithm | The cryptographic algorithm used to sign the certificate.  
  **Choices:**  
  - Issued  
  - Installed  
  - Revoked  
  - Retired |
| State | Lifecycle states of the certificate. |
| Subject alternative name | List of fully qualified domain names secured by the certificate.  
  **Reference:** Certificate Domain (certificate_domain) |
| Subject common name | Identifies the hostname/domain associated with the certificate. |
| Subject country | Subject's two letter country code. |
| Subject distinguished name | Identifying information of the subject. |
| Subject email | Subject's email. |
| Subject locality | Subject's locality. |
| Subject organization | Subject's organization. |
| Subject organizational unit | Subject's organizational unit. |
| Subject state | Subject's state. |
| Valid from | Validity start period of the certificate. |
| Valid to | Validity end period of the certificate. |
| Version | X.509 version of the certificate. |

### Certificate Domain

The CMDB CI Class Models store app adds the following column to the Certificate Domain (certificate_domain) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>Fully qualified domain name.</td>
</tr>
</tbody>
</table>

### IBM Frame

The CMDB CI Class Models store app adds the following columns to the IBM Frame (cmdb_ci_ibm_frame) class.
### IBM HMC Processor pool

The CMDB CI Class Models store app adds the following columns to the IBM HMC Processor pool (cmdb_ci_processor_pool) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LPAR IDs</td>
<td>LPAR IDs.</td>
</tr>
<tr>
<td>LPAR names</td>
<td>LPAR names.</td>
</tr>
<tr>
<td>Frame name</td>
<td>Frame name.</td>
</tr>
</tbody>
</table>

### CMDB CI Class Models: IBM HMC (Release 1.2.0)

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

### Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

### Use extension classes

The CMDB CI Class Models app adds the classes and columns and the metadata associated with each class as related records in the following tables:

- **CMDB Class Information (cmdb_class_info):** Class descriptions
- **Identifier (cmdb_identifier):** Identification rules
- **Identifier Entry (cmdb_identifier_entry):** Identification entries
- **CMDB Metadata Hosting Rules (cmdb_metadata_hosting):** Dependent relationships

After installation, navigate to **Configuration** and then click **CI Class Manager**. When you click **Hierarchy** in CI Class Manager, the CI Classes list contains the added classes such as the Nutanix classes. Select a class to see its corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.
Use extension classes as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover various technologies and software such as the Nutanix Enterprise Cloud software.

**Note:** Uninstalling the CMDB CI class models application might compromise the integrity of the CMDB and result in unexpected behavior.

**IBM Hardware Management Console (HMC)**

The IBM HMC extension classes support discovery of IBM virtualization technology by providing:

- Discovery of LPARs/FRAMEs which SAM use cases need.
- Topology data of IBM HMC which event correlation requires.
- Topology data for ITSM use cases such as in frame migration.
IBM HMC extension classes integrated with the CMDB class hierarchy
Nutanix Enterprise Cloud platform

The Nutanix Enterprise Cloud platform is a converged, scale-out compute and storage system that hosts and stores virtual machines. All nodes in a Nutanix cluster share the management of cluster resources. The foundational unit for the cluster is a Nutanix node which runs a standard hypervisor and contains processors, memory, and local storage (SSDs and hard disks). A Nutanix Controller virtual machine runs on each node, enabling the pooling of local storage from all nodes in the cluster.

Classes

The CMDB CI Class Models store app adds the following classes. See each respective class section for further details about the columns added for each class.

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBM HMC Server</td>
<td>Server</td>
<td>IBM console that manages frames and assigns logical partitions (LPARs) to pools.</td>
</tr>
<tr>
<td>(cmdb_ci_hmc_server)</td>
<td>(cmdb_ci_server)</td>
<td></td>
</tr>
<tr>
<td>IBM Frame</td>
<td>Server</td>
<td>IBM physical machine with considerable resources which can be virtualized.</td>
</tr>
<tr>
<td>(cmdb_ci_ibm_frame)</td>
<td>(cmdb_ci_server)</td>
<td></td>
</tr>
<tr>
<td>IBM LPAR Instance</td>
<td>Virtual Machine Instance</td>
<td>IBM logical partition representing the virtual aspect of the operating system.</td>
</tr>
<tr>
<td>(cmdb_ci_lpar_instance)</td>
<td>(cmdb_ci_vm_instance)</td>
<td></td>
</tr>
<tr>
<td>LPAR Resource</td>
<td>Configuration Item</td>
<td>Resource of an LPAR instance.</td>
</tr>
<tr>
<td>(cmdb_ci_lpar_resource)</td>
<td>(cmdb_ci)</td>
<td></td>
</tr>
<tr>
<td>IBM HMC Processor pool</td>
<td>Virtual Machine Object</td>
<td>IBM shared pool used to allocate processors to a group of LPARs.</td>
</tr>
<tr>
<td>(cmdb_ci_processor_pool)</td>
<td>(cmdb_ci_vm_object)</td>
<td></td>
</tr>
<tr>
<td>Nutanix Cluster</td>
<td>Virtual Machine Object</td>
<td>Cluster comprising of the physical nodes running Nutanix software.</td>
</tr>
<tr>
<td>(cmdb_ci_nutanix_cluster)</td>
<td>(cmdb_ci_vm_object)</td>
<td></td>
</tr>
<tr>
<td>Nutanix Controller VM</td>
<td>Application</td>
<td>Nutanix controller virtual machine that is present in each node and that provides the storage clustering and management capabilities.</td>
</tr>
<tr>
<td>(cmdb_ci_nutanix_controller_vm)</td>
<td>(cmdb_ci_appl)</td>
<td></td>
</tr>
<tr>
<td>Nutanix Storage Container</td>
<td>Storage Volume</td>
<td>Subset of Nutanix storage pool used to apply policies such as reserved capacity, replication factor, and storage optimization options.</td>
</tr>
<tr>
<td>(cmdb_ci_nutanix_storage_container)</td>
<td>(cmdb_ci_storage_volume)</td>
<td></td>
</tr>
<tr>
<td>Nutanix Storage Pool</td>
<td>Storage Pool</td>
<td>Grouping of physical disks within a Nutanix cluster which is typically used to create physical separation between virtual machines.</td>
</tr>
<tr>
<td>(cmdb_ci_nutanix_storage_pool)</td>
<td>(cmdb_ci_storage_pool)</td>
<td></td>
</tr>
<tr>
<td>Class</td>
<td>Extends</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Nutanix Host (cmdb_ci_nutanix_host)</td>
<td>Virtualization Server (cmdb_ci_virtualization_server)</td>
<td>Physical host on which all the virtual machines run.</td>
</tr>
</tbody>
</table>

**IBM HMC Server**

The CMDB CI Class Models store app adds the following columns to the IBM HMC Server (cmdb_ci_hmc_server) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frame count</td>
<td>Count of frames.</td>
</tr>
</tbody>
</table>

**IBM Frame**

The CMDB CI Class Models store app adds the following columns to the IBM Frame (cmdb_ci_ibm_frame) class.

**IBM LPAR Instance**

The CMDB CI Class Models store app adds the following columns to the IBM LPAR Instance (cmdb_ci_lpar_instance) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is VIO</td>
<td>Flags whether this VM is a (VIO) virtual input/output server in the HMC topology.</td>
</tr>
<tr>
<td>High Watermark VCPU</td>
<td>Peak in the utilization of virtual CPU assigned to during the reporting period.</td>
</tr>
<tr>
<td>Frame Serial Number</td>
<td>Serial number of a frame (frame being a physical machine such as ESX).</td>
</tr>
<tr>
<td>VIO Servers</td>
<td>List of VIO servers.</td>
</tr>
</tbody>
</table>

**LPAR Resource**

The CMDB CI Class Models store app adds the following columns to the LPAR Resource (cmdb_ci_lpar_resource) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node name</td>
<td>Name of the node.</td>
</tr>
<tr>
<td>Partition Name</td>
<td>Name of the partition.</td>
</tr>
<tr>
<td>Columns (added)</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>Partition Number</td>
<td>Number of the partition.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of LPAR Resource.</td>
</tr>
<tr>
<td>Mode</td>
<td>Mode of LPAR Resource.</td>
</tr>
<tr>
<td>Entitled Capacity</td>
<td>Allotted capacity granted.</td>
</tr>
<tr>
<td>Partition Group-ID</td>
<td>ID of a group of partitions.</td>
</tr>
<tr>
<td>Shared Pool ID</td>
<td>ID of a pool of shared processors.</td>
</tr>
<tr>
<td>Online Virtual CPUs</td>
<td>A virtual CPU.</td>
</tr>
<tr>
<td>Maximum Memory</td>
<td>Maximum amount of memory.</td>
</tr>
<tr>
<td>Minimum Memory</td>
<td>Minimum amount of memory.</td>
</tr>
<tr>
<td>Variable Capacity Weight</td>
<td>Logical partition processor capacity weight.</td>
</tr>
<tr>
<td>Minimum Capacity</td>
<td>Minimum number of processes.</td>
</tr>
<tr>
<td>Capacity Increment</td>
<td>Increments of process.</td>
</tr>
<tr>
<td>Maximum Physical CPUs in system</td>
<td>Maximum CPUs allotted in system.</td>
</tr>
<tr>
<td>Active Physical CPUs in system</td>
<td>Current CPUs in system.</td>
</tr>
<tr>
<td>Active CPUs in Pool</td>
<td>Number of active CPUs within a pool.</td>
</tr>
<tr>
<td>Shared Physical CPUs in system</td>
<td>Number of shared CPUs within a system.</td>
</tr>
<tr>
<td>Maximum Capacity of Pool</td>
<td>Maximum capacity of processes within a pool.</td>
</tr>
<tr>
<td>Entitled Capacity of Pool</td>
<td>Number of processes that are entitled.</td>
</tr>
<tr>
<td>Unallocated Capacity</td>
<td>Number of free spaces.</td>
</tr>
<tr>
<td>Physical CPU Percentage</td>
<td>Number of CPUs allocated to system.</td>
</tr>
<tr>
<td>Unallocated Weight</td>
<td>At no extra charge resources on instance.</td>
</tr>
<tr>
<td>Desired Virtual CPUs</td>
<td>Target number of virtual CPUs.</td>
</tr>
<tr>
<td>Desired Memory</td>
<td>Target amount of memory.</td>
</tr>
<tr>
<td>Desired Variable Capacity Weight</td>
<td>Targeted processor load.</td>
</tr>
<tr>
<td>Desired Capacity</td>
<td>Target resources used within instance.</td>
</tr>
<tr>
<td>High Watermark VCPU</td>
<td>Peak in the utilization of virtual CPU assigned to during the reporting period.</td>
</tr>
</tbody>
</table>

**IBM HMC Processor pool**

The CMDB CI Class Models store app adds the following columns to the IBM HMC Processor pool (cmdb_ci_processor_pool) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pool ID</td>
<td>ID of pool of processors.</td>
</tr>
<tr>
<td>CPU Core count</td>
<td>Number of CPU cores.</td>
</tr>
<tr>
<td>Columns (added)</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Memory count</td>
<td>Amount of memory used.</td>
</tr>
<tr>
<td>Unassigned cores</td>
<td>Number of unused cores.</td>
</tr>
<tr>
<td>Unassigned memory</td>
<td>Amount of unassigned memory.</td>
</tr>
</tbody>
</table>

**Nutanix Cluster**

The CMDB CI Class Models store app adds the following columns to the Nutanix Cluster (cmdb_ci_nutanix_cluster) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block Serial Numbers</td>
<td>Serial numbers of blocks that are connected to the cluster.</td>
</tr>
<tr>
<td>Cluster ID</td>
<td>UUID (Universal Unique Identifier) of the cluster.</td>
</tr>
<tr>
<td>External Subnet</td>
<td>Subnet of the external IP address of the cluster.</td>
</tr>
<tr>
<td>Full Version</td>
<td>Full version of the cluster.</td>
</tr>
<tr>
<td></td>
<td>For example: el7.3-release-euphrates-5.10.3.1-stable-655d4def34bf18785752f2adb8cadd5f8457d1fe3</td>
</tr>
<tr>
<td>Hypervisor Types</td>
<td>Types of hypervisors that are related to this cluster.</td>
</tr>
<tr>
<td>Internal Subnet</td>
<td>Subnet of internal IP addresses.</td>
</tr>
<tr>
<td>NCC Version</td>
<td>Nutanix cluster check version.</td>
</tr>
<tr>
<td>NTP Servers</td>
<td>NTP servers that are related to this cluster.</td>
</tr>
<tr>
<td>Number of Nodes</td>
<td>Number of nodes that are connected to the cluster.</td>
</tr>
<tr>
<td>Timezone</td>
<td>Timezone of the cluster.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the cluster.</td>
</tr>
<tr>
<td></td>
<td>For example: 5.10.3.1</td>
</tr>
</tbody>
</table>

**Nutanix Controller VM**

The CMDB CI Class Models store app adds the following columns to the Nutanix Controller VM (cmdb_ci_nutanix_controller_vm) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hypervisor Type</td>
<td>Type of hypervisor.</td>
</tr>
<tr>
<td>Memory (MB)</td>
<td>Amount of memory (in MB) available on the controller.</td>
</tr>
<tr>
<td>State</td>
<td>On/off power state of controller.</td>
</tr>
<tr>
<td>VM ID</td>
<td>UUID of the controller virtual machine.</td>
</tr>
</tbody>
</table>
### Nutanix Storage Container

The CMDB CI Class Models store app adds the following columns to the Nutanix Storage Container (cmdb_ci_nutanix_storage_container) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compression</td>
<td>Indicates whether compression is enabled.</td>
</tr>
<tr>
<td>Container ID</td>
<td>UUID of the container.</td>
</tr>
<tr>
<td>Deduplication</td>
<td>Indicates whether on disk deduplication is enabled, that is dedup compression applied to data on hard disks (HDD). Performance tier deduplication is a prerequisite for on disk deduplication.</td>
</tr>
<tr>
<td>Erasure Code</td>
<td>Indicates whether erasure coding is enabled.</td>
</tr>
<tr>
<td>Replication Factor</td>
<td>Number of maintained data copies. The replication factor is specified (2 or 3) when the container is created.</td>
</tr>
</tbody>
</table>

### Nutanix Storage Pool

The Nutanix Storage Pool (cmdb_ci_nutanix_storage_pool) class has no added columns.

### Nutanix Host

The Nutanix Host (cmdb_ci_nutanix_host) class has no added columns.

### Nutanix Virtual Machine Instance

The Nutanix Virtual Machine Instance (cmdb_ci_nutanix_vm_instance) class has no added columns.

### CMDB CI Class Models: Nutanix (Release 1.1.5)

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.
Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

Nutanix Enterprise Cloud platform

Use the Nutanix CI class models as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover the Nutanix Enterprise Cloud software.

The Nutanix Enterprise Cloud platform is a converged, scale-out compute and storage system that hosts and stores virtual machines. All nodes in a Nutanix cluster share the management of cluster resources. The foundational unit for the cluster is a Nutanix node which runs a standard hypervisor and contains processors, memory, and local storage (SSDs and hard disks). A Nutanix Controller virtual machine runs on each node, enabling the pooling of local storage from all nodes in the cluster.

CMDB CI class models adds the classes and columns and the metadata associated with each class as related records in the following tables:

- CMDB Class Information (cmdb_class_info): Class descriptions
- Identifier (cmdb_identifier): Identification rules
- Identifier Entry (cmdb_identifier_entry): Identification entries
- CMDB Metadata Hosting Rules (cmdb_metadata_hosting): Dependent relationships

View Nutanix Enterprise Cloud extension classes

After installation, navigate to Configuration and then click CI Class Manager. When you click Hierarchy in CI Class Manager, the CI Classes list contains the added Nutanix classes. Select a class to see its corresponding class details, identification rules, identifier entries, and dependent relationships if applicable.

Note: Uninstalling the CMDB CI class models application might compromise the integrity of the CMDB and result in unexpected behavior.

Classes

The following classes are added:

<table>
<thead>
<tr>
<th>Class</th>
<th>Extends</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nutanix Cluster</td>
<td>Virtual Machine Object</td>
<td>Cluster comprising of the physical nodes running Nutanix software.</td>
</tr>
<tr>
<td>(cmdb_ci_nutanix_cluster)</td>
<td>(cmdb_ci_vm_object)</td>
<td></td>
</tr>
<tr>
<td>Nutanix Controller VM</td>
<td>Application</td>
<td>Nutanix controller virtual machine that is present in each node and that provides the storage clustering and management capabilities.</td>
</tr>
<tr>
<td>(cmdb_ci_nutanix_controller_vm)</td>
<td>(cmdb_ci_appl)</td>
<td></td>
</tr>
<tr>
<td>Class</td>
<td>Extends</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------------</td>
<td>----------------------------------------------</td>

<tr>
<td>State</td>
<td>On/off state of power.</td>
</tr>
<tr>
<td>VM ID</td>
<td>UUID of the controller virtual machine.</td>
</tr>
<tr>
<td>Object ID</td>
<td>ID of the controller virtual machine.</td>
</tr>
</tbody>
</table>

Nutanix Storage Container

The following columns are added in the Nutanix Storage Container (cmdb_ci_nutanix_storage_container) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compression</td>
<td>Indicates whether compression is enabled.</td>
</tr>
<tr>
<td>Container ID</td>
<td>UUID of the container.</td>
</tr>
<tr>
<td>Deduplication</td>
<td>Indicates whether on disk deduplication is enabled, that is dedup compression applied to data on hard disks (HDD). Performance tier deduplication is a prerequisite for on disk deduplication.</td>
</tr>
<tr>
<td>Erasure Code</td>
<td>Indicates whether erasure coding is enabled.</td>
</tr>
<tr>
<td>Replication Factor</td>
<td>Number of maintained data copies. The replication factor is specified (2 or 3) when the container is created.</td>
</tr>
</tbody>
</table>

Nutanix Storage Pool

The Nutanix Storage Pool (cmdb_ci_nutanix_storage_pool) class has no added columns.

Nutanix Host

The Nutanix Host (cmdb_ci_nutanix_host) class has no added columns.

Nutanix Virtual Machine Instance

The Nutanix Virtual Machine Instance (cmdb_ci_nutanix_vm_instance) class has no added columns.
CMDB CI Class Models: Nutanix (Release 1.1.4)

Add class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Use the added classes as any other CMDB class. Applications such as Discovery and Service Mapping patterns can use these class extensions to populate CIs.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

Nutanix Enterprise Cloud platform

Use the Nutanix CI class models as any other CMDB class. Applications such as Service Mapping and Discovery can use these class extensions to discover the Nutanix Enterprise Cloud software.

The Nutanix Enterprise Cloud platform is a converged, scale-out compute and storage system that hosts and stores virtual machines. All nodes in a Nutanix cluster share the management of cluster resources. The foundational unit for the cluster is a Nutanix node which runs a standard hypervisor and contains processors, memory, and local storage (SSDs and hard disks). A Nutanix Controller virtual machine runs on each node, enabling the pooling of local storage from all nodes in the cluster.

CMDB CI class models adds the classes and columns and the metadata associated with each class as related records in the following tables:

- CMDB Class Information (cmdb_class_info): Class descriptions
- Identifier (cmdb_identifier): Identification rules
- Identifier Entry (cmdb_identifier_entry): Identification entries

<tr>
<td>(cmdb_ci_nutanix_vm_instance)</td>
<td>(cmdb_ci_vm_instance)</td>
<td></td>
</tr>
</tbody>
</table>

**Nutanix Cluster**

The following columns are added in the Nutanix Cluster (cmdb_ci_nutanix_cluster) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block Serial Numbers</td>
<td>Serial numbers of blocks that are connected to the cluster.</td>
</tr>
<tr>
<td>Cluster ID</td>
<td>UUID (Universal Unique Identifier) of the cluster.</td>
</tr>
<tr>
<td>External Subnet</td>
<td>Subnet of the external IP address of the cluster.</td>
</tr>
<tr>
<td>Full Version</td>
<td>Full version of the cluster.</td>
</tr>
<tr>
<td>Hypervisor Types</td>
<td>Types of hypervisors that are related to this cluster.</td>
</tr>
<tr>
<td>Internal Subnet</td>
<td>Subnet of internal IP addresses.</td>
</tr>
<tr>
<td>NCC Version</td>
<td>Nutanix cluster check version.</td>
</tr>
<tr>
<td>NTP Servers</td>
<td>NTP servers that are related to this cluster.</td>
</tr>
<tr>
<td>Number of Nodes</td>
<td>Number of nodes that are connected to the cluster.</td>
</tr>
<tr>
<td>Timezone</td>
<td>Timezone of the cluster.</td>
</tr>
</tbody>
</table>
## Nutanix Controller VM

The following columns are added in the Nutanix Controller VM (cmdb_ci_nutanix_controller_vm) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hypervisor Type</td>
<td>Type of hypervisor.</td>
</tr>
<tr>
<td>Memory</td>
<td>Amount of memory (in MB) available to the virtual machine.</td>
</tr>
<tr>
<td>State</td>
<td>On/off state of power.</td>
</tr>
<tr>
<td>VM ID</td>
<td>UUID of the controller virtual machine.</td>
</tr>
<tr>
<td>Object ID</td>
<td>ID of the controller virtual machine.</td>
</tr>
</tbody>
</table>

## Nutanix Storage Container

The following columns are added in the Nutanix Storage Container (cmdb_ci_nutanix_storage_container) class.

<table>
<thead>
<tr>
<th>Columns (added)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compression</td>
<td>Indicates whether compression is enabled.</td>
</tr>
<tr>
<td>Container ID</td>
<td>UUID of the container.</td>
</tr>
<tr>
<td>Deduplication</td>
<td>Indicates whether on disk deduplication is enabled, that is dedup compression applied to data on hard disks (HDD). Performance tier deduplication is a prerequisite for on disk deduplication.</td>
</tr>
<tr>
<td>Erasure Code</td>
<td>Indicates whether erasure coding is enabled.</td>
</tr>
<tr>
<td>Replication Factor</td>
<td>Number of maintained data copies. The replication factor is specified (2 or 3) when the container is created.</td>
</tr>
</tbody>
</table>

## Nutanix Storage Pool

The Nutanix Storage Pool (cmdb_ci_nutanix_storage_pool) class has no added columns.
Nutanix Host

The Nutanix Host (cmdb_ci_nutanix_host) class has no added columns.

Nutanix Virtual Machine Instance

The Nutanix Virtual Machine Instance (cmdb_ci_nutanix_vm_instance) class has no added columns.

Populate the CMDB

You can populate the CMDB by using Discovery, by importing information from another source, by integrating with an existing external CMDB, or by manually creating CIs.

When you populate the CMDB with information, you create a record for each configuration item in the cmdb_ci table or on one of the tables that extend that table.

ITIL configuration management auto-discovery

The key to any configuration management business practice is the initial and on-going inventory or discovery of what you own. the Now Platform provides three options for auto-discovery:

- The separate and highly robust Discovery product.
- A lightweight native discovery tool, called Help the Help Desk, as part of the overall CMDB. Help the Help Desk enables organizations to proactively scan their network to discover all Windows-based PCs and the software packages installed on those PCs. This WMI-based discovery is included in the core ServiceNow functionality, in the Self Service application, at no additional cost.
- For organizations that want to leverage the discovery technologies they already have deployed (SMS, Tally NetCensus, LanDesk, and so on), the Now Platform supports integrations to those technologies via web services. Scanned data can be mapped directly into the CMDB.

For further information on designing, constructing, and maintaining the CMDB, see white papers CMDB Design & Configuration and CMDB Design.

Discovery

The Discovery product automatically populates the CMDB. Discovery runs probes and sensors to collect information on hardware on the network, software running on that hardware, and the relationships between all the items found. This information is sent back to the ServiceNow instance, and is used to populate the CMDB.
Import information from another source

Information can be imported to the CMDB using import sets. Import sets find files of information (in formats such as XML, Excel, or CSV), import them, and transform them onto the required table. This process can be scheduled or performed on demand.

To import relationships between CIs, use import sets to populate the table (cmdb_rel_ci) with information on the parent, the child, and the nature of the relationship. The (cmdb_rel_ci) table displays a list of all CI relationships and is useful when importing CI data.
Integrate with an existing external CMDB

If the data required for the CMDB is already being collected by another CMDB, it is possible to collect the information from that CMDB in an automated process.
CMDB import integration overview

CMDB instance API

Use the CMDB instance API to populate the CMDB by creating or updating CMDB tables.

Manually create a CI

Create a single CI for a specific class. The role required is based on the selected table settings.

1. Use the CI Class Manager:
   a. Navigate to Configuration > CI Class Manager.
   b. Click Hierarchy to display the list of CI Classes. Select the class to use for the CI.
   c. In the class navigation bar, select CI List and then on the CI list view, click New.
   d. Fill out the CI form and then click Submit.

2. Or, directly use a table:
a. Navigate to and expand **Configuration** and then elect the class to use for the CI, such as Business Services.

b. In the navigation filter of the application navigator, enter the table label (such as 'Linux'), or the table name in the format of <table name>.list (such as 'cmdb_ci_linux_server.list'). Then, press Enter.

c. In the list view of the table, click **New** and fill out the form fields for the table.

d. Click **Submit**.

**Integrating third-party data into the CMDB**

Use integrations to import and integrate third-party data into CMDB classes and properties. You can use predefined integrations for common applications from the ServiceNow Store. You can also use IntegrationHub ETL to create new ETL transform maps or edit existing ones.

**IntegrationHub ETL**

Use the IntegrationHub ETL store app to manage ETL transform maps which integrate third-party data into the CMDB. IntegrationHub ETL provides a simplified user interface that guides you through the integration process end-to-end, including a test run of sample data. You can also customize pre-defined ETL transform maps provided by ServiceNow or vendors.

**Request apps on the Store**

Visit the [ServiceNow Store](https://store.servicenow.com) website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](https://store.servicenow.com/store/home/1004).

When you create an integration, you import source data, transform data if needed, and select target CMDB classes and attributes to map the data to. Eventually, you run an integration test of the sample data, using your settings in the IntegrationHub ETL. You can then preview the integration test results and adjust any settings before scheduling recurring integration runs for large data sets. If you develop and test the ETL transform map on a development instance, then you can test and adjust the configuration before implementation on a production instance.

For example, you can integrate data from SCCM (Microsoft System Center Configuration Manager).

Users with the cmdb_inst_admin role can use IntegrationHub ETL to create integrations, or customize a pre-existing integration provided by ServiceNow or a vendor at the ServiceNow Store. A vendor can create a new integration and provide it as an application for anyone to use.

Using IntegrationHub ETL and ETL transform maps has the following advantages over using Import Sets and transform maps:

- Identification and Reconciliation Engine (IRE) processes are incorporated into the IntegrationHub ETL so all data is automatically processed by IRE as part of the integration. Using Import Sets and transform maps does not provide a simple way to apply IRE processes.
- IntegrationHub ETL uses guided setup which provides guidance and a simple user interface for the entire process of integrating third-party data.
- IntegrationHub ETL includes an integration test for a small data set using the new ETL transform map. This test lets you review the results and adjust configuration settings before scheduling recurring integrations.
Terms

The following terms are associated with the IntegrationHub ETL:

**CMDB application**

Name of the third-party vendor such as SCCM 2019. A CMDB application has two associated attributes: **Name** and **Discovery Source**. When creating a new integration, ensure to configure a discovery source for the CMDB application that you plan to use, before using the IntegrationHub ETL.

**Data source**

The source feed, such as SCCM 7.0 Computer Identity, where the raw source data is imported from. If you use various REST endpoints for different types of data, then each REST endpoint is associated with its own data source and an ETL transform map.

**ETL transform map**

The output generated by IntegrationHub ETL. You can integrate third-party data into the CMDB, using an ETL transform map which is configured for the respective integration.

**Source data**

Original, raw data that has been imported into IntegrationHub ETL. Source data can be used in its original form, or you can transform the data before mapping and integration.

**Transform**

An operation, that you can apply to a specific data column to transform the data values. For example, to transform the format of the data values. Use transforms to standardize data formats and meet other system requirements.

**Transformed data**

Some of the source data might not be compliant with the requirements of its target CMDB attributes and classes. In those cases, you can apply various types of transforms to the source data, before mapping the data to the target CMDB classes and attributes. Transforms, can for example convert data format, replace values, and concatenate values from multiple data columns.

**Robust Transform Engine**

Robust Transform Engine (RTE) is used to transform raw source data that is stored in staging tables, into the data that is mapped and integrated into the CMDB. RTE uses ETL transform maps that were created for the integration during data transformation.

Each CMDB application can have multiple connections for retrieving raw data. Each connection that is used to retrieve a certain type of data, has its own pair of data source and an ETL transform map. Therefore, one CMDB application can have multiple ETL transform maps, and each of those ETL transform maps is associated with a single Data Source.

For example:

<table>
<thead>
<tr>
<th>CMDB Application</th>
<th>ETL Transform Map</th>
<th>Data Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCCM</td>
<td>SCCM Computer Identify</td>
<td>/sccm/2019/comp</td>
</tr>
<tr>
<td></td>
<td>SCCM Disk</td>
<td>/sccm/2019/disk</td>
</tr>
<tr>
<td></td>
<td>SCCM Application</td>
<td>/sccm/2019/appl</td>
</tr>
</tbody>
</table>
Process

IntegrationHub ETL uses both, RTE and IRE, that work together to process and integrate data. Data is first imported from a data source, and is then stored in temporary staging tables in Import Sets systems. Using the data in the staging tables and the ETL transform map created by IntegrationHub ETL, RTE creates IRE payloads which are then processed by IRE. IRE applies reconciliation processes to avoid potential problems such as duplicate CIs, ensuring that the CMDB remains healthy, and then integrates the resulting data into the CMDB.

Guided setup

IntegrationHub ETL provides a guided setup which walks you through the completion of all necessary tasks for creating an ETL transform map for a specific integration. Guided setup organizes all the tasks in the correct order, tracks the completion of tasks, and enforces any task dependencies. Tasks that depend on the completion of other tasks, are enabled or disabled as you step through the tool and complete tasks.

Use guided setup to complete the following tasks.

Import source data and specify basic details

Provide basic details for the integration, such as the source of the data that you want to integrate into CMDB, and import the source data.

Role required: cmdb_inst_admin

1. Navigate to Configuration > IntegrationHub ETL.
   The landing page of the IntegrationHub ETL lists all integrations that exist in the system, including integrations that were downloaded from the ServiceNow Store.
2. Click the Name of an integration to view or modify, or click Create new.
3. On the ETL Transform Map Assistant page, in the Specify Basic Details section of the guided setup, select the Import Source Data and Provide Basic Details task.
4. Fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB Application</td>
<td>The CMDB application associated with the ETL transform map. You can select Add new, which adds the CMDB Application and the Discovery Source fields for the new CMDB application.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the ETL transform map.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the integration.</td>
</tr>
<tr>
<td>Data Source</td>
<td>List of all data sources in the system.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Import Set</td>
<td>An Import Set number that identifies an existing Import Set. The list contains Import Sets that are specific to the specified Data Source. If you don’t select an Import Set or if the specified Data Source isn’t associated with any Import Sets, an Import Set is automatically created and selected. When you click Mark as Complete, IntegrationHub ETL automatically generates a new sample pull request for up to 100 records. Then, the Import Set used to preview source data, is created.</td>
</tr>
<tr>
<td>CMDB Application</td>
<td>Name of a new CMDB Application. Appears if you set CMDB Application to Add new.</td>
</tr>
<tr>
<td>Discovery Source</td>
<td>Discovery source associated with a new CMDB Application. Appears if you set CMDB Application to Add new.</td>
</tr>
</tbody>
</table>

5. Click Mark as Complete.

Preview and prepare data

Review the source data and transform any data if needed.

Role required: cmdb_inst_admin

Review the values in the data columns of the sample data and identify columns that do not align with the requirements of the intended target classes and attributes. You can transform data, for example, by converting the data format, replacing values, and concatenating data columns. You can apply transformations one on top of another, creating a chain of data transformations. You can also set a data column to be ignored in the mapping and integration process.

1. Navigate to Configuration > IntegrationHub ETL, and click the Name of an integration.
   The landing page of the IntegrationHub ETL lists all integrations that exist in the system, including integrations that were downloaded from the ServiceNow Store.

2. In the ETL Transform Map Assistant page, in the Prepare Source Data for Mapping section of the guided setup, select Preview and Prepare Data.

3. Optional: Select the action menu for a column, and then select a Sort operation.

4. Optional: Select the action menu for a column, and then select New Transform.
   a) In the New Transform sidebar on the right, select a Transform Type and modify the Transform Description if appropriate.
      For more details about transform types, see Transform types in IntegrationHub ETL.

   b) (Optional) Select Hide initial column used for this transform to hide from the current view all the columns that were used for this transform.
      This setting is temporary for the current session, and if you refresh the page, the hidden column reappears. To show a hidden column, you can also click the gear icon on the banner frame. Then, move the hidden column from the Available to the Selected list and click OK.

   c) Verify the Input Column whose values are being transformed.

   d) (Optional) Modify the Output Column Name for any of the columns that will be added with the transformed values.
e) Click Apply.
   A new column with the transformed values appears. The new column is placed in alphabetical order based on the output column name. If you used the suggested output column name, then the new column appears to the right of the input column.

f) Review the transformed data and adjust any transforms, if needed.

5. Optional: To apply the ‘Set Fixed Value Column’ transform:
   a) Click Advanced and then select Set Fixed Value Column.
   b) In the Set Fixed Value Column sidebar, enter a Column Name and a Column Description for the new column. Then, set Assign Column Value to the value that is fixed for the new column.
   c) Click Apply.

6. Optional: Select the action menu for a column, and then select Ignore in Mapping to exclude the column from mapping and integration in the current session.
   In a subsequent session, the Ignore in Mapping setting does not apply, and the column will be included in mapping.
   You can click Include in Mapping to undo the Ignore in Mapping setting for the column.

7. Optional: Select the action menu for a column, and then select Delete This and Downstream Columns. This delete action deletes the column along with any columns that were added using this column as an input column.

8. Optional: Click Advanced and then select Table Lookup which lets you specify a table to look up and extract additional values from. Fill out the fields in the Table Lookup sidebar on the right.
   Values from the specified lookup table are matched with the mapped data. For the records that match, the specified values from the lookup table, are added as a column, to the data that is being prepared for mapping.

<table>
<thead>
<tr>
<th>Table Lookup</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Lookup Table</td>
<td>Table to use for matching with the data that is being mapped. When records from the lookup table and the mapped data satisfy the Look Up Condition, then specified values from the Lookup Table are extracted from the respective record and added to the mapped data.</td>
</tr>
<tr>
<td>Lookup Condition</td>
<td>A set of pairs of column conditions. Each pair specifies a column in the lookup table and a column in the mapped data, which are attempted to be matched.</td>
</tr>
<tr>
<td></td>
<td>• If values of target table column: The column in the target table to match to a column in the mapped data.</td>
</tr>
<tr>
<td></td>
<td>• Match values of source data table: The column in the mapped data to match to a column in the lookup table.</td>
</tr>
<tr>
<td></td>
<td>You can add multiple pairs of columns to match on.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Lookup Condition</td>
<td>Values to extract from the Lookup Table when there is a match with the mapped data.</td>
</tr>
<tr>
<td></td>
<td>• Then output values from the following columns: The lookup table columns to extract values from, when values from the lookup table and the mapped data, satisfy the Lookup Condition.</td>
</tr>
<tr>
<td></td>
<td>You can specify multiple lookup table columns to extract values from. For every column that you specify, a corresponding Output Column Name field automatically appears. Specify a label for the column that will be added with the extracted values.</td>
</tr>
<tr>
<td>Output Column Name</td>
<td>A label for the column that will be added to the mapped data, with the values extracted from the lookup table.</td>
</tr>
<tr>
<td></td>
<td>An Output Column Name field is automatically added for every column that you specify in Then output values from the following columns.</td>
</tr>
</tbody>
</table>

9. Review the data and ensure that the intended set of data to be integrated is transformed, correctly formatted and prepared for import.

10. Click **Mark as Complete**.

Data is prepared when the set of source data columns and transformed columns that you want to integrate, meet any formatting and other value requirements of the target CMDB classes and attributes. These columns are then ready to be mapped and integrated to CMDB classes and attributes.

**Map data columns to CMDB classes and attributes**

Choose target classes and attributes in the CMDB to map data columns to. You can map a data column to a specific target class, or add conditions so that the choice of target class depends on specific data values.

Role required: cmdb_inst_admin

Data columns that you map can be either source data columns which were not transformed, or transformed data columns. For example, to integrate a data column into the Computer and Software Package classes, select those classes as target classes and then map data columns into specific attributes in those classes.

You must map data to all required attributes of the target class in addition to mapping to attributes that are not configured as required. Also, the following two fields appear by default and you cannot delete them:

**Source Native Key**

Required by Identification and Reconciliation Engine (IRE) to uniquely identify a record and used for building relationships and references. Also, improves performance of insert and update operations. When processing a payload, IRE generates an error if this field is empty.

**Source Recency Timestamp**
Used by IRE to identify records that are older than the current record and therefore can be ignored, to help resolve conflicting attribute values.

For more information about how IRE uses `source_native_key` and `source_recency_timestamp` for CI identification, see Identification and Reconciliation engine (IRE).

A conditional class lets you map different groups of data records to different target classes according to specific column values, or according to the status of a specified plugin. For example, if the display name contains 'Windows', then 'Windows Server' is selected as the target class. But if the display name contains 'Linux', then 'Linux Server' is selected as the target class. For records that do not meet any of these conditions (display name does not contain 'Windows' nor 'Linux'), 'Server' is selected as the target class.

1. Navigate to Configuration > IntegrationHub ETL, and click the Name of an integration. The landing page of the IntegrationHub ETL lists all integrations that exist in the system, including integrations that were downloaded from the ServiceNow Store.

2. In the ETL Transform Map Assistant page, in the Map Data to CMDB and Add Relationships section of the guided setup, select Select CMDB Classes to Map Source Data. Attributes that are configured as required in the platform, are noted, and you must map a data column to each of those attributes.

3. Click Add Class to add a target class to map to. Then, in the Add Class dialog box, select a CMDB Class, and then click Save.

4. Click Add Conditional Class to specify different conditions for selecting different target classes.
   a) In the Add Conditional Class dialog box, specify the conditions that must be met for data to be mapped to the various target classes. In the choose field list, select attribute conditions that data values must meet, or enter plugins in the search box and specify a plugin condition. You can then specify that the rest of the records, which did not match any conditions, are mapped to yet a different target class. Data records are mapped to different target classes according to the conditions met.
   b) Click Save.

5. Click Set Up Mapping to configure mapping for a newly added class, or click Edit Mapping to edit a mapping.
   a) To map, drag data columns from the Data sidebar on the right, to CMDB target attribute on the left side of the mapping page. Or, click the icon to search and select data columns for the mapping.
   b) Click Add Attribute. Then, in the Add Attribute dialog box, from the Attribute list, select one or more items as target attributes to map data to. Close the Attribute list and click Save.
   c) Click View Class Details to view the current class in CI Class Manager.
   d) Optional: Click the Transform Data Source tab to navigate to the data preparation page where you can review and further transform data that you want to map.
   e) Return to the Select CMDB Classes to Map Source Data page.

6. Click Mark as Complete.

Add Relationships

Add relationships that exist among the target CMDB classes, for an integration.
Role required: cmdb_inst_admin

1. Navigate to Configuration > IntegrationHub ETL, and click the Name of an integration.
   The landing page of the IntegrationHub ETL lists all integrations that exist in the system,
   including integrations that were downloaded from the ServiceNow store.
2. In the ETL Transform Map Assistant page, in the Map Data to CMDB and Add Relationships
   section of the guided setup, select Add Relationships.
3. Click Add Relationship.
4. Add Parent, Child, and Relationship Type values to add a relationship.

Preview Mapping Results

Preview the integration results for a sample data set, using the ETL Integration Map.

Role required: cmdb_inst_admin

Run an integration test and view a summary of the results, for the sample data (of up to 100
records). The summary includes total numbers for relationships that were created, mapped
classes, partial and incomplete payloads that IRE couldn’t process. You can also view detailed
messages from RTE and IRE. After you view the details in the summary page, you can return to any
step to make adjustments and then rerun the integration.

1. Navigate to Configuration > IntegrationHub ETL, and click the Name of an integration.
   The landing page of the IntegrationHub ETL lists all integrations that exist in the system,
   including integrations that were downloaded from the ServiceNow Store.
2. In the ETL Transform Map Assistant page, in the Preview Sample Integration Results and
   Schedule Import section of the guided setup, select Test and Rollback Integration Results.
3. View the summary page and click the various tabs to see the integration run results for the
   affected CMDB classes.
4. Optional: Select any class tab and click Edit Mapping to return to the Select CMDB Classes to
   Map Source Data page where you can review and change mapping settings.

   Note: Clicking Edit Mapping rolls back all the changes that were made to the CMDB as
   a result of this integration run.

5. Optional: Click the Relationships tab and review any relationships that were created. Click
   Edit Relationships to return to the Add Relationships page where you can review and change
   any relationship configurations.

   Note: Clicking Edit Relationships rolls back all the changes that were made to the
   CMDB as a result of this integration run.

6. Click the Error Log and Activity Log tabs for details about the activities and any errors logged
   by IRE and RTE during the integration.
7. Click the Incomplete Payloads and Partial Payloads tabs for details about IRE payloads for the
   integration run.
8. Click Mark as Complete. The Rollback options dialog box appears and you can choose either
   of the following options.
   - Retain Data: All the changes to the CMDB resulting from this integration, are retained.
   - Perform Rollback: All the changes to the CMDB resulting from this integration, are rolled
     back and the CMDB is restored to its state before running the integration.

Provide integration schedule

Configure a schedule for importing data to CMDB using this ETL Transform Map.
Role required: cmdb_inst_admin

1. Navigate to Configuration > IntegrationHub ETL, and click the Name of an integration.
   The landing page of the IntegrationHub ETL lists all integrations that exist in the system, including integrations that were downloaded from the ServiceNow Store.
2. In the ETL Transform Map Assistant page, in the Preview Sample Integration Results and Schedule Import section of the guided setup, select Set Import Schedule.
3. On the Provide Schedule page, click Set Schedules.
4. In the Scheduled Data Imports list view (which opens in a new tab), click New.
5. Fill out the Scheduled Data Import form and then click Submit.
   See Schedule a data import for details about the form fields.
6. Click Mark as Complete.

Transform types in IntegrationHub ETL

Use various transforms in IntegrationHub ETL to convert and prepare source data for mapping to the CMDB.

Transforms from the Integration Commons for CMDB (2.1.0) store app, are also available in IntegrationHub ETL.

Concatenation

Combines the values from input fields into a single string, joining them on the optional joining_string field.

<table>
<thead>
<tr>
<th>Details</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>sys_rte_eb_concat_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_fields</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td>Additional Fields</td>
<td>joining_string (optional)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Example</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>“input_1”, “input_2”, “input_3”</td>
</tr>
<tr>
<td>Additional Fields</td>
<td>joining_string = “,”</td>
</tr>
<tr>
<td>Result</td>
<td>“input_1, input_2, input_3”</td>
</tr>
</tbody>
</table>

Convert to Boolean

Converts the incoming value to a boolean. ‘true’ and ‘1’ values convert to ‘true’ (case insensitive), and any other values covert to ‘false’.

<table>
<thead>
<tr>
<th>Details</th>
<th>Table</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>sys_rte_eb_to_boolean_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
</tbody>
</table>
Examples:
- All of the following inputs return ‘true’:
  - true
  - 1
- All of the following inputs return ‘false’:
  - "input_1"
  - ""
  - 0
  - 11

Convert to Date

Attempts to convert the incoming value to a GlideDateTime value by applying the date_format to the incoming value. Attempts to directly convert using GlideDateTime if the date_format is incorrect.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sys_rteEb_to_date_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td>Additional Fields</td>
<td>date_format (Java simple date format)</td>
</tr>
</tbody>
</table>

**Example**

<table>
<thead>
<tr>
<th>Input</th>
<th>&quot;2018/09/20 11:21:00 AM EST&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Fields</td>
<td>date_format = &quot;yyyy/MM/dd hh:mm:ss a z&quot;</td>
</tr>
<tr>
<td>Result</td>
<td>&quot;2018-09-20 16:21:00&quot;</td>
</tr>
</tbody>
</table>

**Example**

<table>
<thead>
<tr>
<th>Input</th>
<th>&quot;2018/09/20 01:21:00 PM EST&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Fields</td>
<td>date_format = &quot;yyyy/MM/dd hh:mm:ss a z&quot;</td>
</tr>
<tr>
<td>Result</td>
<td>&quot;2018-09-20 18:21:00&quot;</td>
</tr>
<tr>
<td>Example</td>
<td></td>
</tr>
<tr>
<td>---------</td>
<td>----------</td>
</tr>
<tr>
<td>Input</td>
<td>“09/20/18”</td>
</tr>
<tr>
<td>Additional Fields</td>
<td><code>date_format = “yyyy/MM/dd hh:mm:ss a z”</code></td>
</tr>
<tr>
<td>Result</td>
<td>“0018-09-20 00:00:00”</td>
</tr>
</tbody>
</table>

**Convert to Numeric**

Converts the incoming value to a number.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td><code>sys_rteEbToNumericOperation</code></td>
</tr>
<tr>
<td>Input fields</td>
<td><code>source_sys_rte_eb_field</code></td>
</tr>
<tr>
<td>Output field</td>
<td><code>target_sys_rte_eb_field</code></td>
</tr>
</tbody>
</table>

If the incoming value is non-numeric, then the output is empty.

<table>
<thead>
<tr>
<th>Example</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>1.23</td>
</tr>
<tr>
<td>Result</td>
<td>1.23</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Example</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

<th>Example</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td><code>two</code></td>
</tr>
<tr>
<td>Result</td>
<td>null</td>
</tr>
</tbody>
</table>

**Copy**

Copies the source field’s value to all of the target fields.
<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sys_rte_eb_copy_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_fields</td>
</tr>
<tr>
<td>Additional Fields</td>
<td>overwrite_existing_value (optional, boolean): If true, then the values of target fields are replaced. Otherwise, any non-empty value is not overwritten.</td>
</tr>
</tbody>
</table>

**Extract Leading Numeric**

Sets the target field to be the first numeric value found in the source field.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sys_rte_eb_extract_numeric_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td>Additional Fields</td>
<td>- decimal_places (optional, number): Forces the output to have a specified number of decimal places. - remainder_target_field (optional, reference to a field): Set to the trimmed remainder of the source field, after removing the first numeric value.</td>
</tr>
</tbody>
</table>

**Example**

<table>
<thead>
<tr>
<th>Input</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>“100 mb”</td>
<td>“100”</td>
</tr>
</tbody>
</table>

**Example**

<table>
<thead>
<tr>
<th>Input</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>“100.123 mb”</td>
<td>“100.123”</td>
</tr>
</tbody>
</table>

**Example**

<table>
<thead>
<tr>
<th>Input</th>
<th>Additional Fields</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>“100.123 mb”</td>
<td>decimal_places = 2</td>
<td>“100.12”</td>
</tr>
</tbody>
</table>

**Example**

<table>
<thead>
<tr>
<th>Input</th>
<th>Additional Fields</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>“100 mb”</td>
<td>decimal_places = 2</td>
<td></td>
</tr>
</tbody>
</table>
### Glide Lookup

Performs a lookup in the database on the `target_table`.

<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb.glide_lookup_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sys_rte_eb.glide_lookup_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_fields</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_fields</td>
</tr>
<tr>
<td>Additional Fields</td>
<td>target_table</td>
</tr>
<tr>
<td></td>
<td>glide_matching_fields (string): Comma-separated list of column names in the target table. For each input field in source_sys_rte_eb_fields, there must be an equal number of values in glide_matching_fields</td>
</tr>
<tr>
<td></td>
<td>glide_target_fields (string): Comma-separated list of column names in the target table. For each target field in target_sys_rte_eb_fields, there must be an equal number of values in glide_target_fields</td>
</tr>
</tbody>
</table>

### Min/Max

Sets the target field to either the maximum or minimum of the values from all input fields.

<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb.min_max_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sys_rte_eb.min_max_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_fields</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td>Additional Fields</td>
<td>data_type (choice list &lt;STRING,NUMERIC,DATE&gt;)</td>
</tr>
<tr>
<td></td>
<td>min_max (choice list &lt;MIN,MAX&gt;)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Example</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
<td>“2”, “-1”, “0”</td>
</tr>
</tbody>
</table>
### Multiple Input Script

Runs a script with multiple inputs, setting the `target_field` == output for that script.

Each source field is available inside of the `batch` variable as JavaScript fields. The name of the JavaScript field is the field attribute of the entity field (looking at `sys_rte_eb_field.field`, not `sys_rte_eb_field.name`).

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td><code>sys_rte_eb_multi_in_script_operation</code></td>
</tr>
<tr>
<td>Input fields</td>
<td><code>source_sys_rte_eb_fields</code></td>
</tr>
<tr>
<td>Output field</td>
<td><code>target_sys_rte_eb_field</code></td>
</tr>
</tbody>
</table>
Example for using `use_unique_input_sets`, with a script function that takes `record_type` and `operating_system` as input and returns `record_with_os`:

Input data

<table>
<thead>
<tr>
<th>Record</th>
<th>record_type</th>
<th>operating_system</th>
<th>record_with_os</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>computer</td>
<td>Windows XP</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>computer</td>
<td>Linux</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>computer</td>
<td>Windows XP</td>
<td></td>
</tr>
</tbody>
</table>

If `use_unique_inputs_sets` is set to `true`, then the script processes only two values (computer + Windows XP and computer + Linux). If `use_unique_inputs_sets` is set to `false`, then each of the three values is individually processed (computer + Windows XP, computer + Linux, and computer + Windows XP).

Sample script:

```javascript
(function(batch, output) {
    for (var i = 0; i < batch.length; i++) {
        // batch[i] is the unique set of inputs/individual record
        // batch[i].<field> gives access to the field value
        var in0 = gs.nil(batch[i].record_type) ? '' : batch[i].record_type;
        var in1 = gs.nil(batch[i].operating_system) ? '' : batch[i].operating_system;
        // output[i] is the output for the specific combination of inputs/individual record
        output[i] = in0 + "_" + in1;
    }
})(batch, output);
```

**Rexeg Replace**

Replaces each substring of the incoming string that matches the specified `match_regex`, with the specified `replacement_regex` string value.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td><code>sys_rteEb_regex_replace_operation</code></td>
</tr>
<tr>
<td>Input fields</td>
<td><code>source_sys_rte_eb_field</code></td>
</tr>
<tr>
<td>Output field</td>
<td><code>target_sys_rte_eb_field</code></td>
</tr>
</tbody>
</table>
### Replace

Replaces each substring in the incoming string that matches the specified `match_string`, with the `replacement_string` string value.

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
</tr>
<tr>
<td>Input fields</td>
</tr>
<tr>
<td>Output field</td>
</tr>
<tr>
<td>Additional Fields</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

**Example**

<table>
<thead>
<tr>
<th>Input</th>
<th>“Original String”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional Fields</td>
<td><code>match_string</code> = “Original”</td>
</tr>
<tr>
<td></td>
<td><code>replacement_string</code> = “Replacement”</td>
</tr>
<tr>
<td>Result</td>
<td>“Replacement String”</td>
</tr>
</tbody>
</table>

### Round Numeric

Rounds the number value to the nearest whole number. Non-numbers are truncated.

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
</tr>
<tr>
<td>Input fields</td>
</tr>
<tr>
<td>Output field</td>
</tr>
</tbody>
</table>
### Example

<table>
<thead>
<tr>
<th>Input</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;1.5&quot;</td>
<td>&quot;2&quot;</td>
</tr>
<tr>
<td>&quot;1.4&quot;</td>
<td>&quot;1&quot;</td>
</tr>
<tr>
<td>&quot;i’m a string&quot;</td>
<td>&quot;&quot;</td>
</tr>
</tbody>
</table>

### Script

Runs a script with input, setting the `target_field == output` for that script.

This transform has been superseded by the Multi Input Script transform and is included for backwards compatibility with existing configurations.

<table>
<thead>
<tr>
<th>Details</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td><code>sys_rte Eb_script_operation</code></td>
</tr>
<tr>
<td>Input fields</td>
<td><code>source_sys_rteEb_field</code></td>
</tr>
<tr>
<td>Output field</td>
<td><code>target_sys_rteEb_field</code></td>
</tr>
<tr>
<td>Additional Fields</td>
<td>- <code>script</code> (script)</td>
</tr>
<tr>
<td></td>
<td>- <code>use_unique_input_sets</code> (boolean): When <code>true</code>, only unique input values are included in the data batch for IRE processing. Otherwise, all input object’s field values are included. For an example and for more details, see the Multiple Input Script transform.</td>
</tr>
</tbody>
</table>

The source field is included in the ‘batch’ variable as the JavaScript field ‘input’.

```javascript
(function(batch, output) {
  for (var i = 0; i < batch.length; i++) {
    // batch[i] is the unique set of inputs/individual record
    // batch[i].input gives access to the field value
    var in0 = gs.nil(batch[i].input) ? '' : batch[i].input;
    // output[i] is the output for the specific combination of inputs/individual record
    output[i] = in0 + " modified by script";
  }
})(batch, output);
```
Set

Sets the target field’s value to the string specified in `set_value`.

<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb_set_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td></td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td>Additional Fields</td>
<td>· <code>set_value</code> (string)</td>
</tr>
<tr>
<td></td>
<td>· <code>overwrite_existing_value</code> (optional, boolean): When true, the current value of the target field is overwritten. Otherwise, a non-empty value isn’t replaced.</td>
</tr>
</tbody>
</table>

Split

Splits the source field’s value on the `splitting_string` and assigns each resulting item from the split to the `target_sys_rte_eb_fields`, in order.

<table>
<thead>
<tr>
<th>Details</th>
<th>sys_rte_eb_split_operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td></td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_fields</td>
</tr>
<tr>
<td>Additional Fields</td>
<td><code>splitting_string</code> (string)</td>
</tr>
</tbody>
</table>

Example

Input: "value1||value2||value3", with target_sys_rte_eb_fields (target1,target2,target3)

Additional Fields: `splitting_string` = "||"

Result: target1 : value1, target2 : value2, target3 : value3

Example

Input: "value1||value2||value3", with target_sys_rte_eb_fields (target1)

Additional Fields: `splitting_string` = "||"

Result: target1 : value1

Example

Input: "value1", with target_sys_rte_eb_fields (target1,target2,target3)

Additional Fields: `splitting_string` = "||"
Trim

Trims leading and trailing whitespace from the `source_sys_rte_eb_field` value and assigns the result to the `target_sys_rte_eb_field`. This transform is equivalent to a Java `String.trim()`.

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
</tr>
<tr>
<td>Input fields</td>
</tr>
<tr>
<td>Output field</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
</tr>
<tr>
<td>Result</td>
</tr>
</tbody>
</table>

Uppercase

Uppercases the `source_sys_rte_eb_field` value and assigns the result to `target_sys_rte_eb_field`.

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
</tr>
<tr>
<td>Input fields</td>
</tr>
<tr>
<td>Output field</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input</td>
</tr>
<tr>
<td>Result</td>
</tr>
</tbody>
</table>

Uppercase Trim

Combines both the Uppercase and the Trim transforms.

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
</tr>
<tr>
<td>Input fields</td>
</tr>
<tr>
<td>Output field</td>
</tr>
</tbody>
</table>
**Example**

<table>
<thead>
<tr>
<th>Input</th>
<th>“value1”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Result</td>
<td>“VALUE1”</td>
</tr>
</tbody>
</table>

**Integration Commons for CMDB (2.1.0)**

The Integration Commons for CMDB store app contain a set of RTE (Robust Transform Engine) transforms and script includes. Use these transforms and script includes to standardize the values stored in the CMDB by different data integrations or by changes.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the [ServiceNow Store version history release notes](#).

**CMDB Integrations Dashboard**

The Integration Commons for CMDB store app provides a dashboard with a central view of status, processing results, and processing errors of all installed integrations. You can see metrics for all integration runs, or filter the view to a specific CMDB integration, a specific time duration, or a specific integration run.

To access the CMDB Integrations Dashboard:

1. Navigate to **Self-Service > Dashboards**.
2. On the Dashboards view, select the **CMDB Integrations Dashboard** dashboard.
   - Click the **CMDB Execution Status** tab to see metrics such as the total number of integrations and processed rows, integration runs actively running, daily statistics, and details about the classes that were updated.
   - Click the **CMDB Integration Errors** tab to see metrics such as number of import and integration errors, and number of erroneous imported records.
   - Drill down metrics to list associated records, and you can point to charts to show more details for the chart.
   - Narrow down the scope of the integration runs included in the metrics on the dashboard by configuring filters on the right-hand side of the dashboard. Set any of the following filters and then click **Apply**. The filter settings apply to any metric with a filter icon in its upper left corner.

<table>
<thead>
<tr>
<th>Filters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import Date</td>
<td>Select <strong>All</strong> or a time period, such as <strong>Last 7 days</strong>, from which to include integration runs in metrics.</td>
</tr>
<tr>
<td>CMDB Applications</td>
<td>Select <strong>All</strong>, or a CMDB application, such as <strong>SCCM</strong>, from which to include integration runs in metrics.</td>
</tr>
</tbody>
</table>
Using the transforms and script includes in Integration Commons for CMDB

The attributes that are included in the Integration Commons for CMDB store app are attributes that Identification and Reconciliation Engine (IRE) requires for identification or attributes that could be used to derive classes.

The transforms are templated operations, meaning that there is a script that controls the logic for the transform. The result is that there can be only a single output. When a transform returns multiple values, then those values are concatenated by a triple pipe (|||). You then must use the split transform to retrieve the values that you are interested in. The inputs are either a single field or a list of fields. For all but one transform, the inputs are assumed to be a fixed list of fields as described for each of the following individual transform.

ServiceNow integrations that are available at the ServiceNow Store, have dependencies on the transforms and script includes in the Integration Commons for CMDB store app. Therefore, when you install such CMDB integration, the Integration Commons for CMDB store app is automatically installed too.

The following RTE transforms are included in the Integration Commons for CMDB store app, and are available in the IntegrationHub ETL store app.

Cleanse Company

Use when there is a hardware manufacturer name that must be cleansed and added to core_company to populate a reference, but the manufacturer is not linked to a model or software (cpu_manufacturer).

<table>
<thead>
<tr>
<th>Cleanse Company</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table</strong></td>
<td>sn_cmdb_int_util_cleanse_company_operation</td>
</tr>
<tr>
<td><strong>Input fields</strong></td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Input is a company/manufacturer name.</td>
</tr>
<tr>
<td><strong>Output field</strong></td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Output is the resulting sys_id and name of the company in core_company, concatenated by triple pipe (</td>
</tr>
<tr>
<td><strong>Script include function</strong></td>
<td>sn_cmdb_int_util.CmdbIntegrationHardwareModelUtil().cleanseCompany(input)</td>
</tr>
</tbody>
</table>

If a matching record does not exist, then a new record is created in core_company so the return always includes a sys_id and name (unless the input is empty or invalid). The name is cleansed and a fuzzy lookup is done via the CmdbIntegrationCompanyModelUtil script include before the MakeAndModelJS platform API is called.
Cleanse Hardware Model

Use to create, cleanse, or lookup a hardware model to create a reference (model_id).

<table>
<thead>
<tr>
<th>Cleanse Hardware Model</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_cleanse_hardware_model_operation</td>
</tr>
</tbody>
</table>

Input fields

- **source_sys_rteEb_fields**
  - Input in order is:
    1. The manufacturer name
    2. The model name
  - If either value is provided by itself, then the operation only processes what is found.

Output field

- **target_sys_rteEb_field**
  - Output is the resulting sys_id and name of the company in core_company, and sys_id and name of the model in cmdb_model - all concatenated by triple pipe (|||).

Script include function

- sn_cmdb_int_util.CmdbIntegrationHardwareModelUtil().cleanseModelAndCompany(manufacturer_in, model_in)

For either the manufacturer or model, if a matching record does not exist then a new record is created so the return always includes sys_ids and names for both records (unless the input is empty or invalid).

The manufacturer name is processed like the Cleanse Company transform and then both the manufacturer name and model name are sent to the MakeAndModelJS platform API.

Cleanse IP Address

Use when a field provides an IP address.

<table>
<thead>
<tr>
<th>Cleanse IP Address</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_cleanse_ip_operation</td>
</tr>
</tbody>
</table>

Input fields

- **source_sys_rteEb_field**
  - Input is the IP address to cleanse.

Output field

- **target_sys_rteEb_field**
  - Output is the resulting IP address, which can be empty.

Script include function

- sn_cmdb_int_util.CmdbIntegrationNetworkUtil().cleanseIpAddress(input)

The IP address is tested for both IPv4 and IPv6 structures along with some known derivations (an IPv4 with spaces instead of periods). If a result is found, then it is formatted and returned.
Cleanse IP Version

Use when the source of data does not provide an IP version or when the IP version might be unreliable.

<table>
<thead>
<tr>
<th>Cleanse IP Version</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_cleanse_ip_version_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Input is the IP address to cleanse.</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Output is the resulting cmdb_ci_ip_address.ip_version lookup key (either 4, 6, or empty).</td>
</tr>
<tr>
<td>Script include function</td>
<td>sn_cmdb_int_util.CmdbIntegrationNetworkUtil().deriveIpVersion(input)</td>
</tr>
</tbody>
</table>

The input IP address value is checked for either proper IPv4 or IPv6 structure, otherwise the return is empty. This function provides no IP cleansing.

Cleanse MAC Address

Use when a field provides a MAC address.

<table>
<thead>
<tr>
<th>Cleanse MAC Address</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_cleanse_mac_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Input is the MAC address to cleanse.</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Output is the resulting MAC address which can be empty.</td>
</tr>
</tbody>
</table>
The MAC address is tested for proper structure along with some known derivations (for example, a MAC address with spaces instead of colons). If a result is found, then it is formatted and returned.

### Cleanse Operating System

Use when the source provides an operating system.

<table>
<thead>
<tr>
<th>Cleanse Operating System</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util.CmdbIntegrationOsUtil().cleanseAndInsertOs(input)</td>
</tr>
</tbody>
</table>

Input fields

<table>
<thead>
<tr>
<th>Input fields</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_sys_rte_eb_field</td>
<td>Input is the operating system name to cleanse.</td>
</tr>
</tbody>
</table>

Output field

<table>
<thead>
<tr>
<th>Output field</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>target_sys_rte_eb_field</td>
<td>Output is the resulting operating system name. The resulting operating system name is also written to the cmdb_ci_computer.os list field.</td>
</tr>
</tbody>
</table>

Most of the current cleansing is centered on Microsoft operating system values aside from common cleansing such as fixing casing.

**Examples:**

<table>
<thead>
<tr>
<th>Operating System In</th>
<th>Operating System Out</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows 2003</td>
<td>Windows 2003</td>
</tr>
<tr>
<td>Windows Vista 64 bit Edition</td>
<td>Windows Vista</td>
</tr>
<tr>
<td>Windows XP Service Pack 2-3</td>
<td>Windows XP</td>
</tr>
<tr>
<td>Microsoft Windows 2003</td>
<td>Windows 2003</td>
</tr>
<tr>
<td>Microsoft Windows Vista 64 bit Edition</td>
<td>Windows Vista</td>
</tr>
<tr>
<td>Microsoft Windows 2000 Professional Service Pack 4</td>
<td>Windows 2000 Professional</td>
</tr>
<tr>
<td>Microsoft Windows XP Service Pack 2-3</td>
<td>Windows XP</td>
</tr>
<tr>
<td>Linux Ubuntu</td>
<td>Linux Ubuntu</td>
</tr>
<tr>
<td>Operating System In</td>
<td>Operating System Out</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>Linux Ubuntu Server</td>
<td>Linux Ubuntu Server</td>
</tr>
</tbody>
</table>

**Cleanse Software Model**

Use when the source provides software which is not an operating system.

<table>
<thead>
<tr>
<th>Cleanse Software Model</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Table</strong></td>
<td>sn_cmdb_int_util_cleanse_software_model_operation</td>
</tr>
<tr>
<td><strong>Input fields</strong></td>
<td><strong>source_sys_rte_eb_fields</strong></td>
</tr>
<tr>
<td></td>
<td>Input in order is:</td>
</tr>
<tr>
<td></td>
<td>1. The manufacturer name</td>
</tr>
<tr>
<td></td>
<td>2. The software name</td>
</tr>
<tr>
<td></td>
<td>3. The software version (not required)</td>
</tr>
<tr>
<td></td>
<td>If only manufacturer or name is provided, then only those values are processed and returned.</td>
</tr>
<tr>
<td><strong>Output field</strong></td>
<td><strong>target_sys_rte_eb_field</strong></td>
</tr>
<tr>
<td></td>
<td>Output is the resulting sys_id and name of the company in core_company, the cleansed software name, and the cleansed software version all concatenated by a triple pipe (</td>
</tr>
<tr>
<td><strong>Script include function</strong></td>
<td>sn_cmdb_int_util.CmdbIntegrationSoftwareModelUtil().cleanseSoftwareModel(company, model, version)</td>
</tr>
</tbody>
</table>

If a matching manufacturer record does not exist, then a new record is created so the return always includes the sys_id and name for the manufacturer (if the manufacturer is not empty or invalid).

The manufacturer name is processed the same as in the Cleanse Company transform and then the manufacturer name is sent to the MakeAndModelJS platform API.

The software name and version are cleansed and formatted and returned. The version is removed from the software name if present.

<table>
<thead>
<tr>
<th>Manufacturer In</th>
<th>Software Name In</th>
<th>Software Version In</th>

**Derive CI Class from Operating System**

Use when processing a computer record and an operating system is provided but the class of the computer is ambiguous otherwise. Can be used along with other Derive CI Class transforms.
Derive CI Class from Operating System | Details
--- | ---
Table | `sn_cmdb_int_util.derive_class_from_os_operation`

Input fields | `source_sys_rte_eb_fields`
Input in order is:
1. The operating system name
2. The current class name

Output field | `target_sys_rte_eb_field`
Output is the resulting class name.

Script include function | `sn_cmdb_int_util.CmdbIntegrationClassUtil().deriveClassNameFromOsName(os_in, class_in)`

Does not return a value of a class which is higher in the class hierarchy (a parent class) than the provided input class. For example, does not return `cmdb_ci_computer` if the input is `cmdb_ci_server`. Looks only at the `cmdb_ci_computer` hierarchy, going through `cmdb_ci_server` (`cmdb_ci_computer`, `cmdb_ci_server`, children of `cmdb_ci_server`).

Currently looks for Server, Windows Server, and Linux Server indicators in the operating system name.

Derive Virtual From Native Indicator

Use when processing a computer record that may be virtual, a virtual indicator is provided by the source, and the virtual status is ambiguous. Can be used along with other Derive Virtual From transforms.
Derive Virtual From Native Indicator

<table>
<thead>
<tr>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table: sn_cmdb_int_util_derive_virtual_from_native_value_operation</td>
</tr>
</tbody>
</table>

**Input fields**

- **source_sys_rte_eb_fields**
  - Input in order is:
    1. The native indicator
    2. The current virtual flag value

**Output field**

- **target_sys_rte_eb_field**
  - Output is the resulting virtual flag (true/false). If the current virtual flag is ‘true’, the result is true. Otherwise the result is ‘true’ or ‘false’.

**Script include function**

- sn_cmdb_int_util.CmdbIntegrationVirtualDetectionUtil().detectVirtualFromNativeIdentifier(native_in, is_virtual_in)

Tests native indicator against a list of common values and looks for a ‘true’ boolean indicator.

<table>
<thead>
<tr>
<th>Native Virtual Value In</th>

</tbody>
</table>
### Derive Virtual From Serial Number

Use when processing a computer record that may be virtual, a serial number is provided by the source, and the virtual status is ambiguous. Can be used along with other Derive Virtual From transforms.

<table>
<thead>
<tr>
<th>Derive Virtual From Serial Number</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_derive_virtual_from_serial_number_operation</td>
</tr>
<tr>
<td>Input fields</td>
<td>source_sys_rte_eb_fields</td>
</tr>
<tr>
<td></td>
<td>1. The serial number</td>
</tr>
<tr>
<td></td>
<td>2. The current virtual flag value</td>
</tr>
<tr>
<td>Output field</td>
<td>target_sys_rte_eb_field</td>
</tr>
<tr>
<td></td>
<td>Output is the resulting virtual flag (true/false). If the current virtual flag is ‘true’, the result is true. Otherwise the result is ‘true’ or ‘false’.</td>
</tr>
<tr>
<td>Script include function</td>
<td>sn_cmdb_int_util.CmdbIntegrationVirtualDetectionUtil().detectVirtualFromSerialNumber(serial_in, is_virtual_in)</td>
</tr>
</tbody>
</table>

Looks for indicators in the serial number for a virtual device (VMware).

<table>
<thead>
<tr>
<th>Serial Number In</th>
<th>Virtual Flag In</th>
<th>Virtual Flag Out</th>
</tr>
</thead>
<tbody>
<tr>
<td>123</td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td>123</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>123</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>vmware-123</td>
<td>true</td>
<td>true</td>
</tr>
</tbody>
</table>

### First Non Null Value

Use when you have a list of fields providing similar information that must map to a single field and you want to rank the order in which they can provide those values.

<table>
<thead>
<tr>
<th>Serial Number In</th>
<th>Virtual Flag In</th>
<th>Virtual Flag Out</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td></td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td></td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td></td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>
For example: Internally in SolarWinds, there is a hierarchy of tables that are join. In one example, a computer’s name could come from the child most table or any of that tables parents but each of those is a separate field in the pull. Starting with the most specific table, the values are searched for the first instance of a name value.

<table>
<thead>
<tr>
<th>First Non Null Value</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_first_non_null_operation</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Input fields</th>
<th>source_sys_rte_eb_fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input is a list of fields of any length.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output field</th>
<th>target_sys_rte_eb_field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output is the value from the first field in the list that doesn’t have a null (or empty) value.</td>
<td></td>
</tr>
</tbody>
</table>

| Script include function | sn_cmdb_int_util.CmdbIntegrationFirstNonNullValueUtil().firstNonNullValue(batch(i)) |

**Process Name, Domain, FQDN, DNS set**

Use when the source provides name, domain, FQDN, or DNS information. Can be used for only a subset of these (if for example, the source only provides name and domain).

In the case that a source only provides fields that are lower in the input list (FQDN) the CmdbIntegrationHardwareNameUtil script include can be called from a script operation to minimize having to create empty dummy fields.

<table>
<thead>
<tr>
<th>Process Name, Domain, FQDN, DNS set</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util_process_name_set_operation</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Input fields</th>
<th>source_sys_rte_eb_fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Takes up to four Input fields (any additional fields are ignored), in the following order:</td>
<td></td>
</tr>
<tr>
<td>1. Name</td>
<td></td>
</tr>
<tr>
<td>2. Domain</td>
<td></td>
</tr>
<tr>
<td>3. FQDN</td>
<td></td>
</tr>
<tr>
<td>4. DNS</td>
<td></td>
</tr>
</tbody>
</table>

You don’t have to provide all four input values, but you must provide those values in the specified order. If for example, you only want to cleanse domain, you must provide a name attribute, even it if empty.

<table>
<thead>
<tr>
<th>Output field</th>
<th>target_sys_rte_eb_field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output is a concatenated set of values in the same order, using a triple pipe (</td>
<td></td>
</tr>
</tbody>
</table>

| Script include function | sn_cmdb_int_util.CmdbIntegrationHardwareNameUtil().processNameDomainFqdnDnsSet(name, domain, fqdn, dns) |

© 2020 ServiceNow, Inc. All rights reserved.
FQDN and DNS are first processed to see if their formats are correct. FQDN has an additional discovery regex it must pass (via properties):

- `glide.discovery.fqdn.regex` - default: `^([^.]+)\.(?:[^.]\.)+(^\.)+$`

Possible name and domain values are extracted if possible. When name and domain are processed, if there is no FQDN, a value is generated if possible. A resulting name value is also modified using the following discovery flags:

1. `glide.discovery.hostname.case` - default: No change. Can be set to ‘Lower case’, ‘Upper case’, ‘No change’
2. `glide.discovery.hostname.include_domain` - default: false. If ‘true’ the domain is added to the final name value

### Table

| Name In   | Domain In  | FQDN In       | DNS In         | Output (name||| domain||| FQDN|||DNS) |
|-----------|------------|---------------|----------------|----------------------------------------|
| myName    | other.net  | otherName.other.net | mycomp.servicenow.com | myName|||other.net|||otherName.other.net|||mycomp.servicenow.com |
| na        | other.net  | otherName.other.net | mycomp.servicenow.com | otherName|||other.net|||otherName.other.net|||mycomp.servicenow.com |
|           |            |               | servicenow.com | name.servicenow.com|||servicenow.com|||servicenow.com|
|           |            |               | name.servicenow.com | name.servicenow.com|||name.servicenow.com|||name.servicenow.com|
|           |            |               | name.servicenow.com | name.servicenow.com|||name.servicenow.com|||name.servicenow.com|
| name      | servicenow.com |               |                | name|||servicenow.com|||servicenow.com|||servicenow.com|||servicenow.com|

### Process FQDN

Use when the source provides a suspected FQDN value but no other naming fields such as name, domain, or DNS.

<table>
<thead>
<tr>
<th>Process FQDN</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td><code>sn_cmdb_int_util_process_fqdn_operation</code></td>
</tr>
</tbody>
</table>
### Process FQDN

<table>
<thead>
<tr>
<th>Input fields</th>
<th>source_sys_rte_eb_field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>Input is a single field containing an FQDN.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output field</th>
<th>target_sys_rte_eb_field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>Output is a concatenated set of values in the same order using a triple pipe (</td>
</tr>
</tbody>
</table>

| Script include function | sn_cmdb_int_util.CmdbIntegrationHardwareNameUtil().processNameDomainFqdnDnsSet("", ",", fqdn, ") |

The processing follows the same logic as the ‘Process Name, Domain, FQDN, DNS set’ transform except that only FQDN is used as an input.

### Scale Units

Use when the source has numerical inputs that must be scaled. The source does not always provide the current units so it may be required to calculate or guess the units being provided. The target units depend on the field being targeted in the CMDB.

<table>
<thead>
<tr>
<th>Scale Units</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sn_cmdb_int_util.scale_unit_operation</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Input fields</th>
<th>source_sys_rte_eb_fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>Inputs in order are:</td>
</tr>
<tr>
<td></td>
<td>1. The input value</td>
</tr>
<tr>
<td></td>
<td>2. The current units</td>
</tr>
<tr>
<td></td>
<td>3. The target units</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output field</th>
<th>target_sys_rte_eb_field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Details</td>
<td>Output is the input value scaled from the current units to the target units. If no units are found for the current units, then the input value is returned. If no current or target units are found the input is returned as the output.</td>
</tr>
</tbody>
</table>

| Script include function | sn_cmdb_int_util.CmdbIntegrationScaleUnitUtil().scaleUnits(input_value, input_unit, output_unit) |

### Application services

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website.

ServiceNow applications refer to devices and applications that comprise an application service as configuration items (CIs). The various CIs and the relationships between them, that comprise an application service, are stored in the CMDB.

In the base system, you can manually create an application service and then populate it by adding CIs and their relationships from the CMDB. After adding CIs to an application service,
you can see a flat list of those CIs, as the context for the service. The system generates a map which shows the CIs and relationships in the application service. The system also tracks changes to application service and shows the history of those changes in the application service map.

All application services that you create manually or by using an API, or that are discovered by Service Mapping, are stored in the Application Service (cmdb_ci_service_discovered) table. Activating Service Mapping or Event Management provides additional functionality for creating, updating, and using application services.

**Dynamic manual services**

The dynamic manual service service type is an enhancement to the application service service type. A dynamic manual service is unique in that it automatically updates to reflect changes in the relationships of CIs within the service.

Changes to relationships in the CMDB are tracked in the CI Relationship (cmdb_rel_ci) table. When adding a relationship to a CI that is contained in a dynamic manual service, then that service automatically updates to reflect the addition of the relationship and the associated new CI. In a similar manner, a dynamic manual service automatically updates upon the removal of a relationship and its associated CI from a CI within the service.

If applicable, dynamic manual services are automatically added as impacted services in a change request. On a Change Request form, if you add an affected CI (Affected CIs tab), then any dynamic manual services associated with that CI are automatically added to the Impacted Services/CIs tab.

**Domain separation**

Domain separation, if deployed, impacts application services as follows:

- When creating an application service, the application service is assigned to the user’s domain.
- When manually adding a CI to an application service, you can choose only CIs that belong to the service domain.
- When using the `createOrUpdateService - POST` REST API for creating or updating an application service, the process stops if one of the CIs referenced in the API belongs to a different domain than the application service itself.
- When converting business services into application services, the newly created application service belongs to the same domain as the original business service. The application service comprises only CIs belonging to the same domain as the application service itself.

**Application services APIs**

Application services provide several APIs that you can use to perform tasks such as creating an application service or adding a CI or a connection to an application service. See *Use application services APIs* for details about all application service APIs.

**Service Mapping**

If activated, Service Mapping discovers application services and automatically populates application services with discovered application and host CIs. If Service Mapping is activated, then an application service can comprise of manually added CIs and Service Mapping discovered CIs. Service Mapping creates and updates application services by communicating
with individual CIs in the CMDB and identifying connections between the CIs. Service Mapping stores information about discovered CIs and relationships in the CMDB.

**Event Management**

Application services are associated with a criticality level which determines the prominence of an application service on the Event Management dashboard. You can also use a criticality value to define recovery strategies. For more information, see *Define criticality for application services*.

**Manually create an application service**

Create an application service that does not contain any CIs.

**Role required:** app_service_admin

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website. Use application services to organize, maintain, and monitor services in your organization.

You can specify an owner for the application service. The application service owner is a user who is familiar with the infrastructure and applications making up the service. This user is the application service SME who provides information necessary for a successful creation of an application service.

An application service has an entry point, which lets users access the application service. If you are at the planning stage and do not know what the entry points are for an application service, you can create the application service without entry points. Such application service is referred to as an empty application service, to which you can add entry points at any later time.

Service Mapping, if activated, can automatically discover and map application services as described in *Application service mapping*. A discovered application service contains the CIs and the connections between them that Service Mapping discovered and mapped.

All application services, both manually created and discovered by Service Mapping, are stored in the Application Service (cmdb_ci_service_discovered) table.

You can also create an application service by using the `createOrUpdateService - POST` REST API.

1. Navigate to **Configuration > Application Services > Application Services**.
2. Click **New**.
3. Specify the basic application service attributes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the application service name. This name must be unique. Use self-explanatory names such as mailing service or printing service.</td>
</tr>
<tr>
<td>Owner</td>
<td>Select an owner who is responsible for this application service in the organization.</td>
</tr>
</tbody>
</table>

4. Optional: Add entry points:
   a) In the Add Entry Point section, fill out the form:
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Select the CI type (CI class) for the CI you are adding. Every CI belongs to a CI type which contains a set of attributes configured for this kind of CI, for example, <code>cmdb_ci_appl</code> for applications.</td>
</tr>
<tr>
<td>CI Name</td>
<td>Select the CI from the list of CIs of the selected CI type.</td>
</tr>
</tbody>
</table>

The CI type list includes only allowed CI types. For example, you cannot add an application cluster.

b) Click **Add**.

c) To add additional entry points, click **Add Entry Point** and fill out the necessary details.

5. **Click Save**.

   This application service is added to the Application Service (`cmdb_ci_service_discovered`) table.

### Manually add CIs to an application service

#### Convert business services to application services

Unify the way you manage services in your organization by converting manually created records in the Service (`cmdb_ci_service`) table into application services.

Using application services has benefits such as:

- Lets you view maps and change history of services.
- Lets you easily see the service context by providing a flat list of all CIs in the application service.
- If Event Management is deployed, you can monitor service performance and identify health issues for application services.
- In Change Management, the list of impacted services on a change request form is more accurate because the list includes only application services.

Using bulk conversion of business services to application services, you can choose to convert services to dynamic manual services, which are a sub-type of application services. Dynamic manual services automatically update to reflect changes to CI relationships within the service.

### Conversion process

During conversion, the following changes and processes occur:

- The service record is moved from the Service (`cmdb_ci_service`) table into the Application Service (`cmdb_ci_service_discovered`) table by changing the record class.
- The application service is set with all the original business service attributes such as name, owner, and operational status.
- The system adds related items from the business service to the converted application service, up to the specified level.
- All connections created between CIs in an application service are of the **Depends on::Used by** relationship type. You can modify this default relationship type by changing the value of the `sa.it_service.manual_ci_rel_type` property.
The system queries the CMDB for the latest CI changes.

Event Management, if activated, applies CI impact rules to CIs that are associated with alerts and that are part of the application service. Event Management deploys CI impact rules for alert monitoring.

Non-compliant CIs

A conversion might involve adding CIs of the following CI types, which cannot be added to an application service:

- `cmdb_ci_endpoint`
- `cmdb_ci_translation_rule`
- `cmdb_ci_config_file`
- `cmdb_ci_qualifier`
- `cmdb_ci_application_cluster`

If the original business service contains related items belonging to these CI types, then the system does not add such CIs or connections coming from them. If necessary, you can prevent CIs of other CI types from being added to application services by modifying the `sa.mapping.user.manual.citype.blacklist` property.

Domain separation

In environments with domain separation, only CIs belonging to the same domain as the application service are added to the application service. If there is a domain hierarchy, CIs must belong to the same child domain as the application service.

Convert business services to application services in bulk

Convert a subset or all business services to application services, in bulk and automatically rather than individually. Specify a criteria for a conversion, and all business services that match that criteria are automatically converted to application services.

Role required: `app_service_admin`, `ecmdb_admin`, or `itil_admin`

Use bulk conversion to convert legacy business services to application services and to dynamic manual services. You can create multiple bulk conversion records, each filtering for a different set of business services. However, do not include a business service in more than one bulk conversion.

After the conversion, use application services to streamline the different types of services in your organization and use ITOM capabilities to:

- View service maps and service history
- Monitor service health
- Apply Customer Service Management tools to open and manage cases at the service level.

1. Navigate to **Configuration > Services**.
2. In the Services list view, click **Convert to Application Services**.
3. Fill out the Bulk Convert Services form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query</td>
<td>Filter that business services must satisfy to be included in the bulk conversion. The number of business services that satisfy the query appear as a link. This number updates as you modify the query. Click the link to see the list of those services.</td>
</tr>
<tr>
<td>Note:</td>
<td>The ([\text{Class}()]\text{Service}) clause is internally built into the query. This clause is always included in the query, even if you delete it on the form.</td>
</tr>
<tr>
<td>Levels</td>
<td>The number of levels of related CIs to include in the converted application service.</td>
</tr>
<tr>
<td>Update service when CMDB updates</td>
<td>Denotes whether to convert the specified business services to application services, or to dynamic manual services.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

- Check the status of a conversion: On the Bulk Convert Services form, scroll to the Bulk Convert Services Entries section to see the status (such as Ready or Completed) of a conversion.
- Track the progress of a conversion as it runs: In the navigation filter, enter `cmdb_convert_bulk_services.list` and press the Enter key to see the list of conversions, and their progress.
- On a change request form, view affected dynamic manual services. For example, after you add an affected CI that is associated with a dynamic manual service:
  1. Navigate to **Change > Open**.
  2. Select a new change request to add affected CIs to.
  3. On the Change Request form, scroll to the Related Links section.
  4. Click the **Affected CIs** tab and then click **Add** to add an affected CI to the change request.
  5. Open the form context menu and click **Refresh Impacted Services**.
  6. Click the **Impacted Services/CIs** tab to see any dynamic manual services that are associated with the affected CI and that are impacted by the change request.

For more information about affected CIs on a change request, see **Associated CIs on a change request**.

**Convert an individual business service to an application service**

Manually convert a specific business service to an application service.

Role required: `app_service_admin`

1. Navigate to **Configuration > Business Services**.
2. Select the business service that you want to convert to an application service.
3. Click **Convert to Application Service**.
4. Select a number from the Up to list, as the number of levels of related CIs to include in the conversion.
The maximum number of levels is eight.
5. Click OK.

The system adds the CIs from the business service to the converted application service.

**Manually update an application service with changes from the CMDB**

Ensure that an application service is up-to-date and reflects all the latest changes to its configuration items (CIs). Regularly update application services to reflect any changes to CIs and their relationships in the CMDB.

Role required: app_service_admin

An example of a change is deleting CIs from the CMDB or connecting two CIs one of which is part of an application service. In the first case, your application service may show a CI that no longer exists. In the second case, on the contrary, the application service omits a CI.

There is no mechanism or an API that automatically updates application services that were created manually. Also, you may need to manually update application services discovered by Service Mapping, if they contain manually added CIs. You can only update application services which contain manually created entry points and which are not discovered by Service Mapping.

An update might involve adding CIs of the following CI types, which cannot be added to an application service:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If necessary, you can prevent CIs of other CI types from being added to application services by modifying the `sa.mapping.user_manual.citype.blacklist` property.

All connections created between CIs in an application service are of the `Depends on::Used by` relationship type. You can modify this default relationship type by changing the value of the `sa.it_service.manual_ci_rel_type` property.

Also, the system can connect a CI from the application service only to actual CIs that exist in the CMDB, not a visualization of other items on the map like clusters or boundaries.

In environments with domain separation, only CIs belonging to the same domain as the application service are added into the application service. If there is a domain hierarchy, CIs must belong to the same child domain.

You can also update application services by using APIs.

1. Navigate to Configuration > Application Services > Application Services.
2. Alternatively, if Service Mapping is deployed, navigate to Service Mapping > Services > Application Services.
3. Select the application service that you want to update.
4. Click Update with changes from CMDB under Related Links.
5. Select a number in the Up to list to limit the number of levels of related items to be updated.
   If the specified number is higher than the number of levels of related items that already exist in the application service, then the system adds the missing CIs and their connections.
Warning: Specifying a lower number than the number of levels that already exist in the application service, does not result in the removal of CIs from the application service.

6. Click OK.

- The system updates the application service with the changes from the CMDB and shows them on the map.
- After the update process is complete, the application service form opens.

Manually add CIs to an application service

Add configuration items (CIs) to manually created application services or to services discovered by Service Mapping. You can edit discovered and manually created application services.

- Verify that the CI type for the CI that you are planning to add, exists. If necessary, create the CI type as described in Create CI types for Service Mapping and Discovery.
- Add CIs to the as for the device or application that you want to add, if necessary. See Populate the CMDB for more information.

Role required: app_service_admin or sm_admin

You can populate an application service that was created manually, by manually adding the CIs comprising it. Adding a CI to an application service requires creating a relationship between the new CI and a CI in the application service.

Attention: You cannot fine-tune or edit tag-based and dynamic services from the map.

Information about the CI in application service, to which you are connecting a new CI, is updated in the CMDB. This information includes the type of the relationship between the CIs. If other application services use the same applicative flow, the CMDB recognizes it and adds the CI you added manually to these application services by analogy. For example, you manually added an IBM WebSphere Message Broker to an IBM WebSphere HTTP Listener in the Bank Customer Portal service. The system also adds this IBM WebSphere Message Broker to the same HTTP Listener in the Bank Internal Portal, because it uses this HTTP Listener. The same logic applies when you remove a CI you added manually: The system removes it from all application services where you either manually added it or the system added it by analogy.

All connections created between CIs in an application service are of the Depends on::Used by relationship type. You can modify this default relationship type by changing the value of the sa.it_service.manual_ci_rel_type property.

You can manually connect a CI only to actual CIs existing in the CMDB, not to a visualization of other items on the map such as clusters or boundaries. Also, it is prohibited to add CIs of these CI types to an application service:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If necessary, you can prevent CIs of other CI types from being added to application services by modifying the sa.mapping.user.manual.citype.blacklist property.
In environments with domain separation, only CIs belonging to the same domain as the application service are added to the application service. If there is a domain hierarchy, CIs must belong to the same child domain as the application service.

If working with an application service discovered by Service Mapping, manually add a CI:

- To indicate that an application service contains a device or application, which Service Mapping cannot discover. For example, add an A/C unit to the Production Floor service.
- To add a temporary placeholder for a CI, which Service Mapping did not discover. In this case you are planning to perform necessary troubleshooting to ensure that Service Mapping discovers this CI in the future. For example, add an IBM WebSphere Message Broker to the Bank Customer Portal service.
- To create an application service that combines entry points and CIs automatically discovered by Service Mapping with entry points and CIs from the CMDB. After you manually add an entry point, you can update the application service with CIs from the CMDB based on the relationships defined there.

For additional information related to Service Mapping, see Discovery patterns used by ITOM Visibility and Enable traffic-based discovery for CI types or specific CIs.

1. Navigate to Configuration > Application Services > Application Services.
2. Alternatively, if Service Mapping is deployed, navigate to Service Mapping > Services > Application Services.
3. Open the relevant application service map:
   a) Click View map next to the relevant application service.
   b) If needed, click Edit to ensure that the map is in Edit mode.

   If Service Mapping is deployed, then in Edit mode, the Discovery Messages section appears below the map.

4. To connect a CI to another CI on the map, right-click the CI to which you want to connect the new CI, and then select Add a CI.
5. In the Add A CI dialog box, specify the CI to add:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Select the CI type (CI class) for the CI you are adding. Every CI belongs to a CI type which contains a set of attributes configured for this kind of CI, for example, cmdb_ci_appl for applications.</td>
</tr>
<tr>
<td>CI Name</td>
<td>Select the CI from the list of CIs of the selected CI type.</td>
</tr>
</tbody>
</table>

The CI type list includes only allowed CI types. For example, you cannot add an application cluster.

6. Click Submit.

The manually added CI appears on the map.

Note: When you manually add a CI, which is an application, as a child to a service that already includes its parent application CI, the newly added child application CI is hidden inside the inclusion. Click the plus (+) symbol next to the parent application CI to see the child application CI.

7. Optional: (If Service Mapping is activated) To add a discoverable outgoing connection for the manually added CI:
a) Right-click the manually added CI.

b) Select **Manually add a connection**.

[Note: If you do not see the **Manually add a connection** option in the right-click menu, check that you are logged in with the user that belongs to the same domain as the application service.]

c) Configure attributes for the entry point as described in **Entry point attributes**.

d) Click **Submit**.

Discovery and Service Mapping attempt to discover this CI. If successful, the CI appears on the map. Otherwise, a warning icon appears.

8. Optional: (If Service Mapping is activated) If you want Service Mapping to automatically discover a CI, which you previously added manually:

a) Customize the relevant pattern or fine-tune traffic-based discovery to enable Service Mapping to discover the CI.

b) Navigate to the relevant application service map.

c) Click **Run discovery**.

d) After the discovery process finishes, verify that Service Mapping discovered the CI by checking the connector leading to the CI. If Service Mapping discovered the CI, then two connectors, a manual and automatically discovered, appear for the CI.
e) Right-click the CI you added manually.  
   In the example, it is IBM WebSphere Message Broker.  

f) Select **Remove manually added CI**.  
The map shows the CI with only one connector leading to it. If this CI had any manually added connections, they are removed together with the manually added CI.

---

**Link application services**

You can manually add to one application service a reference to another application service. You can edit discovered and manually created application services.

**Attention:** You cannot fine-tune or edit tag-based and dynamic services from the map.

Ensure that you know the name of the application service that you want to add a reference to. 
Role required: app_service_admin or sm_admin
An application service can be part of another application service, in which case you can link one to the other. To link, edit an application service, and add a reference to another application service as an outgoing connection of the relevant CI inside the other application service.

When you link an application service to another application service, the information about the CI, to which you linked the service, is updated in the CMDB. The CMDB recognizes other application services that use the same applicative flow, and adds the application service you linked to these application services by analogy. The same logic applies when you remove a linked application service: The system removes it from all application services where you either manually linked this service or the system linked this service by analogy.

When using Service Mapping, you may want to link application services to create:

- A link between two discovered services.
- A placeholder for a map branch that Service Mapping failed to discover. If you modify or add a pattern that can discover the configuration item (CI) serving as an entry point for the linked application service, Service Mapping can discover this linked service.
- An indication that an application service contains a branch, which Service Mapping cannot discover.

You can link application services to one another to create dependencies for impact monitoring in Event Management.

1. Navigate to **Configuration > Application Services > Application Services**.
2. Alternatively, if Service Mapping is deployed, navigate to **Service Mapping > Services > Application Services**.
3. Click **View map** next to the application service which you want to link to another application service.
4. Right-click the CI to which you want to link an application service as a reference.
5. Select **Add A CI**.
6. In the Add a CI dialog box, select the application service you want to add as a reference:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Select <em>Application service</em> from the list.</td>
</tr>
<tr>
<td>CI Name</td>
<td>Select the name of the application service that you want to link as a reference.</td>
</tr>
</tbody>
</table>

7. Click **Submit**.
   The icon for the linked service appears on the map.

Navigate to the linked application service, and double-click its icon on the map. The map window shows the linked application service.

Service maps contain no indication of transferred services being linked to their original services. You may need to know if a service is a part of another, larger service when dealing with changes or incidents. Use the updateset to add the ability to view the list of all application services that contain a certain service as a link, as described in [KB0748865: Viewing list of application services that contain a certain service as a link](#).

**Group application services**

Organize application services by groups to perform actions simultaneously on multiple services, and to control user access to services. You can use Event Management to track service health by service groups.

Role required: sm_admin or app_service_admin

Typically, enterprises have hundreds of services which makes it impractical to manage them individually. Service groups can make service lists much shorter and easier to manage, especially in large organizations or service providers.

How you group application services depends on the user and on service provisioning policies in your enterprise. The relation between application services in groups is purely logical and the same application service can belong to multiple groups. For example, the Mobile service can be part of the following service groups: sales, Beijing, and telephony.
You can embed a service group within another service group to create a hierarchy of service groups. If users have access to a parent service group, they automatically have access to all its child groups. By default, all new services are assigned to the All service group that lets all users view and manage application services. When you assign a role to a service group, the users with this role can access only application services in this service group. To enable users with this role to access other services, assign this role to the respective service group.

If Service Mapping is activated, service groups can contain a mixture of manually created application services and application services discovered by Service Mapping.

1. Navigate to Configuration > Application Services > Service Groups. Or, if Service Mapping is activated, navigate to Service Mapping > Services > Service Groups.
2. Click New.
3. Enter the name of the new application service group in the Name field.
4. To embed this group in another group, enter the name of the other group in the Parent Group field.
5. Right-click the form header and click Save.
6. Add an application service to the newly created service group.
   a) In the Service Group Members section, click New.
   b) In the Name field, enter the name of the application service. If you are using Event Management, you can also enter an alert group name.
   c) Click Submit.
7. Alternatively, add an application service to a group from the application service form.
   a) Navigate to Configuration > Application Services > Application Services.
   b) Select the application service you want to add to a service group.
c) In the **Service Group Members** section, double-click **Insert a new row**.
d) Enter the name of the service group to which you want to add the selected application service.
e) Click the **OK** icon (✔).
f) Click **Update**.

**Control user access to application services**

Assign user roles to service groups to grant users access to application services in your organization. Your organization may restrict access to some services for security or secrecy reasons.

Make sure that you have performed the user provisioning tasks for the users you want to grant access:

1. **Add users to user groups.**
2. **Create new roles.**
3. **Assign roles to users or user groups.**

Also, make sure that you have created service groups as described in **Group application services**.

Role required: **app_service_admin** or **sm_admin**

In the base system, the following roles provide access to application services:

- **app_service_admin**
  - Creates and modifies application services, creates service groups, views, and edits application service maps.

- **app_service_user**
  - Views application service maps. The itil role that serves as the basic helpdesk technician role contains the **app_service_user** role.

Service Mapping provides these preconfigured roles:

- **sm_admin**
  - Sets up the Service Mapping application. Maps, fixes, and maintains application services.
  - Also performs advanced configuration and customization of the product. Assign this role to application administrators.

- **sm_user**
  - Views maps for operational application services to plan change or migration, as well as analyze the continuity and availability of services. Assign this role to application users.

- **sm_app_owner**
  - Provides information necessary for successful mapping of an application service. Once a service is mapped, this user reviews the results and either approves it or suggests changes. Assign the **sm_app_owner** role to users who own application services and are familiar with the infrastructure and applications that make up the services.
Event Management provides these preconfigured roles:

_evt_mgmt_admin
Has read and write access to all Event Management features to configure Event Management.

_evt_mgmt_operator
In addition to the evt_mgmt_user permissions, can also activate operations on alerts such as acknowledge, close, open incident, and run remediations.

_evt_mgmt_user
Has read access to all Event Management features. Has write access to alerts to manage the alert life. Has the itil role to be able to manage incidents that are created from alerts.

_evt_mgmt_integration
Has create access to the Event (em_event) and Registered Nodes (em_registered_nodes) tables to integrate with external event sources.

Typically, enterprises have hundreds of services which makes it impractical to manage them individually. Service groups can make service lists much shorter and easier to manage, especially in large organizations or service providers. In a hierarchy of service groups, access to a parent service group automatically grants access to all the child service groups.

Users inherit permissions from roles that are assigned to them. You can assign some roles directly to service groups to allow all users with this role to access all application services belonging to this group. However, most enterprises choose to organize their roles as a hierarchy. It helps to manage roles across multiple ServiceNow applications. For example, the Service Mapping administrator (sm_admin) can be part of a broader administrator role like administrator (admin). You can add users to user groups and then assign roles to the user groups to give permissions of this role simultaneously to all the group users.
Assigning a role to an application service group

By default, all new services are assigned to the All service group that lets all users view and manage application services. When you assign a role to a service group, the users with this role can access only application services in this service group. To enable users with this role to access other services, assign this role to the respective service group.

**Note:** Some references in the user interface to business services are actually references to application services.

1. Navigate to either of the following:
   - Configuration > Application Services > Service Group Responsibilities.
   - If Service Mapping is activated: Service Mapping > Services > Service Group Responsibilities.
   - If Event Management is activated: Event Management > Services > Service Group Responsibilities.

2. Click **New** and fill out the Business Service Group Responsibilities form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business Service Group</td>
<td>Service group to which you want to assign a role.</td>
</tr>
<tr>
<td>Role</td>
<td>Role you want to assign to the selected service group.</td>
</tr>
<tr>
<td></td>
<td>For example, financial_services_admin.</td>
</tr>
</tbody>
</table>
3. Click **Submit**.

To manage access to services that contain sensitive financial information in your organization:

1. Organize the services into the Financial Services group.
2. Create a new user role, financial services administrator (financial_services_admin) role, that contains the (app_service_it) role.
3. Assign the Financial Services administrator role to the Financial Services group.

As a result, only users with the Financial Services administrator role can access application services belonging to the Financial Services group.

**View an application service map in base system**

An application service map provides a visualization of data for the CIs comprising an application service, and the relationships and connections between these CIs.

Role required: app_service_user to view the map in View mode, and app_service_admin to modify services in Edit mode.

When you create an application service, the system generates an associated application service map. The system then updates the map to reflect any changes to the application service. This map consists of icons representing CIs and arrows that represent the connections between them.

If Service Mapping is deployed, see [Application service maps](#) and [View CI connection attributes in an application service map](#) for more details.

To open an application service map, navigate to **Configuration > Application Services > Application Services** and then click the **View map** link. You can then perform any of the following operations:

- Click ![on the windows bar to navigate to a different application service.](#)
- Use the navigation tools to increase or decrease the view of the map and to move the map on the page. You can also click anywhere on the map area and drag a segment of the map into the visible area.
- View changes: You can view changes and change records associated with the application service as a whole or with any of its CIs, within a time range. For more information, see View the change history of application services.

  Records under the Change tab underneath the map, which are associated with a selected CI or connection, are highlighted. If you select a change record under the Change tab, then the associated CI icon appears yellow on the map.

- View attributes: When you select a device, application, or connector on the map, it appears in blue and its attributes appear in the Properties pane on the right of the map. When nothing is selected on the map, the details of the application service itself appear on the Properties pane.

- Open the CI's form for further details by clicking Detailed Properties at the bottom of the Properties pane.

- Click Edit or View to switch the map mode. Edit mode lets you add or remove CIs from the map.

- Click for Additional actions:
  
  - Set Group CIs on map: Simplify maps by grouping 10 or more CIs belonging to the same type and hosted on servers sharing prefix and domain name.
  
  - Set Spanning tree view: Simplify the map by organizing CIs into a tree structure and hiding some connection lines. This option is especially useful for very large maps.
  
  - Map Indicators: Show additional information for a CI or for the application service itself by displaying related records such as alerts, outages, incidents, and problems. For each indicator that is enabled, the corresponding indicator icon appears next to CIs with associated records, and the corresponding tab appears underneath the map. If a record is associated with the application service itself, the indicator appears next to the application service name.

  For information about managing map indicators, see Create or modify map indicators. For more general information, see Event Management Map Indicators (Video).

  - Export to PDF: Export the map to a .PDF file which you can then share as needed. After the PDF file is ready, click to download the PDF file to your local drive.

- View the details of a connection.

  By default, connection lines for the same CI on an application service map, are merged. This merge reduces clutter on the map and helps to make the map more readable. For a merged connection line, you can view details for all the underlying connection lines.
• To view the source and target CIs of a connection, right-click a connection line.
  If spanning tree view is enabled:
  1. Click the CI whose connections you want to view to show all the concealed connections for the CI.
  2. Right-click one of the connection lines.

• To view properties of a connection, click a connection line. For manually added connections, Endpoint Type is Manual Endpoint.

• To view properties of a connection within a merged connection:
  1. Right-click the merged connection line.
  2. Select one of the connections.
  3. Select **Select edge**.
You can change the details that appear in the Properties pane by updating the form view 'Form view and section', as described in Configuring the form layout.

View CI attributes in an application service map

An application service map displays attributes for each configuration item (CI) that is part of the application service, as well as for the application service itself. The attributes come from the CMDB.

Role required: sm_admin or sm_user

You can view the following information for each CI:

- **Name label**
  The CI name. This attribute is either preconfigured on the CI or configured during CI installation.

- **Basic attributes**
  A summary of the most important CI attributes.

- **Detailed attributes**
  A complete list of all attributes collected for the CI.

Each CI type (CI class) has different attributes. For example, the Linux Server type has different attributes than the SQL Instance type.

If Service Mapping is deployed, the way CIs appear on the map depends on the view you select for the map. Attributes available for viewing also depend on the Service Mapping setup. For more information see description of components installed with Service Mapping.

The following user interface screens refer to application services as business services: Business Service Group Responsibilities, Approve, Service Mapping Properties, and Service Map Planner.

1. Navigate to Configuration > Application Services > Application Services.
2. Alternatively, if Service Mapping is deployed, navigate to Service Mapping > Services > Application Services.
3. Click View Map next to the relevant application service.
4. To see the full name of a CI whose name has been shortened on the map, point to the CI.
   A tooltip displays the full CI name.
5. Click a CI to see its details in the Properties pane.
   The attributes of applications and the servers that host them appear separately.
6. To view more detailed attributes for the CI, click **Detailed properties** at the bottom of the Properties pane.

7. Optional: (If Service Mapping or Discovery are enabled, and if tracking changes to configuration files is enabled for a CI) To view configuration files associated with a CI:
   - Review the list of files under **Tracked Files** in the Properties pane. Click the file name to open the actual file.
   - Click the **Affected CIs** tab and view the list of configuration files. Click the file name to open the actual file.
View the change history of application services

You can view changes made to an application service as a whole and to the individual configuration items (CIs) comprising the service. Change history is useful for maintenance, planning, or troubleshooting procedures.

Role required: admin, sm_admin, sm_user, app_service_admin, or app_service_user

Details about changes to an application service and to its CIs is stored in the CMDB. Typically, these changes reflect adding or removing CIs from an application service, upgrading or updating CIs, or modifying CI configuration files. The system gathers this data by querying CMDB tables and then creating the change history view. In deployments where Service Mapping is activated, the type of change information Service Mapping queries depends on discovery patterns that Service Mapping uses to discover CIs.

Changes to configuration files are associated with CIs to which these files belong. Maps show configuration file changes as changes to related CIs.

While you can see change records for a specific CI in the context of application services, you can also see detailed history of a specific CI separate from its application service as described in History Timeline.

If the Now Platform is configured to validate changes, all changes are evaluated and rendered as valid or not. If a change is valid, its change record on the application service map is marked as approved. For more information about configuring the platform for change validation, see Managing proposed changes.

Changes to the application service appear on the history timeline.

The type of change mark depends on the nature of changes that it represents:

**Light gray balloon**

Unapproved change that does not influence the application service behavior. For example, a change in a network path or adding a node to a cluster.

**Dark gray balloon**

Unapproved change that changes the application service behavior.

**Green balloon**

Approved change that is part of the application service behavior.
An approved change in deployments where the Now Platform is configured to validate changes.

**Double balloon**

Multiple separate changes that happened a short time from each other.

You can mark times on the history scale by creating baselines to quickly return to the marked view.

The following user interface screens refer to application services as business services: Business Service Group Responsibilities, Approve, Service Mapping Properties, and Service Map Planner.

1. Navigate to **Configuration > Application Services > Application Services**.
2. Alternatively, if Service Mapping is deployed, navigate to **Service Mapping > Services > Application Services**.
3. Click **View map** for the application service for which you want to see change history. Actions or map elements which are relevant only for application services discovered by Service Mapping, do not appear on maps for manually created application services.
   The **Changes** tab at the bottom of the page shows all change records created for this application service.
4. On the history timeline, set the time range of changes that you want to view.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>To set the time range of the history timeline</td>
<td>Click the hour, day, week, or month icons.</td>
</tr>
<tr>
<td>To increase or decrease the time range</td>
<td>Click the zoom in and zoom out icons.</td>
</tr>
<tr>
<td>Option</td>
<td>Action</td>
</tr>
<tr>
<td>-------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>To change the upper limit on your history range</td>
<td>Click the history scale.</td>
</tr>
</tbody>
</table>

The time that serves as the upper limit appears above the history timeline.

**Note:**
You cannot set the lower limit on your history range to a time before this application service was created. This time is marked with the **IT Service Created** event on the history timeline.

The map shows the history view of the application service for the time you selected.

**Note:** The **Change** tab shows all change records, even the ones which are filtered out of the history view.

5. To mark a time on the time scale, set a baseline:
   a) Click the **Compare** icon.
   b) Navigate to the time you want to mark as a baseline on the history scale.
   c) Click **Set baseline**.
d) Enter the name of the baseline and click **OK**.
The new baseline appears as a button above the history scale and as a blue flag on the history scale.

6. View the change history:
<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>To see the CI responsible for a change record</td>
<td>Select a change record on the <strong>Changes</strong> tab.</td>
</tr>
<tr>
<td></td>
<td>The related CI is marked yellow in the map.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>To see only change records related to a CI</td>
<td>Select the required CI or the connection on the map. The <strong>Changes</strong> tab displays only change records related to the selected CI or connection.</td>
</tr>
</tbody>
</table>

![Diagram showing a change record](image)

1. Set the time on the history scale.  
2. In the **Properties** pane, scroll to **Tracked Configuration Files**, and click the file name. The new tab opens displaying the content of the tracked configuration file at the selected time.
To see network at the selected moment in the past

1. Set the time on the history scale.
2. Right-click the connection and select Show network path.

The new tab opens displaying the network or storage path map for the time you selected.

**Note:** You cannot view the network path for connections marked as boundaries to this application service.

7. To exit the history view and see the current status of the application service, click the current icon.

---

### Compare two versions of an application service

You can see a summary of application service changes at a glance by comparing two versions of an application service. This feature is useful for checking the application service status before and after a certain change or problem.

Role required: admin, app_service_admin, app_service_user, sm_admin, or sm_user

Specify two points in time for which to compare the two versions of an application service. You can use the change indicators on the timeline to specify one point in time that is before and another that is after a change for which to see the details. For example, if you know that the application service started to fail at a certain time, you can compare two versions of the application service, one before and one after the problem started. This comparison lets you see the summary of changes that possibly led to the problems.

Service Mapping, if deployed, tracks and shows all changes to a CI including configuration files associated with a CI. When you compare two versions of an application service, you can see changes made to configuration files as changes to CIs. You can also compare two versions of a configuration file to see the actual changes in the files, during the time range specified for the comparison.

The following user interface screens refer to application services as business services: Business Service Group Responsibilities, Approve, Service Mapping Properties, and Service Map Planner.

1. Navigate to **Configuration > Application Services > Application Services**.
2. Alternatively, if Service Mapping is deployed, navigate to **Service Mapping > Services > Application Services**.
3. Click **View Map** next to an application service.
4. On the history timeline, set the time range of changes that you want to view.

<table>
<thead>
<tr>
<th>Option</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>To set the time range of the history timeline</td>
<td>Click the hour, day, week, or month icons.</td>
</tr>
<tr>
<td>Option</td>
<td>Action</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>To increase or decrease the time range</td>
<td>Click the zoom in and zoom out icons.</td>
</tr>
<tr>
<td>To change the upper limit on your history range</td>
<td>Click the history scale.</td>
</tr>
</tbody>
</table>

The time that serves as the upper limit appears above the history timeline.

**Note:**

You cannot set the lower limit on your history range to a time before this application service was created. This time is marked with the **IT Service Created** event on the history timeline.

The map shows the history view of the application service for the time you selected.

**Note:** The **Change** tab shows all change records, even the ones which are filtered out of the history view.

5. Click the **Compare** icon.

6. Set **Compare point 1** and **Compare point 2** as the two points in time for the comparison. You can drag the pointers on the history scale to set corresponding time points.
If the history scale does not include the time set for comparison, then its corresponding pointer appears next to the compare point in yellow:

![Compare view](image)

Note: If there are no changes to the service during the time interval specified by Compare point 1 and Compare point 2, then no change details are displayed.

7. Click Compare.
   The comparison view opens in a separate tab.
8. Select a marked CI to see the relevant change record on the Changes tab.
9. Optional: If Service Mapping is deployed, you can compare two versions of a configuration file that appears on the map as Updated:
   a) Select the CI that is associated with the updated configuration file.
   b) In the Properties pane, click the link to the updated file.
The **Tracked Configuration Files Version Compare** tab opens showing two versions of the configuration file side by side.

c) Review actual changes.

Highlight colors indicate the type of change:
- Purple — Updated line
- Pink — New line
- Gray — Deleted line

d) Navigate between the changes using the arrows in the upper right corner.

e) Close the **Tracked Configuration Files Version Compare** tab when finished.

10. Close the comparison view when finished.
Use application services APIs

Application services provide APIs that let you perform operations such as creating and updating an application service, populating it with CIs from the CMDB, and retrieving details from an existing application service.

Role required: app_service_admin

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website.

Create an application service

Using the `createOrUpdateService - POST` REST API to create an application services suits your organization if the ServiceNow CMDB already contains the CIs making up the service. Typically, it is the case when you have manually added CIs directly into the CMDB, or used the Discovery application to discover CIs and store information about them in the CMDB. You can also use this API to create application services containing CIs discovered using non-ServiceNow applications.

By default, when an application service is created, all CI connections are of the **Depends on::Used by** relationship type. You can modify this default type by changing the value of the `sa.it_service.manual_ci_rel_type` property.

Before creating an application service, ensure that:

- The CMDB contains all the CIs comprising the application service.
- You have the sys_id of each CI comprised in the application service you want to create.
- You understand the hierarchy that the CIs form.

The Application Service (cmdb_ci_service_discovered) table contains all application services including services you create using APIs.

You can also manually create application services using the user interface as described in [Manually create an application service](#).

Retrieve content from an application service

Use the `getContent - GET` REST API to retrieve a list of CIs and the relationships between them, for an application service that was created manually.

Additional APIs

The following JavaScript APIs are also available:

- `addCI()`: Add a CI to a manually created an application service.
  
  For restrictions on the CIs being added and other details about adding CIs to application services, see [Manually add CIs to an application service](#).
- `addManualConnection()`: Add a manually created connection to an application service.
- `migrateManualToApplicationService()`: Convert a manual service to an application service.
- `populateApplicationService()`: Populate an application service with CIs and relationships from the designated entry point.
- `removeCI()`: Remove a manually created CI from an application service.
- `removeManualConnection()`: Remove a manually created connection and the connected CI from an application service.

**Components installed with application services**

Several types of components are installed with activation of the Application Service (com.snc.cmdb.it_service) plugin, including tables, user roles, and scheduled jobs.

*Note:* The Application Files table lists the components installed with this application. For instructions on how to access this table, see [Find components installed with an application](#).

**Roles installed**

<table>
<thead>
<tr>
<th>Role title (name)</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>(app_service_user)</td>
<td>Provides read-only access to application services, and ability to call any GET APIs (GetContent).</td>

<tr>
<td>Service Group Members (sa_service_group_member)</td>
<td>Maps service groups to application service members.</td>
</tr>
<tr>
<td>Business Service Group Responsibilities (sa_service_group_responsibilities)</td>
<td>Data on users having access to application service groups.</td>
</tr>
<tr>
<td>Checkpoint Attribute Description (checkpoint_attribute_description)</td>
<td>Links between history timeline changes and service model internal entities (checkpoints). Used in lists of history of changes in application service maps.</td>
</tr>
<tr>
<td>Monitored Service (cmdb_ci_service_auto)</td>
<td>Services that can be monitored by the system, which in the base system, includes only application services. If Service Mapping is activated, there can also be records for technical services. If Event Management is activated, there can be records for alert groups.</td>
</tr>
<tr>
<td>Application Service (cmdb_ci_service_discovered)</td>
<td>Application service CIs. For each application service, there is a container CI record that models the application service.</td>
</tr>
<tr>
<td>Bulk Convert Services (cmdb_convert_bulk_services)</td>
<td>All bulk conversions of business services to application services (current and past), along with the conversion progress which is refreshed every 10 seconds.</td>
</tr>
</tbody>
</table>

**Properties installed**

To access application services properties, navigate to Configuration > Application Services > Properties. The role required for modifying property values, is app_service_admin.

If Service Mapping is deployed, see Properties installed with Service Mapping for additional application service properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Usage</th>
</tr>
</thead>
</table>
| The sys_id of the default relation type to be added between source and target when adding CI manually to application service sa.it_service.manual_ci_rel_type | - **Type:** string  
- **Default value:** 5599a965c0a8010e00da3b58b113d70e (Depends on::Used by)  
- **Learn more:** Manually add CIs to an application service |
| Coefficient of aggregation interval. 0 value means no aggregation is performed on history timeline. The purpose of this property is to decrease number of changes in history timeline by increasing the interval allowed between changes sa.history.aggr_interval_coef | - **Type:** integer  
- **Default value:** 1 |
<table>
<thead>
<tr>
<th>Property</th>
<th>Usage</th>
</tr>
</thead>
</table>
| A list of comma delimited CI types that are excluded when using the 'Convert to Application Service' and 'Populating Application Service from CIs in the CMDB' operations. Example: cmdb_ci_service,cmdb_ci_endpoint.cmdb_ci_hardware | This exclusion list applies when:  
- Manually adding CIs to an application service  
- Converting a business service to an application service  
- Creating or updating an application service using APIs  
- Manually updating an application service with changes from the CMDB  
Type: string  
Default value: None |
| Sync Service Mapping operations with Service Modeling sa.service_modeling.use | Type: true | false  
Default value: true |
| Enable verbose mode for identification engine sa.identification_engine.verbose | Type: true | false  
Default value: false |
| Enable limitation of application service maps drawing by number of nodes and edges. sa.map.LIMIT_MAX_GRAPH_SIZE | Limit the number of nodes and edges on application service maps.  
Type: true | false  
Default value: true  
Setting this property to false may reduce performance in maps of large services. |
| Maximal number of displayable nodes on application service map. Maps with larger values will not be displayed. sa.map.MAX_NODES_FOR_LAYOUT | The max number of nodes displayed on an application service map. If the number of nodes exceeds the specified number, the map does not appear and an error message appears.  
Type: integer  
Default value: 5000 |
| Global flag to allow or disable spanning tree view for maps. true (default) - allows but not forces spanning tree view on maps. sa.map.ALLOW_SPANNING_TREE_VIEW | Enable spanning tree view for application service maps.  
Type: true | false  
Default value: true |
| Maximal number of displayable edges on application service map before spanning tree view applied. sa.map.MAX_EDGES_FOR_FULL_LAYOUT | The max number of edges displayed on an application service map, before applying spanning tree view.  
Type: integer  
Default value: 1000 |
<table>
<thead>
<tr>
<th>Property</th>
<th>Usage</th>
</tr>
</thead>
</table>
| Maximal number of displayable edges on application service map. Maps with larger values will not be displayed. sa.map.MAX_EDGES_FOR_LAYOUT | Max number of edges displayed on an application service map. If the number of edges exceeds the specified number, the map does not appear and an error message appears.  
  - **Type**: integer  
  - **Default value**: 100000  
  Increasing the default value may reduce performance in maps for large services. |
| Maximal degree of node on application service map for large map mode. Maps with smaller degrees will be displayed in regular mode. Maps with larger degrees will apply more edges merging for more compact view. sa.map.LIMIT_GRAPH_DEGREE |  
  - **Type**: integer  
  - **Default value**: 1000  
  Increasing the default value may reduce performance in maps for large services. |
| Limit of amount of services that displayed on Services Tree on maps. Then this limit reached, Services Tree will be blocked. sa.service_tree.MAX_ITEMS_TO_DISPLAY |  
  - **Type**: integer  
  - **Default value**: 7000 |
| Maximal amount of connection properties to be shown at once when connection line selected on service map. If selected line contains more connections than defined here, then properties panel will have notification about cut-off connections. sa.map.max_connections_in_properties_panel |  
  - **Type**: integer  
  - **Default value**: 50 |
| Enable grouping of CIs on map. sa.map.enable_auto_grouping |  
  - **Type**: true|false  
  - **Default value**: true |
| Minimal number of CIs on a map to apply CI grouping. Relevant only if CI grouping is enabled on the map. The following CIs are not counted: discovered clusters, internal CIs inside inclusion boxes, entry points, error nodes, host CIs or CIs that are not hosted on other CIs. sa.map.min_nodes_for_auto_grouping |  
  - **Type**: integer  
  - **Default value**: 10 |
| Render full labels on CIs on map. Applicable to all CI labels (CI name, host name, cluster label, etc.) Enabling this will disable labels truncation, and labels will most probably overlap with other map elements. Not applicable to network/storage path maps. sncCommonMap.RENDER_FULL_LABELS | The default value of disabled, means none.  
  - **Type**: choice list  
  - **Default value**: Disabled  
  - **Other possible values**:  
    - Exported PDF only: pdf  
    - Map and PDF views: all |
### Baseline CMDB

CMDB baseline provides capabilities that help you understand and control the changes that have been made to your configuration items (CIs) in the CMDB.

- You can create a baseline, which is a snapshot of your configuration items in the CMDB. You can review the changes that have been made to that configuration item since a previous baseline. Multiple baselines may be created and the system tracks the changes that have been made per baseline.

Creating a baseline captures the attributes of the CI as well as all first-level relationships for the CI. Any changes to the base CI or to any related CIs are captured and displayed. Newly created CIs are not automatically added to a baseline.

- Associate a configuration item with a task, a change or change task, and to propose changes to the CI after the change is complete. You can record changes, and these changes are not applied to the CI immediately but are delayed until the change is complete.

---

<table>
<thead>
<tr>
<th>Property</th>
<th>Usage</th>
</tr>
</thead>
</table>
| Maximal width of CI node labels in pixels. Relevant for any kind of labels (CI name, host name, cluster label etc.) This size also modifies horizontal space between CI elements. Applied to map view and exported PDF view. Not applicable to network/storage path maps. | **Type:** integer  
**Default value:** 95  
**Other possible values:**  
- Min value: 20  
- Max value: 1000  
sncCommonMap.NODE_LABEL_WIDTH |
| Identification Engine Logging: Identification Engine severity level sa.ie.log.ie_severity_level | **Type:** choice list  
**Default value:** Debug  
**Other possible values:**  
- Info  
- Warn  
- Error  
- DebugVerbose  
- DebugObnoxious  
**Learn more:** Examine identification engine run logs |
| Identification Engine Logging: Service cache severity level sa.ie.log.service_cache_severity_level | **Type:** choice list  
**Default value:** debug  
**Other possible values:**  
- Info  
- Warn  
- Error  
- DebugVerbose  
- DebugObnoxious  
**Learn more:** Examine identification engine run logs |
When the change is complete, you can choose to apply the proposed changes which makes all changes previously proposed and associates the changes with the task.

Create a CMDB baseline

You can create a baseline for a CI to track updates to the CI over time.

Role required: ecmdb_admin and itil

1. Navigate to Configuration > Baselines > Baselines.
   If the Baselines module is not visible in the Configuration application, the module is inactive. In that case append /sys_app_module.do?sys_id=f4463879a9fe3dba01b30bc100cbf404 to the instance URL, and in the Module - Baselines form, ensure that the module is Active.

2. Click New.

3. Enter a Name for the baseline.
   By default, the cmdb_ci table is selected so that the record creates the baseline for all configuration items in the system.

4. Optional: To limit the baseline to specific CIs, select a different Table or choose Conditions that a CI must meet for it to have a baseline entry.
   For example, you might create a baseline for the Database table with the condition (Location) (is) (<configured location>).

5. Click Submit.
   The creation of a baseline is time consuming and occurs in the background. A message at the top of the record list notifies you that your baseline has been scheduled and you will receive an email when the process is complete.

Display baseline differences

You can see the changes that have been made to a CI or any first level related CIs by configuring the CI form layout to display the CMDB Baseline diff field. This field is labeled Baseline differences on the form.

Role required: itil

Changes are displayed only for the cmdb_ci table and child tables. You can change the com.cmdb.baseline.max_changes system property to limit the number of relationships and changes that appear in a baseline diff section on a CI form (set to 100 by default).

1. Open a CI record.
2. Select the baseline you want to see for this CI from the choice list.
   The field displays the details of any changes that were made to the current record for the selected baseline, or indicates that no changes were made.

3. To add a relationship to the CI, click the green plus icon in the Related Items toolbar.
The new relationship appears below the toolbar. For more information about the Related Items toolbar and how to control the display, see CI relations formatter.

4. Update a related CI and see the changes displayed as **Basic attribute changes** in the current CI record.

<table>
<thead>
<tr>
<th>Baseline differences</th>
<th>SQL Baseline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baseline differences</td>
<td>Basic attribute changes</td>
</tr>
<tr>
<td>2009-09-14 15:17:42</td>
<td>System Administrator - Changed: Sys audit, RAM (MB), Disk space (GB)</td>
</tr>
<tr>
<td>Storage Area Network 002</td>
<td>(relationship added) - CI Relationship Change</td>
</tr>
<tr>
<td>ApplicationServerPeopleSoft</td>
<td>(relationship added) - CI Relationship Change</td>
</tr>
<tr>
<td>RAM (MB): 4 was: -1</td>
<td></td>
</tr>
<tr>
<td>Disk space (GB): 500 was: 100</td>
<td></td>
</tr>
</tbody>
</table>

**Properties for baseline CMDB**

Use the baseline CMDB properties to configure how many changes and relationships for a CI can appear in the baseline diff for the CI.

These properties are available for baseline CMDB. To view and edit these properties, the admin role is required.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of changes and relationships for a CI that can appear in the baseline diff for the CI.</td>
<td>Type: integer</td>
</tr>
<tr>
<td>com.cmdb.baseline.max_changes</td>
<td>Default value: 100</td>
</tr>
<tr>
<td>com.cmdb.baseline.max_changes</td>
<td>Location: Configuration &gt; CMDB Properties &gt; Baseline Properties</td>
</tr>
</tbody>
</table>

**Managing proposed changes**

The proposed changes feature allows you to pre-configure changes to configuration items and their associated relationships. These pre-configured changes are prepared to be implemented, but do not actually happen until they are applied at a later time.

When you view a CI, the proposed changes can be displayed so that you can see what is planned.

This feature is useful when you want to make modifications while a change process is in the approval stage, and only implement the changes after the approvals are complete. If the change is never approved, no changes to records have to be reversed. If the change is approved, a quick command applies all the proposed changes.

You can make the following proposed changes to a CI:

- Modify any field on the CI form.
- Add or delete a relationship to that CI.
To modify a relationship, you must delete the current relationship and add a new relationship. You cannot delete a proposed change.

**View CI history**

You can view the history of changes to a CI in a list, calendar, or timeline format.

**View the proposed changes of a CI**

You can view the proposed changes so that you can see what is planned for the CI.

Role required: personalize_form

To view any proposed changes, configure the CI form layout to display the CMDB Scheduled Changes field. Proposed changes are not displayed in a CI form by default.

1. Navigate to Change > Open and open a change request.
2. In the Affected CIs related list, open the Configuration Item. You may also navigate directly to the CI form.
3. Right-click the form header bar.
4. Select Configure > Form Layout.
5. Move the CMDB Scheduled Changes field to the Selected pane.
6. Click Save.

The CI form shows the details of any proposed changes in the Scheduled changes area.

**Add a proposed change to a CI**

Proposed changes to a CI can be made while viewing a change request or any task-related record.

Role required: itil

1. In the Change Request form, go to the Affected CIs related list. If there are no CIs in the Affected CIs list, click Edit to add CIs that are affected by this change request.
2. Right-click the CI that you want to configure for a proposed change, and select Proposed Change.
3. Complete the form to make the proposed changes, and click Save Proposed Change. Click Update to apply the changes immediately. Click Delete to delete the CI.
4. To propose an addition or a removal of a CI relationship:
   a) Click the plus icon in the Related Items section.
   b) In the Relationships section, add or delete a relationship. For information about using the relationship editor, see Create or edit a CI relationship.
   c) Click Save Propose Change.
   d) Confirm saving the proposed change.

Click Update or Delete to commit the changes immediately.

**Note:** Use only with CI relationships. Proposing additions or removal of relationships is not valid for user relationships and group relationships.
After the proposed changes are saved, the **Apply Proposed Changes** button appears on the Change Request form. This button lets the user commit the proposed changes to the CI. Your business processes determine the appropriate time to commit the changes. The CI retains the existing data until the proposed changes are committed. However, users can see that changes have been proposed.

### Apply a proposed change to a CI

When you apply the proposed changes, all the proposed changes for that change request are applied to the configuration item. You can apply proposed changes without verification, or if verification tests of the proposed changes have failed.

Role required: itil

After you apply the proposed changes, the **Scheduled changes** part of the form displays **No scheduled changes found**. You can configure proposed change verification rules which you can use to verify proposed changes before applying the changes.

1. Navigate to the **Change Request** form.
2. Click the **Apply Proposed Changes** button.

   You may have to right-click the form header and select the **Reload Form** option to see the changes.

### Create or edit a proposed change verification rule

Ensure that proposed changes meet business requirements and do not introduce invalid data to the CMDB, create a rule that includes a script to verify the proposed changes.

Role required: asset or itil

When you configure proposed change verification rules for a CI, you have an option to verify that the proposed changes pass the verification test script in the rule. The verification test results are logged as passed or failed, and you can view the results. Running the verification test is not mandatory, and a failed verification test does not prevent you from applying proposed changes.

1. Navigate to **Configuration > Change Verification > Proposed Change Verification Rules**.
2. Click **New** or select an existing rule to edit.
3. Fill in the fields, as appropriate.

**Proposed Change Verification Rules form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule name</td>
<td>The name of this rule.</td>
</tr>
<tr>
<td>Table name</td>
<td>The table to which the rule applies.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Conditions to apply this rule to specific CIs.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this rule.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rule script</td>
<td>A verification Java script that needs to return true or false. For example:</td>
</tr>
<tr>
<td></td>
<td>validateRule()</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>var os = current.getValue(&quot;os&quot;);</td>
</tr>
<tr>
<td></td>
<td>var cpu = current.getValue(&quot;cpu_count&quot;);</td>
</tr>
<tr>
<td></td>
<td>//Use current.getValue(fieldName) to get the proposed change value, eg.</td>
</tr>
<tr>
<td></td>
<td>var os = current.getValue(&quot;os&quot;);</td>
</tr>
<tr>
<td></td>
<td>//Your verification code</td>
</tr>
<tr>
<td></td>
<td>if (os != &quot;SunOS&quot;</td>
</tr>
<tr>
<td></td>
<td>//Return true to pass the verification and false if the verification</td>
</tr>
<tr>
<td></td>
<td>failed return true;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

4. **Click Submit or Update.**

On the Change Request form, you can click Verify Proposed Changes to verify proposed changes for the affected CIs.

**Verify proposed changes**

Before applying proposed changes to affected CIs, use proposed change verification rules to verify that the changes meet business requirements and do not add invalid data to the CMDB.

Create or edit the rules used to verify proposed changes. For details, see Create or edit a proposed change verification rule.

Role required: none

You can apply proposed changes even if they are unverified or fail a verification test.

1. **Open the Change Request form that affects the CI.**
2. **Click Verify Proposed Changes.**
   - The proposed changes are verified against any proposed change verification rules in which the CI meets the Filter condition criteria.
3. **Review the message that appears at the top of the form after the verification process is finished.**
   - The message states whether the verification tests passed or failed.

To view the details of any verification tests that were performed for the change request in the past two days, click the Proposed Change Verification Log related link.
Create or edit a planned change validation script

Create a custom script that checks if a change to a class was valid according to business requirements, and whether the change was planned or not. A planned change validation script is used whenever a CI change is viewed in the CI timeline or change history.

Role required: admin or itil

The system attempts to validate each CI change as follows:

- If a custom script exists for the CI or one of the CI parents, then the script is executed and the results are used to flag the change as valid or invalid. Parent CIs are examined in the hierarchical order.
- If a custom script does not exist for the CI or any of its parents, then a predefined validation script is used. The change is determined as a planned change if the change occurred between the Work start and Work end dates of the change request associated with the changed CI.

However, this check is not always reliable because a user might have manually modified the CI within the work dates, which flags the change as valid even if it is invalid.

The script needs to return a boolean, true or false, which depends on meeting the test criteria in the script. You can define a separate script for each CI class, and you can define multiple planned change validation scripts for a single class. For example, to maintain different versions of the script. Only one script can be active for a CI class at any given time.

These are the parameters that uniquely characterize a change:

- The fields that were changed
- The data source that performed the change
- The time stamp of the change

To correctly determine the validity of a change, examine the parameters and apply business logic to evaluate if the validation tests are met. A planned change validation script can test any of these characteristics and determine when a change meets pre-established criteria. For example, the custom script can check if the mode of the CI is operational or maintenance, or who initiated the change.

1. Navigate to Configuration > Change Verification > Planned Change Validation Script.
2. Click New or select a validation script to edit.
3. Complete the form.

### Planned change validation script form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box to activate this script for validating changes.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Class that this script applies to.</td>
</tr>
<tr>
<td>Script</td>
<td>Script to run to validate a change. If the script does not return a boolean value, then it is configured to false.</td>
</tr>
</tbody>
</table>

The script has a template which displays the input variables of the script.
### Template script input variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current</td>
<td>GlideRecord</td>
<td>Current record that is being processed.</td>
</tr>
<tr>
<td>updatedOn</td>
<td>GlideDateTime</td>
<td>Time stamp of the change.</td>
</tr>
<tr>
<td>updatedBy</td>
<td>String</td>
<td>Entity responsible for the change.</td>
</tr>
<tr>
<td>fieldsChanged</td>
<td>String</td>
<td>Comma-separated list of the names of all fields that were changed.</td>
</tr>
</tbody>
</table>

This sample script checks who initiated the record update. It returns true if admin initiated the record update. Otherwise, the script returns false.

```javascript
isValidChange();

function isValidChange(/*GlideRecord current, GlideDateTime updatedOn, String updatedBy, String changedFields*/) {
  //Return true if the user that updated the record has an admin role
  return isUserAdmin(updatedBy);
}

function isUserAdmin(userName) {
  var grUser = new GlideRecord("sys_user");
  grUser.addQuery('name', userName);
  grUser.query();
  if(grUser.next()) {
    var roles = new GlideRecord ("sys_user_has_role");
    roles.addActiveQuery();
    roles.addQuery('user', grUser.sys_id);
    roles.query();
    while(roles.next()) {
      if(roles.role.name == 'admin')
        return true;
    }
  }
  return false;
}
```

4. Click Submit.

### CI relationships in the CMDB

The CMDB, in contrast to a static asset list, helps you track not only the configuration items (CIs) within your system, but also the relationships between those items.

A relationship in the CMDB consists of two CIs and a relationship type:

- Parent CI
- Child CI
• Type of the relationship that links both CIs

For example, in the (Server1) (Managed by) (Server2) relationship:
• Server1 is the child CI
• Server2 is the parent CI
• (Managed by) is the relationship type

For example, a web application might read data from an instance of Oracle, which in turn might depend on a piece of underlying hardware. Most CIs in a CMDB have multiple relationships to other CIs, users, and groups.

The relationships between CIs can be automatically discovered. If you use Discovery, many relationships can be automatically loaded into the system through the discovery process. If you import your data from another system, you get some form of relationships.

You can add to automatically discovered relationships, create relationships, or edit relationships for a CI by launching the CI relationship editor from the CI form.

Suggested class relationships

The system keeps a table (Suggested Relationship (cmdb_rel_type_suggest)) of relationship types that are appropriate for a CI type, based on its class. You can manage suggested relationships by navigating to Configuration > Suggested Relationships, or in the CI Class Manager.

Suggestion model

The relationship editor has a base CI. The base CI designates the CI that a user was on before launching the editor, as the base CI in the new relationship. If you launched the relationship editor from the Inux100 CI, then Inux100 becomes the base CI. Also, every CI in the system has a type (class). For example, bond Inux100 is of the Linux server type.

Many CI types are children of other types in the hierarchy. For example, the class hierarchy for a Linux server is:

cmdb_ci -> cmdb_ci_computer -> cmdb_ci_server -> cmdb_ci_linux_server

The suggestion model works by analyzing the suggested relationship table for all relationships whose base class is the current base class of the user or any one of its parent classes. For example, looking at a Linux server, the suggestion model would retrieve any relationships whose base class was:

cmdb_ci_linux_server, cmdb_ci_server, cmdb_ci_computer, or cmdb_ci

The system automatically adds relationships that are used in Service Mapping and Discovery (if activated), to the Suggested Relationship table.

Suggested CI relationships in the relationship editor

The CI relationship editor uses the suggestion model to help users select reasonable relationships for configuration items.

For example, consider these relationship types in the system:
• Provides Power for :: Receives Power From
• Runs on :: Hosts
Typically, a user uses these relationships to define the following reasonable relationships between two items as follows:

- a database runs on a server
- a rack provides power for a server

Typically, neither of the following definitions would be appropriate:

- a rack runs on a server
- a server runs on a database

### Add a suggested relationship

Add a suggested relationship for a class. The list of suggested relationships for a class is available when you create a new relationship for a CI of that class.

**Role required:** To view — itil. To create, update, or delete suggested relationships — itil_admin.

1. Use the CI Class Manager (Role required: itil_admin):
   - Navigate to **Configuration > CI Class Manager**.
   - Click **Hierarchy** to expand the CI Classes list. Then select the class to add a suggested relationship to.
   - In the class navigation bar, click **Suggested Relationships**.
   - Click **New**.
   - In the Add Suggested Relationship dialog box, select a **Relationship** and a **Target Class** for the relationship. This Class and the **Target Class** become parent or child in the suggested relationship, based on your selection of the **Relationship**.
   - Click **Save**.

2. Or, navigate to **Configuration > Relationships > Suggested Relationships** (Role required: admin):
   - Click **New**.
   - Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base class</td>
<td>The base class in the relationship, which depending on the relationship type, is either the parent or the child in the relationship.</td>
</tr>
<tr>
<td>Relationship</td>
<td>Relationship type.</td>
</tr>
<tr>
<td>Dependent class</td>
<td>The dependent class in the relationship, which depending on the relationship type, is either the parent or the child in the relationship.</td>
</tr>
</tbody>
</table>
Suggested relationship you can add

<table>
<thead>
<tr>
<th>Base Class</th>
<th>Relationship</th>
<th>Dependent/Target Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle</td>
<td>Is Hosted On</td>
<td>Linux Server</td>
</tr>
<tr>
<td>Oracle</td>
<td>Is Hosted On</td>
<td>Solaris Server</td>
</tr>
</tbody>
</table>

Note: The same parent class and relationship can appear more than once.

You may need to delete a suggested relationship, for example, to limit the choice of available relationships in the CI relationship editor. Removing a suggested relationship does not affect relationships that are created or updated by Discovery.

Relationship governance rules

Relationship governance rules is a set of relationship rules used to ensure consistency and validity in modeling relationships between configuration items (CIs) in the CMDB. Use relationship governance rules to prevent the selection of relationship types or directions that are not allowed between specific CI types.

Different applications such as Discovery and Service Mapping, create relationships between CIs. Each application might use inconsistent relationship type or direction to represent the same entity, resulting in multiple views of the same CIs. Relationship governance rules define what are valid relationship types and valid directions between pairs of CI types resulting in valid and consistent relationships in the CMDB.

Relationship governance rules consist of:

- **CMDB dependent relationship rules**: Rules (hosting and containment rules) that are used for CI identification. You can view and modify dependent relationship rules in the CI Class Manager, after selecting a class from the class hierarchy and clicking Dependent Relationship.
- **Suggested relationships**: Rules that are based on existing suggested relationships in the Suggested Relationship (cmd_rel_type_suggest) table. Suggested relationships are used in the CI relationship editor. You can view and modify suggested relationships in the CI Class Manager, after selecting a class from the class hierarchy and clicking Suggested Relationships.
- **Reference rules**: Rules that are used mostly by Cloud Management to represent all the possible valid combinations of pairs of referencing and referenced CIs in the service definition.
- **Built-in valid relationships**: The following relationships are pre-defined in the base system as valid relationships:
  - cmdb_ci_endpoint -> Applicative Flow To::Applicative Flow From -> cmdb_ci_endpoint
  - cmdb_ci_endpoint -> Implement End Point To::Implement End Point From -> cmdb_ci
  - cmdb_ci -> Use End Point To::Use End Point From -> cmdb_ci_endpoint

General behavior

- Relationship governance rules support inheritance.

  For example, suppose that the suggested relationship cmdb_ci_appl Runs On::Runs cmdb_ci_hardware exists. Then a Runs On::Runs relationship between a cmdb_ci_appl dot_net CI and a cmdb_ci_windows_server CI is valid. That is because .Net Application class inherits from the Application class and the Windows Server class inherits from the Hardware class.
• Duplicate relationship governance rules are not allowed.
• Relationship governance rules are not domain separated.
• It is allowed to have more than one relationship type between the same two CI types.

For example, the following relationships are valid:

- cmdb_ci_appl Depends On::Used by cmdb_ci_service
- cmdb_ci_appl Receives data from::Sends data to cmdb_ci_service

**Reports**

A relationship between CIs is considered valid if it conforms to any of the relationship governance rules. Use the CMDB dashboard to view reports about overall relationships health including relationships compliance with relationship governance rules. The ‘Relationships not compliant with all relationship rules’ report shows CI relationships that are not compliant with any of the relationship governance rules.

**CI relations formatter**

The default CI form includes a CI relations formatter from which you can examine a CI and its relationships in various views. From the CI relations formatter, you can also launch the CI relationship editor for the CI.

If the domain separation plugin is activated, then only relationships in which the logged on user is authorized to view both CIs, are displayed.

The CI relations formatter contains a list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs. You can configure the controls in this formatter to modify varying aspects of the view. For more information about formatters, see Create a formatter and add it to the form.

**Note:**

- If an endpoint is a child in one relationship and the same endpoint is a parent in another relationship, then that endpoint is hidden and does not appear in the relations formatter view. Similarly, relationship qualifier chains are also hidden and do not appear in the relationship formatter view.

  **Example:** CI1 > endpoint > CI2
  
  In this example, CI1 is related to CI2 through relationships with endpoint. A single relationship appears in the relations formatter:

  CI1 > CI2 (These relationships appear as a direct relationship without endpoint, because endpoint is a parent in one relationship and a child in another relationship)

- **Example:** CI1 > endpoint1 > CI2 > endpoint2

  Two relationships appear in the relations formatter:

  CI1 > CI2 (endpoint1 is hidden because it is a parent in one relationship and a child in another relationship)

  CI1 > CI2 > endpoint2 (appears as level 2 relationship – endpoint1 is hidden and endpoint2 appears as it a child and not a parent in any other relationship)

- On instances that do not meet the internet browser requirements for the CI relations formatter, the default CI form includes the legacy CI relations formatter instead. For more information, see Legacy CI relations formatter.
• CIs not extended from the Configuration Item (cmdb_ci) table, are not displayed in Dependency Views maps and in CI relation formatters.

• The Applicative Flow To::Application Flow From relationship is a special relationship type used only between Service Mapping endpoints. This relationship type is not intended for use in the CMDB as a relationship between CIs and therefore it is not displayed in the relations formatter.

## Controls for viewing related CIs

<table>
<thead>
<tr>
<th>Control</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Add CI relationship" /></td>
<td>Starts the relationship editor to manually create CI relationships. For more information, see <a href="#">Create or edit a CI relationship</a>.</td>
</tr>
<tr>
<td><img src="image" alt="Show dependency views" /></td>
<td>Launches a Dependency Views map in another window or tab. The CI is the central node in the map, with a configurable number of levels above and below that node in the hierarchy. Map indicators next to the nodes indicate the number of tasks, incidents, problems, changes, or outages related to that node. Right-click to expand collapsed nodes or display a list of related tasks or problems. For more information, see <a href="#">Dependency Views map</a>.</td>
</tr>
<tr>
<td><img src="image" alt="Search for CI" /></td>
<td>Filters the CIs included in the display.</td>
</tr>
</tbody>
</table>

Click the **Settings** icon to configure additional view settings that filter the data displayed. Settings are preserved through logging out and logging back in.

### Related items settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show Relations in Flat/Tree Layout</td>
<td>To view a flat list of related CIs that are grouped by relationship type in alphabetical order, click <strong>Flat</strong>. To view groups of related CIs in a hierarchical tree, click <strong>Tree</strong>. If you select the tree view, you cannot configure any other settings for viewing related CIs. A single list of upstream and downstream relationships is displayed.</td>
</tr>
<tr>
<td>Show Relations in Split/Merge Layout</td>
<td>To view separate lists for upstream and downstream relationships, click <strong>Split</strong>. To view a single list that includes both upstream and downstream relationships, click <strong>Merge</strong>. Relationships are grouped by relationship type.</td>
</tr>
<tr>
<td>Setting</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Filter Relations by Max Level</td>
<td>Select the number of levels in the hierarchy to include when displaying CIs in a flat view.</td>
</tr>
<tr>
<td>Filter Relations by Relationship Type</td>
<td>Select the types of relationships to view.</td>
</tr>
<tr>
<td>Filter Relations by CMDB View</td>
<td>Filter by tables specified in CMDB views, if any relationship filters exist.</td>
</tr>
</tbody>
</table>

The relations formatter uses the following icons to provide additional information about changes, problems, and outages related to CIs in the relationship:

**Icons related to CIs**

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>🔄</td>
<td>Recently closed changes</td>
</tr>
<tr>
<td>🔄</td>
<td>Planned changes</td>
</tr>
<tr>
<td>🔄</td>
<td>Currently open changes</td>
</tr>
<tr>
<td>🔄</td>
<td>Recently closed outages</td>
</tr>
<tr>
<td>🔄</td>
<td>Problems</td>
</tr>
<tr>
<td>🔄</td>
<td>Incidents</td>
</tr>
<tr>
<td>🔄</td>
<td>Planned outages</td>
</tr>
<tr>
<td>🔄</td>
<td>Currently open outages</td>
</tr>
</tbody>
</table>

In large networks, a list of related CIs might be excessively long, which can slow performance when a CI form is rendered. You can configure these properties to control the amount of data that is displayed. To find a property, enter `sys_properties.list` in the left navigation filter and search for the property.

**Properties related to performance**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ecmdb.find_relationship_issues</td>
<td>Hides or displays an icon in the CI relations formatter that links to open issues for the CI. This property defaults to true (displays the icon).</td>
</tr>
<tr>
<td>glide.ui.max_relation_levels</td>
<td>Specifies the maximum level for displaying CIs in flat view before reaching the maximum relations limit. The default value is 5.</td>
</tr>
</tbody>
</table>
### Property Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.max_relations</td>
<td>Specifies the maximum number of related CIs to display. When exceeded, a notification is displayed indicating that the limit has been reached, and that not all relations are displayed. The default value is 1000.</td>
</tr>
</tbody>
</table>

### Domain separation in the relations formatter and the CI relationship editor

This is an overview of domain separation as it pertains to the relations formatter and the CI relationship editor. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

#### Overview

This application fully supports domain separation. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

#### How domain separation works in the relations formatter and relationship editor

- **Relations formatter**

  The relations formatter is domain-separation supported. The relations formatter is used to display CMDB relationships in the UI in different views. Since the CI Relationship (cmdb_rel_ci) table is not domain separated, relationships are visible in the relations formatter only if both parent and child CIs (cmdb) are visible in the domain.

  The CI Relationship Type (cmdb_rel_type) table is not domain separated. Therefore, in the relations formatter, all the relationship types are available to be selected as a filter.

  By default domain separation is supported in the relations formatter.

- **Relationship editor**

  The relationship editor is domain-separation supported. You can use the relationship editor to add new relationships or delete existing relationships for the current CI.

  - The CI relationship editor displays a list of CIs to add or remove from relationships. Since they are domain separated, the CI list view in the relationship editor displays the CIs that are visible to the current domain.
  
  - The CI relationship editor displays a list of relationships to add or remove. Since the CI Relationship (cmdb_rel_ci) table is not domain separated, the relationships list view displays all the relationships of the current CI.

  The Suggested Relationship (cmdb_rel_type_suggest) table is not domain separated, which means that all the suggested relationship types in the relationship editor are visible for all domains.

  By default domain separation is supported in the relationship editor.

#### Create or edit a relationship filter

Create a custom relationship filter to display CI relationships from selected tables in the CI relations formatter.
Role required: ecmdb_admin

The CI relations formatter displays related CIs for the base CI, and the relationships between the CIs. You can use relationship filters on the CI relations formatter to customize CI relationship views.

1. Navigate to Configuration > Relationships > Relationship Filters.
2. Click New or select a filter to edit.
3. Enter or edit the relationship filter name.
4. Right-click the form header and click Save.
5. In the Configuration Types section, click Edit.
6. On the Edit Members form, select the tables of the CIs that you want to show with the filter and then move the tables to the Configuration Types list.
7. Click Save.

On a CI form, in the relations formatter settings, you can select the newly defined relationship filter from the Filter Relations by CMDB View list.

In the legacy CI relations formatter, you can click View and select the newly defined relationship filter.

After you select a filter, the relations formatter displays only CIs from the tables specified in the filter or from descending tables.

Exclude relationships from the relations formatter view

Create a list of relationships that should not appear in the relations formatter view on CI forms.

Role required: ecmdb_admin

1. Navigate to Configuration > Relationships > Relationship Type Exclusion List.
2. In the CI Relation Filters list view, click New.
3. Fill out the CI Relation Filter form to specify the relationship that you want to exclude from view.
4. Click Submit.

Excluded relationships do not appear in Related Items on CI forms.

Legacy CI relations formatter

On instances that do not meet the internet browser requirements for the latest CI relations formatter, the default CI form includes the legacy CI relations formatter instead.

This element contains the list of related CIs and a toolbar with controls for viewing the relationships between the current CI and related CIs.

Related Items field

Note: The legacy BSM map provides a more complete view of CI relationships.

Configure the controls in this formatter with two properties that restrict varying aspects of the view.

Flat layout

Click the flat layout icon ( ) to group the related CIs by relationship.
Flat layout view

Tree layout

Click the tree layout icon ( ) to group the related CIs in a hierarchical tree.

CI relationship editor

Use the CI relationship editor to create CI relationships.

When you use the relationship editor, the CI from which the editor was launched is designated as the base CI. You can then select one or more CIs as a second CI for the relationship. Depending on the selected relationship type, the base CI can become the parent CI or the child CI in the new relationship.
The relationship editor operates differently, depending on whether you select the **Use suggested relationship** check box.

- With suggested relationships, the relationship editor lists all available relationship types for the base CI. To define a new relationship, select a relationship type, and then select a second CI for the relationship.

  Suggested relationships are highlighted for you. These relationships are displayed in blue with a prefix of (Suggested).

- Without suggested relationships, you define a new relationship by first selecting a second CI for the relationship and then selecting a parent or a child relationship type.

  **Note:** The following relationship types are used only for Service Mapping endpoints, and you cannot use them as a relationship type between two CIs:

  - Implement End Point To: Implement End Point From
  - Use End Point To: Use End Point From
  - Applicative Flow To: Applicative Flow From

### Suggested relationships

If you select the **Use suggested relationship** check box in the editor, the **Suggested relationship** list appears. It displays all available CI, user and group relationship types for the base CI. Relationship types have a suffix of (Parent) or (Child) to note the relationship descriptor, and suggested relationship types are displayed in blue and have a “*” prefix.

When you select a relationship, you are also designating the base CI as being the parent or the child CI in the new relationship. For example, if you select the ‘Feeds’ relationship type, the base CI becomes the designated parent CI, and the second CI that you select becomes the child CI in this relationship.

### Downstream relationships

If you do not select the **Use suggested relationship** check box in the editor, the **Downstream relationships** list appears. It displays all relationships in which the base CI is the parent CI. The child CI of the relationship is displayed in the Child column.

### Upstream relationships

If you do not select the **Use suggested relationship** check box in the editor, the **Upstream relationships** list appears. It displays all relationships in which the base CI is the child CI. The parent CI in each relationship is displayed in the Parent column.

### Supported browsers for the relationship editor

You must use supported browser versions in order to use the latest CI relationship editor. If you do not use a supported browser version, the instance provides the legacy CI relationship builder.

- Firefox version 20 and up
- Chrome version 25 and up
- Safari version 6 and up
- Internet Explorer version 9 and up
Create or edit a CI relationship

Use the relationship editor to view, create or modify CI relationships. You can open the relationship editor from the CI Relations formatter.

Role required:

- To create relationships: ITIL or asset
- To view relationships, depending on the state of the Table API ACL:
  - If inactive (default): ITIL or asset
  - If active: ITIL or asset, and snc_platform_rest_api_access

For more information, see REST API and Table API.

The relationship editor operates differently, depending on whether you check the Use suggested relationship option or not.

1. Launch the relationship editor:
   a) Open a CI form.
   b) Locate the Related Items section near the center of the form.
   c) Click the plus (+) icon on the Related items section.

2. To use suggested relationships, first select a relationship type, and then select one or more CIs to be the child CIs in the relationship:
a) Select **Use suggested relationship**.
b) From the **Suggested relationship type** list, select a relationship type. You can filter the list of suggested relationships by using the filter check boxes.

<table>
<thead>
<tr>
<th>Filter option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide CI relationship</td>
<td>Hides any relationships between the base CI and another CI (such as &quot;Receives data from&quot;). Default filter is stored in the <code>ci_manage_relationships_filter_hint.cmdb_ci</code> user preference.</td>
</tr>
<tr>
<td>Hide user relationship</td>
<td>Hides any relationships between the base CI and a user (such as &quot;Logs reviewed by&quot;). The default filter is stored in the <code>ci_manage_relationships_filter_hint.sys_user</code> preference.</td>
</tr>
<tr>
<td>Hide group relationship</td>
<td>Hides any relationships between the base CI and a group (such as &quot;Backups done by&quot;). Default filter is stored in the <code>ci_manage_relationships_filter_hint.sys_user_group</code> user preference.</td>
</tr>
</tbody>
</table>

The **Configurations Items** list displays all the CIs that are appropriate for the base CI and the selected relationship type. The **Relationships** list at the bottom of the editor, displays all existing relationships of the selected relationship type, in which the base CI is a parent CI or a child CI.

c) From the **Configuration Items** list, select one or more CIs as a second CI for the relationship.

You can filter the list of **Configurations Items** by adding conditions in the Filter section and clicking **Run filter**.

If you selected a parent relationship type, these CIs becomes the child CI in the relationship, and if you selected a child relationship type, then the selected CIs become the parent CI in the relationship.

d) In the **Relationships** section, click the plus icon (+) to add the new relationships.

Alternatively, you can drag the selected CIs to the **Relationships** list. Each new relationship will consist of the base CI, the selected relationship type, and a selected second CI.

3. To not use suggested relationships, first select one or more CIs to be the child CIs in the relationship, and then select the relationship type:
a) Clear **Use suggested relationship**.

b) In the **Configuration Items** list, select one or more CIs as a second CI for the relationship. You can filter the list of **Configurations Items** by adding conditions in the **Filter** area and clicking **Run filter**.

   Depending on the relationship type that you will select, the selected CIs might become a parent or a child CI in the relationship.

c) With at least one CI selected in the **Configuration Items** list, click the ‘+’ sign in the **Downstream Relationships** section or the **Upstream Relationships** section to create the relationship.
• Add the relationship to **Downstream Relationships** to create a relationship in which the base CI is the parent CI and the selected CI is the child CI.

• Add the relationship to **Upstream Relationships** to create a relationship in which the base CI is the child CI and the selected CI is the parent CI.

d) For each newly created relationship in either the **Downstream Relationships** or the **Upstream Relationships** lists, click **Please select a relationship** and select a relationship type.

  • The list of available relationship types in the **Downstream Relationships** list contains parent relationships only, in which the base CI is the parent CI.
  • The list of available relationship types in the **Upstream Relationships** list contains child relationships only, in which the base CI is the child CI.

e) Click **Save** or **Save and Exit**. Only after you enter all the information that is necessary for creating the relationship, these buttons light up indicating that there are pending updates that require saving.

### Legacy CI relationship builder

Used to define CI relationships manually, this page is a sophisticated version of the standard slushbucket. In the legacy CI relations formatter, click the CI relationship builder icon (⊕) to display the legacy Define Relationships page.

#### Select a CI relationship type

The top half of the legacy relationship editor contains a large option box that allows you to select which type of relationship you want to manipulate. Click the particular type of relationship you are interested in working with.

#### Filter the list of CI relationships

In the legacy relationship editor, the checkboxes along the right hand edge of the select box provide a quick way to filter down the list of available relationships.

By default, the system displays a list of all suggested relationships for the type of CI you selected. For example, if you selected a Database instance, a relationship of "Runs on" makes sense, but a relationship of "Provides HVAC for" does not. The default filter is stored in the user preferences ci_manage_relationships_filter_hint.cmdb_cici_manage_relationships_filter_hint.sys_user, and ci_manage_relationships_filter_hint.sys_user_group.

- **Hide CI relationship** -- Hides any relationships between this CI and another CI (e.g. "Receives data from").
- **Hide user relationships** -- Hides any relationships between this CI and a user (e.g. "Logs reviewed by").
- **Hide group relationships** -- Hides any relationships between this CI and a group (e.g. "Backups done by").
- **Show all relationships** -- If you have the appropriate role (out of the box this is itil_admin) you will have an additional checkbox labeled "Show all relationships." If you click that checkbox, the system will let you choose any relationship defined in the system, regardless of where it is on the "suggested" list for this type of CI.
Select CI relationship targets

In the legacy relationship editor, users can link or unlink CIs for a relationship type.

As soon as you pick a relationship type, the system will fill in the two select boxes at the bottom of the screen with CIs that are appropriate for the relationship you suggested. The left hand select box will contain a list of CIs that might reasonably be linked via this relationship, while the right hand box contains a list of those CIs which are already linked.

1. Link or unlink items.

| Link new items | Move that CI from the left hand box to the right hand box. |
| Unlink existing items | Move them from the right hand box to the left. |

**Result:** When you make either type of change, a message appears indicating that you have pending changes.

2. Apply or cancel your changes.

| Click the Save button. | This will save your set of changes, and go back to the previous screen (either a CI or the BSM map depending on how you got here). |
| Click the Cancel button. | This causes you to exit without saving your changes. |

Relation qualifier

A relation qualifier, which is a CI of the Qualifier (cmdb_ci_qualifier) type, stores important information about the CI relationships.

In a relation qualifier, you can annotate arbitrary unique information about the relationship between two CIs. You can define multiple qualifiers for a single relationship, resulting in a qualifier chain. But, there can be only a single qualifier chain for a specific relationship type between two CIs.

For example, for a relationship between a parent CI and a child CI, you can add a relation qualifier to note that the relationship was discovered based on traffic (such as cmdb_ci_qualifier_trafficbased). This results in having two records in the CI Relationship (cmdb_rel_ci) table for the relationship.

- A record that links the parent CI and the new qualifier
- A record that links the new qualifier and the child CI

For this relationship, there is a parent CI and a child CI, and a relation qualifier of type cmdb_ci_qualifier_trafficbased.

For information about usage of relation qualifiers in the identification process, see [CMDB identification rules](#).

CI relationship security

When applying security to CI relationships, it is important to apply the access controls both to the CI Relationship (cmdb_rel_ci) table and to create an operation editCIRelations to the * table as well.

If the current instance has defined security for editCIRelations, it will be applied to edit_ci_relations automatically in the process of upgrading, and the out-of-date security will be removed.

Create a CI relation rollup

A CI relation rollup allows you to sum, count, max, min, or mean a relationship type. You can create CI relation rollups.

Role required: ecmdb_admin

CI relation rollup can be useful for tracking and for receiving notifications. For example:

- In a sum roll up, add up fields from multiple CIs and display the result on another CI to which they are related. So, if you have four configuration items in a rack that are all consuming power, create a CI relation rollup to add all the power usage together and display the result in one field on the rack CI form.
- If a certain level of power consumption in a rack is exceeded, send a notification.
- With a rack that has 10 slots, send a notification when 9 slots are filled.

CI relation rollups use the cmdb synch event business rule on the (cmdb_ci) table. Although this business rule is active by default, you must modify the rule slightly before it will run.

1. Navigate to Configuration > Relationships > CI Relation Rollups.
2. Click New.
3. Complete the form.

CI Relationship Rollup fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Relationship Type</td>
<td>Select a relationship type from the list to use with the rollup. For example, Members::Member contains the parent descriptor Members and the child descriptor Member of.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of rollup from the drop-down list: COUNT, MAX, MEAN, MIN, or SUM.</td>
</tr>
<tr>
<td>Parent field</td>
<td>The target field on which the operation will be done.</td>
</tr>
<tr>
<td>Child field</td>
<td>The input to the equation type. The Parent field is affected by the selections in the child field.</td>
</tr>
<tr>
<td>Rollup class</td>
<td>The classes that can use the relationship. For example, you can specify that the relationship only applies to racks.</td>
</tr>
</tbody>
</table>

4. To run the cmdb synch event business rule, navigate to Business Rules.
5. Use the search box to find the (cmdb synch event) table.
6. Click the cmdb synch event business rule to go to the Business Rule page.
7. Select the Update, Delete, and Query check boxes.
Additionally, if you wish CI relation rollups to recalculate when there is a change to a relationship, use a similar procedure to select the Active check box on the cmdb_rel_ci synch event business rule.

**CMDB classifications**

CMDB classifications are groups of configuration items (CIs) that share attributes and are stored in their own table. Classifications allow administrators to define the hierarchy of CIs within the CMDB. A CI class refers to the actual table name in the instance database. In that context, CI Type is a friendly name that a CI is known by, such as computer, router, or printer.

As good practice, keep CI classifications as simple as possible.

**CMDB record types**

The CMDB contains the following major record types.

<table>
<thead>
<tr>
<th>Record types</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item (CI)</td>
<td>Any computer, device, or service in the CMDB. A CI's record includes all of the relevant data, such as manufacturer, vendor, location, etc. Configuration items can be created or maintained either using tables, lists, and forms within the platform, or using the Discovery application.</td>
</tr>
</tbody>
</table>
| Relation Type      | A defined relationship between a CI and either another CI, a user, or a group. Relation types are defined twice, once from the perspective of the child CI and once from the parent CI's perspective.  
For example, a parent CI that powers a child CI uses relation type **Powers::Is Powered By**. Example relation types include **In Rack::Rack contains**, **Log Reviewed by::Reviews logs** for, or **Backup done by::Does backups** for.  
CMDB relationships can be established using Discovery or using the tables, lists, and forms within the platform. The CMDB form has a specific Related Items toolbar optimized for modifying relationships. |

**Related Lists of CI components**

Related lists in CI records display additional components contained by that CI, such as disk drives on a server and the rules that control the behavior of a network router.

When Discovery runs, the Related List is populated with the components that Discovery finds running on the CI. The CI record might show different lists from scan to scan, depending on whether or not Discovery found the component.
By default, the Related Lists only display those components that are associated with that CI in the CMDB that have been discovered by the last scan. Components that are recorded in the CMDB but are not discovered in a scan, are deemed absent and do not appear in the list.

There are two types of components that appear in the Related List: those that are CIs themselves (such as hard disks), and those that are not (serial numbers and rules). The default filter condition in the breadcrumbs for components that are CIs is (Status) (≠) (Absent). The filter condition for components that are not CIs is (Absent) (=) (false).

In the following example, the snc-tc01 router has several Related Lists affected by these filter conditions, including routing rules, disk drives, interfaces, and network adapters. Only those components found during the last Discovery appear in these Related Lists.

---

**CI Related Lists**

**Create a CI class**

Create a CI class (table) that is an extension of an existing CI class. Then create identification and reconciliation rules for the new class.

The class that is being extended must have its `Is_Extendable` field checked, indicating that the class is extendable.

Roles:
- `Itil_admin` and `personalize_dictionary`: Required for editing the dictionary table
- `admin`: Full access

The CI Class Manager is a centralized location for managing CMDB tables and for creating a class that is derived from another CMDB class. Creating a class requires basic details such as a label and a name. Identification and reconciliation rules are also required to ensure that the class can be successfully identified by the identification engine.
For more information about extending a class and how attributes are derived from a parent class in that process, see *Table extension and classes*.

1. Navigate to **Configuration > CI Class Manager**.

2. Click **Hierarchy** to expand the CI Classes list. Then select the class that the new class is extended from.

3. Click **Add Child Class**.
   - The **Add Child Class** option appears only if the selected class is extendable.

4. On the **Provide Basic Info** tab, fill out the information and then click **Next**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Display name</strong></td>
<td>A unique label for the class (such as Laptops or Thin Clients). The label appears on list and form views for the class. Updating the <strong>Label</strong> field also updates the label record in the language file for the current language. See Field Labels in <em>Data dictionary tables</em>. Maximum string length is 80 characters.</td>
</tr>
</tbody>
</table>
| **Table name**   | Automatically populated based on the table label and a prefix as follows:  
   - For a table in a scoped application, the name is prefixed with a namespace identifier to indicate that it is part of an application.  
   - For a table in the global application, the name is prefixed with the string ‘u_cmbd_ci’. This prefix denotes that the table is created by a user in the CMDB.  
   - You cannot modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_).  
   - Maximum string length is 80 characters. |
| **Description**  | Explanation of the use purpose of the class.                                                                                                   |
| **Icon**         | The icon associated with the class.                                                                                                               |
| **Extensible**   | Indicating whether this class can be extended.                                                                                                       |
| **Principal Class** | Denotes whether this class is included in the **Principal Class filter**. If this class is included in the Principal Class filter, then CIs from this class appear in CI list views when the Principal Class filter is applied. |

5. On the **Add Attributes** tab, click the + sign and enter details for each new class column. Then click **Next**. For description of the different columns in the list view, see *Dictionary entry form*. Set **Identification** to true to designate the column as a CI identifier for class identification.

6. On the **Set Identification Rule** tab, examine the **Derived** identification rule and its **Identifier Entries**. You can click **Replace** to replace the derived rule with a new identification rule and new identifier entries specific to the new class.
   - See *Identification rules* for details about identification rules and identifier entries.

7. On the **Dependencies** tab, click **Add dependency** to add **dependent rules**.
The Dependencies tab appears only if there are dependent identification rules for the selected class.

8. On the Add Reconciliation Rules tab, click Add to create the following rules:
   a) Reconciliation Rules
   b) Data Precedence Rules
   c) Data Refresh Rules

9. On the Add Suggested Relationships tab, review the diagram of the class derived suggested relationships. Use the filter to display only inbound, outbound, or specific relationship types. To add a suggested relationship for the class:
   a) Click New.
   b) In the Add Suggested Relationship dialog box, select a Relationship and a Target Class for the relationship. This Class and the Target Class become parent or child in the suggested relationship, based on your selection of the Relationship.
   c) Click Save.

When building relationships for the class in the Query Builder, the list of suggested relationships is updated.

10. Click Done.

Reclassify a CI

You can upgrade, downgrade, or switch the class of a CI by modifying its Class attribute.

Role required: itil or asset (In general, the roles required to update a CI)

Each class is defined with a unique set of attributes. This set consists of attributes that were derived from the parent class, and additional attributes defined for the class.

When you reclassify a class, the following occurs.

1. The set of attributes is adjusted to match the set of attributes of the newly assigned class. Attributes are added or removed as needed.
2. If any attributes are unique to the current class and are not defined in the newly reclassified class, they are lost.
3. A new record with the CI’s current sys_id is inserted to the table of the new class, with the appropriate set of attributes for the class (the sys_id of the CI is retained).

Depending on the reclassification, the following occurs.

Downgrade

The CI class is updated to a class that is lower in the class hierarchy, and the newly assigned class is a parent of the current class. For example, reclassifying a CI from the cmdb_ci_server class to the cmdb_ci_computer class.

For example, the cmdb_ci_server class has attributes that the cmdb_ci_computer class does not have. During the downgrade, these attributes and their respective values are not included in the new CI record that is inserted into the cmdb_ci_computer class.

Upgrade
The CI class is updated to a class that is higher in the class hierarchy, and the newly assigned class is a derived child of the current class and has additional attributes. For example, reclassifying a CI from the `cmdb_ci_computer` class to the `cmdb_ci_server` class.

**Switch**

The newly assigned class is in a different branch in the class hierarchy and has a different set of attributes than the current class. For example, reclassifying a CI from the `cmdb_ci_linux_server` class to the `cmdb_ci_win_server` class.

A switch is a combination of a downgrade and an upgrade. For example if the CI is downgraded to the `cmdb_ci_server` class, and then upgraded to the `cmdb_ci_win_server` class. Therefore, attributes are lost in the same manner as in a downgrade operation.

**Note:** Avoid the CI class downgrade and CI class switch operations as those can lead to data loss. When automatic CI reclassification is enabled (which is by default), the identification process can result in some automatic reclassifications which lead to data loss.

For more information about system properties that control system-wide behavior of automatic CI reclassification, see [CI reclassification](#).
class. For each table, you can directly access CMDB Health settings and rules such as datasource precedence rules, orphan scorecard, and certificate template defined for the table class.

For more information about extending a class and how attributes are derived from a parent class in that process, see Table extension and classes.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to expand the CI Classes list and then select a class to display details for.
3. On the class navigation bar, expand the following items to display further details for the class.

   - **Class Info**:
     - **Basic Info**: Displays details for the selected class, such as the display and table name, description, and class icon. Lets you edit some of the class definitions, and prevents editing of some details such as the table name.
       Role required: itil for reading, and itil_admin and personalize_dictionary for writing.
     - **Attributes**: Displays table attributes (columns). Lets you edit those attributes and add new ones. For description of the different attributes in the list view, see Dictionary entry form.
       Role required: personalize_dictionary and itil for editing, and personalize_dictionary for reading.
       To add an attribute:
       1. Click the **Added** tab and scroll to the bottom of the list.
       2. Double-click **Insert new column**, and enter details for each new class attribute. Set Identification to true to designate an attribute as a CI identifier for class identification.
       3. Click **Save**, and fix any errors that appear.

   - **Identification and Reconciliation**: Displays and lets you edit, create, and delete identification and inclusion rules, reconciliation, data precedence, and data refresh rules for the class.
     See CMDB Identification and Reconciliation for more information.
     Role required: itil for reading, and itil_admin (on top of itil) for writing.
   - **Dependent Relationships**: Displays and lets you edit, create, and delete hosting and containment relationships for the class. See CMDB dependent relationship rules for more information.
     Role required: itil for reading and itil_admin (on top of itil) for writing.
   - **Suggested Relationships**: Displays a diagram of all suggested relationships for the class, and lets you delete or add suggested relationships for the class. Use the navigation tools to increase or decrease the diagram, and to move the diagram on the page. Use the filter to display specific relationship types. See Suggested class relationships for more information.
     Role required: itil

   - **All Relationship Rules**: Displays a combined diagram of all suggested relationships and all dependent relationships for the class. Use the navigation tools to zoom in or out, and to move or center the diagram on the page. Use the filter to display specific relationship categories.

   - **Health**: Lets you review and configure CMDB Health-related system properties, scorecards, and rules and settings for all CMDB health KPI and metrics, at the class level. See CMDB Health for information about enabling and configuring CMDB Health, and displaying health reports.
ServiceNow Orlando Now Platform capabilities

Role required: itil for reading and itil_admin (on top of itil) for writing.

- **CI List**: Displays the CIs of the selected class. Lets you create CIs of the selected class and perform other operations such as delete.

  Role required: itil for reading. Writing requirements follow the selected table settings.

---

**Update the list of classes in the Principal Class filter**

Manage the list of classes that are included in the Principal Class filter to restrict the CIs that appear in CIs list views to only specific classes that you need. You can add or remove CMDB classes from the Principal Class filter.

Role required: itil_admin and personalize_dictionary

Apply the CMDB Principal Class filter in list views of CMDB CIs so that only CIs that belong to the classes in the filter, appear. In a base system, the Principal Class filter doesn’t contain any classes. The principal class setting applies only to the current class and is not derived by child classes.

For more information about list view filters, see *Save and use filters in a list view*.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to expand the CI Classes list and then select a class to add or remove from the Principal Class filter.
3. On the class navigation bar, navigate to **Class Info > Basic Info**.
4. On the Basic Info form, select or clear **Principal Class**.
5. Click **Save**.

The Principal Class filter is updated with the addition or the removal of the class from the list of classes in the filter. When you apply the Principal Class filter to a Configuration Items list view, only CIs from classes included in the filter, appear.

In both of the following scenarios, the list of CIs refreshes to display only CIs whose class is included in the Principal Class filter:

- 1. In the **Filter navigator**, type `cmdb_ci.list` and then press the Enter key.

  2. In the Configuration Items list view, click the **List controls** menu icon, select **Filters** and then click **Principal Class**.

- 1. Open a Change Request form.

  2. Scroll down and select the **Affected CIs** tab. Click **Add**.

  3. In the **Add Affected CIs** form, click the **List controls** menu icon, select **Filters** and then click **Principal Class**.

For more information about adding affected CIs to change requests, see *Associated CIs on a change request*.

---

**Querying the CMDB**

The CMDB Query Builder allows you to easily build complex infrastructure and service queries, that span multiple CMDB classes, non-CMDB tables, and that involve many CIs that are connected by different relationships.

The CMDB Query Builder provides a canvas into which you drag the CI classes that you want to include in a query. Then you add relationships, AND/OR operators between the CI classes, and
define the relationship properties to query for. You can use saved queries to populate a CMDB
group with CIs, and then use scriptable APIs to retrieve the CI list and apply actions collectively to
all the CIs in the group.

There are two query types: CMDB Query and a Service Mapping query, which you can use
separately or in combination to create queries such as:

- All CIs of a certain type in a business service. For example, all Apaches/Web Servers/Linux
  servers per service.
- All virtual servers and the physical servers that host them.
- All servers that are not mapped to any business service.
- All Servers with a database.
- All database servers that are included in any business service or in a particular business service.
- All business services and their associated servers and the cost of each server. This query helps
  evaluate the cost of technology for each business service.

A start node in the Query Builder is the starting point of the query and is noted by gray
background in its query node. The first class that you drag to the canvas becomes automatically
the start node of the query and you cannot select a different start node. In a complex query,
the start node must always be the only node connected to an AND/OR operator. If you try to
connect a second node to an operator that the start node is connected to, the query fails to run
and a prompt to select a different start node appears.

**CMDB Query**

A query type that queries the infrastructure for CI classes and optionally a non-CMDB table, and
the relationships and references that connect them.

When you create a CMDB query, you can add tables from a list of non-CMDB tables. The list of
non-CMDB tables includes a subset of tables within the system (such as Asset, Task, and Problem),
which have a reference to the Configuration Item (cmdb_ci) class or its children. You can use the
system property `glide.cmdb.query.non_cmdb.blacklisted_tables` to narrow down the list of non-
CMDB tables to choose from.

**Service Mapping Query**

A query type that queries business services and technical services, and thus requires that Service
Mapping is activated. The query is framed within a business service map. You define a pattern,
and query for business service maps that have that pattern in their definition. The relationships in
Service Mapping queries are matched by single-level direct relationships which is similar to the
CMDB queries, and in addition, they are also matched by multi-level indirect relationships if they
exist. A query for a relationship between two CI classes is satisfied even if the two CI classes are
connected by intermediate CI classes that are not specified in the query.

**Combination Query**

You can combine the two query types by incorporating a saved Service Mapping query into
a CMDB query. For example, create a CMDB query for Windows Servers that are connected to
Tomcat WAR. Then connect the Tomcat WAR CI class to a Service Mapping query. The query
changes to find Windows Servers that are connected to Tomcat WAR which is included in the
services that returned by the Service Mapping query. You can inverse that query by choosing
**Does Not Belong To Service.** This changes the query to find Windows Servers that are connected
to Tomcat WAR that is not included in services returned by the Service Mapping query.
Relationship properties

When you connect CI classes on the canvas, the CMDB Query Builder displays the Connection Properties in the right-side bar, where you can configure the properties of the relationship, such as the relationship direction. For Service Mapping queries, you can configure whether to query for related or unrelated CIs.

Connection properties include:

- Relationship type: Query for CIs and descending classes with specific relationship types.
- Relationship direction: Which CI class is the parent and which CI class is the child in the relationship.
- Relationship level: Query only on first-level relationship or also on second-level relationships.
- No relationships: Query for CIs which have no relationship to the set class.
- References fields: A field that the parent and ancestor parent CI classes use to reference the child CI class.

Newly added relationships between CI classes may take up to 30 minutes to appear in the relationship list.

Domain separation in CMDB Query Builder

This is an overview of domain separation as it pertains to the CMDB Query Builder. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

This application fully supports domain separation. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

How domain separation works in the CMDB Query Builder

With the CMDB Query Builder you can easily build complex infrastructure and service queries that span multiple CMDB classes, and that involve many CIs that are connected by different relationships. Domain separation is set to be on by default.

- Saved Query
  
  The user creates a query by dragging a class node from the class hierarchy and dropping it to the canvas and connecting the nodes with the relationships type.
  
  The user can save the created query as an XML file to the database (qb_saved_query) table in the CMDB for future use. The saved query is domain separated.

- Query results
  
  With a saved query, the user clicks Run and the query result is saved and displays in the platform list view.
  
  In the query results, the domain separation behaves in the same way as the platform list view for the CI relationship (cmdb_rel_ci) table and CMDB CI (cmdb) table. Consequently, since the CI relationship is not domain separated, all relationships of the query result display, regardless of
the domains. Conversely, if the query result is CI only, since the CMDB CI is domain separated, the results display only if visible in the current domain.

**Build a CMDB query using the CMDB Query Builder**

A CMDB query type queries the infrastructure for CI classes and optionally a non-CMDB table, and the relationships and references that connect them.

The *UI16 plugin* (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder_read to only view and run saved queries, and cmdb_query_builder (contained for itil, itil_admin, and asset) to create and save queries, modify saved queries, and run queries.

Authorized users can update and delete a query created by another user.

Build the query by dragging the CI classes and a non-CMDB table that you want to include in the query. Then dropping them as nodes on the canvas, and defining relationship properties between them. You can filter on the attributes of any node to narrow down the results to a specific set of CIs of that class or to a single specific CI. You can also select which property columns appear in the query results.

As you step through building a query, list options and other user interface elements of the CMDB Query Builder, are dynamically filtered as appropriate to your selections.

1. Navigate to Configuration and click CMDB Query Builder.
2. On the CMDB Query Builder page do either of the following steps:
   - Click Create new. Type in a Name, choose CMDB Query as the Query type, and then click Create.
   - Click a widget of a saved query to continue building an existing query. Search saved queries first if needed.
   - Point to the upper right corner of a saved query widget, and click the Duplicate Query icon to edit a copy of a saved query. The default name of the new query contains the string ‘copy’.
3. On the canvas, you can do any of the following operations:
   - Add CI classes to the query: Select classes from the CMDB Classes hierarchy list and drag them to the canvas.
   - Add a non-CMDB table to the query: Select a table from the Non-CMDB Tables list and drag it to the canvas.
   - Add connections (relationships) between two nodes on the canvas:
     1. On the first node in the relationship, click the small square at the center of the right side.
     2. On the second node in the relationship, click the small square at the center of the left side to create the connection.
     3. In Connection Properties on the right-side bar, configure the following settings (click the connection line if necessary):
        - In the Relationship Direction section, select the Parent node (the Child node automatically adjusts).

**Note:** A non-CMDB table cannot be the start node in the query, and you cannot connect a CMDB class to two non-CMDB tables of the same type.
• In the Relationship Levels section, set **Level** to **First level relationships** if the CIs are directly connected. Or, **Up to 2nd level relationships** if the CIs are connected either directly or indirectly through another CI.

• In the Relationship Types and Related Items section, select either option:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Relationships</td>
<td>To query for CIs with no connecting relationships, such as All Tomcat WAR CIs which are not connected to a Windows Server.</td>
</tr>
<tr>
<td>Add Relationship Types</td>
<td>To select specific or any relationship type.</td>
</tr>
<tr>
<td>Add a Related Item</td>
<td>To query for related CIs between the nodes.</td>
</tr>
</tbody>
</table>

• (Applies only to a non-CMDB table). In the CI Reference Column section, select the column with a reference to a class from the **Reference column to a CI to query on** list. If there is only one option, it is automatically selected.

**Relationship UI Notations**

<table>
<thead>
<tr>
<th>Notation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full line</td>
<td>A relationship in a CMDB query.</td>
</tr>
<tr>
<td>Red asterisk at the center of the connection line</td>
<td>Information such as relationship type is missing, invalidating the query.</td>
</tr>
<tr>
<td><strong>Levels:&lt;n&gt;</strong> <strong>Types:&lt;n&gt;</strong> or <strong>&lt;Reference type&gt;</strong> notation on the connection line</td>
<td>As applicable: The number of relationship levels and the number of relationship types included for the connection. Or, a reference type for a relationship that is a reference.</td>
</tr>
</tbody>
</table>

• Add filters to a class node: Apply filters to narrow down a class query to a specific set of CIs or to a single specific CI.

  1. Point to the node to add a filter to, and then click the **Apply filters** icon that pops up above the node.

  2. In the Filters section, add attribute and **related list conditions**.

  3. Close the **Filters** section.

  For example: Add a filter for database location to query for databases located in Seattle.

  Click **Applied Filters** in the right-side bar to view all filters for each node on the canvas.

• Add And/Or operators to the query:

  1. Connect one node to two other nodes.

  2. Click the **And** box that appears on the connection line, to toggle between the **And/Or** operators.
For example: C1 is Tomcat WAR, C2 is Linux Server, and C3 is Windows Server. Query for All Tomcat WAR CIs which are connected either to Linux Server Or to a Windows Server.

- Add property columns for a node, to appear in the query results:

  Note: For a relationship, the query results include the parent, child, and type columns. You cannot add any other columns from the (cmdb_rel_ci) table.

1. Click Properties in the right-side pane.
2. Click a node once or twice, so that the Report Columns section appears in the right-side bar, and then click Add Columns.
3. Select properties and then click outside the properties list to close it.

- Create a combination query by integrating a Service Mapping query into a CMDB query:

  1. When building a CMDB query, click Saved Service Queries in the left-side bar.
  2. Select and then drag a Service Mapping query to the canvas.

  This query returns all CIs that satisfy the CMDB query, and that are included in the services returned by the embedded Service Mapping query.

- Add a search tag that can then be used as a search criteria for saved queries:

  1. Click the Add Tags icon at the top of the canvas.
  2. Click Add Tag and in the Query Tags dialog box enter one or more tag strings.
  3. Click the Add Tags icon again to close the Query Tags dialog box.

4. Click Save.

On the Saved Queries tab, point to a saved query widget and click Query Information. Query details such as the query type, last update date, CMDB groups associated with the query, and the query schedules appear.

- Click Run.

Only the first 100 results of the query appear in the results pane.

- Click Load More Results to view the next set of 100 results.
- Click Load All Results to view the rest of the query results, up to the number specified by the glide.cmdb.query.max_results_limit system property (10,000 by default).

Click a CI to open its CI form, and on the CI form click Dashboard to view CI health in the CI dashboard.

Note:
- If Level is set to Up to 2nd level relationships, then the relationship type does not appear in the query results.
- When a query is running, wait for it to complete or to time out before opening or running another query.
- **Modify Query Builder settings**: Click the (Settings) icon to open the **Query Builder Settings** dialog box.

- Copy and share the URL of a saved query with users that have access to the CMDB Query Builder. Pasting the shared URL in a new internet browser window, directly opens the saved query in the CMDB Query Builder.

- **Create reports in CMDB Query Builder**.

- **Create a schedule** to run the query at a future time, and to email the results to interested parties.

- **Export query results**: Click the Query Results context menu and select **Export**. Even if the **Load More Results** button is visible, indicating that there are additional query results, only the results that are visible are exported.

- **Export and import a CMDB query** to port a query definition between instances.

- **Populate a CMDB group** using a saved query.

---

**Build a Service Mapping query using the CMDB Query Builder**

The Service Mapping query type is a pattern consisting of classes and relationships between those classes. After you build the pattern and run the query, the query returns all the Service Mapping services that contain that pattern.

The **Ul16 plugin** (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder_read to only view and run saved queries, and cmdb_query_builder (contained for itil, itil_admin, and asset) to create and save queries, modify saved queries, and run queries.

Authorized users can update and delete a query created by another user.

Build the query by dragging the CI classes that you want to include in the query, dropping them as nodes on the canvas, and then defining relationship properties between them. For every class node in the query, you can filter on its attributes to narrow down the results to a specific set of CIs of that class or to a single specific CI. You can also select which property columns appear in the query results.

As you step through building a query, list options and other user interface elements of the CMDB Query Builder, are dynamically filtered as appropriate to your selections.

1. **Navigate to** **Configuration** and click **CMDB Query Builder**.

2. **On the CMDB Query Builder** page do either of the following:
   a) Click **Create new**, Type in a **Name**, choose **Service Mapping Query** as the **Query type**, and then click **Create**.
   b) Click on a widget of a saved query to continue building an existing query. **Search saved queries** first if needed.
   c) Point to the upper right corner of a saved query widget, and click the **Duplicate Query** icon to edit a copy of a saved query. The new query’s default name contains the string ‘copy’.

3. **On the canvas, you can do any of the following**:
   - **Add CI classes to the query**: Select classes from the **CMDB Classes** hierarchy list and drag them to the canvas.
• Add connections (relationships) between two nodes on the canvas:
  1. On the first node in the relationship, click the small square at the center of the right side.
  2. On the second node in the relationship, click the small square at the center of the left side to create the connection.
  3. In Connection Properties on the right-side bar, configure the following (click the connection line if necessary):
     • In the Relationship Direction section, select the Parent node (the Child node automatically adjusts).
     • In the Service Query Properties section, select Find Related CIs or Find Unrelated CIs to query for a pattern in which the two classes have or do not have relationships with each other, respectively.

For example, All Tomcat WAR CIs which are not connected to a Windows Server.

<table>
<thead>
<tr>
<th>Relationship UI Notations</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dashed line</td>
<td>A relationship in a Service Mapping query.</td>
</tr>
</tbody>
</table>

• Add filters to a class node: Apply filters to narrow down a class to a specific set of CIs or to a single specific CI.
  1. Point to the node to add a filter to, and then click the Apply filters icon that pops up above the node.
  2. In the Filters section, add attribute and related list conditions.
  3. Close the Filters section.

For example: Add a filter for business criticality to query for businesses that are 'most critical'.

Click Applied Filters in the right-side bar to view all filters for each node on the canvas.

• Add And/Or operators to the query:
  1. Connect one node to two other nodes.
  2. Click the And box that appears on the connection line, to toggle between the And and the Or operators.

For example C1 is Tomcat WAR, C2 is Linux Server, and C3 is Windows Server. Query for all Tomcat WAR CIs which are connected either to Linux Server Or to a Windows Server.

• Add property columns for a node, to display in the query results:

  Note: For a relationship, the query results display the parent, child, and type columns. You cannot add any other columns from the cmdb_rel_ci table.

  1. Click Properties in the right-side pane.
  2. Click a node once or twice, so that the node's Report Columns section appears in the right-side bar, and then click Add Columns.
3. Select properties and then click outside the properties list to close it.

- Select columns and add filters that will be applied to the resulting set of services:
  1. Select Properties in the right-side bar, and then click an empty space on the canvas to ensure that nothing is selected.
  2. Click Add Columns at the bottom of the right-side bar and select columns to add. Click outside the columns list to close it.
  3. Click the Apply Service Mapping Query Filters icon at the top of the canvas and add filters.

- Inverse the entire query and search for all Service Mapping services that do not include the query pattern:
  - Click a node once or twice so that Query Properties appear in the right-side bar. In the Metadata section, toggle Services Including This Pattern to enable or disable the option.

- Add a search tag that can then be used as a search criteria for saved queries:
  1. Click the Add Tags icon at the top of the canvas.
  2. Click Add Tag and in the Query Tags dialog box enter one or more tag strings.
  3. Click the Add Tags icon again to close the Query Tags dialog box.

4. Click Save.

On the Saved Queries tab, point to a saved query widget and click Query Information to view query details such as the query type, last update date, and the query schedules.

- Click Run.

The query results pane displays only the first 100 results of the query.

- Click Load More Results to display the next set of 100 results.
- Click Load All Results to display the rest of the query results, up to the number specified by the glide.cmdb.query.max_results_limit system property (10,000 by default).

Click a CI to open its CI form, and on the CI form click Dashboard to view CI health in the CI dashboard.

**Note:** When a query is running, wait for it to complete or to time out before opening or running another query.

- Modify Query Builder settings: Click the (Settings) icon to open the Query Builder Settings dialog box.
- Copy and share the URL of a saved query with users that have access to the CMDB Query Builder. Pasting the shared URL in a new internet browser window, directly opens the saved query in the CMDB Query Builder.
- Create reports in CMDB Query Builder.
- Create a schedule to run the query at a future time, and to email the results to interested parties.
- Export query results:
Export query results that are visible: Click the Query Results context menu and select Export. Even if the Load More Results button is visible, indicating that there are additional query results, only the results that are visible are exported.

- Export and import a CMDB query to port a query definition between instances.
- Populate a CMDB group using the saved query.

Sample CMDB queries

Use the following sample queries to build your own CMDB queries.

Using the CMDB Query Builder requires that the UI16 plugin (com.glide.ui.ui16) is activated.

CMDB query sample

Use this example to build a CMDB query.

All servers with a connection to a database

1. Navigate to Configuration and click CMDB Query Builder
2. Click Create new. Enter a Name - All servers with a connection to a DB. Choose CMDB Query, and click Create.
3. In the CMDB Classes list, locate the Server class, and drag it to the canvas.
4. Locate the Database class, and place it to the right of the Server class node on the canvas.
5. Click at the center of the right side of Server, and then at the center of the left side of Database to create a connection.
6. Select the Server 1 node on the canvas. In the Relationship Types and Related Items section in the right-side bar, click Add Relationship Types and add all the relationships from the list.
   Note that the added relationships appear in the right-side bar, in the Relationship Types and Related Items section.
7. Click Save, and then click Saved Queries on the left to see the widget for the saved query.
8. Click the query widget to return to the canvas in edit mode.
9. Click Run to execute the query.
   Review the query results. Each row displays the name of a server CI, the name of a database CI, and the relationship type between them.
10. Add columns to the query results:
   a. Click the Server 1 node on the canvas once or twice so that the Server 1 Report Columns section appears in the right-side pane. Click Add Columns.
   b. Select Manufacturer and then click outside the columns list to close it.
   c. Click Run.
      Review the query results which now include the Manufacturer column.
   d. Click Save again to save all your customization for this query.
Service Mapping query sample

Use this example to build a Service Mapping query.

**Linux server in services**

*Note: To build and run a Service Mapping query, Service Mapping must be activated.*

1. Navigate to Configuration and click CMDB Query Builder.
2. Click Create new. Enter a Name - Linux server in services. Choose Service Mapping Query, and click Create.
3. In the CMDB Classes hierarchy list, locate Linux Server and drag it to the canvas.
4. Click Run.
   - Review the query results. Each row displays the name of a Service Mapping Service and the name of a Linux Server that is a member of that service.
5. On the right-side pane, click Disable Service Including This Pattern and then click Run again.
   - Review the query results. Now, each row displays the name a Service Mapping Service that does not include the specified Linux Server.

Run a partial CMDB query

You can run a partial query in the CMDB Query Builder by defining a section of a query, and then running it.

The **UI16 plugin** (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder (contained for itil, itil_admin, and asset)

While building a query or reviewing a saved query, you can run only a section of the query. On the canvas in the CMDB Query Builder, highlight a section of the query which contains the nodes and relationships of the partial query that you want to run. You can then examine the results of the partial query, and update the query if needed.

1. Navigate to Configuration and click CMDB Query Builder.
2. On the CMDB Query Builder page, click a tile to open an existing query.
3. Click the selection tool under the navigation tool to switch to a section selection mode.
4. Border a section of the query:
   a) Click the mouse device on the upper left corner of the section that you want to create.
   b) Drag the mouse device to the bottom right corner of the section that you want to create.
      As you drag the mouse device, the selected section is highlight in light blue.
   c) Release the mouse device. The query nodes that are included in the partial query, appear with a blue border.
5. Click Run.
6. In the Pick Starting Node dialog box, select the starting node for the partial query, and click Confirm.
The results of the partial query appear in the Results pane.

**Navigation in CMDB Query Builder**

Use the navigation tools to enlarge or shrink the query, to move the query, or to border a section of the query to run.

Using the Query Builder requires that the `UI16 plugin` (com.glide.ui.ui16) is activated.

Use the buttons in the navigation tool as follows:

- Use the plus sign (+) to increase magnification of the query.
- Use the minus sign (-) to decrease magnification of the query.
- Click the center dot to center the query on the canvas.
- Use the direction arrows to move the query in that direction.
- Use the selection tool under the navigation tool to toggle between two states:
  - Moving the entire query on the canvas.
  - Bordering a section of the query, which you can then run as a partial query.

**Create reports in CMDB Query Builder**

Use CMDB Query Builder reports to show the results of a CMDB query or a Service Mapping query. Create a basic report, or a dynamic report that automatically updates when the results of the associated saved query change.

**Create a dynamic report**

After running a saved query in the CMDB Query Builder, create a dynamic report that continuously updates to show the latest query results. You can use a dynamic report as any other report created using Reporting and you can add it to Performance Analytics (PA) dashboards.

Ensure that the query that you want to create a dynamic report for is a saved query, and that there is a specified schedule for the query. Also, run the saved query and ensure that all query results are visible.

**Role required:**

- To create: `cmdb_query_builder` and `report_user`
- To view: Reporting role requirements might apply, see *Administering reports* for Reporting role requirements.

In a base system, the `cmdb_query_builder` role is contained in the `itil` and `asset` roles.

The *Create Report* button in CMDB Query Builder which is used to create a dynamic report, is activated only if:
The query is saved
- The query has a schedule
- The entire set of query results is present after a query run

The initial dynamic report that you create, is based on the results from the initial run of the saved query. Then, on every subsequent run of the saved query, the associated report automatically updates with the latest query results.

However, if you change the query definition itself, the query and the report are no longer in sync and you must create a new report.

1. Navigate to Configuration > CMDB Query Builder.
2. In the Saved Queries tab, select the saved query for which you want to create a report. Ensure that the query has a specified schedule.
3. Click Run and ensure that all query results appear. Click Load All Results if available, to load all results.
   The Create Report button is enabled only if all query results are showing.
4. Click Create Report.
   If the CMDB Query Builder displays the query results in a new tab, then after the new tab opens with the query results, return to the CMDB Query Builder window.
5. In the Report Designer, click Next or Back to view and configure the new report in the Data, Type, Configure, and Style tabs.
   The report is pre-populated with the CMDB query results and a few other report details.
   - Report name is set to the name of the saved query.
   - Source type is set to Data source.
   - Data source is set to the table in which the query results are stored.
   - Query Sys ID is the ID of the latest run of the query.

For more details about Reporting and about configuring a report in the Report Designer, see Reporting, Creating reports.

6. Click Save or Run.

CMDB Query Builder creates a report source which you can attach to a report and use with PA dashboards. For more details about report sources, see Report sources.

Use either of the following steps to view the new report source. The name of the new report source is set to the name of the CMDB query it was created from, and cannot be changed.

- In Query Builder, click Saved Queries. In the Saved Queries window, click the Query Information icon in the tile of the saved query. Scroll to the bottom of the information list and then click the link under Report source.
- Navigate to Reports > Administration > Report Sources and locate the new report source.

Create a basic report

After running a query in the CMDB Query Builder, you can create a basic report that is scoped to the query execution.

The U16 plugin (com.glide.ui.ui16) must be activated.

Role required:
- View report: cmdb_query_builder or cmdb_query_builder_read
- Create report: cmdb_query_builder or cmdb_query_builder_read, and report_user
In a base system, the cmdb_query_builder role is contained in the itil and asset roles.

1. Navigate to **Configuration** and click **CMDB Query Builder**.
2. Build a query.
3. In the query results pane, click the list context menu and select **Bar Chart** or **Pie Chart**.

The Reports application creates a basic report, which is scoped to the query execution and is static.

### Search saved queries

The CMDB Query Builder allows you to search for a specific saved query using any combination of search criteria based on the query’s title, type, custom tags, and who created or updated the query.

To locate a saved query using a **Query Tags** search criteria, the query must have a query tag associated with it. For more information see [Build a CMDB query using the CMDB Query Builder](#) or [Build a Service Mapping query using the CMDB Query Builder](#).

The **UI16 plugin** (com.glide.ui.ui16) must be activated.

Role required: cmdb_query_builder (contained for itil, itil_admin, and asset)

1. Navigate to **Configuration > CMDB Query Builder**.
2. In the **Search Saved Queries** box on the **Saved Queries** tab, enter a string to search for.
   - The resulting list displays all search categories that can be applied using the search string.
3. Select an item from the list to add it as a search criteria.
4. Refine the search string or select additional search criteria as needed.

### Create a schedule for a CMDB query

Schedule a saved CMDB query to run once at a scheduled time or on a recurring schedule, and to email the query results to specified users.

The **UI16 plugin** (com.glide.ui.ui16) must be activated and a saved CMDB query that was built in the CMDB Query Builder must exist.

Role required: cmdb_query_builder (contained for itil and asset)

The query results are attached to the email as a file in the specified format. By default, the maximum result rows that can be attached is 10,000. This is controlled by a system property.

1. If need to, navigate to **Configuration**, click **CMDB Query Builder**, and then click a saved query.
2. **Click Create Schedule** and fill out the form.

**Note:** Configure the form layout to add this field to the form.

---

### Export and import a CMDB query

Export a saved CMDB or Service Mapping query definition to an XML file which you can later import and run in the CMDB Query Builder. This process lets you port a saved query between instances, such as from a development environment to a production environment.

- You must save a query before you can export it.
- Domain in an exported query must be visible in both, source and destination instances.

Role required: cmdb_query_builder (contained in itil, itil_admin, and asset).

When exporting a combination query, the integrated Service Mapping query definition is included in the exported query.

For backward compatibility, you can alternatively **Export and import a query as an update set**.

1. Navigate to **Configuration > CMDB Query Builder**.
2. Export a saved query:
   a) In the **Saved Queries** tab, in either list view or card view, select a saved query.
   b) Click the **Export query** icon at the top of the Query Builder canvas.
   c) Wait for the **Query Export Complete** message to appear and then click **Download**.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
You can now access the query XML file.

3. Import a saved query:
   a) In the Saved Queries tab, click the Import query icon at the top of the CMDB Query Builder window.
   b) In Finder, select the saved query XML file and click Open.

The imported query is available in the Saved Queries tab of the CMDB Query Builder on the instance.

Export and import a query as an update set

Export a saved query definition to an XML file as an update set, which you can later import.

Role required: To export — cmdb_query_builder (contained in itil and asset). To import — user with permission to import an update set.

Domain in the exported query must be visible in both, source and destination instances.

Export a query definition as an update set which you can later import and commit. This process lets you port a query between instances, such as from a development environment to a production environment. For more information about exporting and then committing update sets using XML files, see Save an update set as a local XML file.

When exporting a combination query, the integrated Service Mapping query definition is included in the exported update set.

1. Export a saved query:
   a) In the Filter navigator, enter qb_saved_query.list and hit Enter to navigate to the Saved Queries table.
   b) In the Saved Queries list view, select the query that you want to export.
   c) Click Actions on selected rows and then select Export query.
   d) Wait for the Query Exporter to complete the export.

2. Import the exported saved query:
   a) Navigate to System Update Sets > Retrieved Update Sets.
   b) On the Retrieved Update Sets form, click Import Update Sets from XML.
   c) On the Import XML page, click Choose file and select the exported XML file. Then click Upload.
   d) Open the new record that was added to the Retrieved Update Sets list view.
   e) On the Retrieved Update Set form, click Preview Update Set Batch and then close the Batch Update Set Preview dialog box.
   f) Click Commit Update Set Batch and then close the Commit Update Set Batch dialog box.

The imported query is added to the Query Builder saved queries on the instance.

Settings for CMDB Query Builder

Use settings to control some aspects of the CMDB Query Builder behavior.

Using the Query Builder requires that the UI16 plugin (com.glide.ui.ui16) is activated.

Open the Query Builder Settings dialog box:
1. Navigate to **Configuration** and click **CMDB Query Builder**.

2. On the **CMDB Query Builder** page, click the (Settings) icon.

3. Click the **Settings** icon again to close the dialog box.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Relationships in Results</td>
<td>Display the relationship between CIs in the query results.</td>
</tr>
<tr>
<td>Display Suggested Connections</td>
<td>Filter the CMDB classes and the non-CMDB tables lists in the left pane to display only classes and tables that the selected node on the canvas has a relationship with. You can then drag any item from the filtered list to the canvas, and connect it to the selected node on the canvas. This setting applies only to CMDB queries.</td>
</tr>
<tr>
<td>Display Results in New Tab</td>
<td>Display query results in a separate browser tab titled <strong>Query Results</strong>.</td>
</tr>
</tbody>
</table>

**Properties for CMDB Query Builder**

Use the CMDB Query Builder properties to configure query processing.

These properties are available for CMDB Query Builder. To view and edit these properties, the admin role is required.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Limits the number of results for a scheduled query and in the results section in the Query Builder when you click **Load All Results**. glide.cmdb.query.max_results_limit | - Type: integer

| creating a CMDB query.                                                  |                                                                                                                                                                                                          |
| glide.cmdb.query.non_cmdb.blacklisted_tables                            |                                                                                                                                                                                                          |

**CMDB Search**

Query on CMDB CIs and relationships by entering a search text with configurable synonyms and stop words, which CMDB Search converts into a properly formulated query.

CMDB Search is integrated into the global text search, providing enhanced capabilities for searching the CMDB. CMDB Search is designed to search within CMDB tables and relationships, allowing for queries that are more complex than basic text search. For example, you can query for all Tomcats that are running on Linux, or for all applications of a specific version that are running on Linux.

CMDB Search parses the search text that you enter, to formulate a properly formatted query that runs on the CMDB. Your search text can include plain words which are then parsed to identify any CMDB table, column, or relationship names. CMDB Search also uses synonyms and stop words to replace any plain text strings within your search text.

Localization is not supported for CMDB Search. In a localized instance, query words such as CI, relationship, or server, must be in English.

**Stop Words**

A collection of words that are ignored when CMDB Search parses your search text. When CMDB Search finds a stop word in your search text, that word is ignored. CMDB Search provides default stop words such as ‘if’, ‘me’, and ‘have’. You can delete or add stop words.

To view stop words, navigate to Configuration > CMDB Search > Stop Words.

**Relation Synonyms**

A collection of synonyms for relationships. CMDB Search searches your search text for strings that match any relationship synonym. For any such string that is found, CMDB Search replaces that string with the relationship type specified in the relation synonym. CMDB Search provides relationship synonyms for common words that stand for any relationship between two tables. For example, the strings "connect", "in", and "on" in your search text, are all treated as a general reference to a relationship, without specifying any relationship in particular. You can modify, delete, or add relationship synonyms.

To view relationship synonyms, navigate to Configuration > CMDB Search > Relation Synonyms.

**CI Class Synonyms**

A collection of synonyms for CI classes. CMDB Search searches your search text for strings that match any CI class synonym. For any such string that is found, CMDB Search replaces that string with the CI class name specified in the CI class synonym. CMDB Search provides at least one default CI class synonym for each CMDB table. Most default CI class synonyms are the class label. You can modify, delete, or add CI class synonyms.
To view CI class synonyms, navigate to Configuration > CMDB Search > CI Class Synonyms.

Column Synonyms

A collection of synonyms for table columns. CMDB Search searches your search text for strings that match any column synonym. For any such string that is found, CMDB Search replaces that string with the column name specified in the column synonym. CMDB Search provides at least one default column synonym for each table column in the CMDB. Most default column synonyms are similar to the column name itself. You can modify, delete, or add column synonyms.

To view column synonyms, navigate to Configuration > CMDB Search > Column Synonyms.

CMDB Search supports domain separation, searching CIs according to the user domain.

Plugin

To use CMDB Search, activate the CMDB Search (com.snc.cmdb_search) plugin. Activating CMDB Search, triggers an indexing of all CMDB tables to enable using Zing, which is required for some CMDB Searches.

Search text format and examples

The format of the search text is:

\(<\text{CI class name}> (\text{<attribute>} "\text{value}\")* (\text{<relationship>})* \)\)*

Consisting of a table name, followed by pairs of ‘<column> “<value>”’, without any separating commas, and with values surrounded by quotation marks. For column, table, and relationship names, you can search by actual names, labels, or synonyms, and column names can be omitted.

Examples:

- application runs on ci name "ciname"
- application name "JBoss Server13" version "1.0.0.0" on tomcat name "Tomcat10" version "2.1"
- tomcat on linux
- tomcat name “My Tomcat” version “2.0” running on linux server name “Linux8”
- tomcat “My Tomcat”
- tomcat name “My Tomcat”
- tomcat name related to Linux server “my server”
- tomcat name related to Linux server ip 1.1.1.1
- services related to tomcat “my tomcat”
- CI impacted by service “EmailService”

Sometimes the search text contains a name, such as Port, which is both a class and a column name. In this situation, the CMDB Search strategy is to first search for a class with the specified name, and then search for a column with the specified name. If this strategy does not yield the expected results, then use the actual class or column name to prevent ambiguity.

Results

Up to 10 query results appear after running the query. To view any additional results, click View all <record> matches. The total number of results that you can view depends on the value of
the `cmdb.search.rows.limit` system property, which is set to 100 by default. You can increase this property value, or you can change the query to return a smaller number of results. Increasing the number of query results might impact performance.

### Add synonyms and stop words to CMDB Search

Create, delete, or modify CI class synonyms, column synonyms, relationship types synonyms, and stop words for CMDB Search.

The CMDB Search (com.snc.cmdb_search) plugin must be activated.

Role required: cmdb_read

You can add any number of synonyms or stop words. There can be multiple synonyms for the same CI class, column, or relationship type.

- **Add a CI class synonym:**
  a) Navigate to [Configuration] > CMDB Search > CI Class Synonyms.
  b) Click **New** and fill out the CMDB Search CI class synonym form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Designates that the synonym is in effect.</td>
</tr>
<tr>
<td>Synonym</td>
<td>String to replace with <strong>CI type</strong> when parsing the search text.</td>
</tr>
<tr>
<td>CI class</td>
<td>The CMDB class for which the synonym applies.</td>
</tr>
<tr>
<td>Is attribute value</td>
<td>Designates that the synonym is applied only for CIs with an attribute whose value equals the synonym. When checked, the synonym is searched through the columns of the CI class. For example, 'Ubuntu' is specified as a synonym for the <code>cmdb_ci_linux_server</code> CI class, but only if one of the CIs attributes (such as operating system) is 'Ubuntu'.</td>
</tr>
</tbody>
</table>

c) Click **Submit**.

- **Add a column synonym:**
  a) Navigate to [Configuration] > CMDB Search > Column Synonyms.
  b) Click **New** and fill out the CMDB Search column synonyms form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Designates that the synonym is in effect.</td>
</tr>
<tr>
<td>Column</td>
<td>The CMDB column for which the synonym applies.</td>
</tr>
<tr>
<td>Synonym</td>
<td>String to replace with <strong>Column</strong> when parsing the search text.</td>
</tr>
</tbody>
</table>

c) Click **Submit**.

- **Add a relationship type synonym:**
  a) Navigate to [Configuration] > CMDB Search > Relation Synonyms.
b) Click **New** and fill out the CMDB Search relation synonym form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Designates that the synonym is in effect.</td>
</tr>
<tr>
<td>Synonym</td>
<td>String that represents any relationship type.</td>
</tr>
</tbody>
</table>

c) Click **Submit**.

- Add a stop word:
  a) Navigate to **Configuration > CMDB Search > Stop Words**.
  b) Click **New** and fill out the Stop Words form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Designates that the synonym is in effect.</td>
</tr>
<tr>
<td>Stop word</td>
<td>String to ignore when parsing the search text.</td>
</tr>
</tbody>
</table>

c) Click **Submit**.

When parsing a search text in the global text search box, CMDB Search uses all synonyms and stop words.

**Components installed with CMDB search**

Several types of components are installed with activation of the CMDB Search (com.snc.cmdb_search) plugin, including tables and properties.

**Note:** The Application Files table lists the components installed with this application. For instructions on how to access this table, see *Find components installed with an application*.

**Scheduled jobs installed**

<table>
<thead>
<tr>
<th>Scheduled job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synchronize CMDB Search synonyms for new CIs and Columns</td>
<td>Synchronizes new CI types and new columns to synonym tables. Runs once a day.</td>
</tr>
</tbody>
</table>

**Tables installed**

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI synonyms (search_cmdb_ci_synonym)</td>
<td>CI class synonyms used by CMDB search when parsing search text.</td>
</tr>
<tr>
<td>Column synonyms (search_cmdb_column_synonym)</td>
<td>Column synonyms used by CMDB search when parsing search text.</td>
</tr>
</tbody>
</table>
### CMDB CI Lifecycle Management

From the time of its creation to the time that it is no longer needed, a CMDB CI would typically transition through several operational states while undergoing various operations. CI Lifecycle Management provides the mechanism to define states and actions for a CI and lets you apply appropriate actions based on a CI’s state to tailor the management of CI lifecycle to business needs.

**Terms associated with CI Lifecycle Management:**

**Operational states**

A set of states that a CI can be at such as ‘Operational’ or ‘Repair in Progress’. A CI can be associated with only a single operational state at any given time. The choices for operational states are based on the `operational_status` field in the `cmdb_ci` table. There are several operational states that are defined in the base system such as ‘Retired’ and ‘Repair in Progress’. You can modify this list to reflect operational states that are relevant in your business.

**Note:** By default, Service Mapping is configured to ignore all host CIs for which the value of Operational status (`operational_status`) is not 1 (Operational) or the value of status (`install_status`) is 100 (absent). For additional information about this behavior, see *Preparing customized ServiceNow deployments to work with Service Mapping (KB0647574)* in the HI Knowledge Base.

### Properties installed

**Note:** To open the System Property (sys_properties) table, enter `sys_properties.list` in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cmdb.search.raws.limit</td>
<td>Maximum number of records to include in the query results.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 100</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location:</strong> System Properties (sys_properties) table.</td>
</tr>
<tr>
<td>cmdb.search.timeout.sec</td>
<td>Number of seconds to wait before timing out the query.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Type:</strong> integer</td>
</tr>
<tr>
<td></td>
<td>• <strong>Default value:</strong> 45</td>
</tr>
<tr>
<td></td>
<td>• <strong>Location:</strong> System Properties (sys_properties) table.</td>
</tr>
</tbody>
</table>
CI Lifecycle Management allows multiple operators and automations to simultaneously set different operational states of a CI. Since a CI cannot be associated with multiple operational states, it is important to configure each operational state with a priority. These priorities are then used in such situations to determine which of the operational states is the cumulative operational state.

CI actions
A set of actions that can be applied to a CI during its lifetime. You can define CI actions that are relevant in your business.

Compatible CI Actions
CI Lifecycle Management allows a CI to have multiple active CI actions simultaneously, however they must be specifically defined as compatible. By default, there are no two actions for a CI that are compatible with each other. You can change this behavior by specifying pairs of actions that are compatible and thus allowed to be applied simultaneously to a CI. For example, you can specify that the ‘Patching’ and the ‘Provisioning’ CI actions are compatible making it possible to apply both simultaneously to a CI.

Not Allowed CI Actions
By default, any CI action can be applied to any CI. You can restrict this behavior by defining a rule that an action is not allowed for a CI when it is in a specific operational state. For example, you can define a Not Allowed CI Action in which it is not allowed to apply the ‘Provisioning’ action to a Linux Server that is in a ‘Non-Operational’ state.

Not Allowed Operational Transitions
By default, transitions are allowed from any operational state to another. You can restrict this behavior by defining a rule that for a specified CI, a transition from a certain operational state to another operational state is not allowed. For example, you can define that for a Linux Server it is not allowed to transition from ‘Repair in progress’ to ‘Non-Operational’.

Requestor
A requestor can be a workflow or a non-workflow operator that is trying to set operational states and apply CI actions. Each requestor has an associated requestor ID that is a GUID and that can be an active workflow context or a non-workflow registered operator ID.

Lease time
A time period that each requestor (especially non-workflow operators) can provide, during which a specified CI action is allowed to be active for a specified CI.

CMDB CI Lifecycle Management provides a set of APIs to manage CI operational states and CI actions. And the UI where you define a set of rules to restrict certain operational state transitions and to restrict actions based on operational states. It also provides a mechanism to audit CI operational state and CI actions during the entire CI lifecycle.

Providers such as automation, workflows, or Change Management can use CI Lifecycle Management as a mechanism to manage CI operational states and apply CI actions. By default, the behavior of CI Lifecycle Management has no restrictions on some operations, and full restrictions on other operations. The CI Lifecycle Management UI lets you modify this default behavior by specifying Not Allowed CI Actions, Compatible CI Actions, and Not Allowed Operational Transitions that restricts some operations and enables for others.

With CI Lifecycle Management you can:
- Manage CI operational states and CI actions throughout the entire CI lifecycle.
- Manage CI operational state transitions.
- Restrict certain operational state transitions.
- Associate certain actions for certain CI types that are in specific operational state.
- Restrict IT Service Management applications based on CI operational state.
- Audit CI operational states and CI actions during the entire CI lifecycle.

**Lifecycle management APIs**

CI Lifecycle Management provides a set of APIs to manage CI operational state and CI actions during the entire CI lifecycle. All restrictions and allowances specified by rules in the UI are enforced when state management APIs run, and if an API attempts to perform a restricted operation, the operation is blocked and an error is logged.

**Registering requestors**

When using the lifecycle management APIs to apply CI actions, requestors are required to be registered and to obtain a requestor ID which is unique within the lifecycle management tables. To register and to obtain a requestor ID, non-workflow users should call the `registerOperator` API. Workflow users can use the active Workflow context as the requestor ID, and they do not need to explicitly call `registerOperator`.

After completing the CI lifecycle operations, the requestor should call the `unregisterOperator` API to unregister. All the state management records associated with that specific requestor ID are then marked as inactive or they are removed by the CI Lifecycle Management — Restore Internal State Management Tables scheduled job.

**Integration with Incident Management and Problem Management**

A base instance includes the pre-defined CI action `CreateTask` used for creating a task for a CI. New instances have a pre-defined Not Allowed CI Action, specifying that the `CreateTask` action is not allowed for any CI with a Retired operational state. This restriction is integrated with Incident Management and with Problem Management to prevent the creation of incident or problem tasks for retired CIs. The `CreateTask` CI action is used as a reference qualifier to the `Configuration Item` field of the Incident/Problem tables. In a new incident or problem, CIs in which `Operational Status` is Retired — are filtered out from the `Configuration Item` list on the form. For more information about reference qualifiers, see [Reference qualifiers](#).

**Integration with Asset Management**

In a base system, a CI’s `Operational Status` field and the `Status/Hardware Status` (if its hardware) fields are kept synchronized if one of the two fields’ values is Retired. When `Operational Status` of a CI is set to Retired, then the `Status/Hardware Status` field is automatically set to Retired. In the opposite direction, when the `Status/Hardware Status` field of a CI is set to Retired, `Operational Status` is then automatically set to Retired too. When an `Operational Status` field changes from Retired to another status, the CI’s `Status/Hardware Status` field is set to Installed. And when a CI’s `Status/Hardware Status` field changes from Retired to another status, the `Operational Status` field is automatically set to Non-Operational.

Whenever CI’s `Status/Hardware Status` changes, it is synchronized to the CI’s corresponding `Asset State` field, and vice versa — keeping the CI’s `Operational Status` and the CI’s corresponding `Asset State` synchronized.

For more information about mapping `Asset State` and `Substate` fields to a CI’s `Status/Hardware Status` (if its hardware) field, see [Map asset state and CI hardware status](#). And for more information about retiring assets, see [Retire assets](#).
Get started with CI Lifecycle Management

Follow these high level steps to get started and to track activities of the CI Lifecycle Management module of the CMDB application.

1. Activate the base system CI Lifecycle Management - Restore Internal State Management Tables scheduled job that continuously checks and maintains data integrity of all internal CI Lifecycle Management tables.

2. Define CI actions.

3. Define compatible CI actions rules.

4. Define not-allowed CI actions rules.

5. Define not-allowed operational state transitions rules.

6. Define new operational states by modifying the operational_status field in the (cmdb_ci) table in the system dictionary.

7. Set priority for operational states.

8. Call APIs to apply CI actions.

9. Navigate to Configuration > CI Lifecycle Management > View CI State Registered Users to display currently registered operators that were registered via the registerOperator API.

10. Review Renew Lease tasks and extend leases as needed: Navigate to Configuration > CI Lifecycle Management > Renew Lease Tasks. These tasks are created automatically by the CI Lifecycle Management - Restore Internal State Management Tables scheduled job for CI action records in which the lease for a valid requester has expired. The Requestor should use the lifecycle management API ExtendCIActionLease to extend the lease. Otherwise, if the lease remains expired for a specified grace period, the CI Lifecycle Management - Restore Internal State Management Tables scheduled job marks the respective CI action record as ‘inactive’.

   The grace period for expired lease time is configurable by the system property glide.cmdb.statemgmt.max_lease_expired_days.

11. Navigate to Configuration > CI Lifecycle Management > State Management Logs to display logs of CI Lifecycle Management operations.

Lifecycle management APIs

CI Lifecycle Management provides a set of state management APIs for manipulating CI operational states, and applying CI actions. State management APIs adhere to restrictions and allowances specified by Not Allowed CI Actions, Compatible CI Actions, and Not Allowed Operational Transitions. If an API attempts to perform a restricted operation, the operation is blocked, an error is logged, and a task is automatically created if appropriate.

Lifecycle management APIs can set operational states and CI actions to CMDB groups by utilizing lifecycle management bulk APIs.

Registration APIs

- registerOperator() - Method to register operator with state management for non-workflow user.
- unregisterOperator(String requestorId) - Method to unregister operator for non-workflow users.

© 2020 ServiceNow, Inc. All rights reserved.  
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
- isValidRequestor(String requestorId) - Method to determine if the specified requestor is a valid active workflow user or a registered user.
- isLeaseExpired(String requestorId, String ciSysId, String ciActionName) - Method to check if registered user lease expired.
- extendCIActionLease(String requestorId, String ciSysId, String ciActionName, String leaseTime) - Method to extend CI Action Lease time, for registered users. If previous lease already expired, extend lease from now.

Operational State APIs

- setBulkCIOperationalState(String requestorId, String sysIdList, String opsLabel, String opsStateListOld) - Method to set Operational State for an array of CIs.
- getOperationalState(String ciSysId) - Method to get CI Operational State.

CI Actions APIs

- addBulkCIAction(String requestorId, String sysIdList, String ciActionName, String ciActionListOld, String leaseTime) - Method to add CI Action for an array of CIs.
- removeBulkCIAction(String requestorId, String sysIdList, String ciActionName) - Method to remove a CI Action for a list of CIs.
- getCIActions(String ciSysId) - Method to get CI Actions.

Not Allowed Action Based on Operational State API

- isNotAllowedAction(String ciType, String opsLabel, String actionName) - Method to check if a specific CI action is not allowed for specific Operational State on a CI Type.

Not Allowed Operational State Transition API

- isNotAllowedOpsTransition(String ciType, String opsLabel, String transitionOpsLabel) - Method to check if specific operational state transition is not allowed on a CI Type.

Compatible Action API

- isCompatibleCIAction(String actionName, String otherActionName) - Method to check if two specific actions are compatible with each other.

Using state management APIs

```javascript
// 1. Register Operator with State Mgmt
var output = SNC.StateManagementScriptableApi.registerOperator();
var jsonUntil = new JSON();
var result = jsonUntil.decode(output);
var requestorId = result.requestorId;

// Get list of sys_ids to update
var sys_ids;
```

Components installed by CI Lifecycle Management

Several types of components are installed by CI Lifecycle Management (included in the com.snc.cmdb plugin), including tables, scheduled jobs, and properties.

Note: The Application Files table lists the components installed with this application. For instructions on how to access this table, see Find components installed with an application.

Scheduled jobs installed

<table>
<thead>
<tr>
<th>Scheduled job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Lifecycle Management - Restore Internal State Management Tables</td>
<td>Continuously checks and maintains the data integrity of all internal CI Lifecycle Management tables.</td>
</tr>
</tbody>
</table>

Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI State Registered Users (statemgmt_register_users)</td>
<td>All currently active registered users that were created via the registerOperator API. You cannot manually add new records to this table.</td>
</tr>
<tr>
<td>CI Actions (statemgmt_ci_actions)</td>
<td>A set of CI actions that can be applied to a CI during its lifetime.</td>
</tr>
<tr>
<td>CMDB CI Actions (statemgmt_cmdb_actions)</td>
<td>Active/inactive CI actions set by a specific requester for a specific CI. You cannot manually add new records to this table.</td>
</tr>
<tr>
<td>Compatible CI Actions (statemgmt_compat_actions)</td>
<td>Set of rules that define pairs of CI actions that are compatible for a CI and can be applied simultaneously.</td>
</tr>
<tr>
<td>Not Allowed CI Actions (statemgmt_not_allow_actions)</td>
<td>Set of rules that define specific actions that are not allowed for a CI when its in a specific operational state.</td>
</tr>
</tbody>
</table>
### Properties installed

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.cmdb.statemgmt.max_lease_expired_days</td>
<td>Maximum number of days that lease expiration can be set with for CI Actions.</td>
</tr>
<tr>
<td></td>
<td><strong>Type</strong>: integer</td>
</tr>
<tr>
<td>glide.cmdb.statemgmt.max_bulk_count</td>
<td>Maximum number of CIs that CI Lifecycle Management can process in a bulk update operation.</td>
</tr>
<tr>
<td></td>
<td><strong>Type</strong>: integer</td>
</tr>
</tbody>
</table>

### Activate the CI Lifecycle Management scheduled job

When starting to use the CI Lifecycle Management module, ensure to activate the **CI Lifecycle Management - Restore Internal State Management Tables** scheduled job which is disabled by default. This scheduled job continuously checks and maintains the data integrity of all internal CI Lifecycle Management tables.

When CI Lifecycle Management operations do not complete properly, for example due to a failure of the requestor or a requestor whose lease has expired, the integrity of tables related to CI Lifecycle Management might be compromised. The **CI Lifecycle Management - Restore Internal State Management Tables** scheduled job scans tables related to CI Lifecycle Management, and does the following:

- De-activates or removes all internal lifecycle management records with invalid requestors, and closes any corresponding Renew Lease Tasks if present.
· Detects records associated with a valid requestor whose lease has expired, and automatically creates a Renew Lease Task to notify the user and to provide details for extending the lease. If the requestor takes no action and the lease remains expired for a specified grace period (default 15 days), automatically de-activates the corresponding CI action record, and closes any corresponding Renew Lease Task if present.

1. Navigate to System Definition, and click Scheduled Jobs.
2. Search for the CI Lifecycle Management - Restore Internal State Management Tables job.
3. In the respective Active column, double-click the value false, and select true.
4. Click the Save icon.

Define a CI action

Define a CI Lifecycle Management CI action that can be later applied to CIs.

You can view a list of all the actions that are currently applied to CIs by navigating to Configuration and clicking CMDB CI Actions.

1. Navigate to Configuration > CI Lifecycle Management > CI Actions.
2. On the CI Actions page, click New. Fill in Name and Description, and then click Submit.

Define compatible CI actions

Allow a CMDB CI Lifecycle Management operation in which two specified CI actions can be applied simultaneously to a CI.

By default, it is not allowed to apply more than a single action to a CI. You can change that behavior by defining pairs of CI actions as compatible and therefore these actions can be applied simultaneously to a CI. For example, you can specify that Provisioning and Patching are compatible CI actions, which lets you apply both to a CI at the same time.

1. Navigate to Configuration, and click Compatible CI Actions.
2. On the Compatible CI Actions page click New and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>First action in the compatibility actions pair.</td>
</tr>
<tr>
<td>Compatible Action</td>
<td>Second action in the compatibility actions pair.</td>
</tr>
</tbody>
</table>

An API can successfully apply the two specified actions simultaneously to a CI.

Define a not-allowed CI action

Define a restriction for CI Lifecycle Management in which a specified action is not allowed for a CI that is in a specified operational state.

By default, there are no restrictions in the CMDB CI Lifecycle Management on applying CI actions. You can restrict this behavior by not allowing a specified action to be applied to a CI when it is in a specified operational state. For example, you can define a restriction in which the provisioning action cannot be applied to a Linux Server that is in a non-operational state.

1. Navigate to Configuration > CI Lifecycle Management > Not Allowed CI Actions.
2. Click **New** on the **Not Allowed CI Actions** page, and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not Allowed Action</td>
<td>The action that is being restricted.</td>
</tr>
<tr>
<td>CI Type</td>
<td>The CI type for which the restriction applies to. To apply a rule to all CIs, select Configuration Item.</td>
</tr>
<tr>
<td>Operational State</td>
<td>The operational state that the CI must be at in order to apply the restriction.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

If an API attempts to apply the specified action to the specified CIs, while it is in the specified operational state, the operation fails and an error is logged.

**Set priority for an operational state**

CI Lifecycle Management allows multiple operators or automations to simultaneously set different operational states for a CI. A CI can have only a single operational state, so in this case, the cumulative operational state of the CI is set to the one with the highest priority. It is recommended that you specify a priority for each operational state that you define so that a cumulative state can be correctly calculated.

1. Navigate to **Configuration > CI Lifecycle Management > Operational State Priority**.
2. On the **Operational State Priority** page, click the operational state for which you want to set or update priority.
3. Enter a **Priority** and click **Update**.
   Smaller numbers represent higher priority.

**Define a non-allowed operational transition**

Define a restriction for CI Lifecycle Management in which a specified CI cannot transition from one operational state to another.

By default, CI Lifecycle Management has no restrictions for transitioning CIs from one operational state to another. You can restrict this behavior by defining transitions that are not allowed for a specified CI. For example, you can define a restriction on transitioning a Linux server from non-operational state to repair in progress state.

1. Navigate to **Configuration > CI Lifecycle Management > Not Allowed Operational Transitions**.
2. On the **Not Allowed Operational Transitions** page, click **New** and fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>The CI type for which the restriction applies.</td>
</tr>
<tr>
<td>Not Allowed Transition</td>
<td>The CI state into which transitioning is restricted.</td>
</tr>
<tr>
<td>Operational State</td>
<td>The operational state that the CI must be in for the restriction to apply.</td>
</tr>
</tbody>
</table>

If an API attempts to transition a CI that is in the specified operational state to a state that is not allowed, the operation fails and an error is logged.
CMDB groups

A CMDB group is a collection of CIs that lets you apply CI actions collectively to all the CIs that are members in the group. For example, a CMDB CI Lifecycle Management API can use a CMDB group scriptable API to retrieve the group’s list of CIs, and then apply a CI Lifecycle Management action collectively to all the CIs.

Group type

A CMDB group is configured with a group type. If a CMDB group is set with the Health group type, then the CIs in the group can be monitored by CMDB Health, and the aggregated health is reported for the group as a whole in the CMDB group view dashboard. For example, you can monitor health only for CIs in a specific location.

Populate a CMDB group

Depending on the group type, you can populate a CMDB group by manually adding individual CIs, selecting saved CMDB queries, or building encoded queries in the CMDB group itself. The resulting CIs from each query are added as members to the group.

Roles required:

- To view CMDB groups - itil
- To use a CMDB queries - cmdb_query_builder on top of itil
- To manually add CIs - itil or asset

Also, to populate a CMDB group using a CMDB query, a saved CMDB query must exist.

1. Navigate to Configuration > CMDB Group.
2. In the CMDB Groups pane click New.
3. Fill out the form, right-click the title bar and select Save.

CMDB Group form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Name</td>
<td>A unique name for the group.</td>
</tr>
<tr>
<td>Group type</td>
<td>• Default: Basic group type which can be populated by manually adding CIs,</td>
</tr>
<tr>
<td></td>
<td>saved queries, and encoded queries.</td>
</tr>
<tr>
<td></td>
<td>• Health: Sets CMDB Health to monitor the health of the group CIs and aggregate</td>
</tr>
<tr>
<td></td>
<td>health results for the group as a whole. Can be populated only by encoded</td>
</tr>
<tr>
<td></td>
<td>queries.</td>
</tr>
</tbody>
</table>

Note: Dynamic filters are not supported when populating this type of CMDB groups.

4. To use saved CMDB queries:
   a) Click CMDB Group Contains Saved Queries and then click Add Query.
   b) Select a query from the Query Builder Saved Query list.
c) Click Submit.

The query that is used returns a list of CIs of the class in the start node of the query.

5. To manually add CIs:
   a) Click CMDB Group Contains Configuration Items and then click Edit Manual CI.
   b) Optionally add filters.
   c) Select CIs in the Configuration Item list and click the ‘+’ icon at the bottom.
   d) In the Group members list, select the CIs to add to the group.
   e) Click Save or Save and Exit.
   f) In the Save Confirmation dialog box, click OK.
   g) Click Submit.

6. To use encoded queries:
   a) Click CMDB Group Contains Encoded Queries and then click New.
   b) Select a class for which the encoded query applies to and add conditions to build a query. The resulting CIs are included in the group.
   c) Click Submit.

   **Note:** Dynamic filters are not supported for CMDB health-type groups, even though it is possible to add them in a condition clause.

c) Click Submit.

Click Show All CI to display all CI members of the group.

**Show CI Lifecycle Management details for CMDB group CIs**

Display CI Lifecycle Management operational state and CI actions that apply to the CIs that are members of a CMDB group.

If the CMDB group is based on a CMDB query, then the query runs in real-time and displays the resulting CIs. If the query does not complete successfully due to timing out or for other reasons, then appropriate error messages are displayed.

1. Navigate to Configuration > CMDB Groups.
2. On the CMDB Groups page, click on a CMDB group.
3. Click Show All CI.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item</td>
<td>CI group member.</td>
</tr>
<tr>
<td>Class</td>
<td>Class of CI group member.</td>
</tr>
<tr>
<td>Operational Status</td>
<td>CI Lifecycle Management operational state of the CI such as 'Repair in Progress' or 'Operational'. Possible operational states are defined in the choice list of the Operational status field in the cmdb_ci table.</td>
</tr>
</tbody>
</table>
CMDB Identification and Reconciliation

The Identification and Reconciliation module provides a centralized framework for identifying and reconciling data from different data sources. It helps maintain the integrity of the CMDB when multiple data sources are used to create and update CI records.

The use of multiple sources, such as EventManagement, Discovery, ImportSets, CloudInsights, pattern discovery, and ManualEntry, increases the risk of introducing inconsistencies through duplicate records. To maintain the integrity of the database, it is important to correctly identify CIs and services so that new records are created only for CIs that are truly new to the CMDB. Identification and Reconciliation helps you prevent duplication of CI records, reconcile CI attributes, reclassify CIs, and allow only authoritative data sources to update the CMDB.

Domain Separation

The identification process is domain aware. If the domain separation plugin has been activated, then identification processes only those CIs in which the domain ID is identical to the domain of the currently logged on user. If duplicate CIs exist across domains (including parent and child domains), then those CIs are not considered duplicate CIs because their domain IDs do not match.

Domain separation in CMDB Identification and Reconciliation

This is an overview of domain separation and the CMDB Identification and Reconciliation feature. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

This topic explains how domain separation is enforced during the CMDB Identification and Reconciliation process. In addition this topic addresses how domain separation is applied to the Identification and Reconciliation rules.

This application fully supports domain separation. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation.

How domain separation works in Identification and Reconciliation

Domain separation in the identification engine is enforced as soon as users activate the domain separation plugin.
Domain separation during the Identification and Reconciliation Process

- Domain separation during the Identification/Reconciliation process is enforced through the domain ID.
- Domain IDs do not need to be explicitly sent in the input payload of the identification engine APIs. Internally, the identification engine causes the current domain ID of the user to call the identification engine APIs.
- Only CIs that have the same domain ID as the currently logged-in user’s domain display during matching.
- During matching, if no records are found and a CI needs to be inserted, the CI’s domain ID is the same as the domain ID of the currently logged-in user’s domain.
- During matching, if duplicates are found, De-Duplication tasks created in the (reconcile_duplicate_task) table, have the same domain ID as those of the duplicate CIs.
- Duplicate CIs that exist across domains (including parent and child domains) are not considered as duplicate CIs by the identification engine.
- During matching, if reclassification of the CI is not allowed, reclassification tasks are created in the (reclassification_task) table, with the same domain ID as the CI for which reclassification is needed.

Domain separation and Identification Rules

- The identification rules and identification inclusion rules used during the identification process are always defined at the global level. For example, the tables below do not have a sys_domain field:
  - Identifier (cmdb_identifier), Identifier Entries (cmdb_identifier_entry), Related Entries (cmdb_related_entry), and Identification Inclusion Rules (cmdb_ie_active_config).

Domain separation and Reconciliation Rules

- The reconciliation definition rules and data source precedence rules that are used during the reconciliation process can be defined for different domains. For example, the tables below do have sys_domain, sys_overrides, sys_domain_path fields:
  - Reconciliation Definition (cmdb_reconciliation_definition), Datasource Precedence (cmdb_datasource_precedence), and Data Source Staleness Definitions (cmdb_datasource_staleness).

Components and process of Identification and Reconciliation

The CMDB Identification and Reconciliation functionality is supported by the Identification and Reconciliation engine (IRE) and rules and tasks. Identification rules, reconciliation rules, IRE data source rules, de-duplication tasks, and reclassification tasks determine how IRE identifies and reconciles CI.

Concepts and Components of Identification and Reconciliation

Identification
Process of uniquely identifying CIs, to determine if the CI already exists in the CMDB or if it is a newly discovered CI that must be added to the CMDB. Identification processes rely on identification rules, or on unique IDs for CIs that data sources can provide.

**Reconciliation**

Process of reconciling CIs and CI attributes by allowing only designated authoritative data sources to write to the CMDB at the CI table and attribute level. The CMDB is updated in real time as records are being processed. There is no staging area to verify the reconciliation activities before they are committed. Reconciliation processes rely on reconciliation rules, data source precedence rules and IRE data source rules.

**De-duplication tasks**

If the instance encounters duplicate CIs during the Identification and Reconciliation process, it groups each set of duplicate CIs into a de-duplication task. Review the information in these tasks to see how it was determined that these CIs are duplicates.

**Reclassification tasks**

During the CI identification process, a matched CI might need to be upgraded, downgraded, or switched to another CI class. If automatic reclassification is disabled, then the system generates a reclassification task. Review the information in these tasks, and decide whether a manual reclassification of the CI is appropriate.

**APIs**

The Identification and Reconciliation APIs are a centralized set of APIs that can be used with different sources of data such as Discovery, Monitoring, or Import Sets. You can use it to enforce Identification and Reconciliation before data is stored in the CMDB. Data sources do not directly write to the CMDB. Instead, they call APIs first to ensure that the data being written does not introduce inconsistencies.

Identification engine APIs are accessible in scoped apps. The Configuration Management For Scoped Apps (CMDB) plugin (com.snc.cmdb.scoped) allows a scoped app in scripts to use the prefix 'sn_cmdb.IdentificationEngine.<method>' to access identification engine APIs. The Configuration Management For Scoped Apps (CMDB) plugin is activated in base systems.

- **createOrUpdateCI()**: A scriptable API that creates or updates a CI based on Identification and Reconciliation rules.
- **IdentifyCI()**: Similar to the createOrUpdateCI API, but does not commit the result to the database. Use this API with a given payload to find out if the identification engine will perform insert or update operations, without committing the operation.
- **CreateOrUpdateCIEnhanced()**: A scriptable API that provides the functionality of enhanced IRE features such as partial payload, partial commit, incomplete payload, and deduplication of payload items. You can select the enhanced features to use. However, if you enable partial payloads, then deduplication of payload items and partial commit are automatically enabled.
- **CMDBTransformUtil**: An API to be used exclusively with Import Sets to apply Identification and Reconciliation processes to data imported by Import Sets.

Predefined Identification and Reconciliation rules are included for tables that are in the base instance. You can customize these rules for your organization. When a new table is created in the CMDB, it derives Identification and Reconciliation rules from its parent table if these rules exist. To apply Identification and Reconciliation rules to a new table, create the rules either at the child level or at its parent level.
Identification and Reconciliation engine (IRE)

IRE is an underlying key component in Identification and Reconciliation, providing a centralized framework to perform identification and reconciliation processes across different data sources. IRE uses identification rules, reconciliation rules, and IRE data source rules when processing incoming data before inserting that data to the CMDB. IRE processes help maintain data integrity in the CMDB.

- IRE prevents duplicate CIs by uniquely identifying CIs.
- IRE reconciles CI attributes by allowing only authoritative data sources to write to CMDB.

Process flow of Identification and Reconciliation

Apply CI Identification and Reconciliation to Import Sets

You can apply CMDB Identification and Reconciliation processes when Import Sets are used to import CIs into the CMDB. CI identification can prevent duplicate CIs in the CMDB, which Import Sets might otherwise cause.
Populating CMDB tables using Import Sets can inadvertently result in duplicate CIs when multiple imported records are identical to an existing CI. To minimize this duplication, you can apply CMDB Identification and Reconciliation processes to Import Sets when importing new records into CMDB tables.

**Transform map script**

In the onBefore transform map script for an import set, add a call to the `CMDBTransformUtil` API, similar to the following code sample:

```javascript
(function runTransformScript(source, map, log, target) {
  // Call CMDB API to do Identification and Reconciliation of current row
  var cmdbUtil = new CMDBTransformUtil();
  cmdbUtil.identifyAndReconcile(source, map, log);
  ignore = true;

  if (cmdbUtil.hasError()) {
    var errorMessage = cmdbUtil.getError();
    log.error(errorMessage);
  } else {
    log.info('IE Output Payload: ' + cmdbUtil.getOutputPayload());
    log.info('Imported CI: ' + cmdbUtil.getOutputRecordSysId());
  }

})(source, map, log, target);
```

The `ignore = true` code phrase prevents Import Sets from creating the same record again after it is processed by the identification engine.

**Process**

The identification engine performs identification of each source record before it is inserted into the CMDB. The identification engine determines if the record is a duplicate of an existing CI, and then:

- If not duplicate: Inserts the record to the target table.
- If duplicate: Updates the existing CI in the CMDB, with data from the source record.

The CMDBTransformUtil API pre-processes the source data, then passes the input values to the identification engine with import set being the data source by default. The CMDBTransformUtil API supports a target field that is a reference field in the same manner that Import Sets supports it. The CMDBTransformUtil API also supports a source script, evaluating source scripts to determine the target value which is then passed to the identification engine. For more information, see [Create a field map](#).

**Specify multiple target tables for an import set**

You can configure each record in an import set with its own target table. Then, instead of inserting all the transformed records into a single target table, the records are inserted into the different target tables that are specified per record. For example, you might need to insert some records from the import set to the Computer class and other records to the Server class.

When importing data using Import Sets, incorporate the following steps:
In the data source file, add a target table column. Use a string such as ‘MyTable’ to label the column header. In each record row, enter the target table for the record, as a valid CMDB class name such as "cmdb_ci_computer".

After you Auto Map Matching Fields on the Table Transform Map form, add a field map for the added target table column to establish a relationship between classes and the target tables in the CMDB.

1. In the Field Map related list on the Table Transform Map form, click New.
2. Set Source field to the header of the target table column that you added in the data source file, such as MyTable.
3. Set Target field to Class.
4. Click Submit.

When you configure an import set with multiple target tables as described in the steps above, the Target table that is specified on the Table Transform Map form is not used.

Restrictions

The following restrictions apply:

- An import set should be associated with a single transform map. While adding a call to the CMDBTransformUtil API, ensure that still a single transform map exists for the import set.
- The CMDBTransformUtil API does not check if mandatory fields have values when used with Import Sets. Regardless of how enforce mandatory fields is set in the transform map, data import fails if a mandatory field does not have a value.
- CI Identification and Reconciliation cannot be applied to Import Sets for dependent CIs (CIs with dependent identification rules).

CMDB identification rules

The CMDB identification process relies on identification rules to uniquely identify CIs.

An identification rule applies to a CI class and consists of a single CI identifier and one or more identifier entries and related entries, each with a different priority. Each identifier entry defines a unique attribute set with a specific priority and each related entry defines rules for identifying related items. Create strong identification rules that are set with the highest priority for the strongest identifier entries and related entries.

The identification process and identification rules use the CIs attributes for identification:

- **Unique attributes**
  Designated sets of criterion attribute values of a CI, that can be used to uniquely identify the CI. Unique attributes can be from the same table or from derived tables.

- **Required attributes**
  Designated attributes of a CI that cannot be empty.
Identification rule types

The steps for identifying dependent CIs can be different from the steps for identifying independent CIs. This difference is reflected in the differences between dependent identification rules and independent identification rules.

Independent identification rule

A rule that identifies a CI based on the CI's own attributes, independently of other CIs or relationship.

Dependent identification rule

A rule in which identifying a CI requires identifying a dependent CI first. A CI can have dependency on one or more CIs, and a dependent CI can have only a single parent CI with dependency. The relationship types between the CI and its dependent CIs are also included in the identification process. To help with the identification process of dependent CIs, create dependent relationships that define the dependency chain within CI types.

The payload used for identification of a dependent CI, can include a relationship with a qualifier chain. For such relationship, if there is a matching parent/child pair, the system compares the qualifier chain in the payload, with the qualifier chain of the CIs in the database. If there is a difference, the qualifier chain in the database is updated to match the qualifier chain in the payload for that relationship.

Identifier entries

You can configure an identifier entry to match a CI not only based on the CI's own attributes (field-based identification) but also based on the CI's related list (lookup-based identification) such as Serial Numbers or Network Adapters. The lookup table that is used for identification, needs to have a reference field that points to cmdb_ci.

There are three types of identifier entries:

Regular identifier entry

Based on CI's attributes that uniquely identify the CI.

Lookup identifier entry

Uses a lookup table (related table) which can be any table that has a reference to the CI that is being identified. After you select a related lookup table, you select identifier attributes from the related table that reference either the cmdb_ci table itself, or one of its descendants.

Hybrid identifier entry

A combination of both, a regular identifier entry and a lookup identifier entry.

Example: When discovering virtual machines in a cloud environment which contains two virtual machines with identical serial numbers. A regular identifier entry for the Hardware table such as [Table: Serial Number, Criterion Attributes: Serial Number, Serial Number Type] cannot uniquely identify these two virtual machines. However, a hybrid identifier entry such as [Table: Serial Number, Criterion Attributes: Serial Number, Serial Number Type + (Name field from main Hardware table)] can uniquely identify the two virtual machines.
Guidelines for lookup tables

Follow these guidelines when specifying a lookup table in an identifier entry.

1. Ensure that lookup tables reference the cmdb_ci table.
2. It is preferable to enforce exact count match (check box Enforce exact count match (Lookup)) for a stronger identification rule. During lookup identification, this option enforces matching only on exact lookup records count match.
3. Do not create conflicting identification rules especially for lookup-based rule.
   - Example: In a CI Identifier for the Hardware class, you specify a lookup-based rule for the Network Adapter class and you also define a CI Identifier for the Network Adapter class. Duplicates might potentially be created in the Network Adapter table, because there are contradicting rules to identify a unique CI in that table:
     - One rule that looks only at criterion attributes (CI identifier rule)
     - Another rule that looks at criterion attributes and referenced sys_id (lookup rule).

Example: CI with related items that needs to be inserted - sysId is available.

```javascript
var payload = {
  items: [
    {
      className:'cmdb_ci_linux_server',
      related: [
        {
          className:'cmdb_ci_spkg',
          values: {
            name:'package1',
            version:'version1'
          }
        },
        {
          sys_id:'194876usytrr65378098'
        }
      ],
      values: {
        sys_id:'194876usytrr65378098'
      }
    }
  ]
};
```

Related entries

You can also define related entries which are rules that are based on related CIs. A related entry is based on a related table which can be any table that has a reference to the CI that is being identified. After you select a related table for the rule, the list in Referenced field is populated with fields from the related table that reference either the cmdb_ci table itself, or one of its descendants.

Create or edit a CI identification rule

Identification rules are used to uniquely identify CIs in the CMDB, as part of the identification and reconciliation process. Each CMDB class can be associated with a single identification rule.

Role required: itil has read access, itil_admin (on top of itil) has full access.

In a CI identification rule, specify a CI identifier, and identifier entries and related entries that uniquely identify the CI. You cannot use the CI Class Manager to create related entries for an identification rule, instead, add related entries directly to the cmdb_identifier table.

Review the following before creating identification rules:

- CMDB identification rules
• **Effective usage of CMDB Identification**

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list. Select the class for which to create an identification rule.
3. In the class navigation bar, expand **Class Info** and then click **Identification Rule**.
4. Click **Edit** to edit an existing rule, or click **Add** in the Identification Rule section to create one. Fill out the form, and then click **Save**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Independent/Dependent</td>
<td>Designation of whether the CI identifier can identify the CI independently of other CIs, or not.</td>
</tr>
<tr>
<td><strong>Note:</strong> To set the rule as Dependent, you must specify dependent relationship rules for the selected class.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of CI identifier.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of the CI identifier.</td>
</tr>
</tbody>
</table>

5. In the Identifier Entries section, click an existing identifier entry to edit, or click **Add** to create one.
6. In the Identifier Entry dialog box, choose an option and then click **Next**. Continue with one of the following three steps according to the option you selected.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use attributes from main table &lt;table&gt;</td>
<td>Lets you select attributes from the currently selected table (regular identifier entry).</td>
</tr>
<tr>
<td>Use attributes from another table (Lookup table)</td>
<td>Lets you select attributes from any related table, other than the currently selected table (lookup identifier entry).</td>
</tr>
<tr>
<td>Use attributes from main and another table (Hybrid)</td>
<td>Lets you select attributes from both the currently selected table, and from another table (hybrid identifier entry).</td>
</tr>
</tbody>
</table>

7. **Use attributes from main table <table>** option: Set the options on the form and then click **Save**.

**Search On Table** is preset to the currently selected table in the CI Classes list.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check box that specifies the identifier entry is active. At least one identifier entry in an identification rule must be active for the rule to apply.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Priority                    | Priority of the identifier entry. Identifier entries are applied based on priority. Rules with lower priority numbers are given higher priority. Identifier entries of identical priorities are applied randomly.  
You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order. |
| Criterion Attributes        | Set of attributes that uniquely identify the CI. Attributes can belong to the current class, or to a parent class.  
It is not possible to add reference fields as a criterion attribute. Reference fields store sys_ids that point to a record in another table, and thus is considered a weak criterion attribute (in terms of uniqueness) for the current table. |
| Allow null attribute        | When selected, then if at least one criterion attribute is not null, allow to attempt matching with an identifier entry even if there are criterion attributes which are null.  
Otherwise, all criterion attributes must have values to attempt matching with an identifier entry. |
| Allow fallback to parent’s rules | Allows the identification rules of the CI’s parent to be used if a match is not found for this identification rule. Applies only for dependent identification rules. |

**Note:** If criterion attributes have only two attributes and `sys_class_name` is one of them (for example (name, sys_class_name), (ip_address, sys_class_name)), then the other attribute cannot be NULL, even if `Allow null attribute` is enabled. This restriction is due to `sys_class_name` being considered a special system matching attribute.

8. **Use attributes from another table (Lookup table) option:**
   a) Set **Search On Table** to a table other than the currently selected table in the CI Classes list. The **Search On Table** must have a reference field to `cmdb_ci`, otherwise the identifier entry is considered invalid.
   b) Set the rest of the fields as described in the previous step.
   c) Optionally, click **Advanced options** and enter the information for a lookup identifier (scroll down if necessary).

<table>
<thead>
<tr>
<th>Advanced Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All of these conditions must be met</td>
<td>A filter to narrow the set of records that will be searched for a matching CI.</td>
</tr>
<tr>
<td>Advanced Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Enforce exact count match</td>
<td>For lookup identification, match only on exact lookup records count match. When enforced:</td>
</tr>
<tr>
<td></td>
<td>1. Only matches CIs that have all the lookup items from the input payload referencing the CI in CMDB.</td>
</tr>
<tr>
<td></td>
<td>2. If there are multiple matches, selects the oldest created CI as the final match.</td>
</tr>
<tr>
<td></td>
<td>When not enforced:</td>
</tr>
<tr>
<td></td>
<td>1. Matches any CI that has at least one of the lookup items from the input payload referencing the CI in CMDB.</td>
</tr>
<tr>
<td></td>
<td>2. If there are multiple matches, selects the CIs with the max number of lookup items from the input payload referencing the CI in CMDB.</td>
</tr>
<tr>
<td></td>
<td>3. If there are still multiple matches, selects the oldest created CI as the final match.</td>
</tr>
</tbody>
</table>

**d)** Click **Save**.

**9. Use attributes from main and another table (Hybrid) option:**

**a)** Set the options on the **General Settings** tab as described in previous steps, and then click **Next**.

**b)** On the **Main Table Settings** tab, select the attributes to use from the currently selected table, and then click **Next**. 
**Search On Table** is preset to the currently selected table in the CI Classes list.

**c)** On the **Lookup Table Settings** tab, select a **Search On Table** and then in **Criterion Attributes** select attributes from the specified table. **Search On Table** must have a reference field to **cmdb_ci**, otherwise the identifier entry is considered invalid.

You can click **Advanced options** and enter the information for a lookup identifier as described in the previous step (scroll down if necessary).

**d)** Click **Save**.

**Note:** The **Allow null attribute** option in the hybrid option, is set to ‘false’. Therefore, all of the selected criterion attributes from both the currently selected table and the lookup table, must have a value.

**10. Optional: Add related entries to the cmdb_identifier table.**

**a)** In the main platform navigation bar, navigate to **Configuration > Identification/Reconciliation**, and click **CI Identifiers**.

**b)** In the **Identifiers** view, locate and click the identification rule that you have been editing or creating.
c) Click the **Related Entries** tab.

d) In the **Related Entries** related list, click **New** or open an existing entry to specify a related entry for matching the related item. Fill out the form, and then click **Submit**.

**Related Entry form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifier</td>
<td>The CI identifier for which this related entry belongs to. By default it is set to the identifier you previously selected.</td>
</tr>
<tr>
<td>Related table</td>
<td>A related table that references the CI that is being matched.</td>
</tr>
<tr>
<td>Referenced field</td>
<td>A referenced field in <strong>Related table</strong> that should store the referenced CI. This field always references the cmdb_ci table, or a descendent of the cmdb_ci table.</td>
</tr>
<tr>
<td>Criterion attributes</td>
<td>The set of attributes to uniquely identify the related item. Attributes can belong to the current class, or to a parent class. Click the lock icon to view, add, or remove attributes from the identification rule.</td>
</tr>
<tr>
<td>Optional condition</td>
<td>Use the <strong>Add Filter Condition</strong> and the <strong>Add 'OR' Clause</strong> buttons to construct a filter to narrow the set of records that will be searched for a matching related item.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that specifies that the related entry is active.</td>
</tr>
<tr>
<td>Allow null attribute</td>
<td>If at least one criterion attribute in the related table is not null, allow to attempt matching with an identifier entry even if there are criterion attributes which are null.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of the related entry for the specified <strong>Related table</strong>. Rules with lower priority numbers are given higher priority while matching a related item for specific related table. Related entries for the specified related table with identical priorities are applied randomly. You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.</td>
</tr>
</tbody>
</table>

**Note:** If criterion attributes have only two attributes and **sys_class_name** is one of them (for example (name, sys_class_name), (ip_address, sys_class_name)), then the other attribute cannot be NULL, even if **Allow null attribute** is enabled. This
restriction is due to `sys_class_name` being considered a special system matching attribute.

For example, the pre-defined Hardware Rule applies to the Hardware (cmdb_ci_hardware) table. It has an identifier entry with the criterion attribute Serial Number, Serial Number Type and its Search on table field is set to Serial Number.

The following payload snippet adds a CI to the cmdb_ci_linux_server class, that is a child of the Hardware class. It also shows how you can add related items in the payload for which you should create Related Entries on the CI Identifier page for the Hardware (cmdb_ci_hardware) table:

```json
{
    "items": [
        {
            "className": "cmdb_ci_linux_server",
            "lookup": [
                {
                    "className": "cmdb_serial_number",
                    "values": {
                        "serial_number": "VMware-42 21 e3 da 44 14 5a a6-56 48 2b 0a 28 53 42 4c",
                        "serial_number_type": "system",
                        "valid": "true"
                    }

                        "short_description": "My Chassis 2"
                    }
                }
            ]
        },
        {
            "values": {
```
When the **Hardware Rule** is applied, the Serial Number (cmdb_serial_number) table is searched for a match with the values specified within the *lookup* key. Unless **Enforce exact count match (Lookup)** is checked, it is not necessary for every lookup key to return a match, as long as there is at least one match. If all matches reference the same CI, then that CI is considered to be the existing CI record. If no match is found, then the identification search continues to the next rule entry. If after all the rules are exhausted without finding a match, a new CI record is created in the database.

You can optionally *create an inclusion rule* to narrow the scope of CIs that are included in identification.

**Create an identification inclusion rule**

Narrow the scope of CIs that are included in the identification process by creating an identification inclusion rule.

**Role required:** itil has read access, itil_admin (on top of itil) has full access.

During duplication detection of independent CIs, the identification and reconciliation engine (IRE) processes only the CIs that satisfy the identification inclusion rules. For example, you can set a filter to include only CIs whose state is operational. When no identification inclusion rules exist, all CIs are included in the identification process and in the CMDB Health duplicate metric calculations. In the base system, there are no predefined identification inclusion rules. Identification inclusion rules are defined at the class level.

Identification inclusion rules also indirectly impact what appears in CMDB health dashboards for duplicate CIs, in addition to any **health inclusion rules**.

**Note:** Identification inclusion rules impact any script that calls IRE, therefore create them carefully. Identification inclusion rules can prevent the identification of certain types of CIs, affecting some features of Discovery and Service Mapping.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list. Select the class for which to create an identification inclusion rule.
3. In the class navigation bar, expand **Class Info** and then click **Identification**.
4. In the Inclusion Rule (Advanced) section, click **Add** to create a rule or click **Edit** to edit an existing rule. In the Create Inclusion Rules dialog box, specify a criteria in the **Active record condition** field. CIs must meet this criteria to be included in the identification process and in the duplicate CMDB Health metric.
5. Click **Save**.
Navigate to Configuration > Identification/Reconciliation > Identification Inclusion Rules to see the list of all identification inclusion rules.

Reconciliation rules

Reconciliation rules specify which data sources can update a table or a set of table attributes, and they can be defined at the parent and the child table level. Ensure that there is a reconciliation rule for each data source that is authorized to update an attribute - multiple reconciliation rules can exist for the same set of attributes.

Data sources are used with the createOrUpdateCI() API to simulate manual updates to CIs. EventManagement, ImportSet, ManualEntry, and Tivoli are examples of data sources.

As you create reconciliation rules, keep the following principles and guidelines in mind. These principles are designed for flexibility and the refinement of rules at the attributes level.

Example reconciliation rules

For example, you might have the following reconciliation rules. The rules are created for the cmdb_ci_computer table and one of its child tables, the cmdb_ci_linux_server table. The rules specify the following:

1. Discovery is exclusively authorized to update the name attribute in the cmdb_ci_computer table.
   
   Because reconciliation rules are derived by child tables from parent tables, this rule also authorizes Discovery to update the name attribute in any child tables for the cmdb_ci_computer table.

2. ServiceWatch is exclusively authorized to update the name attribute in the cmdb_ci_linux_server table.

3. ServiceWatch is exclusively authorized to update all attributes in the cmdb_ci_linux_server table, as configured by leaving the Attributes field empty in the rule.

Authorization for all attributes in a table

If you want to authorize a data source to update all attributes in a table, leave the attribute list empty in the reconciliation rule for the data source. However, this authorization can be overridden for some of the attributes by rules for child tables in which specific attributes are listed.

For example, if only example rules #1 and #3 are created, then Discovery is authorized to update the name attribute in the cmdb_ci_linux_server table. ServiceWatch is authorized to update all other attributes in the table except for the name attribute.

To override the authorization of Discovery to update the name attribute, example rule #2 is added to specifically authorize ServiceWatch to update the attribute.

Authorization to only specific attributes in a table

If you want to authorize a data source to update specific attributes in a table, list these attributes in the reconciliation rule for the data source. A rule that grants access to specific attributes in a table overrides other rules with an empty attribute list that grants access to the entire table.
Example rule #1 grants Discovery with exclusive authority to update the name attribute of the cmdb_ci_computer table. All other data sources are prevented from updating the name attribute of any CI in the cmdb_ci_computer table.

Child table rules overrides parent table rules

Any reconciliation rules defined for a child table override the rules defined for its parent table. For example, rule #1 lets Discovery update the name attribute in the cmdb_ci_computer table and all of its child tables. However, rule #2 for the cmdb_ci_linux_server child table, which overrides rule #1 for the parent table, explicitly authorizes ServiceWatch to update this attribute in the child table.

As a result:
- Discovery cannot update the name attribute of the child cmdb_ci_linux_server table. Only ServiceWatch is authorized to update this attribute.
- Discovery is authorized to update the name attribute of CI records in all other child tables of the cmdb_ci_computer table.

Overlapping rules

Rules that authorize different data sources for the same attributes of the same table can coexist and do not exclude each other.

For example, assume the following rule is added. It is similar to example rule #1 but authorizes a different data source:
- ServiceWatch is authorized to update the name attribute in the cmdb_ci_computer table.

Like example rule #1, this new rule applies to the name attribute in the cmdb_ci_computer table so both Discovery and ServiceWatch can update the attribute. Any applicable data source precedence rules are enforced to prevent the data sources from overwriting each other's updates.

Domain separation

If Domain Separation is enabled, then you can scope reconciliation rules to specific domains. Rules of the parent domain, if not overridden, apply to CIs of child domain. All rules that are visible to a domain are applied, and a rule overriding the parent domain displays the child domain version.

Create or edit a CI reconciliation rule

A reconciliation rule specifies the attributes that a data source is authorized to update for a given table and prevents unauthorized data sources from overwriting the attributes' values. If an attribute does not have any reconciliation rules created for it, data sources are allowed to overwrite each other's updates to the attribute's value.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Reconciliation rules are used in conjunction with data refresh rules and data source precedence rules to determine reconciliation steps for a CI. These rules determine if, when, and by which data source a CI can be updated.

1. Navigate to Configuration > CI Class Manager.
2. Click **Hierarchy** to open the CI Classes list. Then select a class for which to create a reconciliation rule.

3. In the class navigation bar, expand **Class Info** and then click **Reconciliation Rules**.

4. In the Reconciliation Rules section, click **Add** to create a rule or select an existing rule to edit.

5. In the Create Reconciliation dialog box, fill out the fields on the **Rule Info** tab, and then click **Next**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source</td>
<td>The data source that you are configuring this rule for.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this reconciliation rule.</td>
</tr>
</tbody>
</table>

6. In the Create Reconciliation dialog box, fill out the fields on the **Attributes** tab, and then click **Next**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply to All Attributes</td>
<td>Authorizes the specified source to update all table attributes.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Attributes that the data source is authorized to update.</td>
</tr>
<tr>
<td></td>
<td>You can select attributes from the current class, or a parent class.</td>
</tr>
<tr>
<td></td>
<td>Available only if <strong>Apply To All Attributes</strong> is false.</td>
</tr>
<tr>
<td>Update with Null</td>
<td>Attributes that the data source can update with a null value.</td>
</tr>
<tr>
<td></td>
<td>By default, authorized data sources cannot overwrite a non-null value with a null value. Attributes in this list, which are not in the <strong>Attributes</strong> list, are not included with the attributes that the data source can update with a null value.</td>
</tr>
</tbody>
</table>

7. In the Create Reconciliation dialog box, fill out the fields on the **Filter Condition** tab if applicable.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Filter Condition</td>
<td>Conditions that a CI must meet, in order for the rule to apply to that specific CI.</td>
</tr>
<tr>
<td></td>
<td>For example, to apply this rule only to CIs that are associated with the Finance department, select this condition: <em>(Department) is (Finance)</em></td>
</tr>
</tbody>
</table>

8. Click **Save**.

Additional rules that affect reconciliation:

1. **Define or edit data source precedence rules**
2. **Create data refresh rules**

**Define or edit data source precedence rules**
If multiple data sources are authorized to update the same table or the same table attributes in the CMDB, assign a priority to each of these data sources to prevent them from overwriting each
other's updates. Without data source precedence rules, data sources can overwrite each other's modifications.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Data source precedence rules are used along with data refresh rules and reconciliation rules to determine reconciliation steps for a CI. These rules determine if, when, and by which data source a CI can be updated.

After an authorized data source updates an attribute, subsequent updates are accepted only from the same data source or from a data source with a higher priority. Updates from a data source with a lower priority are rejected, unless these two conditions are met:

- The lower priority source is the first source updating the CI.
- The CI became stale based on data refresh rules for the CI class.

Information about the last data source that updates each attribute is stored in the Data Source History (cmdb_datasource_last_update) table.

Data source precedence rules affect reconciliation of stale CI attributes. During reconciliation, the information in the Data Source History table is considered along with the data refresh rules for the CI's class, to determine if a CI attribute is stale. A CI attribute is determined to be stale if it was not updated by the latest data source to update the CI, within a time period. The time period is specified by the Effective Duration time in the data refresh rule for the class for the data source. In this case, if another authorized data source, with a lower priority attempts to update the stale CI attribute, the update is allowed.

Note: Users with the itil role have read access to the CI identification rules.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a data source precedence rule.
3. In the class navigation bar, expand Class Info and then click Reconciliation Rules.
4. In the Data Precedence Rules section, click Add to create a rule or select an existing rule to edit. Fill out the details in the Create Precedence Rules dialog box.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source</td>
<td>The data source that this precedence rule applies to. EventManagement, ImportSet, ManualEntry, or an application such as Tivoli are examples of a data source.</td>
</tr>
<tr>
<td>Priority</td>
<td>Priority of this precedence rule within the set of precedence rules for the specified table. Smaller numbers designate higher priority. Data sources without a precedence rule are assigned the lowest priority.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this precedence rule.</td>
</tr>
</tbody>
</table>

5. Click Save.

Create data refresh rules

Specify data refresh rules to determine if a CI is stale for a specific data source. Such CIs can then be updated by a lower-priority authorized data source.

Role required: itil has read access, itil_admin (on top of itil) has full access.
Data refresh rules are used in conjunction with data source precedence rules and reconciliation rules to determine reconciliation steps for a CI. These rules determine if, when, and by which data source a CI can be updated.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list. Select the class for which to create a data refresh rule.
3. In the class navigation bar, expand Class Info and then click Reconciliation Rules.
4. In the Data Refresh Rules section, click Add to create a rule or select an existing rule to edit. Fill out the details in the Create Data Refresh Rules dialog box.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source</td>
<td>Data source of the class.</td>
</tr>
<tr>
<td>Effective Duration</td>
<td>The time period that is used for the staleness test. If the fields specified in the reconciliation rule for the CI’s class were not updated by the specified data source within the specified time period — the CI is determined to be stale for that data source. If you enter a value with a prefix that is valid and a suffix that is not, such as 15 x — the valid portion of the value is used (15). If the entire value is invalid — the default value of 0 is used.</td>
</tr>
<tr>
<td>Active</td>
<td>Specifies that the rule is active.</td>
</tr>
</tbody>
</table>

5. Click Save.

Create an IRE data source rule

When using Identification and Reconciliation Engine (IRE), you can prevent a specific data source from inserting new CIs for a specific class. Create IRE data source rules for data sources that you don’t trust in creating CIs but continue to trust in updating those CIs that exist.

Role required: itil_admin

For example, an IP scan tool that discovers network gear but does not discover servers and therefore creates server CIs without details. You can prevent such data source from creating specific CIs, while still permitting it to update those specific CIs if they exist. IRE data source rules are stored in the IRE Data Source Rule (cmdb_ire_data_source_rule) table.

- Child classes derive IRE data source rules from parent classes like identification rules do.
- IRE data source rules that are specified for a child class, override any IRE data source rules derived from a parent class.

When IRE processes an insert operation that is prohibited by an IRE data source rule, the insert operation fails. This failure happens when the data source and CI class in the insert operation and in an IRE data source rule, match. When `CreateOrUpdateCIEnhanced()` is used, IRE stores the failed payload in the CMDB IRE Partial Payloads (cmdb_ire_partial_payloads) table for future potential use.

If later, a permitted data source attempts to insert that same CI, then IRE inserts the CI after merging it with the matching CI from the partial payloads. IRE then deletes the partial payload from the CMDB IRE Partial Payloads (cmdb_ire_partial_payloads) table, and allows future updates by the data source specified in the rule.
IRE data source rules do not apply to lookup and related items, and only a single rule can be active for any class/data source pair.

1. Navigate to Configuration > Identification/Reconciliation > IRE Data Source Rule.
2. In the list view, click New and fill out the IRE Data Source Rule form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activates the IRE data source rule.</td>
</tr>
<tr>
<td>Applies to</td>
<td>The class (and child classes) that the specified data source is not allowed to create CIs of.</td>
</tr>
<tr>
<td>Data source</td>
<td>Data source that is not allowed to create CIs of the specified class.</td>
</tr>
<tr>
<td>Insert Not Allowed</td>
<td>Disables the specified data source from inserting new CIs from the specified class, to the CMDB.</td>
</tr>
</tbody>
</table>

3. Click Submit.

If a payload item with an insert request, and in which the data source and the CI class match the data source and the CI class specified in the IRE data source rule:

1. The insert operation fails and IRE logs the following message:
   INSERT_NOT_ALLOWED_FOR_SOURCE Insert into [xyz] is blocked for data source [xyz] by IRE data source rule.
2. If using `CreateOrUpdateCIEnhanced()`, then IRE stores the payload item as a partial payload in the CMDB IRE Partial Payloads (cmdb_ire_partial_payloads) table.

If later, a permitted data source successfully inserts a CI that matches the CI from a partial payload item:

1. The current CI is merged with the matching CI from the partial payload, applying reconciliation rules as needed.
2. The respective partial payload in the CMDB IRE Partial Payloads (cmdb_ire_partial_payloads) table is deleted.
3. Later payloads in which the non-permitted data source updates the respective CI, run successfully.
4. IRE allows the data source, that was previously prohibited from inserting the CI, to update that same CI which now exists in the CMDB.

### Detecting duplicate CIs

When the identification process encounters duplicate CIs, it groups each set of duplicate CIs into a de-duplication task for review and remediation. A large number of duplicate CIs might be due to weak identification rules. You can configure the identification engine to reconcile duplicate CIs.

During CMDB Identification, processing of duplicate CIs is determined by the properties `glide.identification_engine.skip_duplicates` (set to true by default) and `glide.identification_engine.skip_duplicates.threshold` (set to 5 by default), and on the number of duplicate CIs that are detected. You can configure these properties so duplicate CIs are automatically reconciled, skipping duplication.
• If `glide.identification_engine.skip_duplicates` is true, and the number of duplicate CIs is less than the threshold specified by `glide.identification_engine.skip_duplicates.threshold`, then the oldest of the duplicate CIs is picked as a match and gets updated. That oldest duplicate CI also becomes the master CI for that set of duplicate CIs. The rest of the duplicate CIs are tagged as duplicates by setting the cmdb_ci's `duplicate_of` to the appropriate master CI. During matching, the identification engine filters out any CI that is tagged as duplicate of any CI.

• If `glide.identification_engine.skip_duplicates` is false, then matching of duplicate CIs fails with an error, and none of the duplicate CIs are updated.

Note: In either case, de-duplication tasks are always created.

For more information about these properties, see Properties for Identification and Reconciliation.

Review de-duplication tasks

For information about reviewing and remediating de-duplicate tasks, and how the master CI is used, see Duplicate CIs.

Identification and Reconciliation engine (IRE)

IRE is an underlying key component in Identification and Reconciliation, providing a centralized framework to perform identification and reconciliation processes across different data sources. IRE uses identification rules, reconciliation rules, and IRE data source rules when processing incoming data before inserting that data to the CMDB.

IRE processes help maintain data integrity in the CMDB.

• IRE prevents duplicate CIs by uniquely identifying CIs.
• IRE reconciles CI attributes by allowing only authoritative data sources to write to CMDB.

ServiceNow® applications such as Service Mapping, horizontal discovery, and pattern discovery, use APIs to apply identification and reconciliation processes. You can also apply IRE processes to data imported by import sets. Other data sources including third-party data sources, can leverage REST or scriptable IRE APIs to perform identification and reconciliation.

For more information about using IRE APIs, see IdentificationEngine.

CI identification

The CMDB identification process relies on identification rules to uniquely identify CIs. When possible, CIs can also be uniquely identified using `source_name` and `source_native_key` values provided in the `sys_object_source_info` section of the payload, and the Discovery Source (sys_object_source) table. If identification is successful using that method, then it is not necessary to apply matching algorithms that rely on identification rules, which is a slower identification method.

A unique CI identifier can be provided in the optional `sys_object_source_info` object in the IRE payload.

```json
{
  "items": [
    {
      "className": "cmdb_ci_win_server",
      "values": {
```
Payload items identification

IRE generates identifier keys for all payload items in an incoming payload and then uses those keys when trying to match partial payload and incoming payloads. An identifier key is based either on:

- Combination of the `source_name` and `source_native_key` values from the `sys_object_source_info` object.
- Identification criterion attributes.

IRE stores the identifier keys associated with partial items in the `cmdb_ire_partial_payloads_index` table, and then uses those keys to try to match with identifier keys of incoming payloads.

Enhanced IRE features

The `CreateOrUpdateCIEnhanced()` scriptable API provides the functionality for the following enhanced IRE features, which can be enabled or disabled as needed:

Partial payloads

IRE isolates items for which data sources did not provide enough information to uniquely identify the CI and therefore processing cannot continue. Some of these items are identified as partial items, which get stored for potential later processing. Other items are identified as incomplete items, which get stored for logging purposes only.

For example: SCCM has multiple feeds such as a disk feed and a computer feed. The disk feed might have complete information about the disk but insufficient information about the computer CI that it depends on.

API option: `partial_payloads` which is enabled by default. When `partial_payloads` is enabled, `partial_commits` and `deduplicate_payloads` are automatically enabled regardless of their setting in options.

Partial commits

Errors in some items do not prevent committing the rest of the items in a payload. Therefore, when a payload contains items with errors, IRE still commits the remaining valid items in the payload.

API option: `partial_commits` which is enabled by default.

Deduplicate payload items

IRE deduplicates duplicate items within the payload, merging those duplicates into a single payload item for processing.
API option: `deduplicate_payloads` which is enabled by default.

**Generate summary**

IRE generates summaries in the output payload with processing details such as the number of updates per class.

API option: `generate_summary` which is disabled by default.

**Partial items**

A payload item is determined to be a partial item if it contains the necessary data for unique identification and if it has one of the following errors. Unique identification requires that the payload item has the `sys_object_source_info` section with `source_name` and `source_native_key` values, or the full set of the identification criterion attributes specified for the CI class, or both.

IRE errors for a partial item:

- **MISSING_MATCHING_ATTRIBUTES** — Item does not have identification criterion attributes to use at least one identifier entry for matching.
- **REQUIRED_ATTRIBUTE_EMPTY** — Unable to create a CI because a required attribute is missing.
- **MISSING_DEPENDENCY** — Dependent CI is missing a dependency relation which is specified in the payload.
- **INSERT_NOT_ALLOWED_FOR_SOURCE** — An IRE data source rule prevents the specified data sources from creating CIs of the specified class.

For more details about IRE error messages, see [IRE error messages](#).

If processing fails because payload items are determined to be partial items, then the partial items are saved as partial payloads in the CMDB IRE Partial Payloads (cmdb_ire_partial_payloads) table in JSON format for later potential processing. IRE uses identifier keys to attempt to match incoming payloads with stored partial payloads.

If later, a data source sends the data that was missing in the partial item, IRE matches the incoming payload with the stored partial payloads. IRE then merges any matching partial payloads with the incoming payload. To resolve any conflicting attributes, IRE uses either `source_recency_timestamp` (when `source_native_key` and `source_name` are identical), or reconciliation rules specified for the class. The result is a complete and valid payload which IRE then processes to create or update the respective CIs.

Partial payloads older than 90 days are deleted from the CMDB IRE Partial Payloads (cmdb_ire_partial_payloads) table.

Sample of a partial payload:

```
Disk feed:
{
  "items": [
    {
      "className": "cmdb_ci_computer",
      "sys_object_source_info": {
        "source_native_key": "Server001",
        "source_name": "SCCM",
        "source_feed": "DISK_FEED",
        "source_recency_timestamp": "2019-08-26 13:00:00"
      }
    },
    {
      "className": "cmdb_ci_disk",
...
```

© 2020 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
The computer item in the above payload does not have any attributes and therefore IRE can't process it. However, `source_name` and `source_native_key` are provided making it a partial item. Because the computer item is partial, the disk item that depends on the computer item, is a partial item too.

Sample of a subsequent payload that completes the previous partial payload by providing the missing details:

```json
Server/Computer feed:
{
  "items": [
    {
      "className": "cmdb_ci_linux_server",
      "values": { "name": 'linux001',
        "ip_address": "100.126.38.19",
        "mac_address": "DSWER4587" },
      "sys_object_source_info": {
        "source_native_key": "Server001",
        "source_name": "SCCM",
        "source_feed": "COMPUTER_IDENTITY",
        "source_recency_timestamp": "2019-08-26 14:00:00"
      }
    }
  ]
}
```

The computer in the partial payload and the server in the new payload match because they have identical `source_name` and `source_native_key`. Therefore, the partial payload and the new payload are merged, the operation is committed, and the partial payload is deleted from the Partial Payloads table.

For more information about partial payloads, see `CreateOrUpdateCIEnhanced()`.

### Incomplete items

A payload item is determined to be an incomplete item if:

- It does not contain all the data necessary for unique identification
- It has an error that is not associated with a partial item

Unique identification is not possible if neither `source_name` and `source_native_key` within the `sys_object_source_info` object, nor the full set of identification criterion attributes specified for the CI class, is provided.

Incomplete items are saved as incomplete payloads in the CMDB IRE Incomplete Payloads (cmdb_ire_incomplete_payloads) table in JSON format. Incomplete items are stored for the purpose of logging payloads with irrecoverable errors, and are never processed again.
Adding relationships

Add relationships by using either indices, or the optional JSON internal_id element.

Use the relations object in the payload to add or update relationships by referring to internal_ids of items. Relationships can be created using main items and related items in the payload. For example:

- Relation (parent Index, child Index, Relation Type)
- Relation (parent Internal Id, child Internal Id, Relation Type)

For more information and for code samples, see `CreateOrUpdateCIEnhanced()`.

Adding references

Add references by using the optional JSON internal_id element, which is used to uniquely identify payload items.

Use the referenceItems block to add or update references. You can add references between any two items, including main items, lookup items, and related items, in a single payload.

For more information and for code samples, see `CreateOrUpdateCIEnhanced()`.

CI reclassification

Use the updateWithoutUpgrade, updateWithoutDowngrade, and updateWithoutSwitch flags in the settings block in a payload, to prevent unintentional updates to CIs' class. These flags prevent upgrading, downgrading, or switching the class of a CI that multiple data sources unintentionally might attempt while updating the same CI. For more information and for code samples, see `CreateOrUpdateCIEnhanced()`.

Reclassification flags have precedence over any other system settings for CI reclassification.

Examine identification engine run logs

Applications that use the identification engine (such as Discovery) can provide a URL to viewing identification engine run logs. To view results and for debugging purposes, you can use these links to examine the details of logs generated by the identification engine for payload runs.

Role required: admin

These URLs link to a central page where the identification engine payload output logs appear in a user friendly format. Logging is in the context of a specific run of the identification engine, and you can filter the log list by a specific data source and time range. Up to 1000 run logs that are up to 2 months old are listed, grouped by Context IDs, and run times. You can use the glide.identification_logs.max_run_ids property to modify the 1000 limit.

You can control the logging level by using the glide.discovery.identification.log_level Discovery system property and setting the value to one of the following:

- Info
- Warn
- Error
- Debug
- DebugVerbose
• DebugObnoxious

1. Navigate to Configuration > Identification/Reconciliation > Identification Logs.
2. Filter the runs list as follows:
   a) **Source**: Select the data source for which to display run logs.
   b) **Time Range**: Specify a time range for which to display run logs.

   The Runs list displays all runs for the specified data source, during the specified time range.
3. In the Runs list, click a Run # to display its Context ID and Run ID.
   A unique Context ID is associated with each specific payload that is run. Each run of that payload, is associated with a unique Run ID. A single Context ID for a payload that is run multiple times is associated with multiple Run IDs.
4. Click the drop down arrow for a Run # to display additional details.
   • **Input**: Displays the payload for the run.
   • **Logs**: Displays all the logged messages that the identification engine generated while running the payload, according to the specified logging level.
   • **Output**: Displays the output payload returned by the identification engine.

**IRE error messages**

The Identification and Reconciliation Engine (IRE) generates the following errors and messages. Depending on settings, these messages appear in the Identification Logging pane and in the system logs.

For information about lookup-based CI identification and qualifier chains, see Create or edit a CI identification rule.

**Note:** Discovery performs an initial verification of a payload before processing identification rules. If Discovery detects any duplicate CIs based on any class identifiers, the payload is rejected and processing stops.

| Insert into \textit{(xyz)} is blocked for data source \textit{(abc)} by IRE data source rule | **Description:**
An \textit{IRE data source rule} is configured to prevent data source \textit{(abc)} from inserting CIs of the \textit{(xyz)} class.

**Resolution:**
Delete or update the appropriate IRE data source rule to let data source \textit{(abc)} insert CIs of the \textit{(xyz)} class.
Or, wait for another permitted data source to create the same CI.

Generate and simulate payload execution using identification simulation

Identification simulation is a central location for automatically constructing a payload that is guaranteed to be complete and valid. You can then simulate the processing of the payload by the identification and reconciliation engine (IRE) and examine the results before actually submitting it for execution by IRE.

Use identification simulation to construct an input payload, and simulate processing of the payload by IRE. You can then examine the results, adjust identification rules if needed, and re-run the simulation of the updated payload.

Use the identification simulation to:
- Automatically construct input payload that is based on existing identification rules, hosting and containment rules.
- Simulate execution of a payload (automatically constructed by identification simulation, or manually created).
- Browse payload output and execution log messages for a simulated run.

\textbf{Note:} Identification simulation does not commit any updates to the CMDB.
Automatically generate payload using identification simulation

Use identification simulation to automatically construct an input payload for a specified class. The constructed payload is complete with any required dependent CIs, correctly structured, and syntactically valid for processing by the identification and reconciliation engine (IRE).

Role required: admin

The payload that is constructed during identification simulation is for the specified class. For a dependent CI class, you will be prompted for information about all dependencies. After you provide the required details, identification simulation constructs the payload based on your input.

1. Navigate to Configuration > Identification/Reconciliation, and click Identification Simulation.
2. In the Start with CI Class box click Start.
3. On the Payload Information form, in the Data source field, select the data source that is associated with this class update.
   For the ServiceNow Discovery data source, select ServiceNow.
4. Select the Class in the payload.
   a) In the Criterion Attributes area select the CI identifier attributes and then specify the values that uniquely identify a CI.
   b) In the Additional Attributes area specify attributes and values that matching CIs will be updated with.
5. For dependent CIs associated with dependent identification rules, fill out the Criterion Attributes and Additional Attributes sections in all Container level sections that display.
6. Click Generate Script. If any errors indicate that there are missing fields, fill in the missing fields and then click Generate Script again.

- Click Run Simulation to simulate processing of the payload by IRE.
- Examine the results of the simulation, fine-tune the payload as needed, and combine with other payloads for other classes as desired. After finalizing the payload, use the createOrUpdateCI() API to execute the payload by IRE which will result in actual updates to the CMDB.
- Click Copy Script to copy the JSON script into the clipboard. You can then paste that script into a third party software or to another screen of the identification simulation.

Simulate payload processing using identification simulation

Use identification simulation to simulate the identification and reconciliation engine (IRE) process of CI identification for an input payload. Provide a valid payload, which was constructed using identification simulation or that was created manually.

Role required: admin

1. Navigate to Configuration > Identification/Reconciliation, and click Identification Simulation.
2. Optional: To run a simulation of an existing payload:
   a) Click Start in the Start with Existing Payload tile.
   b) In the Data source field, select the data source that is associated with this class update.
   c) Paste the JSON payload into the empty canvas.
3. Optional: To construct a new payload click Start in the Start with CI Class tile. See Automatically generate payload using identification simulation for more information.
4. Click Run Simulation to simulate processing of the payload by IRE.
1. Examine the results of the simulation in the results pane, and fine-tune the payload as needed:
   a. Click Run #1 to display the Context ID and the Run ID of the simulated run.
   b. Click the drop down arrow next to Run #1 to display additional details.
      - **Input**: Displays the payload for the simulation.
      - **Logs**: Displays all the logged messages that IRE generated while simulating processing of the payload, according to the specified logging level.
      - **Output**: Displays the output payload returned by IRE.

2. After finalizing the payload, use the createOrUpdateCI() API to execute the payload by IRE which will result in actual updates to the CMDB.

**Set logging level for identification simulation**

Identification simulation logs each step of a simulated payload processing. You can then examine these run logs to determine if a payload was processed as expected, and if identification rules are effective. You can adjust the level of logging so it is helpful, and so that the amount of messages is not excessive or insufficient.

Role required: admin

1. Navigate to Configuration > Identification/Reconciliation, and click Identification Simulation.
2. Click the Settings icon.
3. Select logging level for the identification and reconciliation engine (IRE) under IE Log Level and for the service cache under Service Cache Log Level.
   The logging levels are displayed in ascending order, from the minimum level to the maximum level of logging.
4. Click on the Settings icon again to close the Settings dialog box.

**CI reclassification**

During the CI identification process, a CI might need to be reclassified to a different sys_class_name type. By default, CIs are reclassified automatically. If automatic reclassification is disabled, then the CI is not reclassified and the system generates a reclassification task for your review.

A CI can be upgraded to a higher class, downgraded to a lower class, or switched to a different branch in the class hierarchy. For more details about reclassification operations, see *Reclassify a CI*. You can configure CI reclassification behavior at a system-wide level or individually per CI.

**Note:** The updateWithoutUpgrade, updateWithoutDowngrade, and updateWithoutSwitch flags in an IRE payload prevent updates to a CI's class, regardless of the system settings for CI reclassification. These flags prevent an attempt to upgrade, downgrade, or switch the class of a CI.

**Enabling and disabling automatic CI reclassification**

You can use the glide.class.upgrade.enabled, glide.class.downgrade.enabled, and glide.class.switch.enabled properties to configure system-wide behavior for CI reclassification. These properties are set to true by default, enabling automatic reclassification. To disable automatic CI reclassification, set the respective properties to false.
For more information about CI reclassification related properties, see Properties for Identification and Reconciliation.

Alternatively, you can control the reclassification behavior for individual CIs in the input payload of the createOrUpdateCI() API. In the payload, you can set these properties to true or false to temporarily override the respective property setting.

- classUpgrade
- classDowngrade
- classSwitch

The following sample JSON payload enables automatic reclassification for the specified CI:

```json
{
    items: [{
        className: 'cmdb_ci_server',
        classUpgrade: true,
        classDowngrade: true,
        classSwitch: true,
        values: {
            name: 'linux123',
            serial_number: '12srt567',
            ip_address: '10.2.3.4'
        }
    }]
}
```

View a reclassification task

When automatic CI reclassification is disabled, reclassification tasks are created for CIs that could not be automatically reclassified during the identification process. Review these tasks to locate the CIs and decide if to reclassify them.

Role required: admin or itil

1. Navigate to Configuration > Identification/Reconciliation > Reclassification Tasks.
2. Select a reclassification task.
3. Examine the details on the Reclassification Task form.

Reclassification Task form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration item</td>
<td>The CI that must be reclassified.</td>
</tr>
<tr>
<td>Short description</td>
<td>Short description noting that CI reclassification was not allowed.</td>
</tr>
<tr>
<td>Description</td>
<td>Description noting the current class of the CI and the class that the CI must be changed to.</td>
</tr>
<tr>
<td>Internal payload</td>
<td>Payload used in the identification process.</td>
</tr>
</tbody>
</table>

After examining the task details, you can locate the CI that is noted in the task Description and manually reclassify it. For details, see Reclassify a CI.

CMDB dependent relationship rules

Service definitions consist of CI types and relationship types. Dependent relationship rules define the dependency structure of the CI types and the relationship types in these service definitions, helping in CI identification and in the construction of business service maps.

The dependencies that are defined by these rules are used when identifying dependent CIs to prioritize the order of CI identification, and to match CIs and respective dependent CIs in a payload. Dependent relationship rules are also used by Service Mapping and can be defined for custom CI types. After defining a new CI type, you can define dependent relationship rules that specify how the new CI type is related to existing types in the CMDB.
Dependent relationship rules consist of hosting and containment rules (dependent relationship rules), each type modeling the data from a different perspective of the CI. Containment rules represent CIs’ configuration hierarchy, describing which CI contains which other CIs. Hosting rules represent CIs’ placement in a business definition, describing what CIs run on.

Both hosting and containment rules describe a relationship type between two CI types and the same relationship type can be used in a hosting rule and in a containment rule. It is the context in which the relationship is used that distinguishes between a containment and hosting rule.

Manage dependent relationship rules:

- To access rules at the class level, use the CI Class Manager. Navigate to Configuration > CI Class Manager.
- To access grouped rules, use the Metadata Editor. Navigate to Configuration > Identification/Reconciliation > Metadata Editor.

The plugins that have been activated on an instance determine which hosting and containment rules exist in a base system.

Hosting rules

Hosting rules represent all the possible valid combinations of pairs of hosting and hosted CIs in the service definition. Hosting rules are a flat set of rules that can be only one level deep, and which always involve resources, typically physical or virtual hardware. Each hosting rule is a stand-alone rule between two CI types, describing either a valid CI type that another CI type can host, or by which another CI type can be hosted. A hosting rule consists of a parent CI type, a relationship type (such as Hosted On::Hosts) and a child CI type. For example, you can have a hosting rule that specifies that the CI type ‘Application’ ‘Runs On::Runs’, the CI type ‘Hardware’.

A CI can be hosted on multiple resources (such as Windows and Linux). This CI is represented by a hosting rule for the CI with each resource that the CI can be hosted on. During CI identification, the pair of CIs that are being examined, should satisfy at least one hosting rule.

Hosting rules are stored in the CMDB Metadata Hosting Rules [cmdb_metadata_hosting] table.

Containment rules

Containment rules represent the containment hierarchy for a CI type, describing valid objects that a CI type can contain in the service definition, and valid objects that can be contained by the CI type. Containment rules are chained to each other in a containment rules group, with a CI type that is the top-level (root) parent of the group. The collection of containment rules construct a hierarchy-like map of containment relationships. Containment rules are logical concepts used to represent logical CIs, for example to describe software that runs on a server. A containment rule consists of a parent CI type, a relationship type (such as ‘Contained By::Contains’), and a child CI type. For example, you might have a containment rule specifying that the CI type ‘Tomcat’ ‘Contains::Contained By’ CI type ‘WAR File’.

Endpoints are special containment rules that specify incoming or outgoing connections in the model, designating the CI types that data of some specified type flows in to or out from the service definition. After adding an endpoint to a containment rule, you cannot add any child rules to the endpoint rule.

Containment rules are stored in the CMDB Metadata Containment Rules [cmdb_metadata_containment] table.
Reference rules

Reference rules are used mostly by Cloud Management to represent all of the possible valid combinations of pairs of referencing and referenced CIs in the service definition.

- Reference rules are a flat set of rules that can be only one level deep.
- Reference rules always involve resources, typically virtual entities. Each reference rule is a stand-alone rule between two CI types, describing either a valid CI type that another CI type can reference, or by which another CI type can be referenced. Both the CI classes should be able to live independent of each other.
- A referencing rule consists of a parent CI type, a relationship type (such as Provisioned From::Provisioned) and a child CI type. For example, you can have a referencing rule that specifies that the CI type ‘Virtual Machine’ Provisioned From::Provisioned, the CI type ‘Image’.
- A CI can reference multiple resources (for example, a VM Instance can have a reference relation with both the Image and the Hardware templates). This CI is represented by a referencing rule for the CI with each resource that the CI can be referenced from.
- The reference rule cannot be part of the CI identification.
- Reference rules are stored in the CMDB Metadata Reference Rules (cmdb_metadata_reference) table.

Rules requirements

The rules that you create are bound by the following requirements which narrow the relationships and ensure that only valid options are available in the drop-down lists in the Metadata Editor.

- Given a CI type that is as a child in a containment rule: Not this CI type or its children can be a top-level (root) parent of any other containment rule, and it cannot be in any hosting rule, either as a parent or as a child.
- Given a CI type that is a top-level (root) parent of a containment rule: It cannot be a child in a hosting rule (for example, you cannot be hosted on Tomcat, if Tomcat has any containment rules).
- Given a CI type that is a child in a hosting rule: It cannot be in any containment rule, either as a parent or a child.
- Given a CI type that is a parent in a hosting rule: It cannot be a child in any containment rule.
- Hosting rules cannot create loops such as Tomcat –runs_on- VMWare –runs_on- Tomcat.
Hosting and containment rules model

Hosting rules that model the diagram:
- Tomcat ‘Runs on’ Hardware

Containment rules that model the diagram:
- Tomcat ‘Contains’ Configuration File
- Tomcat ‘Contains’ WAR
- WAR has two endpoints for JDBC with MySQL:
  - Inbound
  - Outbound

Valid set of rules

Tomcat Hosted Linux
Linux Hosted Computer

The second metadata entry triggers the third requirement, which is satisfied (it is a hosting rule, not a containment rule).

Create dependent relationships

Create hosting and containment rules (dependent relationship rules) for CI classes to help with correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

You can create a basic hosting or containment rule in the CI Class Manager. Or, use the Metadata Editor to create groups of hosting and containment rules, and inbound or outbound
endpoints in containment rules. The CI Class Manager and the Metadata Editor are synchronized, and you can use each of those tools to display and edit a dependent rule.

Create a dependent relationship rule for a CMDB class

Use the CI Class Manager to create a basic dependent relationship rule (hosting or containment relationship rule) for a CMDB class.

Role required: itil has read access, itil_admin (on top of itil) has full access.

The class for which you create dependent relationship rule, must have a dependent identification rule.

1. Navigate to Configuration > CI Class Manager.
2. Click Hierarchy to display the CI Classes list, and select the class for which you want to create a hosting or a containment rule.
3. In the class navigation bar, click Dependent Relationships.
4. In the Dependent Relationships view, click Add dependency.
5. Fill out the details in the Add Dependent Relationship Rule dialog box.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule Type</td>
<td>Designation of whether this rule is a hosting rule or a containment rule.</td>
</tr>
<tr>
<td>This Class</td>
<td>The class that the rule applies to.</td>
</tr>
<tr>
<td>Relationship</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Target Class</td>
<td>The target class for the dependent relationship rule. The designation of this class as a child or parent class, is based on the specified Relationship.</td>
</tr>
</tbody>
</table>

6. Click Save.

You can click Reset to derived and then confirm the operation to delete all dependent relationship rules that were added specifically for the selected class. Only dependent relationships that are derived from a parent class, remain.

For more information about child and parent classes, see Table extension and classes.

Create or edit a collection of containment rules

Create containment rule for CIs to help with correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

Role required: admin

A containment rule is a dependent relationship rule which defines a relationship between two CIs, structured as: CIType1 RelationshipType CIType2. The first CI type that you add becomes the top level CI of a containment rules group which is a chain of containment rules. The entire set of containment rules is organized as groups according to top-level CIs.

To create a containment rules group for a new CI type, you need to first add the CI Type1 of the relationship. To add a child containment rule for a CI type that exists, you need to select that CI type, and define the second portion of the relationship rule which is the relationship type and CI Type2.

To each rule within a containment rules group you can add inbound or outbound endpoints, which are noted by blue up and down arrows. After adding an endpoint, you can not add a containment rule in that branch of the containment rules hierarchy.

1. Navigate to Configuration > Metadata Editor.
2. In the Metadata Editor, click the **Containment Rules** tab.

3. Click **Add New Rule** to add a top-level rule. Or, point to a rule for which you want to add a child rule and click the green ‘+’ icon that appears on the right.

4. Complete the **Add Containment Rule to <class>** form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Type</td>
<td>The CI class that the rule applies to.</td>
</tr>
<tr>
<td>Relationship Type</td>
<td>The relationship type for the rule.</td>
</tr>
<tr>
<td>Reverse Relationship Direction</td>
<td>Enable to use the reverse relationship in the rule.</td>
</tr>
<tr>
<td>Always include in Service Model</td>
<td>Enable to always include the CIs of the specified class in the Service Map if their parent CI (based on the containment relationship) is present in the Service Map.</td>
</tr>
</tbody>
</table>

5. Click **Create**.

6. Add an endpoint to a child rule:
   a) Point to a child rule for which you want to add an endpoint.
   b) Click the blue “+” icon that appears on the right.
   c) Complete the **Add Endpoint To <class>** form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint Type</td>
<td>The type of endpoint.</td>
</tr>
<tr>
<td>Inbound or Outbound</td>
<td>The direction of the endpoint.</td>
</tr>
</tbody>
</table>

   d) Click **Create**.

Create or edit a collection of hosting rules

Create hosting rule for CIs to assist in correctly identifying dependent CIs during the business discovery process and service mapping. Discovery calls the identification API that applies dependent relationship rules.

A hosting rule is a dependent relationship rule which defines a relationship between two CIs, structured as: `<CI Type1> <relationship type> <CI Type2>`. To create a hosting rule, you need to add a CI type as `<CI Type1>` in the relationship rule, and then define the second portion of the relationship rule which is the relationship type and `<CI Type2>`. The entire set of hosting rules is organized as groups according to the top-level hosted CIs.

A hosting rule implicitly contains two rules, which are the reversal of each other. When you create the rule `<CI Type1> <relationship type> <CI Type2>`, the rule `<CI Type2> <reversed relationship type> <CI Type1>` is automatically added.

Role required: admin

1. Navigate to **Configuration > Metadata Editor**.

2. In the Metadata Editor, click the **Hosting Rules** tab.

3. Click **Add New Rule** to add a top-level rule. Or, point to a rule for which you want to add a child rule and click the green ‘+’ icon that appears on the right.

4. Complete the **Add Hosted/Hosting Rule to <class>** form.

<table>

Effective usage of CMDB Identification

Use CMDB Identification effectively.

Identification rules

An independent identification rule identifies a CI based on the CI’s attributes, independently of other CIs.

A dependent identification rule identifies a CI by its dependent CIs and the relationships of the identified CI with those dependent CIs. Identification with a dependent identification rule is based on the dependent CIs and the relationships and qualifiers between the identified CI and its dependent CIs. Identification then requires more time than with an independent identification rule and is prone to some identification errors. Usage of dependent rules should therefore be minimized.

CI modeling determines which type of identification rules are required for proper CI identification.

Create identification rules using the following order of importance:

1. Independent identification rules — It is always preferable to create independent identification rules rather than dependent identification rules. When you model a CI, define the CI with a complete set of attributes that lend themselves to independent identification, eliminating the need to use additional CIs for identification.

2. Dependent identification rules — If it is necessary to create dependent identification rules, then define a single level of dependency. Two is the maximum number of dependency levels that is supported.

3. Avoid creating lookup identifier entries. The use of lookup identifier entry is highly discouraged as it can reduce performance. If unavoidable, ensure to first review class definitions and consider updates that allow usage of independent identification rules.

4. Limit the number of identifier entries within an identification rule, ideally to 1. A second identifier entry can further reduce performance, as will each additional identifier entry.

5. Create strong identification rules in which the strongest identifier entries and related entries are set with the highest priority.

6. Ensure that the identification rule is at the class level that it needs to be.

Payload

Create the payload using the following order of importance:

1. Payload size — Limit the number of CIs per payload to 500.

2. Avoid duplicate entries in the payload.
Example: If an identification rule has a criterion attribute for the **name** field, then the following payload has duplicate items resulting in failure:

```javascript
var payload = {
    items: [{
        className:'cmdb_ci_linux_server',
        values: {
            name:'Win Server 200',
            ram:'2048'
        }
    }, {
        className:'cmdb_ci_linux_server',
        values: {
            name:'Win Server 200',
            ram:'4096'
        }
    }]
};
```

3. Do not pass system data such as the following in the payload.

```javascript
var payload = {
    items: [{
        className:'cmdb_ci_linux_server',
        values: {
            name:'Win Server 200',
            sys_domain:'global',
            sys_domain_path:'xyz',
            sys_updated_on:'2017-06-15 16:25:11',
            sys_mod_count:23
        }
    }]
};
```

4. Provide the minimum necessary set of criterion attributes for each payload item, according to what is specified in the corresponding identification rules.

5. When matching CIs, use CIs’ sysIds if available.
   - Example: Independent CI that needs to be updated — sysId is available.

```javascript
var payload = {
    items: [{
        className:'cmdb_ci_linux_server',
        values: {
            sys_id:'194876usytrr65378098',
            ram:'2048'
        }
    }]
};
```

   - Example: Dependent CI that needs to be inserted. Tomcat War CI depends on Tomcat CI, and Tomcat CI depends on Linux Server CI. SysIds for the Tomcat and the Linux CIs are available.

```javascript
var payload = {
    items: [{
        className:'cmdb_ci_app_server_tomcat_war',
        values: {
            name:'war1',
            short_description:'my description'
        }
    }, {
        className:'cmdb_ci_app_server_tomcat',
        values: {
            sys_id:'194876usytrr65378098'
        }
    }]
};
```
6. When inserting many CIs, all of which depend on the same CI, you should serialize your API calls. Otherwise, attempting to concurrently process many CIs can clog the system, significantly degrading overall system performance.

Properties for Identification and Reconciliation

Use the Identification and Reconciliation properties to configure the identification engine. These properties are available for Identification and Reconciliation. To view and edit these properties, the admin role is required.

**Note:** To open the System Properties (sys_properties) table, enter `sys_properties.list` in the navigation filter.

### Properties for Identification and Reconciliation

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enforce the requirement that required attributes cannot be null during identification and reconciliation.</td>
<td><strong>glide.required.attribute.enabled</strong></td>
</tr>
</tbody>
</table>
| - Type: true | false  
| - Default value: true  
<p>| - Location: <strong>Configuration &gt; CMDB Properties &gt; Identification/Reconciliation Properties</strong> |</p>
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Allow class upgrade during identification and reconciliation. **glide.class.upgrade.enabled** | - Type: true | false  
- Default value: true  
- Location: **Configuration > CMDB Properties > Identification/Reconciliation Properties**  
- Learn more: [CI reclassification](#) |
| Allow class downgrades during identification and reconciliation. **glide.class.downgrade.enabled** | - Type: true | false  
- Default value: true  
- Location: **Configuration > CMDB Properties > Identification/Reconciliation Properties**  
- Learn more: [CI reclassification](#) |
| Allow class switching during identification and reconciliation. **glide.class.switch.enabled** | - Type: true | false  
- Default value: true  
- Location: **Configuration > CMDB Properties > Identification/Reconciliation Properties**  
- Learn more: [CI reclassification](#) |
| Allow the update of an empty field by a lower priority data source. **glide.reconciliation.override.null** | - Type: true | false  
- Default value: true  
- Location: **Configuration > CMDB Properties > Identification/Reconciliation Properties** |
| Controls how identification processes a small set of duplicate CIs. **glide.identification_engine.skip_duplicates** | - Type: true | false  
- Default value: true  
- Other values:  
  - **true**  
    - If the number of duplicate CIs is less than the threshold specified by **glide.identification_engine.skip_duplicates.threshold**, then the oldest of the duplicate CIs is picked as a match and gets updated. That oldest CI is also designated as the master CI for that set of duplicate CIs.  
    - For the rest of the duplicate CIs, the **duplicate_of** field is set as a reference to the master CI.  
  - **false**  
    - Matching a CI fails, and an error is logged.  
- Location: **Configuration > CMDB Properties > Identification/Reconciliation Properties** |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Maximum number of CIs that can be in a set of duplicate CIs to allow identification to process the duplicate CIs according to the setting of glide.identification_engine.skip_duplicates. glide.identification_engine.skip_duplicates.threshold | If the number of duplicate CIs exceeds the threshold, then identification processes the duplicate CIs as if glide.identification_engine.skip_duplicates is set to false.  
- Type: Integer  
- Default value: 5  
- Location: Configuration > CMDB Properties > Identification/Reconciliation Properties |
| Maximum number of log runs that can be displayed when navigating to Configuration > Identification Logs. glide.identification_logs.max_run_ids |  
- Type: integer  
- Default value: 1000  
- Location: Configuration > CMDB Properties > Identification/Reconciliation Properties |
| glide.cache.size.service_cache | Maximum cache size (in MB) that is used by the identification engine for inbound and outbound relations. When the limit is reached, the least recently used cached data is discarded, releasing space for new data.  
- Note: You cannot disable the service cache.  
- Type: Integer  
- Default value: 20  
- Location: Add to System Properties (sys_properties) table. |
| glide.identification_engine.distributed_locking | By default, identification and reconciliation processes acquire a global lock. Enable this property to allow acquiring mutex lock faster, and at a more granular level.  
This lock optimization is mostly beneficial for scenarios with update operations rather than insert operations.  
- Type: true | false  
- Default value: false  
- Location: Add to System Properties (sys_properties) table. |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.identification_engine.granular_insert_locking | Determines whether to use multiple granular insert locks or single global insert lock. Set to false if there are performance issues associated with the usage of multiple granular insert locks.  
  - Type: true | false  
  - Default value: true  
  - Location: Add to System Properties (sys_properties) table. |
| glide.identification_engine.batch_update_last_discovered | Controls batch update of last_discovered field in CIs that are being processed by the identification engine. Set to false if there are business rules that apply to last_discovered field, and you want to trigger these rules when calling Identification and Reconciliation API.  
  - Type: true | false  
  - Default value: true  
  - Location: Add to System Properties (sys_properties) table. |
| glide.identification_engine.related_items_local_cache_count | For optimization, a custom number of locally cached query result entries of related/lookup items.  
  - Type: integer  
  - Default value: 15000  
  - Location: Add to System Properties (sys_properties) table. |

**Note:** If there is a memory issue due to optimization related to using local cache, set the glide.identification_engine.related_items_local_cache_count and the glide.identification_engine.dependent_items_local_cache_count properties to 0.
### Property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.identification_engine.dependent_items_local_cache_count | For optimization, a custom number of locally cached query result entries of dependent CIs.  
  - Type: integer  
  - Default value: 10000  
  - Location: `Add to System Properties (sys_properties)` table.  
  
  **Note:** If there is a memory issue due to optimization related to using local cache, set the `glide.identification_engine.related_items_local_cache_count` and the `glide.identification_engine.dependent_items_local_cache_count` properties to 0. |

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.identification_engine.independent_items_local_cache_count | For optimization, a custom number of locally cached query result entries of independent CIs.  
  - Type: integer  
  - Default value: 100000  
  - Location: `Add to System Properties (sys_properties)` table.  
  
  Setting the value to 0 avoids using local cache for independent CIs and might affect performance. |

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.cmdb.logger.source.identification_engine | Enable and configure what type of details the system logs when using IRE outside the scope of identification simulation. For example, when using an API, ECC queue or scheduled jobs.  
  - Type: string  
  - Values: info, warn, error, debug, or debugVerbose  
  - Location: `Add to System Properties (sys_properties)` table. |

### Components installed with Identification and Reconciliation

Several types of components are installed with Identification and Reconciliation (included in the `com.snc.cmdb` plugin), including tables.

### Tables installed

<table>
<thead>
<tr>
<th>Table</th>

</table>

**CMDB Health**

Monitoring and maintaining the health of the CMDB is essential to an effective and continuous use of the product. Health indicators such as duplicate CIs, required CI fields, and audits contribute to the calculation of health scorecards at the CI, class, and CMDB level.

The health of the CMDB data is monitored and reported for the following KPIs, each further consisting of sub metrics:

- Completeness: CIs are tested for required and recommended fields that are not populated.
• Correctness: CIs are tested against pre-defined data integrity rules such as identification rules (to detect duplicate CIs), orphan CI rules, and stale CI rules.
• Compliance: The CMDB data is audited for adherence to pre-defined certificates.
• Relationships: The health of CI relationships is tested for indicators such as orphan and duplicate relationships. And for compliance with suggested relationships, hosting and containment rules.

After CIs are tested for various health indicators, the results are aggregated at the class level, and eventually at the overall CMDB level. You can configure how health is calculated and the weight of each KPI and each metric at every level of the aggregation. For most health tests, you can configure the health tests themselves.

CMDB Health is domain aware. If the domain separation plugin has been activated, then the CMDB dashboard displays health based on data, rules, and settings from the logged-on user domain. If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.

CI remediation

CMDB Health provides a framework for configuring CI remediation. Remediation lets you proactively apply corrective actions to unhealthy CIs in a managed and standardized fashion.

Setup

You need to configure CMDB Health related system properties, and health KPI and metric rules, to customize how aggregated data is calculated and other CMDB Health behavior. To start gathering and aggregating health data, you need to enable the CMDB Health-related jobs (CMDB Health Dashboard jobs) which are initially disabled. See Setup and configure CMDB Health for details about enabling these jobs and about configuring other CMDB Health settings.

Domain separation in CMDB Health

This is an overview of domain separation as it pertains to CMDB Health. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Overview

This application fully supports domain separation. Not all ServiceNow applications support domain separation; some include limitations on the data and administrative settings that can be domain separated. To learn more, see Application support for domain separation. CMDB dashboards should be set up with their own set of rules to best accommodate how the user needs them. CMDB dashboard jobs adhere to those rules to produce reports. These are covered in separate sections below.
How domain separation works in CMDB Health

For dashboards to be the most effective, users should configure the dashboard accordingly. This is done by setting up the orphan, staleness, and inclusion rules to meet their needs, and which then affect the reports displayed on the dashboard.

The settings and metrics define different aspects of each application because each domain can be configured differently. These rules are set up in addition to those that are included in the base system. There are different types of owners for different CIs; each domain has its own set of rules.

Note: Domain separation is on by default, but each domain can be configured as needed.

Health Preferences

Configure these preferences during setup:

1. Global system properties that control CMDB Health – System properties are not domain separated. To learn more see CMDB Health system properties.

2. CMDB Health Dashboard Jobs – There is a dashboard job for each major KPI, such as Completeness. That job finds the health of the CIs across all the enabled domains. There is only one job run for all domains and jobs themselves are not domain separated. To learn more see Enable and configure a CMDB Health Dashboard job

Users can define the frequency with which they want to run jobs; the report runs for all the domains. The more domains included in the job, the longer the job runs.

3. Health Metrics – These selections are domain-separated and adhere to the established “system overrides” logic of domain separation. Changes are made according to the domain for which the user is logged in. Base system values are defined at the global domain. The overriding domain logic means these values apply for all domains. If users want different values for a domain, they must be logged in to a specific domain and change the property from there. The new property setting applies only to that domain and any domain that inherits this domain. To learn more see Health Metrics.

Note: Regarding the Completeness, Compliance, and Correctness KPIs: Users can disable this KPI if they don’t want to see that as part of the dashboard score. All these settings are domain-separated and the user can define specific properties for the domain.

a. Weighted averages – These settings can affect all or part of the metrics in Completeness, Compliance, Correctness, and Relationship. They can be set differently for different domains.

b. Active – This setting is the most important because it affects how long the jobs run. The more domains with flags set to Active, the longer the jobs take. It’s best to select only those domains you wish to be Active and render the rest Active = false. You can set this in Health Preferences. The default settings for global domain are set to Active = true, but you can modify or disable specific domains the user wants to see in the dashboard. Users should consider the domain hierarchy when changing these values. If there is a large number of domains (>100) the job can take a very long time. To mitigate this, set Active to False for all the root domains, thereby disabling all the other domains in the hierarchy. If there is a rule at the top, all child domains inherit that rule.

c. Failure Threshold, Create Task, Task Assignee Group – All these settings can be set differently for different domains depending on what is needed in each domain.
d. Exceptions – For Relationship metrics (relationship, duplicate relations, orphan relations, stale relations) the failure threshold setting is not domain separated. The Failure Threshold for the global domain is applied to all domains. For example, even if users were to override the Failure Threshold for a domain, the global domain setting for Threshold is still applied.

e. Troubleshooting / Implementation detail – These settings are stored in the cmdb_health_metric_pref table, which is domain separated.

Health Rules

Health rules settings are addressed here:

- Required
- Recommended
- Orphan
- Staleness

Most of the CMDB Health Rules are domain separated and provided by the users. Users can define different rules for different domains by logging in to each domain and adding/overriding rules in the CI Class Manager.

These are the rules for the different metrics:

1. Completeness
   a. Required fields – These are based on the class schema defined in the platform’s System dictionary and is fixed for all domains. These cannot be changed.
   b. Recommended fields – These are domain separated. The table used is cmdb_recommended_fields, which is domain separated. The user can set these up for different domains.

2. Correctness
   a. Duplicates – Duplicates are based on Identification rules, which are not domain separated, so the same rules apply to all domains.
   b. Orphan – Orphan rules are domain separated; there are different orphan rules for different domains. The table used is cmdb_health_orphan_rule and is domain separated.
   c. Staleness – Staleness rules are domain separated. The table used is cmdb_health_staleness_rule. The base system rule (60 days) is set for global domain so is inherited by all domains as the default rule.

3. Compliance
   a. Audit – Audit scores are based on the desired state or scripted audits defined in the compliance module by the user.

   Audits themselves are domain separated. When audit score evaluation is enabled for a domain, scores become based only on the audits visible in that domain.
Health Dashboards (CMDB View/ Service View / Group View)

If a user is logged into a domain and views a health dashboard:

1. Only scores for enabled metrics in that domain display (based on the Health Preferences Active flag as discussed above).
2. All scores are based on CIs that are visible from the specific domain. (These are regular domain visibility rules: From that domain you can see CIs in global domain, the specific domain, any child domain of that domain or any domain that gets directly or indirectly contained by that domain.)
3. The dashboard view is based on domain rules defined in domain mapping, as opposed to those provided by the logged-in user. This view overrides any additional domain visibility rules that a logged-in user might have. The admin sets the basic rules, but does not set each individual domain. The admin can give specific users or user groups additional visibility to other domains and the dashboard still does not change. The dashboard strictly follows the domain rules mentioned above, based on the domain hierarchy for the domain in which the user is logged in.
4. As explained in the Health Preferences section, users can define different preference values for any domain which impact the scores reported in the dashboard. Preferences that can impact scores include Weighted Averages, Failure Threshold, and Active.
5. As explained in the CMDB Health Rules section, the scores reported for the metrics are based on the health rules defined for them (staleness, orphan, recommended, audit, and inclusion rules) which can be defined differently for a specific domain (in the CI Class Manager). Only the required metric and duplicate metric are based on rules that apply in all domains.
6. Service View/ Group View – These reports also largely follow the above points. Typically, these views differ from various views/filters for the Health Report. One is based off business rules, the other is based off CMDB Health groups.

Setup and configure CMDB Health

The data collection system is highly configurable, however, the base system is minimally configured for aggregating CMDB health data. Most importantly, the CMDB Health Dashboard jobs are disabled by default and data is not collected. To display valuable and meaningful data, you should review and adjust settings.

1. Review CMDB Health KPIs and metrics to learn what CMDB Health can monitor, and what needs to be configured to enable and support each metric.
2. For each KPI and associated metric that you want monitored, define the necessary rules and fulfill other needed requirements. For example, create orphan rules for detecting orphan records, if you are interested in this metric.
3. Review and adjust the threshold ranges for best, at risk, and critical states for the CMDB health metrics scorecards - see Configure CMDB Health scorecard thresholds.
4. Set metric aggregation preferences, deactivate KPI and metrics that you are not interested in reporting, set failure thresholds, and adjust weighted averages of aggregation - see Configure KPI and metrics aggregation preferences.
5. Narrow the scope of CIs that are included in health calculations - see Create health inclusion rule.

6. Enable the Health Dashboard jobs for the KPIs that you want reported - see Enable and configure a CMDB Health Dashboard job.

7. Customize the CI dashboard (optional).

CMDB Health system properties

Configure the following system properties to customize how CMDB Health is monitored and evaluated.

Role required: itil_admin

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max time in minutes for which individual metric processor will run in each scheduled cycle (glide.cmdb.health.metricProcessor.maxRunningTime)</td>
<td>If processing of a metric exceeds the specified time, CMDB Health processing halts until the next CMDB Health job is scheduled to run.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 120</td>
</tr>
<tr>
<td></td>
<td>• Location: Navigate to Configuration &gt; Health Preference. In the right hand-side navigator, click System Properties.</td>
</tr>
<tr>
<td></td>
<td>For performance reasons, it is recommended not to set this property to a value greater than 120.</td>
</tr>
</tbody>
</table>

Note: If you enter an invalid value, the default value is used.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.cmdb.logger.use_syslog.CMDBHealth | A comma-separated list that controls the level of logging of CMDB Health jobs. Logging creates entries in the system logs to capture messages generated by the health auditing process each time they run. This logging helps debugging if there is a failure. For example, to log error and info messages, set the value to ‘error,info’.  
- Type: String  
- Default value: error  
- Other possible values: Comma-separated list with any of the following values:  
  - info  
  - error  
  - warn  
  - ‘*’ which is equivalent to including all possible values.  
- Location: System Property (sys_properties) table. |
| glide.cmdb.health.src.cmdb_health_audit_only | When set to true, disables health results from sources other than CMDB Health audit (such as cloud discovery). Only results generated by CMDB Health audit appear in the CMDB dashboard. For example, by default, if a CI is determined to be stale by Discovery, then that CI appears as stale in the CMDB dashboard even though CMDB Health audit did not determine that CI to be stale. To disable these stale CI health results, set the property to true.  
- Type: true | false  
- Default value: false  
- Location: System Property (sys_properties) table.  
- Learn more:  
  - CMDB Health KPIs and metrics  
  - Discovery for VMware vCenter |
Enable and configure a CMDB Health Dashboard job

Enable and configure the jobs that process CMDB health tests, to start calculating CMDB health scores for the completeness, compliance, correctness, and relationship KPI. These health scores are then aggregated into the overall CMDB health report.

Role required: admin

In the base system, CMDB Health Dashboard jobs are disabled by default. Enable and configure the respective job for the CMDB health KPI that you want data collected and aggregated for. You can schedule a job to run on a recurring schedule, or execute it once at any time.

1. Navigate to Configuration > CMDB Dashboard > CMDB View, and then click CMDB Health Dashboard Jobs.
2. Select a job that you want to enable or configure.

<table>
<thead>
<tr>
<th>CMDB Health Dashboard job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB Health Dashboard - Completeness Score Calculation</td>
<td>Script for calculating the completeness KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Compliance Score Calculation</td>
<td>Script for calculating the compliance KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Correctness Score Calculation</td>
<td>Script for calculating the correctness KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Relationship Score Calculation</td>
<td>Script for calculating the CI relationships KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Relationship Compliance Processor</td>
<td>Script for calculating compliance of relationships with suggested relationships, and with hosting and containment rules.</td>
</tr>
</tbody>
</table>

3. Review the default configuration, and update as necessary.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Job name. It is recommended that you do not modify the job's name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select to activate the job.</td>
</tr>
<tr>
<td>Run</td>
<td>Configure recurring schedule of job execution, or select On Demand.</td>
</tr>
<tr>
<td>Time</td>
<td>If Active is selected, set the time (hour, minute, and second) to run the job.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditional</td>
<td>If selected, the scripted condition must evaluate to true before the job can run.</td>
</tr>
<tr>
<td>Run this script</td>
<td>The job's script. Modifications to the script are not recommended.</td>
</tr>
</tbody>
</table>

4. **Click** Execute Now **to run the job once immediately.**

After you enable a CMDB Health Dashboard job, the results for the KPI are aggregated and displayed in the CMDB dashboard and Ci dashboard, at the CMDB, class, and Ci levels.

**Configure CMDB Health scorecard thresholds**

Configure the thresholds for best, at risk, and critical state definitions for the KPIs and metrics scorecards. You can configure these settings globally for the entire CMDB, or individually per class.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Scorecard thresholds are used to determine overall metric state, and are defined by upper and lower thresholds. For example, scorecards thresholds for completeness:

- **0 - lower threshold:** Best state
- **Lower threshold - upper threshold:** At risk state
- **Upper threshold - 100:** Critical state

In the base system, upper thresholds are set to 67 and lower thresholds are set to 33 for all KPIs and metrics. You can adjust scorecard thresholds to reflect the range of failures that should be used for each health state. Applying the change to a scorecard is based on the selected class in the Ci Classes list:

- If the top level Configuration Item class is selected in the Ci Classes list, changes to metric scorecards apply to the entire hierarchy.
- If any other class is selected in the Ci Classes list, changes to metric scorecards apply to the selected class.

For CMDB groups, you can specify a separate set of scorecard thresholds, per CMDB group/KPI or metric. See **Configure CMDB groups scorecard thresholds** for more details.

1. **Navigate to** Configuration > CI Class Manager.
2. **Click** Hierarchy **to display the Ci Classes list, and then select a class to set scorecards for.**
3. **In the class navigation bar, expand Health.**
4. **To configure the overall scorecard**, select Other Scorecards and then select Overall Scorecard.
5. **To configure a scorecard for any of the KPIs (such as Compliance)**, or for relationship-related metrics (such as duplicate relations):
   a) Select **configuration item** at the top of the Hierarchy list.
   b) Click a KPI item, Completeness, Compliance, or Correctness.
   c) Click the tab CMDB Completeness Scorecard, CMDB Compliance Scorecard, or CMDB Correctness Scorecard.

When you select the top-level Configuration Item class, changes to threshold settings in any metric scorecard apply to the entire class hierarchy.

6. **To configure a scorecard for any metric:**
   a) In the Ci Classes list, select the class to which the updated scorecard should apply to. Select the top level Configuration Item to apply the change to the entire hierarchy.
b) Click the KPI that contains the metric for which you want to configure scorecard. For example, click Completeness to configure the Required Fields scorecard.

c) Select the scorecard tab of the metric to configure, such as Required Fields Scorecard. You might need to click New to edit the scorecards.

7. Slide the threshold sliders, or enter specific numbers to increase or to decrease the threshold bars to fit your definitions for best, at risk, and critical levels for the scorecard.

8. Click Save.

Configure CMDB groups scorecard thresholds

Each CMDB group can have its unique set of scorecard thresholds for best, at risk, and critical state definitions for specific KPIs or metrics.

Role required: itil_admin (on top of itil)

Scorecard thresholds are used to determine overall metric state, and are defined by upper and lower thresholds:

- 0 - lower threshold: Best state
- Lower threshold - upper threshold: At risk state
- Upper threshold - 100: Critical state

In the base system, for all KPIs and metrics, upper thresholds are set to 67 and lower thresholds are set to 33. You can adjust scorecard thresholds for a specific CMDB group per KPI or metric, to reflect the range of failures that should be used in health reporting.

CMDB groups scorecard thresholds are stored in the (cmdb_health_scorecard_group_threshold) table.

1. In the search box in the navigation bar, enter cmdb_health_scorecard_group_threshold.list and press the Enter key.

2. In the CMDB Health Group Scorecard Thresholds list, click New.

3. Fill out the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Upper threshold</td>
<td>Upper range of percentage of CIs failing the specified metric tests, that is used to calculate best and at risk states.</td>
</tr>
<tr>
<td>CMDB Group</td>
<td>The CMDB group to which this scorecard threshold setting applies to.</td>
</tr>
<tr>
<td>Lower threshold</td>
<td>Lower range of percentage of CIs failing the specified metric tests, that is used to calculate at risk and critical states.</td>
</tr>
<tr>
<td>Metric</td>
<td>The metric to which the scorecard threshold setting applies to.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Configure KPI and metrics aggregation preferences

Metrics health scorecards are aggregated into their respective KPI, which in return are aggregated into the overall CMDB Health report. Set aggregation preferences for KPIs, and for each of their respective metrics, deactivate KPIs and metrics that you are not interested in reporting, and adjust weighted averages of aggregation.
To start collecting and reporting CMDB health KPIs and metrics, you must first enable and configure the CMDB health dashboard jobs.

Role required: itil_admin (on top of itil)

The completeness KPI for example, consists of the metrics **required fields** and **recommended fields**, each contributing a different weight to the sum. You can configure the proportional weight of required fields and recommended fields within completeness to be 25 and 75 respectively. You can also configure the proportional weight of completeness, compliance and correctness within the aggregated sum of the overall CMDB health.

**Note:** Non-active KPI or metrics are displayed on the CMDB dashboard in faded coloring, displaying the most recent aggregations that were calculated when the KPI or metric was active.

If Domain Support - Domain Extensions is activated, then you can configure aggregation preferences per domain.

In the ServiceNow base system, the weights of KPIs have default settings, and metrics are globally set.

1. Navigate to **Configuration > Health Preferences**.
2. Select **Health Metrics** on the right-hand side navigator.
3. From the **Select Metric** list select one of the KPIs such as **Completeness**, or a metric.
   For **Completeness, Compliance** and **Correctness**:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activate the KPI so it is included in the aggregated CMDB health report.</td>
</tr>
<tr>
<td>Weighted Averages</td>
<td>Specify the weight of each metric in the aggregated KPI health report. The sum of weighted averages of all metrics should be 100.</td>
</tr>
</tbody>
</table>

   For a metric:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activate the metric so it is included in the aggregated health report for the respective KPI.</td>
</tr>
<tr>
<td>Create Task</td>
<td>If a record fails the metric test, create a task with details about the failure. You can then view the task on the CI dashboard, and configure remediation for the task.</td>
</tr>
<tr>
<td>Failure Threshold</td>
<td>When the threshold number of CIs that fail the health metric test is reached, health processing stops for the metric for this cycle.</td>
</tr>
<tr>
<td>Task Assignee Group</td>
<td>An assignment group for the task.</td>
</tr>
</tbody>
</table>

4. Click **Save**.

**Set a CI attribute to be mandatory**

Configure a CI attribute as mandatory so it is included in the CMDB Health tests for the **required** metric if enabled. **Required** is a metric of the CMDB Health **completeness** KPI.
Role required: itil_admin

When a field is configured as mandatory, then if the **required** metric is enabled, the CMDB health tests check whether that field is populated or not. The CMDB dashboard displays the aggregated report of the percentage of CIs for which one or more required fields is empty.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list. Then select the class with the field that needs to be set as mandatory.
3. In the class navigation bar, expand **Class Info** and then select **Attributes**. In the Attributes view, click **Added**.
4. Locate the attribute that you want to set as mandatory, and then double-click its **Mandatory** value and set it to true.

The next time the form is opened, a field status indicator appears next to the field label, indicating that a value is mandatory.

**Note:** Mandatory fields are global. The field is marked as mandatory everywhere it appears on a form. Also, mandatory fields do not appear correctly when using Service Mapping tag-based discovery. For more information, see *Tag-based discovery in Service Mapping*.

Set a CI field to be recommended

Define a list of CI fields as **recommended**, noting that it is desirable that they are populated by a data source such as Discovery. You can then configure the CMDB completeness KPI to include recommended fields in its aggregated health reports.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Use this for fields which should not be mandatory, but that might have useful information that the CI should have. For example, a field with information that might at some point help with diagnosis. Initially, a derived class is set with the recommended fields that are defined at the parent level. You can add or remove recommended fields for a derived class, setting it with its own recommended fields, without affecting the recommended fields at the parent or sibling levels. If all recommended fields for a derived class are removed, then the derived class automatically derives the recommended fields from its parent class.

For more information about child and parent classes, see *Table extension and classes*.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list. Then select the class that contains the fields that need to be set as recommended.
3. In the class navigation bar, expand **Health** and click **Completeness**. Then click **Recommended Fields**.
4. In the Recommended Fields tab, use the slushbucket to move the fields that you want to designate as recommended, from the **Available** list to the **Selected** list.
5. Click **Save**.

Create or edit a CMDB Health orphan rule

Create an orphan rule to determine the percentage of orphan CIs in the CMDB. This sum is then aggregated into the correctness CMDB Health KPI, and weighed into the overall CMDB health report. Orphan rules are defined per class, and only a single orphan rule can be defined per class.

Role required: itil has read access, itil_admin (on top of itil) has full access.
In order for a CI to be considered an orphan CI, specify attributes that a CI must have, relationships that a CI should not have, or both. In the relationship conditions, you can either specify that the CI has no relationships, or a set of specific relationships that he CI does not have. An orphan rule can for example define that if a CI doesn’t have an owner or an asset, then it is considered an orphan CI.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list. Select the class for which to create an orphan rule.
3. In the class navigation bar, expand **Health**. Click **Correctness** and then click **Orphan Rule**.
4. Select a rule to edit if one exists, or click **New**. Fill out the form.
   
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class</td>
<td>The class for which the orphan rule applies.</td>
</tr>
<tr>
<td>Attributes</td>
<td>Attribute conditions that a CI must satisfy to be considered an orphan CI. For example, the filter conditions in which both the <strong>Assigned to</strong> and the <strong>Owned by</strong> fields are empty, will identify the matching CIs as orphans.</td>
</tr>
<tr>
<td>Condition</td>
<td>And/Or operation between the <strong>Attributes</strong> conditions and the <strong>Relationship</strong> conditions.</td>
</tr>
<tr>
<td>Relationship</td>
<td>The relationship conditions that a CI must fail in order to be considered an orphan CI. To specify that a CI must have no relationships, choose <strong>Any Relation</strong> and <strong>Any Class</strong> respectively.</td>
</tr>
</tbody>
</table>

5. Click **Submit** or **Update** to save the rule.

**Create or edit a CMDB Health staleness rule**

If the staleness metric is in effect, then staleness rules are used to determine the percentage of stale CIs in the CMDB. This sum is then aggregated into the correctness KPI, and weighs into the overall CMDB health calculation. Staleness rules are defined per class.

Role required: itil has read access, itil_admin (on top of itil) has full access.

The Discovery setting of certain types of CIs as stale takes precedence over a CMDB Health staleness rule defined for the CI. For more information about Discovery marking CIs as stale, see **Discovery for VMware vCenter**.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list. Select the class for which to create a staleness rule.
3. In the class navigation bar, expand **Health** and then click **Correctness**. Click **Staleness Rule**.
4. Select a staleness rule to edit or click **New**, and then fill out the Staleness Rule form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applies to</td>
<td>The class for which the rule applies.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effective Duration</td>
<td>The time period that is used for the staleness test. If the CI was not updated (based on Updated <code>sys_updated_on</code>) within the specified time period — the CI is determined to be stale. If you enter a value with a prefix that is valid and a suffix that is not, such as 15 x — the valid portion of the value is used (©15©). If the entire value is invalid — the value is ignored and the previous valid value is used.</td>
</tr>
</tbody>
</table>

5. Click **Submit** or **Update** to save the rule.

### Prepare a scripted audit for the compliance KPI

To include a scripted audit in CMDB Health compliance calculations, you need to update the audit's script so it captures the time that the audit ran last.

Role required: certification_admin

CMDB Health uses audits’ **Last run date** to collect the results from the most recent complete audit run. These results are then aggregated into the CMDB Health compliance KPI. When scripted audits run, they do not register the runtime. Therefore, to include scripted audits in the compliance KPI health aggregation, you must update the audit script so it populates the **Last run date** field.

1. **Create or edit a scripted audit.**
2. On the Audit form, update the script in **Run this script.** Add the following code at the top of the script, just before the code that filters CIs:
   ```java
   SNC.CertificationProcessing().updateLastRunDate(current.sys_id);'
   ```

### Create health inclusion rule

Filter the CIs that are included in health calculations and that appear in CMDB health dashboards by defining health inclusion rules. Health inclusion rules can be specified per domain.

Role required: itil has read access, itil_admin (on top of itil) has full access.

Evaluation for the required, orphan, recommended, duplicate and staleness health metrics, will apply only to CIs that satisfy health inclusion rules. For example, if you want scores of the duplicate metric to appear only for server and network CIs.

**Note:** Applying a health inclusion rule to the duplicate metric, is supported only in the global domain.

In addition to any health inclusion rules, **identification inclusion rules** also indirectly impact what appears in CMDB health dashboards for duplicate CIs. The dashboard itself uses the identification engine (IRE) to identify duplicate CIs and therefore identification inclusion rules are applied.

Inheritance of health inclusion rules:

- If there are no health inclusion rules specified for a child class, then rules specified on a parent class are applied to the child class.
- If health inclusion rules are specified for a child class, then those rules take precedence over rules specified on a parent class.
In the base system, there are no predefined health inclusion rules, in which case all CIs are included in the CMDB Health calculations.

1. Navigate to **Configuration > CI Class Manager**.
2. Click **Hierarchy** to display the CI Classes list. Select the class for which to create a health inclusion rule.
3. In the class navigation bar, expand **Health** and then click **Health Inclusion Rules**.
4. Click an existing rule to edit or click **New** and then fill out the Health Inclusion Rules form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>

</tr>
<tr>
<td>Applies to metric</td>
<td>Metrics that the rule applies to.</td>
</tr>
</tbody>
</table>

5. Click **Save** or **Update**.

**CMDB Health KPIs and metrics**

The overall CMDB health score consists of three Key Performance Indicators (KPIs) which are **correctness**, **compliance** and **completeness**, each further consisting of sub-metrics. Each KPI and metric is associated with a scorecard that determines its contribution to the aggregated health at the overall CMDB level, class, and CI level.

You can configure which KPIs and metrics are included in the aggregated calculation, and set their weight in the aggregation. In the base system, all KPIs and all metrics are included in the aggregated health report.

**Overall**

An aggregation of all three KPIs (correctness, completeness and compliance), according to their overall scorecard weight settings.

**Correctness**

A KPI which is an aggregation of the following metrics, according to the correctness scorecard weight settings.

**Orphan**

Measures the percentage of orphan CIs in the CMDB. A CI can become orphan if it was unintentionally left in the CMDB when it is no longer needed. A CI is determined to be orphan if:

- The CI satisfies the criteria in an **orphan rule**. This criteria checks for specific attributes that a CI must have, and for CIs that have no relationships or that don't have specific relationships.
- Data is missing for the CI in its respective table, or in one of its parents’ table.

**Staleness**

Measures the percentage of stale CIs in the CMDB. A CI is stale if it was not updated within the Effective Duration time period that is specified in the **staleness rule** that applies to the class.
The base system includes a default staleness rule for the Configuration Item (cmdb_ci) class, which sets the **Effective Duration** time to 60 days. This rule applies to all extended CMDB classes, and can be overridden by class specific staleness rules defined by the user. To determine CI staleness, a staleness rule for the CI's class is used if it exists, otherwise, the default staleness rule is used.

In addition, a relationship in which a stale CI is a parent or a child, is determined to be a stale relationship.

**Note:** Discovery marks VMware vCenter CIs that no longer physically exist, as stale. By default, this setting takes precedence over a CMDB Health staleness rule defined for the CI. When drilling-down in the CMDB dashboard to Health Results, the **Source** for CIs determined to be stale by Discovery, is **CLOUD_DISCOVERY**. Setting the `glide.cmdb.health.src.cmdb_health_audit_only` system property to true, ensures that the CMDB dashboard displays health results generated only by CMDB Health. For more information, see **CMDB Health system properties** and **Discovery for VMware vCenter**.

**Duplicate**
Measure the percentage of duplicate CIs in the CMDB using **identification rules**. Only independent CIs are evaluated for duplication. In a set of duplicate CIs, the count of duplicate CIs is the total number of CIs in the set, minus one. The detailed graphs for a duplicate set of CIs display all the CIs in the set.

**Completeness**
A KPI which is an aggregation of the following metrics, according to the completeness scorecard weight settings.

**Required**
Measures the percentage of CIs in which fields that are defined as mandatory, are not populated. Missing fields are tagged as incomplete noting that for this CI some information is missing. Required fields are equivalent to the fields that are **specified as mandatory** in the system dictionary.

**Recommended**
Measures the percentage of CIs in which fields that are **set as recommended**, are not populated. Out-of-box, no recommended fields are specified.

You can use the **Add Identifier Fields In Recommended Rules** scheduled job to set criterion attributes from active identification rules, as recommended fields. You can use the **Remove Identifier Fields In Recommended Rules** scheduled job to unset criterion attributes from active identification rules, as recommended fields.

**Compliance**
Based on the results of actual CMDB audit runs.

**Audit**
Audit compares actual values of specified fields, against expected values defined in template and scripted audits. Based on the **Last run date** of audits, CMDB Health identifies the set of the most recent complete audit run, and uses those audit results. To pass the CMDB Health audit test,
a CI must be in compliance with all audits for that CI. Create a compliance-type audit, for which the results are calculated into the CMDB Health compliance KPI.

When running scripted audits, the **Last run date** is not populated. Therefore, for the compliance KPI to include the results of a scripted audit, update the script in the audit to record the audit run time.

For more information, see *Create an audit*.

**Relationships**

Measures the health of CI relationships, consisting of the following metrics which are not-configurable:

**Duplicate relationships**

Relationships that have identical parent and child CIs, identical relationship type, and an identical port. Duplicate relationships are displayed per relationship type. In a set of duplicate relationships, the duplicate relationship count is the total number of duplicate relationships in the set, minus one. The detailed graphs for a duplicate set of relationships display all the relationships in the set.

**Orphan relationships**

A relationship that is missing either a parent CI, a child CI, or both.

**Stale relationships**

A relationship in which the parent CI or the child CI is a stale CI.

A single relationship can fail more than one health test. For example, a duplicate relationship can also be stale.

Also reports the following relationship-related summaries:

- Relations not compliant with suggested relations
- Relations not compliant with containment rules
- Relations not compliant with hosting rules

**CMDB Health dashboards**

CMDB dashboards display CMDB health reports and let you configure the CMDB health KPIs and metrics that CIs are evaluated for.

</tbody>
</table>

### View CMDB health reports

The CMDB dashboard serves as a central location to view aggregated health reports for your CMDB at a glance which helps you understand the CMDB health status. Also, it provides functions to address health issues, and improve CMDB health.

The CMDB dashboard requires some configuration before it can display meaningful data. Once CMDB Health is configured and the CMDB Health Dashboard Jobs are enabled, the dashboard displays data that is automatically collected and calculated on a recurring schedule. The CMDB dashboard uses the Performance Analytics framework for dashboards and employs some of the capabilities it provides. The CMDB dashboard is domain aware.

Using the CMDB dashboard requires the asset or itil role, and if the system property `glide.cms.enable.responsive_grid_layout` exists, then its value must be true. For more information, see [Enable responsive dashboards](#).

For information about sharing a responsive dashboard (Sharing), see [Share a responsive dashboard](#).

**Note:** Only users with the itil role can view a CMDB dashboard which has been shared.

Access the CMDB dashboard by navigating to **Configuration > CMDB Dashboard > CMDB View**. On the CMDB dashboard:

- Click **CMDB Health Dashboard Jobs** to enable and manage the jobs that monitor and collect health data for CIs and CI relationships.
- Click the default **CMDB Dashboard - CMDB View** dashboard to list additional CMDB drill-in dashboards.

The CMDB dashboard has two viewing modes. Click **CI Health** or **Relationship Health** to toggle between them.

### CMDB Health view

The CMDB Health view is the default view for the CMDB dashboard which contains:

- Scorecards detailing the overall health of CIs in your CMDB, per health KPI and metric
- Useful reports showing a breakdown of any duplicate, orphan, or stale CIs by class
- Widgets that list the top 10 incident, alert, and change generating CIs in the CMDB

© 2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Note: To improve performance, you can use the system property `glide.cmdb.health.src.top_10_cache_time_in_minutes` to extend browser caching time for those top 10 CIs widgets. The value is set to 30 (minutes) by default.

All the default widgets in the CI Class view can be filtered using the CMDB class hierarchy tree. Initially, the class hierarchy filter is set to the root class, Configuration Item (All). Click All to select a different class, filtering all widgets on the dashboard to display data only for the selected class and its child classes.

In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health results of associated metrics are displayed underneath, each contributing according to the configuration of the metric scorecard, and its threshold.

Except for the Overall health scorecard, you can drill into any widget in the CI Class view:

- In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.
- In a charts widget: Click a bar to display a list of all the records that the bar represents.
- In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.

Relationship Health view

The Relationship Health view displays various scorecards for health indicators of CI relationships in your CMDB. It contains charts detailing any duplicate, orphan or stale relationships, broken down by relationship type. You can drill down these charts for further details.

Changing the CI Class selection while in the Relationship view has no effect on the data displayed in this view.

Color codes

Both, the CI class view and the relationship view, use color codes when displaying aggregated health status. The status definitions are based on each scorecard’s threshold limits that are defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Note: The icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries
Dashboard layout configuration

The CMDB dashboard uses some of the capabilities that Performance Analytics provides for responsive dashboards. You can, for example, add or remove widgets from the layout.

For information about adding a widget (Add Widgets) and changing other layout settings such as adding a tab (Create Tab) to the dashboard, see Edit a responsive dashboard. The drop-down that appears when adding a widget, includes CMDB-related widgets that are used in CMDB dashboards and other system widgets which are typically not relevant in CMDB reports.

Domain separation

If the Domain Support — Domain Extensions Installer plugin is activated, then the CMDB dashboard is domain aware:

- The CMDB dashboard aggregates and reports health failures and scores based on user’s domain visibility of CIs. If domain visibility lets a user see a CI, then the audit rule in that user’s domain applies to that CI, whether the CI is in the user’s domain or in a contained domain. If a CI fails health tests from different user domains, then separate failure records are created.
- Users can configure KPI and metric settings specific to the needs in their domain. So different domains can have different settings such as active/inactive, and thresholds.
- A child domain derives its immediate parent’s domain health configurations if the child domain does not configure its own. A child domain can override parent’s configurations by modifying them.

View services health reports

The CMDB service dashboard serves as a central location to view aggregated health reports for services at a glance. Also, it lets you drill into a service to perform remediation actions that address health issues, and that improve CMDB health. The CMDB service dashboard uses the Performance Analytics framework for dashboards and employs the capabilities it provides.

Requirements

- The Event Management and Service Mapping Core plugin must be activated.
- If the system property glide.cms.enable.responsive_grid_layout exists, then it needs to be set to true. For more information, see Enable responsive dashboards.
- Role required: asset or itil

Configuration

The CMDB service dashboard requires some configuration before it can display meaningful data, using the same settings as the CMDB dashboard. The CMDB service dashboard uses the settings for the Business Service, Manual Service, and Technical Service classes. For each CI that is included in a service, the rule settings of its respective class are applied. You can customize these settings in the CI Class Manager, and on the CMDB Health Preferences page. Once CMDB
Health is configured and the CMDB Health Dashboard Jobs are enabled, the CMDB service dashboard displays data that is automatically collected and calculated on a recurring schedule. 

CMDB Health is domain aware. If domain separation has been activated, then the CMDB service dashboard displays health based on data, rules, and settings from the logged-on user domain. If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.

**Access**

Access the CMDB service dashboard by navigating to Configuration > CMDB Dashboard > Service View.

**Report details**

The CMDB service dashboard displays aggregated health for services, and also details for individual services. For a specific service, the CMDB service dashboard displays aggregated health for all the CIs in that service, including the service CI itself. Also it provides useful reports about service classes such as the Business Service class. You can drill down those reports to display further details of duplicate, orphan, or stale CIs per service and lists of the top 10 incident, alert, and change generating CIs in the service.

All default widgets can be filtered using the CMDB service hierarchy tree. Initially, the service hierarchy filter is set to Business Service. Click Business Service to expand it and to select a different class, filtering all widgets on the dashboard to display data only for the selected class, its child classes, or services of that class.

In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health results of associated metrics are displayed underneath, each contributing according to the weight configuration of the metric scorecard, and its threshold.

With the exception of the Overall health scorecard, you can drill into any widget in the service dashboard:

- In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.
- In a charts widget: Click a bar to display a list of all the records that the bar represents.
- In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.

**Color codes**

The CMDB service dashboard uses color codes when displaying aggregated health status. The status definitions are based on the threshold limits for each scorecard, defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or</td>
</tr>
<tr>
<td></td>
<td></td>
<td>equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
</tbody>
</table>
The icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries display 0%.

View CMDB groups health reports

The CMDB group view dashboard serves as a central location to view aggregated health reports for CMDB groups at a glance. Also, it lets you drill into a CMDB group to perform remediation actions that address health issues, and that improve CMDB health. The CMDB group view dashboard uses the Performance Analytics framework for dashboards and employs the capabilities it provides.

Configuration

The CMDB group view dashboard requires some configuration before it can display meaningful data, using the same settings as the CMDB dashboard. For each CI that is included in a CMDB group, the rule settings of its respective class are applied. You can customize these settings in the CI Class Manager, and on the CMDB Health Preferences page. Once CMDB Health is configured and the CMDB Health Dashboard Jobs are enabled, the CMDB group view dashboard displays data that is automatically collected and calculated on a recurring schedule.

If the system property `glide.cms.enable.responsive_grid_layout` exists, then it needs to be set to true. For more information, see Enable responsive dashboards.

CMDB Health is domain aware. If domain separation has been activated, then the CMDB group view dashboard displays health based on data, rules, and settings from the logged-on user domain. If rules and settings are not defined for a child domain, then the parent’s settings are applied, recursively.

Role required: asset or itil

Access

Access the CMDB group view dashboard by navigating to Configuration > CMDB Dashboard > Group View. Then, select a CMDB group from the CMDB Health Group List drop-down list.

Report details

For each CMDB group, the CMDB group view dashboard displays aggregated health for all the CIs in that group. You can drill down those reports to display further details of duplicate, orphan, or stale CIs per CMDB group. In each scorecard widget, the horizontal bar in the center and the % number are correlated, displaying the aggregated health summary for the KPI. Health results of associated metrics are displayed underneath, each contributing according to the weight configuration of the metric scorecard, and its threshold.

With the exception of the Overall health scorecard, you can drill into any widget in the CMDB group view dashboard:

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>
In a scorecard widget: Click the large aggregated percent number or the health bar to drill into a more detailed dashboard for that KPI.

In a chart widget: Click a bar to display a list of all the records that the bar represents.

In lists: Click the ‘i’ icon to view a list of all the tasks or alerts related to the CI.

**Color codes**

The CMDB group view dashboard uses color codes when displaying aggregated health status. The status definitions are based on the threshold limits for each scorecard, defined in the CI Class Manager.

<table>
<thead>
<tr>
<th>Color code</th>
<th>Definition</th>
<th>Default threshold setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>Best</td>
<td>Less than or equal to 33</td>
</tr>
<tr>
<td>Orange</td>
<td>At risk</td>
<td>More than 33 and less than or equal to 67</td>
</tr>
<tr>
<td>Red</td>
<td>Critical</td>
<td>More than 67</td>
</tr>
<tr>
<td>Gray</td>
<td>Incomplete</td>
<td>N/A</td>
</tr>
</tbody>
</table>

The **!** icon is a notation that the maximum failure threshold for the scorecard has been reached. The tests for the metric are halted for this cycle, and all associated aggregated summaries display 0%.

**View CI health**

The CI dashboard is a central location displaying health report for an individual CI, history of changes to the CI in a timeline view, and the relation formatter. The CI dashboard also displays incidents, changes, and other tasks affecting the CI, and business services affected by the CI. You can access the CI dashboard from a CI form, or from the CMDB dashboard.

Role required: asset or itil

The health scores are based on settings of CMDB Health KPIs and metrics. The report is calculated in real-time from data stored in health-related tables which the CMDB Dashboard jobs update on a recurring schedule. The completeness and correctness KPIs are always up to date, but for other KPIs, it is possible that updates to the CMDB are not reflected because one of the dashboard jobs hasn’t run yet, as follows:

- Compliance: Depends on audit cycles and on the 'CMDB Health Dashboard - Compliance Score Calculation' job.
- Relationships: Depends on the 'CMDB Health Dashboard - Correctness Score Calculation' job.

To ensure that the latest updates to these KPIs are reflected on the CI dashboard, navigate to the respective dashboard job, and click **Execute Now**.

1. On a CI form click **Dashboard**.
2. Or, navigate to **CMDB Dashboard > CMDB Health** and click **CMDB Dashboard - All** to display the class hierarchy. Enter a search string and then select a CI from the **Configuration Items** group.
The search results are grouped by **Classes** and **Configuration Items** that match the search string.

Various widgets in the report display CI's health with the following color codes:

- **Green**: The CI passed the health test (for example, it is not a duplicate).
- **Red**: The CI failed the health test (for example, it is a duplicate).
- **Grey**: The CI was not tested for this metric, because the threshold was not set for the CI (class) in the CI module.

The report displays the change history for the CI in a timeline format, that you can zoom in or out to select a time period for which to display details for. Use the related lists tabs **Change**, **Incident**, **Task**, **Business Services**, and **Alerts** to further drill into additional details.

**Note:**

Missing rules or other class definitions can prevent some health scores from being evaluated for a CI. The results in the CI dashboard in these situations, are described below:

**Duplicate**
- If no identification rules ([cmdb_identifier]) are defined for the CI’s class or its ancestors: A notification to that effect appears.
- If only dependent identification rules are defined: Not applicable notification appears.

**Orphan**
- If the CI is excluded by health inclusion rules: Not applicable notification appears.
- If no orphan rules ([cmdb_health_orphan_rule]) are defined for the CI’s class or its ancestors: A notification about missing a rule appears.

**Staleness**
- If the CI is excluded by health inclusion rules: Not applicable notification appears.
- If no staleness rules ([cmdb_health_staleness_rule]) are defined for the CI’s class or its ancestors: A notification about missing a rule appears.

**Audit**
- If no audits ([cert_audit]) are defined for the CI (CI dashboard checks only desired states and scripted audits): Not applicable notification appears.
- If there are audits defined for the CI but the audits did not run: Not applicable notification appears.

**Customize the CI dashboard**

You can add, remove or re-arrange content on the CI dashboard to display the CI health statistics that are important to you.

Role required: itil_admin

On a CI form click **Dashboard** and customize the CI dashboard as follows:

- Drag a tile near its upper edge and drag it to a different location on the dashboard to rearrange the current layout.
• Click the X in the upper right side of a widget to hide the widget.
• Click the + sign in the upper left corner of the dashboard to add content. In the Add content dialog box, select the content to add and the location to place it.
• Click the gear icon in a widget tile to edit widget settings such as title and height.
• Click Reset to Default to revert to the base system settings.

View CI relationships health

View aggregated orphan, stale, and duplicate CI relationships in the CMDB dashboard. You can configure the relationship scorecards, but you cannot configure the underlying relationship KPI health tests.

The CMDB Health Dashboard - Relationship Compliance Processor dashboard job must run to generate data for these reports.

Role required: itil or asset

CMDB Health measures CI relationship health using a separate KPI and metrics.

**Orphan relationship**

A relationship that is missing parent, child, or relationship type.

**Duplicate relationship**

Relationships that have identical parent, child, and relationship type.

**Stale relationship**

A relationship in which one of the CIs is stale. For a stale CI — its associated relationships are also stale.

In addition, the following relationship compliance reports are available:

**Relationships not compliant with all relationship rules**

Relationships that do not comply with any relationship governance rule, including suggested relationships and dependent relationship rules.

**Relationships not compliant with suggested relationships**

Suggested CI relationships are used as rules to test if relationships comply with specified suggested relationships.

**Relationships not compliant with containment rules**

Containment rules are used to test if relationships comply with specified containment relationships.

**Relationships not compliant with hosting rules**

Hosting rules are used to test if relationships comply with specified hosting relationships.

For each of the compliance reports, testing a relationship requires a rule (suggested relationship, hosting rule, or containment rule) in which the parent and child CI classes match the parent and child CI classes in the tested relationship. If the relationship types in the rule and in the tested relationship do not match, then the relationship is not in compliance. If an applicable rule is not found, then the relationship is considered to be in compliance. Rules apply to the classes specified in the rule, and also to descendant classes. Therefore, when testing a relationship, rules that apply to descendant parents of the CIs in the tested relationship are used. If there are multiple rules that match the parent and the child CI classes of the tested relationship, then the tested relationship needs to satisfy only one of these rules to be in compliance.

1. Navigate to **Configuration > CMDB Dashboard > CMDB View**.
2. Select the **Relationship Health** tab.
3. Scroll to the bottom of the page to examine the relationship compliance reports.
   
   Report results are grouped by relationship type, and you can drill down for further details:
   
   - Point to a relationship type to display its label and the % of relationships that are not in compliance.
   - Click on a relationship type to drill down to a detailed list of all the relations of that type that are not compliant. Click on a specific relationship to display more details such as the failure description. The **Failure Description** field lists only a single rule that the relationship did not comply with, even if there are additional rules that the relationship fails to comply with.

### Create CMDB remediation rule

A CMDB remediation rule is associated with a task that was created for a failed CMDB health test. A CMDB remediation rule is applied automatically or manually to execute a remediation workflow that can, for example, delete stale CIs.

You need to first create and publish a remediation workflow that addresses the CI issue. The workflow can be a regular workflow, or an Orchestration workflow, and the table in the workflow needs to match the task type in the remediation rule. Do not configure the workflow with any filter conditions by setting **If condition matches** to **None**, so that the filters of the CMDB remediation rule will apply.

**Role required:** itil_admin (on top of itil)

1. Navigate to Configuration > CMDB Remediations.
2. Fill in the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Remediation name.</td>
</tr>
<tr>
<td>Task type</td>
<td>Type of CMDB health-related tasks to apply the remediation to.</td>
</tr>
<tr>
<td>Task filter</td>
<td>Filters tasks to apply remediation to. Also applies <strong>dot-walking</strong> on CI fields so that remediation is applied to tasks associated with matching CIs.</td>
</tr>
</tbody>
</table>
| Execution      | • Manual: Remediation is applied manually.  
                    • Automatic: The workflow is applied once, upon the creation of a task that matches the Task type and Task filter. |
| Active         | Allowing the workflow to run.                                               |
| Workflow       | The CMDB remediation workflow (regular or Orchestration) that will execute automatically or manually, depending on the Execution setting. You can click the Lookup using list icon, and then click New to create a new workflow. |

3. Click **Submit**.
If **Execution** is set to Automatic, then the business rule **Run remediations for CMDBHealth task** applies the remediation workflow to CIs that match the Task filter. If **Execution** is set to Manual, then you can manually apply the remediation workflow defined in the rule.

**Apply CMDB remediation**

Manually initiate a workflow to remediate a CI that failed a CMDB health test. For example, you can remediate CIs that are orphan or stale.

To manually apply a CMDB remediation, a CMDB remediation rule must exist, in which **Execution** is set to Manual.

Role required: itil_admin

Except for the duplicate and audit health metrics, you can choose to create tasks for health test failures for a metric.

To remediate failures of the duplicate metric, use **de-duplication tasks**.

For all metrics except for audit, each CI that failed a metric test is associated with a single task. Because a CI can fail multiple audits, a single CI can be associated with multiple audit tasks. The first of those tasks is in the **Task** field, and any additional tasks are in the **Additional Tasks** field. To remediate failures of the audit metric, refer to the audit tasks for the audits that the CI failed.

1. Navigate to **Configuration > CMDB Dashboard**, and then click **CMDB View**, **Service View**, or **Group View**.
2. Click on one of the bars in a bar chart on the page. Or, click on a metric tile that is associated with the remediation that you want to apply, and then in a detailed report click on a bar in a bar chart. For example, to remediate an orphan CI, click the **Completeness** tile.
3. In the **Task** column in the **CMDB Health Results** list, select the task that is associated with the CI that you want to remediate. Point to the information icon for a result record to display the CMDB Health Results dialog box with more details about the health test.

The CMDB Health Results list contains records only for the CIs that failed a metric test.

<table>
<thead>
<tr>
<th>Field</th>
<th>Column</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI</td>
<td>The CI associated with the test results.</td>
</tr>
<tr>
<td>Class Name</td>
<td>The CI’s class.</td>
</tr>
<tr>
<td>Description</td>
<td>Details about the reasons for the CI failing the metric test.</td>
</tr>
<tr>
<td>Last Evaluated On</td>
<td>Time that the CI was evaluated for the metric, and which resulted in failure.</td>
</tr>
<tr>
<td>Metric</td>
<td>The CMDB Health metric associated with this test result.</td>
</tr>
<tr>
<td>Source</td>
<td>Source of the health test failure:</td>
</tr>
<tr>
<td></td>
<td>· CMDB Health Audit: Corresponds to the dashboard</td>
</tr>
<tr>
<td></td>
<td>· Cloud discovery</td>
</tr>
<tr>
<td>Task</td>
<td>The task associated with the health test failure. For the audit metric, if there are multiple failures, then only the first task is listed.</td>
</tr>
<tr>
<td>Field</td>
<td>Column</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Additional Tasks</td>
<td>If there are multiple tasks related to the audit metric, contains all tasks other than the first which is in the Task field.</td>
</tr>
<tr>
<td>Active</td>
<td>Used internally in combination with the To Delete field to determine the correct results set that this failure belongs to.</td>
</tr>
<tr>
<td>To Delete</td>
<td>Used internally in combination with the Active field to determine the correct results set that this failure belongs to.</td>
</tr>
</tbody>
</table>

4. On the task form, click **Remediate**.
5. In the **Run Remediations** dialog box, select the remediation rule that you want to apply.
   The list of remediation rules is based on the type of health metric (such as orphan, stale), and on the filter defined in the rule.
6. Click **Execute**.

## Components installed with CMDB Health

Several types of components are installed with CMDB Health (included in the com.snc.cmdb plugin), including tables and scheduled jobs.

**Note:** The Application Files table lists the components installed with this application. For instructions on how to access this table, see *Find components installed with an application*.

### Scheduled jobs installed

<table>
<thead>
<tr>
<th>Scheduled job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB Health Dashboard - Completeness Score Calculation</td>
<td>Script for calculating the completeness KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Compliance Score Calculation</td>
<td>Script for calculating the compliance KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Correctness Score Calculation</td>
<td>Script for calculating the correctness KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Relationship Score Calculation</td>
<td>Script for calculating the CI relationships KPI of CMDB health.</td>
</tr>
<tr>
<td>CMDB Health Dashboard - Relationship Compliance Processor</td>
<td>Script for calculating compliance of relationships with suggested relationships, and with hosting and containment rules.</td>
</tr>
<tr>
<td>Add Identifier Fields In Recommended Rules</td>
<td>Sets all criterion attributes from all active Identifier entries from all active identification rules, as recommended fields. These added recommended fields are then checked by the CMDB Health Dashboard - Completeness Score Calculation scheduled job when evaluating the recommended health metric.</td>
</tr>
</tbody>
</table>
### Scheduled job

<table>
<thead>
<tr>
<th>Scheduled job</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remove Identifier Fields In Recommended Rules</td>
<td>Identifies any recommended field that is a criterion attribute in any active identifier entry in any active identification rule. Then removes the recommended setting for that field.</td>
</tr>
</tbody>
</table>

### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB Health Metric (cmdb_health_metric)</td>
<td>Details such as if a KPI or metric is enabled, maximum failure threshold, and other settings for all CMDB Health KPIs and metrics.</td>
</tr>
<tr>
<td>CMDB Health Result (cmdb_health_result)</td>
<td>Results from the most recent CMDB Health processing cycle.</td>
</tr>
<tr>
<td>CMDB Health Scorecard (cmdb_health_scorecard)</td>
<td>Current and historic health scores. Status of historic score records is ‘Historic’, and of latest score records is ‘Complete’.</td>
</tr>
<tr>
<td>CMDB Health Orphan Rule (cmdb_health_orphan_rule)</td>
<td>Rules for calculating orphan records per class.</td>
</tr>
<tr>
<td>CMDB Recommended Fields (cmdb_recommended_fields)</td>
<td>Recommended fields per class.</td>
</tr>
<tr>
<td>CMDB Health Metric Status (cmdb_health_metric_status)</td>
<td>Internal table that tracks the status of each KPI and metric that is being processed. Includes status, processing time, and processing start date. State for a KPI or metric changes from 'In Progress' to either of:</td>
</tr>
<tr>
<td></td>
<td>• Complete</td>
</tr>
<tr>
<td></td>
<td>• MaxFailures</td>
</tr>
<tr>
<td></td>
<td>• Daily Processing Time Out</td>
</tr>
<tr>
<td></td>
<td>Processing of a timed out KPI or metric continues on the following day.</td>
</tr>
<tr>
<td>CMDB Health Processor Status (cmdb_health_processor_status)</td>
<td>Internal table that tracks the processing progress of each KPI and metric. Contains a list of tables that are processed for each KPI and metric, and processing status. Classes are processed sequentially, changing status from Draft -&gt; In Progress -&gt; Complete.</td>
</tr>
<tr>
<td>CMDB Relationship All Rules Health Results (cmdb_health_result_rel_all)</td>
<td>Stores results about relationship health, to be used by the All Relationships report.</td>
</tr>
</tbody>
</table>
CMDB Health troubleshooting

Use the following information to track and resolve issues with the CMDB Health processes.

Logging

By default, only error messages are logged to the syslog table, with the source name CmdbHealth. To enable logging of ‘info’ and ‘warning’ messages (which are typically logged at the start and end of each processing cycle), update the system property glide.cmdb.logger.use_syslog.CMDBHealth. For information about using this property, see CMDB Health system properties.

Processing status

If scheduled jobs are enabled, but data is not displaying on the CMDB dashboard, you can check the processing status in the CMDB Health Metric Status (cmdb_health_metric_status) table. Depending on the status of the inactive metric, decide how to proceed.

Initially, the state of all metrics is ‘In Progress’.

Possible final states of a metric:

Complete
All classes are processed and the number of failures is under the maximum failures threshold.

Max Failures
The number of failures for this metric reached the maximum failures threshold. Processing has been aborted and will start over in the next run.

Daily Time Out Pause
The processor reached the processing time limit. Processing is paused and will resume in the next run.

At the end of a processing cycle, the final state of a KPI depends on the final state of its associated metrics. Possible final state of a KPI:

Complete
All associated metrics are in Complete state and score calculation is complete.

Incomplete
Score is not calculated because one of the associated metrics reached its maximum failure thresholds.

Daily Time Out Pause
Timed out because one of the associated metrics has reached its processing time limit.

Processing time

If processing of a metric times out, you can find out which class takes too long to process. Use this information to find out if any validation rules are weak.

The progress of each metric is tracked in the CMDB Health Processor Status table (cmdb_health_processor_status). Status for classes that have been processed for a metric is
Complete, and for classes that are yet to be processed is Draft. By looking at the update time for each class, you can calculate the length of processing time for each class.

**Fixing orphan records due to broken hierarchy**

Orphan rules might detect an orphan CI, which you are not able to access and delete. Or, there might be a mismatch between the list view that displays the orphan records, and the total number of records. These findings are due to records being deleted in the database from only one table in the CMDB hierarchy.

These CI records are not accessible via GlideRecord and must be deleted directly from the database. Therefore, in this case, to delete an orphan CI from the database you must get help from ServiceNow Technical Support.

Orphan test results provide the details of where exactly the hierarchy is broken. For example, the message "This cmdb_ci_linux_server CI (91054fc24f22520053d6e1d10c713) is missing record in cmdb_ci_computer table" means that a record of that sys_id must be deleted from the CMDB, cmdb_ci, cmdb_ci_hardware, cmdb_ci_server, and the cmdb_ci_linux_server tables (the Computer class is between the Hardware and the Server classes in the hierarchy.)

**Scripted audits Skipped**

An error message is logged if the results from a scripted audit are not included in the compliance KPI. The reason can be that the script in the audit was not updated to populate its Last ran date field. Without a Last ran date value, CMDB Health is unable to identify these run results as part of a recent complete audit run, and skips those results.

See [prepare scripted audits for the compliance KPI](#) for information about how to resolve this issue.

**CMDB Health troubleshooting: failure threshold reached**

The CMDB dashboard displays the string ‘failure threshold reached’ when the number of CIs that are failing the metric tests, reaches the failure threshold set for the metric.

CMDB Health stops processing for this metric in the current cycle, and therefore there is no aggregated health score for the metric. Processing will be attempted again in the next cycle. Also, status in the CMDB Health Metric Status (cmdb_health_metric_status) table is set to Max Failures for this metric.

When the health score of a metric cannot be evaluated, then the processing status of the respective KPI (for example, correctness) is set to Incomplete. The CMDB dashboard displays the string Incomplete score for the respective KPI and for the CMDB Health overall score. Also, aggregated health scores for the metric are not available for any class in the CMDB hierarchy.

To troubleshoot, do any of the following:

- Review and refine the rules defined for the metric which has reached max failures. If a rule associated with the metric is too generic, resulting in large number of failures, attempt to refine it. For Example:
  - Completeness – Review the recommended fields that are causing failures and remove the ones that are not critical for the health score. For more information see [Set a CI field to be recommended](#).
  
  - Correctness – For the staleness metric, depending on the cause of the failures it might be helpful to increase the value of the glide.cmdb.health.staleness CMDB Health system property.
- Reduce the number of failures by fixing CI records: If after adjusting the metric test rules the max failures for some metrics is still reached, then address the failures by updating CI records with the relevant missing information.
- Increase the failure threshold for the metric that is failing and check if processing for this metric completes successfully in the next cycle. Increasing the failure threshold beyond 500K might reduce overall performance.

**CMDB Health troubleshooting: incomplete score**

The CMDB dashboard displays the string ‘incomplete score’ for a metric when it fails to calculate the score for the metric.

‘Incomplete score’ is displayed when:

- The number of CIs that are failing the tests of one of its sub-metric, reaches the failure threshold set for the metric. In this situation, the processing status for the respective parent metric (for example, correctness) is set to ‘incomplete’ in the CMDB Health Metric Status (cmdb_health_metric_status) table. Processing for the failing metric in the current cycle stops, and therefore there are no aggregated health scores for the sub-metric, the parent parent metric, or the overall CMDB Health.

To troubleshoot, resolve the underlying cause of CIs failing the sub-metric tests. See **CMDB Health troubleshooting: failure threshold reached** for more information about resolving the failures of the sub-metric.

- An error is encountered while processing the sub-metric.

To troubleshoot, examine the system logs system logs to determine the cause of the error. After fixing the cause of the problem, restart processing by manually executing the respective parent metric dashboard job.

**Duplicate CIs**

When the instance encounters duplicate CIs during identification and reconciliation, it groups each set of duplicate CIs into a de-duplication task for review and remediation.

**De-Duplication tasks**

De-duplication tasks provide details about the duplication, including a list of all the duplicate CIs. Review the details of each duplicate CI in the task and the data that was used to determine that the CI is a duplicate.

From a de-duplication task, you can run the Duplicate CI Remediator wizard to reconcile a set of duplicate CIs into a single CI, eliminating the duplication.

**Duplicate CI Remediator**

The Duplicate CI Remediator is a wizard-like tool that you can use to reconcile a set of duplicate CIs associated with a de-duplication task. You can choose one of the duplicate CIs to retain as an active CI, and then decide how to process the rest of the duplicate CIs. The Duplicate CI Remediator lets you set reconciliation options for attributes, relationships, and related items.

For information about using the Duplicate CI Remediator, see **Remediate a de-duplication task**.
Properties that affect processing of duplicate CIs

During CMDB Identification, processing of sets of duplicate CIs is determined by:

- Property `glide.identification_engine.skip_duplicates` (true by default).
- Property `glide.identification_engine.skip_duplicates.threshold` (5 by default).
- Number of duplicate CIs in a set.

For information about how these properties affect the management of duplicate CIs, see *Detecting duplicate CIs*.

Master CI

The master CI plays an important role in the remediation of duplicate CIs. The master CI is a single CI from a set of duplicate CIs, that remains active while the rest of the duplicate CIs in the set are potentially retired, deleted, or reconciled into the master CI. Using the Duplicate CI Remediator, you can select a master CI for a set of duplicate CIs associated with a de-duplication task.

The `duplicate_of` attribute in duplicate CIs, is used to store a reference to the master CI. For duplicate CIs which existed in an instance that was upgraded to the New York release or later, the master CI is unknown. After upgrade, `duplicate_of` for those duplicate CIs is set to 'Unknown', indicating that the CI is a duplicate but the master CI is unknown.

Duplicate CIs set

Before remediation, the CIs in a duplicate CIs set are all duplicates of each other. After remediation, a set of duplicate CIs consists of one master CI, and any number of CIs, each considered a duplicate of the master CI. The `duplicate_of` attribute of the master CI is empty. The `duplicate_of` attribute for all the rest of the duplicate CIs in the set, is a reference to the master CI of the set.

If you attempt to modify the value of `duplicate_of` directly on a CI form or by using a script, the following restrictions are enforced to ensure data integrity:

- A CI cannot be its own master CI (you cannot set a CI as a duplicate of itself).
- A CI and its master CI cannot be from different domains.
- The `duplicate_of` attribute of the master CI cannot reference any CI as its master CI (you cannot set a CI as a duplicate of another duplicate CI to create a chain of duplicate CIs).
  - If you attempt to set a CI as a duplicate of another duplicate CI, then the CI is set as a duplicate of the master CI of the duplicate CI you are trying to set. If the master CI of the duplicate CI you are trying to set is 'Unknown', the operation fails.

**Example: Attempt to set a CI as duplicate of another duplicate CI**

<table>
<thead>
<tr>
<th>CIs</th>
<th>Attempted setting</th>
<th>Result (System enforced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI1: <code>duplicate_of</code> = empty</td>
<td>CI1: <code>duplicate_of</code> = CI2</td>
<td>CI1: <code>duplicate_of</code> = CI3</td>
</tr>
<tr>
<td>CI2: <code>duplicate_of</code> = CI3</td>
<td>CI2: <code>duplicate_of</code> = CI3</td>
<td>CI3: Master CI</td>
</tr>
<tr>
<td>CI3: Master CI</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If CI2 is a duplicate of 'Unknown', the operation fails.

- If a master CI becomes a duplicate of another CI, then it can no longer be a master CI. All CIs that were duplicates of that master CI are set as duplicates of the new master CI.
Example: Attempt to set a master CI as duplicate of another CI

<table>
<thead>
<tr>
<th>CIs</th>
<th>Attempted setting</th>
<th>Result (System enforced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI1: duplicate_of = CI4</td>
<td></td>
<td>CI4: duplicate_of = CI5</td>
</tr>
<tr>
<td>CI2: duplicate_of = CI4</td>
<td></td>
<td>CI1: duplicate_of = CI5</td>
</tr>
<tr>
<td>CI3: duplicate_of = CI4</td>
<td></td>
<td>CI2: duplicate_of = CI5</td>
</tr>
<tr>
<td>CI4: Master CI</td>
<td></td>
<td>CI3: duplicate_of = CI5</td>
</tr>
<tr>
<td>CI5: duplicate_of = empty</td>
<td></td>
<td>CI4: duplicate_of = CI5</td>
</tr>
</tbody>
</table>

- If a master CI becomes a duplicate of a CI within the same duplicate CI set, then the selected duplicate becomes the master CI in the duplicate CI set. The rest of the duplicate CIs in the set are set as duplicates of the new master CI.

Example: Attempt to set a master CI as duplicate of a CI within the duplicate CIs set

<table>
<thead>
<tr>
<th>CIs</th>
<th>Attempted setting</th>
<th>Result (System enforced)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI1: duplicate_of = CI4</td>
<td></td>
<td>CI4: duplicate_of = CI1</td>
</tr>
<tr>
<td>CI2: duplicate_of = CI4</td>
<td></td>
<td>CI1: Master CI</td>
</tr>
<tr>
<td>CI3: duplicate_of = CI4</td>
<td></td>
<td>CI2: duplicate_of = CI1</td>
</tr>
<tr>
<td>CI4: Master CI</td>
<td></td>
<td>CI3: duplicate_of = CI1</td>
</tr>
<tr>
<td>CI4: duplicate_of = CI4</td>
<td></td>
<td>CI4: duplicate_of = CI1</td>
</tr>
</tbody>
</table>

- You cannot delete a CI that is the master CI of duplicate CIs. To delete a master CI, you must first disassociate that master CI with all of its duplicate CIs. Either delete all duplicate CIs that are associated with that master CI, or remove the reference to that master CI from all duplicate_of attributes in any duplicate CIs that have it.

**Review de-duplication tasks**

Review details of de-duplication tasks, and then potentially remediate a de-duplication task.

Role required: itil to view and itil_admin to remediate a de-duplication task.

If a duplicate CI is a dependent CI, then you can view the details of the dependent relationship, the Depend on CI, and any relation qualifier chain. If the dependent CI has a lookup table, then you can see the details of the respective lookup table.

1. Navigate to Configuration > Identification/Reconciliation > De-duplication Tasks.
2. Select a task.

**Remediate Duplicate Task form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>Unique task number.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>Person who is responsible for resolving the task.</td>
</tr>
<tr>
<td>Short description</td>
<td>Description for the task.</td>
</tr>
</tbody>
</table>
3. In the related lists section, click the **Duplicate Audit Results** tab to see the list of duplicate CIs in this task. You can click a CI to display more CI details.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Duplicate CI</td>
<td>Reference to the duplicate CI.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field is a document ID type, which means that it can reference any record on any table. If the referenced CI is deleted as part of resolving duplicate tasks, then this field is empty.</td>
</tr>
<tr>
<td>Relationship</td>
<td>For a duplicate CI that is a dependent CI, this field shows the relationship between the duplicate CI and depend on CI.</td>
</tr>
<tr>
<td>Depend on CI</td>
<td>If the duplicate CI is a dependent CI, then this field displays the depend on CI.</td>
</tr>
<tr>
<td>Discovery source</td>
<td>Discovery method used for the CI.</td>
</tr>
</tbody>
</table>

Analyze de-duplication tasks to determine which CIs should remain active and which of the duplicate CIs in the Duplicate Audit Results lists are stale or incorrect. Click **Remediate** to remediate a de-duplication task (requires the itil_admin role).

**Manually create a de-duplication task**

Manually create a de-duplication task when it cannot be automatically created. You can then use the Duplication CI Remediator to remediate the manually created task.

In some situations, duplicate CIs are not automatically detected and de-duplication tasks are not automatically generated. Such situation happens with a class for which identification rules are not defined and the identification engine cannot be applied. However, you still want to reconcile these duplicate CIs by utilizing the Duplication CI Remediator.

Use the **CMDBDuplicateTaskUtils** API to manually create a de-duplication task in which all duplicate CIs are specified. The de-duplication tasks that you create manually and the automatically created tasks, are stored in the same table (reconcile_duplicate_task) and are processed in the same manner.
Note: You can manually create a de-duplication task only for CMDB CIs and a CI can be specified as a duplicate CI only in a single de-duplication task.

Remediate a de-duplication task

Remediate a de-duplication task by using the Duplicate CI Remediator wizard. Use the wizard to guide you through the duplicate CI reconciliation process or to apply a custom workflow.

Important concepts associated with the Duplicate CI Remediator:

Master CI

The master CI is one of the duplicate CIs that you want to retain as an active CI while potentially retiring or deleting the rest of the duplicate CIs. The first step in the Duplicate CI Remediator is to select a master CI for the remediation process. The Duplicate CI Remediator lets you choose which attribute values, relationships, and related items from the duplicate CIs to reconcile into the master CI. Alternatively, you can choose not to consolidate any data and retain the master CI as it is.

Default related items list

A list of related items that is used globally in the Duplicate CI Remediator for all de-duplication tasks. All items from the default related items list are selected by default to be merged to the master CI, on the Merge Relationships and Related Items tab. Adding or removing items from that slushbucket does not affect the default related items list. See Manage default related items list for more information.

Note: Asset related tables are not included in the default related items list and therefore they are not available for merge.

Property for duplicate CIs

Review Properties for duplicate CIs for information about important properties that affect how the Duplicate CI Remediator operates. Including the glide.duplicate_ci_remediator.dry_run property that determines if the Duplicate CI Remediator actually updates the CMDB or not.

Role required: itil_admin

As you progress through the tabs of the Duplicate CI Remediator, CIs are not updated. All updates are applied only in the final step, after you click Remediate.

Note:

- Merging of attributes and related items that are associated with assets is not supported in the Duplicate CI Remediator.
- The Duplicate CI Remediator behaves differently in remediations that involve a large number of duplicate CIs or where the duplicates are serial numbers. For information about those special cases, see the 'Special remediation scenarios' section at the bottom.

1. Navigate to Configuration > Identification/Reconciliation > De-duplication Tasks.
2. Open the de-duplication task that you want to remediate. On the task form, click Remediate.
3. In the Remediate dialog box, select either of the following options:
   - Use the Duplicate CI Remediator (Recommended): Use the wizard to consolidate duplicate CIs according to your configurations and settings. Follow the Duplicate CI Remediator tabs to configure the reconciliation.

---

• **Use a custom remediation workflow:** Use an existing CMDB remediation rule or select **Add New** to create a new one.

  • On the CMDB Remediation Rule form, set **Task type** to Remediate Duplicate Task and select **Active**.
  • On the Workflow form, set **Table** to Remediate Duplicate Task (reconcile_duplicate_task) and **If condition matches** to None.
  • Ensure that the associated workflow remediates duplicate CIs.

In the Remediate dialog box, click **Next** to start the workflow and to exit the Duplicate CI Remediator. The Remediate Duplicate Task form appears, where you can update the **State** of the task.

4. On the **Select Master CI** tab in the Duplicate CI Remediator:
   a) Select the master CI for this reconciliation using either of the following lists of duplicate CIs. For any CI, you can click the **Name** link to display the CI’s attributes, or click the **Related Items** link to display the number of related items.

   • **Recommended:** A subset of the **All** list, containing only system recommended master CIs. System recommendations are based on checking the duplicate CIs for the following criteria:
     
     • CI with most related items.
     • CI with most relationships.
     • Newest discovered CI.
     • Newest updated CI.
     • Oldest created CI.
     • Previous master CI, if one was previously selected.

   • **All:** All duplicate CIs for the de-duplication task.

   Either option lets you review a summary of the remediation settings before starting the remediation.

   b) Select one of the following options to choose whether to consolidate any attribute values, relationships, or related items from any of the duplicate CIs into the master CI:

   • **Remediate Manually:** Lets you specify which attribute values, relationships, and related items from duplicate CIs to consolidate into the master CI.

   • **Use Master CI:** Retains master CI attribute values, merges relationships, and merges only the default related items.

   Skip to step number 7 as this selection skips all configurations other than choosing the action for the duplicate CIs on the **Determine Duplicate CI Actions** page.

5. On the **Merge Attribute Values** tab review inconsistent values of each attribute. For each attribute, choose to retain the master CI’s value, or choose a value from a duplicate CI for the master CI to be set with. Then click **Next**.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Attribute for which there are different values.</td>
</tr>
<tr>
<td>Master CI Value</td>
<td><strong>Attribute</strong> value in the master CI.</td>
</tr>
<tr>
<td>Other Values</td>
<td>The number of unique <strong>Attribute</strong> values within the duplicate CIs.</td>
</tr>
</tbody>
</table>
To override the master CI attribute value with a duplicate CI value:

a) Click the **Other Values** link.

b) In the attribute dialog box, click **Unique Values** to display only unique attribute values, or **All** to display all attribute values including identical values.

c) Select a value for the master CI **Attribute** to be set with.

You can click **Reset to Original** to undo the selection of a different attribute value for the master CI.

d) Click **Select**.

---

**Note:** Attributes, such as system fields, discovery fields (discovery_source, last_discovered, first_discovered), and read-only fields (such as the asset field) do not appear in the list.

---

6. On the **Merge Relationships and Related Items** tab:

a) In the Merge Relationships section, select whether to merge all relationships from all duplicate CIs into the master CI. Click **View all relationships** to display all the relationships in which a duplicate CI is a parent or a child. You can click a **Parent** or a **Child** link to display more details. Orphan and duplicate relationships of duplicate CIs are deleted if you choose to merge relationships. For more information about the CMDB Health relationship KPI, see **CMDB Health KPIs and metrics**.

b) In the Merge Related Items section use the slushbucket to select related items to be merged into the master CI. Click **View all related items** to display all related tables (items) and the count of references in each table to one of the duplicate CIs. You can click the links in **Master CI Related Items** and **Duplicate CIs Related Items** to display details about the related items.

Related items in the slushbucket have the following format:

- By default, all items in the default related items list are selected to be merged.
- Related items (tables) that have no references to a duplicate CI are not listed, unless that table is included in the default related items list.
- Since asset related tables are part of the blacklist, they are not available for merge.

See **Manage default related items list** for more information about configuring a default list of related items.
c) Click **Next**.

7. On the **Determine Duplicate CI Actions** tab, choose one of the following actions to perform after completing the reconciliation. Then click **Next**.
   - **Set attributes to custom values** (recommended): Retain all duplicate CIs. Mark the duplicate CIs as invalid by setting a specific **Attribute** to a specific **Value** for all duplicate CIs. For example, set **Operational Status** to **Retired** to retire the duplicate CIs.
     
     The **duplicate_of** attribute of the duplicate CIs is automatically set to the appropriate master CI. Also, the duplicate CIs will not be added to any de-duplication task after this task is remediated. If the identification engine is not configured to **skip duplication**, ensure that identification inclusion rules are configured to exclude the duplicate CIs during identification. This configuration prevents new de-duplication tasks with the same duplicate CIs from being created after remediation.

     **Note:** Discovery fields, system fields, read only fields, and date fields are excluded from the attributes list.

   - **Delete**: Delete all duplicate CIs (only the master CI remains).
     
     **Note:** Review **Roll back and delete recovery** for information about reverting the deletion of CIs and related records.

8. On the **Review and Confirm** tab:
   a) Review the summary of the expected updates for this duplicate CIs reconciliation.
      Updates are based on your selections and therefore the summary includes only the details that are applicable. This summary can include details of the relationships and related items that will be merged to the master CI, the attribute values that the master CI will be set with, and the number of CIs that will be deleted. Click **Attributes**, **Relationships**, **Related Items**, or **Duplicate CI Actions** if applicable, to display further details such as changes to attribute values.

   b) Click **Remediate** to complete the reconciliation according to your reconciliation settings. Once complete, the task **State** is set to **Closed Complete**.

The following relationships are deleted without being merged to the master CI:

- Relationships in which the type, child, or parent field is empty.
- Relationships for which merging to the master CI will result in cyclic relationships.
- Relationship for which merging to the master CI will result in duplicate relationships.

The reconciliation process runs in the background and may take a while to complete. Upon completion, the system sends a confirmation notice to the remediator of the task. Meanwhile, you can:

- **Review Identification Rules**: Review identification and inclusion rules and make any necessary updates to reduce CI duplication.
- **Check Progress**: View the task activities that are logged as the remediation progresses.
- **View Master CI**: View the master CI for this reconciliation process.
Special remediation scenarios

There are a few special remediation scenarios in which the Duplicate CI Remediator behaves differently.

Large number of duplicate CIs

Support for reconciliation of duplicate CIs in the Duplicate CI Remediator is limited when the number of duplicate CIs exceeds a certain threshold. This threshold is based on the value of the glide.duplicate_ci_remediator.max.cis property, which is 1,000 by default. You can update this property to increase the threshold. However, this threshold never exceeds 5,000, even if you set the property to a value greater than 5,000.

When the number of duplicate CIs for a de-duplication task exceeds the threshold, the options available in the wizard are limited:

- On the Select Master CI tab, only the Recommended list of master CIs appears, and only the Use Master CI option is available.
- Recommendations are based only on the oldest created, newest updated, and most recently discovered CIs.
- Reconciliation of attribute conflicts and CI relationships is not supported, and only default related items are reconciled.

Duplicate serial numbers:

The Duplicate CI Remediator is usually applied to duplicate CMDB CIs. However, in some situations de-duplication tasks might be created for duplicate serial numbers. When the Duplicate CI Remediator processes duplicate serial numbers, the merge of relationships from duplicate records, is not referenced and is not applied.

Manage default related items list

You can add or remove items from the default list of related items which is used globally in the Duplicate CI Remediator for all de-duplication tasks.

Role required: itil_admin

The default related items list appears on the Merge Relationships and Related Items tab in the Duplicate CI Remediator. Globally modifying the list affects all de-duplication tasks being remediated by the Duplicate CI Remediator.

Alternatively, you can modify the list for only a specific task in the Duplicate CI Remediator without affecting the default global list.

**Note:** Only related items in which the reference field points to Configuration Item (cmdb_ci) in sys_dictionary can be selected for the default related items list. Related items with references to any child of the Configuration Item class cannot be selected for the default related items list, but are still available for merging in the Duplicate CI Remediator for a specific task.

1. Navigate to Configuration > Identification/Reconciliation > Duplicate CI Remediator Default Related Items.
2. On the Default Related Items List for Duplicate CI Remediator page, use the slushbucket to add or remove items from the Selected list.
3. Click Save.
Properties for duplicate CIs

Use the properties for duplicate CIs to configure how duplicate CIs are processed.

These properties are available for duplicate CIs. To view and edit these properties, the admin role is required.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attributes in which <code>max_length</code> exceeds this property value (4000 by default) are excluded from the <code>Select Master CI</code>, <code>Merge Attribute Values</code>, and <code>Determine Duplicate CI Actions</code> tabs in the Duplicate CI Remediator wizard.</td>
<td>If the <code>max_length</code> for an attribute is equal to the property value, and the size of the data exceeds the property value, then the data is truncated to the property value and the attribute appears in attribute lists.</td>
</tr>
</tbody>
</table>
| `glide.duplicate_ci_remediator.max.field_length`                         | • Type: integer

## CI Class Manager

Use the CI Class Manager to centrally view, create, or edit basic class definitions, and class settings for identification, reconciliation, and CMDB Health. To access the CI Class Manager, navigate to Configuration > CI Class Manager.

### Class Basics

- Create a class
- View class basic information
- Class columns
- Add a suggested relationship
- Display all CIs for a class
- Dependency Views map icons for a class
- Delete CIs for a CMDB class

### CMDB Health

- CMDB Health orphan rule
- CMDB Health staleness rules
- Set a CI field to be recommended
- Set a CI attribute to be mandatory
- Certification filter
- Certification template
- Audit

### Identification and Reconciliation

- Identification:
  - CI identification rules
  - Identification inclusion rules
- Reconciliation:
  - CI reconciliation rules
  - Data source precedence rules
  - Data refresh rules

Service Mapping

- **Entry point types for Service Mapping**
- **CI types for Service Mapping and Discovery**

**Agent Workspace for Configuration Management Database (CMDB)**

Agent Workspace for CMDB provides an easy-to-navigate interface that helps service agents access essential CMDB configuration items and drill down to related items such as changes, incidents, and timeline.

Agent Workspace for CMDB provides:

- Key health scores for CIs
- Level 1 CI relationships
- Condensed timeline view of incidents, changes, and change requests for a CI, for the past 7, 14 (default), or 30 days
- Critical incidents and change requests for CIs
- Key attributes related to CIs.
- Ability to create incidents and change requests for CIs, and to delete a CI

**Plugins**

The CMDB Workspace plugin (com.cmdb-workspace) is activated by default in a base system. The CMDB Workspace plugin adds the following to Agent Workspace:

- CMDB list category and associated filtered lists
- Configured CMDB Workspace forms for many common CMDB classes
- CMDB-specific widgets: CMDB Health, CMDB Relationships, and CMDB Timeline

**Roles**

To access Agent Workspace for CMDB, the workspace_agent and itil roles are required.

**CMDB Workspace form view in Agent Workspace**

Service agents see forms in the CMDB Workspace form view for the CMDB classes that this view is configured for:
The CMDB Workspace form view for CMDB classes contains the following components:

**Widgets**

- **CI Health:**
  Shows Critical Incidents, Change Requests, and the following CMDB Health scores: incomplete attributes, non-compliant relationships, stale relationships. Lets you open the CI Dashboard.
- **Level 1 Relationships:**
  Shows level 1 relationships. Lets you open the Dependency Views map.
- **CI Timeline:**
  Shows record changes, change requests, and incidents on a timeline. The timeline is for the past 14 days, condensing details that might be relevant to a current issue.

**Actions**

The `more` icon in the upper right corner lets you create a change, create an incident, or delete the CI.

**Related lists**

The CMDB Workspace form includes CIs' related lists such as Change Requests, Incidents, Tasks, or other related lists that apply to the class.

**Derivation of the CMDB Workspace form**

The CMDB Workspace form is derived throughout the hierarchy as follows:

- CMDB Workspace form definitions are not derived by child classes in the CMDB hierarchy.
- In a base instance, the ribbon of the CMDB Workspace form is defined for the top level Configuration Item class and is derived throughout the hierarchy.
- The form header of the CMDB Workspace form view is derived by child classes. However, in a base instance, the CMDB Workspace form header is specified per class for the classes that a CMDB Workspace is configured for.

**Default CMDB filtered lists**

Agent Workspace for CMDB includes by default several filtered lists such as Applications, Databases, Infrastructure Gear, Servers, and PC. Those filtered lists are not always aligned with the CMDB hierarchy. Instead, they represent user-friendly groupings of several categories of CMDB classes. The columns that appear for each class, are the default columns for the class as specified in the platform.

To see the list of classes that are included in a CMDB list category:

1. Navigate to Workspace Experience > Workspace > Agent Workspace Home.
2. In Agent Workspace, click the User Menu icon in the upper right corner and select Configure Workspace.
3. Select the Workspace List Categories tab under Related Links, and then select the CMDB list category.
4. Select a filtered list such as Applications, to open the Workspace List form for the selected filtered list.
For information about configuring filtered lists in Agent Workspace, see *Set up filtered lists in a workspace*.

**Default form view**

CMDB classes that do not have a CMDB Workspace form view configured for, appear with the default Agent Workspace form view which you can use for updating CIs. You can configure CMDB Workspace form views for any additional CMDB table that is commonly used in your organization, for which a CMDB Workspace form is not configured by default.

**Configure a CMDB Workspace view**

Configure a CMDB Workspace view for a CMDB table that is commonly used in your organization, for which a CMDB Workspace form is not configured by default.

Roles required vary by the element being configured in each step:

- Form headers: workspace_admin
- Form sections: personalize_form
- Related lists: personalize_form
- System property: admin
- Workspace view rules: workspace_admin

1. Configure form header:

   See *Set up form headers in Workspace* for the steps to configure a form header. When configuring a form header, set the **Table** field on the configuration forms to the CMDB class that you are creating a CMDB Workspace form for.

   If not configured for the class, form headers are derived from parent classes.

2. Configure form sections:

   a) Open a CI form for the class that you are creating a CMDB Workspace form for.

   b) Right-click the CI form banner and select *Configure > Form Layout* in the menu.

   c) On the layout configuration form, create a new view named **CMDB Workspace**:

      1. Ensure that the default section, which is named as the class name, contains the class key attributes. Note the name of that section and then rename it to **Key attributes**.

      Navigate to *System UI > Form Sections*. In the Section Elements list view, locate that form section (which is associated with the CMDB Workspace view) and set its **Caption** value to **Key attributes**.

      2. Add a new section named **More attributes**. Add the rest of the attributes to this section, and as the last item add **Activities (filtered)** to see activity stream on the form.

         For more information about configuring form layout, see *Configure form layout*.

3. Select the class attributes to appear in the activity stream on the form:

   a) Create a system property, using the ‘glide.ui.cmdb_ci_<class name>_activity.fields’ format for the property name.

   b) Set the property **Type** to **string**.

   c) Set the **Value** to the field names that you want to include in the activity stream on the form.
4. Add related lists to the form:
   a) Right-click the CI form banner and select **Configure > Related Lists**.
   b) On the Configuring related lists form, create a new view named **CMDB Workspace**.
   c) Add the related lists you want to see on the form, such as **Change Request # Configuration Item**.

   For more details, see **Add a related list to a form**.

5. **Configure a Workspace View Rule** to tie the respective class table to the CMDB Workspace view.

**View CI in Agent Workspace**

View various details for a CI using CMDB Workspace form view, in Agent Workspace. The CMDB Workspace form view provides details such as key health scores, a timeline view of incidents, changes, and change requests, and critical incidents, change requests, and attributes related to CIs.

CIs appear in a CMDB Workspace form view only if a CMDB Workspace form view is configured for the respective CMDB class. Otherwise, CIs appear in the default CMDB Workspace form view, which you can use for updating CIs.

Role required: agent_workspace_user and itil

1. Navigate to **Workspace Experience > Workspaces > Agent Workspace Home**.
2. Click **Lists**, navigate to **CMDB** and then click a class such as **Servers**.
3. In the class list view, select a CI.

   - Click the **more** icon in the upper right area and select **Create Change**, **Create Incident**, or **Delete** to delete the CI.
   - In the CI Health widget, click **CI Dashboard** to open the CI Dashboard.
   - In the Level 1 Relationship widget, click **Dependency Map** to open the Dependency Views map for the CI.
   - In the CI Timeline widget, click **Show Legend** and set what type of events appear on the timeline.

**View CMDB benchmarks**

CMDB calculates several CMDB Health benchmarks which then display in the Benchmarks dashboard. These benchmarks are based on various CMDB Health metrics, displaying monthly averages, trends, comparisons to industry averages of your ServiceNow peers, and global benchmarks.

The CMDB Health Dashboard jobs must be enabled and health data must be collected. Also, navigate to **Benchmarks > Setup** and ensure that the CMDB KPIs are enabled under **IT Operations Management**.

CMDB provides the following benchmarks:

- % of non-compliant CIs
- % of duplicate CIs
- % of stale CIs

For an instance, each of these benchmarks is the calculated monthly average for the corresponding CMDB Health metric. Calculating a monthly average requires that there is a
metric result value for each day of the month. Therefore, each day on which the respective
Health Dashboard job did not run, is assumed with the aggregated result from the run that is most
recent to that day. The monthly average is then calculated based on the sum of all the daily
aggregated results for the metric in that month, divided by the number of days of the month. For
a CMDB Health Dashboard job that ran multiple times in a single day, only the results of the last
run in that day are used for the monthly average calculation.

Note: The frequency of CMDB Health Dashboard job executions depend on whether the
job is enabled, its schedule and on manual runs.

Global averages are based on the sum of monthly averages of all peer instances, divided by the
number of instances (aside from instances for which the monthly average is 0).

1. Navigate to Benchmarks > Dashboard.
2. Click the
   
   icon and select IT Operations Management.
3. Click ALL or CMDB.
4. Click on a CMDB benchmark to drill down to trend data, and other benchmark details.

CMDB APIs (CMDB SDK)

Use CMDB APIs to create, update, and read operations on the CMDB. Domain separation is
supported in CMDB APIs.

CMDB APIs (CMDB SDK)

Use the following CMDB APIs to create, update, and read operations on the CMDB:

- CMDBGroupAPI
- CMDBTransformUtil
- CMDBUtil
- IdentificationEngineScriptableApi
- IdentificationEngine

Domain separation in CMDB APIs

Domain separation enables you to separate data, processes, and administrative tasks into logical
groupings called domains. You can then control several aspects of this separation, including
which users can see and access data.

This application fully supports domain separation. Not all ServiceNow applications support
domain separation; some include limitations on the data and administrative settings that can be
domain separated. To learn more, see Application support for domain separationApplication
support for domain separation.

CMDB APIs are used for accessing the CMDB from a script. CMDB stores the CI and relation
information; CMDB is domain separated.

CMDB APIs support the following operations:

- Create a new CI
- This operation goes through the Identification and Reconciliation Engine which supports domain separation when creating a CI. The domain of the caller is used for this operation.

- Update an existing CI
  - This operation goes through the Identification and Reconciliation Engine which supports domain separation when creating a CI. The domain of the caller is used for this operation.

- Create/Delete relations
  - The cmdb_rel_ci table is not domain separated.

- Query CMDB CI/Query CMDB table
  - Results are filtered by the domain(s) visible to the caller.

- Query CMDB metadata table
  - Metadata information is not domain separated.

**Setting up domain separation for CMDB APIs**

If domain separation is enabled for CMDB, then it is also available for CMDB APIs.

**Data separation**

Data is stored and domain separated in CMDB. There is no additional work needed from the CMDB API perspective.

**Configuring a domain-separated environment**

The configuration is done at the CMDB level.

**If a domain column is present for base system application tables**

See the *Domain separation in CMDB Health* topic.

**Tenant domains and application data**

There is no application-specific data to manage with CMDB.

**Quick start tests for Configuration Management Database (CMDB)**

Validate that Configuration Management Database (CMDB) still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.
Configuration Management Database (CMDB) quick start tests require activating the Configuration Management (CMDB) plugin (com.snc.cmdb) and the CMDB - ATF Tests plugin (com.snc.cmdb.atf).

**CMDB: CI Health Dashboard test suite**

Test suite to check whether CMDB CI Health Dashboard is functional at a basic level.

<table>
<thead>
<tr>
<th>Test</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB: Health Job Status</td>
<td>Checks whether any CMDB Health dashboard jobs, which were started 30 or more days ago, are still in progress.</td>
</tr>
</tbody>
</table>
| CMDB: CMDB Health Completeness/Recommended                 | Checks whether the CI dashboard is functional for the recommended metric (included in the CMDB Health completeness KPI). This test validates:  
  · Creation of a health inclusion rule for the recommend metric.  
  · Creation of a recommended field that satisfies the health inclusion rule.  
  · Validate that the health inclusion rule is correctly applied to a test record with missing data in the recommended field. |

**CMDB: Query Builder test suite**

Test suite to verify CMDB Query Builder functions such as create query, read query, and execute query using two related user roles - cmdb_query_builder and cmdb_query_builder_read.

<table>
<thead>
<tr>
<th>Test</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB: Query Builder - cmdb_query_builder Role</td>
<td>Verify that cmdb_query_builder user role can save queries, and access and run all saved queries, in CMDB Query Builder.</td>
</tr>
<tr>
<td>CMDB: Query Builder - cmdb_query_builder_read Role</td>
<td>Verify that cmdb_query_builder_read user role can access and run all saved queries, and cannot save any query, in CMDB Query Builder.</td>
</tr>
</tbody>
</table>

**CMDB: Relationship Editor and Formatter test suite**

Test suite to verify functionality of Relationship Editor and Relationship Formatter.

<table>
<thead>
<tr>
<th>Test</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB: Relationship Editor</td>
<td>Check addition of relations to a CI and deletion of relations from a CI using itil user role.</td>
</tr>
<tr>
<td>CMDB: Relationship Formatter</td>
<td>Check accuracy of CI information, relationship types, relationships, associated records such as change tickets, and settings such as CMDB views (relationship filters), displayed for a specific CI in relationship formatter using itil user role.</td>
</tr>
</tbody>
</table>
**CMDB: SDK REST API test suite**

Test suite to verify functionality of CMDB SDK Rest APIs.

<table>
<thead>
<tr>
<th>Test</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB: Query CMDB Metadata</td>
<td>Test querying CMDB metadata.</td>
</tr>
<tr>
<td>CMDB: Create a relation for a CI using REST APIs</td>
<td>Test creation of a relationship for a CI in the CMDB using the CMDB REST APIs.</td>
</tr>
<tr>
<td>CMDB: Delete a relation for a CI using REST APIs</td>
<td>Test deletion of a relationship for a CI using CMDB REST APIs.</td>
</tr>
<tr>
<td>CMDB: Create a CI using REST API</td>
<td>Test creation of a CI using CMDB REST APIs.</td>
</tr>
<tr>
<td>CMDB: Query CMDB using REST APIs</td>
<td>Test querying the CMDB using CMDB REST APIs.</td>
</tr>
<tr>
<td>CMDB: Update a CI using REST APIs</td>
<td>Test updating of a CI using CMDB REST APIs.</td>
</tr>
<tr>
<td>CMDB: Query for a CI using REST APIs</td>
<td>Test querying a CI using CMDB REST APIs.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Test</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDB: IRE Validation</td>
<td>Validate CI identifiers and reconciliation definitions and check indexes for CI identifiers.</td>
</tr>
<tr>
<td>CMDB: Dependency Views</td>
<td>Test functionality of Dependency Views APIs. These APIs retrieve Dependency Views map and associated map items such as context menu items, for a given CI sys_id and using itil user role.</td>
</tr>
</tbody>
</table>

**Useful related lists in CI forms**

By default, the forms that display manageable configuration items (CI) - computers, printers, network gear, uninterruptible power supplies (UPS), and power distribution units (PDU) - provide a number of related lists for the form.

The following related lists are common to all forms for manageable CIs.

- **Network Adapters** - Displays all the NICs installed on a CI.
- **CI IPs** - Displays all the IP addresses on this CI:
  - Computers (workstations, laptops using various Mac and Windows operating systems)
  - Windows servers
  - Linux servers
  - AIX servers
  - Solaris servers
  - Devices discovered through SNMP.
- **DNS Names for CIs** - Displays all the DNS names on a CI.

The IP version information appears in all IP address related lists and forms.

**Note:** Since all paths here click into the IP Address to DNS Names list that associates an IP address with a DNS name, this part of the common flow was not added to the tree structure.
Discovery source

A table called Source (sys_object_source) stores information identifying the source of a discovery (by ServiceNow Discovery or another product), the ID of that source, and the date/time of the last scan. To view this information, configure a CI form and add the Sources related list. This table is populated automatically when the Discovery plugin is enabled.

Activate the Extended CMDB plugins

The Configuration Management (CMDB) application provides core functionality for the configuration management database, including modules for hardware and configuration items. The separate Extended CMDB plugin includes a collection of modules for specialized configuration items, such as radio hardware, test equipment, and voice system hardware.

Role required: admin

The Configuration Management (CMDB) plugin is automatically active for all instances. You must activate related plugins to access the modules for specialized configuration items.

- CMDB Mainframe (com.snc.cmdb.mainframe)
- CMDB Radio Category (com.snc.cmdb.radio.category)
- CMDB Telecom Category (com.snc.cmdb.telecom.category)
- CMDB Test Equipment (com.snc.cmdb.test.equipment)

1. Navigate to System Definition > Plugins.
2. Right-click the plugin name on the list and select Activate/Upgrade.
   If the plugin depends on other plugins, these plugins and their activation status are listed.
3. Optional: Select the Load demo data check box.
   Some plugins include demo data—sample records that are designed to illustrate plugin features for common use cases. Loading demo data is a good policy when first activating the plugin on a development or test instance. You can load demo data after the plugin is activated by repeating this process and selecting the check box.
4. Click Activate.

Help the Help Desk

Help the Help Desk is a tool that allows users to populate the CMDB automatically with information about their Windows computer.

Help the Help Desk is a small web application that downloads and runs locally, using a WMI login script to gather information such as serial number, computer name, disk configuration, network configuration, installed software, memory, and much more. Users have the option of using two types of SOAP authentication for running the Help the Help Desk script.

- Cookie-based authentication for Help the Help Desk
- Basic access authentication for Help the Help Desk

Note: Domain separation is not supported for Help the Help Desk.
User roles and user names

Users must have the hthd_user role, and only this role, to use Help the Help Desk from within an instance. The user should also be configured with web service access only.

For users without access to an instance, you can configure Help the Help Desk to allow users to run the script without login credentials. Users with access to an instance can also use Help the Help Desk configured in this way, but only if they have the hthd_user role.

User name cannot contain these characters: \n
Any user name that contains the \n characters prevents the Assigned to field on a computer from being populated.

Help the Help Desk device identification

Help the Help Desk uses a predefined series of queries to identify and update existing CIs in the CMDB or to create a new CI if no match is found. These queries attempt to match devices using three criteria in a certain order.

Updates to an existing CI require only a single match as the list is evaluated. For example, if a device’s name has changed, but the MAC address is the same, the CI with the matching MAC address is updated.

- Serial number in the (cmdb_ci_computer) table
- MAC address in the (cmdb_ci_network_adapter) table
- Computer name in the (cmdb_ci_computer) table

**Note:** Discovery Identifiers are incompatible with Help the Help Desk queries.

Script include

The script include CIIdentifierForHelpDesk provides the logic for updating existing CIs or creating a new CI if no matching device exists in the CMDB. Do not modify this script. Errors introduced into this script can result in update failures or in new CIs being created for every device found.

Configure SOAP authentication for Help the Help Desk

By default, the ServiceNow system requires SOAP authentication. This affects the way in which your browser is configured for Help the Help Desk.

Role required: admin

1. Navigate to System Properties > Web Services.
2. Verify the system property for Require basic authorization for incoming SOAP requests glide.basicauth.required.soap is enabled.
3. Click Save.

**Note:**

If you receive the error, There was a problem retrieving the XML data(0): Unknown, an authentication issue is preventing the script from sending information to your ServiceNow instance. Verify the user meets the requirements for Cookie-based authentication.
Cookie-based authentication for Help the Help Desk

Cookie-based authentication uses cookies generated by Windows Internet Explorer for SOAP authentication on the instance.

This type of authentication can be used to run the Help the Help Desk script at the time it is downloaded or after it has been saved to the local drive. When the script is downloaded, Internet Explorer generates a cookie using the user's login credentials, and then shares this cookie with the script. When a user attempts to run the script, the instance checks first for this cookie. If the cookie has been created, the script can authenticate on the instance through SOAP.
Cookie-based authentication

The following setup requirements are imposed on .hta file downloads by Microsoft.

- You must use Internet Explorer and choose to run the script while you are logged in to your instance. If you choose to use a different browser and download the script file to run later, the script will not work properly unless you have an active session on your instance with Internet Explorer.
- Disable **Protected Mode** and **User Account Control (UAC)**. Protected Mode is available in Internet Explorer 7 or later in Windows Vista. UAC is a feature of Windows Vista and Windows 7.
• This feature requires that your logged in user session be persisted to the Help the Help Desk script. For this to occur, the Remember me check box in the login screen must be enabled and selected (the default behavior). This option enables the system to write back an HTTP cookie to your browser to be persisted across sessions.

**Basic access authentication for Help the Help Desk**

An alternative to cookie-based authentication for the Help the Help Desk script is basic access authentication, which employs two properties to configure the script with credentials.

When a user logs in with the proper credentials, that user accesses the instance in the hthd_user role, which grants access to the ECC queue but limits the user's access to other features. The administrator then configures the system properties with the user name and password for the hthd_user user.

The values from these properties are automatically saved to the script file helpthehelpdesk.js. When this user runs the Help the Help Desk script, the instance checks for a cookie. If no cookie is found, the instance checks for the login credentials provided by the system properties, and authenticates the script automatically.

**Set up basic access authentication for the Help the Help Desk script**

You can set up basic access authentication for the Help the Help Desk script.

Role required: admin

1. Create a new user with the following values.

<table>
<thead>
<tr>
<th>User ID</th>
<th>Create an easily recognizable user name such as SOAPAUTH or SOAPONLY.</th>
</tr>
</thead>
<tbody>
<tr>
<td>First name</td>
<td>SOAP</td>
</tr>
<tr>
<td>Last name</td>
<td>Authentication</td>
</tr>
<tr>
<td>Password</td>
<td>Any password</td>
</tr>
</tbody>
</table>

2. Right-click the header bar and select Save. The record is saved, and the Related Lists appear.

3. In the Roles Related List, click Edit.

4. In the slushbucket, move the hthd_user role from the Collection list to the Roles list, and then click Save.

5. Navigate to System Definition > Help the Help Desk.

6. Add the user name and password you created to the appropriate properties, and then click Save. The password is encoded when saved.

The login credentials from these properties are saved to the helpthehelpdesk.js script. When the Help the Help Desk script is run by a user logged in with these credentials (in the hthd_user role), the script is able to authenticate automatically on the instance.

**Help the Help Desk login script**

The Help the Help Desk script enables organizations to proactively scan their network to discover all Windows based hardware and the software packages installed on those devices.

This WMI-based script is included in the core ServiceNow platform functionality. This script also can be set up to run as a Windows login script and used to keep the CMDB up to date. The script is named helpthehelpdesk.js and can be downloaded from each customer's local instance.
Install and use the login script

The login script is installed on the instance and can be downloaded directly from a module.

Role required: admin

The same script is used to perform the Help the Help Desk scan, which gathers information about a user’s Windows computer and updates the CMDB.

1. Log in to your instance with Windows Internet Explorer.
2. Navigate to System Definition > Help the Help Desk Login Script.
3. Follow the download instructions in the page that appears.
4. Put the helpthehelpdesk.js file in the following folder: %SystemRoot%\sysvol\sysvol\<domain DNS name>\scripts where %SystemRoot% is usually c:\winnt or c:\WINDOWS and <domain DNS name> is the DNS name of the domain, similar to MyDomain.com. This folder is replicated to all domain controllers in the domain.
5. Open the helpthehelpdesk.js file in a text editor, such as Wordpad.
6. Check the var server line to ensure that the URL for your ServiceNow instance is correct.

7. Ensure that basic authorization for SOAP requests is enabled in your instance, and a SOAP user is defined.
   This allows the script to connect to your instance. The entry should look something like this:

```javascript
var server = "https://abctech.service-now.com/";
```

8. Create a Logon.bat script to run helpthehelpdesk.js as follows.

```
@echo off
cscript %0\..\helpthehelpdesk.js
EXIT
```

9. Add Logon.bat to the Logon script field on the Profile tab of the user properties dialog in the Active Directory Users and Computers MMC corresponds to the scriptPath attribute of the user object.

   Logon scripts can also be configured in Group Policy. However, Group Policy only applies to clients with Windows 2000 or above. The setting in Group Policy is User Configuration, Windows
**Settings, Scripts (Logon/Logoff), Logon.** Copy the file you want for the Logon script to the Windows clipboard.

10. Open the *Logon* setting in the Group Policy editor.
11. Click the *Show Files* button.
12. Paste the desired file in the dialog.
   You can select the file and edit it in this dialog as well. This is easier than navigating in Windows Explorer to the folder where Group Policy Logon scripts are saved. However, if you do have to navigate to the folder, the path on the domain controller is:

\%SystemRoot\%\sysvol\sysvol\<domain DNS name>\<policy GUID>\user\scripts\logon

Again, \%SystemRoot\% is usually c:\winnt and <domain DNS name> is the DNS name of the domain, similar to MyDomain.com.

<policy GUID> is a hexadecimal string representing the GUID (unique identifier) of the specific Group Policy Object (GPO). Group Policies are assigned to a domain, site, or organizational unit in Active Directory.

The logon script setting applies to all users in the domain, site, or organizational unit to which the GPO applies. You will notice that you assign a logon script to all users in the container at once, rather than having to assign the scriptPath attribute for each user. This makes it much easier to assign logon scripts to many users. However, since the same Group Policy applies to all users in the domain, site, or organizational unit, you must code the logon script to accommodate all users.

**Run the Help the Help Desk script**

You can run the Help the Help Desk script manually.

You also can configure Help the Help Desk to run automatically when users log into their computer. For more details, see *Help the Help Desk login script*.

1. On your instance, navigate to **Self Service > Help the Help Desk**.
2. Click **Start the Scan to Help the Help Desk**.
   
   You are prompted to run or save the discovery.hta script.
3. Run or save the discovery.hta script.
   - If your browser is Windows Internet Explorer, run the script.
   - If you are using any other browser, click **Save** and save the script to the local machine. To execute the saved script, double-click the file.

   The script runs a series of WMI queries to gather information about the Windows machine. When it is finished, the data is sent back to your instance and is used to populate the configuration database (CMDB).

The error message **Error: Unable to parse SOAP document** means that the Help the Help Desk script was unable to connect to the instance to relay the information that was discovered.

**Run the discovery.hta script with browsers other than Internet Explorer**

You can run the discovery.hta script with browsers other than Internet Explorer.

Browsers other than IE cannot handle files with the .hta extension. Browsers like Firefox, Safari, and Opera prompt users to download the script file, which you can then double-click to run.

However, in Windows XP (including Vista, Windows 2003 Server, and later), files downloaded from the Internet are marked with a security restriction that interferes with running the script. The typical error message introduced by this security restriction looks like this:
To remove the security lock on the downloaded file, complete the following steps.

1. Right-click on the downloaded file and select **Properties**. The following message is displayed on the bottom of the form: This file came from another computer and may be blocked to protect this computer.
2. Click ** Unblock** to remove the security restriction.

The script will run if SOAP authentication is disabled.

**Access Help the Help Desk status**

Help the Help Desk displays the status of all scans in daily records. Drill down into a record for details on how the CMDB was updated within the last 24 hours from scans performed on the instance.

Role required: admin

1. Navigate to **System Definition > Help the Help Desk Status**.
   A new status record is created each day and displays the number of scans completed (devices scanned). The **Description** field shows Help the help desk as the source of the scan.
2. To view the details of individual scans, open a scan record.
3. In the scan record, select the **Devices** tab to view all the devices scanned by Help the Help Desk that day.
   Each CI displays the device class and the activity completed: **Created CI** or **Updated CI**. By default, Help the Help Desk cannot discriminate class between servers and workstations and classifies each CI as a **Computer**. However, if Discovery is activated on the instance, Help the Help Desk can classify CIs as either Windows servers or computers.
4. Select the **ECC Queue** tab to examine the data payload returned from each scan.

If Discovery is active on the instance, the Help the Help Desk status appears in the Discovery Status record list. These scan records are described as **Help the help desk** in the list to differentiate them from regular discoveries run from a schedule or a UI action. Open the status record to access the forms described in this page.

**Determine values for the Assigned to field**

This page explains how to set properties to determine which value appears in the **Assigned to** field when the script is run.
Role required: admin

Any user name that contains the \n characters prevents the Assigned to field on a computer from being populated.

- Navigate to **System Definition > Help the Help Desk**.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.wmi.assigned_to_always_overwrite   | If the Help the Help Desk script is run on the same computer by different users, the platform overwrites the user name in the Assigned to field each time the script is run.  
To prevent this, set the For Help the Help Desk script, if the property is "yes", the "assigned_to" field of the CI is always overwritten; otherwise the field is not overwritten unless it is empty (glide.wmi.assigned_to_always_overwrite) property to false (clear the check box). |
| glide.discovery.assigned_user_match_field | Help the Help Desk attempts to match a Windows user name it finds with the the user_name field of the User (sys_user) table. However, this might not be desirable if the user_name field from the User (sys_user) table contains formatting that is different from that found in Windows.  
The For Discovery and Help the Help Desk, the following field in the sys_user table is used to associate a computer CI with a user (glide.discovery.assigned_user_match_field) property enables you to select an alternative field for matching. For example, you can create a field called u_username, and then populate it with a user ID that can be matched against the Windows user name. In this case, replace the default value in the property with u_username. |

**View scan results**

You can view the results of Help the Help Desk scans on an instance.

Role required: admin

These records provide access to logs, CI records, and the ECC Queue for all scans conducted each day. Help the Help Desk status reports are also accessible from the **Discovery** list.

1. Navigate to **System Definition > Help the Help Desk Status**.
2. Open the daily status record.

**Help the Help Desk script troubleshooting**

With the Help the Help Desk script, you can detect all system software on a 64-bit machine. You can also configure the Help the Help Desk script to run for users without prompting for a user name and password.

**Allow users without a ServiceNow instance login to run Help the Help Desk script**

You can configure the Help the Help Desk script to run for users without prompting for a user name and password.

Role required: admin
This setup enables users who do not have access privileges to an instance to run the script on their Windows machines without having to provide a user name and password. The script can be configured to login in automatically as a SOAP user with the hthd_user role.

1. Log in to your instance with Windows Internet Explorer.
2. Navigate to **System Definition > Help the Help Desk Login Script**.
3. Follow the download instructions in the page that appears.
4. Put the helpthehelpdesk.js file in the following folder: `%SystemRoot%\sysvol\sysvol\<domain DNS name>\scripts` where `%SystemRoot%` is usually `c:\winnt` or `c:\WINDOWS` and `<domain DNS name>` is the DNS name of the domain, similar to MyDomain.com. This folder is replicated to all domain controllers in the domain.
5. Open the helpthehelpdesk.js file in a text editor, such as Wordpad.
6. Check the var server line to ensure that the URL for your ServiceNow instance is correct.

```javascript
/* **************** Required Variables **********************************************/
/* The following section should be modified if the information is not correct. */
/* *******************************************************************************/

// The variable should point to your instance URL, such as http://demo.service-now.com
var server = "https://abctech.service-now.com/";

// If SOAP authentication is turned on on the instance. The http authentication should be provided here
var httpUsername = "";
var httpPassword = "";

/* **************** Optional Variables **********************************************/
/* The following section can be modified for other purposes. */
/* *******************************************************************************/
```

7. Ensure that basic authorization for SOAP requests is enabled in your instance and a SOAP user is defined.

This allows the script to connect to your instance. The entry should look something like this:

```javascript
var httpUsername = "user_on_your_instance";
var httpPassword = "user's_password";
```

8. Make the script file available to all users.

**Detect software on 64-bit systems with Help the Help Desk**

You can detect all system software successfully on a 64-bit machine.

A 64-bit browser can detect both 64-bit and 32-bit software, but a 32-bit browser cannot detect 64-bit software.

- To detect all system software, run the Help the Help Desk script from a 64-bit browser.

**Enterprise CMDB**

The Enterprise Configuration Management Database (ECMDB) is targeted toward businesses that want to monitor, manage, measure, track, alert on change, and generally understand business systems that consist of a large number of components, business, and support personnel.
For example, a bond trading service may have multiple application, and web servers, several databases, Linux, UNIX, and Windows servers. There will be security products, network storage, disaster recovery procedures and hardware, etc. that are necessary for the service to operate properly.

The ECMDB makes it easy to either manually enter the relationships or have them populated automatically by discovery tools. In addition to the hardware, software, network, database, and storage areas, it is beneficial to know which individuals or groups are responsible for the service from both a business perspective as well as an IT perspective. Who are the line of business users and managers? Who starts and stops the application or its components? Who monitors the log files? Who is in charge of backup and restore, business continuity, and disaster recovery?

Enterprise CMDB is available with the Configuration Management (CMDB Enterprise Edition) (com.snc.cmdb.enterprise) plugin, which is active in the base system.

**CMDB Relationships**

The ECMDB lets you easily track all relationships by relationship type.

The Enterprise CMDB extends the capabilities of the Now Platform CMDB in the following areas.

**Extended configuration item types**

- Clusters
- Database Instances (Oracle, MySQL, MSFT SQL Server)
- File Systems (Direct and network attached)
- Linux Servers
- Solaris Servers
- AIX Servers

**Extended relationships**

Accurate description of relationships between items, and between items and people or groups, is important to understand the fabric of a business service. ECMDB provides many relationship types out of the box, but it is easy to extend the number of relationship types. Example relationship types include the following.

- Connects to
- Depends on / Provides Service to
- Powered by / Powers
- Protected by / Protects
- Disaster Recovery Provided by / Provides Disaster Recovery for

**Visualization**

The system can show relationships as a hierarchy using a standard treeview, flattened, or graphically, all in a simple web interface.

**Auditing**

Auditing of changes to configuration items is turned on by default.
Federation

Federation of third party discovery and configuration data is supported through standard synchronization offerings (SMS, LAN Desk, others) and through the CMDB Discovery (cmdb_discovery) table.

Configuration item modeling (product models)

Model driven configuration management allows the definition of CI models up front that can be associated to product maintenance lifecycles, cost centers, and support organizations, as well as provides a means for capacity and inventory planning. By defining models for CIs (which have a many to one relationship to the model), you can dynamically group actual discovered or imported CIs into logical, operational, and financial models. This facilitates an organized approach to managing your assets (CIs) in their respective domains.

Enterprise Configuration Management Database (ECMDB) action icons

Any of the following icons may appear in the ECMDB lists of related items.

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>☑️</td>
<td>For currently active incidents against this configuration item</td>
</tr>
<tr>
<td>☐️</td>
<td>For currently active problems against the configuration item</td>
</tr>
<tr>
<td>☘️</td>
<td>For currently active changes against the configuration item that are not covered in the past, current, pending changes. For example, a request to update the operating system on a server that is currently in progress may display this icon.</td>
</tr>
<tr>
<td>☢️</td>
<td>For changes that were recently completed against the configuration item. Changes with an &quot;Actual_end_date&quot; in the past.</td>
</tr>
<tr>
<td>☢️</td>
<td>For changes that are planned soon against the configuration item. Changes with an &quot;Actual start date&quot; in the future.</td>
</tr>
<tr>
<td>☘️</td>
<td>For currently active changes against the configuration item that have an &quot;Actual start date&quot;</td>
</tr>
<tr>
<td>☢️</td>
<td>For outages that were recently completed against the configuration item. Outages with an &quot;end&quot; date in the past.</td>
</tr>
<tr>
<td>☢️</td>
<td>For outages that are planned soon against the configuration item. Outages with a &quot;begin&quot; date in the future.</td>
</tr>
<tr>
<td>☢️</td>
<td>For currently active outages against the configuration item that have a &quot;begin&quot; date in the past and no &quot;end&quot; date</td>
</tr>
<tr>
<td>⬤</td>
<td>This will only show up in the Tree view and indicates that a configuration item that is downstream has at least one of the above issues against it.</td>
</tr>
</tbody>
</table>
The system looks 5 calendar days in the past and 7 calendar days in the future when looking at recent outages and changes.

**Business service tables**

In the CMDB, the Service table (cmdb_ci_service) stores information about business services.

A business service is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user's account. A business service management map graphically displays the configuration items (CI) that support a business service and the relationships between the configuration items.

The Service table (cmdb_ci_service) stores the business services in the CMDB.

**The Service table**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</table>
Field | Description
--- | ---
Users supported | The users that this service supports. A reference to the Group (sys_users_group) table.
Version | Use this field for your own versioning processes.

The Service Configuration Item Association table

The Service Configuration Item Association table (svc_ci_assoc) binds a business service and a configuration item (CI) to track which CIs are part of each business service.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Item Id</td>
<td>A reference to the Configuration Item (cmdb_ci) table.</td>
</tr>
<tr>
<td>Service Id</td>
<td>A reference to the Service (cmdb_ci_service) table.</td>
</tr>
</tbody>
</table>

The Service Relationship Association table

The Service Relationship Association table (svc_rel_assoc) binds a business service and a relationship to track which relationships are part of a business service.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relation Id</td>
<td>A reference to the CI Relationship (cmdb_rel_ci) table.</td>
</tr>
<tr>
<td>Service Id</td>
<td>A reference to the Service (cmdb_ci_service) table.</td>
</tr>
</tbody>
</table>

Table form views

When you view a table definition form, you can open the context menu, and select a form view in which to display the table. The default view for a table is the Default view. For any class that is an extension of the CMDB table, you can select the CI Definition view which provides additional access to related tables and information.

The CI Definition form view is a centralized location from which you can configure and view a table. In addition to the information that the default view displays, the CI Definition form view provides the following controls.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Icon tab</td>
<td>View and create new NG-BSM icons for CI types</td>
</tr>
<tr>
<td>CI Identifier tab</td>
<td>View and create new CI identifiers</td>
</tr>
</tbody>
</table>
To access these additional controls on the CI Definition form view, you need to first create a new table that is derived from the CMDB table, and then view it using the CI Definition form.

### Analytics and Reporting Solution for Configuration Management (CMDB)

Analytics and Reporting Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With Analytics and Reporting Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

**Important:** Set up and test Analytics and Reporting Solutions on a sub-production instance before enabling them in production. You can set up Performance Analytics on a sub-production instance without a subscription.

**Note:**
- Analytics and Reporting Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.
- Analytics and Reporting solutions and in-form analytics provide all the configuration records required to analyze default applications. Customize these records for use in your production environment.

To enable the solutions for Configuration Management (CMDB), an admin can navigate to **Performance Analytics** > **Guided Setup**. Click **Get Started** then scroll to the section for Configuration Management (CMDB). The guided setup takes you through the entire setup and configuration process.

### Dependency Views

ServiceNow® Dependency Views graphically displays an infrastructure view for a configuration item (CI) and the application or business services that it is part of and that it supports. Dependency Views indicates the status of its configuration items, and allows access to CIs related alerts, incidents, problems, changes, and services.

If Service Mapping is activated, Dependency Views maps are enhanced to display dependencies that reflect connections in service maps.

- Create or edit a dependency type
- Change the layout of Dependency Views map
- Filter the view of a Dependency Views map
- Perform actions on nodes in a Dependency Views map
- Supported browsers for Dependency Views

Develop
- Developer training
- Developer documentation
- Properties for Dependency Views
- Components installed with Dependency Views

Integration
- View metrics for CIs in a Dependency Views map

Troubleshoot and get help
- Ask or answer questions in the Now Community
- Search the HI knowledge base for known error articles
- Contact ServiceNow Technical Support

Supported browsers for Dependency Views

The latest version or service pack of internet browsers are required to view and manipulate Dependency Views maps.

The Dependency Views module supports the latest version or service pack of the following browsers:

- Firefox with the latest ESR
- Chrome latest version
- Safari version 8 or later (latest is recommended)
- Microsoft Internet Explorer (IE) version 11 and Microsoft Edge.

The Dependency Views module is not supported on tablets and on mobile devices.

Domain separation and Dependency Views

This is an overview of domain separation in Dependency Views. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: Basic

- There is business logic to ensure data goes into the proper domain for the application’s service provider use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at run time.
- The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Use case: As a service provider when I use chat to respond to a tenant-customer’s message, the client must be able to see my response.
How domain separation works in Dependency Views

Dependency views are generated using both Configuration Item (cmdb_ci) and CI Relationship (cmdb_rel_ci) tables. The (cmdb_ci) table is domain separated, but the (cmdb_rel_ci) table is not. You can create relationships only by selecting two CIs. They should be in the same domain for you to be able to see them.

To be successful with domain separation in Dependency Views, make sure that relevant CIs are visible for the current domain. If the instance is domain separated, ServiceNow domain separation rules apply (see Related information link below).

Tenant domains will be able to see only their domain and global CIs.

Dependency Views map

ServiceNow® Dependency Views maps graphically display CIs that support application or business services and the relationships between the CIs.

A ServiceNow service (application service or business service) is work or goods that are supported by an IT infrastructure. For example, delivering email service to an employee can require services such as email servers, web servers, and the work to configure the user’s account.

A Dependency Views map has one starting point, called the root CI or root node of the map. The root CI is surrounded by a darker frame that repaints itself with a pulsing effect drawing the attention to the root CI. The maps can show both upstream and downstream dependencies for the root CI. By default the Dependency Views map displays 3 levels, both upstream and downstream relationships. Administrators can configure the number of levels displayed. The map collapses and expands clusters to make them easier to view. By default, clusters are collapsed.

In a Dependency Views map, map indicators indicate if a CI has any active, pending issues. You can investigate the tasks that are connected to a CI to get more details. When you return to the map from another form, the system restores the last map viewed, using the default filter and layout settings. When you click the icon on a CI record or on a task record that identifies a CI, the map opens.

Many of the relationships in map are created through the discovery process. You can also create, define, and delete CI relationships in the map. You can display the map from different perspectives and open specific records that relate to configuration items. The system refreshes the map automatically to reflect changes to the CMDB.

Note: CIs not extended from the Configuration Item (cmdb_ci) table, are not displayed in Dependency Views maps and in CI relation formatters.

The Dependency Views module is active in all instances, and includes demo data.
Dependency Views sample map

When you click the map icon

on a CI record or on a task record that identify a CI, a map opens.

Roles

Users with the itil and ecmdb_admin roles can view maps and perform all actions in the map. Actions include access to the map views and saved filters, both from the lists in the map and from the Saved Filters module.

Dependency Views map menus and controls

Dependency Views maps contain the following menus and controls.
## Map options

The following options are available across the top of the map.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Menu</td>
<td>Menu to save, load and export views of the map.</td>
</tr>
<tr>
<td>&lt;Root CI&gt;</td>
<td>Next to the menu icon is the name of the current root node (CI) of the map.</td>
</tr>
<tr>
<td>Search for CI</td>
<td>Enter the name of a CI, application service, or business service to load into the map. Alternatively, you can start typing to have the auto-complete feature present a list of CIs and services that match your partial value.</td>
</tr>
<tr>
<td>Vertical</td>
<td>Display the map in vertical view.</td>
</tr>
<tr>
<td>Horizontal</td>
<td>Display the map in horizontal view.</td>
</tr>
<tr>
<td>Radial</td>
<td>Display the map in radial view.</td>
</tr>
<tr>
<td>Force</td>
<td>Centers the elements around the parent CI, regardless of upstream or downstream relationships.</td>
</tr>
<tr>
<td>Group</td>
<td>Groups the elements according to their CI type.</td>
</tr>
</tbody>
</table>
| Details         | Displays related lists such as Problems, Changes and Related Services that are associated with the selected CI.  
                     * Click a service to highlight the CIs that are associated with that service.  
                     * Click Related Services, then double-click a service to display the map in the Event Management dashboard.  
                     If the Event Management plugin is active, then events and alerts are also displayed. |
| Settings        | Set filters for the map.                                                                                                                   |
Use the navigation tools to increase or decrease the view of the map, rearrange the icons on the map, and move the map on the page.

- Use the plus sign (+) to increase magnification of the map.
- Use the minus sign (-) to decrease magnification of the map.
- Click the center dot to center the map on the page.
- Use the direction arrows to move the page in that direction.
- Use the selection tool under the navigation tool to toggle between moving the entire map or moving one CI on the map.

### Map menu

The following options are available if you right-click the map background.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run Layout</td>
<td>Redraws the map with the current layout option.</td>
</tr>
<tr>
<td>Fit To Screen</td>
<td>Resizes the map to fit all the nodes in the map window.</td>
</tr>
<tr>
<td>Reset Filters</td>
<td>Performs the same action as the Filters &gt; Reset option.</td>
</tr>
</tbody>
</table>

### Node menu

The following options are available if you right-click a node.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Form</td>
<td>Displays the CMDB record of the selected CI in a new tab of the browser.</td>
</tr>
<tr>
<td>View Map</td>
<td>Reloads the map using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.</td>
</tr>
<tr>
<td>View Related Tasks</td>
<td>Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>View Affected CIs</td>
<td>Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the map from the map icon in a task record's Configuration item field.</td>
</tr>
</tbody>
</table>
### Relationship menu

The following options are available if you right-click a relationship link.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>View Relationship Form</strong></td>
<td>Opens the CI Relationship form. You can modify the Parent, Type, and Child of the relationship from this form.</td>
</tr>
<tr>
<td><strong>Modify Relationship</strong></td>
<td>Searches for and selects a new relationship for this link.</td>
</tr>
</tbody>
</table>
### Cluster nodes in a Dependency Views map

Dependency Views maps can display cluster group nodes alongside individual CI nodes, and the child nodes of these cluster groups.

Clusters are CIs in the Cluster (cmdb_ci_cluster) table. A cluster CI is an organized set of computer CIs that work together as a single system. Each node in a cluster group represents a CI, typically a server, that can have referenced hardware, such as disks and network adapters.

Cluster nodes on a Dependency Views map can display in two modes:

- **Collapsed mode**: Displays only the cluster CI node without its child CI nodes. This mode avoids unnecessary clutter in large maps.
- **Expanded mode**: Displays the cluster CI node and all its child CI nodes.

Menu options available for a clustered node include **Collapse** and **Expand** which allow you to control the density on the map.

By default, Dependency Views collapses all cluster groups and displays clusters in collapsed mode on the map.

### Annotation

Icons for cluster nodes and cluster group CI nodes are noted by the string "Cluster" and by a unique cluster icon. The system searches through all the component nodes in a cluster CI or collapsed node looking for tasks, outages, and trouble, such as incidents, problems, or change requests. This search evaluates only the number of levels that are displayed in the diagram.
An expanded cluster node displaying its child nodes
Virtual grouping of nodes in a Dependency Views map

To reduce the density on a map, Dependency Views automatically groups CIs of a similar CI type from the same level.

A large number of nodes can cause a Dependency Views map to become too dense to be helpful. Therefore, if the number of nodes with a similar CI type from same level, exceeds the value of the **Maximum number of nodes (of a similar CI type and at the same level) to display before applying virtual grouping** property, then those nodes are automatically grouped into a virtual group. A single node, the virtual group node is displayed to represent the virtual group, while all actual nodes in the virtual group (that are of a similar CI type), are hidden. Virtual group nodes represent CIs of a similar CI type but are not CIs by themselves and cannot have tasks assigned to them. The number of actual collapsed nodes in the virtual group is noted on the virtual group node.

By default, child nodes of a virtual group are not displayed. You can enable the **Show children of virtual groups** property to display child nodes underneath virtual groups.

Virtual grouping is not applied at the level underneath a virtual group even if the criteria for virtual grouping is met (the number of nodes with a similar CI type from that level exceeds the preconfigured property value). However, virtual grouping can happen at the following level if that criteria is met. This behavior does not depend on any property settings, and you cannot change it.

Menu options for a virtual group include **Expand** and **Collapse**, which allow you to apply virtual grouping and display only the virtual group node, or to undo the virtual grouping and display all actual nodes.

Virtual links

A virtual node is connected to other nodes with a virtual link. A virtual link denotes that there such link between at least one CI in the virtual group, to another CI node on the map.

**Note:** Predefined filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a predefined filter would have excluded. Upon the expansion of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

Also, when using the node menu option **Load More**, virtual grouping is not applied at the newly loaded level even the criteria for virtual grouping is met.
An expanded virtual group
Use Dependency Views

Use the layout controls on a Dependency Views map to display elements in different configurations for easier management. Use the filter panel on the map to display fewer levels or to filter out elements you don't want to see, then save the filter for use later. Draw new relationships between elements or edit existing relationships.

View a Dependency Views map

When you display a Dependency Views map using one of the options below, the map is centered on the root CI, and displays the layout and number of levels defined in the map properties. If Operational Intelligence is activated, then a Dependency Views map provides a mode that lets you directly access metrics information for the CIs on the map.

General role requirements:

- To access a Dependency Views map from either the navigation menu, a script API, or directly from a URL, the minimum role required is the dependency_views. Some operations that are related to icons, indicators, and menu actions require the ecmdb_admin role. Some operations that are related to properties and dependency types require the admin role.
- Dependency Views enforces ACL permissions on CIs, and visually hides them and their relationship from the map if the permission requirement is not met.

The maps generated by Dependency Views are based on D3 and Angular technology, providing a modern interactive graphical interface to visualize configuration items and their relationships.

If Service Mapping is activated, Dependency Views maps are enhanced to display dependencies that reflect connections in service maps. In addition, the list of related services in the Details section includes application services, and technical and manual services if Event Management is activated. All CIs that are included in a service are displayed underneath the service node on the map.

Maps provided by Service Mapping are for application services, including comprehensive maps from the perspective of application services. For more information, see Service Mapping.

Administrators can configure the setting for the default layout of the map and number of levels displayed. When you access the map from a saved view, the map opens using the properties in the saved view, and not the default map properties.

Navigate to Dependency Views and open one of these modules:

- View Map in New Tab: Opens the map in a new, full screen tab without the application navigator.
- View Map: Opens the map in the content pane of the current tab.
- Saved Views: Opens a view of a map that you previously saved.

Click a number in the Version column, and then click the icon.

Save or load a Dependency Views map

In the View Map module, use the menu icon to save and load Dependency Views maps.

1. Navigate to Dependency Views > View Map.
2. Click the view menu icon

3. Select **Save View**, **Load View**, or **Last View**.

**Delete a saved Dependency Views map view**

Use the **Saved Views** module to delete a previously saved view.

1. Navigate to **Dependency Views > Saved Views**.
2. Use the checkbox in the first column of the table to select the map view that you wish to delete.
3. Select **Delete** from the **Actions on selected rows** drop-down menu.

**Change the layout of Dependency Views map**

You can select from different layout options for your Dependency Views map.

1. Navigate to **Dependency Views > View Map**.
2. Select one of the following layout options from the menu across the top of the view.
   - **Vertical**: Displays the elements in a vertical tree pattern according to their upstream and downstream relationships. This is the default value for the initial display of the map.
   - **Horizontal**: Displays the elements in a horizontal tree pattern according to their upstream and downstream relationships.
   - **Radial**: Displays the elements in a radial pattern according to their upstream and downstream relationships.
   - **Force**: Centers the elements around the parent CI, regardless of upstream or downstream relationships.
   - **Group**: Groups the elements according to their CI type.
   - **Details**: Displays related alerts, incidents, problems, and related services.

   **Related Services** displays application services, and if Event Management is activated then also technical services and manual services. You can double-click a service to display the map in the Event Management dashboard.

**Filter the view of a Dependency Views map**

You can filter a Dependency Views map to display specific types or categories of configuration items.

Use the filter panel to control which elements of the map are displayed and to save versions of a filter for later use.

1. Navigate to **Dependency Views > View Map**.
2. Click the

   ![Filter button](image)

   button to open **Map Settings**. Click a filter strip to expand or collapse it, and to set filter items.
<table>
<thead>
<tr>

<td>Description</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Fit to Screen Automatically      | **On:** The map magnification will increase or decrease automatically to display all CIs on the map.  
**Off:** The map magnification remains unchanged when the map is reloaded. |

**View metrics for CIs in a Dependency Views map**

Operational Intelligence processes metrics data for CIs, calculates statistics and aggregations, and detects metrics anomalies. A Dependency Views map lets you switch to metrics mode to directly access the Insights Explorer that displays metrics data for CIs on the map.

The Operational Intelligence (com.snc.sa.metric) plugin must be activated to enable this functionality, and metrics data needs to be processed for the CIs on the Dependency Views map.

Open a Dependency Views map in metric mode which integrates a Dependency Views map with the Insights Explorer functionality that is tailored to the map. In this mode, you can access Insights Explorer functions directly from the map, to explore metrics data for the CIs on the map.

All map CIs are accessible in the right hand side pane, from where you can drill into metrics data.

1. Navigate to **Dependency Views > View Map** to open a map.
2. Right-click on a CI on the map and select **View Metrics** to open the Dependency View map in metrics mode.
   
   In the panel on the right side, the CI that you selected on the Dependency View map is selected by default, and the list of all the metrics available for that CI are displayed.
3. Click the ‘<’ sign on the left of the CI to display all the CIs that you can explore metrics for.
   
   The Insights Explorer is scoped for exploring only the CIs that currently display on the Dependency Views map, and you cannot add or remove CIs from the list. If you use map settings or filters to filter out CIs from the map, the same filtering will apply to the list of CIs that you can explore metrics for.
4. Click on a CI in the CIs list or right-click on a CI on the Dependency Views map, to drill down to the CI’s metrics.
5. Click the **Dependencies Map** tab or the **Metrics** tab to switch modes:
   
   a) In **Metrics** mode: The full functionality of the Insights Explorer is available, you can create metric charts by dragging metrics into the canvas. You can modify chart settings, select different time ranges for the charts, and perform other actions as described in **View metric values in the Insights Explorer**.
   
   b) In **Dependencies Map** mode: Select a CI on the map to drill down to its metrics data, drop-down the **Layout** list to choose a different layout, or modify map settings.

**Perform actions on nodes in a Dependency Views map**

You can view various related items for the nodes in a Dependency Views map.

If the node is a collapsed node or represents a cluster, the incidents, problems and change requests are for all the collapsed nodes.

1. Navigate to **Dependency Views > View Map**.
2. Click the ▼ icon next to a node or right-click a node on the map, to access the following menu items:

**Node Menu**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View Form</td>
<td>Displays the CMDB record of the selected CI in a new tab of the browser.</td>
</tr>
<tr>
<td>View Map</td>
<td>Reloads the view using the selected CI as the new root node, with the currently defined layout setting. This option does not display on the root node.</td>
</tr>
<tr>
<td>View Related Tasks</td>
<td>Displays all tasks or outages associated with the selected CI, including incidents, problems, change requests, and follow-on tasks. This option is always available, even if there are no tasks associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>View Affected CIs</td>
<td>Shows a list of all tasks that have the CI listed as an Affected CI. This option is only visible when you access the view from the view icon in a task record’s Configuration item field.</td>
</tr>
<tr>
<td>View Related Outages</td>
<td>Displays all outages involving the selected CI. This option only appears when there is an outage associated with the CI. This option does not appear on collapsed nodes.</td>
</tr>
<tr>
<td>Add Relationship</td>
<td>This option displays a dotted green line that you can drag to another CI to create a relationship link. A popup dialog allows you to define the relationship type.</td>
</tr>
<tr>
<td>Expand</td>
<td>Displays all CIs and components within a cluster node or a collapsed node. This option only appears if the node is a collapsed or cluster node. The number of additional icons to display is bound by the value of the <code>glide.bsm.max_nodes</code> property.</td>
</tr>
<tr>
<td>Collapse</td>
<td>Collapses all CIs and components within a cluster node or a collapsed node back to a single node. This option only appears if the node has been expanded using the Expand menu item.</td>
</tr>
<tr>
<td>Run Layout From Here</td>
<td>This option re-runs the chosen layout using the current node. Use this option to get a new or clearer view on the same map.</td>
</tr>
</tbody>
</table>
Load More

Starting at the selected icon, loads the next level of the map, past the setting of Max Levels.
The number of additional icons to display is bound by the value of the glide.bsm.max_nodes property.

Export a Dependency Views map

You can export a Dependency Views map to an image in PNG format.

1. Navigate to Dependency Views > View Map.
2. Configure the map view as you want the image to appear. The exported image displays the current view of the map.
3. Click the view menu icon
   ![View menu icon]
4. Click Export Image.
5. Right-click the image and select Save Image As, Print, or any other menu option.
   **Note:** You can not export images from a Dependency Views map using Internet Explorer as your browser.
6. Click the "X" button to close the Export Image window.

View collapsed nodes in a Dependency Views map

Cluster and virtually grouped nodes can be displayed in a collapsed mode to avoid unnecessary clutter in large maps.

1. To expand a collapsed node, right-click the CI and select Expand from the context menu.
2. To collapse an expanded cluster node with children, right-click the CI and select Collapse from the context menu.

Administer Dependency Views

Users with the admin role can control the appearance and behavior of Dependency Views by configuring map indicators, map related items, map icons, and menu actions.

Create or modify map indicators

Dependency Views maps and application service maps, use icons to display additional information for a CI by displaying its related records such as alerts, outages, incidents and problems. These icons are called map indicator.

The default configuration includes map indicators for the following record types:

- Open incident.
- Open alert.
- Unplanned current outage.
- Planned current outage, or an open problem.
Current, planned, or recent change request.

You can filter out the display of affected CIs, alerts, current change requests, incidents and problems from the map settings menu. Also, you can create a map indicator to define additional record types, such as trouble sources for CIs in a service. You can also modify an existing map indicator, for example to use a different color scheme or to alter the priority of a task.

The Affected CI’s map indicator appears for CIs in two related but not identical situations. It appears for CIs for which tasks such as change request, incident, or problem were directly created for, and for any CIs that were added in those tasks (parent tasks) as Affected CIs (The CI for which a task is directly created for, is automatically added as an affected CI in that task).

The state of affected CI’s depends on the status of the respective parent task. For as long as the parent task is active, the associated affected CIs continue to be impacted by the task issue. In a map, the Affected CI’s indicator displays for all affected CIs for as long as the parent task is active. On a map, the Affected CI tooltip displays the details of the task records in which the CI was added as an affected CI. However, the Details pane does not contain an Affected CI’s tab, and no further details about affected CIs, or the associated tasks are displayed. After the parent task is closed, the Affected CI’s indicator no longer displays for any of the tasks’ affected CIs. For information about affected CIs in Change Management, see Associate CIs to a change request.

**Note:** Details about affected CIs are derived from the task and the cmdb_ci tables and their extensions. Therefore, if you use custom tables to store CIs for incidents, problems and changes, it affects the details that are displayed for affected CIs.

For more information on how map indicators are used to show tasks and outages in clusters and collapsed nodes, see Cluster nodes in a Dependency Views map.

1. Navigate to Dependency Views > Map Indicators.
2. Click New to create a new map indicator, or click the name of an indicator from the Table column to modify an existing map indicator.
3. Fill in the fields on the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the table represented by this map indicator.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the map indicator. Views are not supported, although included in the list.</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the indicator.</td>
</tr>
<tr>
<td>Order</td>
<td>Priority order of the task. The highest priority task is the indicator with the lowest order number. When more than one indicator is present on a CI, the displayed color is the color associated with the highest priority task. Additionally, a glyph on a CI displays the color indicator of the highest priority task attached to that CI.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Icon                  | File name and path of the icon image file, which can be a system image.  
  - To create a new icon, see Create or modify map icons  
  - To create or use a system image see . |
| CMDB CI field         | Name of the field on the selected table that contains the configuration item. |
| Start field           | The record property that determines the time-point on the metric chart timeline for placing records in the Insights Explorer.  
  Possible values depend on the selected Table. For example, the incident indicator has values such as Actual end, Actual Start, and Approval Set. |
| Description field     | Name of the field on the selected table that contains the description of the configuration item. |
| Description           | Text to display when hovering over the indicator. Alphanumeric characters and spaces are valid for this field. |
| Conditions            | Condition builder that specifies for which CIs to apply this indicator. For example, a CI that has a current past outage is highlighted for 5 days. You can configure a condition to designate a different timeframe for what is considered to be current. |
| Active in Service Map | Enable to make the toggle for the specified table available in the Settings dialog box for application service maps. You can then toggle between displaying or not displaying the respective records on the map. |
| Active Dependencies   | Enable to make the toggle for the specified table available in the Settings dialog box for Dependency Views maps. You can then toggle between displaying or not displaying the respective records on the map. |
| Active in Metrics     | Enable to make the toggle for the specified table available in the Settings dialog box for the Insights Explorer. You can then toggle between displaying or not displaying the respective records on the Insights Explorer. |
| Label                 | Text to display for the indicator on the map. |
| Tooltip Label         | The prefix portion of the tooltip (Tooltip Label : Tooltip Info). |
| Tooltip Info          | The suffix portion of the tooltip (Tooltip Label : Tooltip Info). |

4. Click **Submit** to enter a new map indicator. Click **Update** to modify an existing map indicator.
For an indicator to appear in a Dependency Views map, a CI must meet all filter conditions, and Active Dependencies must be selected.

Create or modify map icons

You can upload new icons or modify existing icons to customize the icon displayed for a CI in maps in Dependency Views, Service Mapping, and Event Management.

The icons used in Dependency Views maps are listed in the Map Icons module. Records in the Map Icons list are arranged by CI classes, such as cmdb_ci_linux_server. The path to the default image files is https://<instance name>.service-now.com/images/app.ngbsm/<image name.svg>. For information about uploading images to the database, see Storing images in the database.

Role required: admin or cmdb_admin roles are required to access the records in this table (ngbsm_icon) to upload new icons.

- Navigate to Configuration > CI Class Manager, and:
  a) Click Hierarchy to display the CI Classes list.
  b) Select a class to modify the icon for.
  c) In the class navigator bar, expand Class Info and then select Basic Info. On the Basic Info form, click Icon.
  d) In the Icons dialog box, select an icon and then click Update.
  e) On the Basic Info form, click Update.

- Navigate to Dependency Views > Map Icons, and:
  a) Click New to create a new map icon or click the name of an existing icon in the Label column to modify an existing icon.
  b) Fill in the fields on the form, as appropriate.

  Map Icons form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CI Type</td>
<td>Label or the informal name of the CI table that this icon represents in the view.</td>
</tr>
<tr>
<td>Icon</td>
<td>Name of the icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Path to the icon image using the following format: /image name.svg Click the lock icon to enter a new path.</td>
</tr>
</tbody>
</table>

  c) Fill in the fields on the form, as appropriate.
  d) Click Submit to enter a new icon. Click Update to modify an existing icon.

You can modify a Dependency Views map indicator to use the new icon.

Create a predefined filter

Create filters to narrow down the CIs that are displayed on a Dependency Views map. You can create filters that are based on CIs' class, CIs' attributes, or CIs' relationships.

Role required: ecmdb_admin
Create a predefined filter that you can then select to determine the scope of the CIs that are displayed in a Dependency Views map. *Configuration type filters* filter by CI class, *CI filters* filter by CI attributes, and *relationship filters* filter by relationships. Only CIs that match at least one of the configuration type filters (if any exists), and at least one of the CI filters (if any exists), and at least one of the relationship type filters (if any exists) - are displayed on the map. If no filters are defined, then no filtering is applied.

**Note:** Predefined filters do not apply to virtual groups. Therefore a virtual group displays even if it contains CIs that a predefined filter would have not included. Upon the expansion of a virtual group, predefined filters are applied, and any or all of the CIs that were previously virtually grouped, might no longer display on the map.

1. Navigate to Dependency Views > Predefined Filters.
2. On the Predefined Filters page, click New.
3. Type in a Name for the filter. Click Roles, and in the Roles dialog box, select the roles that this filter will be available for.
4. Right-click on the page header, and click Save.
5. To create a configuration type filter:
   a) Click Configuration Types, and then click Edit.
   b) In the Collection slushbucket, select the classes that CIs must belong to in order to be displayed on the map, and move them to the Configuration Types List.
   c) Click Save.
6. To create a CI filter:
   a) Click CI Filters, and then click New.
   b) In the CI Filters page enter conditions to filter CIs by specific attribute values.
   c) Click Submit.
7. To create a relationship type filter:
   a) Click Relationship Type, and then click New.
   b) In the Collection slushbucket, select the relationships that CIs must have in order to be displayed on the map, and move them to the Relationship Types List.
   c) Click Save.

After creating a predefined filter, you can apply it to a map:
1. Click the icon to open Map Settings.
2. Select a filter from the Predefined Filters list.
3. Click Apply.

**Set a predefined filter as default**

You can set a custom predefined filter as the default predefined filter for viewing maps.
1. Create the custom predefined filter to be used as the default predefined filter.

© 2020 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
2. On the predefined filter form, click the context menu and select **Copy sys_id**.
3. Navigate to **User Administration > User Preferences**.
4. Click **New** and create a new user preference record using these values:
   - **Name**: ecmdb.ciview
   - **Type**: String
   - **Value**: Paste the sys_id of the custom predefined filter
   - **User**: Leave blank to create a system-wide setting
   - **Description**: Description of the predefined filter
   - **System**: Selected
5. Click **Submit**.

In **Map Settings**, when you select the **Default** option for **Predefined Filters**, the custom predefined filter that was set, will be applied.

### Create or modify Map Related Items

The Map Related Items module relates referenced CIs to one another, which allows them to be displayed in a Dependency Views map.

The base system configuration includes the following tables and relates them to items in the Computer (cmdb_ci_computer) and Server (cmdb_ci_server) tables.

- Disk (cmdb_ci_disk)
- Network Adapter (cmdb_ci_network_adapter)
- Database (cmdb_ci_database)

Some additional referenced CIs that can be related in this manner are file systems and running processes.

In the following example, computer nodes in the map are related to network adapter nodes if the **Configuration Item** field of the adapter records reference the specific CI node. Access or create a network adapter record from the Network Adapter related list in the cmdb_ci_computer record.

![Network Adapter](image)

**Dependency Views Configuration Item field**

The Dependency Views map for the *JEMPLOYEE-IBM computer shows the network adapter attached to the computer.*
You can configure Dependency Views to display CIs that have no relationship record, but are related to other CIs by reference fields.

1. Navigate to **Dependency Views > Map Related Items**.
2. Click **New** to create a new related item, or click in the row of an existing CI to modify an existing map related item.
3. Fill in the fields on the form, as appropriate. See the Related Items form table.
4. Click **Submit** to enter a new map related item. Click **Update** to modify an existing map related item.

### Related Items form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Configuration item</strong></td>
<td>CI that represents the base node or a CI in a table that extends the base node table. In the base system, the configuration item that represents the base node is Computer (cmdb_ci_computer), which includes all types of workstations and servers.</td>
</tr>
<tr>
<td><strong>Related item</strong></td>
<td>Table name of the related item. Only the cmdb_ci table and tables that extend it are displayed in the choice list.</td>
</tr>
<tr>
<td><strong>Related field</strong></td>
<td>Field that links this related item to the configuration item. In many cases, the appropriate value is automatically populated in the field after the first two fields are selected. Select the drop-down menu for additional options.</td>
</tr>
</tbody>
</table>
Create or modify Dependency Views menu actions

To modify an existing menu option, first you create a copy of the original menu action record, and then you modify the copy.

This ensures that your instance can update the record normally during the upgrade process and allows you to quickly restore the original menu option, if necessary.

1. To create a new menu option, navigate to Dependency Views > Map Menu Actions and click **New**.
   Fill in the fields on the form, as appropriate. See the Menu Action form table.
2. To modify an existing menu option, navigate to Dependency Views > Map Menu Actions.
3. Open the menu action you want to edit.
4. Right-click in the header and click **Insert and Stay**.
   This step creates a duplicate copy of the menu action and leaves it open for editing.
5. Change the name of the copied record to avoid confusion.
6. Modify the form fields as necessary and save the record.
7. Open the original record and disable it by clearing the **Active** check box.

Menu Action form

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name that appears as the menu option.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that allows you to enable or disable this record.</td>
</tr>
<tr>
<td>Condition</td>
<td>Condition that triggers the display of this menu option. If the condition evaluates to false the menu option does not display. Script is evaluated in JavaScript in the user's browser and does not have access to all the APIs that Business Rules do. For details on available parameters, see Condition Parameters.</td>
</tr>
</tbody>
</table>
| Item    | Map element for which the menu option displays. Valid values are:  
- Canvas for the menu on the map background.  
- Node for the menu on a CI.  
- Relationship for the menu on a relationship link. |
<p>| Order   | Physical location of the option in the menu. The option with the lowest order number appears first in the menu. All editable and custom options appear below the permanent menu options. |</p>
<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Script</td>
<td>Script that is executed in the browser when the menu option is selected. Script is evaluated in JavaScript in the user's browser and does not have access to all the APIs that Business Rules do.</td>
</tr>
<tr>
<td>Type</td>
<td>Menu action type being created, either a menu option or a menu separator. The menu separator is a single line. When the type is a separator, the <strong>Script</strong> field is ignored.</td>
</tr>
</tbody>
</table>

### Condition and script parameters for menu actions

You can use the following condition and script parameters for menu actions.

#### Condition parameters

**Note:** The usual regular expression conventions are valid in the condition field, such as ! for NOT, && for AND, and || for OR.

The **Condition** field contains a boolean expression that evaluates to true or false. If the condition is true or if there is no condition, the specified option appears in the menu when you right-click a CI or a relationship link. When you select the option from the menu, ServiceNow executes the associated script.

**Common Elements for Building a Condition**

<table>
<thead>
<tr>
<th>Text</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Node or reference link’s data on which you performed the right-click action.</td>
</tr>
<tr>
<td>item.label</td>
<td>Label of the node.</td>
</tr>
<tr>
<td>item.ci_type</td>
<td>CI’s type (table), such as cmdb_ci_service.</td>
</tr>
<tr>
<td>item.name</td>
<td>Name of CIs. CI’s type name or the table label.</td>
</tr>
<tr>
<td>item.location</td>
<td>Location of the CI, such as New York.</td>
</tr>
<tr>
<td>item.manufacturer_name</td>
<td>Name of the CI’s manufacturer, such as Dell Inc.</td>
</tr>
<tr>
<td>item.id</td>
<td>The sys_id of the CI.</td>
</tr>
<tr>
<td>item.is_selected</td>
<td>The item that is selected in the map.</td>
</tr>
<tr>
<td>item.level</td>
<td>The current default level.</td>
</tr>
<tr>
<td>item.locationId</td>
<td>The sys_id of the CI node’s location.</td>
</tr>
<tr>
<td>item.locationName</td>
<td>The full address of the location.</td>
</tr>
<tr>
<td>item.manufacturerId</td>
<td>The sys_id of the CI’s manufacturer.</td>
</tr>
</tbody>
</table>
Valid Conditions for Condition Parameters

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.isCollapsed</td>
<td>The node is a collapsed node.</td>
</tr>
<tr>
<td>item.isCluster</td>
<td>The node is a cluster node.</td>
</tr>
</tbody>
</table>

Script parameters

Menu action scripts are executed on the client when a user clicks the menu option. You can use the same building blocks in scripts as in conditions. Menu action scripts do not function on separators. These are some additional, useful expressions for scripts:

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item.id</td>
<td>The sys_id of the CI node or relationship link.</td>
</tr>
<tr>
<td>item.source</td>
<td>The sys_id of the relationship’s parent or child.</td>
</tr>
<tr>
<td>item.target</td>
<td>The sys_id of the relationship’s parent or child.</td>
</tr>
<tr>
<td>item.label</td>
<td>The name of the CI node, such as IronMail-SD-02.</td>
</tr>
<tr>
<td>item.location</td>
<td>The sys_id of the CI node’s location.</td>
</tr>
<tr>
<td>item.location_name</td>
<td>The full address of the location, such as 4616 Clairemont Drive, North Clairemont, San Diego CA.</td>
</tr>
<tr>
<td>item.manufacturer_id</td>
<td>The sys_id of the CI’s manufacturer.</td>
</tr>
</tbody>
</table>

Create or edit a dependency type

Use one of the dependency types provided, or create a custom dependency type with a script that will execute in real time to generate a custom view of a Dependency Views map for a specific CI.

Create a JavaScript to customize the map. The script must comply with JavaScript syntax guidelines and the directions in the default script template, and it can call platform APIs. Use a dependency type, for example:

- To narrow down and simplify a map, leaving out CIs that are not important for a specific task.
- To include only specific CIs that are hidden by default, such as qualifiers, end-points, and entry points.
- To display virtual relationships that are calculated, and that otherwise do not exist in the CMDB.
- As a tool to plan a new topology deployment that is based on existing resources.

The following dependency types are included in the base system:

**Application to Network Devices**

Returns the network devices in the network paths leading to/from the given CI.

**Network Device to Applications**

Returns the applicative CIs which are target or source of network paths containing the given network device. In addition, returns the hosts of those applicative CIs, and for an applicative CI that is an inclusion, its parent CI is returned too.
Physical Network Connections
Returns hosts/network devices that are physically connected to the given host or network device.

Flow Dependencies
Returns all the server to server connections that were discovered using the Netflow collector. The script builds a graph based on data in the \texttt{(sa\_flow\_server\_comm)} table. This table contains pairs of services represented by an IP and a listening port that are communicating with each other. For more information, see \textit{Data collection and discovery using Netflow} and \textit{Data collection and discovery using VPC Flow Logs}.

Show All Relationships
Returns all qualifiers, end points, and entry points. This dependency type is disabled by default and is typically enabled for debugging and tracking purposes.

1. Navigate to \textbf{Dependency Views > Dependency Types}.
2. In the \textbf{Load Filter Scripts} list view, select an existing dependency type, or click \textbf{New}.
3. Enter or modify a script, adhering to the guidelines and requirements in the script template that is provided.
4. Click \textbf{Submit}.

In a Dependency Views map, you can click \textbf{Use Dependency Type} to apply a custom script defined in a dependency type.

Properties for Dependency Views

Use Dependency Views properties to configure how data appears in Dependency Views maps. These properties are available for Dependency Views. To view and edit these properties, the admin role is required.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of CIs to display on a map at once. glide.bsm.max_nodes</td>
<td>The maximum number of nodes to retrieve from the database. If more nodes exist in the database, they are not displayed in the map.</td>
</tr>
<tr>
<td>Maximum level depth from the root CI that can be initially displayed in Dependency Views. glide.bsm.max_levels</td>
<td>Level depth is the graph distance between the root CI and a node.</td>
</tr>
<tr>
<td></td>
<td>Type: Integer</td>
</tr>
<tr>
<td></td>
<td>Default value:: 3</td>
</tr>
<tr>
<td></td>
<td>Other possible values: 1-49</td>
</tr>
<tr>
<td></td>
<td>Location: \textit{Dependency Views &gt; Map Properties}</td>
</tr>
</tbody>
</table>

| Property                                                                 || Description                                                                                                                                 |
|--------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Display the continuation of the map underneath virtual group. Virtual links are used to connect virtual groups to their child nodes. glide.bsm.show_virtual_node_children | • Type: Yes | No  
• Default value: No  
• Location: Dependency Views > Map Properties |
| Maximum number of child nodes to display (the rest will be collapsed). glide.bsm.too_many_children | Maximum number of nodes (of a similar CI type and at the same level) to display before applying virtual grouping. Nodes are collapsed for the map to meet this limit.  
• Type: Integer, valid values 1 or greater  
• Default value: 10  
• Location: Dependency Views > Map Properties |
| A value of true indicates that filtered out items will be removed from the graph along with any disconnected children while a value of false indicates that the items will be dimmed in color. glide.ngbsm.filters_remove_filtered_items | • Type: Yes | No  
• Default value: Yes  
• Location: Dependency Views > Map Properties |
| Maximum number of relations per node. glide.bsm.max_num_rels | The maximum number of relations to retrieve from the database. If more relations exist in the database, they are not displayed in the map.  
• Type: Integer  
• Default value: 100  
• Other values: 1 or greater  
• Location: Dependency Views > Map Properties |
| A value of true indicates that when filters are changed the graph will recalculate its layout using the currently selected layout algorithm. glide.ngbsm.filters_run_layout_automatically | • Type: Yes | No  
• Default value: Yes  
• Location: Dependency Views > Map Properties |
| A value of true indicates that when filters are changed the graph will be fit to the screen automatically. glide.ngbsm.filters_fit_to_screen_automatically | • Type: Yes | No  
• Default value: No  
• Location: Dependency Views > Map Properties |
| A value of true allows relationship lines to be drawn using smooth curves instead of straight line segments. These curves can be more taxing on the browser, setting to false may improve fluidity of animation and interaction for Dependency Views. glide.ngbsm.performance_allow_curves | • Type: Yes | No  
• Default value: Yes  
• Location: Dependency Views > Map Properties |

**Components installed with Dependency Views**

Several types of components are installed with the activation of the Next_Gen BSM (com.snc.ng_bsm) plugin, such as tables.

**Note:** The Application Files table lists the components installed with this application. For instructions on how to access this table, see *Find components installed with an application*.

### Tables installed

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available CI icons (ngbsm_ci_icons)</td>
<td>Stores all available CI class icons.</td>
</tr>
<tr>
<td>Icons for CI types (ngbsm_ci_type_icon)</td>
<td>Maps icons to CI class names.</td>
</tr>
<tr>
<td>Map Script (ngbsm_script)</td>
<td>Custom scripts that run in real time and generate a custom view of a map for a specific CI.</td>
</tr>
<tr>
<td>Map View (ngbsm_view)</td>
<td>Serialized map views saved by users.</td>

</table>
### Compliance

Compliance is a tool set that enables administrators to certify ServiceNow data for correctness and fix any discrepancies found in the data.

Compliance offers these certification options to suit the size and requirements of your organization:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related Item</td>
<td>Stores which reference fields should be treated as relationships when building the map. This allows users to include CI's that are related via a reference field instead of a relationship.</td>
</tr>
<tr>
<td>(ngbsm_related_item)</td>
<td></td>
</tr>
<tr>
<td>Edge Colors</td>
<td>Color definitions to use when drawing the relationships between nodes based on relationship type.</td>
</tr>
<tr>
<td>(bsm_edge_color)</td>

Compliance certification options

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Desired State</td>
<td>Automatically compares the actual attributes and relationships of specific ServiceNow records against the desired states for those records. For example, an audit can detect a Linux database server with insufficient RAM or whose Depends on relationships with another CI is incorrect. The system then publishes any discrepancies found and automatically assigns follow-on tasks to qualified users to bring that server into compliance.</td>
</tr>
<tr>
<td>Architecture Compliance</td>
<td>Automatically compares the actual attributes of specific CIs, such as CPU count, RAM, or disk size against the expected attributes for those CIs. The system publishes any discrepancies found and automatically assigns remediation tasks to qualified users.</td>
</tr>
</tbody>
</table>

Compliance Activation

Compliance functionality is provided by the Certification Core plugin.

The Certification Core plugin which contains shared functionality required for certification audits. It consists of the following plugins, and is activated by default.

- Desired State (activated by default)
- Architecture Compliance *(activate)*
- Data Certification *(activate)*

Installed with Compliance

These components are installed with the Certification Core plugin.

Demo data is included with the Desired State and Architecture Compliance plugins.

The Certification Core plugin adds or modifies these tables.

Compliance Certification Core tables

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

</tr>
<tr>
<td>Certification Related List Condition (cert_related_list_cond)</td>
<td>Contains the related list conditions. This table extends the Certification Condition (cert_cond) base table.</td>
</tr>
<tr>
<td>Certification Filter (cert_filter)</td>
<td>Contains a certification filter, including the table that contains the records to audit and the filter conditions.</td>
</tr>
</tbody>
</table>

**User roles**

The certification role is automatically assigned to all users with the itil role when the Certification Core plugin is activated or when compliance applications are upgraded. Certification core installs two business rules, both called Add Certification Role To Manager, that perform similar tasks on different tables. One rule checks for a manager specified on the User (sys_user) table, and the other checks for the certification role on the User Role (sys_user_has_role) table. When both a manager and the certification role are specified for a user, the system automatically grants the certification role to the manager. This functionality ensures that a certification task can be escalated successfully to the next level. The system grants this automatic role to the user’s immediate manager only and not to others up the management chain.

**Note:** When a manager has only the certification role and no other role, the manager is considered a Requester and is not counted as a subscribed user (Fulfiller).
### Compliance Certification Core user roles

<table>
<thead>
<tr>
<th>Name</th>
<th>Contains roles</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification</td>
<td>none</td>
<td>Can read and update certification tasks to resolve discrepancies.</td>

<tr>
<td>Prevent deletion of audit with results</td>
<td>Audit (cert_audit)</td>
<td>Prevents deletion of an audit containing results.</td>
</tr>
<tr>
<td>Prevent delete of Filter with Template</td>
<td>Certification Filter (cert_filter)</td>
<td>Prevents deletion of a filter still linked to a template or audit.</td>
</tr>
<tr>
<td>Prevent deletion of result with task</td>
<td>Audit Result (cert_audit_result)</td>
<td>Prevents deletion of an audit result with an attached task.</td>
</tr>
<tr>
<td>Prevent delete of Template with Audit</td>
<td>Certification Template (cert_template)</td>
<td>Prevents deletion of a template still being used by an audit.</td>
</tr>
<tr>
<td>Update conditions’ tables</td>
<td>Certification Template (cert_template)</td>
<td>When storing template conditions, properly run all workflows and update the condition fields to contain the display version of the conditions.</td>
</tr>
<tr>
<td>Update filter version</td>
<td>Certification Filter (cert_filter)</td>
<td>Creates a version when the filter changes in any meaningful way.</td>
</tr>
<tr>
<td>Update next run time</td>
<td>Audit (cert_audit)</td>
<td>Updates the time in the Next scheduled run field when an audit is modified.</td>
</tr>
<tr>
<td>Update next run time during execution</td>
<td>Audit (cert_audit)</td>
<td>When the audit runs, update the Next scheduled run field to the next time the audit is scheduled to run.</td>
</tr>
<tr>
<td>Update table</td>
<td>Certification Template (cert_template)</td>
<td>Update the stored table to the table of the filter.</td>
</tr>
<tr>
<td>Update template version</td>
<td>Certification Template (cert_template)</td>
<td>Creates a version when the template changes in any meaningful way.</td>
</tr>
</tbody>
</table>

**Compliance Templates and Audits**

The Templates and Audits modules on the top level of the Compliance menu enable a certification_admin user to create, edit, and delete all template and audit types.

You can use Compliance Templates and Audits to evaluate records for any table in the ServiceNow system, not just those tables extending the Configuration Item [cmdb_ci] table. Compliance audits certify record attributes only. Compliance templates can be used in Control Test Definitions in Governance Risk and Compliance.
Compliance Overview module

The Compliance Overview module is a type of homepage.

The Compliance Overview module summarizes:

- Current audit states
- Outstanding certification tasks
- Compliance discrepancies
- Upcoming audits
- General state of compliance audits for Data Certification, Desired State, Architectural Compliance, and Scripted audits

To use the Compliance Overview:

1. Navigate to Compliance > Overview.
2. Click elements within the reports to obtain more information.
   For example, click the Disk space (GB) bar in the Compliance Discrepancies chart to open a list of audit results filtered by disk space attributes.
Compliance Overview module roles

Only users with certain roles can access the Overview module.

The different levels of access are:

<table>
<thead>
<tr>
<th>Role</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification</td>
<td>View (view overview page and refresh reports)</td>
</tr>
<tr>
<td>certification_admin</td>
<td>· View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>· Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td></td>
<td>View, customize</td>
</tr>
<tr>
<td>admin</td>
<td>· View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>· Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td></td>
<td>· Edit (can edit gauges)</td>
</tr>
</tbody>
</table>

Architecture Compliance

Architecture Compliance performs scheduled or on-demand audits of configuration management database (CMDB) data to determine which configuration items (CI) match the expected attributes.

The compliance process checks servers to ensure that their resources, such as CPU speed or memory, comply with standards set by your organization. Audit reports show any discrepancies in the attributes of the target CIs, and ServiceNow automatically assigns follow-on tasks to qualified users who can remediate those discrepancies.

Activate Architecture Compliance

Administrators can activate the Architecture Compliance plugin to access the application.

Activating this plugin automatically activates these additional plugins.

- Certification Core plugin contains shared functionality required for certification audits.
- Version Management plugin manages certification filter and template versions.

1. Navigate to System Definition > Plugins.

   A banner notifies you that you're in the All Applications page, which contains plugins and ServiceNow Store applications.

   Note: To redirect to the legacy list view for plugins, click the link.

   You have been redirected to All Applications. To see the Plugins list click here
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   - If you're certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.

   ![Activate Plugin dialog box]

   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.
        If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
     4. If demo data is available and you want to install it, click Load demo data.
        Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
     5. Click Activate.

Architecture Compliance

Architecture Compliance manages scheduled or on-demand reviews of CMDB data to determine which configuration items (CI) match expected attributes. The compliance audits check servers to ensure that their physical resources, such as CPU speed or memory, comply with certain standards.
The administrator responsible for compliance checking creates template definitions of expected attributes and then schedules an audit to check CIs for compliance. The audit results identify CIs that pass certification and itemize the discrepancies in those CIs that fail. ServiceNow automatically generates and assigns follow-on tasks to track the process of getting the CIs back into compliance. Users with the admin role activate Architecture Compliance.

**Architecture Compliance Process**

Perform these tasks in this order to certify configuration items with Architecture Compliance.

1. **Create a filter.**
   
   Create a filter that defines a subset of configuration items to certify. You can create multiple versions of a filter, and then activate the version you want to use for compliance checking. Architecture compliance only supports filters on the Configuration Item (cmdb_ci) table and all tables that extend it.

2. **Create a template.**
   
   Create template conditions using values from reference fields in a related list or conditions that define the expected physical attributes of each CI in an audit. The template uses a filter to determine which configuration items the system examines based on these conditions.

3. **Create and run an audit.**
   
   Create and schedule an audit or run an audit on demand. The audit generates a set of results based on the conditions in the template you specify.

4. **View audit results.**
   
   View the audit results which display any discrepancies between the expected state, as expressed by the template conditions, and the actual state of the target configuration items.

5. **Correct discrepancies.**
   
   Correct the discrepancies the audit found by completing the follow-on tasks created by the system.

**Architecture Compliance Overview module**

The Architecture Compliance Overview module displays various architecture compliance reports. The Overview module is a type of homepage.

Only compliance users with certain roles can access the Overview module. The different levels of access are:

<table>
<thead>
<tr>
<th>Role</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification</td>
<td>View (view overview page and refresh reports)</td>
</tr>
</tbody>

**Architecture Compliance roles**

To access or configure certification elements, a user must have the certification_admin role. These users can create, update, and delete filters if they have the proper access to necessary tables.

In the base ServiceNow system, certification_admin users have limited system rights and do not have access to all the necessary tables. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, the certification administrator needs roles that grant access to these tables:

- **Company**: [core_company]
- **Cost Center**: [cmn_cost_center]
- **Schedule**: [cmn_schedule]

**Desired State**

Desired State performs scheduled or on-demand audits of CMDB data to determine which records match the expected attributes, CI relationships, and relationships to other records in the system.

For example, desired state can determine if a computer has a license for a particular software program. The compliance process checks configuration items (CI) to ensure that their attributes and relationships comply with standards set by your organization. Audit results show any discrepancies in the desired state of a record, and ServiceNow automatically assigns follow-on tasks to qualified users who can remediate those discrepancies.

**Desired State process**

The Desired State application conducts scheduled or on-demand audits of CMDB data to determine which configuration items (CI) match a desired state.

The desired state certification process can mean checking servers to ensure that their physical resources, such as CPU speed or memory, comply with certain standards. This process also ensures that all critical business services have a manager, support group, and approval group assigned.

The administrator responsible for certification creates definitions of desired states and then schedules an audit to check CIs for compliance. The audit results identify CIs that pass certification and itemize the discrepancies in those CIs that fail. The ServiceNow system automatically generates follow-on tasks to track the process of adjusting the CIs to the desired state.

Desired state differs substantially from data certification. Data certification is a manual process to ensure that your data matches reality. Desired state examines the same data and determines when the configuration of each item is in the desired and approved state.

1. **Create a certification filter**: Create a filter that defines a subset of configuration items to certify. You can create multiple versions of a filter, and then activate the version you want to use for certification. You can create filters on the Configuration Item (cmdb_ci) table and all tables that extend it.

2. **Create a template**: Create a template with conditions that define the desired state of the physical attributes, related records, and relationships for a CI. The certification filter you select for the template determines which configuration items the system examines.

3. **Create and run an audit**: Create an audit using the template. Set the audit to run on a schedule or on demand. The audit generates a set of results based on the conditions from the template you specify. Determine usage of follow-on tasks:
• Determine if the audit creates follow-on tasks and assignment.
• Determine if the same follow-on task is used for the same audit failure across multiple runs. The system attribute `glide.allow.new.cert_follow_on_task` is set to true by default, allowing for new follow on tasks to be created for the same failure, at each audit run.

4. View audit results: View the audit results which display any discrepancies between the desired state, as specified by the template, and the actual state of the target configuration items.

5. Correct discrepancies: Correct the discrepancies the audit found by completing the follow-on tasks created by the system.

**Desired State roles**

To access or configure certification elements, a user must have the `certification_admin` role. These users can create, update, and delete filters if they have the proper access to necessary tables.

In the base system, `certification_admin` users have limited system rights and do not have access to all the necessary tables. When assigning compliance resources, make sure to grant additional roles to the `certification_admin` user as needed. For example, the certification administrator requires roles that grant access to these tables:

- Company (`core_company`)
- Cost Center (`cmn_cost_center`)
- Schedule (`cmn_schedule`)

**Desired State Overview module**

The Desired State Overview module displays various desired state reports. The Overview module is a type of homepage.

The Desired State Overview module is a type of homepage.

**Use the Desired State Overview module**

The Desired State Overview module displays various desired state reports.

1. Navigate to **Compliance > Desired State > Overview**.
2. Move or add reports where needed.
3. Click elements within the reports to obtain more information.

The Desired State Overview Module in the base system contains these reports:

- Upcoming Desired State Audits: All scheduled audits.
- Outstanding Desired State Tasks: All follow-on tasks in the **Pending**, **Open**, or **Work in Progress** state.
- Hierarchical Task Roll Up: All follow-on tasks grouped by **Assigned to** user.
- Desired State Discrepancies: All audit discrepancies for attributes and relationships.
- 30/60/90 Day Task Aging: All outstanding follow-on tasks grouped by age in 30-day increments.

<td>View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td></td>
<td>Edit (can edit reports)</td>
</tr>
</tbody>
</table>

**Access levels**

The different levels of access are:
- **View**: can view the overview page and refresh reports.
- **Customize**: can refresh, add, delete, and rearrange reports.
- **Edit**: can edit reports.

**Desired State reporting**

The Desired State application includes reports to assess your audit results.

These reports are available to all users whose role gives them access to the Reporting application. Users with the admin role can share these reports with specific users of groups or change the display options.

Navigate to **Reports > View / Run**. In the **Reports** search field, enter all or part of the report name. You can also scroll to the designated category and select one of the reports.

In addition to these reports, you can also generate other reports.

**Certification audits**

A certification audit compares the actual attributes of certain ServiceNow records. This audit selects a filter, against the expected attributes, relationships, and related record values defined by template conditions or a script.

You can configure the audit to create and assign follow-on tasks to remediate any discrepancies the audit finds. Audit records use a standard ServiceNow scheduler to determine when to run. After an audit runs, the results and follow-on tasks appear in related lists in the audit record.

Users with the certification_admin role can create, update, delete, and run audits. Users with the certification role can view audits, audit results, and follow-on tasks.

**Create an audit**

Compliance offers two types of audits: one uses templates to define conditions and the other uses a script.

Role required: certification_admin

1. Ensure that an appropriate template record was created for this audit.

   **Note:** Conditions in the template define the values to audit.

2. Use the CI Class Manager:
   a) Navigate to Configuration > CI Class Manager.
   b) Click **Hierarchy** to display the CI Classes list. Select the class for which to create an audit.
   c) In the class navigation bar, expand **Health** and then click **Compliance**. Click **Audit**.

3. Or, navigate to one of these modules:
   - Compliance > Audits
   - Compliance > Architecture Compliance > Audits
   - Compliance > Desired State > Audits
   - Compliance > Scripted Audits > Audits

4. Click **New**.
The system opens a new record for the audit type associated with the navigation path you selected. The **Audit type** field is read-only.

5. Complete the form using the fields described in the table below.

6. Right-click the header bar and select **Save**.

The **Audit Results** and **Follow On Tasks** related lists appear on the form.

7. To run the audit immediately, click **Run Audit**.

When template audits run, ServiceNow updates the date and time in the **Last run date** field and populates the related lists. For scripted audits, the **Last run date** field is not populated.

8. View the records that passed and the discrepancies found by the audit in the **Audit Results** related list.

You can open template records and any follow-on tasks directly from this related list. Notice that the value in the **Task description** field appears as the **Short description** in the follow-on tasks.

**Note:** You cannot delete audit records that have audit results or audit results that have follow-on tasks. ServiceNow disables the **Delete** option in records and lists where these dependent records exist.

### Creating Audits

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for this audit.</td>
</tr>
<tr>
<td>Filter</td>
<td>Filter to use when the audit type is Scripted. This field is required for scripted audits, but is hidden for all other audit types.</td>
</tr>
<tr>
<td>Template</td>
<td>(Required) Template to use when this audit runs. Audit type filters the list of available templates, and only the active versions of templates are available for selection. For example, when you create an audit from Desired State, only templates of the Desired State audit type are available for selection. For the Desired State and Architecture Compliance audit types, only templates for tables that extend the Configuration Item (cmdb_ci) table are available. This field is hidden when the audit type is Scripted.</td>
</tr>
<tr>
<td>Table</td>
<td>(Read-only) Table for the template.</td>
</tr>
<tr>
<td>Create tasks</td>
<td>Option to create follow-on tasks for correcting discrepancies (selected). In a scripted audit, you can create the logic for either task state by using <strong>true</strong> to create tasks or <strong>false</strong> to not create tasks. By default, this check box is cleared (<strong>false</strong>) in a new audit record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assignment type</td>
<td>Method for assigning follow-on tasks. This field is visible only when the Create task check box is selected. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• User Field: Select a user reference field on the table being audited. For example, you choose the user identified in the Managed by field on the failed record to perform the tasks. This selection displays the Assigned to and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td></td>
<td>• Specific User: Select a specific user to perform the tasks. This selection displays the User field.</td>
</tr>
<tr>
<td></td>
<td>• Group Field: Select a group reference field on the table being audited. For example, you choose the group identified in the Support group field on the failed record to perform the tasks. Tasks are assigned to all members of the group. This selection displays the Assign to group and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td></td>
<td>• Specific Group: Select a specific group to perform the tasks. This selection displays the Group field. All members of the selected group are assigned to the tasks.</td>
</tr>
<tr>
<td>User</td>
<td>The specific user this audit assigns to follow-on tasks. This user must have the certification role. This field is available under these conditions:</td>
</tr>
<tr>
<td></td>
<td>• Assignment type is set to Specific User.</td>
</tr>
<tr>
<td></td>
<td>• Assign to empty is set to Create Assigned Task, and Assignment type is set to User Field.</td>
</tr>
<tr>
<td>Assign to group</td>
<td>The group field that defines which group this audit assigns to the follow-on task. This field is available only when the Assignment type is Group Field.</td>
</tr>
<tr>
<td>Group</td>
<td>The specific group this audit assigns to follow-on tasks. This field is available only when the Assignment type is Specific Group.</td>
</tr>
<tr>
<td>Assign to</td>
<td>The user field that defines which user this audit assigns to the follow-on task. This field is available only when the Assignment type is User Field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Assign to empty          | The behavior to use if the field selected in **Assign to** or **Assign to group** is blank on the record being audited. For example, if a follow-on task must be assigned to a manager, but no manager is identified, the **Assign to empty** setting determines what happens. This field appears only when the **Assignment type** is **User Field** or **Group Field**. Choices are:  
  - Do Not Create Task: No follow-on task is created when the **Assign to** or **Assign to group** field is empty.  
  - Create Unassigned Task: Create a follow-on task, but do not assign it to any user or group. The task can be manually assigned later.  
  - Create Assigned Task: Create a follow-on task and assign it to the user or group specified. If the assignment type is **User Field**, the **User** field becomes available. If the assignment type is **Group Field**, the **Group** field becomes available.  
  The audit automatically creates follow-on tasks for all records that have **Assign to** populated, regardless of the **Assign to empty** setting. |
| Short description        | Brief description of the purpose of the audit.                                                                                              |
| Task description         | General description of the work required for the follow-on tasks for the audit. All follow-on tasks created by this audit inherit this description. |
| Active                   | Activation control for this audit record. Clear this check box to prevent this audit from running and creating follow-on tasks.              |
| Run                      | How often to run the schedule that generates the audit.  
  - Daily  
  - Weekly  
  - Monthly  
  - Periodically  
  - Once  
  - On Demand |
| Day                      |  
  - If **Run** is **Weekly**, the day of the week when the audit runs.  
  - If **Run** is **Monthly**, the day of the month when the audit runs. If the day is 29, 30 or 31, for shorter months the audit runs on the last day of the month. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat Interval</td>
<td>If <strong>Run is Periodically</strong>, the frequency that the audit runs, based on a 24-hr. clock. Enter the number of days between audits and the time of day that you want the audit to run. For example, set <strong>Days</strong> to 10 and <strong>Hours</strong> to 14:00:00 to run the audit every 10 days at 2:00pm.</td>
</tr>
<tr>
<td>Starting</td>
<td>If <strong>Run is Periodically</strong> or <strong>Once</strong>, the date and time when the audit runs.</td>

<td>Health window unit</td>
<td>Unit of measurement that defines the duration of a health window. The default value for this field is <strong>Days</strong>. Choices are:   - Minutes   - Hours   - Days   - Months</td>
</tr>
<tr>
<td>Threshold count</td>
<td>Sets the acceptable number of audit failures for the desired state field that can occur within the specified health window for a CI. The audit results indicate when a desired state field is within or has exceeded this threshold limit. The default value for the threshold is 5.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stability count</td>
<td>Sets the acceptable number of times that audit results for a CI can switch between <strong>Certified</strong> and <strong>Failed</strong> within the specified health window. The audit results for a CI indicate whether it is stable or unstable. The default value for stability is 1.</td>
</tr>
<tr>
<td>Run this script</td>
<td>Audit script to run which contains the conditions that a CI need to comply with to pass the audit. This field is available only when the audit type is <strong>Scripted</strong>. The Audit form includes a sample script with instructions for performing the audit and generating the follow-on tasks.</td>
</tr>
</tbody>
</table>

### Audit Scheduling

The system performs audits automatically from the schedule you configure.

Users with the certification_admin or admin role can generate on-demand audits directly from the Audit form by clicking **Run Audit**. When an audit runs, ServiceNow populates the **Audit Results** related list in the form and shows follow-on tasks, if any, in the **Follow On Tasks** related list. Click **Preview Audit Results** to generate an audit preview that tests your template conditions without generating any audit results.
Audit Running

Certification audit results

Audit results show the records that have passed or failed an audit and itemize any discrepancies detected.

A discrepancy is considered any departure from the expected conditions defined in the template or script used for the audit. Audit results provide links to the source records and to the follow-on tasks for bringing failed records into compliance. Records that pass an audit have a single entry in the results table with a state of Certified. Records that fail an audit show all discrepancies, each with a state of Failed.

ServiceNow displays results from a certification audit in these locations:

- Audit Results list
- A related list in the Audit record
• A related list in the compliance view of a CI record

View an audit result

To generate certification results, you must first create and run an audit.

1. Navigate to one of the following locations:
   - Compliance > Desired State > Audit Results
   - Compliance > Architecture Compliance > Audit Results
   - Compliance > Scripted Audits > Audit Results
   - Data Certification > Schedules > Audit results

2. From any audit results list, you can edit the filter to show the results for any audit type.

   Audit Type filter

   The results filter by audit type and grouped by audit number. Within the groups, results list by date, from oldest to newest.

3. You can open the audit record, the CI record, or the follow-on tasks from this list.

   Note: The Audit type field was set automatically when the audit result was created and cannot be changed. For scripted audits, the audit type is set when you create the audit record.
Desired State Audit Results

Audit results show this information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Date and time the audit ran.</td>
</tr>
<tr>
<td>Document</td>
<td>Record that was certified, such as a configuration item (CI).</td>

<td>• Stable</td>
</tr>
<tr>
<td></td>
<td>• Unstable</td>
</tr>
</tbody>
</table>

Delete an audit result

While audit results can be deleted, you cannot delete an audit result that has a follow-on task associated with it.

1. Navigate to one of these modules:
   - Compliance > Desired State > Audit Results
   - Compliance > Architecture Compliance > Audit Results
   - Compliance > Scripted Audits > Audit Results

   The list groups by audit name.

2. Select the checkbox for a result in the list, and then select **Delete** from the **Actions on selected rows** menu at the bottom of the list.

   **Note:** If the result record has a follow-on task, the **Delete** option is not available. If you select multiple records, some with and some without tasks, the system only deletes those records that do not have tasks.
3. Click a date/time link to see the results for a specific CI.

   **Note:** The Delete button only appears on the form if the audit result does not have a follow-on task.

4. Click Delete.

Audit Result Delete Available
View an audit result in the Compliance view

After an audit has run, you can view the results and follow-on tasks from the Compliance view in the records of every CI audited.

This view is available only for systems that use the default CI classes provided with the base ServiceNow system, such as Hardware, Software, and Computer. For information about creating views, see View Management.

1. Navigate to Configuration and open the record of a CI that was included in a compliance audit.
2. Select the view to configure by performing the appropriate action for your list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List V2</td>
<td>Open the context menu and select View &gt; Compliance.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the context menu and select Change View, and then click Compliance.</td>
</tr>
</tbody>
</table>

List v2: select View > Compliance

The Audit Results Compliance View appears.

<tr>
<td>Follow On Tasks</td>
<td>Lists all follow-on tasks generated from audit discrepancies for this CI.</td>
</tr>
</tbody>
</table>

3. Right-click the header bar and select View > Compliance from the context menu.
Results preview

You can preview an audit to view potential results without saving audit results or generating follow-on tasks. For example, use this feature to test template conditions for correctness without creating thousands of result records.

In an audit record, click **Preview Audit Results** under **Related Links**.

A summary of the potential audit results appears at the top of the audit record. Previewing does not change the **Last run date** field.

Health windows

A health window is a trailing time frame in which the ServiceNow system evaluates audit results from CIs that have desired state fields defined.
The **Health window** and **Health unit** fields define each window, and ends when an audit runs. For example, an audit runs on the fifteenth of the month with a seven-day window. It evaluates the threshold values of a desired state field from the eighth to the fifteenth. When the same audit runs the next day, the system evaluates the threshold from the ninth to the 16th, and so on. The audit counts backward seven days from the current day. ServiceNow evaluates a CI threshold value for each health window, without considering the results from the previous window. As a result, the health of a CI can fail for one audit and then pass in a subsequent audit that runs in a new window.

ServiceNow evaluates stability by recording the number of times a desired state threshold value for a CI switch between **Failed** and **Certified** within the health window. In the example shown here, a 5-minute health window was set for the desired state field on a UPS unit that measures the remaining battery time. The threshold was set at 2, which allows the field to fail two audits in the same health window.

**Desired State Health Window**

In the initial audit, the system evaluated the threshold value for the **Seconds on battery** field within a 5-minute window. This window ran from 13:52:51 to the time of the audit at 13:57:51. The desired state field showed In Limit for that audit and the second audit conducted less than a minute later. The next two audits were conducted within five minutes of the first audit and both showed that the threshold (set at 2) was Exceeded. A subsequent audit was conducted five minutes after the audit in which the desired state field threshold was first exceeded. Since the health window had moved forward enough units, the **Seconds on battery** field was within limits again with only one failure in the 5-minute window being evaluated.
Desired State Health Results

Copy an audit

New audits can be created from an existing audit.

1. Open the audit record you want to copy.
2. Change the name or short description to distinguish this audit from the original.
3. Make any other changes you need.
4. Right-click in the header bar and select either Insert or Insert and Stay from the context menu.
Arch Comp Audit Insert

The system clears the **Last run date** field and inserts the record into the database.

**Certification filters**

A certification filter creates a subset of ServiceNow records to audit, typically from configuration items (CI) of a certain type, such as all UNIX servers in a specific datacenter.

However, you can define a filter for any ServiceNow table by using any set of system-supported conditions. Audited records identified by a filter for expected attributes or relationships, depending on the audit type.

You can create multiple versions of a filter, reactivate inactive versions, and select the version you want to use in a template or a certification schedule. Only the active versions of a filter are available for selection in template records. You can use a single filter for multiple certification templates or schedules.
Certification filters

<table>
<thead>
<tr>
<th>Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Certification</td>
<td>Validates CMDB data.</td>
</tr>
<tr>
<td>Architecture Compliance</td>
<td>Manages reviews of CMDB data in architecture compliance audits to determine which configuration items (CIs) match expected attributes.</td>
</tr>
<tr>
<td>Desired State</td>
<td>Manages reviews of CMDB data to determine which CIs match a desired state for both attributes and relationships.</td>
</tr>
<tr>
<td>Compliance</td>
<td>Manages reviews of records from any ServiceNow table to determine which records match an expected set of attributes and related record conditions.</td>
</tr>
<tr>
<td>IT Governance Risk and Compliance</td>
<td>Generates audits and tests to ensure that controls are being followed and creates tasks to track corrective actions.</td>
</tr>
</tbody>
</table>

Compliance filter

The compliance filter for license bases uses the following fields to define entitled users or CIs. These field values can be used independently or together to calculate compliance.

<table>
<thead>
<tr>
<th>Compliance Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entitled company</td>
<td>All users or configuration items (CI) at all locations of this company, in all departments are entitled to use this software package. Compliance at this level calculates how many licenses are purchased for the company at large and how many entitled users or CIs consume them.</td>
</tr>
<tr>
<td>Entitled location</td>
<td>CIs and users who are assigned to this company location in any department are entitled to use this software package. Compliance at this level calculates how many licenses are purchased for this company location and how many users and CIs consume them.</td>
</tr>
<tr>
<td>Entitled department</td>
<td>Only the users or CIs in this department at this company location are entitled to use this software package. Compliance is calculated for a single department only.</td>
</tr>
</tbody>
</table>

The license form can display information about all CIs or named users who are using this software package. The form indicates when license reconciliation is necessary and displays all compliant users or CIs.

Possible compliance levels are:
### Compliance

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non applicable</td>
<td>Compliance levels for all infrastructure licenses that are related to cluster licenses are set to <strong>Non applicable</strong> automatically. Compliance levels are calculated in the cluster license only, and not in the related infrastructure licenses.</td>
</tr>
<tr>
<td>Out of compliance</td>
<td>More licenses are being consumed than were purchased. There are more users or CIs using this license than the license allows, and some users or CIs are not be entitled to use this software package.</td>
</tr>
<tr>
<td>Unused</td>
<td>The licenses for this software package are currently unused.</td>
</tr>
<tr>
<td>Reconciliation required</td>
<td>CIs or users who are not entitled to use this software are consuming licenses. Licenses that require reconciliation are considered out of compliance. Reconciliation requires action to ensure that unentitled users are not using the software. Reconciliation involves uninstalling software or increasing license counts to match actual user counts.</td>
</tr>
<tr>
<td>Nearly out of compliance</td>
<td>For a software package to be at this compliance level, more than 95% of the licenses are in use by entitled users or CIs. License bases at this level are considered to be <strong>In compliance</strong>.</td>
</tr>
<tr>
<td>In compliance</td>
<td>This software package has unused licenses. All users or CIs using a license are entitled to use this software package.</td>
</tr>
</tbody>
</table>

### Copy a filter

New filters can be created from an existing filter.

1. Open the filter record you want to copy.
2. Make sure to change the filter name or description to distinguish the new filter from the original.
3. Make any other necessary changes.
4. Right-click in the header bar and select either **Insert** or **Insert and Stay** from the context menu.
Desired State Filter Clone

The system increments the record number and sets the version to 1 for the new record. Both the original filter and the copy are Active and appear in the record list. Showing all copies of a filter allows you to see the entire history of the filter.

Desired State Filter Insert
**Additional Roles**

In the base ServiceNow system, users with the certification_admin role have limited system rights and do not have access to the tables required for creating a filter.

When assigning compliance resources, make sure certification_admin users have any additional roles they need. For example, a user requires roles that grant access to the Company [core_company] table.

**Filter versions**

Versions can be displayed in a list.

The default list of filters displays only the active version of each filter. To see all filter versions in the list view, select **All** in the breadcrumbs.

---

**Desired State Filter List**

**Create a filter**

You can create as many versions of a filter as necessary. You can then designate which versions are active and available for selection in Compliance template records, Governance Risk and Compliance control test definitions, or Data Certification schedule definitions.

1. Navigate to **Configuration > CI Class Manager**, and:
   a) Click **Hierarchy** to display the CI Classes list. Select the class to create a filter for.
   b) In the class navigation bar, expand **Health** and select **Compliance**. Then click **Certification Filter**.

2. Or, navigate to one of these modules:
   - **Compliance > Filters**
   - **IT GRC > Administration > Filters**
   - **Data Certification > Schedules > Certification Filters**

3. Select an existing filter to edit, or click **New**.

4. Fill in the fields (see table below).

5. Click **Submit**.
   This action saves the filter as version 1.
6. To create another version of this filter, open the record and modify the name, table, or conditions.

   **Note:** You can change a filter Description without incrementing a version.

7. Click **Update**.

   The system saves a new version of the current filter and makes it the Active version. The previous version is marked inactive. The system displays only active filter versions for selection when you create templates or schedules.

### Creating Filters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>(Read-only) Displays the automatically assigned filter identification number. All versions of a filter have the same number.</td>
</tr>
<tr>
<td>Name</td>
<td>(Required) Filter name.</td>
</tr>
<tr>
<td>Description</td>
<td>(Optional) Describes this filter. You can change the description of a filter without incrementing a version.</td>
</tr>
<tr>
<td>Table</td>
<td>Specifies the table containing the records to select. The template or schedule that uses this filter works on this table. For example, select the ESXi Server [cmdb_ci_esx_server] table to select VMware ESX servers.</td>
</tr>
<tr>
<td>Active</td>
<td>Makes this filter available for use from the Filter field on the Certification Template or Schedule Definition form. Multiple versions of a filter can be active. You can activate or deactivate a filter without incrementing the version.</td>
</tr>
<tr>
<td>Version</td>
<td>(Read-only) Indicates the version of this filter. Any changes to this filter, except to the description or the Active check box, makes it inactive. The system increments the version of the updated filter and marks it as active. The system saves all versions of the filter and makes them available for reactivation.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Specifies the fields, operators, and values that create the filter. The available fields are based on the table selected. The condition builder shows the number of records that match the conditions. Click the refresh icon to recalculate the number of matching records when you edit the conditions.</td>
</tr>
</tbody>
</table>
Delete a filter

Only users with the certification_admin or admin role can delete filter versions. But, you cannot delete a filter that is being used in a template or a scripted audit.

You cannot delete a filter that is being used in a template or a scripted audit.

1. To delete a single filter version, open that version record and click **Delete**.

   The system hides the **Delete** button for filters that are in use. If you delete the latest version of a filter that is active, the previous version of that filter is reset to Active.

2. To delete all unused and inactive versions of a filter, open any version of that filter and click **Delete inactive versions** under **Related Links**.

3. When prompted, click **OK** to proceed.

   The system deletes unused filter versions. A message in the header bar identifies filter versions that cannot be deleted because they are used in a template or scripted audit.
Manage a filter version in a form

You can view and manage all versions of a filter from the Certification Filter form.

1. Open any version of a filter.
   The Other Versions related list displays all other versions of this filter, both active and inactive. The system prevents you from editing either the filter version or the record number in the list view.
2. Click any version in the related list to display the record for that version.
3. To make an inactive filter the current version, open the filter, edit it if desired, and then click Revert.
   This action:
   - Deactivates the previous active version of the filter.
   - Copies the inactive filter.
   - Makes this new copy current and active.
Certification follow-on tasks

The ServiceNow system can automatically generate and assign follow-on tasks to correct discrepancies detected during compliance audits.

The system attribute `glide.allow.new.cert_follow_on_task` is set to true by default, allowing for new follow on tasks to be created for the same failure, at each audit run. You can set this property to false, to configure audit to use the same follow-on task for the same audit failure across multiple runs.

You configure and assign follow-on tasks to qualified users or groups in the audit record. A user with the certification_admin role can reassign any follow-on task. The Audit Results related list in the Follow On Task form contains links to the records that failed.

Access follow-on tasks

Users with the certification role can only access follow-on tasks assigned to them but can reassign these tasks to other users.

1. Navigate to Compliance > My Follow On Tasks.
   The list contains all active follow-on tasks assigned to the logged in user.
Follow-on Task My Work

2. Open a task.

The record shows the specifics of the task, the task activity, and the failed audit results.
Follow-on Task

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
3. Open records from the **Audit Results** related list to see each discrepancy.

![Audit Result Detail](image1)

### Audit Result Detail

4. Go to the CI named in the record and perform the work to bring it into compliance.
5. Update the **State** field in the follow-on task record and add work notes as you correct each discrepancy.

When you change the state, the system updates the task activity appropriately.

![Follow-on Task Activity](image2)

### Follow-on Task Activity

When the task is **Closed Complete** it no longer appears on the **My Work** list.
Manage follow-on tasks

Users with the certification_admin or admin role can see all follow-on tasks.

Tasks are pre-assigned to a user or group as specified in the audit record, but users with the certification_admin role can reassign the task.

1. Navigate to the appropriate application:
   - Compliance > Architecture Compliance > Follow On Tasks
   - Compliance > Desired State > Follow On Tasks
   - Compliance > Scripted Audits > Follow On Tasks

The list of follow-on tasks appears, filtered by audit type.

2. Open a task.
   - The Audit and Configuration item fields are read-only for all users.

3. Edit the Assignment group or the Assigned to field if necessary.
4. Edit the Short description field if necessary.

   The short description is inherited from the Task description field in the Audit form.
Arch Comp Task

5. Use the links in the **Audit Results** related list to open the individual records that failed the audit.
6. If you update the follow-on task record, be sure to add work notes.

**Certification templates**

Certification templates can define attributes, relationships, and reference field values that indicate what a record is expected to contain.

These values are used to perform audits on ServiceNow records. The certification filter selected in the template identifies the table and records to audit, and the template conditions set the expected state for those records. The type of audit you create determines which tables and template conditions are available.

Users with the certification_admin role can create, update, and delete templates. Users with the certification role can view template versions.
Certification template audit types

When you create a template, ServiceNow assigns an Audit type that determines which tables and conditions are available in the certification template. This value is based on the application from which the template is created. Each application lists only the templates with the associated type.

Available Condition Builders

The available condition builders for each audit type:

- **Compliance**: Runs audits on any set of ServiceNow records, not only configuration items (CI). This audit type provides the following types of conditions for any ServiceNow table:
  - **Attribute**: Sets conditions for the attributes of the records.
  - **Related List**: Runs audits on records in tables that reference the table defined in the template.

- **Architecture Compliance**: Defines the following types of conditions for tables that extend the Configuration Item (cmdb_ci) table.
  - **Attribute**: Sets conditions for physical attributes of CIs, such as memory or disk size.
  - **Related List**: Runs audits on records in tables that reference the table defined in the template.

- **Desired State**: Defines the following types of conditions for tables that extend the Configuration Item (cmdb_ci) table.
  - **Attribute**: Sets conditions for physical attributes of CIs, such as memory or disk size.
  - **CI relationship**: Defines the relationships these CIs have with other CIs. An example of a relationship is a business service, such as Outlook Web Access, that depends on a server.
  - **User relationship**: Defines the user who reviewed the log records. The only operator available with this condition builder.
  - **Group relationship**: Defines user groups who backed up this CI. The only operator available with this condition builder.
  - **Related List**: Runs audits on records in tables that point toward the table defined in the template.

Create or edit a certification template

To create a certification template, follow these instructions.

Activate the Certification Core plugin to enable the Compliance functionality. See Compliance Activation for details.

1. Ensure that you have an appropriate filter that defines the records the template evaluates. The template applies its conditions to these records.
2. Use the CI Class Manager to navigate to the Certification Template form:
   a) Navigate to **Configuration > CI Class Manager**.
   b) Click **Hierarchy** to display the CI Classes list. Select the class for which to create a certification template.
   c) In the class navigation bar, expand **Health** and then click **Compliance**. Click **Certification Template**.
3. Or, navigate using one of these paths:
   - Compliance > Architecture Compliance > Templates
   - Compliance > Desired State > Templates
   - Compliance > Templates
   - IT GRC > Audit Definitions > Templates

4. Click **New** or select a certification template to edit.
   The following fields are completed automatically:
   - **Number**: Each new template has a unique number. All versions of the same template use the same number.
   - **Active**: All new templates are set to **Active**.
   - **Version**: The version of a new template is set to **1**.
   - **Audit type**: The system sets the default type to **Architecture Compliance**, **Desired State**, or **Compliance**, depending on the application in which the template was created. You can select a different type when you create the template, but the field becomes read-only when you submit the record. The system uses audit types to filter record lists for appropriate data and determine which conditions are visible on the template form.

5. Complete the following mandatory fields:
   - **Name**: Enter a descriptive name for this template. The name helps identify the purpose.
   - **Filter**: Select the filter that identifies the records to be certified. You can select either active or inactive filter versions. By default, the system presents only active versions for selection. If you start typing the name of a filter, the auto-complete feature displays all versions for selection. For architecture compliance and desired state templates, only filters that use a table extended from Configuration Item [cmdb_ci] appear on the choice list. All filters appear on the choice list for a compliance template. After you select a filter, the template condition builder appears. The template operates on the table specified in the filter.

6. Enter a **Description** for this template
7. Define certification conditions using the condition builders. All conditions are AND conditions.
   The audit type of the template determines which conditions are available.
   - **Certification Attribute Conditions**: (All audit types) Select configuration item attributes or specifications to certify, such as CPU count, memory, or disk space. Available fields in the attribute condition builder depend on the table from the filter. Typical ServiceNow conditions for attributes are available, including the **between** operator for setting numerical conditions with high and low boundary values. This operator was added specifically for desired state conditions.
   
   The **Show Related Fields** item supports dot-walking, allowing you to include referenced fields in a certification attribute condition. Click **Show Related Fields** or **Remove Related**
Fields to add or remove referenced fields (in the form of <field> => <field>). Select a referenced field to drill down to the next level of referenced fields.

See Selecting fields on related tables using dot-walking.

- Certification CI Relationship Conditions: (Desired State audit types) Define the CI relationships to certify, such as Runs on or Depends on.
- Certification User Relationship Conditions: (Desired State audit types) Select the desired user relationship for this configuration item. The relationship provided in the base system is Log reviewed by.
- Certification Group Relationship Conditions: (Desired State audit types) Select the desired group relationship for this configuration item. The relationship provided in the base system is Backed up by.
- Certification Related List Conditions: (All audit types) Select field values from tables that reference the template table, or user-defined related lists which are created via custom relationships in the sys_relationship table. To create a condition that evaluates all servers in the Server (cmdb_ci_server) table for the presence of Microsoft Word 2007, as referenced in the Software Installation (cmdb_sam_sw_install) table. The resulting condition is (Software Installation->Installed on) (Display name) (is) (Microsoft Word 2007).

Check All to include all records in the condition requirements of the related list. If there are no records in the related list, then:

- If All is checked, the condition requirement is met.
- If All is unchecked, the requirement is not met.
Note: By default, the condition builders for relationships display only suggested relationships. To see all possible relationships, select the Show all relationships check box on the right side of the form.

Clear Check

- a) Click Insert a new row to insert a condition. You cannot insert an empty condition.
- b) Click the green check mark icon to save a condition. Make sure to save the condition before performing any other operation. Updating the form does not save the condition.
- c) To delete a condition, click the red X beside the condition. The system marks the condition as inactive.

The system marks the condition as inactive.
d) To reactivate a condition, click the gray X. If another condition for the same field exists, the system prevents reactivation and warns you of the conflict.

8. Click Submit.
   ServiceNow saves the template as version 1.

9. To create another version of this template, change the name, edit the conditions, or select a different filter. Updating the template Description does not create a new version.

   **Note:** If you select a filter whose table is incompatible with the existing template conditions, the system displays a warning that the conditions cannot be applied.

   ![Condition Marked as Inactive](image)

10. Click Update.
    The system saves a new version of the current template and makes it the Active version. The previous version is marked inactive.

**Certification Template Record List**

The default Templates list displays only the active version of each template, but users can update the breadcrumbs to display all template versions.

**Default Templates List**

The default Templates list displays only the active version of each template, filtered by Audit type.
Default Template

All Template Versions

To view all template versions for an audit type, click the arrow before **Active=true** to remove that condition from the breadcrumbs.
ServiceNow, Orlando, Now Platform capabilities

All Template Versions

Manage Certification template versions

You can view and manage all versions of a template from the Template form.

1. Open any version of a template.
   The Other Versions related list displays all other versions of this template, both active and inactive.
2. Click any version in the related list to display the record for that version.
3. Update the template to create a new version. The system increments a version of the template when you edit any field except Description and Active. You can manage the template versions without returning to the list view.
### Certification Attribute Conditions

**Related Links**
- Delete inactive versions
This action does:
- Deactivates the previously active version of the template.
- Copies the inactive template.
- Makes the new copy the current, active version.

5. Select the **Audits** related list to view all audits configured to use this template.

6. Click **New** to create a new audit record with the template selection and table pre-populated.

**Clone a Certification template**

New templates can be cloned from an existing template.

1. Open the template record to be copied.
2. Make any necessary changes.
3. Change the template name or description to distinguish it from the original.
4. Click **Clone**.

    ServiceNow increments the record number above the highest template number and sets the version of the new record to 1. A message appears under the header bar naming the source record for the clone.
Desired State Template Clone

Both templates are **Active** and appear in the record list. The record list allows you to see the entire history of the template.
Delete a Certification template

Certification templates can be deleted.

Only users with the certification_admin or admin role can delete template versions. You cannot delete a template version that is being used for an audit.

1. To delete a single template version, open that version record and click Delete.

   The system hides the Delete button for templates that are in use. If you delete the latest, active version of a template, the previous version of that template is reset to Active.

2. To delete all unused and inactive versions of a template, open any version of that template and click Delete inactive versions under Related Links. This control appears on all versions, whether they are used in an audit.
3. When prompted, click **OK** to proceed. The system deletes only template versions that are not used in an audit. All protected versions are named in a message that appears in the header bar.

![Used Template Delete](image)

**Controls and tests management**

After you identify the risks, define controls with accompanying control tests to prevent issues from occurring.

This diagram illustrates the entire IT GRC control process.
Define a control

Define a control before you define a control test.

1. Navigate to IT GRC > Controls > All.
2. Click New.
3. Fill in the form, as appropriate (see table).
4. Click Submit.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control ID</td>
<td>A unique identifier generated dynamically by the system.</td>
</tr>
<tr>
<td>Name</td>
<td>A name for the control.</td>
</tr>

<tr>
<td></td>
<td>· <strong>Advanced</strong>: Uses condition collections to apply conditions to the table and to related tables.</td>
</tr>
<tr>
<td></td>
<td>· <strong>Template</strong>: Uses certification templates to apply conditions to the specified table. Select the template to use from the <strong>Template</strong> field.</td>
</tr>
<tr>
<td>Sample size</td>
<td>An integer number of rows for a random sample if <strong>Include supporting data</strong> is selected. A sample size of zero returns all matching records. This field is available only if <strong>Condition type</strong> is set to <strong>Basic</strong> and <strong>Data purpose</strong> is set to <strong>Support test execution</strong>.</td>
</tr>
<tr>
<td>Control test conditions</td>
<td>A condition builder that limits the sample data when <strong>Include supporting data</strong> is selected. This field is available only if <strong>Condition type</strong> is set to <strong>Basic</strong>.</td>
</tr>
</tbody>
</table>
### Field | Description
---|---
In scope definition | A reference to a condition collection if Include supporting data is selected and Condition type is set to Advanced.
Configuration to retrieve | Method for using the Configuration reference field if Include supporting data is selected and Condition type is set to Advanced or Template.
  - None: Returns all records in scope.
  - Matching: Returns all matching records in scope.
  - Non-matching: Returns all non-matching records in scope.
Template | (Required) Certification template that defines conditions for this test definition. Only templates with an audit type of Compliance are available for selection. This field is available and mandatory when the value in the Condition type field is Template.
Configuration | Condition collection to use. This field is available only if Include supporting data is selected, Condition type is set to Advanced, and Configuration to retrieve is set to anything except None.

### Advanced conditions
Set the Condition type to Advanced on control tests to define more flexible conditions using condition collections.

Condition collections have one primary condition, which is applied to the selected table, and one or more supplemental conditions.

When a control test is performed, advanced conditions evaluate in this order:

1. The system processes the condition collection in the In scope definition reference in this order:
   a. The primary condition is processed on the fields specified in Table and Fields on the control test definition, returning an array of elements.
   b. For each element in the array returned by the primary condition, supplemental conditions are processed, filtering the array of elements further.
   c. The In Scope field is updated with the number of elements in the array.

2. The condition collection in the Configuration reference is processed on the array of elements returned from the In scope definition. The choices for Configuration to retrieve are:
   - None: These conditions are skipped. Supporting Data is all the elements that are in scope.
   - Matching: The control test checks the array of elements, returning any elements that match the Configuration.
   - Non-matching: The control test checks the array of elements, returning any elements where at least one condition did not match the Configuration.
3. The final array of elements is recorded as **Supporting Data** records.

Both the **In Scope** and **Configuration** fields refer to the Condition Collection [grc_condition_collection] table.

To define condition collections:

1. Navigate to **IT GRC > Administration > Condition Collections**.
2. Click **New**.
3. Populate these fields:
   - **Name**: Name of the condition collection.
   - **Description**: Description of the condition collection.
   - **Type**: Which **Control Test Definition** field references the condition collection. Choices are:
     - **In Scope Definition**
     - **Configuration Definition**

4. After the condition collection is defined, use the **Add Condition** related link to add these conditions:
   - **Condition**: Predefined condition definition from the Condition [grc_condition] table.
   - **Condition type**: The condition collection **Type** determines the choices:
     - **In Scope Definition**
       - Primary
       - Supplemental
     - **Configuration Definition**
       - Not Applicable

To define new condition records:

1. Navigate to **IT GRC > Administration > Conditions**.
2. Click **New**.
3. Populate these fields:
   - **Name**: Name of the condition collection.
   - **Description**: Description of the condition collection.
   - **Table**: Table on which the condition applies.
   - **Reference Field**: For supplemental conditions, the reference field for the table on which the primary condition is running.
   - **Condition**: Condition builder for defining the condition.

**Control test processing**

When performing a control test, processing dependencies are evaluated.

- If a control test definition is active, the system generates the control test instances dynamically, according to definition. To generate a control test manually:
  1. Navigate to **IT GRC > Administration > Control Test Definitions**.
2. Open a control test definition record.

3. Click **Execute Now**.

   ServiceNow generates a control test instance, marks it Pending, and assigns it to the group or individual responsible for the test according to the control test definition.

- If sample data was requested in the definition, any sample data that matches the conditions is found in the **Supporting Data** section. The **Test Complete Data Values** related list holds references to the records returned by the sample data query.
- If a control test has a condition type of **Basic**, the value in the **Sample size** field limits the number of failures that are stored as support data. If the result is passed or compliant, all the matching data is stored.
- If a control test has advanced conditions, the system evaluates them as follows:
  1. The condition collection in the **In scope** definition reference is processed.
    a. The primary condition is processed on the fields specified in **Table** and **Fields** on the control test definition and returns an array of elements.
    b. For each element in the array returned by the primary condition, supplemental conditions are processed, filtering the array of elements further.
    c. The **In Scope** field is updated with the number of elements in the array.
  2. The condition collection in the **Configuration** reference is processed on the array of elements returned from the **In scope definition**. The choices for **Configuration to retrieve** are:
    - **None**: These conditions are skipped. **Supporting Data** includes all the elements that were in scope.
    - **Matching**: The control test checks the array of elements, returning any elements that match the **Configuration**.
    - **Non-matching**: The control test checks the array of elements, returning any elements where at least one condition did not match the **Configuration**.
  3. The final array of elements is recorded as **Supporting Data** records.

**Remediation Tasks**

If the control test reveals problems in the process, create a task from the **Remediation Task** related list. You can relate remediation tasks to any task in the system with the related items tool from the Many to Many Task Relations plugin.

**Scripted audits**

A scripted audit enables users with the certification_admin role to conduct an audit from a script rather than using restrictive template conditions.

A scripted audit uses a **certification filter** to select the records to audit, and then creates standard follow-on tasks for remediation of any discrepancies. Use this type of audit to query for any values or states that a script can define. A scripted audit is a specific audit type that is activated together with the **Desired State** plugin. ServiceNow provides a sample audit script with configuration instructions.
Create a scripted audit

A scripted audit is an audit whose conditions are defined by a script.

1. Navigate to Compliance > Scripted Audits > Audits.

   An audit type of Scripted filters the list.

2. Click New.

3. Complete the form (see table).

4. Create the audit script.

   The Run this script field includes a sample script with instructions for performing the audit and generating the follow-on tasks. This field appears only when you access audits from the Scripted Audits module.

5. Click Submit.

Sample script:

```javascript
/*
\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\n```
new SNC.CertificationProcessing().logAuditResultFail(current.sys_id, sysId, followOnTask, columnNameSpace, 'greater than', desiredFloorSpaceUsage, floorSpaceInUse, true);
}
}

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Assign to empty       | The behavior to use if the field selected in Assign to or Assign to group is blank on the record being audited. For example, if a follow-on task must be assigned to a manager, but no manager is identified, the value in this field determines what happens. This field appears only when the Assignment type is User Field or Group Field. The possible selections are:  

**Field selection**

<table>
<thead>
<tr>
<th>Selection</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do Not Create Task</td>
<td>No follow-on task is created when the Assign to or Assign to group field is empty.</td>
</tr>
<tr>
<td>Create Unassigned Task</td>
<td>Create a follow-on task, but do not assign it to any user or group. The task can be manually assigned later.</td>
</tr>
<tr>
<td>Create Assigned Task</td>
<td>Create a follow-on task and assign it to the user or group specified. If you selected an assignment type of User Field, the User field becomes available. If you selected the Group Field type, the Group field becomes available.</td>
</tr>
</tbody>
</table>

The audit automatically creates follow-on tasks for all records that have Assign to populated, regardless of which selection you make for Assign to empty.

<table>

<td></td>
<td>isCI: True, if the audited record is a CI, false if otherwise.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>domainToUse: Sys_domain of the cert_audit record.</td>
</tr>
</tbody>
</table>
### Data Certification

Data Certification manages scheduled and on-demand validations of the configuration management database (CMDB) data.

Information is added to the CMDB by Discovery, by importing from third-party tools, or manually. For regulatory or procedural reasons, information in the CMDB requires checks for accuracy and certification. The person or team responsible for certification can define what information requires verification and a verification schedule. The schedule then generates a checklist for verifying the data. Individuals assigned to certification tasks answer a series of questions to verify the data. Data certification can be performed against specific fields on specific tables. Based on the certification schedule, certification tasks are automatically created and assigned. For example, you can set up a certification to validate key information fields, such as **Operating System** and **CPU count**, on all Windows servers located in Chicago. You can then assign the tasks to the appropriate team member automatically.

Domain separated systems can use the Data Certification application.

### Activate Data Certification

Activate the Data Certification plugin to access the application. Activating this plugin also activates the Version Management plugin, which manages certification filter versions.

Role required: admin

1. Navigate to **System Definition > Plugins**.
   
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.
2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to
   request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page, or you can view more
   details about the plugin before you activate it.
   - If you're certain that you have the correct plugin, click Install, then in the Activate Plugin
     dialog box, click Activate.
   - To view plugin details before activation:
     1. Click the plugin name.
     2. On the form, click the Activate/Update related link.
     3. In the dialog box, review the dependent plugins.
        If your plugin requires dependent plugins, they're activated automatically when you
        activate your plugin if they're not active already.
     4. If demo data is available and you want to install it, click Load demo data.
        Some plugins include demo data, which are sample records that describe plugin
        features for common use cases. Load demo data when you first activate the plugin
        on a development or test instance. You can always load demo data later by clicking
        Load demo data only on the plugin form.
     5. Click Activate.
Installed With Data Certification

Activating the Data Certification plugin installs the following components.

Demo data is available with Data Certification. The demo data provides information including filters, schedules, instances, and tasks.

Tables

Data Certification adds the following tables:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Certification Audit Definition (cert_audit_definition)</td>
<td>Stores collections of certification schedules that can be run as a single entity.</td>
</tr>
<tr>
<td>Certification Audit Definition Elements (m2m_cert_audit_def_cert_sched)</td>
<td>Lists the certification schedules in each certification audit definition.</td>
</tr>
<tr>
<td>Certification Audit Instance (cert_audit_instance)</td>
<td>Stores the certification instances associated with a specific audit definition.</td>
</tr>
<tr>
<td>Certification Element (cert_element)</td>
<td>Stores the data elements that are grouped into certification tasks.</td>
</tr>
<tr>
<td>Certification Filter (cert_filter)</td>
<td>Stores the data that requires certification using a filtering condition for the certification.</td>
</tr>
<tr>
<td>Certification Instance (cert_instance)</td>
<td>Stores a collection of certification tasks representing a single instance of a scheduled certification. This table extends the Audit (cert_audit) table.</td>
</tr>
<tr>
<td>Certification Schedule (cert_schedule)</td>
<td>Stores certification for a specific set of information on a specific table, what user or group the tasks are assigned to, and how often this certification is done.</td>
</tr>
<tr>
<td>Certification Task (cert_task)</td>
<td>Stores individual certification tasks. Certification Task extends the Task table.</td>
</tr>
</tbody>
</table>

Script Includes

Data Certification adds the following script includes:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CertificationAjax</td>
<td>Provides utilities that enable individual certification elements to be certified, rejected, or reverted.</td>
</tr>
<tr>
<td>CertificationTaskCreate</td>
<td>Custom code that extends the standard code for certification tasks.</td>
</tr>
<tr>
<td>CertTaskEscalationTimerPercentage</td>
<td>Updates time and percentage complete information for a certification.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CertificationUtilities</td>
<td>Provides utility functions for certification.</td>
</tr>
</tbody>
</table>

**Client Scripts**

Data Certification adds the following client scripts:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alert If Boxes Checked</td>
<td>Certification Task (cert_task)</td>
<td>Provides a warning if the certifier attempts to leave a record without certifying the checked elements</td>
</tr>
<tr>
<td>Check Table Name</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Updates the table name when a different filter is selected.</td>
</tr>
</tbody>
</table>

**UI Policies**

Data Certification adds the following UI policies:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hide next scheduled run</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Hides the <strong>Next Scheduled Run</strong> field when the schedule is set to run once or on demand only.</td>
</tr>
<tr>
<td>Hide “run” associated fields when active is set to false</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Hides the <strong>Run</strong> field when <strong>Active</strong> is set to <strong>False</strong>.</td>
</tr>
<tr>
<td>Hide Run When Not Active</td>
<td>Certification Schedule (cert_schedule)</td>
<td></td>
</tr>
<tr>
<td>Make table name read only</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Makes the <strong>Table</strong> field read-only.</td>
</tr>
<tr>
<td>Hide Table field</td>
<td>Certification Element (cert_element)</td>
<td>Hides the <strong>Table</strong> field on the certification task form.</td>
</tr>
<tr>
<td>Make percent complete field read only</td>
<td>Certification Instance (cert_instance)</td>
<td>Makes the <strong>Percent complete</strong> field read only when the <strong>State</strong> is <strong>Work in Progress</strong>, <strong>Closed Complete</strong>, <strong>Closed Incomplete</strong>, or <strong>Cancelled</strong>.</td>
</tr>
<tr>
<td>Show Assign to fields</td>
<td>Certification Schedule (cert_schedule)</td>
<td>Shows the <strong>Assign To</strong> field when the assignment type is <strong>User</strong> and hides the <strong>Assign To</strong> field for all other assignment types.</td>

</tbody>
</table>

### Business Rules

Data Certification adds the following business rules:

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjust dates for cert tasks</td>
<td>Certification Instance (cert_instance)</td>
<td>Adjusts dates for tasks belonging to the certification instance when the dates are changed for an active certification.</td>
</tr>
<tr>
<td>Cancel Instance</td>
<td>Certification Instance (cert_instance)</td>
<td>Cancels all open certification tasks when an active certification is canceled.</td>
</tr>
<tr>
<td>certification audit instance events</td>
<td>Certification Audit Instance (cert_audit_instance)</td>
<td>Sends an inserted event when an active certification audit instance is created. Sends a completed event when an active certification audit instance is marked as complete or incomplete.</td>
</tr>
<tr>
<td>certification element events</td>
<td>Certification Element (cert_element)</td>
<td>Sends a failed event when an element of a certification is marked as failed.</td>
</tr>
<tr>
<td>certification instance events</td>
<td>Certification Instance (cert_instance)</td>
<td>Sends an inserted event when an instance of a certification is created. Sends a completed event when an instance of a certification is completed.</td>
</tr>
<tr>
<td>Certification Instance Rollup</td>
<td>Certification Task (cert_task)</td>
<td>Updates the <strong>Percent complete</strong> field on the certification instance record.</td>
</tr>
<tr>
<td>certification task events</td>
<td>Certification Task (cert_task)</td>
<td>Sends an inserted event when a task is inserted. Sends a completed event when a task is deactivated. Sends a canceled event when a task is canceled.</td>
</tr>
<tr>
<td>Certification Task Values</td>
<td>Certification Element (cert_element)</td>
<td>Updates the percent complete of the parent task when a certification element is updated.</td>
</tr>
<tr>
<td>Name</td>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>--------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Check Certification Audit Progress</td>
<td>Certification Instance (cert_instance)</td>
<td>Updates the completion status of the audit instance as a whole when a certification that is part of an audit is complete.</td>
</tr>
<tr>
<td>Clean Certification Views</td>
<td>Certification Instance (cert_instance)</td>
<td>Cleans all related records when a certification instance is deleted.</td>
</tr>
<tr>
<td>Copy certification schedule fields</td>
<td>Certification Instance (cert_instance)</td>
<td>Copies changes to the certification schedule to the certification instance.</td>
</tr>
<tr>
<td>Merge Certification Tasks</td>
<td>Certification Task (cert_task)</td>
<td>Merges two tasks together when a task is reassigned and there is another task for the same instance with the new user.</td>
</tr>
<tr>
<td>Prevent delete of Filter with Schedule</td>
<td>Certification Filter (cert_filter)</td>
<td>Prevents the deletion of a filter that is used in a schedule.</td>
</tr>
<tr>
<td>Reassign Notification</td>
<td>Certification Task (cert_task)</td>
<td>Sends out a notification to the new and previous assignees when a task is reassigned.</td>
</tr>
<tr>
<td>Rollup State</td>
<td>Certification Task (cert_task)</td>
<td>Updates all necessary parent items when task state is changed.</td>
</tr>
<tr>
<td>Update audit reference</td>
<td>Certification Task (cert_task)</td>
<td>Makes Data Certification records compatible with Desired State records. This rule makes sure that the Audit field is correctly completed when a record is inserted using Insert and Stay.</td>
</tr>
<tr>
<td>Update audit result</td>
<td>Certification Element (cert_element)</td>
<td>Makes Data Certification records compatible with Desired State records for reporting purposes. This rule puts certified values in the Desired value column when an audit is Certified. It also puts actual values in the Discrepancy value column when an audit is Failed.</td>
</tr>
<tr>
<td>Update follow_on_task &amp; audit references</td>
<td>Certification Element (cert_element)</td>
<td>Makes Data Certification records compatible with Desired State records for reporting purposes. This rule makes certification tasks compatible with follow-on tasks and displays all tasks, regardless of origin.</td>
</tr>
</tbody>
</table>
### Name | Table | Description
--- | --- | ---
Update next run time | Certification Schedule (cert_schedule) | Updates the Next scheduled run field when a schedule runs Daily, Weekly, Monthly, or Periodically.
Verify Fields | Certification Schedule (cert_schedule) | Verifies that no field is used in both Display and Certification fields when the fields of a certification schedule are changed.

### Formatter

Data Certification adds the following formatter:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| Certification Task Elements | Enables custom user interface formatting of elements on a certification task. For example, displays the green check mark and red exclamation point to use when certifying an element.

### Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.ui.cert_task_activity.fields | System Properties (sys_properties) | Defines which journal field is the task activity field. Default: work_notes

### User Roles

Data Certification adds the following user roles:
**User Roles**

<table>
<thead>
<tr>
<th>Role</th>
<th>Contains Roles</th>
<th>Description</th>
</tr>
</thead>
</table>
| certification_admin | certification  | Can:  
  - Create and configure certifications  
  - Override provided answers  
  - Perform certification tasks for certification task owners  
  - Send certification task notifications to users and owners at any time  
  - Cancel or delete certifications in any state |
| certification_filter_admin | certification | Can create and manage all data certification filters.                      |
| certification        | none           | Can update active or incomplete tasks assigned to them or to groups of which they are a member. Can also update configuration items owned by them or by groups of which they are a member. Receives email notifications when assigned certification tasks. |

**Events**

Data Certification adds the following events. The ServiceNow system uses these events to send email notifications to task owners and managers about changes in certification records.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cert_audit_instance.completed</td>
<td>A certification audit instance has been completed.</td>
</tr>
<tr>
<td>cert_audit_instance.inserted</td>
<td>A certification audit instance has been inserted.</td>
</tr>
<tr>
<td>cert_element.failed</td>
<td>A certification element has failed certification.</td>
</tr>
<tr>
<td>cert_instance.complete</td>
<td>A certification instance has been completed.</td>
</tr>
<tr>
<td>cert_instance.inserted</td>
<td>A certification instance has been inserted.</td>
</tr>
<tr>
<td>cert_task.cancelled</td>
<td>A certification task has been canceled.</td>
</tr>
<tr>
<td>cert_task.completed</td>
<td>A certification task has been completed.</td>
</tr>
<tr>
<td>cert_task.escaplate</td>
<td>A certification task record has been escalated.</td>
</tr>
<tr>
<td>cert_task.inserted</td>
<td>A new certification task has been created.</td>
</tr>
<tr>
<td>cert_task.notifications</td>
<td>A certification task notification has been resent to a user.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>cert_task.overdue</td>
<td>A certification task is past its specified completion date.</td>
</tr>
<tr>
<td>cert_task.reassign</td>
<td>A certification task has been reassigned.</td>
</tr>
<tr>
<td>cert_task.warning</td>
<td>A new task escalation point has been reached.</td>
</tr>
</tbody>
</table>

**Email Templates**

Data Certification adds the following email templates:

<table>
<thead>
<tr>
<th>Name</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification.task.cancelled</td>
<td>A certification task assigned to you/your group as part of the data certification and management process has been canceled.</td>
</tr>
<tr>
<td>certification.task.reminder.inserted</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.</td>
</tr>
<tr>
<td>certification.task.reminder.outstanding</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process requires attention.</td>
</tr>
<tr>
<td>certification.task.reminder.overdue</td>
<td>A certification task that has been assigned to you/your group as part of the data certification and management process is overdue.</td>
</tr>
</tbody>
</table>

**Certification schedules**

A certification schedule defines the information that requires certification and the frequency of execution.

At each time interval specified, or on-demand, the certification schedule generates a set of certification tasks based on set conditions. Use the Preview Certification Tasks related link to preview the certification tasks generated from a certification schedule.
Certification schedule

The minimum requirements for Unix Servers are:
- CPU Speed: 3GHz
- RAM: 16GB
- CPU Core Count: 4
Certification tasks

A certification task represents the work of verifying the data associated with a particular record. Task owners are responsible for performing the certification tasks. Tasks have an associated workflow that sends reminders to the task owner and, if necessary, the manager of the owner at regular intervals.
Certification task

**Clean up invalid elements**

Use the **Clean up invalid elements** UI action to query and delete certification elements that reference invalid records. Each certification task has a certification schedule, and each certification schedule has Table and Filter fields. When you use this UI action, it performs the following processing:

1. Collects all available records from Table field in the certification schedule with filters that are available in certification schedule.

2. Collects all certification elements associated with the current certification task.

3. Deletes the certification elements that are no longer available for the data collected in the previous step.

4. After deleting invalid records, it recomputes the certification completion percentage using the following formula:

   \[ (1 - \frac{\text{number of certification elements pending}}{\text{total no of certification elements associated}}) \times 100; \]

5. If there are no certification elements with a Pending status, it marks the associated certification task as Closed, and deactivates it.

6. If there are remaining certification elements with a Pending status, it activates the associated certification task and changes its status to Work in Progress.

**Certification elements**

Each element of each record being certified is tracked in its own certification element record. Also tracked are the date and time when the element was certified, comments, and the original and certified values of the field. You can view elements on individual certification tasks.
Certification elements

Certification instances

A certification instance is the collection of certification tasks for one execution of a certification schedule.
Certification instances

Certification audit instances

A certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.
Certification audit definition

A certification audit definition is a collection of certification schedules that can be run at once.
Certification audit definition

Certification Schedules (2) Certification Audit instances (1)

- Certification Schedule
- Certification fields

- Certify servers
  - cmdb_ci_server
  - classification, cost_center, owned_by, support_group

- Certify groups
  - sys_user_group
  - cost_center, email, type, default_assignee
Data Certification Overview module

The Data Certification Overview module displays various data certification-related reports on the Data Certification Console homepage.

The Overview module is a type of homepage.

The different levels of access are:

<table>
<thead>
<tr>
<th>Role</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification</td>
<td>View (view overview page and refresh reports)</td>
</tr>
<tr>
<td>certification_admin</td>
<td>• View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>• Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td>admin</td>
<td>• View (view overview page and refresh reports)</td>
</tr>
<tr>
<td></td>
<td>• Customize (refresh, add, delete, and rearrange reports)</td>
</tr>
<tr>
<td></td>
<td>• Edit (can edit reports)</td>
</tr>
</tbody>
</table>

Data Certification Overview Module

The Overview module includes the following reports:

<table>
<thead>
<tr>
<th>Data Certification Overview Module Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>report</td>
</tr>
<tr>
<td>30/60/90 Day Aging</td>
</tr>
<tr>
<td>Certification Instances</td>
</tr>
<tr>
<td>Certification Progress Report</td>
</tr>
<tr>
<td>Certification Task Completed Report</td>
</tr>
<tr>
<td>Exceptions To Date</td>
</tr>
</tbody>
</table>
**Functional Roll Up**
Lists the managers that have groups with assigned certification tasks. The report is a horizontal bar chart, grouped by status, with each bar representing a manager of an assignment group.

**Hierarchical Roll Up**
Shows the managers that have employees with assigned certification tasks (task owners). The report is a horizontal bar chart, grouped by status, with each bar representing a manager of a task owner (identified in the Assigned to field).

**Upcoming Schedules**
Lists all schedules that are scheduled to run within the next 30 days.

---

**Use the Data Certification Overview module**

View the status of data certification tasks.

1. Navigate to **Data Certification > Overview**.
2. Click elements within the reports to obtain more information.
   - For example, click any of the colored bars in the **Functional Roll Up** bar chart and detailed information replaces the Data Certification Console screen.
3. Update some fields directly on the overview page.
   - For example, in the red box on the image shown, a certification schedule is being updated in the certification instances report.
Data certification overview module
Data Certification planning

Initial planning can make the certification process more successful.

By defining certification schedules and certification audit definitions, users with the certification_admin role establish when certifications are performed, who performs it, and what data must be certified.

Required Roles

Users with the certification_admin role can view filter versions. These users can create, update, and delete filters, if they have the proper access to necessary tables. In the base ServiceNow system, certification_admin users have limited system rights and do not have access to all the tables required for creating a filter. When assigning compliance resources, make sure to grant additional roles to the certification_admin user as needed. For example, this user requires roles that grant access to these tables:

- Company [core_company]
- Cost Center [cmn_cost_center]
- Schedule [cmn_schedule]

Planning Data Certification

Planning the data certification process requires defining:

- The certification schedule defines certification for a particular set of information on a particular table. It also generates certification tasks to perform that certification. One certification task is generated per task owner and a certification instance record groups the tasks.
- The optional certification audit definition groups some certification schedules to be performed together and generates certification audit instances to perform them.

The following questions require answers for each certification schedule:

- What information requires certification?
- When is the due date for certification?
- Who must perform the certification?

Create a certification filter

A filter is a subset of configuration items from any ServiceNow table that is created with a standard condition builder.

An example is a filter that selects all UNIX servers in the Australian data center.

With filters, you can:

- Create multiple versions of a filter and then select the version you want to use.
- Use one filter on multiple certification schedules.
- View the number of records that match your filter as you create the conditions.

Note: Be sure to create certification filters before creating certification schedules.

1. Navigate to **Data Certification > Certification Filters**.
2. Click **New**.
3. Fill in the form (see table).
4. Click **Submit**.

This action saves the filter as version 1.

Certification filter V1

5. To create another filter version, modify the filter conditions and click **Update**.

The system saves the new filter and increments the version number.
Certification filter V2

By default, the Certification Filters list shows only the current version of each filter. To see all filter versions, click **All** in the breadcrumbs.
Certification Filter List

6. To make an inactive filter the current version, open the inactive filter and click Revert.
Certification filter revert

This action creates a new, active version of the filter and makes all previous versions inactive.

7. To delete a single filter version, open that version record and click **Delete**.
8. To delete inactive versions of a filter, click **Delete inactive versions** under **Related Links** in that filter record.

You cannot delete a filter that is used in a schedule definition. The system displays a warning and the filter is not deleted.

Creating certification filters

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>(Required) Filter name.</td>
</tr>
<tr>
<td>Description</td>
<td>(Optional) Brief description of the filter.</td>
</tr>
<tr>
<td>Number</td>
<td>(Read-only) Automatically assigned filter identification number.</td>
</tr>
<tr>
<td>Table</td>
<td>Table containing the records to be filtered. Use of the Database View [sys_db_view] table is limited by version.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Active</td>
<td>Control to make the filter available for use from the Filter field on the Certification Schedule form.</td>
</tr>
<tr>
<td>Version</td>
<td>Current version of this filter. Any significant changes to the filter make the current version inactive. The system copies the updated filter, marks it as active, and increments the version number. The system saves all versions of the filter and makes them available to users. More than one version of a filter can be marked active.</td>
</tr>
<tr>
<td>Filter condition</td>
<td>Field, operator, and value to create the condition. The available options depend on the table selected. You can view the number of records that match the filter by clicking the refresh icon.</td>
</tr>
</tbody>
</table>

**Define a certification schedule**

A certification schedule specifies the fields to display, the fields that require certification, certification task assignments, completion requirements for task owners, frequency of schedule, and detailed instructions.

Use the preview option to see what tasks are created before saving the schedule. If the tasks are not what you want, edit the schedule and preview the tasks again. The system creates certification tasks automatically when it executes a schedule.

To schedule a certification:

1. Navigate to **Data Certification > Schedule Definitions**.
2. Click **New**
3. Fill in the fields (see table).
4. Click **Submit**.

**Defining A Certification Schedule**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A schedule name.</td>
</tr>
<tr>
<td>Filter</td>
<td>A certification filter for this schedule.</td>
</tr>
<tr>
<td>Table</td>
<td>(Read-only) The table holding the records to be certified. To change the table name, select a different Filter or create a new Filter.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Display fields</td>
<td>The fields displayed in the Certification Task list to provide context. These do not require certification themselves. For example, although users are not required to certify the Name field of a record, it displays so that users know what record they are certifying.</td>
</tr>
<tr>
<td>Certification fields</td>
<td>The fields to certify on this certification schedule.</td>
</tr>
<tr>
<td>Assignment type</td>
<td>A choice list to select how the certification schedule assigns the certification tasks.</td>
</tr>
<tr>
<td></td>
<td>• User Field: Select a user reference field on the table being certified. As an example, select the user named in the Managed by field to identify the user who performs the task. This selection displays the Assign to and Assign to empty fields. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td></td>
<td>• Specific User: Select a specific user to perform the tasks. This selection displays the User field.</td>
</tr>
<tr>
<td></td>
<td>• Group Field: Select a group reference field on the table being certified. As an example, select the Support group field to identify the user who performs the task. This selection displays the Assign to group and Assign to empty fields. All members of the group from the reference field on the record are assigned to the tasks. If the reference field on the record is empty, the value in the Assign to empty field is used.</td>
</tr>
<tr>
<td></td>
<td>• Specific Group: Select a specific group to perform the tasks. This selection displays the Group field. All members of the named group are assigned to the tasks.</td>
</tr>
<tr>
<td>User</td>
<td>This field appears when:</td>
</tr>
<tr>
<td></td>
<td>• Assignment type is Specific User. This system assigns this user to all certification tasks for this schedule.</td>
</tr>
<tr>
<td></td>
<td>• The Assign to empty field is set to Create Assigned Task, and you have selected User Field as the assignment type. The system assigns this user to certification tasks containing unassigned records.</td>
</tr>
<tr>
<td></td>
<td>You can only select users with the certification role.</td>
</tr>
<tr>
<td>Assign to group</td>
<td>The group field that defines the group assigned to the certification tasks. This field is available only when the Assignment type is Group Field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Group</td>
<td>The specific group to which certification tasks are assigned for this schedule. This field is available only when the <em>Assignment type</em> is <em>Specific Group</em>.</td>
</tr>
<tr>
<td>Assign to</td>
<td>The user field that defines which user is assigned to the certification task. This field is available only when the <em>Assignment type</em> is <em>User Field</em>.</td>
</tr>
<tr>
<td>Assign to empty</td>
<td>The behavior to use if the field selected in <em>Assign to</em> or <em>Assign to group</em> is blank on the record being certified. For example, if a task must be assigned to a manager, but no manager is identified, the value in this field determines what happens. This field appears only when the <em>Assignment type</em> is <em>User Field</em> or <em>Group Field</em>. The possible selections are:</td>
</tr>
<tr>
<td></td>
<td>- <em>Do Not Create Task</em>: No task is created when the <em>Assign to</em> or <em>Assign to group</em> field is empty.</td>
</tr>
<tr>
<td></td>
<td>- <em>Create Unassigned Task</em>: Create a task, but do not assign it to any user or group. The task can be manually assigned later.</td>
</tr>
<tr>
<td></td>
<td>- <em>Create Assigned Task</em>: Create a task and assign it to the user or group specified. If you selected an assignment type of <em>User Field</em>, the <em>User</em> field is available. If you selected the <em>Group Field</em> type, the <em>Group</em> field is available.</td>
</tr>
<tr>
<td></td>
<td>The schedule automatically creates certification tasks for all records that do have “Assign to” populated, regardless of which selection you make for “Assign to empty.”</td>
</tr>
<tr>
<td>Days to complete</td>
<td><em>(Required)</em> The number of days that task owners have to complete the certification tasks. When the certification schedule is part of a certification audit definition, the <em>Days to Complete</em> audit definition value overrides the value set for the certification schedule.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box to activate this certification schedule, generating certification tasks at the scheduled date and time. Clear this check box to hide scheduling fields on the form (except <em>Last run date</em>) and not generate certification tasks.</td>
</tr>
<tr>
<td>Run</td>
<td>How often to run the schedule that generates certification tasks:</td>
</tr>
<tr>
<td></td>
<td>- Daily</td>
</tr>
<tr>
<td></td>
<td>- Weekly</td>
</tr>
<tr>
<td></td>
<td>- Monthly</td>
</tr>
<tr>
<td></td>
<td>- Periodically</td>
</tr>
<tr>
<td></td>
<td>- Once</td>
</tr>
<tr>
<td></td>
<td>- On Demand</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Day</td>
<td>When Run is Weekly, the day of the week when the schedule runs and generates certification tasks. When Run is Monthly, the day of the month the schedule runs and generates certification tasks. If the day is 29, 30 or 31, the certification runs on the last day of the month for shorter months.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>When Run is Periodically, the frequency that the schedule runs to generate certification tasks, entered in time, days, or both. For example, set Days to 10 and Hours to 14:00:00 to run the schedule and generate certification tasks every 10 days at 14:00.</td>
</tr>
<tr>
<td>Starting</td>
<td>When Run is Periodically or Once, the date and time the schedule runs and generates certification tasks.</td>
</tr>
<tr>
<td>Time</td>
<td>When Run is Daily, Weekly, Monthly, or Once, the time of day, on a 24-hour clock, the schedule runs and generates certification tasks.</td>
</tr>
<tr>
<td>Last run date</td>
<td>(Read-only) The date and time that the schedule ran last, either on its regular schedule or manually, and generated certification tasks.</td>
</tr>
<tr>
<td>Next scheduled run</td>
<td>(Read-only) The next date and time the schedule runs and generates certification tasks.</td>
</tr>
<tr>
<td>Task Description</td>
<td>A description to add to the Short Description field of the certification task.</td>
</tr>
<tr>
<td>Instructions</td>
<td>An HTML field for providing instructions to the user or group performing the certification.</td>
</tr>
</tbody>
</table>

**Preview a certification task**

Previewing certification tasks saves any changes to the Certification Schedule form and displays the tasks that are created when you execute the certification schedule.

Previewing tasks is especially useful if you want to test different combinations of options in the Assignment type, Assign to, and Assign to empty fields.

1. Navigate to Data Certification > Schedules > Schedule Definitions.
2. Click a certification schedule Name.
3. In Related Links, click Preview Certification Tasks.
   The tasks to be created appear at the top of the screen.
Use a certification schedule notification

After you define a certification schedule, the system automatically sends notifications to specific users based on the information in the schedule.

The following notifications are sent automatically:

<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email template name</th>
<th>Notification message is sent to</th>
</tr>
</thead>
<tbody>
<tr>
<td>0% (when task is created)</td>
<td>certification.task.reminder.inserted</td>
<td>Task owner or assignment group, if specified</td>
</tr>
<tr>
<td>50%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner or assignment group, if specified</td>
</tr>
<tr>
<td>75%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner, assignment group, if specified, and manager of the task owner, if specified</td>
</tr>
<tr>
<td>95%</td>
<td>certification.task.reminder.outstanding</td>
<td>Task owner, assignment group, if specified, and manager of the task owner, if specified</td>
</tr>
<tr>
<td>100%</td>
<td>certification.task.reminder.overdue</td>
<td>Task owner, assignment group, if specified, and manager of the task owner, if specified</td>
</tr>
</tbody>
</table>

The email templates used in the notifications can be edited, for example, to change the email message text.

Executing a Certification Schedule

Executing a certification schedule generates certification tasks based on the schedule.

1. Navigate to Data Certification > Schedules > Schedule Definitions.
2. Click a certification schedule Name.
3. Click Execute Now.

The related lists Certification Instances and Certification Tasks display the instances or tasks generated by the schedule. The amount of time it takes to generate all certification tasks depends on the size of the table selected and how many fields require certification.
Execute certification schedule

Define and create a certification audit

A certification audit is a collection of certification schedules that can be run as a single entity.

Certification audits can be useful when there are multiple certification schedules. After creating a certification audit definition, you can generate a certification audit instance. The certification audit instance is a collection of the certification instances and tasks generated by a single execution of the certification audit definition.

1. Navigate to Data Certification > Audits > Audit Definitions.
2. Click New.
3. Fill in the fields (see table).
4. Right-click the header bar and select Save.
5. In the Certification Schedules related list, click Edit.
6. In the Collection list on the left, select one or more schedules and click Add.
7. Click Save.
8. In Related Links, click Create Certification Audit Instance.

The system generates an audit instance based on the certification schedules selected. All audit instances based on this audit definition are listed in the Certification Audit Instances related list.
Defining and Creating a Certification Audit

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the audit definition.</td>
</tr>
<tr>
<td>Days to Complete</td>
<td>The number of days that task owners have to complete the certification tasks created by this audit definition. Overrides the identical field on the certification schedule.</td>
</tr>
<tr>
<td>Description</td>
<td>A short description of the intended audit.</td>
</tr>
</tbody>
</table>

Track a certification audit instance

You can view a list of all certification audit instances at any time.

1. Navigate to **Data Certification > Audits > Audit Instances**.
2. View the **Certification Instances** related list.

The list contains each of the associated instances generated as part of the audit.

Data certification performance

After the certification process has been planned, certification tasks can be performed according to defined schedules.

Users with the certification role can perform certification tasks. The certification tasks can be tracked as part of certification instances.

Fulfill certification tasks

After you execute a certification schedule manually or at a scheduled time, the ServiceNow system performs certain actions.

- Creates tasks for any records that meet the filter requirements in the specified table, like tasks from the Configuration Item \[cmdb_ci\] table.
- Assigns the new tasks to the user or group identified in one of these certification schedule fields:
  - Assign to
  - User
  - Assign to group
  - Group
- Places the new tasks in the **Work in Progress** state.
- Adds the certification schedule **Short description** and **Assigned to** values to the corresponding fields on the certification task record.
- Adds the certification schedule **Days to complete** and **Complete by** date fields to the certification task record, based on when the task is created.

**Note:** If the certification filter does not match any CIs, the system sets the **State** to **Closed Complete** and the **Percent complete** to 100.
To view tasks assigned to you, navigate to **Data Certification** > **Tasks** > **My Tasks**.

The following information is tracked on the certification task record:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>An identification number for the certification task.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>The user responsible for certifying the data.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>The group responsible for certifying the data.</td>
</tr>
<tr>
<td>Complete by</td>
<td>(Read-only) A date field containing a deadline for the task. This field is automatically filled in based on the Days to Complete field on the certification schedule.</td>
</tr>
<tr>
<td>State</td>
<td>(Read-only) The current state of the certification task. The selections are: Work in Progress, Closed Incomplete, Closed Complete, and Cancelled.</td>
</tr>
<tr>
<td>Percent complete</td>
<td>The task progress as a percentage. This field is read-only when a task is in a Closed Incomplete, Closed Complete, or Cancelled state.</td>
</tr>
<tr>
<td>Escalation</td>
<td>(Read-only) The escalation level of the task. When 0–49% of the time to Complete By has elapsed, this field is set to Normal. At 50%, this field changes to Moderate and an email reminder is sent to the task owner. At 75%, this field changes to High and an email reminder are sent to the task owner and the manager of the task owner. At 95%, this field remains set to High, but a second email reminder is sent to the task owner and manager.</td>
</tr>
<tr>
<td>Short Description</td>
<td>A short description of the task. This field is automatically filled in with the text from the certification schedule of the Task description field.</td>
</tr>
<tr>
<td>Work notes</td>
<td>Information about work performed on the certification.</td>
</tr>
</tbody>
</table>

**Export the certification list**

Users with the certification_admin role can export the certifications list and save the list in Excel, CSV, XML, or PDF format. This list is useful when you have a long list of certification elements or if many different users are assigned to certify elements on a single certification schedule.

For general information and common export steps, see [List export](#).

1. Navigate to **Data Certification** > **Tasks** > **All Tasks**
2. Open a task.
3. Open any column context menu in the certification data list and complete the export.
Certify an element

The Certification Task form contains a list of all elements to be certified.

**Note:** After you certify all the elements in a task, no elements can be reverted.

1. Navigate to Data Certification > Tasks > My Tasks.
2. Open a certification task with a State of Work in Progress.
3. In the upper right corner of the list, select records that require certification for this task or all records that are part of this certification task.

4. Select the check box beside a certification element.
5. In Optional comment for checked elements, above the list, enter information that would be useful to others.
6. Do:
   - Click the green check mark to certify the element.
   - Click the red exclamation point to fail the element.

7. To see the certified or failed element, set the view to Show All Records. A green check mark or red exclamation mark appears beside the element.

8. Point to an icon to see any certification comments.

9. Ensure that all elements have the correct certification, either accepted or rejected.
   After you certify all elements, no elements can be reverted. When all elements of a certification task are certified or rejected, the task State changes to Closed Complete.

**View an audit result**

View audit results after you certify the elements.

1. Navigate to Data Certification > Schedules > Audit Results. The list of data certification audit results appears, grouped by certification instances. Certified configuration items show the Original value only. Failed CIs contain the Certified value and the Original value.

2. Click the links in the list to open any of the related records.
Data cert audit results

Reset certifications
You cannot reset any element after all elements are certified.
- To reset individual certifications, right-click the element in the certification list and select Revert Certification.
- To reset the entire task to its starting point, click the Reset all Certifications to Pending related link.

Track a task with a certification instance
The Certification Tasks related list on the certification instance record provides information about associated tasks.

The State field on the certification instance record is read-only and is based on the cumulative states of the certification tasks associated with the instance. The Percent complete column allows
users with the certification_admin role to track task progress quickly. For more information, see Track Certification Tasks.

To track a certification instance:
1. Navigate to Data Certification > Schedules > Instances.
2. Click a certification instance Number.
3. View and edit the following fields as necessary.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number</td>
<td>(Read-only) Automatically generated identification number for the instance.</td>
</tr>
<tr>
<td>Certification Schedule</td>
<td>The <em>certification schedule</em> used to create the certification instance.</td>
</tr>
<tr>
<td>State</td>
<td>(Read-only) Current state of the certification instance: Work in Progress, Complete, Closed Incomplete, or Cancelled. For more information, see Track Certification Tasks.</td>
</tr>
<tr>
<td>Created</td>
<td>(Read-only) Date and time the certification instance was created. Date is filled in automatically when the Execute Now button clicks the associated certification schedule.</td>
</tr>
<tr>
<td>Complete by</td>
<td>(Required) Date and time when the certification instance must be completed. The system updates this field when it executes the schedule, using the deadline specified on the instance. All certification tasks associated with the certification instance must be marked Complete, Closed Incomplete, or Cancelled before the instance is complete.</td>
</tr>
<tr>
<td>Percent complete</td>
<td>Percentage of the instance that has reached the Closed Complete state. This field is automatically filled in based on the Percent Complete fields on the associated certification tasks.</td>
</tr>
<tr>
<td>Task Description</td>
<td>Information about the certification instance. This field automatically displays the text from the Task description field of the associated certification schedule.</td>
</tr>
<tr>
<td>Instructions</td>
<td>Field for providing instructions to the user or group performing the certification. This field is automatically filled in with information from the Instructions field on the associated certification schedule.</td>
</tr>
</tbody>
</table>

Cancel a certification instance

Users with the certification_admin role can cancel a certification instance. The instance must have a State of Work in Progress. Canceling a certification instance:

- Changes the certification instance State to Cancelled.
Changes all associated **Work in Progress** certification tasks to **Cancelled**.

To cancel a certification instance:

1. Navigate to **Data Certification > Schedules > Instances**.
2. Click a certification instance **Number**.
3. Click **Cancel**.

**Track a certification task**

Use the certification task state to track the progress of a task.

The available task states are **Work in Progress**, **Closed Complete**, **Closed Incomplete**, and **Cancelled**.

When the state of a certification task changes, the certification instance state also changes in the following cases:

- If any certification task is in **Work in Progress** state, the certification instance is placed in **Work in Progress** state.
- If all certification tasks are in **Cancelled** state, the certification instance is placed in **Cancelled** state.
- If all certification tasks are in **Cancelled** or **Closed Complete** state, the instance is placed in **Closed Complete** state. For example, if three certification tasks are **Cancelled**, and one task is **Closed Complete**, the instance state is changed to **Closed Complete**.
- When one certification task is **Closed Incomplete** and the remainder of the tasks are **Cancelled** or **Closed Complete**, the instance is placed in **Closed Incomplete**.

To view the state of certification tasks:

1. Navigate to **Data Certification > Tasks** and select **My Tasks** or **All Tasks**.
2. View the **State** column for each task.

**Escalate a certification task**

Users with the certification_admin role can escalate a task in the Work in Progress state. To escalate a task, the task owner identified in the Assigned to field on the task record must have an associated manager.

Personalize the User form to see the **Manager** field.

Escalating a task:

- Sends an email message to the task owner and the manager of the task owner stating that the task has been escalated.
- Sets the manager as the new task owner.

The event that triggers the escalation is named `cert_task.escalate` and the email notification is named `Escalation Notification`. To edit the text of the email message that is sent, edit the **Escalation Notification** email notification directly.

For more information, see **Email and SMS notifications**.

To escalate a certification task from the Certification Task form:

1. Navigate to **Data Certification > Tasks > All Tasks**.
2. Click a certification task **Number**.
3. Click Escalate. If the Escalate button is not available, the user in the Assigned to field does not have an associated Manager.

Escalate a certification task from the certification task list

Escalate a certification task to notify the manager of the current task owner.

To escalate a task, the task owner identified in the Assigned to field on the task record must have an associated manager.

1. Navigate to Data Certification > Tasks > All Tasks.
2. Select the check box to the left of a certification task Number. Multiple check boxes can be selected.
3. From the Actions on Selected Rows menu below the list, select Escalate. If the Escalate button is not available, the user in the Assigned to field does not have an associated Manager. Select multiple tasks from the list. The menu option shows how many tasks are not eligible for escalation, such as Escalate (4 of 6).

Reassign a certification task

If you have the certification_admin role, you can reassign any certification task in the Work in Progress state. Tasks in Closed Complete, Closed Incomplete, or Cancelled state cannot be reassigned. When a task is reassigned, the current task owner and the new task owner are sent a message.

Role required: certification_admin

The event associated with the reassignment is named cert_task.reassign and the email notification is named Certification Task Reassignment. To edit the text of the email message that is sent, edit the Certification Task Reassignment email notification directly.

For more information, see Email and SMS notifications.

To reassign a certification task:

1. Navigate to Data Certification > Tasks > All Tasks.
2. Click a certification task Number.
3. Enter a new name in the Assigned to field.

Send certification task reminders

The Certification Task Escalations workflow sends automatic email reminders.

The Certification Task Escalations workflow sends automatic email reminders to the:

- Certification task owner.
- Assignment group, if the assignment group was specified on the Certification Task form.
- Manager of the certification task owner, if necessary and if a manager was specified on the User form.

The reminders are based on the Complete by field on the certification task record. If the Complete by date is changed, the reminder schedule automatically adjusts to reflect the new date.
### Certification task reminders

<table>
<thead>
<tr>
<th>Time elapsed to end date</th>
<th>Email reminder is sent to</th>
<th>Escalate field on task record reads</th>
</tr>
</thead>
<tbody>
<tr>
<td>50%</td>
<td>task owner and assignment group (if specified)</td>
<td>Moderate</td>
</tr>
<tr>
<td>75%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
<tr>
<td>95%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
<tr>
<td>100%</td>
<td>task owner, assignment group, and manager of the task owner</td>
<td>High</td>
</tr>
</tbody>
</table>

To set reminders for different or more intervals, edit the workflow Certification Task Escalations. In addition to the email reminders sent automatically, users with the certification_admin role can send email reminders manually at any time.

### Send an email reminder from the certification task form

How to manually send email reminders from the Certification Task form.

1. Navigate to Data Certification > Tasks > All Tasks.
2. Click a certification task Number.
3. Right-click the header bar and select Resend email notifications.

### Send an email reminder from the certification task list

How to manually send email reminders from the Certification Task list.

1. Navigate to Data Certification > Tasks > All Tasks.
2. Select the check box to the left of a certification task Number. Multiple check boxes can be selected.
3. From the Actions on Selected Rows menu below the list, select Resend email notifications. Select multiple tasks from the list. The menu option shows how many notifications are outstanding and how many were sent, such as Resend email notifications (15 of 18).

### Mark a certification task as closed incomplete

Mark a task as closed incomplete if, for example, only some of the elements can be certified. The following users can mark a task as closed incomplete:

- Users with the certification_admin role.
- User identified in the Assigned to field on the certification task record.

To mark a task as closed incomplete:

1. Navigate to Data Certification > Tasks and select All Tasks, or My Tasks.
2. Click a certification task Number.
3. In Work Notes, enter information about why the task could not be completed.
4. Click Close Incomplete.
If at least one task on a certification instance is marked **Closed Incomplete**, the **Completed** date and **Percent complete** fields on the certification instance record are not updated. A user with the certification_admin role can:
- Complete the incomplete task or tasks.
- Cancel the incomplete task or tasks.

When all tasks on the certification instance are **Closed Complete** or **Cancelled**:
- The system sets the **Completed** date field on the certification instance record to the current date and time.
- The **Percent complete** field on the certification instance record is set to 100 percent.

**Certification tasks cancellation**

Users with the certification_admin role can cancel a certification task in the Work in Progress or Closed Incomplete state.

When a certification task is cancelled, a notification email is sent to the task owner or assignment group assigned to the task. The task owner or assignment group manager is not notified.

**Cancel an individual task**

Cancel a particular data certification tasks in the Work in Progress state.

1. Navigate to **Data Certification > Tasks > All Tasks**.
2. Find a task with a **State** of **Work in Progress**.
3. Click the task **Number**.
4. Click **Cancel**.

**Cancel all tasks in an instance**

Cancel data certification tasks in the Work in Progress state.

1. Navigate to **Data Certification > Schedules > Instances**.
2. Find an instance with a **State** of **Work in Progress**.
3. Click the instance **Number**.
4. Click **Cancel**.

   All tasks in the instance with a state of **Work in Progress** are cancelled. The task owner or assignment group is notified.

   The email template used for the notification is named **certification.task.cancelled**. The email templates can be edited to change the email message text, for example.

**Domain separation and Data Certification**

This is an overview of domain separation and Data Certification processing. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Support level: Basic*

- Includes Basic level
- Business logic: Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.
- The owner of the instance must be able to configure MVP business logic and data parameters per tenant as expected for the specific application.

Use case: As a service provider when I use chat to respond to a tenant-customer’s message, the client must be able to see my response. **Support: Data only**

How domain separation works in Data Certification

- Data Certification has only basic domain separation. As long as the Certification Instances (CIs) or records that must be certified are correctly domain-separated and the user who must certify the CIs or records are in a domain that can view the data, Data Certification will work as expected.
- It’s best that the instance owner must be responsible for assigning Certification Tasks and Certification Instances to the correct domain. Changing the domain for these records does not change functionality, but limits the view of the records.

How to set up domain separation for Data Certification

After enabling the Domain Separation plugin, there are no additional steps required to set up domain separation for Data Certification.

- instance owners determine which CIs or records that need to be certified can be domain-separated.
- Customers can configure a domain-separated environment by assigning tasks to a domain, but if the data is already domain separated, then only users with the right domain permissions can view the data in a certification task.

How tenant domains manage their own application data

Setting the domain on the certification tables is not necessary, but can be done if the instance owner wants. As long as the CIs or records that must be certified are domain separated, users with the correct domain permissions can view them.

Domain separated tables

- cert_instance – Changing the domain on this table does not change any functionality, or change the domains of the tasks created from it.
- cert_task – Changing the domain on this table changes the domain viewing permissions of the task.
- cert_element – It is not recommended to change the domain on these records. As long as the CIs or records to be certified are already domain-separated, cert_element records will reflect that.
Use cases

Instance owners who have multiple clients that must certify the infrastructure they own can assign domains to those CIs and the Certification Tasks to restrict the view from one client to another.

Connect

ServiceNow® Connect is a real-time messaging platform that connects you to your coworkers, bypassing email and static documents.

Connect integrates with other features within the system, such as Visual Task Boards, Human Resources Management, and Customer Service Management. The Connect interface overlays the standard interface, which allows users to participate in conversations while they work.

Connect contains the following features:

- Connect Chat: Enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.
- Connect Support: Enables support agents to provide real-time assistance to end users, using queues. Requires the Connect Support plugin.

UI16 or UI15 is required to use Connect.

Note:

- Connect does not replace legacy chat but offers some of the same functionality. Do not use these features concurrently.

Supported browsers for Connect

The system supports Connect Chat and Connect Support on most modern browsers.
• The latest public release of Firefox or Firefox ESR
• The latest public release of Chrome
• Safari version 9.1 and later
• Internet Explorer version 11
  • Edge mode is supported.
  • Compatibility mode is not supported.
  • Setting Security Mode to High (via the Internet Options > Security tab) is not supported.
  • Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.

Activate Connect

Connect is active by default on new instances. For upgraded instances, you can activate the Connect plugin (com.glide.connect) if you have the admin role.

Role required: admin

If you used Collaboration in the Fuji release, the Connect plugin is activated automatically.

1. Navigate to System Definition > Plugins.
   A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   ![Note: To redirect to the legacy list view for plugins, click the link.](image)

2. Find the plugin using the filter criteria and search bar.
   You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in Request a plugin.

3. Activate the plugin.
   You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   • If you’re certain that you have the correct plugin, click Install, then in the Activate Plugin dialog box, click Activate.
To view plugin details before activation:
1. Click the plugin name.
2. On the form, click the **Activate/Update** related link.
3. In the dialog box, review the dependent plugins.
   - If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click **Load demo data**.
   - Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking **Load demo data only** on the plugin form.
5. Click **Activate**.

**Properties installed with Connect**

Properties are added with activation of Connect.

**Note:** To open the System Property (sys_properties) table, enter `sys_properties.list` in the navigation filter.

### Activate Connect Support

You can activate the Connect Support plugin (com.glide.connect.support) if you have the admin role. This plugin includes demo data.

If you are currently using the legacy chat feature to provide help desk support, close any open help desk chats before activating Connect Support. Legacy chat and Connect Support should not be used concurrently. When you activate Connect Support, the system automatically sets the state of all Chat Queue Entry (chat_queue_entry) records to Closed Complete. This ends any open help desk chats. For more information, see [Migrate from legacy chat to Connect Support](#).

**Role required:** admin

1. **Navigate to System Definition > Plugins.**
   - A banner notifies you that you’re in the All Applications page, which contains plugins and ServiceNow Store applications.

   **Note:** To redirect to the legacy list view for plugins, click the link.

   ![Redirect to Legacy List](#)

2. **Find the plugin using the filter criteria and search bar.**
   - You can search for the plugin by its name or ID. If you cannot find a plugin, you may have to request it from ServiceNow personnel. To request a plugin, follow the steps in [Request a plugin](#).

3. **Activate the plugin.**
   - You can activate the plugin directly from the All Applications page, or you can view more details about the plugin before you activate it.
   
   - If you’re certain that you have the correct plugin, click **Install**, then in the Activate Plugin dialog box, click **Activate**.
To view plugin details before activation:

1. Click the plugin name.
2. On the form, click the Activate/Update related link.
3. In the dialog box, review the dependent plugins.
   
   If your plugin requires dependent plugins, they're activated automatically when you activate your plugin if they're not active already.
4. If demo data is available and you want to install it, click Load demo data.
   
   Some plugins include demo data, which are sample records that describe plugin features for common use cases. Load demo data when you first activate the plugin on a development or test instance. You can always load demo data later by clicking Load demo data only on the plugin form.
5. Click Activate.

Properties installed with Connect Support

Properties are added with activation of Connect Support.

<table>
<thead>
<tr>

## Additional plugins for Connect Support

Additional plugins are available for Connect Support. These plugins integrate Connect Support with other features and provide capabilities to track performance metrics.

You must have the admin role to activate these additional plugins. For details, see Activate a plugin.

### Additional plugins for Connect Support

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect Support Manager’s Dashboard (com.glide.connect.managers_dashboard)</td>
<td>Provides a homepage for Connect Support, and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.</td>
</tr>
<tr>
<td><strong>Note</strong>: The Connect Support Manager’s Dashboard plugin does not activate Connect Support automatically. You must activate Connect Support to collect data for the homepage.</td>
<td></td>
</tr>
<tr>
<td>Human Resources Application: HR Connect (com.snc.hr.hr_connect)</td>
<td>Sets up a human resources (HR) chat queue and makes it available on the HR Service Portal.</td>
</tr>
<tr>
<td><strong>Note</strong>: This plugin does not appear in the System Definition&gt;Plugins list. Contact ServiceNow personnel to activate it.</td>
<td></td>
</tr>
<tr>
<td>If not already active, the Human Resources Application: HR Connect plugin activates these related plugins:</td>
<td></td>
</tr>
<tr>
<td><strong>Human Resources Application: Core (com.snc.hr.core)</strong>: Provides basic HR features.</td>

</tr>
</tbody>
</table>
| Performance Analytics - Content Pack - Service Desk Chat              | Provides the **Service Desk Chat Monitor** dashboard, which analyzes key Connect Support metrics and indicators.  
- The Performance Analytics - Content Pack - Service Desk Chat plugin activates these related plugins if they are not already active:  
  - **Connect Support Manager’s Dashboard** ([com.glide.connect.managers_dashboard])  
    - See description in this table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| (com.snc.pa.chat)                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Performance Analytics - Context Sensitive Analytics for Chat          | Provides in-form analytics for Connect Support. These analytics are available as a related link on the Chat Queue Entry ([chat_queue_entry]) form, and also as the **Context Sensitive Analytics - Chat** dashboard.  
- The Performance Analytics - Context Sensitive Analytics for Chat plugin activates these related plugins if they are not already active:  
  - **Performance Analytics - Content Pack - Service Desk Chat** ([com.snc.pa.chat])  
    - See description in this table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| (com.snc.pa.chat.context_sensitive_analytics)                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Connect interface**

Users can work in a compact view of Connect, which overlays the standard user interface, or in a full-screen workspace.

Connect Chat and Connect Support share the same interface, so support agents can keep track of all their conversations in one place.

**Connect overlay**

The Connect overlay appears over the standard user interface. It consists of the Connect sidebar, which is the primary interface for Connect Chat and Connect Support, and any Connect mini windows that are open. Each mini window contains a header, a conversation area, and a message field.
Note: An administrator can disable the Connect overlay so users can only use the Connect workspace, a full-screen interface with additional Connect tools.

Connect sidebar

The Connect sidebar is the primary interface for Connect Chat and Connect Support. It lists your conversations and provides access to create conversations.

The sidebar is collapsed by default. Click the toggle Connect sidebar icon in the banner frame to expand or collapse the sidebar, which appears on the right edge of the interface.

Connect Chat

The chat view of the sidebar is available to all users. If Connect Support is enabled, users must click the chat tab of the sidebar, which is represented by a speech bubble icon. If Connect Support is not enabled, there are no tabs in the sidebar and the chat view displays by default.

The chat view of the sidebar lists all your current Connect Chat conversations. It also contains a filter tool and a button to create conversations.
If you have unread messages in a conversation, a number appears by the conversation in the sidebar. Point to a conversation and click the x icon to remove the conversation from the sidebar.

**Connect Support**

The support view of the sidebar is available when Connect Support is activated. The support view is visible only to users who are agents for at least one support queue. Users must click the support tab of the sidebar, which is represented by a headset icon.

The support view displays *Queues* to which you belong. It also displays your open support conversations under *Cases*. 
If you have unread messages in a conversation, a number appears by the conversation in the sidebar.

Support view of the Connect sidebar

Connect mini windows

When you open a Connect Chat or Connect Support conversation in the Connect overlay, it opens in a Connect mini window. Each mini window contains a header, a conversation area, and a message field.

Several icons appear in the mini window header and by the message field.

Note: The icons you see for each conversation depend on the conversation type and other conditions.
# Chat mini window icons

<table>
<thead>
<tr>
<th>Icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="icon" alt="add_user" /></td>
<td>Add user</td>
<td>Add a user to the conversation. This icon is visible for group and record conversations only. Administrators can enable this icon for Connect Support conversations.</td>
</tr>
<tr>
<td><img src="icon" alt="view_document" /></td>
<td>View document</td>
<td>View the record associated with the conversation. This icon is visible for record and support conversations only.</td>
</tr>
<tr>
<td><img src="icon" alt="new_window" /></td>
<td>New window</td>
<td>Open the conversation in the Connect workspace, a full-screen window with additional Connect tools.</td>
</tr>
<tr>
<td><img src="icon" alt="collapse_expand" /></td>
<td>Collapse/Expand conversation</td>
<td>Hide or show the conversation. Alternatively, click anywhere in the mini window header to the left of the icons.</td>
</tr>
<tr>
<td><img src="icon" alt="close_window" /></td>
<td>Close window</td>
<td>Close the mini window. The conversation remains in the Connect sidebar and the history is preserved when you reopen the conversation. You can also close a mini window by pressing the Escape key.</td>
</tr>
<tr>
<td><img src="icon" alt="connect_actions" /></td>
<td>Connect actions</td>
<td>Open the Connect actions menu, which contains options like Transfer and Create Incident. This icon is visible only when Connect actions are available for the conversation. By default, this icon is visible for support conversations only. Administrators can add options to this menu by creating Connect actions.</td>
</tr>
<tr>
<td><img src="icon" alt="message_type" /></td>
<td>Message type</td>
<td>Choose whether messages are added to the associated record as comments or work notes. This icon is visible only for record and support conversations.</td>
</tr>
<tr>
<td><img src="icon" alt="attach_file" /></td>
<td>Attach file</td>
<td>Attach and send a file. Select one or more files and click Open. You can also add an attachment by dragging and dropping it directly in the conversation.</td>
</tr>
</tbody>
</table>
**Connect workspace**

The Connect workspace is a full-screen view of all your Connect Chat and Connect Support conversations in one place. It contains the conversation pane, which displays the conversation header and an expanded version of the mini window, and the conversation tools area.

To open the Connect workspace, navigate to **Collaborate > Connect Chat** or click the new window icon

in a Connect mini window. If you do not have any recent conversations, a screen appears with helpful information about Connect.

The Connect workspace is composed of the following elements.

**Connect workspace elements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sidebar</td>
<td>Provides access to conversations. The Connect sidebar behaves the same way in the workspace as it does in the Connect overlay. The only difference is that the sidebar appears on the left edge of the Connect workspace. For more information about using the sidebar, see <a href="#">Connect sidebar</a>.</td>
</tr>
<tr>
<td>Conversation pane</td>
<td>Displays the currently selected conversation.</td>
</tr>
<tr>
<td>Conversation tools</td>
<td>Provides quick access to key information, conversation members, attachments, and notification preferences for the currently selected conversation. Some of the conversation tools vary depending on the type of conversation.</td>
</tr>
</tbody>
</table>
Connect workspace
Conversation pane

The conversation pane of the Connect workspace displays the conversation header and an expanded version of the mini window.

The header displays basic conversation details like the avatar and name. You can edit these details for group or record conversations.

Below the header, messages appear in chronological order. You can enter messages in the text entry field at the bottom of the window.

Connect conversation tools

The conversation tools area in the Connect workspace contains several tabs, each represented by an icon.

Click an icon to open the tab. Click the same icon again to hide the tab. The tabs you see for each conversation depend on the conversation type and other conditions.

### Conversation tool tabs

<table>
<thead>
<tr>
<th>Tab icon</th>
<th>Tab name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="i" /></td>
<td>Info</td>
<td>Contains the following sections, each of which appears only if it contains information.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Record</strong>: Lists details about the record the current conversation follows, such as record number, state, assignee, and short description. The fields displayed in this section vary by the type of record. This section is available only for record conversations.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Related Records</strong>: Lists Visual Task Boards and task records that have been referenced in the conversation, such as incidents, problems, or changes. When you send a record number as a message or drag a record in a conversation, it appears as a link. The list displays the short description for each task. Click a task to open the record in a new browser tab. Only conversation members who have rights to view the tasks can access them.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- <strong>Links</strong>: Lists URLs that have been referenced in the conversation. Click a link to open the destination page in a new browser tab. This tab is not available for support conversations.</td>
</tr>
<tr>
<td><img src="image" alt="file" /></td>
<td>Record</td>
<td>Displays a compact form view of a record created from the current conversation, such as an incident. If more than one record has been created from the conversation, there is a separate record tab for each one. These tabs are available only for support conversations.</td>
</tr>
<tr>
<td><img src="image" alt="knowledge" /></td>
<td>Knowledge Base</td>
<td>Displays a compact view of the knowledge homepage. For more information, see Share knowledge in a Connect Support conversation.</td>
</tr>
<tr>
<td><img src="image" alt="members" /></td>
<td>Members</td>
<td>Lists all members of the current conversation. You can add or remove conversation members for group and record conversations.</td>
</tr>
<tr>
<td><img src="image" alt="attachment" /></td>
<td>Attachments</td>
<td>Lists all attachments in the conversation. Click an attachment to open it. Click Add Attachment to upload an attachment.</td>
</tr>
</tbody>
</table>
Enable or disable Connect notifications globally

You can edit your Connect notification settings globally to enable or disable mobile, desktop, email, or audio notifications for all your Connect Chat and Connect Support conversations.

Role required: none

By default, Connect mobile, email, and audio notifications are enabled globally. You must enable desktop notifications.

An administrator can customize the sound used for audio notifications.

**Note:** You receive mobile notifications only if you have installed the ServiceNow mobile app.

1. In the banner frame, click the gear icon (⚙️) to open the system settings.
2. In the system settings window, click the **Notifications** tab.
3. In Notifications by Category, navigate to **Connect**.
4. Enable or disable Connect mobile, desktop, email, or audio notifications.
5. Optional: Configure the following system notifications. For more information on how to configure system notifications, see [Apply notification conditions](#).

<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity Stream @Mention Email</td>
<td>Sends an email alert to a user anytime they get @mentioned in an activity stream</td>
</tr>
<tr>
<td>Collaboration Offline Group Message(s)</td>
<td>Sends email to offline users who are members of a group conversation after a certain number of minutes determined by the collaboration.email_interval property to limit spam.</td>
</tr>
</tbody>
</table>

**Note:** It takes 90 seconds after a user logs out for the system to register that the user is offline. If a message is sent to the user within 90 seconds of them logging out, then the user does not receive the notification.
<table>
<thead>
<tr>
<th>Notification</th>
<th>Description</th>
</tr>
</thead>
</table>
| Collaboration Offline Message Bundle | Sends email to offline users after a certain number of minutes determined by the `collaboration.email_interval` property to limit spam.  
**Note:** It takes 90 seconds after a user logs out for the system to register that the user is offline. If a message is sent to the user within 90 seconds of them logging out, then the user does not receive the notification. |
| ConnectMessagePushNotification       | Uses a push notification to inform users when there are new messages in a conversation                                                                                                                     |
| ConnectNotificationPushNotification  | Uses a push notification to inform a user when they have been @Mentioned in a record                                                                                                                      |

Edit which notifications you receive *for a specific conversation.*

**Connect notification browser support**

The following browsers support Connect chat notifications.

**Connect chat browser support**

<table>
<thead>
<tr>
<th>Browser</th>
<th>Enable notification steps</th>
</tr>
</thead>
</table>
| Chrome                                       | 1. From a Chrome window, click the Chrome menu in the upper right corner.  
2. Go to **Settings > Show advanced settings... > Privacy > Content settings.**  
3. In the Content settings window, from the notifications section, select your notification settings.                                                                 |
| Mozilla Firefox (starting with version 44)  | Manage browser notification settings using the information icon next to the URL.                                                                                                                                             |
| Safari (starting with OS X Mavericks)       | 1. From a Safari window, open **Preferences.**  
2. Select the notifications tab.  
3. Select **Allow** or **Deny** to control which websites have access to notifications.                                                                                                                                     |
<table>
<thead>

</table>

**Note:** Internet Explorer does not support Connect notifications out of box.

### Edit which notifications you receive for a conversation

You can control which types of Connect notifications you receive for each conversation and when you receive them.

**Role required:** none

Connect can send mobile, desktop, email, and audio notifications to inform you of messages and other activity, when you are not actively viewing Connect. You can edit your notification preferences in each conversation to control which notifications you receive for the conversation and under what circumstances. For example, if you are a member of a large group conversation, you might want to receive mobile, desktop, and email notifications for all activity, and audio notifications only when someone mentions you. You might also want to disable a certain type of notification entirely for a conversation.

By default, you receive mobile, email, and audio notifications for all activity in every conversation you belong to. You must enable desktop notifications manually. Not all browsers allow desktop notifications. For more information, see *Enable or disable Connect notifications globally*.

An administrator can customize the sound used for audio notifications.

**Note:** You receive mobile notifications only if you have installed the ServiceNow mobile app.

1. Open a conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation, click the notification settings tab (_sound icon_).
3. Edit the following settings according to your preferences.

**Note:** If a notification type is disabled globally, a link to enable that type appears. You must click the link before you can edit conversation-specific notification settings.
Notification type disabled globally

**Upload a profile picture**

You can upload a profile picture in your Live Feed profile to use as an avatar in Connect Chat and Connect Support conversations.

Role required: none
Users who do not have profile pictures are represented by an avatar with their initials. Administrators can upload a profile picture in a user record which displays if there is no Live Feed photo.

1. Navigate to Collaborate > Live Feed.
2. Click the tile with your picture or initials and title.

3. Use one of the following actions to add your photo.
   - Locate the photo file you want to use and drag it over the existing photo.
   - Point to the existing picture (or tap the photo in the smartphone or tablet interface) to display the Upload a picture link. Click the link, navigate to the location of the photo you want to use, and click Open.

Drag a file into a Connect conversation

Drag and drop functionality in Connect Chat and Connect Support provides an easy way to share external attachments and links or items from within your instance.

Role required: none

You can drag several things from within an instance, including items from the application navigator, records or breadcrumbs from lists, and Visual Task Boards from the My Task Boards page.

Drag an item in a Connect mini window.
To drag a record from a list, drag the reference icon
the record number, or a reference column value.
Connect accepts the same file extensions as the platform. For more information, see Add and manage attachments.

Share a Visual Task Board in a Connect conversation
You can share a Visual Task Board in a Connect Chat or Connect Support conversation.
Role required: none
2. Drag a task board to a Connect mini window.
A link to the task board appears in the conversation. The task board is also listed in the conversation tools, which are visible in the Connect workspace. Only conversation members who are members of the board can access it. If you share a task board in a record conversation, it appears as a URL in the record activity stream.

Mention a user in a Connect conversation
You can get someone’s attention in a group conversation by mentioning them.
Role required: none
Users can set their notification preferences so they receive notifications only when they are mentioned. Mentioning a user creates a shortcut to view their basic information and send them a direct message.
1. Open a Connect group conversation.
2. In the message field, type the @ character.
   A suggestion menu appears with the names of the conversation members.
3. Select the person you want to mention and send the message.

**Connect administration**

Administrators can configure various performance settings and features that impact both Connect Chat and Connect Support.

**Note:** There are also administrative options specifically for Connect Chat or Connect Support. For more information, see Connect Chat administration and Connect Support administration.

**Domain separation in Connect Support and Connect Chat**

This an overview of how domain separation works in Connect Support and Connect Chat, and the expected interactions across domains to support multiple tenants. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.
Support level: Basic

- There is business logic to ensure data goes into the proper domain for the application’s service provider use cases.
- In the application, the user interface, cache keys, reporting, rollups, aggregations, and so on, all consider domain at run time.
- The owner of the instance needs to be able to set up the application to function normally across multiple tenants.

Use case: As a service provider when I use chat to respond to a tenant-customer’s message, the client must be able to see my response.

Overview

Connect Support adheres to the standard domain separation patterns within ServiceNow, with some exceptions. Most notably, Connect Support allows for users in a parent or top-level domain to interact with chat_queue_entry records generated from child domains. Users can then pose questions in specifically-labeled chat_queues directly to the primary administrators of the instance.

Connect Chat supports data separation within domain separated instances. Delegated administration—the ability to override configuration settings and logic in domains—is not supported.

How domain separation works in Connect Support

Connect Support supports data separation within domain-separated instances. Delegated administration—the ability to override configuration settings and logic in domains—is not supported.

Configuration

Connect Support is configurable by system administrators only. Configuration settings apply to all domains. Overrides for configuration details and process logic in domains are not supported.

After domain separation has been enabled, the following Connect Support-related tables are not domain-separated in the base system:

- chat_queue
- connect_action

Records created from users in a child domain remain in the child domain to both the agent and the user initiating the chat. Any of the following tables represent records that support the conversation.
### Records from conversations

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chat_queue_entry</td>
<td>Holds the initial question from the end user, and other metrics to determine overall support efficiency, such as wait_time.</td>
</tr>
<tr>
<td>live_group_profile</td>
<td>Represents the conversation itself</td>
</tr>
<tr>
<td>live_group_member</td>
<td>Each individual member of the support conversation</td>
</tr>
<tr>
<td>Incident and other task-based records</td>
<td>Any record generated from connect_actions.</td>
</tr>
</tbody>
</table>

### How domain separation works in Connect Chat

Configuration: Connect Chat is configurable by system administrators only. Configuration settings apply to all domains. Overrides for configuration details and process logic in domains are not supported.

Actions may be made available to specific domains based on condition filters set by system administrators.

Data Management: Connect Chat messages are not assigned to a domain. Rather, visibility is restricted to conversation participants.

### Usage scenarios

Chat with users in the same domain (Supported)
- Domain visibility allows users to see other users in the same domain.
- Examples:
  - Service Provider user may chat with another Service Provider user
ServiceNow Orlando Now Platform capabilities

- ACME user may chat with another ACME user

Parent domain user initiates chat with child domain user (Supported)
- Domain visibility allows users to see users in child domains.
- Examples:
  - Service Provider user may initiate a chat with a Service Provider sub-contractor user
  - ACME user may initiate a chat with ACME EMEA user

Domain user initiates chat with user in a domain where visibility has been granted (Supported)
- Domain visibility allows the user initiating a chat to see users in the target domain.
- Examples:
  - Service Provider sub-contractor user may initiate a chat with an Initech user, given domain visibility
  - Service Provider users may initiate a chat with any domain user, given the contains relationship with the TOP domain

Sub-domain user initiates chat with Parent domain user (Not supported)
- Domain visibility does not allow users in child domains to see users in parent domains. This means they are unable to initiate a chat session.

Configuration

Administrators may configure multiple Chat Queues. Support Queues are not assigned to a domain. Assignment groups may exist in any domain.

Any user with the appropriate link can enter a queue, regardless of the user’s domain. Exposure of links to specific queues through the default user interface may be controlled using domain-specific overrides. Exposure of links to specific queues through the Service Portal may be controlled using conditions or custom coding logic.

The Reporting Dashboard contains statistics related to all queues and all agents. Statistics are not filtered according to domain. Therefore, it is not appropriate to expose this page to users within child domains.

Data management

Connect Support Queues are global. No domain field exists on this table and it is not suitable for domain separation.

Connect Support messages are assigned to a domain based on the domain of the user entering the queue. Members of the Assignment group for the queue must have domain visibility to the user entering the queue to participate in chat sessions.

Records generated from chat sessions display based on the agent’s home domain. However, once the record is saved with a Company value, business rules assign the newly created record to the corresponding domain.
Usage scenarios

In the illustration above:

- The ACME support queue is configured to be available from 8-5 on weekdays. The ACME Support group in the ACME domain provides first-level support. If more advanced support is required, users are escalated to the Service Provider’s Service Desk queue.
- The Service Desk queue is configured to be available 24x7 and is staffed by the Service Desk Group in the Service Provider domain. If more advanced support is required, users are escalated to the Tier 2 Support queue in the same domain.

Properties for Connect

The Connect Properties page provides several configuration options for Connect. Users with the admin role can access these properties by navigating to Connect > Administration > Properties.

**Note:** Many of the properties also impact Connect Support.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable Presence</td>
<td>Turns off user presence globally when enabled. Enabling this property turns off user presence throughout the platform, not just in Connect.</td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>

- **Type:** true | false
- **Default value:** false
- **Location:** Connect > Administration > Properties
- **Learn more:** User presence
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Enable Connect in the frameset | Determines whether the Connect overlay is visible (enabled). This property also impacts Connect Support.  
- **Type**: true | false  
- **Default value**: true  
- **Location**: Collaborate > Administration > Properties  
- **Learn more**: Disable the Connect overlay |
| Enable Connect to retrieve external link metadata in order to render richer content in messages with links to YouTube, news articles, images, etc. | Enables Connect to render URLs for external sites as links. When this property is disabled, URLs that point anywhere outside the instance appear as plain text. This property also impacts Connect Support.  
- **Type**: true | false  
- **Default value**: true  
- **Location**: Collaborate > Administration > Properties |
| Number of minutes to wait before collecting unread messages and sending an email to offline users. | Sets the number of minutes the system waits before sending a Connect notification email to an inactive user.  
- **Type**: integer  
- **Default value**: 3  
- **Location**: Collaborate > Administration > Properties  
- **Learn more**: Configure the email notification interval |
| Maximum number of latest conversations to show during search. (Default = 50) | Sets the number of results that appear when you search conversations in Connect. In the System Properties (sys_properties) table, this property appears as connect.search.conversation_limit.  
- **Type**: integer  
- **Default value**: 50 |
| Audio file to play to notify users of new messages, support conversation transfers and @mentions in Connect. This property’s value should point to the ‘name’ field of an audio file in the db_audio table. | Specifies the audio file to play to notify users of new messages, support conversation transfers, and @mentions in Connect. This property’s value must point to the Name field of a record in the Audio File (db_audio) table. This property also impacts Connect Support.  
- **Type**: string  
- **Default value**: connect_alert.mp3  
- **Location**: Collaborate > Administration > Properties  
- **Learn more**: Customize the Connect audio notification sound |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Comma separated whitelist of roles able to access Connect. Empty allows all roles. connect.roles | Determines which user roles are required to access Connect. When the value is blank, no role is required. This property also impacts Connect Support.  
  
  **Note:** If you choose to restrict Connect access to specific roles, consider updating the role requirements for Connect modules and other access points.  
  
  - **Type:** string  
  - **Default value:** <empty>  
  - **Location:** Collaborate > Administration > Properties |
| Determine whether or not a button is shown in task forms to view the Collaboration document conversation or Live Feed Record Feed related to the task. Note: The Collaboration button will only be enabled if the frameset view is also enabled with collaboration.frameset = true glide.live_feed.task_header_button | Determines whether the show live feed icon ( ) and Follow button are available in the form header of tables that have the live_feed=true dictionary attribute.  
  
  - **Type:** choice list  
  - **Default value:** collaboration  
  - **Other possible values:**  
    - both: enables both the show live feed icon and the Follow button.  
    - live_feed: enables the show live feed icon.  
    - none: disables both the show live feed icon and the Follow button.  
  
  - **Location:** Collaborate > Administration > Properties  
  - **Learn more:** Configure record conversations |
| Disable the legacy chat "Create or Join Chat Room" link on the Incident form (Must have Chat plugin enabled to see link) glide.connect.enabled | Hides the Create or Join Chat Room related link, which appears on the incident form when legacy chat is enabled. Legacy chat and Connect Chat should not be used concurrently and this property should not be modified.  
  
  - **Type:** true | false  
  - **Default value:** true  
  - **Location:** Collaborate > Administration > Properties |

**Configure the polling interval**

The polling interval determines how frequently the system polls for new Connect messages.  
  
  Role required: admin
The default interval is 10 seconds. You can change this value. The shorter the polling interval, the more frequently the system checks for new messages and the greater the impact on performance.

**Note:** This setting impacts Connect Chat and Connect Support.

1. Navigate to `sys_properties.list`.
2. Locate the `collaboration.polling_interval` property.
3. Set the Value to a different number of seconds.

   Setting the polling interval to a value smaller than 2 is likely to tax the system too heavily, while a value greater than 10 is likely to result in a poor user experience.

### Disable the Connect overlay

The Connect overlay is enabled by default and is integrated with the standard user interface. You can disable the Connect overlay.

Role required: admin

To disable the Connect overlay and remove the toggle Connect sidebar icon from the banner frame, set the `collaboration.frameset` property to `false`.

1. Navigate to **Connect > Administration > Properties**.
2. Locate the property called **Enable Connect in the frameset** (`collaboration.frameset`) and clear the check box.
3. Click **Save**.

When the frameset is disabled, any Connect chats open in the Connect workspace. For more information on completely disabling Connect Chat, see [Disable Connect Chat](#).

### Customize the Connect audio notification sound

You can replace the default Connect audio notification sound with an audio file of your choice. **Upload the audio file** you want to use as the notification sound.

Role required: admin

The audio notification sound is used for all Connect conversation types, including Connect Support conversations.

1. Navigate to **System UI > Audio Files**.
2. Locate the audio file you want to use as the notification sound and copy the **Name** value.
3. Navigate to **Connect > Administration > Properties**.
4. Locate the property called **Audio file to play to notify users of new messages, support conversation transfers and @mentions in Connect** (`connect.notification.audio_alert`) and replace the default value with the name of the audio file.
5. Click **Save**.

End users receive audio notifications when sending and receiving support chats. Support agents only receive audio notifications for inbound chats when the chat window is not in focus.

### Administer Connect actions

You can create or modify Connect actions to provide custom functionality in Connect Chat or Connect Support conversations.
If you want to customize the icon for a Connect action, navigate to **Collaborate > Administration > Action Icons** to view the available icons and their class names. Note the class name of the icon you want to use.

Role required: admin

The Connect action menu appears by the message entry field when one or more Connect actions are available for a conversation, based on defined conditions. When a user selects a Connect action, the system runs the script defined for that action.

1. Navigate to **Connect > Administration > Actions**.
2. Click **New** or open an existing record to edit a table.
3. On the form, fill in the fields.

### Connect Action form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Condition**          | JavaScript condition statement that must return true for the action to be available in a conversation. For example, to show the action in Connect Support conversations only, enter `conversation.type === "support"` or `conversation.table === 'chat_queue_entry'`.
For information about the `conversation` object, see the API reference documentation. |
| **Hint**               | This field is not used. |
| **Icon Class Name**    | Class name of the icon to use. To view all available icons and their class names, navigate to **Collaborate > Administration > Action Icons**. |
| **Order**              | Order of the action relative to other items in the Connect action menu. |
| **Script**             | Script to execute when the action is run. For example, to create a new incident that is based on the conversation, enter the following code: |

```
response.newRecord("incident", {
  short_description: conversation.document.short_description || ",
  caller_id: conversation.document.opened_by
});
```
For information about the `response` object, see the API reference documentation. |

**Note:** You can only create a Connect action that is based on a task table.
### Connect Actions form

#### Configure the fields on a record card in Connect

When a record is either linked to or create from a Connect conversation, the details of the record display as a card in the chat window.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shortcut</td>
<td>Text that triggers the action when entered after the &quot;/&quot; character in a conversation.</td>
</tr>
<tr>
<td>Title</td>
<td>Text that appears in the Connect action menu. The title for each Connect action should be unique.</td>
</tr>
</tbody>
</table>
The card view only applies to the full Connect page and the end user view of Connect Support conversations.

Role required: admin

1. Navigate to the form you want to configure fields for.
2. Right-click the header and select **Configure > Form Layout**.
3. Under the Form View section, select the Connect view.
   You may need to create a Connect view for the form. For more information on creating a form view, see [*Create and delete views*](#).
4. Select the fields to appear on the card by adding or removing the fields from the **Selected** column. You can also adjust the order they appear on the form by moving the fields up or down.
   You cannot remove the Author or the Updated fields from the card regardless of whether they are on the view or not. The card always shows the Short Description field in the top even if it is in a different order in the list.

### Disable specific URLs for Connect

Prevent users from accessing certain websites by disabling linking to specific Top-Level Domains (TLDs).

Role required: admin

1. In the navigation filter, type `sys_properties.list`.
2. Search for the `glide.ui.url.external.top_level_domains` system property.
3. In the value field, remove any TLDs that you do not want your users to have access to. For example, remove any TLDs that are commonly used for restricted websites, such as `xxx` or `adult`.
   The list of TLDs is based on the *top 200 most common domains*.

Any TLD not included in the value field becomes unclickable in Connect.

### Connect Chat

Connect Chat is a real-time messaging tool that enables users to chat with individuals and groups, quickly share files, and collaborate on any record by connecting with the right people instantly.

Connect Chat animates communication around records, Visual Task Boards, topics of interest, or groups of people.

Features include:
- Direct conversations between two users.
- Group conversations between three or more users.
- Conversations linked to records. Comments and work notes appear in conversations in real time and users can update the record directly from the conversation.
- Drag-and-drop sharing of links, files, and records.

UI16 or UI15 is required to use Connect Chat.

This video demonstrates how to use Connect Chat.

This video demonstrates how to use Connect Support.

Connect Chat use

All users have access to Connect Chat, a convenient way to stay updated on all the people and documents you work with in a familiar chat interface.

You can start using Connect Chat right away with virtually no setup. Connect Chat supports a few different types of conversations so you can use it as a social tool or a quick way to follow specific records.

Start a direct or group conversation

You can start a conversation with one or more users in Connect Chat.

Role required: none

A conversation between two users is called a direct conversation. A conversation between three or more users is called a group conversation.

1. In the chat view of the Connect sidebar, click the plus icon (+) by the filter. A Connect mini window appears.
2. In the To field, enter the name of the user you want to chat with. Suggestions appear as you type.
3. Optional: Enter additional names to create a group conversation. You can add or remove group conversation members later. You cannot add members to a direct conversation after you create it.
4. Press the Enter key to shift focus to the message field.
5. Send a message to create the conversation. The conversation is added to the Connect sidebar for quick access.

Follow a record in Connect

You can follow a record in Connect Chat to track activity as it happens, in a familiar chat interface. When you follow a record, you become a member of a record conversation.

Role required: whichever role is required to access the record you want to follow in Connect

You must first activate the Connect (com.glide.connect) plugin to complete this task.

Any record conversation you create in Connect becomes a record feed in live feed, and vice versa. Unlike direct or group conversations, all messages in record conversations are comments or work notes.

Note: By default, record conversations are enabled for all tables that extend Task (task). Administrators can enable record conversations for additional tables or disable them if desired.

1. Navigate to a task record.
2. Do one of the following actions.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Follow the record</strong></td>
<td>1. In the form header, click <strong>Follow</strong>.</td>
</tr>
<tr>
<td></td>
<td>The system adds you as a member of the record conversation, but does not open the conversation. You can open the conversation from the Connect sidebar.</td>
</tr>
</tbody>
</table>
| **Follow the record and open a chat mini window** | 1. In the form header, click the down arrow in the **Follow** button.  
2. Select **Open Connect Mini**.                                                                 |
|                                             | The system adds you as a member of the record conversation and opens it in a Connect mini window.                                             |
| **Follow the record and open the Connect workspace** | 1. In the form header, click the down arrow in the **Follow** button.  
2. Select **Open Connect Full**.                                                                 |
|                                             | The system adds you as a member of the record conversation and opens it in the Connect workspace, the full-screen view.                      |

The **Follow** button is relabeled **Following**.

3. Add comments or work notes to the record directly from Connect. Any comments or work notes added to the record appear in the record conversation. Likewise, comments and work notes you add to the conversation appear on the record.

a) In the record conversation, by the text entry field, click the message type icon

![Message Type Icon](image)

b) Select **Comment** or **Work Note**.

c) Enter a message.

By default, record conversation messages are added as work notes.

- **Note**: If you add an attachment to a record conversation, it is attached to the underlying record as well.

*Edit your notification settings* for the record conversation.

**Edit basic conversation details**

In Connect Chat, you can customize the avatar, name, and description for a group or record conversation.

Role required: none

These details are not editable for direct conversations.
Note: The name and description for a record conversation default to the record name and short description. However, editing the name or description for a record conversation does not change anything on the underlying record.

1. Open the a group or record conversation in the Connect workspace.
2. Click anywhere in the conversation header to the left of the icons. A pop-up appears to edit conversation details.
3. Edit the conversation image, name, and description as needed.
4. Click Save.

Add or remove conversation members

In Connect Chat, any member of a group or record conversation can add or remove other conversation members. In a direct conversation with only two people, you cannot add members to the conversation after you create it.

Role required: none

1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab.
3. Do one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a member</td>
<td>1. Click Add Member to Group.</td>
</tr>
<tr>
<td></td>
<td>2. Use the search field to find and select a user.</td>
</tr>
<tr>
<td>Remove a member</td>
<td>1. Point to a member name.</td>
</tr>
<tr>
<td></td>
<td>2. Click the minus icon (-).</td>
</tr>
</tbody>
</table>

Create a Connect conversation from a Visual Task Board

Create a Connect Chat conversation from a Visual Task Board to collaborate with board members and keep track of activity as it happens.

Role required: none

When you create a conversation from a task board, all the board members become members of the conversation. The members are synchronized between the task board and the conversation. For example, if you remove a user from the conversation, the system automatically removes the user from the board as well.

2. Open a task board.
3. In the board header, click the connect with board members icon ( ). The system automatically opens a record conversation for the board. Each board member becomes a member of the conversation.
Connect Chat administration

Administrators can configure various performance settings and features of Connect Chat.

Note: There are also settings that apply to both Connect Chat and Connect Support. For more information, see Connect administration.

Configure the email notification interval

The email notification interval determines how long the system waits before sending a Connect Chat email notification to an inactive user.

Role required: admin

The default interval is 3 minutes. You can change this value.

1. Navigate to Connect > Administration > Properties.
2. Locate the property called Number of minutes to wait before collecting unread messages and sending an email to offline users. (collaboration.email_interval) and set the value to a different number of minutes.
3. Click Save.

When an offline user is sent a Connect message, the collaboration.new_offline_message event fires. The system waits the amount of time provided in the collaboration.email_interval property, then triggers the collaboration.notify_offline_user and collaboration.notify_offline_user.group events (depending on if the conversation was peer to peer or a group conversation). The sysevent_email_action record listens for collaboration.notify_offline_user(.group) then builds an email notification containing all the messages from the last collaboration.email_interval minutes that the user has received in that conversation.

Enable record conversations for a table

Record conversations are enabled for all tables that extend Task (task) by default. You can configure record conversations for additional tables that extend Task.

Role required: admin

To create record conversations, users must have access to the Follow button in the form header. To show the button and thus enable record conversations for a table, the following conditions must be true.

- The live_feed dictionary attribute must be set to true for the table.
  - By default, live_feed=true for all tables that extend Task (task).
- The glide.live_feed.task_header_button property must be set to both or collaboration.
  - By default, glide.live_feed.task_header_button is set to collaboration.

1. Navigate to the list view of a table for which you want to enable record conversations.
2. Perform the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
</table>
| List v3 | 1. Click the list title menu and select Configure.  
          2. In the Configure window, click Dictionary. |
| List v2 | Right-click any column header and select  
          Configure > Dictionary. |
The list of dictionary entries for the table appears.

3. Open the dictionary entry that has Type set to Collection.
   The Dictionary Entry form appears.
4. In the Attributes related list, click New.
   The Dictionary Attribute form appears.
5. In the Attribute field, enter Live feed.
6. In the Value field, enter true.
7. Click Submit.
8. Navigate to Collaborate > Administration > Properties.
9. Locate the property called Determine whether or not a button is shown in task forms to view
   the Collaboration document conversation or Live Feed Record Feed related to the task
   (glide.live_feed.task_header_button).
10. Ensure the property is set to both or collaboration.
    The glide.live_feed.task_header_button property also controls whether the show live feed icon
    ( ) appears. If the property is set to collaboration, the show live feed icon does not appear
    on form headers.

Prevent users from following records in Connect for all tables

Users can follow records in Connect for any table that extends Task (task) by default. You can
disable this functionality for all tables.

Role required: admin

To disable record conversations for all tables, prevent the Follow button from appearing in all form
headers by editing the glide.live_feed.task_header_button property.
1. Navigate to sys_properties.list.
2. Locate the glide.live_feed.task_header_button property.
3. Set the Value to live_feed.

Prevent users from following records in Connect for a specific table

Users can follow records in Connect for any table that extends Task (task) by default. You can
disable this functionality for a specific table.

Role required: admin

To disable record conversations for a specific table, prevent the Follow button from appearing in
form headers for the table. To do so, set the live_feed dictionary attribute to false for the table.
1. Navigate to the list view of a table for which you want to disable record conversations.
2. Perform the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click any column header and select Configure &gt; Dictionary.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and select Configure, and then select Dictionary.</td>
</tr>
</tbody>
</table>

The list of dictionary entries for the table appears.

3. Open the dictionary entry that has Type set to Collection.
   The Dictionary Entry form appears.
4. In the Attributes related list, locate the Live feed dictionary attribute.
5. Set the **Value** to **false**.
   Setting the dictionary attribute to **false** also removes the show live feed icon
   for the table.

**Disable Connect Chat**

You can disable Connect Chat to prevent users from being able to chat within the platform.

Role required: admin

Disabling Connect Chat hides the Connect Chat sidebar icon. Users who try to access Connect Chat from the navigation pane receive a message that says Connect has been disabled.

1. In the navigation filter, type `sys_properties.list` and press Enter.
2. Search for the `glide.connect.chat.disabled` property.
3. Set the property value to **true**.

**Connect Support**

Connect Support is a real-time messaging tool that enables support agents to easily keep track of their support cases, quickly find solutions, and resolve problems quickly.

Connect Support builds on the messaging platform provided with Connect. For general information about the Connect interface, setup, and administration, see Connect. When Connect Support is enabled, users designated as support agents have access to the support tab of the Connect sidebar.

Using Connect Support:

- Administrators can create chat queues and enable users to access live support.
- Support agents can monitor the queues to provide instant support.
- Users can share links, files, and records using drag-and-drop.

UI16 or UI15 is required to use Connect Support.

**Note:**
- Connect Support does not replace legacy chat but offers some of the same functionality. Do not use the features concurrently.

**Monitor incoming Connect Support conversations**

In the support tab of the Connect sidebar, you can monitor the queues for which you are an agent and accept incoming conversations.

Role required: none

**Note:** The support tab is visible only if you are an agent for one or more queues.

1. Navigate to **Connect > Connect Support**.
   The Connect workspace opens in a new tab.
2. Click the support tab of the Connect sidebar, indicated by a headset icon (🎧).
The support tab displays **Queues** to which you belong. It also displays your open support conversations under **Cases**. When a user starts a support conversation or an agent transfers a conversation to a queue, any agent who belongs to the associated queue can accept the conversation. An agent can also request to **transfer a conversation** directly to you.

Support tab of Connect sidebar

3. Accept a conversation in one of the following ways.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Accept a transfer request</td>
<td>Under <strong>Cases</strong>, click <strong>Accept</strong> by a transfer request.</td>
</tr>
</tbody>
</table>

**Transfer request**

The conversation opens in the conversation pane. The agent who transferred the conversation can stay in the conversation.

4. Respond to the user and help resolve the issue.

By default, your messages are added to the conversation record as comments and are visible to the user.

**Share knowledge in a Connect Support conversation**

The support view of the Connect workspace has a built-in knowledge tool that makes it easy to search for knowledge articles and share them in a conversation.

Role required: none

Use the knowledge tool to research user questions and provide solutions quickly and easily.

1. Open a support conversation in the Connect workspace.
   The knowledge tool is not available in Connect mini windows.

2. In the conversation tools area to the right of the conversation pane, click the knowledge base tab, which is represented by an open book icon.

   ![Knowledge tools](image)

   The knowledge homepage appears in the conversation tools pane.
3. Search for articles related to the user's issue.
   For more information about finding knowledge, see Search using Knowledge Management v3.

4. To share an article in the conversation, drag a knowledge article link to the conversation pane and drop it anywhere in the drop zone that appears.

**Transfer a Connect Support conversation to a different agent or queue**

You can transfer a Connect Support conversation to a different agent in the queue or to a different queue.

Role required: none

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (≡) to open the Connect actions menu.
3. In the Connect actions menu, select **Transfer**. A transfer dialog box opens.

![Transfer to an agent in the HR Department Chat Queue queue]

4. Do one of the following actions.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transfer the conversation to an agent</td>
<td>1. To start the transfer request, click Transfer by an agent’s name. Be sure to choose an agent who is online. A green dot on their avatar indicates that a user is online. You can cancel the transfer any time before it is accepted.</td>
</tr>
<tr>
<td></td>
<td>2. When the transfer is accepted, select one of the following options in the dialog box that appears.</td>
</tr>
<tr>
<td></td>
<td>• Stay: Remain in the conversation, which is also known as a warm transfer. This option is ideal if you want to provide the new agent with background information or introduce the user to the new agent.</td>
</tr>
<tr>
<td></td>
<td>• Leave: Exit the conversation, which is also known as a cold transfer.</td>
</tr>
<tr>
<td>Transfer the conversation to a queue</td>
<td>Click Transfer by a queue. The system automatically removes you from the conversation and the conversation enters the queue you selected.</td>
</tr>
</tbody>
</table>

**Add a user to a Connect Support conversation**

You can add additional users to a Connect Support conversation.

An administrator must enable the `glide.connect.support.add_members` property before users can be added to conversations.

Role required: none

1. Open a group or record conversation in the Connect workspace.
2. In the conversation tools to the right of the conversation pane, click the member list tab
3. Do one of the following actions.
### ServiceNow Orlando Now Platform capabilities

#### Option | Description
---|---
Add a member | 1. Click Add Member to Group.  
2. Use the search field to find and select a user.

Remove a member | 1. Point to a member name.  
2. Click the minus icon (−).  
The assigned support agent cannot be removed from a Connect Support conversation.

---

**Note:** Only the assigned support agent can create an incident from the Connect Support conversation.

---

### Escalate a Connect Support conversation

If an escalation path is defined for a Connect Support conversation, you can use a shortcut to escalate a Connect Support conversation to a different queue.

Define an escalation path for the queue, using the **Escalate to** field on the Chat Queue (chat_queue) table. For more information, see *Administer Connect Support queues*.

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (⋮) to open the Connect actions menu.
3. In the Connect actions menu, select **Escalate**.  
   A confirmation dialog box appears.
4. In the dialog box, click **Escalate**.  
The system automatically removes you from the conversation and the conversation enters the escalated queue.

---

### Create an incident from a Connect Support conversation

You can use a shortcut to create an incident on behalf of a user, directly from a Connect Support conversation.

**Role required:** none

You might want to create an incident if you cannot resolve the user’s issue over chat or if you want to create a record of the conversation to share with the user. When you create an incident from a support conversation, the system copies the conversation history to the incident activity stream as comments and work notes. Future messages are tracked in the incident as well.

**Note:** Administrators can customize the behavior of the **Create Incident** Connect action.  
For more information, see *Administer Connect actions*.

1. Open a Connect Support conversation.
2. At the bottom of the conversation, click the menu icon (⋮) to open the Connect actions menu.
3. In the Connect actions menu, select **Create Incident**.
In the conversation tools area to the right of the conversation, a new incident form opens in a record tab. The system automatically sets the **Caller** field to the user who opened the support conversation.

4. Complete the form as necessary and click **Submit**.

Any comments or work notes in the record conversation appear as comments on the incident form. Work notes do not appear in the chat for the ESS user. The chat agent can select whether a message is a Comment or Work Note in the conversation.

   a) In the record conversation, by the text entry field, click the message type icon.

   b) Select **Comment** or **Work Note**.

   c) Enter a message.

By default, record conversation messages are added as comments.

**Note:** If you add an attachment to a record conversation, it is attached to the underlying record as well.

The system automatically shares the record in the conversation, copies the conversation to the record activity stream, and references the record on the Chat Queue Entry (chat_queue_entry) table. Any new journal fields added to the record do not appear in the chat. The system also changes the document ID for the conversation to reference the incident number instead of the entry in the Chat Queue Entry table.

**Connect Support chat states**

Connect Support chats move through specific states.
Connect Support chat states

<table>
<thead>
<tr>
<th>Composite state</th>
<th>State</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Waiting</td>
<td>- Requester/end user enters a queue by sending a message. Agent has not yet accepted it.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Requester/end user rejoins a session that is in a Reopenable state.</td>
</tr>
<tr>
<td>Work in Progress</td>
<td></td>
<td>- Agent accepts a chat from a queue. Both requester and agent engage in a chat session.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Requester/end user temporarily leaves an ongoing conversation; requester or agent does not end the session; requester rejoins session.</td>
</tr>
<tr>
<td>Reopenable</td>
<td>Closed</td>
<td>Requester/end user clicks End Chat button before agent accepts the request.</td>
</tr>
<tr>
<td></td>
<td>Abandoned</td>
<td></td>
</tr>
<tr>
<td>Permanently</td>
<td>Closed by Client</td>
<td>- Requester/end user clicks End Chat button after agent accepts the request.</td>
</tr>
<tr>
<td>closed</td>
<td></td>
<td>- Requester/end user times out.</td>
</tr>
<tr>
<td></td>
<td>Closed</td>
<td>Agent escalates an ongoing conversation by performing the Escalate action from the menu icon.</td>
</tr>
<tr>
<td></td>
<td>Complete</td>
<td>Agent ends the session.</td>
</tr>
</tbody>
</table>

Connect Support administration
Administrators can configure various performance settings and features of Connect Support.

**Note:** There are also settings that apply to both Connect Chat and Connect Support. For more information, see Connect administration.

Migrate from legacy chat to Connect Support
Connect Support is an extension of Connect. Users designated as support agents have access to the support tab of the connect sidebar. Do not use Connect Support concurrently with legacy chat.

Before you activate Connect Support, inform your support agents to close out any existing chats.

Legacy chat uses a different field to determine which state a help desk chat is in. A fix script is included in the Connect Support plugin that circumvents this issue by closing out any existing help desk chat sessions. Manually closing out any existing chats before allowing this script to run helps prevent any loss of chat information.

If you do not close out existing help desk chats, your metrics and chat queue will not work accurately.

1. Activate the Connect Support plugin.
   When you activate the Connect Support plugin, the glide.connect.support.enabled property redirects the legacy chat URL to Connect Support.

   For more information, see Activate Connect Support.
2. Hide the Social IT application. Activating Connect Support does not completely eliminate the legacy chat module. To prevent users from using the legacy chat, hide the Social IT application menu. For more information, see Enable or disable an application menu or module.

Properties for Connect Support

The Connect Support Properties page provides several configuration options specifically for Connect Support. These properties are available for Connect Support.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Should Connect be used for handling chat queue entries glide.connect.support.enabled | Disables or enables Connect Support. When the property is enabled, the Service Desk Chat button in the Employee Self-Service portal opens the conversation in Connect Support, rather than legacy chat. Additionally, the Support tab appears in the Connect sidebar.  
  - **Type**: true | false  
  - **Default value**: true  
  - **Location**: Collaborate > Support Administration > Properties |
| Number of support conversations an individual agent can have at one time (-1 is unlimited) connect.support.conversation_limit | Determines how many support conversations an individual agent can have at one time. When the value is set to -1, an agent can participate in an unlimited number of conversations.  
  - **Type**: integer  
  - **Default value**: -1  
  - **Location**: Collaborate > Support Administration > Properties |
| Show agent avatar in Connect Support conversations. connect.support.show_agent_avatar | Determines whether an agent’s avatar is shown in a support conversation (enabled). When the property is disabled, users see the agent’s name only.  
  - **Type**: true | false  
  - **Default value**: true  
  - **Location**: Collaborate > Support Administration > Properties |
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Number of seconds to wait (without user interaction), before presenting end users with an idle countdown timer | Determines how many seconds a user must be inactive in a support conversation before an idle countdown timer appears.  
- **Type**: integer  
- **Default value**: 120  
- **Location**: Collaborate > Support Administration > Properties |
| connect.support.idle.delay                    |                                                                                                                                                                                                            |
| Number of seconds to count down from before marking end user as having left their support session | Determines how many seconds the idle countdown timer remains open after it appears. If the idle user does not dismiss the timer before the countdown completes, the system closes the support session.  
- **Type**: integer  
- **Default value**: 60  
- **Location**: Collaborate > Support Administration > Properties |
| connect.support.idle.count_down               |                                                                                                                                                                                                            |
| Limits the number of closed conversations that the support user can see. (0 = unlimited) | Determines how many closed conversations appear in a user's support conversation history. When the value is set to 0, all previous conversations appear in the history.  
- **Type**: integer  
- **Default value**: 0  
- **Location**: Collaborate > Support Administration > Properties |
| connect.support.user.closed.conversation_limit |                                                                                                                                                                                                            |

**Administer Connect Support queues**

You can define the support agents, default messages, schedule, and escalation path for each Connect Support queue.

**Role required**: admin

**Note**: Both Connect Support queues and legacy chat queues are stored on the Chat Queue (chat_queue) table. Do not use Connect and legacy chat concurrently.

1. **Navigate to Connect > Queues.**
2. **Click New** or open an existing queue from the list.
3. **Complete the Chat Queue form, as appropriate.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>Active</td>
<td>Not used in Connect.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assignment group</td>
<td>User group that contains the support staff for the queue. Any user in the group can view the queue in the Connect sidebar and accept chats. No other users can access the queue. This field must be populated.</td>
</tr>
<tr>
<td>Average wait time</td>
<td>Average time it takes for an agent to accept a chat in the queue. This value is automatically calculated. Do not manually edit.</td>
</tr>
<tr>
<td>Confirm problem</td>
<td>Not used in Connect.</td>
</tr>
<tr>
<td>Escalate to</td>
<td>Different queue to which an agent can escalate a chat. For example, there is a queue for high priority support chats. When a queue is defined in this field, agents can access the Escalate option in conversations.</td>
</tr>
<tr>
<td>Initial agent response</td>
<td>Message that users see when an agent accepts their chat. For example, Thank you for contacting support. We are looking into your question now and will be with you shortly.</td>
</tr>
<tr>
<td>Not available</td>
<td>Message that users see when they attempt to start a chat outside the defined queue Schedule. You can use HTML to format the message and include links or media.</td>
</tr>
<tr>
<td>Question</td>
<td>Initial phrase that users see when they start a new chat in the queue. For example, How can I help you?</td>
</tr>
<tr>
<td>Schedule</td>
<td>Schedule that defines when the queue is available. Leave the field blank to make the queue available all the time. Users cannot start a new conversation in the queue outside the schedule hours.</td>
</tr>
</tbody>
</table>

4. To review conversations associated with the queue, add the Chat Queue Entries related list and review the records for the following information.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>How long the user waited and the result</td>
<td>Review information in the State and Wait time columns.</td>
</tr>
<tr>
<td><strong>Who is actively helping employees in the queue</strong></td>
<td>Review the names of agents in the Assigned to column.</td>
</tr>
</tbody>
</table>

Make a Connect Support queue accessible to end users

To make a Connect Support queue accessible to end users, use the accepted URL format.

Create a queue. Create agents for the queue by assigning users to the assignment group associated with the queue.

Role required: admin

For example, you might create a module or add a link to a portal. The accepted URL format is https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>.

1. Navigate to Connect > Administration > Queues.
2. Right-click the name of the queue to which you want to link.
3. In the context menu, select **Copy sys_id**. Follow browser instructions to copy the sys_id if browser security measures restrict this function.
4. Preview the support queue by navigating to `https://<instancename>.service-now.com/$chat_support.do?queueID=<sys_id>`.
5. Create a module or other link to the queue using the URL.

**Add a scripted extension point for Connect Support chats**

Implement the `ConversationServerInteractionService` extension point, which enables you to create custom scripts that use context variables from pre-chat surveys presented to requesters in the Agent Chat client.

**Role required:** admin

1. Navigate to **System Extension Points > Scripted Extension Points** and select the `ConversationServerInteractionService` scripted extension point.
2. Click the **Create implementation** related link to create a new custom script include.
3. In the Script Include form, create the code that uses the pre-chat context variables to route chats to the appropriate Connect Support queue.
4. Click **Update**.

The custom script is created and registered against the `ConversationServerInteractionService` scripted extension point.

**Connect Support metrics**

Optional plugins provide a homepage and Performance Analytics dashboards, which contain helpful Connect Support metrics.

The reporting homepage is ideal for support managers who want a simple solution to track the recent performance of the support organization. The Performance Analytics dashboards provide a more full-featured solution for support managers who want to analyze trends over time.

Users with the admin role can activate the following plugins to use these features.

**Connect Support homepage and dashboard plugins**

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connect Support Manager’s Dashboard</td>
<td>Provides a homepage for Connect Support, and all required configuration records. Though the plugin name contains the term dashboard, the plugin does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.</td>
</tr>
<tr>
<td><a href="#">com.glide.connect.managers_dashboard</a></td>
<td></td>
</tr>
<tr>
<td>Performance Analytics - Content Pack - Service Desk Chat</td>
<td>Provides the <strong>Service Desk Chat Monitor</strong> dashboard, which analyzes key Connect Support metrics and indicators.</td>
</tr>
<tr>
<td><a href="#">com.snc.pa.chat</a></td>
<td></td>
</tr>
<tr>
<td>Performance Analytics - Context Sensitive Analytics for Chat</td>
<td>Provides in-form analytics for Connect Support. These analytics are available as a related link on the Chat Queue Entry (chat_queue_entry) form, and also as the <strong>Context Sensitive Analytics - Chat</strong> dashboard.</td>
</tr>
<tr>
<td><a href="#">com.snc.pa.chat.context_sensitive_analytics</a></td>
<td></td>
</tr>
</tbody>
</table>
Use the Connect Support homepage
Use the Connect Support homepage to view key indicators and metrics related to support conversations, queues, and agents.

Activate the Connect Support Manager’s Dashboard plugin (com.glide.connect.managers_dashboard) to view this homepage.

Role required: chat_admin

The homepage is called Service Desk - Chat.

1. Navigate to Connect > Support Administration > Reporting Dashboard.

Note: Though the module name contains the term dashboard, the module does not provide functionality related to Performance Analytics dashboards. Homepages are similar to dashboards, but do not require Performance Analytics roles to view.

The Connect Support homepage, which is called Service Desk - Chat, opens.

2. Click a widget to drill down into its data.

Use the Connect Support dashboards
Use the Connect Support dashboards in Performance Analytics to understand trends in your support organization’s performance over time.

Activate one or both of the following plugins, according to your analytics needs:

- Performance Analytics - Content Pack - Service Desk Chat (com.snc.pa.chat)
- Performance Analytics - Context Sensitive Analytics for Chat (com.snc.pa.chat.context_sensitive_analytics)

Role required: both chat_admin and pa_viewer

The Performance Analytics - Content Pack - Service Desk Chat plugin (com.snc.pa.chat) includes the Service Desk Chat Monitor dashboard, which contains the following tabs:

- **Chat Monitor By State**: Contains metrics related to closed support conversations.
- **Overview**: Contains several metrics related to support conversations, queues, and agents.
- **KPI Process**: Contains metrics that are key performance indicators (KPIs) of the Connect Support process, including the average queue response time, the average duration of support conversations, and the number of new support conversations per day.

The Performance Analytics - Context Sensitive Analytics for Chat plugin (com.snc.pa.chat.context_sensitive_analytics) includes the Context Sensitive Analytics - Chat dashboard. The dashboard contains additional metrics related to support queues, including the number of support conversations closed.

Note: You must license Performance Analytics to collect scores for the indicators on the dashboards. Without Performance Analytics premium, the dashboards display the indicators with no data.

1. Navigate to Performance Analytics > Dashboards.

The last dashboard you viewed opens.

2. In the dashboard picker, under the Connect Chat group, select the dashboard you want to view.
3. View the indicators.

**Configure the add support users property**

To enable support agents to add users to a Connect Support conversation, add the `glide.connect.support.add_members` property.

Role required: admin

When the `glide.connect.support.add_members` property is added and enabled, support agents can add users to a support conversation. Any added user can also add other users. Only the assigned agent can create an incident from the chat. When non-support agents are added to a chat, the chat appears in their chat tab.

ℹ️ **Note:** Make sure you are in the Global scope when adding this property.

1. Enter `sys_properties.list` in the navigation filter. The entire list of properties in the System Properties (sys_properties) table appears.
2. Verify that the property does not exist by searching for the property name. If it does exist, update the property with the information in the following table.
3. Click **New**.
4. Complete the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td><code>glide.connect.support.add_members</code></td>
</tr>
<tr>
<td>Type</td>
<td><code>true</code></td>
</tr>
<tr>
<td>Value</td>
<td><code>true</code></td>
</tr>
</tbody>
</table>

**Service Desk Chat Analytics and Reporting Solutions**

Analytics and Reporting Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With Analytics and Reporting Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

ℹ️ **Important:** Set up and test Analytics and Reporting Solutions on a sub-production instance before enabling them in production. You can set up Performance Analytics on a sub-production instance without a subscription.

ℹ️ **Note:**
- Analytics and Reporting Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.
- Analytics and Reporting solutions and in-form analytics provide all the configuration records required to analyze default applications. Customize these records for use in your production environment.
To enable the solution for Service Desk Chat, an admin can navigate to Performance Analytics > Guided Setup. Click Get Started then scroll to the section for Service Desk Chat. The guided setup takes you through the entire setup and configuration process.

**Connect Support and Service Portal**

Use Connect Support in your portal to allow your users to ask questions or submit requests to support agents. You configure the instance options to control the appearance of your widget and how it functions.

The Connect Support and Service Portal integration creates a Connect Support widget that you can add to a page in the Service Portal.

**Activate Connect Support for Service Portal**

Activate the Connect Support and Service Portal integration plugin so you can add the Connect Support widget to a portal page.

Role required: admin

Activating the Connect Support and Service Portal integration plugin automatically activates the Connect Support plugin.

1. Navigate to System Definition > Plugins.
2. Search for and activate the Connect Support and Service Portal integration plugin (com.glide.connect.support.service-portal).

After activating the plugin, the Connect Support widget appears in the list of widgets under Service Portal > Widgets. Use Connect Support in a portal by adding the widget to any page within the portal. For more information on adding a widget to a page, see Create and edit a page using the Service Portal Designer.

**Configure Connect Support widget instance options**

You can control the appearance of your widget and how it functions by configuring the instance options.

Role required: admin

1. Navigate to Service Portal > Service Portal Configuration and open the Service Portal Designer.
2. From the Service Portal Designer, select the page you added the Connect Support widget to. If you have not yet added the widget to a page, see Create and edit a page using the Service Portal Designer for more information.

3. Click the edit icon in the corner of the widget to open the instance options menu.

4. Complete the fields using the following table. Depending on the functionality you want to add, you may not need to add all these fields. For example, if you include the Queue ID, you do not also need to include the Queue Name or the Queue URL.

### Connect Support widget instance options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bootstrap color</td>
<td>Select a color for your widget from a list of common bootstrap colors. Themes control the overall color of a widget, but if you want your widget to be a specific color, you can select it from the list.</td>
</tr>
<tr>
<td>Queue URL</td>
<td>The URL for the Connect Support chat queue that you want questions to be directed to. For example, http://&lt;instancename.service-now.com/$chat_support.do?queueID=&lt;sys_id&gt;</td>
</tr>
<tr>
<td>Queue Name</td>
<td>The name of the queue you want the questions to be directed to. You can find a list of queue names in Collaborate &gt; Connect Support &gt; Queues.</td>
</tr>
<tr>
<td>Queue ID</td>
<td>The sys_id of the queue you want questions to be directed to. You can find this ID by going to the support queue and either copying the queue ID from the support link, or by selecting Copy sys_id from the context menu.</td>
</tr>
<tr>
<td>Message</td>
<td>The text for the button in the Connect Support widget</td>
</tr>
<tr>
<td>Window</td>
<td>Use this option to open the chat in another tab rather than in a new window.</td>
</tr>
<tr>
<td>Title</td>
<td>The name in the widget header</td>
</tr>
</tbody>
</table>

### Content Management System

The Content Management System (CMS) is a ServiceNow application that enables users to create a custom interface for the Now Platform and ServiceNow applications.

The CMS application is powerful and flexible. Customers use it for a wide variety of projects, from creating entire websites to integrating with other products. The Content Management application is active by default.

This video provides an overview of the CMS application.

A CMS typically requires a systems administrator or a web developer to set up and add features. Non-technical users can use the CMS application as a tool for website maintenance. You also want to consider the timing of the addition of content management, and the maturity level of ServiceNow data. For more information, see CMS Planning.

Following are several CMS project ideas:
• Design a company-wide service catalog that offers a collection of services.
• Present a customized UI for a knowledge base.
• Create customized login pages, search pages, views of lists, tables, charts, or graphs.
• Design a complete website.
• Integrate ServiceNow with other company applications.
• Build a tailored self-service portal for end users that is in compliance with a corporate style guide.

Example CMS sites

There are two common interface approaches within the ServiceNow community:

• An image and text-based interface similar to Amazon.com
• A search-based interface similar to Google

Both approaches have been used successfully. The approach you select depends on the needs of the people using the data and how easy it is to train them. While the two design philosophies are different, both approaches share the common goal of UI simplicity.

Activating CMS

You must request the Content Management System (CMS) application from ServiceNow personnel. Instead of activating CMS, use Service Portal for new development. Service Portal is an alternative to CMS with a refined user experience, and is active by default in the base system. See Service Portal and Content Management and Service Portal.

Content Management design

Before building a website in the CMS, it is important to have a good understanding of what to build and who the audience is.

A high volume of content can heavily influence the look and feel of the site and the site hierarchy. When deciding the content, design for ease of maintenance for the people who take care of the system. This level of planning can be time-consuming, but is important.

Review website design prerequisites to help you set expectations, scope deliverables, and define reasonable time lines. Consider both the planning and execution of site design, to understand how sites are built, and to provide a working overview of the CMS.

Timing is important when considering the addition of content management. Successful deployments of the content management system usually take place after phase 1 processes (for example, Incident, Problem, Change, Catalog, and Knowledge) are in place. This is especially true if the team has limited website design experience. Waiting until phase 2 of deployment gives administrators time to work in ServiceNow and to understand how the organization uses the system and what business needs it meets.

Also consider the maturity level of data in the ServiceNow system. Depending on the ITIL processes used, content management is only useful and effective once the data within ServiceNow is established. Ensure that hierarchies, tasks, and workflows are well-defined. For example, before creating a catalog interface, confirm that the service catalog has been in place for some time, has been used, and contains data. The same is true for a knowledge management interface, particularly when high ratings or view counts define article placement on the page.
Content organization

Before you begin to build the CMS website, list all the content that you want to include and take the time to organize it.

A site created in CMS relies on two different types of content.

- CMS site information, such as site pages, images, and menus
- System information, such as knowledge base articles and catalog items

CMS content

Begin by listing all the content you want to host on the CMS pages. Examples include help pages, My Requests, My Approvals, and specific catalog items. Think about current solutions that you can implement immediately, and note ideas for future implementation phases.

Within CMS, you group pages to define the top-down menu structure. You establish a home or starting page, and other pages in the site reference the home page in the Parent Page reference field.

There are several ways to group, such as by audience or the purpose of the website. After listing the content to host, group it logically and identify a common name for each group, as shown in the following examples.

<table>
<thead>
<tr>
<th>IT environment groups</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Content built for</strong></td>
</tr>
<tr>
<td>End user</td>
</tr>
<tr>
<td>IT professional</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>General groups</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Purpose of site</strong></td>
</tr>
<tr>
<td>Reports</td>
</tr>
<tr>
<td>Help and knowledge</td>
</tr>
</tbody>
</table>

System content

Organize the content so the interface is easy to navigate and understandable to the user. Determine the organization based on the data that you are leveraging, both in the CMS (using sites, parent pages, pages, and navigational menus) and throughout the rest of the system. For example, within the catalog you have "category," and in the knowledge base you have "category" and "subcategory." You can use these hierarchies with filtered lists for good search results.

Organizing CMS content logically is important for long-term maintenance of the site, however, the data typically comes from other ServiceNow applications. Communicate with the administrators for these applications, such as the knowledge base, service catalog, and business service portfolio. Work with them to offer the application data appropriately through the CMS pages you create. For example, the team that created the ServiceNow corporate website in CMS began by evaluating the naming conventions used in the corporate knowledge base.
Branding elements

Branding refers to the logo, name, colors, and symbols that identify an organization. It imposes consistency in design and use of terms. Your marketing department defines branding elements and can provide them to you as you plan your CMS pages. Consider how to incorporate the following branding elements.

- Logos
- Color palette
- Tag line
- Trademarked elements
- Graphics

Site design

During planning, consider providing a core set of features with a standard appearance throughout the site. The following web design elements are often used to create a consistent look.

- Page templates
- Navigation schemes
- Header
- Breadcrumbs
- Footer
- Forms

ServiceNow features

Analyze and organize the following ServiceNow features in your instance if you plan on using any of them with CMS pages.

- Account settings
- Email
- Workflow approvals
- Filters

Team member identification

Identify the team members who assist you with website design, branding, and development.

Engage team members for each listed function before you begin to build pages for the CMS website. Each function can be performed by the same or different people.

- Gather corporate style design guidelines.
- Define the written terminology and content for the site.
- Gather and define the site flow.
- Manage the CMS project as the webmaster. The CMS webmaster is responsible for executing the design and making the site work. The following skills are required:
  - Basic ServiceNow administration skills
  - HTML
  - CSS
  - Graphic design
- Web design

After you identify the project team members, establish who is responsible to complete the tasks involved in building the CMS website.
- Determine who owns each page.
- Set a page update schedule so owners do not overwrite each other.
- Formalize content management processes, including content review and page updates.

Data preparation

It is important that there is enough data in the ServiceNow instance before you begin to build the CMS website.

Ensure that the necessary data and content are available in the instance by taking the following actions.
- Review the ITIL processes that you intend to implement in the CMS. Ensure that the data in the instance is a mature representation of the applications being used, for example, service catalog, knowledge management, and incident management.
- Review the defined hierarchies, such as the categories and subcategories for the knowledge base or service catalog. You use these categories to design the entry page into the application.

Corporate style guide

When you build a CMS website, you design the look and feel based on guidelines in the corporate style guide.

A corporate style guide provides detailed information for designing any corporate interface, including corporate websites.

Corporate design team

Many organizations have a web development team that designed the corporate website. Contact this team and involve the designers early in the planning, as they provide help and give their approval to the interface you design. Without approval, there is the risk of having to redesign the entire site because it does not adhere to the organizational guidelines.

Corporate style guide

A corporate style guide takes the guesswork out of designing the CMS website. The example style guide shown is defined down to the pixel. Creating a site with the style guide makes it easy to create clean CSS and HTML. Without the style guide, building the site can take a great deal of time.

Design considerations

Some modifications to the base design for forms may be necessary. The content area of any CMS design should be no smaller than 860px, or service catalog forms are clipped. The sample style guide entry specifies the content area to be 576px, which clips service catalog forms.
Columns and topics:

1. Navigation (levels 2–4)
2. Main content
3. Info snippets
Prototypes and rapid web design

Many user interface designers use prototypes and rapid web design techniques to visualize the final product before it is developed.

Design revisions are the most time consuming and expensive phase of site design. When the team analyzes and then uses prototypes to create pages, revisions to the published pages are minimal.

Develop the prototype and print it. Review the design with the appropriate team members and annotate the prototype, and annotate what to update on each page.

Define the following elements within the prototype.
- The site map for the entire site.
- A detailed prototype of every intended page, including elements such as links, link destinations, content, page names, and page descriptions.

Content Management navigation

After you design the hierarchical structure of the site, begin planning site navigation.

Consider the following as you plan site navigation.
- Placing navigation elements on every page.
- Locating navigation elements in the same place on every page.
- Using either text or images for navigation.
- Providing visitors with an easy way to understand where they are in the site, for example, with breadcrumbs or a specific color scheme.
- Adding a site map, which is a one-page, hyperlinked, hierarchical outline of the site.
- Providing a link to the home page from every site page, as visitors often enter the site on a page other than the home page.
- Designing navigation to help visitors find information quickly with as few clicks as possible.

In the CMS, navigation menus define your site navigation. Build menus as navigational blocks to create navigation paths. The menu chosen for the task depends on the size and complexity of your site. Available menu options include the following items.
- List menus
- Two types of tab menus
- Vertical, clickable list, usually placed on the left side
- Horizontal blocks
- Vertical blocks
- Super menu (a menu of menus)

System content management

Most of the content in a CMS site is managed in different locations throughout the system.

For example, if you are building a knowledge website, the pages and blocks exist in CMS, but the knowledge articles are authored and managed in the Knowledge application. The same is true for any other type of content you plan to leverage. It is important to take time to understand the table structure of data to become acquainted with content.

Links to content are typically static, however, take time to look at the document tree and review how field values are formatted for use within the CMS. To understand the information provided below, right-click within forms in the platform and select Show XML to view the document tree for
the referenced table. To see the table values for each field, right-click the form label and choose **Show - (field name)** or **Configure Dictionary** for reference.

Look at several internet news sites for ideas on how to format dynamic list data and also the full article detail. Research blog sites, shopping sites, and any other site you find easy to use, as layout and usability design can be time-consuming. If you find a site that inspires you, emulate it in your design.

- This *New York Times example* has two separate list formats.
- The *CNN example* has several list formats on the page.
- Several different list formats are used on the ServiceNow website.

**Knowledge articles - kb_knowledge table**

When you right-click and select **Show XML** on any form within the system, the document tree for the referenced database table becomes reference-able. Review the following selected subset of the document tree so you can acquaint yourself with the content readily available to your site design.

```xml
<kb_knowledge>
  <active>true</active>
  <author display_value= "First Last Name" >Use this field value if author name is important </author>
  <short_description>Use this field value as the link to the full article detail</short_description>
  <description>Provide this field value as a 1-2 sentence summary of the article</description>
  <number>Unique ID can be leveraged in a number of different ways</number>
  <published>Published time stamp of the article</published>
  <rating>This field value provides a 1 to 5 star rating similar to iTunes</rating>
  <sys_updated_on>Add to supplement article published timestamp</sys_updated_on>
  <sys_view_count>8</sys_view_count>
  <topic>Useful field value in creating hierarchical breadcrumbs</topic>
  <category>Also useful in organizing articles hierarchically</category>
  <use_count>Use this similar to Facebook's "like" feedback, answer to the question was this useful</use_count>
</kb_knowledge>
```

```xml
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
  <div class = "cms_knowledge_list customer_success" >
    <g:for_each_record file = "${current}" max = "$\{jvar_max_entries\}" >
      <tr><td class = "cms_knowledge_list_image" >
        <j:if test = "${current.u_logo.getDisplayValue() != ''}" >
          <a href = "knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}" >
            <img src = "${current.u_logo.getDisplayValue()}" alt = "${current.text}" width = "110px" />
          </a>
        </j:if>
      </td>
      <td>${current.text}</td>
    </tr>
  </g:for_each_record>
</div>
</j:jelly>
```
Domain separation in the Content Management System

This is an overview of domain separation and the Content Management System. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

No support

- The domain field may exist on data tables, but no logic exists to manage data.
- This level is not considered domain-separated.

Configure Content Management sites

Planning a CMS site involves obtaining resources, communicating with others about design, and gathering content.

Role required: content_admin or admin

The following steps are a high-level overview of how to set up a site.

1. Plan and design your content.
2. Create a site.
   The site is the container that holds all the content. To simplify your process, you can copy an existing site and edit its components. For more information on creating a site, see Create a site. For more information on copying a site, see Copy a site.
3. Add pages to the site.
   Pages contain blocks of information for the site. For more information, see Create a content page.
4. Create content blocks to customize the layout, headers, menu navigation, lists, and static and dynamic content.
Content blocks are chunks of actual HTML that make up the content page. There are various content block types available to help with your customization. For more information, see Content blocks.

5. Add style to your site using themes, style sheets, and frames.

Neither content sites or content pages reference style sheets directly. Configure them using the Themes or Style Sheets options. For more information, see Style in Content Management.

6. Test the site.

After you create or modify a site, test the site to ensure that content displays properly and all links work correctly. For more information, see Test the site.

Content sites

A content site is a group of related content pages that have the same basic theme, layout, and URL suffix.

Content sites are made up of a series of basic building blocks. The Employee Self-Service site is an out-of-box sample site that is included in the CMS activation. It provides existing, working examples or each CMS component, which you can use like a template to build your own site.
Create a site

Configure a site by either creating a new site with CMS or by editing a copy of either the ESS Portal or the Service Management Portal.

Role required: content_admin or admin

If you are creating a catalog site in CMS, follow the steps in Manage catalog sites in Service Catalog

1. Navigate to Content Management > Sites.
2. Click New.
3. Complete the form.

Since you have not yet created pages, you cannot select the Home, Search, Login, and Gauge target pages. Add them to the site record after you create them.

Site fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The URL suffix that identifies the site. The URL suffix is case-sensitive,</td>
</tr>
<tr>
<td></td>
<td>the suffix you enter impacts the CMS site URL used to launch the site. It</td>
</tr>
<tr>
<td></td>
<td>is incorporated into the URL as follows:</td>
</tr>
<tr>
<td></td>
<td>http://&lt;instance name&gt;.service-now.com/url_suffix/page.do</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Do not use portal and cms in the URL suffix. They are reserved</td>
</tr>
<tr>
<td></td>
<td>terms and return a Page not found if you use them.</td>
</tr>
<tr>
<td>Home page</td>
<td>The page to display when the user does not specify a page name in their</td>
</tr>
<tr>
<td></td>
<td>URL: http://&lt;instance name&gt;.service-now.com/url_suffix/</td>
</tr>
<tr>
<td>Search page</td>
<td>The page that displays search results when a user searches from any page</td>
</tr>
<tr>
<td></td>
<td>within the site.</td>
</tr>
<tr>
<td>Login page</td>
<td>The page to use for logging in to the site. If specified, users must log</td>
</tr>
<tr>
<td></td>
<td>in to access the pages on the site. If left blank, no login is required to</td>
</tr>
<tr>
<td></td>
<td>access the pages within the site.</td>
</tr>
<tr>
<td>Gauge target page</td>
<td>The page that displays gauge content. When the user clicks a gauge on the</td>
</tr>
<tr>
<td></td>
<td>new site, the gauge target page opens to show the gauge content. The gauge</td>
</tr>
<tr>
<td></td>
<td>target page replaces the CMS page in the current tab.</td>
</tr>
<tr>
<td>Title</td>
<td>A title for the site. The title can be the same as or different from the</td>
</tr>
<tr>
<td></td>
<td>Name.</td>
</tr>
<tr>
<td>Description</td>
<td>A full description of the site.</td>
</tr>
<tr>
<td>Default layout</td>
<td>The layout for pages to use by default. Any page in the site that has a</td>
</tr>
<tr>
<td></td>
<td>blank Layout field uses the layout selected in this field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default theme</td>
<td>The theme for pages to use by default. Any page in the site that has a blank Theme field uses the theme selected in this field.</td>
</tr>
<tr>
<td>Simple catalog display</td>
<td>Selecting this option simplifies catalog pages in the site by hiding the search bar, breadcrumbs, and the results per page choice list. It also prevents you from adding attachments from record producers to your CMS site.</td>
</tr>
<tr>
<td>Use external cart</td>
<td>Option to omit the default cart when rendering catalog pages within a site that contains catalog pages. Provide a catalog cart block somewhere on the site to allow users to make catalog requests.</td>
</tr>
</tbody>
</table>

**Note:** If you use an external cart, the no cart check box on a service catalog item has no effect. The external cart appears for all items.

4. Click **Submit**.

The following is the site record for the ESS Portal:
Copy a site

To create a new site quickly, you can copy an existing site.

Role required: content_admin or admin

The site copy option creates a complete standalone copy of the site and all its resources. If you are copying a site to create a second site, use this option after the first site is complete, tested, and production ready. This consideration is important because the blocks, CSS, and pages are duplicated to support the new site. There are various reasons why site copying is useful, such as site versioning, branding, or creating a backup.
Images are not included when you use the Copy Site option. They are stored separately in the sys_attachments table.

To copy just a few pages without duplicating all the resources (CSS, blocks, menus), use the page copy option. Page copy duplicates the page but not the resources used in the page. For more information, see Copy a page.

1. Navigate to Content Management > Sites > (Site Name).
2. On the Site form, click Copy.
3. In the dialog box that opens, type a name for the new site.
   - This name is a prefix for all the site elements that are duplicated. Do not use Portal or CMS in the site name.
   - A progress bar shows the copy process. When the process is complete, the Site form shows information for the new site.

Content Management security

There are several methods for securing CMS sites and pages. Site security is set in the Login page field on the site record. You can control if a page is public or private through the URL.

Every content page has its own URL that users can access outside of the platform. Depending on how the Login page or roles are defined, the URL may or may not be public.

- If the content page has no defined Read role or there is no defined Login page, any internet user can navigate to the URL and view the content page.
- If there is a defined Read role, then anyone who goes to the URL is asked to log in before they can view the site.
- If there is a defined Login page on the site record, all pages in the site are private.

Content Management URLs

The format for Content Management URLs is as follows.

<instance name>.service-now.com/<site suffix>/<page suffix>.do

The <site suffix> is defined by the URL Suffix field on the site form. The <page suffix> is defined by the URL Suffix field in the page form. The URL suffix is case-sensitive.

For example, the page Austere - Site Entry has a site URL Suffix of austere and a page URL Suffix of entry. The constructed URL looks like the following URL.

<instance name>.service-now.com/austere/entry.do

If the site URL Suffix field is left blank, the <site suffix> is cms, as shown in this example:

instance.service-now.com/cms/page.do

If the page URL Suffix is left blank, the name of the page is used as shown in this example:

instance.service-now.com/austere/Page Name.do

Special characters in the name of the page have to be escaped.

Login pages instead of login rules

You set a login page on the site record to allow users to log in or out directly through the content site.
Login rules were used in earlier versions to dictate what users saw after logging in, based on their roles or permissions. Login rules still work, but their use is deprecated.

Configure CMS sites to use single sign-on (SSO)

To configure CMS to use SSO, make the view_content page private.

Because public pages do not require login, and CMS sites are public by default, CMS pages do not use SSO. Use the following procedure to turn off public-facing content pages and enable SSO.

1. Navigate to Public Pages (sys_public.list).
2. For the view_content page, set **Active** to **false**.

Content pages in CMS

Content pages are the core of the Content Management System. A content page is a web page that displays blocks of content.

Pages are built from content blocks and organized into sites. Pages display as regular webpages that are rendered in HTML. Constructing a content page requires a basic knowledge of HTML. Content pages are formed by arranging content blocks in predefined layouts. They can be used to present login pages, search pages, or ServiceNow content.

Create a content page

Pages are built from content blocks and organized into sites.

Role required: content_admin or admin

1. Navigate to **Content Management > Sites**.
2. Open the site to add the page.
3. In the **Pages** related list, click **New**.
4. Complete the form.

Page form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique name for the page. Prefix each page name with the name of the site followed by a dash and the page function. For example, <strong>ESS - Catalog Detail</strong> and <strong>ESS - Search Results</strong> are page names within the <strong>ESS</strong> site.</td>
</tr>
<tr>
<td>URL suffix</td>
<td>The URL suffix that identifies the page. It is incorporated into the URL as follows: <strong><a href="http://instance">http://instance</a> name.service-now.com/site/url_suffix.do</strong></td>
</tr>
<tr>
<td>Parent page</td>
<td>The existing page that is the parent of the current page. Parent pages keep sections sortable on the site list of pages and are used to create breadcrumbs dynamically. Use CSS to define menus that give the Parent page context within the user interface.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Layout</td>
<td>The layout to use for the page. Layouts define dropzones where content blocks can be added to the page. If this field is left blank, the page inherits the default layout of the site. If the site does not have a default layout, there is a single dropzone for the entire page.</td>
</tr>
<tr>
<td>Content theme</td>
<td>The theme to use for the page. Themes bundle CSS style sheets that are applied to all content within the page. If this field is left blank, the page inherits the default theme of the site. Use the default theme unless the page requires a different set of CSS style sheets from the other pages in the site.</td>
</tr>
<tr>
<td>Frame buster</td>
<td>Select the check box to remove any restrictions placed by frames that contain the page. This way you avoid frame-within-frame issues that sometimes occur with improper linking.</td>
</tr>
<tr>
<td>Content site</td>
<td>The site associated with the content page. If you created the page from the related list in the site, the value defaults. The content site provides the &lt;site_suffix&gt; in the page URL, as follows: http://&lt;instance_name&gt;.service-now.com/site_suffix/page_suffix.do</td>
</tr>
<tr>
<td>Read roles</td>
<td>Users with the selected roles can view the page. Click the lock icon to select roles.</td>
</tr>
<tr>
<td>Model document</td>
<td>A document ID of a record to display by default.</td>
</tr>
<tr>
<td>Page status</td>
<td>The status for the page, such as Draft or Published.</td>
</tr>
<tr>
<td>Created by</td>
<td>The user who created the page. If your role has higher privileges than your user name and you enter your user name, the field defaults to the role. For example, if you are logged in as an Admin and you type your name, which has lower privileges, this field displays Admin.</td>
</tr>
<tr>
<td>Title</td>
<td>The title for the page. The title displays on the browser tab when the page is accessed.</td>
</tr>
<tr>
<td>Description</td>
<td>Type a description of the page that displays for users when they access the page.</td>
</tr>
</tbody>
</table>

5. Click Submit.
Add content to a page

After you define the page settings, set the content of the page by adding content blocks. Setting content blocks is similar to how you add content to homepages.

Role required: content_admin or admin

Note: Do not add any type of report, such as a calendar, to iFrames. For more information on adding a report directly onto a page without using iFrames, see Embedding reports in Jelly.

2. Click Add Content.
3. Select a content block from the picker.
4. Select the dropzone where the content goes.
   Create content blocks by adding one of the content blocks named *New (block type)* to the page.
Copy a page

Copying pages is an efficient way to avoid duplicating the same work and to create pages quickly from a guiding master template.
Role required: content_admin or admin

1. Navigate to **Content Management > Sites** and select the site.
2. Select the page to copy.
3. Click **Copy**.
4. Rename the page.

**Note:** Do not use **service_catalog** to rename a page. It is already a valid page in the system.

5. Edit the page fields.
6. Click **Update**.

**Assign a page to a site**

If you have created multiple sites, you can add pages from one site to another site.

Role required: content_admin or admin

1. Navigate to **Content Management > Sites**.
2. Select a site.
3. In the **Pages** related list, click **Edit**.
4. Select other pages to include in the site.
5. Click **Save**.
6. Update the site.

**Add a page to an application**

Homepages and content pages are not added automatically to update sets and applications. They must be manually added.

Role required: content_admin or admin

1. Navigate to **Content Management > Pages**.
2. Right-click a content page record.
3. Select **Unload Portal Page**.

   The page is added to the current application and to the current update set.

**Configure a private UI page for CMS links**

With single sign-on (SSO) in place, you can generate email links that take users directly to tickets and applications through the CMS interface.

Role required: content_admin or admin

You accomplish this procedure by creating a private UI page to redirect CMS links. Because the page is not public, it requires authentication and redirects to SSO appropriately.

1. Check that your CMS site is private by completing the following steps.
   a) Navigate to **Content Management > Sites > (Your Site)**
   b) Verify that the **Login page** field has a page listed.

2. Create a new UI page by completing the following steps.
   a) Navigate to **System UI > UI Pages**.
b) Click **New**.

c) Enter a **Name**, for example, **redirector**.

d) Enter the following Adobe Jelly code into the **HTML** field.

```xml
<?xml version="1.0" encoding="utf-8"?><j:jelly trim="true"
xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null"
xmlns:g2="null"><script type="script/javascript">
window.location.href="${sysparm_uri}";</script></j:jelly>
```

The CMS now supports email links with following format:

http://<path to instance>/<UI page>.do?uri=/<CMS suffix>/<record
type>.do%26sys_id=<record ID>

For example:

http://<instance name>.service-now.com/redirector.do?sysparm_uri=/ess/incident.do%26sys_id=46e3e949a9fe19810069b824ba2c761a

**Note:** If you are using SAML 2.0 update 1 for SSO, use the UI page **saml_redirector** instead of creating a new UI page. For example, an email link to a SAML 2.0 redirector page would use the URL format: http://<instance name>.service-now.com/saml_redirector.do?sysparm_uri=/ess/incident.do%26sys_id=46e3e949a9fe19810069b824ba2c761a.

---

**Content Management templates**

Templates are content pages that are reused to provide a consistent look and feel. Templates are useful when creating CMS sites for the following reasons.

<table>
<thead>
<tr>
<th>Create new pages rapidly without risk by copying pages</th>
<th>Using a template to create new pages saves time because you do not have to keep repeating the same steps.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provide a restore point for pages within the system</td>
<td>Have a working template available if something goes wrong in one of the blocks or in the theme CSS. It is often easier to start over from the template instead of trying to undo complex changes.</td>
</tr>
<tr>
<td>Provide a functional reference for editors on the site project</td>
<td>Having the template as a reference ensures that pages continue to conform to the style guide.</td>
</tr>
</tbody>
</table>

**Page templates**

Every page that is part of the site needs a template.

**Critical page reference fields**

When you build a new site, there are four page reference fields on the site record that are critical. Understanding these pages and how they are used helps you define page templates and site defaults.

- **Home page:** landing page for the site. A home page is mandatory.
- **Search page:** page that displays search results when a user searches from any page within the site. A search page is mandatory for your site to have a Search Results block.
• Login page: a standalone login page, which is useful to force authentication for the entire CMS site.

• Gauge target page: page used to display the drill-through content from a gauge. When the user clicks a gauge, the gauge target page opens showing the drill-through content for that gauge.

**Critical page reference fields**

**Detail pages**

Depending on the data or tables that you plan to use, you may need detail pages. These detail pages use one of the content types in the following list.

• Knowledge detail page: displays a full knowledge article detail (mandatory for a knowledge site).

• Incident page: detail page for an incident record.

• Catalog page: detail page for all items, content items, order guides, and record producers.

**Templates for creating sections**

There are two page templates you can use when creating sections:

• Parent page: keeps sections within large sites organized and sortable on the site list of pages. Parent pages are also used to create breadcrumbs dynamically.

• Detail page: differs from the parent page in that the content area displays a full article or detail instead of a selection of related content. Detail pages must have a Current Document block.
These pages are mandatory if you plan on accessing system data. For example, if you plan on showing the service catalog in your CMS, you need the following items.

- A service catalog content type that references the (sc_cat_item table).
- A detail page that provides the full view of the item.

New templates

If the base system sample site pages are not suitable, you can create a template from scratch. Create a page and then use it as a template. For more information, see Create a Content Page.

When you save a new template, include the word “template” in the page name.

Configure a master template

An easy way to create a master template is to copy the existing ESS sample site and customize it to suit your own needs. You can also configure a master template from scratch.

Role required: content_admin or admin

Follow these steps to create a single master page and generate all important components within the site.

1. Design a layout.
   Regardless of the interface, a site can be distilled into a few simple layouts.

2. Create a theme.
   The theme defines the structure of the layouts in CSS and the base styles, such as fonts and colors. For more information, see Design themes.

3. Build the common blocks.
   Pages are composed of content blocks. Most content blocks are reused on multiple pages. For the master template, build basic blocks such as a header, side navigation, and some basic content for the main content area of the page. More detailed content can be added later, but define content for reuse on many of the site pages here. For more information, see Content blocks.

4. Build a site entry page.
   Use the common content blocks you just created to design the first page that users see when they enter the site. For more information, see Create a content page.

5. Build a detail page.
   Design the detail pages to determine how pages such as knowledge articles, catalog items, and search results are displayed. You can build a detail page by copying the site entry page and adding additional content blocks. For more information, see Copy a page.

6. Assign the pages created to the new site.
   Create the site and apply the layout and theme to the site defaults. Then, navigate to the All Pages list and specify the master template site in the Site column for each of the master template pages. For more information, see Create a site.

Customize a copy of a page template

One good source for templates is the base system sample site. It is easy to copy pages and restyle them into new page templates to meet different business requirements.

The Employee Self-Service portal is provided as a working example and design template in the following procedure.

1. Navigate to Content Management > Sites > Employee Self-Service.
2. Select a page.
For example, to copy the ESS sample site homepage, select Portal.

3. Click **Copy**.

4. Rename the page.

5. Right-click in the header and select **Save**.

7. Point your cursor to the content block to change and click the edit icon that appears on the right.
   
   For example, change the menus, alter the layout, or add a different logo.

8. Click **Update**.

9. Use the page in other sites you created by assigning pages to a site.

**Content types**

Content types provide site-specific control of how system data defined by templates is rendered.

In the site, one page displays a list of knowledge articles, and another page displays catalog items or incidents or a combination of the two. Different themes can be used for types of content and each theme can provide different user interaction. Content types define the pages that display content from a table. Each content type corresponds to a table.

Every type of document that the CMS displays has an associated content type. Changing the content type requires knowledge of Apache Jelly scripting. However, the common content types (such as service catalog or knowledge base) come in the base system. Content types can be associated with particular sites. This association allows different sites to use different detail pages for the same content type.

Content types define three features of associated documents.

- What does a link to one of these documents look like? For example, if a list of these documents is displayed on a page, how does each entry appear?
- What does a detailed view of one of these documents look like?
- What detail page is used to display the document? This decision is important and is often an area of confusion for new CMS users.

The document content type determines the page that a list of documents points to, the list itself does not determine the page. The content from a link is displayed in a detail content block on a page. The content type determines in which detail block on a page the document content is displayed.

For example, the list block **Catalog Top 5** displays the top five items in the Service Catalog table (sc_cat_item). Because the table is (sc_cat_item), the content type **sc_cat_item** controls how the **Catalog Top 5** list is displayed. Clicking any item in the list displays the Service Catalog Detail page with the item displayed on it according to the detail template script. These content types are applied:

- in search results to link to the correct page.
- in the Current Document block to display the current record.
- in links on lists and other places that link to record types.

Several content types are available by default for tables such as Catalog Item (sc_cat_item), Gauge (sys_gauge), and Page (content_page).

Content type defaults that are set for CMS can be overridden for individual sites. Use the **Content Types** related list on the site record to customize content types.
**Note:** To learn more about the properties that affect use of content types, see the following topics in Instance Security Hardening Settings:

- Performance monitoring IP restriction
- Specify downloadable file types

## Configure a content type

Users with the content_admin role can create a content type.

**Role required:** content_admin or admin

1. Navigate to **Content Management > Content Types**.
2. Click **New**.
3. Complete the Content Type form.

### Content Type form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the table whose content will be rendered in Content Management.</td>
</tr>
<tr>
<td>Content site</td>
<td>Select the site that will use this content type.</td>
</tr>
<tr>
<td>Media type</td>
<td>Enter one of the following media types to use with this content type.</td>
</tr>
<tr>
<td></td>
<td>• doctype: UI15 desktop interface only</td>
</tr>
<tr>
<td></td>
<td>• m: Smartphone interface only (not for CMS use)</td>
</tr>
<tr>
<td></td>
<td>• tablet: Tablet interface only (not for CMS use)</td>
</tr>
<tr>
<td>Default detail page</td>
<td>Select which page loads after a user clicks a link.</td>
</tr>
<tr>
<td>Gauge page</td>
<td>Select which page is the drill-through target for any gauge. If you display a gauge on a CMS page, then clicking the links loads the page specified here.</td>
</tr>
<tr>
<td>Summary Template</td>
<td>Write an XML script that determines how the list is displayed in the list block, if the link is displayed in a list block.</td>
</tr>
<tr>
<td>Detail Template</td>
<td>Write an XML script that determines how to display the associated information after a user clicks the link.</td>
</tr>
</tbody>
</table>

### CMS gauge support

Gauges are a graphical way to display information from an instance.

A gauge might, for example, show a bar chart breaking down all open incidents by category. Gauges are fully supported within the CMS system. This means:

1. **You can put a gauge on a CMS page**
2. **You can control what will happen when a user clicks on a cell within that gauge**
Put a gauge on a CMS page
You have control over the gauges on a CMS page.

1. Bring up the CMS page in edit mode.
2. Click Add Content.
3. Select the gauge you want to add.
4. Place the gauge on the page in the desired location.

Control what happens on a click
Since a CMS system uses multiple pages you have to tell the system which page to use to display drill through content.

In the normal (non CMS) system, when you click a bar in a bar chart or a wedge on a pie chart, you drill through and your current screen is replaced with a list of records meeting the chart's criteria. For example, if you have a gauge of Incidents by Category and you click the bar labeled Hardware you drill through to a list of all incidents with a category=hardware.

Within the CMS system, there is a similar drill through mechanism at work, but you must manually specify which page to display.

There are two different models of the drill through, use an in-place target frame to receive the content, or use another page to display the content.

Using an In-Place Target
An in-place target is a named iframe on the same CMS page as the gauge. When the gauge is clicked, the drill-through content appears within that iframe rather than changing out the CMS page. The gauge (and the rest of the page other than the target) remain in place and active.

Using a Gauge Target Page
A gauge target page is a separate CMS page that is used to display the drill-through content from a gauge. When a gauge is clicked, the current CMS page is replaced with the gauge target page and the drill-through content is rendered within that second page.

- **Gauge Target Page**
  To set a site default, select Gauge Target Page, on the site configuration page. This page is used as the drill-through target for any gauges in the system that do not have a more specific gauge page specified in their content type.

- **Gauge Page**
  To set a content-type specific page, you can specify a Gauge Page, on a content type page. Any gauges for this type of content then use that page for any drill through.

  **Note:** The gauge target on a particular content type overrides the default, site level, gauge target.

- **Gauge Target block**
  A gauge target page is a normal CMS page, with one special requirement. Somewhere on that page, there must be a Gauge Target block. This market block tells the system where to output the drill through data.

View content types
The following is an example of where you might use Content Types.
This example uses the out-of-box Employee Self-Service (ESS) site as an example.

Role required: content_admin or admin

Use any out-of-box instance of a CMS site.

   The Issue Status, or incident_status CMS page contains two content blocks: Common Answer and Current issues. These content blocks both use Content Types to render results.
   This block matches the Common Answers section of the Issue Status page. The Table field describes the Content Type associated with Common Answers.
4. Use the link to view existing Content Types.
5. Click the Content Type to view the XML that determines how the list and record are rendered in CMS.
   The Default Detail Page field indicates a CMS page that displays a record selected from a List of Content block.
6. Click the Information icon next to the Default Detail Page, to go to that page.
7. From the Default Detail Page, under Related Links, click Edit Page.
   The Detail Block contains a content type formatter. When editing or viewing the page, it is looking for a URL to be passed to determine the record to display, which is why it says "Detail record could not be located".
8. Click the pencil icon to edit and view the Detailed Content block.
   The Type drop down list has "Show the page's current document" selected, which indicates that the document_id must be passed to this block from the CMS pages, then it can display the record based on the content type listed in the document_id.
9. From the Common Answers block, on the Self Service page, select a record.
   The page opens with a URL similar to: https://<instance name>.service-now.com/ess/knowledge.do?
sysparm_document_key=kb_knowledge,02255450d731310013ab49547e61038e
   The table sysparm_document_key=kb_knowledge and sys_id 02255450d731310013ab49547e61038e determine the record. The associated content type, kb_knowledge, renders the content on the Default Detail Page, Portal - Knowledge Detail / url_suffix=knowledge.

Content blocks

A block is a defined piece of content within the system that can be reused.

A content page is constructed by arranging customized blocks of content on a page. Content blocks are an important part of a CMS site. Existing content such as reports, gauges, and record lists are automatically available as content blocks and more can be created within the CMS.

After defining content blocks, use them on any content page by adding them to drop zones. For more information, see Add content to a page.

Create content blocks after sites and pages have been designed.

Configure a content block

To configure a content block, define it in the appropriate form.

Role required: content_admin or admin
1. Perform one of the following actions to create a content block.
- Navigate to **Content Management > Blocks > (Block type) > New**. The form for creating the selected block type opens.
- Navigate to **Content Management > Blocks > All** and select the type of content to create from the list.
- Edit a content page and add a stub block of the desired content block type. Click the link in the stub block.

2. Complete the content block form and save it.
3. Add the content block to any content page.

### View CMS block tags

A CMS block tag is used for advanced block creation and site flexibility.

**Role required:** content_admin or admin

It is constructed as `<g:content_block> {{Jelly_Tags|Jelly}}` and can be used in either of the following ways.

- **Blocks:** to display a block inside a block.
- **Layouts:** to display a block inside a layout.

The tag appears in the format, `<g:content_block type="<type>" id="<sys_id>"/>`.

An example of the block tag is included in the ESS Portal sample site.

1. **Navigate to Content Management > Design > Frames.**
2. **Click cms_admin_home_frame.**
3. **View the code.**

```xml
<style>
DIV.cms_administration_home {
    background: url(gray_${current_page.getURLSuffix()}.pngx) no-repeat right top;
}
</style>

<div class="cms_administration_home">

${body}
<br />
<!-- Would you like to pivot off of parent page instead? try this snippet
  <j:if test="${current_page.getParentPage().getURLSuffix()=='administration'}">
    <g:content_block type="content_block_menu" id="7afc342def002000914304167b2256ac"/>
  </j:if>
  The defaults use the page URL suffix to define sub menus
  -->
  <j:if test="${current_page.getURLSuffix()=='administration'}">
    <g:content_block type="content_block_menu" id="7afc342def002000914304167b2256ac"/>
  </j:if>
  <j:if test="${current_page.getURLSuffix()=='community_inspired'}">
    <g:require name="ess.portal.globals.jsdbx"/>
    <g:content_block type="content_block_menu" id="ccd4b8c7efb70000914304167b22566e"/>
  </j:if>
</div>
```

4. To see what the page looks like, navigate to the ESS Portal administration page. For example, http://instance name.service-now.com/ess/administration.do.

Types of content blocks

Content blocks, which make up content pages, are reusable pieces of content defined within the system.

Each content block can be used for a different type of content.

Configure a header block

A header block is a visual element placed at the top of pages. It provides a place for branding and other important site-wide functionality.

Role required: content_admin or admin

Some of the options that are available in headers include, global search, text size toggle, menus for navigational purposes, and the user name with logout link.

1. Navigate to Content Management > Blocks > Headers.
2. Click New.
3. Complete the form.

Header form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the header block.</td>
</tr>
<tr>
<td>Background</td>
<td>Select a background for the header logo and menus.</td>
</tr>
<tr>
<td></td>
<td>- None - No background is rendered.</td>
</tr>
<tr>
<td></td>
<td>- Gradient/Image - Specify an image or gradient image to serve as the background.</td>
</tr>
<tr>
<td></td>
<td>- Colored Bars - Specify colors for three different sections of the header, top, middle, and bottom.</td>
</tr>
<tr>
<td>Image</td>
<td>If Background is Gradient/Image, upload an image for the header block background. For gradients, upload a gradient image.</td>
</tr>
<tr>
<td>Top bar color</td>
<td>If Background is Colored Bars, enter a CSS color or color name to use as the background for the top menu.</td>
</tr>
<tr>
<td>Middle bar color</td>
<td>If Background is Colored Bars, enter a CSS color or color name to use as the background for the logo and text.</td>
</tr>
<tr>
<td>Bottom bar color</td>
<td>If Background is Colored Bars, enter a CSS color or color name to use as the background for the bottom menu.</td>
</tr>
<tr>
<td>Logo</td>
<td>Select a logo image. The image is also a link to the main page.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Text</td>
<td>Type the text to display beside the logo.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select the check box and type any scripted conditions to apply in the <strong>Condition</strong> script field that appears.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the header block. The category also determines the detail page in which header block links open. Detail pages often display information in different ways.</td>
</tr>
<tr>
<td>Top Menu</td>
<td>Select a navigational menu block to use as a menu above the logo.</td>
</tr>
<tr>
<td>Bottom Menu</td>
<td>Select a navigational menu block to use as a menu below the logo.</td>
</tr>
<tr>
<td>Height</td>
<td>Specify the height for the header.</td>
</tr>
<tr>
<td>Search</td>
<td>Select this check box to add a search element in the header.</td>
</tr>
<tr>
<td>Font sizer</td>
<td>Select this check box to include text sizing controls in the header.</td>
</tr>
<tr>
<td>Login</td>
<td>Select this check box to include a login link in the header. If the user is logged in, this element displays the user name and a logout link. If you specify a login page on the site record, it is important to include a login link so users can enter their username and password.</td>
</tr>
<tr>
<td>Chat Queue</td>
<td>Select the chat queue that users access by clicking the <strong>Help Desk Chat</strong> button in the header. Clear the field to remove the button. This field appears only if the Chat plugin is active.</td>
</tr>
</tbody>
</table>

Create a navigation menu block
Navigation menu blocks enable you to create a menu of links to different content pages.

Role required: content_admin or admin

The following three objects define navigation menus.
- **Menu block**: The menu block defines the entire menu block and how it displays.
- **Menu section**: The menu sections define groups of links displayed within the block.
- **Menu item**: The menu items define the links within each menu section.

1. Navigate to **Content Management > Navigation Menus**.
2. Click **New**.
   A gallery of available navigation menu blocks displays.
Choose a Menu System from the Options Below (CMS Menu Types)

<table>
<thead>
<tr>
<th>Super Menu for Headers</th>
<th>Drop Down Menu for Headers</th>
<th>Tab Menu for Headers</th>
<th>Horizontal Blocks</th>
</tr>
</thead>
<tbody>
<tr>
<td>The super menu is a hybrid between the drop down menu and the tab system which allows the user to create a menu out or any number existing menus.</td>
<td>The drop down menu displays a menu much like those found at the top of typical desktop applications. They are frequently found in the headers of pages.</td>
<td>This tab menu is specifically designed for the bottom menu of header blocks. It is a common alternate for drop down menus, which uses inline links that render directly underneath the text.</td>
<td>The horizontal block menu displays a series of blocks horizontally until the horizontal space is exhausted and then they will stack. They are most often seen in the main content area of pages.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Tab Content Menu</th>
<th>Vertical Blocks</th>
<th>Vertical List</th>
</tr>
</thead>
<tbody>
<tr>
<td>This tab menu for use in the content area of the page. Clicking a tab expands the main section of the block container with the tabs corresponding sub menus.</td>
<td>The vertical blocks menu block displays a menu as a series of blocks stack one on top of the other.</td>
<td>The vertical list menu block displays a menu consisting of a vertical stack of choices. They are most often seen along the left or right side of pages.</td>
</tr>
</tbody>
</table>

CMS menu options

3. Select the desired menu block style.
4. Complete the Navigation Menu form to define the block.

**Navigation Menu form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the block.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of navigation menu, which determines how the links are displayed.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border style for the navigation menu block.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select this check box to enable the use of scripted conditions. If selected, the <strong>Condition</strong> and <strong>Logged On</strong> fields appear.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the navigation menu block only if the user is logged on. This field appears only if <strong>Conditional</strong> is selected.</td>
</tr>
</tbody>
</table>
Configure menu sections

Menu sections define groups of links displayed within the navigation menu block.

Role required: content_admin or admin

1. Navigate to Content Management > Blocks > Navigation Menus and select a block.
2. In the Menu Sections related list, click New.
3. Complete the Menu Section form.

Menu Section form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the menu section.</td>
</tr>
<tr>
<td>Content block menu</td>
<td>Select the navigation menu on which this menu section appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when a user clicks the menu section name and icon.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to display when a user clicks the menu section title and icon. This field is available only if Redirect to is set to {The specified URL}</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when a user clicks the menu section title or icon. This field is available only if Redirect To is set to A content page.</td>
</tr>
<tr>
<td>Left image DB</td>
<td>Select the image database where your site images are stored.</td>
</tr>
<tr>
<td>Right image DB</td>
<td></td>
</tr>
<tr>
<td>Left image</td>
<td>Select icons to appear on the left and on the right of the name.</td>
</tr>
<tr>
<td>Right image</td>
<td></td>
</tr>
<tr>
<td>Second level text</td>
<td>Enter a description to appear beside the menu section title.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu section available for use.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this section appears on the menu relative to other menu sections.</td>
</tr>
</tbody>
</table>
Configure menu items

Menu items are the links that appear within each menu section.

Role required: content_admin or admin

Not all navigation menu sections require menu items. Use menu items to link users to other pages or additional information. These steps use the ESS sample portal site as an example.

1. Navigate to Content Management > Blocks > Navigation Menus and select a navigation menu.
   For example, select the Documentation Menu.
2. From the Menu Sections related list, select a menu section.
   For example, select Getting Started.
3. From the Menu Items related list, click New.
4. Complete the form.

Menu Item form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the menu item.</td>
</tr>
<tr>
<td>Menu section</td>
<td>Select the menu section in which this item appears.</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select what appears when the menu item name and icon are clicked.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the URL to open when the menu item title and icon are clicked. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Detail page</td>
<td>Select the content page to open when the name or icon is clicked. This field is available only if Redirect To is set to A content page.</td>
</tr>
<tr>
<td>Image</td>
<td>Select an icon to appear with the name.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the menu item available for use.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to indicate where this item appears on the menu relative to other menu items.</td>
</tr>
<tr>
<td>Logged on</td>
<td>Select this check box to display the menu item only if the user is logged on.</td>
</tr>
<tr>
<td>Roles</td>
<td>Click the lock to open a list, then select the roles that can access this menu item to restrict access by role.</td>
</tr>
<tr>
<td>Category</td>
<td>Select the category in which the menu item belongs.</td>
</tr>
<tr>
<td>Open in</td>
<td>Select the behavior of clicked links.</td>
</tr>
<tr>
<td>iFrame</td>
<td>Type the name of the iFrame where the link opens when a user clicks the menu item name and icon. Make sure that there is an iFrame on the page. This field is available only if Open In is set to Named iFrame.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Menu types**

By changing the **Type** field on the navigation menu block, you can format the same menu in different ways.

<table>
<thead>
<tr>
<th>Type</th>
<th>Image</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Super Menu for Headers</td>
<td><img src="image" alt="Super Menu" /></td>
<td>The super menu is a hybrid between the drop-down menu and the tabbed system. The user can use a super menu to create a menu from any number of menus.</td>
</tr>
<tr>
<td>Type</td>
<td>Image</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Drop-Down Menu for Headers</td>
<td><img src="image1" alt="Drop-Down Menu" /></td>
<td>The drop-down menu renders the menu sections as drop-down list. Use the mouse to point to the menu name and view the menu items.</td>
</tr>
<tr>
<td>Tab Menu for Headers</td>
<td><img src="image2" alt="Tab Menu" /></td>
<td>The tab menu renders the menu sections as tabs. Use the mouse to click the tab and view the menu items.</td>
</tr>
<tr>
<td>Horizontal Blocks</td>
<td><img src="image3" alt="Horizontal Blocks" /></td>
<td>The horizontal blocks menu renders the menu sections as block headings with menu items as links within the blocks. The blocks are arranged horizontally.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
<td></td>
</tr>
<tr>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Tab Content Block</td>
<td>The tab content block (horizontal) menu renders the menu sections as tabs with menu items as links within the block.</td>
<td></td>
</tr>
<tr>
<td>Vertical List</td>
<td>The vertical list menu renders the menu sections as headings with menu items as links below them.</td>

</tr>
<tr>
<td>Vertical Blocks</td>
<td>The vertical blocks menu renders the menu sections as block headings with menu items as links within the block. The blocks are arranged vertically.</td>
<td></td>
</tr>
</tbody>
</table>

**Menu style customization**

You can customize menu styles in the style sheets your site uses.

Navigate to **Content Management > Design > Style Sheets** to customize style sheets.
Supplementary page navigation menu example code

In the following example, look at the CSS class selectors and rules. Also, review how the block containers (div.cms_menu_section_blocks) are defined based on the outer container (TD.layout_content_submenu_column). The outer container is actually a part of the site layout.

This concept is clearer if you compare the styles to the styles used in the super menu further down in the example. This example shows that there is no need to make a completely new menu system. You can use CSS to change the look and feel of existing menus.

```css
TD.layout_content_submenu_column DIVcms_menu_section_blocks {
  width: 156px;
  height: auto;
  float: left;
  position: relative;
  border-style: solid;
  margin: 0px 0px 0px 0px;
  border: 0px solid #e0e0e0;
  padding: 0px;
  background: none;
  padding: 24px 12px 0px 12px;
}

TD.layout_content_submenu_column DIVsub_menu_section {
  width: 156px;
  height: 20px;
  float: left;
  border-style: solid;
  border: 0px solid #e0e0e0;
  padding: 0px;
  background: none;
  padding: 0px 12px 0px 12px;
}

SPAN.cms_sub_menu_list_link, TD.submenu_cell A {
  color: #FFF;
}

TD.layout_content_submenu_column IMG.menu_bullet{
  display: none;
}

TD.cms_menu_section_blocks_title h2, TD.cms_menu_section_blocks_title h2 a, TD.cms_menu_tab_blocks_text h2 {
  margin:0;
  padding: 0px;
  font-size: 11px;
  text-transform: uppercase;
  color: #42C4DD;
  font-weight: normal;
  white-space: nowrap;
}

TD.layout_content_submenu_column a.cms_menu_block_item {
  margin:0;
  padding: 0px;
  font-size:11px;
}
```
Super menu sections example code

The following menu is a simple float grid. The defaults are written first. Then, below the "SUPER MENU VARIATIONS..." comment, the defaults are overwritten by adding a containing div with a unique class. In the code that renders the header for the base system, the bottom menu resides in a table cell with the class of `cms_header_bottom_menu` (refer to the `TD.cms_header_bottom_menu` CSS selector).

```html
TD.layout_content_submenu_column DIV.cms_menu_section_blocks {
    width: 156px;
    height: auto;
    float: left;
    position: relative;
    border-style: solid;
    margin: 0px 0px 0px 0px;
    border: 0px solid #e0e0e0;
    padding: 0px;
    background: none;
    padding: 24px 12px 0px 12px;
}

TD.layout_content_submenu_column DIV.sub_menu_section {
    width: 156px;
    height: 20px;
    float: left;
    border-style: solid;
    border: 0px solid #e0e0e0;
    padding: 0px;
    background: none;
    padding: 0px 12px 0px 12px;
}

SPAN.cms_sub_menu_list_link, TD.submenu_cell A {
    color: #FFF;
}

TD.layout_content_submenu_column IMG.menu_bullet{
    display: none;
}

TD.cms_menu_section_blocks_title h2, TD.cms_menu_section_blocks_title h2 a, TD.cms_menu_tab_blocks_text h2 {
    margin:0;
    padding: 0px;
    font-size: 11px;
    text-transform: uppercase;
    color: #42C4DD;
```
4.2 2. Super Menu Sections Example Code

This menu is essentially a simple float grid. The defaults are written first. Then, below the "SUPER MENU VARIATIONS..." comment, the defaults are overwritten by adding a containing div with a unique class. In the code that renders the header for the base system, the bottom menu resides in a table cell with the class of "cms_header_bottom_menu" (note the TD.cms_header_bottom_menu CSS selector).

/  *******************************************************************************************
  Section Blocks Menu (cms_menu_section_blocks UI Macro)

  border-top: 1px solid #EEE;
}
Example menu items and content links
The method for choosing a link target (current window, iFrame, or new window) and referencing the item linked (page, attachment, or URL) are similar. Review examples of how to link within these elements.

- A content page reference helps you select the desired page. For example, the value home.do links to the site homepage.
- An attachment reference allows you to reference a single file attached to the menu item or section record. If there is more than one attachment, only the first attachment is referenced. The link is then generated automatically and displays a Browser File Save prompt.
- The specified URL reference allows you to link to a full URL string in your instance or from another system. For example, com.glideapp.servicecatalog_cat_item_view.do?sysparm_id=66c313e7c0a8016b008ebela8e3d97f5&sysparm_nameofstack=b654d15bef921000914304 links to the Ask a Question record producer. Use this reference to link to a page in an existing intranet system.

Menu items can be seen as featured links from each section. There are many choices in URL definitions and link options. Links within the ESS Portal open content pages within the site. In turn, each page has an iFrame or set of blocks that houses the corresponding data. This method is useful for rapid prototyping, but consider where to create dynamic detail pages and use the available linking options.
Menu items are similar to content links except they are called by the list block, not as part of a navigation menu block. Menu items and content links function the same as far as how they are defined and the options available for linking to items. Content links are meant to be called through a list block that calls the Content Link (content_link) table. Content links do not have the **Logged in** field or the **Roles** option used to control the UI experience for various roles.
Content link

View menu and list examples

Menu sections define groups of links and how the links behave.

Role required: content_admin or admin

For example, link behavior determines which page opens when the link is clicked and how it opens, such as in a new page or a new frame. Use the following procedure to view a sample menu section.

2. Click Portal - Block Menu.
3. In Menu Sections related list, click Order Things.
4. Click the reference icon next to Detail Page to open the page.
5. In Related Links, click Edit Page.
   By default, the link goes to the Order Things page with the Portal - Order Splash Menu (Vertical Block Menu) in the page content area.
   In most default CMS menus, the menu section has the menu title with secondary text, a separation line, and the links you define as menu items. Although the design is versatile and flows well between pages, there could be questions about linking and scalability to large catalogs. This practice may only be useful for a small catalog with limited items.
6. To view an example of dynamic content, follow these steps to look at the request catalog list/grid view on the ESS Portal.
   a) Add /ess/manage.do to your instance URL.
      For example, https://<instance name>.service-now.com/ess/manage.do.
   b) In the Code Example Demos section, click Request Catalog List/ Grid View.
   c) Browse the catalog items.
Configure dynamic blocks
Use dynamic blocks to use scripting or to pull information from the system. Dynamic blocks are where most of your content resides.

Role required: content_admin or admin

A good use of dynamic blocks is job postings. Store the postings in knowledge articles and display the postings with a dynamic block.

Several dynamic blocks are predefined, including the following items.
- **New Content**: Each of the new content blocks allows for creating blocks while editing content pages.
- **Clean Login**: The default login page requesting user name and password, which includes a "Remember Me" check box. After the user logs in, this block triggers login rules.
- **Login**: An area that allows a logged out user to log in and a logged in user to log out. This block is especially useful on publicly available content pages.
- **Search**: The global text search field. Currently, global text search is the only form of search that can be included in a content page.
- **Search Results**: An area for displaying global text search results.

For information about Apache Jelly, see [Jelly tags](#).

1. Navigate to **Content Management > Dynamic**.
2. Click **New**.
3. Complete the Dynamic Content form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the dynamic content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the dynamic block. The category also determines the detail page in which dynamic block links open.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the dynamic block. For more information, see <a href="#">Format a frame</a>.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Enter any scripted conditions to be applied. If selected, adds a <strong>Condition</strong> script field to the form.</td>
</tr>
<tr>
<td>Two phase</td>
<td>Select this check box to allow two phase <a href="#">Jelly tags</a>.</td>
</tr>
<tr>
<td>Dynamic content</td>
<td>Enter the XML script field that determines the behavior of the dynamic block.</td>
</tr>
</tbody>
</table>

**Catalog cart block**

The catalog cart block is a dynamic block provided in the base system.

This block provides the same cart that is available within the service catalog. If the site definition has the **Use external cart** option selected, include this block in the site so users can interact with their catalog cart.
Catalog cart block is available when the `glide.sc.use_cart_layouts` property is set to false.

**Customize the list block**

List blocks are content blocks that dynamically generate a list of links to records within the instance. When a user clicks a link in a list block, the associated information is displayed in a detail page determined by its content type.

**Role required:** content_admin or admin

Make the list using a simple query on any table or by scripting a more advanced query. Lists are powerful and flexible. Here are some places that allow you to have complete control over the list display.

**List control**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frames</td>
<td>Frames provide a method to create decorative containers for content blocks and other elements within the site. When frames are used with the <strong>Type</strong> field, the designer has complete control over list placement.</td>
</tr>
<tr>
<td>List Type</td>
<td>The List Definitions module defines the type of lists available for content pages. On the List Block form, select a list definition in the <strong>Type</strong> field.</td>
</tr>
<tr>
<td>List Filtering</td>
<td>Provides every field in the referenced table for more granular results.</td>
</tr>
<tr>
<td>Max Entries</td>
<td>Limits the results from a table to fit the design of the block.</td>
</tr>
<tr>
<td>Order and Order Direction</td>
<td>Allows sorting by any field in the referenced table, in either ascending or descending order.</td>
</tr>
</tbody>
</table>

You can also use list blocks to create a list of links to information outside your instance. Create the external links as records on the Content Link (content_link) table, and then follow the steps in this procedure.

1. Navigate to **Content Management > Lists**.
2. Click **New**.
3. Complete form.

**List Block fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name for the list content block. It is used to identify the record in the instance and is not displayed on the content page. Use the <strong>Title</strong> field for that purpose.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a list definition UI macro to format the list of links. For more information, see <strong>Configure list definitions</strong>.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frame</td>
<td>Select a border style for the list block. For more information, see <a href="#">Create a frame UI macro</a>.</td>
</tr>
<tr>
<td>Advanced</td>
<td>Select this check box to enable generating a list from a script, rather than from a simple filtered query.</td>
</tr>
<tr>
<td>Query</td>
<td>Filters the results using a condition builder.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Title</td>
<td>Enter the name to display at the top of the list block when it appears in a content page.</td>
</tr>
<tr>
<td>Maximum entries</td>
<td>Set the maximum number of entries to display in this list block.</td>
</tr>
<tr>
<td>Table</td>
<td>Select a table to query for the list items. The table determines which detail page displays when a user clicks a link in the list block. For more information, see <a href="#">Configure a content type</a>. Note: The list shows only tables and database views that are in the same scope as the list block.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select this check box to enable the use of scripted conditions. If selected, a Condition script field appears. Other fields that appear include the <strong>Logged On</strong> and <strong>Omit if empty</strong> check boxes.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

Configure list definitions

List definitions, similar to content management frames, are decorative containers that control the look and feel of lists.

Role required: content_admin or admin

Specifically, list definitions are UI macros that use Apache Jelly script to define how a list is rendered inside a list block. Site design often requires multiple list styles within the layout. Lists are often the primary form of navigation within a site, so it is important to have control over their formatting.

Configuring list definitions requires a knowledge of Apache Jelly.

1. Navigate to **Content Management > Configuration > List Definitions**.
2. Click **New**.
3. Complete the List Definition form.

Configure a static HTML block

Use static blocks for text that does not change. For example, use a static block for a site footer with only the company or organization name. A static HTML block allows any HTML code to be run within a page.

Role required: content_admin or admin
Anyone who edits their own HTML, Jelly, or Javascript may find the HTML editor in the static block limited. The HTML editor can also add tags or formats that advanced coders find unnecessary. For more advanced options, use dynamic blocks.

1. Navigate to Content Management > Blocks > Static HTML.
2. Click New.
3. Complete the Static Content form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the static HTML content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the static HTML block. The category also determines the detail page in which static HTML block links open. Detail pages often display information in different ways.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the static HTML block. For more information, see Format a frame.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Enter any scripted conditions to be applied. If selected, adds a Condition script field and Logged on check box to the form.</td>
</tr>
<tr>
<td>Static Content</td>
<td>Enter HTML code that determines the behavior of the static HTML block.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Format an image as a static HTML block
An easy way to add an image to a CMS page is to use a static HTML block. After the block is created, you can reuse it throughout the site.

Role required: content_admin or admin

1. Navigate to Content Management > Design > Images.
2. Click New.
3. Select a Category to help organize the images.
4. Type the file name of the image, including the extension (such as .png).
5. Upload the file by selecting Click to add and browsing for the image.
6. Click OK.
7. Click Update.
9. Paste the following code into the HTML block, substituting the image name as uploaded in the previous step.

The “x” at the end of the filename is required for image caching.

```html
<img src="<image_name>.gifx"/>
```

Now the image is a static HTML block and you can add it to any content page. Use standard HTML code to alter the image in the content block.
Configure Flash movie blocks
Use a Flash movie block to embed any Flash movie (.swf file) as an attachment or by referencing a URL in a content page.

Role required: content_admin or admin

To add streaming video or Flash video (.flv), for example, to a knowledge article, see Embed videos in HTML fields.

1. Navigate to Content Management > Specialty Content > Flash Movies.
2. Click New.
3. Complete the Flash Movie form.

Flash Movie form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Flash movie block.</td>
</tr>
<tr>
<td>Source</td>
<td>Specify where the Flash movie is found.</td>
</tr>
<tr>
<td></td>
<td>- Attachment: If this choice is selected, upload the Flash movie to this record.</td>
</tr>
<tr>
<td></td>
<td>- Link to External Object: If this choice is selected, a URL field appears. Specify the Flash movie URL and ensure that the Flash movie is publicly accessible.</td>
</tr>
<tr>
<td>Height</td>
<td>Enter the height of the Flash movie in pixels.</td>
</tr>
<tr>
<td>Width</td>
<td>Enter the width of the Flash movie in pixels.</td>
</tr>
</tbody>
</table>

4. Click Submit.

Configure content links
Content links are the predecessors to navigation menus. You can use content links to create navigational links to information outside of your instance.

Role required: content_admin or admin

After the content link is configured, it must be defined in a list block. List blocks use content links to reference information outside of your CMS.

1. Navigate to Content Management > Specialty Content > Content Links.
2. Click New.
3. Complete the Content Link form.

Content Link form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the content link</td>
</tr>
<tr>
<td>Redirect to</td>
<td>Select the location of the external link</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the list content block.</td>
</tr>
<tr>
<td>URL</td>
<td>Click the lock icon to open the edit field, then enter the site URL to open when the link is clicked. This field is available only if Redirect to is set to The specified URL.</td>
</tr>
</tbody>
</table>
4. Click **Submit**.
5. From **Content Management > Blocks > Lists**, create a list block that references the content links by selecting **Content Link** in the table field.
6. Create a query to determine which external links display on the page. For example, the query **Category is Search** displays any external links that have a category defined as **Search**.
7. Click **Update**.

**Configure iFrames**
An iFrame embeds a URL on a page within a frame. It can embed external pages or render ServiceNow content.

Role required: content_admin or admin

Configure an iFrame with forms you create in the instance and link to the page in which the iFrame resides.

**Note:** Do not add any type of report, such as a calendar, to iFrames. For more information on adding a report directly onto a page without using iFrames, see **Embedding reports in Jelly**.

**Note:** To deliver ServiceNow content from a web page, see **Service Portal** instead.

1. Navigate to **Content Management > Specialty Content > iFrames**.
2. Click **New**.
3. Complete the iFrame form fields.

### iFrame form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the iFrame block.</td>
</tr>
<tr>
<td>Frame name</td>
<td>Type a name for the frame on the page. When you use iframes to present ServiceNow content such as forms or lists, the frame name must be gsft_main. This name allows links within the iFrame to open within the iFrame.</td>
</tr>
</tbody>
</table>
Integrate Live Feed with CMS

You can provide access to Live Feed from pages built in the Content Management System (CMS). For example, allow an end user to access your company feed via the ESS portal.

The ESS Portal template includes the **Portal - Live page** and Live Feed dynamic block (requires the Live Feed plugin). To provide access to Live Feed from CMS pages, add the Live Feed dynamic block to a CMS page or include the **Portal - Live page** in a site.

1. Navigate to **Content Management > Specialty Content > iFrames**.
2. Click **New**.
3. Complete the iFrame block form with the following values.

### iFrame values

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name: Live Frame</td>
</tr>
<tr>
<td>Frame name</td>
<td>Type a frame name: live_frame</td>
</tr>
</tbody>
</table>

---

Note: Some browsers suppress iFrames because they use an X-Frame-Options header value of SAMEORIGIN. The X-Frame-Options header was introduced in Internet Explorer 8 RC1, to help detect and prevent frame-based redressing. The SAMEORIGIN value causes the browser to render a blank page instead of the target page of the `<frame>` or `<iframe>` when the frame target is not on the same origin as the page itself. Support for this header has been implemented in Safari 4.0, Chrome 4.1.249.1042, and Firefox 3.6.9 and above.

---

ServiceNow, Orlando, Now Platform capabilities

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL to display in the iFrame. If you use the iFrame to display ServiceNow content, start with the page name and do not include the base instance part of the URL. For example, to show the list of requested items, the URL is: <code>sc_req_item_list.do</code> Queries can be applied to the URL. For instance, to display a list of open requested items, the URL is: <code>sc_req_item_list.do?sysparm_query=active=true</code> For more information, see Navigate to a record or module using a URL.</td>
</tr>
</tbody>
</table>

**Sizing**

Select an option for iFrame block size.

Note: The Expand to fit content choice only works with ServiceNow content. If Fixed Size is selected, height and width fields are displayed for you to enter the size in pixels.
iFrame methods
The following examples show how system records are pulled into an iFrame that is placed on a content page.

For system lists or forms, use the frame name `gsft_main` so that links work properly.

- **Order Hardware** is an example of linking to a catalog category.
  - URL: `com.glideapp.servicecatalog_category_view.do?sysparm_parent=d258b953c611227a0146101fb1be7c31&sysparm_view=`
  - Frame name: `gsft_main`

- **My Approvals List** is an example of linking to a list with a view filter and a JavaScript that reference the authenticated user.
  - URL: `sysapproval_approver_list.do?sysparm_query=approver=javascript:getMyApprovals()&sysparm_view=ess`
  - Frame name: `gsft_main`

- **Service Catalog Home Page (system)** references the system catalog page within the Service Catalog application. If you are satisfied with the way the catalog looks, this method is an easy way to bring the page into a CMS design.
  - URL: `catalog_home.do?sysparm_view=catalog_default`
  - Frame name: `gsft_main`

- **Problem Management Overview** references a homepage. `../` makes the URL string relative to system homepages. Without it, the URL string resolves to the default CMS homepage reference in the site.
  - URL: `../home.do?sysparm_view=problem_overview`
  - Frame name: `gsft_main`

Configure a detailed content block
A detailed content block displays the content of an existing document, such as an incident, knowledge article, or service management request. The document type determines the page that a list of documents points to.

Role required: content_admin or admin

The block works with content types in the **Default detail page** field. For more information, see Configure a content type.
If you plan to use a script to find a document, configure the form to add the **Script** field if it is not displayed.

1. Navigate to **Content Management > Configuration > Page Detail Settings**.
2. Click **New**.
3. Complete the Detailed Content form.

## Detailed Content form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Type a unique name for the Detailed Content block.</td>
</tr>
<tr>
<td>Category</td>
<td>Select a category to provide organization for the detailed content block.</td>
</tr>
<tr>
<td></td>
<td>If the block <strong>Type</strong> is <strong>Show the page's current document</strong>, the category displays content from any link of the same type.</td>
</tr>
<tr>
<td>Frame</td>
<td>Select a border styling for the detailed content block.</td>
</tr>
<tr>
<td></td>
<td>For more information, see <strong>Format a frame</strong>.</td>
</tr>
<tr>
<td>Model Document</td>
<td>Select the document to display by default.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to make the block available for use.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the behavior for the block.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Show a Specific Document</strong>: Displays the Model Document.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Show the page's current document</strong>: Displays the currently selected document.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Use a script to find a document</strong>: Uses the <strong>Script</strong> field to select a particular document.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Select the check box and enter any scripted conditions to be applied.</td>
</tr>
<tr>
<td></td>
<td>Selecting this check box adds a <strong>Condition</strong> script field and <strong>Logged on</strong> check box to the form.</td>
</tr>
<tr>
<td>Script</td>
<td>Enter a script to find an appropriate document if the <strong>Type</strong> is set to <strong>Use a script to find a document</strong>. Set the <strong>Return</strong> to the GlideRecord of the desired document.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

### Content Management and the Apache Jelly engine

Apache Jelly is a Java-based and XML-based scripting and processing engine for turning XML into executable code.

The Apache Jelly engine closely resembles XML and should be comfortable for developers familiar with JavaScript, XML, XHTML, or HTML. In the ServiceNow instance, the Apache Jelly engine renders items such as forms, lists, and UI Pages. Apache Jelly code renders well within a dynamic content block, but can have issues when used in static blocks. You can use Jelly tags, calls, and statements, but HTML acts just like XHTML.

```xml
<?xml version="1.0" encoding="utf-8" ?>
```
Ensure that all tags are closed. If the tag is not a naturally closing tag, then place a forward slash before the end bracket. For example, a `<BR />` or an `<IMG src="cms.png" />`.

If you are unfamiliar with Jelly scripting, review these topics:

- **Jelly tags**
- **Extensions to Jelly syntax**
- **Jelly escaping types**

Include the following tag with all Apache Jelly scripts.

```
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null" >
```

The tag looks complex, but keep the following information in mind.

- **Apache Jelly script uses multiple namespaces.**
- **There are two types of prefixes in tags: j and g. The j prefix is used for tags that are natively part of Apache Jelly. The g prefix is used for tags that the Now Platform created and is using for platform purposes.**

The j2 and g2 prefixes are just like j and g, except that they are processed in a second phase. The Apache Jelly script parser runs through each j and g tag respectively. For example:

```
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "null" xmlns:g2= "null" >
  <j:set var="jvar_phase1" value="Hello" />
  <j2:set var="jvar_phase2" value="World" />
  ${jvar_phase1} ${jvar_phase2}
</j:jelly>
```

In phase 1, the parser runs through all the j and g tags. It then caches the result. Before it runs the second phase, it takes the j and g namespaces and moves the namespaces to the second phase. It looks something like the following code.

```
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2= "jelly:core" xmlns:g2= "glide" >
  <j2:set var="jvar_phase1" value="Hello" />
  <j2:set var="jvar_phase2" value="World" />
  Hello ${jvar_phase2}
</j:jelly>
```
For subsequent calls of this script, only phase 2 is parsed.

**Note:** If you plan to use phase 2 Jelly tags (g2 and j2) on the Content Type (content_type) or Dynamic Content (content_block_programmatic) tables, select the **Two phase** option on the content form.

Another example is to create a report of all open incidents assigned to each group. For this purpose, you could use a report and save time, but it is a good example for learning Jelly. Start with the Jelly tag:

```jelly
<j:jelly trim= "false" xmlns:j= "jelly:core" xmlns:g= "glide" xmlns:j2="null" xmlns:g2="null">
</j:jelly>
```

First, you need a list of open incidents. Use a `g2:evaluate` tag. The evaluate tag runs the script. Anything inside the tag is parsed like a business rule, so, for example, you can call global business rules, script includes, and glideredcord.

```jelly
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null"
xmlns:g2="null">
<g:evaluate var="jvar_groups" object="true">
  var gr = new GlideRecord("sys_user_group");
  gr.orderBy('name');
  gr.query();
  gr;
</g:evaluate>
</j:jelly>
```

This script is in phase 1 because frequent changes to incident assignment groups are not expected. Also notice the `var` attribute on the evaluate tag. This attribute specifies what variable is set from this block. At the end of the script, there is a `gr` on a line by itself. That last line is what sets the variable.

You can omit the `jvar_groups` variable, but then all the variables in the evaluate tag become Apache Jelly variables. The `object=true` specifies that the variable is not a primitive data type. If `object=true` is omitted, the script would break because `jvar_groups` would only be able to hold items like integers and strings.

After the evaluate tag, loop through these groups and find the incidents for each one.

```jelly
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null"
xmlns:g2="null">
<g:evaluate var="jvar_groups" object="true">
  var gr = new GlideRecord("sys_user_group");
  gr.orderBy('name');
  gr.query();
  gr;
</g:evaluate>
<table>
  <tr>
    <th>Name</th>
    <th>Incidents</th>
  </tr>
  <j:while test="${jvar_groups.next()}">
    <tr>
      <td>${HTML:jvar_groups.getValue('name')}</td>
      <td></td>
    </tr>
  </j:while>
</table>
</j:jelly>
```
You can include normal XML in the Apache Jelly script at any time. Since there is no namespace, the Apache Jelly script does not try to parse the XML tags. Notice the \j:while loop. It is a normal while loop and can iterate through a GlideRecord object. Also notice that you output a value with $\{HTML:jvar_groups.getValue('name')\}. Here are the important elements:

- The outer brackets, $\{}$, specify the output of the variable and the phase in which the variable is output: $\{}$ means first phase, $\[]$ means second phase.
- HTML before the expression is for escaping the output. The expression jvar_groups.getValue('name') is being escaped for HTML. For other types of escaping, there are JS (Javascript), NS (No Script), and some other options.

To select only one record and not iterate through many records, the code looks like the following example:

```xml
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null"
xmlns:g2="null">
  <g:evaluate var="jvar_groups" object="true">
    var gr = new GlideRecord("sys_user_group");
    gr.orderBy('name');
    gr.query();
    gr;
  </g:evaluate>
  <j:if test="${jvar_groups.next()}">
    We found ${HTML:jvar_groups.getValue('name')}
  </j:if>
</j:jelly>
```

Content management and Jelly code examples

**Code examples**

**Header Example Code**

This dynamic content block needs to be active and have the 'Two Phase' option clicked. The g:requires tag is including the UI script defined in the system whose name is 'servicenow.website.globals'. The file extension in the call is jsdbx and is used only in the call to the UI script, not in the name of the script in the system. For JSDBX, the file being called is a JavaScript(.js) defined within the database (db) that needs to be cached (x).

```xml
<?xml version= "1.0" encoding= "utf-8" ?><j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null">
  <g:requires name = "servicenow.website.globals.jsdbx" />
</j:jelly>
```

**Page Title and Description Example Code**

This dynamic content block needs to be active. There are two actions within this code snippet. First is a forward-looking string container that allows site translation, the $\{gs.getMessage(©Your Text©)\} string call). The second action pulls in the page title and description, $\{current_page.getName()\} and $\{current_page.getDescription()\}.

```xml
<?xml version= "1.0" encoding= "utf-8" ?><j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null">
  <j:if test = "${current_page.getName()=='Solutions'}" ><h1 class = "page_name" > <b> <a href = "solutions.do?" title = "©2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
1078
</b> <a href = "solutions.do?" title = "©2020 ServiceNow, Inc. All rights reserved. ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
1078
</j:jelly>
```
List Block Pulling From Knowledge Articles Example Code

This code example contains one of the best tricks in the CMS. Using the type field with draws from a number of defined list definitions to make slight, or very dramatic changes, to list display. Because the UI is open to configuration and innovation, this is a good opportunity to use design skills. Anyone who can use HTML and CSS knows that a basic list can be turned into a float grid or be made inline. The combinations are limited only by what the designer can dream up and code.

In the code example, there is a custom logo field (u_logo) added to the Knowledge form. The custom field displays customer logos, partner logos, and award images on the awards page. There are a number of different sections that use this list definition so efficient reuse is taking place.

- div class="cms_knowledge_list customer_success" - Begin by creating an outer container with a unique class name that can be used as a basis for CSS style selectors and rules. From the outer container, many of the child elements can be accessed for theming.
- <g:for_each_record file="${current}" max="${jvar_max_entries}" > - Loop for list creation that calls the selected table record and the entries set on the list form.
- <a href="knowledge.do?sysparm_document_key=kb_knowledge,${current.sys_id}"><img src="${current.u_logo.getDisplayValue()}" alt="${current.text}" width="110px"/> - Defines linking to the article detail in the knowledge base. For further reference, look at content types within the site definition and you will see some similarities. The knowledge.do? portion of the URL points to the knowledge detail page which (as mentioned above) is mandatory if you plan to call the knowledge base in your CMS site. The rest of the URL represents the syntax for calling a knowledge article by its sys_id. Each and every item housed within the system has a unique sys_id.
- <ttt>${SP}-${SP}${current.author.first_name}${SP}${current.author.last_name}</tt> - This example is commented out and not used, but it is still interesting in that it has a jelly call ${SP} and it pulls the knowledge article's author by first and last name.

```xml
<?xml version= "1.0" encoding= "utf-8" ?>
<j:jelly trim = "false" xmlns:j = "jelly:core" xmlns:g = "glide" xmlns:j2 = "null" xmlns:g2 = "null" >
<div class = "cms_knowledge_list customer_success" >
<g:for_each_record file="${current}" max="${jvar_max_entries}" >
<table cellspacing = "0" cellpadding = "0" border = "0" class = "background_transparent" >
<tr><td class = "cms_knowledge_list_image"

```
Style in Content Management

Content pages can be styled with CSS, just like any HTML website. Three elements control CSS styles:

- **Style Sheets** are records containing CSS declarations.
- **Themes** are groups of style sheets that can be invoked together.
- **Frames** are UI macros that define the outer border of individual content blocks as they appear on a content page. Frames work by calling on particular definitions in the style sheets.

**Style sheets**

Styles sheets are standard Cascading Style Sheets (CSS) that define the look and feel of all elements within the interface.

Cascading Style Sheets (CSS) can either be internal (stored in the database) or external (hosted on the server), based on organizational needs. To define an internal style sheet, use standard CSS in the style field. Using external CSS allows the Content Management System to use the same CSS as a corporate website or other online resource.

Use an external style sheet by defining a URL that points to the .cssx file. If you upload a .cssx file to the platform, you can reference the .cssx file using a URL.

Content pages do not reference style sheets directly. To invoke a style sheet, you assign the style sheet to a Theme using the related list on the Theme form.

**Design themes**

Design themes are the convergence of structure and styling, making them a critical tool for creating a powerful user interface.

For a successful project, review the corporate style guide and communicate with the corporate website art team. If the organization has an art or design department that maintains branding, include them in this process.

A theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages. In most environments, many pages share a few themes. Use multiple themes within a site to create stylistic differentiators between site areas. You can also use a single theme to create one unified look and feel for the site.

**Customize a design theme**

A theme is a collection of one or more style sheets (CSS files) that define a consistent look for a set of pages.

Role required: content_admin or admin

Themes can be invoked in any of the following ways.

- Directly by content pages.
- As the default theme of a content site.
- On the configuration page as a global default.

1. Navigate to **Content Management > Design > Themes**.
2. Click New.
3. Type a name for the theme and mark it as Active.
4. Right-click the form header and click Save. The Style Sheet related list appears.
5. Use the Style Sheet related list to add style sheets to the theme.

Doctypes

The view_content html page template on which all CMS is based defaults to doctype=html.

The code looks like the following HTML source code.

```html
<!DOCTYPE HTML>
```

If your CMS site does not render properly, remove the doctype from the page by setting the following property:

- `glide.html.doctype.pages = chat_desktop,live_feed,live_feed_small,navigator,navpage11,image_browse`

The following is the default for this property.

- `glide.html.doctype.pages = chat_desktop,live_feed,live_feed_small,navigator,navpage11,image_browse,view_content`

Setting this doctype offers these benefits for building new sites:

- Incorporating common practice: Use a practice that is becoming widely adopted across the Internet and can prevent certain browsers from running in quirks mode.
- Cleaner CSS and markup: Write more standards-based CSS and markup to promote code sharing.
- A step towards browser compatibility: Find solutions that work across browsers and avoid browser-specific workarounds.

Format a frame

Frames provide a way to manage decorative containers for content blocks and any other elements within the site. For example, one frame can be a container, made of div or span tags, that is styled with rounded corners.

Role required: content_admin or admin

Individual content blocks use a frame UI macro to define the frames. When viewing a content block form, the Frame field offers a choice between the different frame UI macros. The frame UI macro does not, however, have the definition for the frame within its Jelly script. Instead, it references a particular frame as defined in a style sheet.

Configuring a new frame is a two-step process.

1. Define the frame in a style sheet.
2. Create the frame UI macro to invoke the frame definition.

Define a frame in a style sheet

Add style definitions for any custom frame UI macro you create.

Role required: content_admin or admin

Each frame has its own class name.

1. Navigate to Content Management > Design > Style Sheets.
2. Select a style sheet to contain the frame definition.  
   Base system themes use a separate Frames style sheet.
3. Add the following code, substituting the desired frame name and style:
   ```html
div.FRAME{border:STYLE;}
```
4. Click Update.

**Create a frame UI macro**
Copy an existing frame UI macro to display content in a custom frame.

Role required: content_admin or admin

Create a custom frame UI macro if you want to control the style of the frame with your own style sheet definitions.

1. Navigate to Content Management > Design > Frames and select one of the existing frame UI macros.
2. Change the name to match the FRAMENAME you used in the style sheet.
3. Right-click the header bar and select Insert and Stay.
4. Update the frame name in the XML field as shown:
   ```xml
   <div class="FRAMENAME">
   ```
5. Click Submit.

- In any content block form, select the UI macro.
- Define the frame in a style sheet.

**Content Management meta tags**

Meta tags are special tags in web pages that contain information about the page but are not rendered with the page. You can define custom meta tags for content pages.

Meta tags are not noticeable to a page visitor unless the visitor looks at the page source code. Web search engines read meta tags as they “crawl” the web, identifying and organizing content. Modern website designers often use meta tags to embed “hints” to search engines about how to index or otherwise crawl the site.

Structurally, a meta tag consists of a tag and a name/content pair and looks similar to the following code.

```html
<meta name="generator" content="MediaWiki 1.16wmf4" />
```

The Content Management System allows you to define both site level and page level tags.

**Configure a page level meta tag**

A page level tag is a meta tag defined on a specific page and included on only that page.

Role required: content_admin or admin

If an individual page has a specific tag with the same name as the site, the page tag takes precedence.

1. Navigate to Content Management > Pages.
2. Open the page.
3. If not already included, add the Meta Tags related list to the form.
4. In the Meta Tags related list, click New.
5. Type a **Name** and **Content** for the tag.
6. Click **Submit**.

**Configure a site level meta tag**

A site level tag is a meta tag is defined on a site and included on every page within that site.

Role required: content_admin or admin

If an individual page has a specific tag with the same name as the site tag, the page tag takes precedence.

1. Navigate to **Content Management > Sites**.
2. Open the site.
3. If not already included, add the **Meta Tags** related list to the form.
4. In the **Meta Tags** related list, click **New**.
5. Enter a **Name** and **Content** for the tag.
6. Click **Submit**.

**Configure DIV-based layouts**

After you create your site, you can change the site layout with DIV tags.

Role required: content_admin or admin

Many web page layouts use tables for a consistent look and feel. Tables are effective for numbers and statistics, but can be limiting for designing other types of information. DIV tags are flexible block-element tags. To use DIV tags for layouts, give the tag an ID and assign attributes using CSS.

Changing to CSS and DIV tags help in the following ways:

- simplify code
- reduce the amount of code
- increase page load speed
- separate content from presentation
- help pages adapt to different device resolutions
- make pages easier for search engines to crawl
- make code more compliant with evolving web page design standards

A theme named **Administration Theme - Charcoal** is included as an example of CSS-driven, DIV-based layouts. To view the **Administration Theme - Charcoal** DIV-based layout, complete the following steps.

1. Navigate to **Content Management > Design > Layouts**.
2. Click **Admin 1 Column**
3. Review the code.

**Content meta tag hierarchy**

Page and site level meta tags are included in a content meta tag hierarchy.

**Site and page level tags**

CMS supports page level and site level tags. The system behavior is to show the sum of all page level and site level tags. For example, if you have two tags on the site and one tag on the page, all with different names, you see three tags on the page. Two are from the site and one is from the page. If both the site and the page have a tag of the same name, only the page tag is used.
Note: The Content Management System does not support some commonly used meta tags. For example, you cannot use the X-UA-Compatible meta tag, which allows you to specify which version of Internet Explorer a site should be rendered in.

Example: all tags have unique names

<table>
<thead>
<tr>
<th>Site Level</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
<td></td>
</tr>
<tr>
<td>breakfast</td>
<td>eggs</td>
<td></td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Page Level</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
<td></td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
<td></td>
</tr>
<tr>
<td>breakfast</td>
<td>eggs</td>
<td></td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
<td></td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
<td></td>
</tr>
</tbody>
</table>

Example: page level tag overrides site level tag

<table>
<thead>
<tr>
<th>Site Level</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
<td></td>
</tr>
<tr>
<td>breakfast</td>
<td>eggs</td>
<td></td>
</tr>
<tr>
<td>lunch</td>
<td>sandwich</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Page Level</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
<td></td>
</tr>
<tr>
<td>lunch</td>
<td>tacos</td>
<td>overrides site level</td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Output</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td></td>
<td></td>
</tr>
<tr>
<td>breakfast</td>
<td>eggs</td>
<td></td>
</tr>
<tr>
<td>lunch</td>
<td>tacos</td>
<td></td>
</tr>
<tr>
<td>dinner</td>
<td>steak</td>
<td></td>
</tr>
</tbody>
</table>

Content Management integration points

Integration points use content blocks in CMS to link different applications together using static and dynamic methods.

By using integration points, users can connect to different systems from a single page. The power of the CMS is that it can display any data within the Now Platform. The ESS portal, for example, connects users to a service catalog, a knowledge base, and a help and incident reporting site. Each section contains a set of links to additional content. List blocks offer the easiest way to display data dynamically. Content types define how lists link to the detailed data they reference.

Generating lists from the Now Platform is straightforward, especially if you use filtering. When the CMS was first introduced, lists were the only method available to create navigational systems for sites. Content types define system record links using specific templates to define the list and the details.
· Summary template: defines the list
· Detail template: defines the detail as it is rendered in a page.

The templates work together to pass data attributes or unique record identifiers (sysid) into a single detail page that manages the data. Any attribute variations use the URL sent to the page.

Understanding how content types work can mean the difference between a site with 20 pages versus a site with 200 pages. There is a time for both types of data calls. Depending on the task, there are appropriate times to use static content and times for dynamic methods.

**View links between system elements and URLs**

You can view the links between your system elements and their URLs to render more specific content within your site.

Role required: content_admin or admin

See the [Navigate to a record or module using a URL](#) page for an overview of URL syntax in the Now Platform.

The Incidents list offers a quick example of viewing a form within its own tab. This viewing method illustrates how to append the URL string to render more specific content within your site.

1. Navigate to **Incident > All**.
2. Right-click in a blank area within the content frame and select **Open Frame in New Window** or **Open Frame in New Tab**.

The URL returned looks similar to this example.

```
<instance_name>/incident_list.do?
sysparm_userpref_module=b55b4ab0c0a80009007a9c0f03fb4da9
```

The URL is comprised of the following elements.

- **incident_list.do?** is the call to the list with no parameters passed into it. Explore context menu options and list filtering variations to see how the URL string is appended with each action.
- **incident_list.do?sysparm_query=&sysparm_view=ess** is an example of how the view is passed in the URL string.
- **incident_list.do?sysparm_query=GROUPBYactive&sysparm_view=** is how the URL looks when the group by option is chosen from the context menu.
- **incident_list.do?sysparm_query=category%3Dsoftware** is the result of applying a category is software filter to the list.

Explore all the options available within the right-click menu. Click through to the Incident form itself (incident.do) to see what the URL string does when parameters are passed into it.

**Element link examples**

View examples that show how to create a site pointing to various system data in several different data tables.

The following examples illustrate setting up access to the following system data.

- **Knowledge**: building a versatile front end for a knowledge base, from overview page to variations on the list definitions used in the site.
- **Catalog**: ideas for a business-to-consumer shopping experience that pulls various items and forms from your service catalog.
- **Service Portfolio**: using the business service portfolio to contain all defined services offered by your organization.
• Featured reports: methods for linking to the most important reports.

Example links to system data

Page source view

Use the tools available in your browser to view the frame source page and understand what URL address bars pass between system frame sets.

The Firefox browser, for example, has the developer tools option. This option provides an easy way to view records that render within the main content frame (gsft_main) of the Now Platform. Also, Firefox quickly builds menus and links to records within the system.

This Firefox functionality is useful when stepping through the menu items section.
Frame view

Static methods

Static methods in the CMS application were created for ease of use. Form-based menu management and WYSIWYG code editing can be useful to both advanced and entry-level users. The technical ability of subject matter experts (SMEs) managing the language of your site can vary considerably. Letting SMEs write the content and having a technical resource manage the linking expedites menu and link creation within the system.
Static and dynamic methods

Navigation Menu Links

Use base system templates to group similar links for placement on the page. Though the terminology is different (menu sections and menu items), this type of linking behaves the same way as content links. For more information on creating a navigation menu block, see Create a navigation menu block.

Static HTML Details

Content blocks that are useful for areas administered by developers unfamiliar with HTML or markup. Anyone familiar with markup can use dynamic blocks because they are extendable. For more information on static HTML, see Using Content Blocks.

Content Links

The predecessors to navigation menus from when the CMS was first introduced. Use content links to make navigational links by defining several content links under the same category. Then, call the links as a list referencing the Content Link (content_link) table.

iFrame Details
Used both dynamically and statically throughout the system. Using them is an easy way to bring any form or list into your CMS pages. For more information on iFrame methods, see Using Content Blocks.

**Dynamic methods**

While static methods are a powerful navigational tool, you have more control over data rendering using the dynamic methods.

Reference common code in the system to make long-term maintenance of the site easier. Coding skills are useful when implementing dynamic methods.

**Static and dynamic methods**

**Dynamic Blocks**

These blocks are where the majority of your work resides. For more information, see Configure dynamic blocks.

**Frames**

Frames are meant to be decorative wrappers around any block in the system. They are mentioned with dynamic blocks because frames are essentially UI macros with the category
of Frame. Frames apply the \{body\} variable to a block and define where the block is inserted when rendered on the page.

Lists

Lists generate links to records based on the filtering rules you define. Lists can be sorted for presentation by any field in the corresponding record. Lists help supplement navigation and pull data from outside the CMS. For more information, see Customize the list block.

Content Types

Content types provide site-specific control of how system data defined as templates is rendered. The rendering of lists is considered first (summary templates). The next consideration is the detail template, which allows control over the record rendering.

List Definitions

List definitions enable you to extend the summary template defaults defined on the site level. Used with frames, list definitions render the same data differently based on the placement on the page or site. For more information, see Configure list definitions.

Detailed Content

Detailed content in page detail settings) are blocks that display the content of an existing document as a block on a content page. For more information, see Configure a detailed content block.

Example integration points

Each element on the page links to a specific URL point.
Business Services links to a content page (CMS page referenced: Business Service Portfolio, URL: (business_service_category.do) that pulls the system service catalog homepage into a frame within the content area. Each link within this section uses the browse by category page, where you pass in the name of the category to return results.

- Target page iFrame URL: catalog_home.do?
  sysparm_nameofstack=aabdaee07ff22100914304167b22567d&sysparm_view=business&sysparm_clear_stack=yes
- Target page frame name: gsft_main
  - Desktop Computing URL: category_browse.do?category=Desktop Computing
  - Business Applications URL: category_browse.do?category=Business Applications
  - Communications Services URL: category_browse.do?category=Communications Services
  - Infrastructure Services URL: category_browse.do?category=Infrastructure Services
  - Hosting Services URL: category_browse.do?category=Hosting Services

Featured Services links to a content page which pulls a small subset of services into an iFrame.

- iFrame URL: com.glideapp.servicecatalog_category_view.do?
  sysparm_parent=d67c46ec0a80165000335aa37eafbc1&sysparm_view=
- Frame name: gsft_main
  - Install Software URL: catalog.do?
    uri=com.glideapp.servicecatalog_cat_item_view.do?
    sysparm_id=10d696896c11227600f6ba4c664824
  - Email Account URL: catalog.do?

Reporting links to a content page that pulls the reports page into an iFrame. All links within this menu leverage homepages in the system, which creates an issue with the home.do URL. Notice in the following links that ../ is used to create a relative URL outside of the CMS site home.do definition. Without this path, the site homepage would render within the iframe.

- iFrame URL: report_home.do
- Frame name: gsft_main
  - Cost Management Overview URL: ../home.do?
    sysparm_userpref_homepage=fa81ae91c0a805c64c0942ab2e4b852b
  - Administration Overview URL: ../home.do?
    sysparm_userpref_homepage=8b7b1ff6c611228901ff3fcbdbd3cc8f
  - Portfolio Overview URL: catalog_home.do?sysparm_view=business
  - Service Availability URL: ../home.do?
    sysparm_userpref_homepage=8ee772000a0bad00c38eb7e68b93d0
Content Management testing

Test your site to ensure that all pages display correctly, links go to the specified address, and images are not broken. It is important to test the site as you build it. Do not wait until just before launch to begin testing.

Also, test templates as you create them so any issues are resolved before creating other content based on the templates. Recruit as many people as possible to help you test.

Here are some general site testing guidelines:

- Test on the browsers and platforms your site visitors use
- Test on various monitors (for example, LCD and CRT)
- View pages using different screen resolutions
- View pages using different color settings
- Test all navigation and links
- Test items that can be downloaded (for example, PDF files)
- Test the search functionality
- Test site security
- If necessary, test for accessibility (for guidelines, see the W3C Website Accessibility Initiative)

Global search in Content Management

When you add global search to a CMS site, two different search result blocks can display, depending on the user role: global or no global.

Roles are defined at System Properties > Global Text Search.

- Search Results (Global): For users with permission to use the global search within the normal frame set. The normal frame set is defined as the default, non-CMS user interface with the set of frames.
- Search Results (No Global): For users without permission to use the global search. Searches only the knowledge base and the catalog.

The header search bar and the Search dynamic block in the base system both automatically handle the permissions and direct the user to the appropriate search results. In the base system, the search result blocks are deployed on the same Search Results content page.

In order for the global search to work properly, it is important to ensure that the DEFAULT directs users to a working content page. If not, the results from the global search link back to the frame set, not to pages within the CMS site.

Note: The global search is similar to the normal frame set user interface and ties to the same roles (Set global text search properties).

Search Results (Global)

Before you use the Search Results (Global) dynamic block, define content types to control the behavior a search result is clicked. If no content type is defined for a table, selecting a link on that table renders the results according to the DEFAULT content type. It is good practice to point
the DEFAULT content type to a page with a normal "Current Document" detailed block. Set the content type detail (Detail Template field) to have just an iFrame.

The Search Results (No Global) dynamic block does not require any additional configuration.

CMS translation

You can translate CMS sites by activating internationalization plugins and manually translating custom interface strings.

Two tables support the translation of a CMS site into other languages.

- Translated Name / Field (sys_translated): Stores strings that are shared or commonly used within a site. These include menu section names, menu item names, site breadcrumb names, link names, and footer menu links. Internationalization plugins typically provide translations for these strings. See System localization.
- Translated Text (sys_translated_text): Stores unique string translations which you create when you manually translate interface elements. See Export and edit translation records.

View a translated CMS site

Activating an internationalization plugin provides a quick way to see translated strings for CMS menus, breadcrumbs, and links. For a full translation, you must translate the instance manually.

The following example explains how to view a translated site in Japanese.

1. Navigate to System Definition > Plugins.
2. In the Go to filter, select Name, enter I18N, and then press the Enter key.
3. Activate both the I18N - Japanese Translations and the I18N: Knowledge Management Internationalization Plugin v2 plugins.
4. Refresh the browser.
6. Browse the site to see the translated language strings.
7. Navigate to the ESS Portal. The path is: http://Instance Name.service-now.com/ess/.
8. Browse the site to see the translated language strings in the ESS Portal.

Connections and Credentials

Credentials and connection information are required to gain access to a computer or network device for Discovery, Service Mapping, and Cloud Management or to perform work using Orchestration. When adding content to Share or AppStore, you can configure connections and credentials relevant to your environment without modifying built content.

Introduction to credentials, connections, and aliases

All application integrations in the Now Platform use connection information, credentials, and aliases to enable their respective applications to access resources.

Before you can execute an application integration in your instance, you must create and configure the corresponding connection information and credentials. Connections pertain to an integration with a system, such as an IP address or endpoint with protocols. It contains specific details, such as database particulars, when integrating with a database. The associated credentials are the authentication data required to make the connection.

Connection information and credentials can vary between QA/Development/Production environments for the same integration. The tight coupling between this data and application metadata, such as workflow or job scheduling, make application metadata obsolete when you change environments. To alleviate this problem, the concept of an alias is introduced, to decouple connections and credentials from application metadata. These aliases allow customers to design their application metadata to pair with an alias, which resolves to connection and credential data during runtime.

There are two types of aliases, a connection and credential alias and a credential alias. Business rules enforce certain constraints on these aliases. Names must contain letters, numbers, and underscores, but cannot use special characters. The alias must be unique in a scope. If you choose to have multiple active connections, you can have more than one active connection in the same domain. If you do not choose this option, you can have only one active connection per domain.

Note: If you enable multiple active connections, the application picks one connection based on an established order. This order depends on the API you use to retrieve connection data.

You can add additional connection attributes to an alias, which are available in connection data during run time. Variables overridden by connection administration during run time should not affect the alias.

The credential alias resolves only credential data. Along with the alias data model, you can use a scriptable API that gets connection and credential data at runtime.

Upgrading credential tags

The upgrade process migrates credential tags to credential aliases. All credential tags in the Credentials (discovery_credentials) table have a corresponding credential alias with this information:

- **Name**: Unique alias name
- **Scope**: global
- **ID**: Alias name
Credential synchronization on MID Servers

Each MID Server in your network synchronized with the instance keeps a copy of every credential that you create. This synchronization speeds up the reading of credentials when applications like Discovery or Service Mapping need to access multiple devices on the network. The MID Servers synchronize when they find a credentials_reload job in the ECC Queue. The reload job instructs the MID Server to make a SOAP call to the instance to get the entire list of credentials in the Credentials (discovery_credentials) table, including all the field values.

The SOAP response that your instance sends to each MID Server also includes custom fields that you added to any credential form that you customized. If you added reference fields, the data in the referenced table is also sent as part of the SOAP response. This can lead to performance issues when credential synchronization occurs with multiple MID Servers. To control this, manually add these properties to the System Properties (sys_properties) table:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>com.snc.credentials_user_fields</td>
<td>Incluedes all customized fields in credential sync. Set this to false if you do not want to include the fields that you added to credential forms.</td>
</tr>
<tr>
<td>com.snc.credentials_recursion_depth</td>
<td>Defines the number of tables to traverse when the credential sync mechanism collects fields from reference tables. Lower this number if you are experiencing performance issues and you have customized credential forms that include reference fields to tables that also have reference fields.</td>
</tr>
</tbody>
</table>

Domain separation for Credentials and Connections

This is an overview of domain separation for Credentials and Connections. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes Basic level
Processes can be created or modified per customer by the service provider. The use cases reflect proper use of the application by multiple service provider customers in a single instance.

The owner of the instance needs to be able to configure MVP business logic and data parameters per tenant as expected for the specific application.

Use case: As an admin, I need the ability to make comments mandatory on close of a record for one tenant, but not for another. Business logic:

**Overview**

Credentials are tied to various ServiceNow features which access systems outside the instance. Credentials follow the domain separation tied to the feature employing the credentials.

Connections are protocol-specific information referencing a target host outside the instance. A connection can specify the domain to run an activity.

**How domain separation works in Credentials and Connections**

Credentials access resources outside of the instance, and are used by the Discovery, Orchestration, Service Mapping, and Cloud Management applications. These credentials are not tied to a specific domain, rather, they can be bound to an application and then follow the domain separation that the application uses. Credentials can also be assigned to a MID Server, and then follow the domain separation specified by the MID Server configuration.

Connections access a target host using a JMS, JDBC, or HTTP(s) connection. You can specify global or a specific domain to which the connection belongs.

**Connection & Credential configuration templates**

Enable users with the admin and flow_designer roles to set up spoke integrations with third-party systems using a single, customizable form.

For example, you can set up an OAuth integration, which registers an OAuth provider, generates a token, and creates connection and credential records. An action designer or developer can use a configuration template to set up the spoke in one place and the system creates the associated records.

**Benefits**

Configuration templates enable:

- Admins or flow designers to set up a complex integrations using a single form.
- Developers to set static values in an integration, simplifying the setup process for admins and flow designers.

**Supported credential types**

You can create configuration templates for integrations with these credential types:

- Basic auth
- API key
- OAuth JWT Bearer grant type
- OAuth Authorization Code grant type
- Custom authentication

Configuration template components

**Default Data Template**

Sets static information that applies to every integration. For example, you can set the API and token URL if the value applies to every integration.

**Dynamic Data Template**

Defines the information that the user must complete to set up the integration. For example, you can add user name and password key-value pairs to gather user-defined values.

**Post Processing Script**

Creates additional records required by the integration. For example, if your spoke includes custom tables, you can create records in those tables based on user input in the configuration template. This script executes after the connection and credential records are created.

**Demo data**

The Connection & Credential Templates (sys_alias_templates) table includes example templates to demonstrate how to set up templates for common authentication types. Use these examples as a guide when creating your own.

**Configure a template for OAuth JWT Bearer grant type**

This example configuration template sets up Credential and Connection records using the JWT Bearer grant type to authenticate requests to Docusign.

**Default data template**

Each top-level item in the default data template creates an associated record. The template includes these sections:

- **Credential**: Creates a record in the Credentials table.
- **Connection**: Creates a record in the Connections (sys_connection) table and any associated connection records.
- **Additional**: Optionally creates records in a custom table. The post processing script tells the system what to do with these records.

The following example creates the records required for OAuth JWT Bearer grant type authentication.

```json
{
    "credential": {
        "oauth_entity": {
            "oauth_entity_profile": [
                {
                    "grant_type": "urn:ietf:params:oauth:grant-type:jwt-bearer",
                    "name": "Docusign Profile",
                    "default": true,
                    "oauth_entity_profile_scope": [ ]
                }
            ]
        }
    }
}
```
"users:read.email"
]
},
"code_challenge_method": "S256",
"type": "consumer",
"oauth_entity_scope": [
{
"oauth_entity_scope": "users:read.email",
"name": "email"
}
],
"client_id": "<provider-client-id>",
"use Mutual auth": false,
"revoke token_url": "https://<provider-domain-name>.com/oauth2/revoke",
"default grant type": "urn:ietf:params:oauth:grant-type:jwt-bearer",
"public client": false,
"oauth_api_script": "3e3a3a11c333210016194ffe5bba8f70",
"name": "Docusign Spoke OAuth",
"client_secret": "<provider-client-secret>",
"auth_url": "https://<provider-domain-name>.com/oauth2/auth",
"token_url": "https://<provider-domain-name>.com/oauth2/token",
"redirect_url": "https://<instance-name>.service-now.com/oauth_redirect.do"
},
"jwt_provider": {
"jwt_keystore_aliases": {
"kid": "<provider-key-id>",
"name": "Docusign Spoke JWT Key",
"signing_keystore": "<signing-keystore-sys-id>",
"signing_algorithm": "rsa_256",
"signing_key_password": "password"
}
},
"jwt_claim_validation": [ {

"is standard": true,
"data_type": "string",
"value": "<docusign-iss-claim>"
},
{ "name": "sub",
"is standard": true,
"data_type": "string",
"value": "<docusign-sub-claim>"
},
{ "name": "aud",
"is standard": true,
"data_type": "string",
"value": "<docusign-aud-claim>"
},
{ "name": "scope",
"is standard": false,
"data_type": "string",
"value": "signature impersonation"
}
],
"name": "Docusign Spoke JWT Provider",
"jwt_api_script": "9ef6af86ff10330001d3cd6bd53bf144"
},
"name": "Docusign Spoke Credential",
"table": "oauth_2_0_credentials"
},
"connection": {
"use_mid": false,
"connection_url": "https://<provider-domain-name>.com"
Dynamic data schema

The dynamic data schema defines what the user sees when they create a Connection & Credential alias and collects their input. Use dot-walking syntax to map user input to fields created in the default data template. For example, connection_fields maps user input to the connection_url field in the connection object created by the default data template.

```json
{
    "connection_fields": [
        {
            "name": "connection.connection_url",
            "label": "Connection URL",
            "type": "text",
            "defaultValue": "https://demo.docusign.net",
            "hint": "Connection URL for Docusign"
        },
    ],
    "additional_fields": [
        {
            "name": "additional.docusign_account_id",
            "label": "Docusign Account Number",
            "type": "text",
            "hint": "Docusign Account Number"
        },
        {
            "name": "additional.docusign_account_name",
            "label": "Docusign Account Name",
            "type": "text",
            "hint": "Name to identify the Docusign account"
        },
        {
            "name": "additional.docusign_account_email",
            "label": "Docusign Account Email",
            "type": "text",
            "hint": "Docusign Account Email"
        }
    ],
    "credential_fields": [
        {
            "name": "credential.oauth_entity.client_id",
            "label": "OAuth Client ID",
            "type": "text",
            "hint": "Client ID for Docusign"
        },
        {
            "name": "credential.oauth_entity.redirect_url",
            "label": "OAuth Redirect URL",
            "type": "text",
            "defaultValue": "https://<instance-name>.service-now.com/oauth_redirect.do",
            "hint": "Callback URL for Docusign"
        }
    ]
}
```
"name": "credential.jwt_provider.jwt_claim_validation[0].value",
"label": "Issuer (iss) Claim value",
"type": "text",
"hint": "The integrator key (also known as client ID) of the application",
}
{
"name": "credential.jwt_provider.jwt_claim_validation[1].value",
"label": "Subject (sub) Claim value",
"type": "text",
"hint": "The user ID of the user to be impersonated"
}
{
"name": "credential.jwt_provider.jwt_claim_validation[2].value",
"label": "Audience (aud) Claim value",
"type": "text",
"defaultValue": "account-d.docusign.com",
"hint": "The URI of the authentication service instance to be used e.g. account.docusign.com"
}
{
"name": "credential.jwt_provider.jwt_keystore_aliases.kid",
"label": "Key ID (kid)",
"type": "text",
"hint": "Indicates which key was used to secure the JWS"
}
{
"name": "credential.jwt_provider.jwt_keystore_aliases.signing_keystore",
"label": "Key Store",
"type": "file"
}

Post processing script

The following post processing script maps user input to fields in the sn_docusign_spoke_accounts table.

(function execute(aliasId, connectionSysId, jsonDefaultData, jsonDynamicData) {
    var jsonDynamicDataP = JSON.parse(jsonDynamicData);
    var accountGR = new GlideRecord("sn_docusign_spoke_accounts");
    accountGR.setValue("account_name", jsonDynamicDataP["additional.docusign_account_name"]);
    accountGR.setValue("alias", aliasId);
    accountGR.setValue("email", jsonDynamicDataP["additional.docusign_account_email"]);
    accountGR.setValue("id", jsonDynamicDataP["additional.docusign_account_id"]);
    accountGR.insert();
})(aliasId, connectionSysId, jsonDefaultData, jsonDynamicData);

Resulting Docusign Connection and Credential configuration form

When the user navigates to the associated Docusign Connection & Credential Alias and selects Create New Connection & Credential, the following dialog appears.
Create Connection and Credential

Please Enter the Connection Information

- **Connection URL:**
  
  https://demo.docusign.net

Please Enter the Credential Information

- **OAuth Client ID:**
  
  Client ID for Docusign

- **OAuth Redirect URL:**
  
  https://demo.docusign.com/oauth_redirect.do

- **Issuer (iss) Claim value:**
  
  The integrator key (also known as client ID) of the application

- **Subject (sub) Claim value:**
  
  The user ID of the user to be impersonated

- **Audience (aud) Claim value:**
  
  docusign.com

- **Key ID (kid):**
  
  Indicates which key was used to secure the JWS
Create a configuration template

Create a template that defines the inputs required to set up a spoke. Set static key-value pairs to create records and set values that apply to every integration. Set dynamic key-value pairs to gather user input and set field values that may vary. Using this template, admins and flow designers can set up the spoke from a single form.

Role required: admin or action designer

1. Navigate to IntegrationHub > Connections & Credentials > Configuration Templates.
2. Click New.
3. Select the type of configuration template you want to create. Selecting a type provides starter data to help you configure the template.

<table>
<thead>
<tr>
<th>Configuration type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP Connection with OAuth Authorization Code grant type</td>
<td>Creates a template to register the third-party system as an OAuth provider using an authorization code.</td>
</tr>
<tr>
<td>HTTP Connection with OAuth JWT Bearer grant type</td>
<td>Creates a template to register the third-party system as an OAuth provider using a JSON Web Token.</td>
</tr>
<tr>
<td>HTTP Connection with Basic Auth Credential</td>
<td>Creates a template to integrate with the third-party system using basic authentication.</td>
</tr>
<tr>
<td>HTTP Connection with API Key Credential</td>
<td>Creates a template to integrate with the third-party system using an API key.</td>
</tr>
<tr>
<td>Other Configuration</td>
<td>Creates a blank template, enabling you to set up a template for custom authentication.</td>
</tr>
</tbody>
</table>

4. In the Name field, add a name to easily identify the template.
5. In the Default Data Template field, make any required changes. This field sets static information that applies to every integration. For example, you can set the API and token URL if the value applies to every integration.

These objects in the default data template are required:

- credential: Creates a credential record with the required fields.
- connection: Creates a connection record with the required fields. Access connection attributes using the extended_attributes child object. For example:

```json
"connection": {
   "extended_attributes": {
      "api_version": "v1"
   },
   "connection_url": "https://<provider-domain-name>.com",
   "name": "Spoke Connection",
   "table": "http_connection"
}
```

You can use the additional object to set up data for a custom table, and use the post processing script to insert the data into the table.

**Note:** In the default data template for the OAuth Authorization Code grant type, the values for the oauth_entity_profile_scope and the oauth_entity_scope keys must match. In the following example, both keys have the Read user's email value.

```json
"oauth_entity_profile": [
   {"grant_type": "authorization_code",
```
6. In the **Dynamic Data Schema** field, make any required changes. This field defines the information that the user must complete to set up the integration. For example, you can add user name and password key-value pairs to gather user-defined values.

Fields in the dynamic data schema include these properties:

- **name**: The field that the user's input maps to. For example, to map user input to the Connection URL field in the Connection record, enter `connection.connection_url`.
- **label**: The field label. This is the label that the user sees when completing the template.
- **type**: The field type. Make sure that this data type matches the data type of the field you are mapping the value to.
- **defaultValue**: Optional. The field's default value. If no default is provided, the hint displays.
- **hint**: Optional. Hint text to display when there is no default value.

**Note**: If setting up a template for OAuth JWT Bearer grant type authentication, you may want user input for a single key-value pair in the `jwt_claim_validation` array. You can refer to a single key-value pair in the dynamic data schema by referring to its index in the array. For example, your default data template might include this snippet.

```json
"jwt_claim_validation" : [ {
"name" : "iss",
"is_standard" : true,
"data_type" : "string",
"value" : "<docusign-iss-claim>"
}, {
"name" : "sub",
"is_standard" : true,
"data_type" : "string",
"value" : "<docusign-sub-claim>"
}, {
"name" : "aud",
"is_standard" : true,
"data_type" : "string",
"value" : "<docusign-aud-claim>"
}, {
"name" : "scope",
"is_standard" : false,
"data_type" : "string",
"value" : "signature impersonation"
} ],
```
7. Optional: In the **Post Processing Script** field, add a script that creates additional records required by the integration. For example, if your spoke includes custom tables, you can create records in those tables based on user input in the configuration template. This script executes after the connection and credential records are created.

The post-processing script has access to these global objects.

<table>
<thead>
<tr>
<th>Global object</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aliasId</td>
<td>Sys_id of the alias record from the Connection &amp; Credential Alias (sys_alias) table.</td>
</tr>
<tr>
<td>connectionSysId</td>
<td>Sys_id of the connection record created by the template.</td>
</tr>
<tr>
<td>jsonDefaultData</td>
<td>JSON content from the Default Data Template field in String format.</td>
</tr>
<tr>
<td>jsonDynamicData</td>
<td>JSON content from the Dynamic Data Template field in String format.</td>
</tr>
</tbody>
</table>

8. Add the template to a Connection & Credential alias.
   a) Navigate to **IntegrationHub > Connections & Credentials > Connection & Credential Aliases**.
   b) Open the alias record for the spoke.
   c) In the **Configuration Template** field, click the Lookup icon.
   d) Select the template you created from the list.
   e) Click **Update**.

When the user navigates to the associated Connection & Credential alias and selects **Create New Connection & Credential**, a dialog appears to collect their input. If you created a template for the OAuth Authorization Code grant type, you can also retrieve an OAuth token from this dialog.

Test the template by navigating to the associated Connection & Credential alias and selecting **Create New Connection & Credential**. Verify that the dialog collects the expected data and creates the required records in the system.

**Getting started with connections**

Use the connections table to set up a Basic, JMS, JDBC, or HTTP(s) connection to a target host.

**Connection Table**

The Connection table (sys_connection) is the base table for all connection tables. You can set up connections for the following protocols:

- Basic connection for PowerShell and SSH
- JDBC
- JMS
- HTTP(s)
The connection table references the connection alias table, which couples the connection alias to connection information. Every connection records the following information:

**Base connection properties**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the connection. This field must be unique on the table.</td>
</tr>
<tr>
<td>Credential</td>
<td>Specify the credential to use with this connection. This is optional.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>The connection alias resolves your connection and credentials at run time. Only one connection is active per Connection alias at any one time.</td>
</tr>
<tr>
<td>Active</td>
<td>Check to make the current connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain to which the connection belongs.</td>
</tr>
</tbody>
</table>

Credential is unique across active connections, if not empty.

**Upgrading connection information**

- The JDBC connection (jdbc_connection) and JMS connection (orch_jms_ds) tables are existing Orchestration connection tables that now extend from the Connection (sys_connection) table. The tables originally extended from sys_metadata. The sys_metadata related data is removed.
- The tables move from the Orchestration run time plugin (com.snc.runbook_automation.runtime) to the Credentials & Connections plugin.
- The upgrade process obtains JDBC and JMS connection information and creates corresponding connection aliases and assigns the alias to its corresponding connection.
- JDBC field name changes:
  - JDBC server is renamed to host
  - Database port is renamed to port
  - Data of the JDBC server and database migrates to host and port during the upgrade

**Create a basic connection for PowerShell and SSH**

Configure connection information to use with a custom activity or action that uses the PowerShell or Secure Shell (SSH) protocol.

Role required: admin or connection_admin

1. Navigate to **Credentials & Connections > Connections**.
2. Click **New**.
3. Select **Basic Connection for PowerShell & SSH**.
4. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the connection record.</td>
</tr>
<tr>
<td>Credential</td>
<td>Select the credential record used to authorize the connection.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
**Host** | Fully qualified domain name of the target host where the system runs the activity or action. For example, host.domain.com.

**Use MID Server** | Select to connect to the target host through a MID Server. If selected, define fields in the Advanced MID Server Configuration section.

**Active** | Select to make this connection active.

**Domain** | Determines the domain the activity runs in. Flow Designer does not support domain separation and ignores this field.

**Override default port** | Target port used by the connection. If you leave this field blank, the system uses the default port value.

**Capabilities** | The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if **Use MID server** is selected.

**MID Application** | The application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. Only displays if **Use MID server** is selected.

---

5. Click **Submit**.

### Create an HTTP(s) connection

The HTTP(s) connection provides the information custom HTTP(s) actions or activities use to connect.

**Role required:** connection_admin

1. Navigate to **Credentials & Connections > Connections**, click **New**, and select **HTTP(s) Connection**.

2. Add the following connection information and click **Submit**:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Unique name of this HTTP(s) connection.</td>
</tr>
<tr>
<td><strong>Credential</strong></td>
<td>Select the credential record used to authorize the connection.</td>
</tr>
<tr>
<td><strong>Connection Alias</strong></td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>URL builder</td>
<td>Either manually enter the connection URL or use system to build the URL based on the inputs. Default is unchecked. If checked, the connection URL is calculated from the following fields:</td>
</tr>
<tr>
<td></td>
<td>- Mutual authentication — Check box if mutual authentication is used.</td>
</tr>
<tr>
<td></td>
<td>- Protocol — If mutual authentication is not used, enter protocol. The default is HTTPs.</td>
</tr>
<tr>
<td></td>
<td>- Protocol profile — If mutual authentication is used, enter protocol profile from sys_protocol_profile.</td>
</tr>
<tr>
<td></td>
<td>- Host</td>
</tr>
<tr>
<td></td>
<td>- Port</td>
</tr>
<tr>
<td></td>
<td>- Base path — Path of the connection string.</td>
</tr>
</tbody>
</table>

**Note:** If mutual authentication is checked, connection URL is built: Protocol +://+host:port+URL. If mutual authentication is unchecked, connection URL is built: Protocol profile +://+host:port+URL.

<table>
<thead>
<tr>
<th>Connection URL</th>
<th>If URL builder is unchecked, enter the connection URL into this field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Check the box to make this connection active.</td>
</tr>
<tr>
<td>Domain</td>
<td>Determine the domain the action or activity runs in.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Check to use a MID Server for this action or activity. If selected, define fields in the Advanced MID Server Configuration section.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if Use MID server is selected.</td>
</tr>
<tr>
<td></td>
<td>Required capabilities determine which MID Server is selected at runtime. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
<tr>
<td>MID Application</td>
<td>The application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. Only displays if Use MID server is selected.</td>
</tr>
<tr>
<td></td>
<td>To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
</tbody>
</table>

3. Click **Submit**.

You are ready to create a custom HTTP(s) action or activity.
Create a JDBC connection

The JDBC Connection provides the information custom JDBC actions or activities use to connect to various target databases.

You must have an appropriate JAR file, whether it is supplied with the instance or a custom JAR file.

Note: The ServiceNow instance supplies mysql-connector-java-5.1.21.jar, sqlserver-jdbc-4.0.jar, and ojdbc6.jar files as part of the current release, which supports MySQL, SQLServer, and Oracle databases. Other databases, such as Sybase or DB2 Universal, must use a custom JAR file that must be uploaded to the instance before setting the JDBC connection.

Role required: connection_admin

JDBC credentials are retrieved separately by the activity designer template and support external credential storage, such as CyberArk.

1. Navigate to Credentials & Connections > Connections, click New and select JDBC Connection.

2. Complete the form using the fields in the table.

   The database selection in the Format field determines which fields are available.

   **JDBC connection fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Database Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>All</td>
<td>Unique name of this JDBC connection. For example, you might enter JDBC MySQLProd.</td>
</tr>
<tr>
<td>Credential</td>
<td>All</td>
<td>Add credentials for JDBC provider.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>All</td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
<tr>
<td>Query timeout</td>
<td>All</td>
<td>Maximum elapsed time the JDBC query is allowed to run without a response.</td>
</tr>
<tr>
<td>Connection timeout</td>
<td>All</td>
<td>Maximum elapsed time for the JDBC activity to wait while attempting to connect to the target database.</td>
</tr>
<tr>
<td>Active</td>
<td>All</td>
<td>Check the box to make this an active connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>All</td>
<td>Domain for this table. By default, the JDBC Connection (jdbc_connection) table runs in the global domain.</td>
</tr>
</tbody>
</table>
### ServiceNow Orlando Now Platform capabilities

#### Field Format Database Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Format</th>
<th>Database</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>All</td>
<td></td>
<td>Database type for this connection. The default choices are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• MySQL</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Oracle</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• SQLServer</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• None</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>You can add Sybase or DB2 Universal to the choice list by uploading the appropriate JDBC driver JAR file to the instance. Orchestration automatically recognizes these drivers when they are loaded into the system and adds them to this list.</td>
</tr>
<tr>
<td>Host</td>
<td>Oracle, MySQL, SQLServer</td>
<td>Host name or IP address of the database server.</td>
<td></td>
</tr>
<tr>
<td>Oracle sid</td>
<td>Oracle</td>
<td>The Oracle database site identifier. The default value is orcl.</td>
<td></td>
</tr>
<tr>
<td>Oracle port</td>
<td>Oracle</td>
<td>Port that the Oracle database is using. The default value is 1521.</td>
<td></td>
</tr>
<tr>
<td>Database name</td>
<td>MySQL, SQLServer</td>
<td>Name of the database.</td>
<td></td>
</tr>
<tr>
<td>Port</td>
<td>MySQL, SQLServer</td>
<td>Port that the selected database is using.</td>
<td></td>
</tr>
<tr>
<td>Instance name</td>
<td>SQLServer</td>
<td>Instance name for the selected SQLServer</td>
<td></td>
</tr>
<tr>
<td>Connection URL</td>
<td>All</td>
<td>URL that the MID Server uses to connect to the specified database. The URL is created automatically when you save the form, and is read-only for the default databases.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** If the format selected is not one of the default databases, you must create the connection URL manually so that the MID Server knows how to create the connection.

<table>
<thead>
<tr>
<th>Field</th>
<th>Format</th>
<th>Database</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JDBC driver</td>
<td>None, DB2 Universal, Sybase</td>
<td>The JDBC driver to use for this connection when it is not a default database.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** If you add a Sybase or DB2 Universal database, you must enter the driver name in this field and upload the driver JAR file to the instance.

<table>
<thead>
<tr>
<th>Field</th>
<th>Format</th>
<th>Database</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use MID server</td>
<td>All</td>
<td></td>
<td>Check to use a MID server for this action or activity. If selected, define fields in the Advanced MID Server Configuration section.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>All</td>
<td></td>
<td>The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if Use MID server is selected.</td>
</tr>
</tbody>
</table>

To learn more about how a MID Server is selected during runtime, see MID Server selection.
### Create a JMS connection

Configure your system to use Java Messaging Service (JMS) with a custom JMS activity or action. **Role required**: connection_admin

The MID Server must have the correct JMS connection factories for your organization. Configure those values in the `mid.property.jms.command.allowed_factory_names` property, found in MID Server > Properties. The default values for this property can be changed to any value or comma-separated list of values that the third-party JMS provider advertises.

1. Navigate to **Credentials & Connections > Connections**.
2. Click **New**, select **JMS Connection**, fill in the form, and then click **Submit**:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of this connection factory.</td>
</tr>
<tr>
<td>Credential</td>
<td>Add credentials for JMS provider.</td>
</tr>
<tr>
<td>Connection Alias</td>
<td>Select the alias record to associate with this connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext.</td>
</tr>
</tbody>
</table>

**Note:** For example, to connect to ActiveMQ V5.10 (JMS Provider), the value is `org.apache.activemq.jndi.ActiveMQInitialContextFactory`.

<table>
<thead>
<tr>
<th>Provider URL</th>
<th>Location of the running JMS provider installation.</th>
</tr>
</thead>
</table>

**Note:** For example, to connect to ActiveMQ V5.1: tcp://ipAddressOrHostName:61616.

<table>
<thead>
<tr>
<th>Active</th>
<th>Check the box to make this an active connection.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain</td>
<td>Determine the domain the action or activity runs in.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Check to use a MID Server for this action or activity. If selected, define fields in the Advanced MID Server Configuration section.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Capabilities</strong></td>
<td>The capabilities the MID Server must support to be eligible for selection. The system runs the action or activity from a MID Server that supports the selected capabilities. Only displays if Use MID server is selected. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
<tr>
<td><strong>MID Application</strong></td>
<td>The application the MID Server must support to be eligible for selection. The system runs the action from a MID Server that supports the selected application. Only displays if Use MID server is selected. To learn more about how a MID Server is selected during runtime, see MID Server selection.</td>
</tr>
</tbody>
</table>

3. Navigate to **Connections & Credentials > Credentials**.
4. Click **New**, select **JMS Credentials**, and then provide the user name and password the MID should use to communicate with the JMS provider. For more information, see **JMS credentials**.
5. Click **Submit**.

You are ready to create a custom JMS action or activity.

**Create connection attributes for IntegrationHub**

Define connection-specific variables that you can use in IntegrationHub integration steps.

- The admin role is required to create connection attributes.
- The connection_admin or admin role is required to assign attribute values.
- The action_designer or admin role is required to use attributes in a custom action.

Connection attributes are only used by integration steps, which require a subscription to IntegrationHub. For more information about activating IntegrationHub, see **Request an IntegrationHub plugin**.

When using an integration step, you must establish a connection with an external system. Use a Connection & Credential alias instead of defining the connection inline. An alias enables you to update the connection details once without having to reconfigure every action. Any action step that uses an alias inherits the attributes associated with it. Flow Designer displays attributes as data pills that you can drag into your action step. For example, you can create a page size attribute that becomes a REST step query parameter.

For more information about building custom Flow Designer actions, see **Action Designer**.

1. Navigate to **Credentials & Connections > Connection & Credential Aliases**.
2. Create or select an alias record.
3. From the Connection Attributes related list, click **New**.
   The Connection Attributes form opens.
4. Define the attribute label and field type. For a list of field types, see **field types**.
5. Click the Advanced view related link to set advanced dictionary preferences for the attribute.
   For example, to create an attribute with a dynamically calculated value. See **Dictionary entry form**.
6. Click **Submit**.
7. Define the attribute values in the connection record.
a) Navigate to **Credentials & Connections > Connections**.
b) Create or select a connection record with the same connection type as the alias.
c) From **Connection alias**, select the alias with connection attributes.
d) Save the record.
   The Attributes tab populates with the connection attributes defined in the alias record.
e) Set values for the attributes.
   If the alias has **Support Multiple Active Connections** enabled, you can associate more than one connection record with an alias and define attribute values in each connection record. If there are multiple connection records with attribute values for the same alias, the connection used when the flow executes determines the attribute values. For example, suppose that you have one action that uses an alias with two active connections endpoints: production and test. The attribute resolves to the value defined by the connection used at runtime.

8. Add the alias to an integration step in Action Designer.
   a) Navigate to Flow Designer and create or select an action.
   b) Add an integration step to the action.
   c) Under Connection Details, add the alias you created attributes for.

   The connection attributes associated with the alias display as data pills in the Data pane.

   **Note:** The system does not track changes to connection attribute labels and data types after you associate the alias to a step. To refresh the connection attribute label or data type, delete the alias from the step and add it again.

---

### Getting started with credentials

The MID Server uses the credentials you create in the Credentials (discovery.credentials) table to access resources for Discovery, Orchestration, Service Mapping, and Cloud Management.

### How MID Servers use credentials

By default, Windows MID Servers use the login credentials of the MID Server service on the host machine to discover Windows devices in the network. You should **configure these service credentials** so that they have at least local administrator privileges. For Linux and UNIX machines and network devices, the MID Server uses the SSH and SNMP credentials configured in the instance in **Discovery > Credentials**.

MID Servers that Orchestration uses must have access to the necessary credentials to execute commands on computers in the network as specified by the **Workflow activities**. Orchestration can use the same SSH and SNMP credentials as Discovery, but has two additional credentials designed for specific Workflow activities: Windows (for **PowerShell**) and VMware.

### Encryption and decryption

The platform stores credentials in an encrypted field on the Credentials (discovery.credentials) table. Once they are entered, they cannot be viewed.
When credentials are requested by the MID Server, the platform decrypts the credentials using the following process:

1. The credentials are decrypted on the instance with the password2 fixed key.
2. The credentials are re-encrypted on the instance with the MID Server’s public key.
3. The credentials are encrypted on the load balancer with SSL.
4. The credentials are decrypted on the MID Server with SSL.
5. The credentials are decrypted on the MID Server with the MID Server’s private key.

Note: The platform does not have separate encryption keys for multi-tenant instances.

Credential order

Credentials can be assigned an order value in the *Credentials Form*, which forces the application to try all the credentials at their disposal in a certain sequence. If you do not specify an order value, the application tries the credentials in the Credentials (discoveryCredential) table randomly, until it finds one that works, such as when Orchestration attempts to run a command on an SSH server (such as a Linux or UNIX machine), or when Discovery attempts to query an SNMP device (such as a printer, router, or UPS).

After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

Note: If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.

Ordering credentials is useful in the following situations:

- The credentials table contains many credentials, with some used more frequently than others. For example, if the table contains 150 SSH credentials, and 5 of those are used to log into 90% of the devices, it is good practice to configure those five with low order numbers, which places them at the top of the execution list. Discovery and Orchestration will work faster if they try these common credentials first. After the first successful connection, the system knows which credentials to use the next time for each device.
- The system has aggressive login security. For example, if the Solaris database servers in the network only allow three failed login attempts before they lock out the MID Server, configure the database credentials with a low order value.

Credential aliases

Credential aliases are available for *Discovery* and *Orchestration*.

Aliases for Discovery allow an administrator to:

- Employ a credential filtering behavior with configurable levels of compliance.
- Assign multiple credential aliases to a Discovery schedule.
• Prevent the creation of **credential affinities** that use inappropriate or sensitive credentials.

Aliases for Orchestration allow workflow creators to:
• Assign individual credentials to any activity in an Orchestration workflow
• Assign individual credentials to any action in Flow Designer
• Assign different credentials to each occurrence of the same activity type in an Orchestration workflow.
• Assign different credentials to each occurrence of the same action in designer flow.

**External credential stores**

If you do not want credentials stored in your instance, you can use external credential repositories. External credential stores save the credentials in an external site that your instance can access. **CyberArk** is the only supported external credential store. However, other external stores can be configured using the ServiceNow API.

**Create a Connection & Credential alias**

Define an alias to label a credential or connection record.
• The admin role is required to create an alias.
• The credential_admin and connection_admin roles have read access to the alias record.

The Connection & Credential alias defines an alias that labels a credential or connection record. The alias contains these fields:

1. Navigate to **Credentials & Connections > Connection & Credential Aliases**.
2. Click **New**.
3. Complete the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the alias. Can only contain alpha, number, and underscore characters. During an upgrade, the tag in the credential record migrates to a Connection &amp; Credential Alias. If the credential tag contains special characters other than alphabets, numbers, and underscores, the tag name is preserved after the upgrade. You can still use this migrated alias, but you cannot update the alias until you change the name to meet the naming restrictions.</td>
</tr>
<tr>
<td>ID</td>
<td>This field is based on the format <code>scope_name.alias_name</code>. The ID must be unique. If the scope is global, the ID is the alias name. For example, if you create a workday alias in global scope, the ID is set to <code>workday</code>. If you create a workday alias in the HR app scope, the ID is set to <code>x_hr_app.workday</code>.</td>
</tr>
<tr>
<td>Type</td>
<td>Select either Credential or Connection and Credential. The default is Connection and Credential.</td>
</tr>
<tr>
<td>Connection type</td>
<td>Select a connection type: Basic, HTTP, JDBC, JMS. The default is HTTP.</td>
</tr>
<tr>
<td>Support Multiple Active Connections</td>
<td>Define whether the alias supports multiple active connections. Add connections using the Connections table and associated them to the alias using the Connections related list.</td>
</tr>
<tr>
<td>Default Retry Policy</td>
<td>Select a retry policy. For more information, see <a href="#">Retry policy</a>.</td>
</tr>
</tbody>
</table>
4. Click **Save**.
The Connections and Connection Attributes related lists display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Template</td>
<td>The configuration information to create a connection and credential record.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Related list</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connections</td>
<td>Related connection records associated with this alias. After creating the alias, you can define connection records and associate them with the alias. If <strong>Support Multiple Active Connections</strong> is selected, you can associate more than one connection with an alias.</td>
</tr>
<tr>
<td>Connection Attributes</td>
<td>Define data specific to a connection and use it in an IntegrationHub integration step. For more information, see Create connection attributes for IntegrationHub.</td>
</tr>
</tbody>
</table>

5. Optional: If you want to create a new credential and connection associated with your credential alias, under **Related Links**, click **Create New Connection & Credential**.

The resulting connection and credential records are based on a pre-defined configuration template. See connection and credential configuration templates.

Create one or more connection records to associate with the alias. For more information about creating connections, see **Getting started with connections**. Add connection attributes to the alias to make connection meta data available to flows in Flow Designer.

**Credential aliases for Discovery**

Credential aliases for Discovery allow an administrator to use specific credentials on Discovery schedules. You can configure behaviors for your aliases that determine how strictly the system enforces their use.

Without credential aliases, Discovery schedules can access all credentials that are defined in the instance. This behavior might not be desirable in some circumstances, particularly for credentials with elevated privileges. Credential aliases provide more control over which credentials a Discovery schedule is allowed to use and prevents the unnecessary exposure of credentials with elevated privileges.

**How credential aliases work**

A **business rule** called **Insert Discovery Affinity & Cred Aliases** (previously named **Insert Discovery Affinity**), runs when a record is inserted into the ECC Queue. The business rule attaches the credential aliases defined in the Discovery schedule to the probe, so that the MID Server can perform credential filtering. The MID Server’s first task is to create the list of credentials to search. It filters the credentials by **affinity** and then by tags, if any exist. The affinities go to the top of the list, and the matching tags go to the bottom of the list. The MID Server iterates through the list until it finds a credential that works. The MID Server then creates an affinity for this credential.

If the business rule determines that an affinity exists for the device, the rule identifies the proper **credential_id** to use. This is the **sys_id** of the record in the Credentials [discovery_credentials] table. When the platform encounters an affinity with a credential alias value, defined as **credential_alias** in the business rule, the business rule determines whether or not the credential referenced by the affinity has the specified alias. If it does, the business rule selects the **credential_id** of the alias and passes that value to the MID Server. If the credential does not have the specified credential alias, any other affinities that exist for the target system are checked.
Create a Discovery credential alias

Create the alias and then add that alias to a credential in the credential record. You can add a credential to multiple aliases and add multiple credentials to a single alias.

Role required: admin, credential_admin (read access only), connection_admin (read access only)

A Discovery schedule only uses credentials that are contained in the aliases defined for that schedule.

1. Create an alias.
   a) Navigate to Connections & Credentials > Connection & Credential Aliases.
   b) Click New.
   c) Enter a unique name for the alias and select Credential for the alias Type.
   d) Click Submit.

   The Credentials related list appears. You can add new credentials for this alias in this list but not existing credentials.

2. Configure a credential for the new alias.
a) Navigate to **Connections & Credentials > Credentials**.

b) Select an existing credential from the list or click **New** to create a new credential.

c) In the credential record, unlock the **Credential alias** field and select the alias you created.

d) Save or submit the record.

3. **Return to** Connections & Credentials > Connection & Credential Aliases and open your new alias. The credential you attached to the alias now appears in the related list.
4. To create an additional credential for this alias, click **New** in the related list and select a credential type.
   
   The alias name is pre-populated in the **Credential alias** field of the credential record.

5. Complete the fields in the form and submit the record.

**Credential aliases for Orchestration activities**

Credential alias gives an administrator more control over the credentials used in Orchestration activities.

This is useful when an activity requires specific credentials to perform a task. You can use a credential tag to assign individual credentials to any activity in a Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow.

Credential alias interacts with **credential affinity** to determine which credentials should be used for an Orchestration activity.
How credential alias works

A business rule called Insert Discovery Affinity (renamed from Insert Credential Affinity in the Geneva release) runs when a record is inserted into the ECC Queue. This rule determines whether a credential affinity exists for the device and identifies the proper credential_id (the sys_id of the record in the Credentials [discovery_credentials] table) to use. When the platform encounters an affinity with a credential alias value defined (credential_alias in the business rule), the business rule determines if the credential referenced by the affinity has the specified alias. If it does, the business rule selects the credential_id of the credential alias and passes that value to the MID Server. If the credential does not have the specified credential alias, any other affinities that exist for the target system will be checked. If no affinity references an appropriately tagged credential, the MID Server iterates through the Credentials (discovery_credentials) table and selects the credential with the appropriate tag. The MID Server then creates a new affinity for this credential.

Create and test your credentials

Create and test the credentials that Discovery, Service Mapping, Cloud Management, and Orchestration require to access hardware and software in your network.

Role required: admin

This task contains general procedures for creating credentials. Refer to the documentation for your credential type for details on specific fields and requirements.

**Supported credential types**

<table>
<thead>
<tr>
<th>Applicative credentials</th>
<th>Basic authentication credentials</th>
<th>Chef server credentials</th>
</tr>
</thead>
<tbody>
<tr>
<td>CIM credentials</td>
<td>Cloud credentials</td>
<td>Infoblox credentials</td>
</tr>
<tr>
<td>JDBC credentials</td>
<td>JMS credentials</td>
<td>OAuth 2.0 credentials</td>
</tr>
<tr>
<td>SAP credentials</td>
<td>SNMP credentials</td>
<td>SSH credentials</td>
</tr>
<tr>
<td>VMware credentials</td>
<td>Windows credentials</td>
<td></td>
</tr>
</tbody>
</table>

1. Navigate to one of these modules:
   - Discovery > Credentials
   - Service Mapping > Credentials
   - Orchestration > Credentials

2. Click New.

3. On the Credentials page, click a link for the credential type and complete the form. Refer to the documentation for the credential type you selected for details.

   You can submit a credential record first and then test it later, or test the credential immediately before saving it.

   Credential testing is supported for these credential types:
   - SSH (including private keys)
   - Windows
   - SNMP (including v3)
   - VMware
   - JDBC
   - JMS
4. Under **Related Links**, click **Test credential**.

   **Note:** Credentials are encrypted at all times during the test.

5. Complete the fields in the Test Credential dialog box.

   ![Test credentials dialog box](image)

   **Test credentials dialog box**

### Credential test fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Credential type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target</td>
<td>Target host on which these credentials are run. This value must be an IP address for all credential types except VMware, which can be the host URL. You cannot target any MID servers.</td>
<td>All</td>
</tr>
</tbody>
</table>

   **Note:** For JMS, this is the provider URL. The information in this URL tells JNDI how to find and access the JMS Provider. An example value for connecting to ActiveMQ V5.1, is `tcp://ipAddressOrHostName:61616`.

<table>
<thead>
<tr>
<th>Port</th>
<th>Port on the target to use for this test. The system pre-populates this field with the default port for the selected credential type.</th>
<th>All</th>
</tr>
</thead>
<tbody>
<tr>
<td>MID Server</td>
<td>MID Server to use for this test. You must use a Windows MID Server to test Windows credentials. Only <strong>Up</strong> and <strong>Validated</strong> MID Servers are available.</td>
<td>All</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Credential type</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB Type</td>
<td>Type of database on which to test these credentials.</td>
<td>JDBC</td>
</tr>
<tr>
<td>DB Name</td>
<td>Name of the database on which to test these credentials.</td>
<td>JDBC</td>
</tr>
<tr>
<td>Initial Context Factory</td>
<td>Name of the JNDI class that is used to create the InitialContext. Using this <strong>Initial Context Factory</strong>, various JMS objects, such as JMS Connection, are created. For example, to connect to ActiveMQ V5.10, (JMS Provider), the value in this field would be <code>org.apache.activemq.jndi.ActiveMQInitialContextFactory</code></td>
<td>JMS</td>
</tr>
</tbody>
</table>

6. **Click OK** to begin the test.

An indicator appears, showing that the system is attempting to contact the target using the credentials you have provided. When the instance connects to the target it displays a success message. If the instance encounters a problem with the test inputs you have provided, it displays the appropriate error message. The following are some common error messages.

- Incorrect target or port number:

  ![TCP connection failure](image)

  **TCP connection failure**

- Incorrect user name or password:

  ![Authentication failure](image)

  **Authentication failure**

- Incorrect MID Server for Windows credentials:
7. Click **Retry** to open the test Credential dialog box and correct the input error.
8. When your credentials test is successful, click **Submit** to save the record.

**Important:** Testing credentials does not ensure that the credentials have the necessary privileges required for the intended Discovery or Orchestration workflow tasks.

**Ansible Tower credentials**

Ansible Tower credentials are required to access your Ansible configuration management account. Use these credentials to manage Ansible resources through the Cloud Management application. To integrate Cloud Management with the Ansible configuration management account, you need only to configure the user name and password for the administrator account in Ansible.

**Form fields for Ansible Tower credentials**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Provide a descriptive name.</td>
</tr>
<tr>
<td>User name/Password</td>
<td>Enter the authentication credentials for the Ansible Tower user with administrator rights.</td>
</tr>
</tbody>
</table>

**Note:** You do not need to configure the other fields.

**API key credentials**

An API key is a unique code that is passed in to an API to identify the calling application or user.

**API key credentials**

**API key credentials form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>API Key</td>
<td>Enter the API key.</td>
</tr>
</tbody>
</table>
Applicative credentials

Some applications require credentials in addition to the credentials that the host machine requires. Credentials required to access these applications are referred to as applicative credentials.

A typical credential contains a user name and a password for logging into a device or application. While most applications require only one credential for accessing them, sometimes hosts and applications have separate credentials for extra security. For example, ABAP SAP Central Services (ASCS) requires applicative credentials in addition to the SSH or Windows host credentials for the server that hosts ASCS.

**Note:** ServiceNow applications refer to devices and applications that comprise an application service as configuration items (CIs).

Just like with host credentials, you assign applicative credentials to MID Servers.

You create applicative credentials per CI type, for example, the CI type for ASCS is SAP ASCS Application (cmdb_ci_appl_sap_ascs). The preconfigured pattern for discovering CIs belonging to this CI type contains commands that require a MID Server to use the applicative credential for this CI type. If there is more than one credential configured for this CI type, the MID Server tries using these credentials in the order you define until it finds the credential that fits.

Check the Discovery requirements information in the ServiceNow documentation to determine if you need to configure applicative credentials for specific application CIs. There is no need to configure applicative credentials, if Discovery prerequisites do not mention it.
### Applicative credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>Name of the credential. Use a descriptive name like Oracle DB or London Oracle DB (for an Oracle database). Do not use spaces or special characters for the credential name.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Select the check box to use the credential.</td>
</tr>
<tr>
<td><strong>User name</strong></td>
<td>Enter the actual user name of the applicative credential.</td>
</tr>
<tr>
<td><strong>Password</strong></td>
<td>Enter the actual password of the applicative credential. Do not use spaces or special characters for the credential name.</td>
</tr>
<tr>
<td><strong>CI type</strong></td>
<td>Select a CI type to which the CI belongs.</td>
</tr>
<tr>
<td><strong>Credential alias</strong></td>
<td>Enter the table name for the CI type whose applicative credentials the application uses. Applications may use applicative credentials of a CI type different from their own.</td>
</tr>
<tr>

</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

## Basic authentication credentials

The basic authentication credential type manages access to store basic authentication credentials.

These fields are available in the Credentials form for basic authentication.

### Basic Auth credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential. For example, you might call it Basic Authentication.</td>
</tr>
<tr>
<td>User Name</td>
<td>Enter the user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for these credentials in the CyberArk external credential storage system. The credential ID may be used as a safe override when multiple safes are in use. By default, the syntax in the Credential ID field is this: <code>&lt;safe name&gt;:&lt;Credential ID&gt;</code>. If the safe name is omitted, there must be a safe name defined in the config.xml file. To change the separator character from the default colon to another character, override the value with the optional ext.cred.safe_name parameter. The Credential ID field has a limit of 40 characters. This field is only visible when the External storage check box is selected.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. Currently, the only supported external storage system is CyberArk.</td>
</tr>
</tbody>
</table>
### Chef server credentials

Chef server credentials access chef integrations with the instance.

These fields are available on the Credentials form for Chef server type credentials. This information comes from the settings you configured when you performed [Chef server installation](#).

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>Admin Name</td>
<td>Provide the administrator name that you created during Chef server installation.</td>
</tr>
<tr>
<td>Admin Key</td>
<td>Enter the RSA private key that the Chef server generated when you created the administrator.</td>
</tr>
<tr>
<td>Validator Name</td>
<td>Enter the validator.</td>
</tr>
<tr>
<td>Validator Key</td>
<td>Enter the RSA private key that the Chef server generated when you created an organization.</td>
</tr>
<tr>
<td>Cert Name</td>
<td>Enter the certification name.</td>
</tr>
<tr>
<td>Cert Key</td>
<td>Enter the certification key.</td>
</tr>
</tbody>
</table>

### CIM credentials

The CIM credential type manages access to a CIM server (also referred to as a CIMOM - Common Information Model Object Manager) for information about VMware ESX servers. This credential type is available for Discovery.

These fields are available in the Credentials form for CIM.

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. For CIM discovery, the user must have the admin role.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The Credential ID field has a limit of 40 characters. This field is only visible when the External credential store check box is selected.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow. To use the credential for discovering CIs not belonging to this CI type using Service Mapping and Discovery patterns, enter the table name for the CI type to which the CI belongs, for example cmdb_ci_apache_web_server. For more information, see Change credentials to non-default.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin is activated. Note: Currently, the only supported external storage system is CyberArk.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>MID servers</td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>
Configure NetApp storage devices for CIM credentials

NetApp storage devices require additional configuration in order for Discovery to explore them.

Role required: admin

1. Install the SMI-S agent on the storage device host. See the Data ONTAP SMI-S Agent 5.2 Installation and Configuration Guide for instructions and requirements.

   Note:
   ServiceNow does not maintain the documentation on this site. Be aware that this document can change without notice.

2. Create a user account and password for the SMI-S agent.
3. Create a credential record for the SMI-S agent credentials. Set the credential type to CIM.

Cloud credentials

Cloud credential types manage access to cloud-based applications, including Amazon Web Services and the Microsoft Azure cloud.

AWS Identity and Access Management (IAM) roles

If you have a MID Server installed on Amazon EC2 in an AWS cloud, and if that MID Server is configured to discover resources within the cloud, you can use security credentials provided by AWS Identity and Access Management (IAM) roles rather than credentials managed on your instance. These AWS credentials grant permissions in the cloud through an instance profile, based on roles. These credentials are temporary and rotate automatically on a configurable interval. When an IAM role is defined for the MID Server, Discovery ignores any credentials stored on the instance in favor of the credentials granted by the role in the instance profile. For more information on AWS instance profiles, see IAM Roles for Amazon EC2.

AWS credentials

AWS Credentials form

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for the AWS credentials.</td>

| Classification            | Enter the Application Classification for CI discovery.                     |
### Cloud Management (CMP) node credentials

Cloud Management (CMP) node credentials associate credentials for a virtual server that Cloud Management provisions. The Cloud Management application automatically creates these credentials.

**Note:** You might need to deactivate these credentials if you no longer want them used, change the order precedence, or select a MID Server that is allowed to access them. Otherwise, you do not need to manually create or modify this type of credential.

### CMP node credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The automatically generated name based on the datacenter where the virtual machine is located.</td>
</tr>
<tr>
<td>Active</td>
<td>If the credentials are active.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Choose whether this credential is available to a specific MID Server or all MID Servers.</td>
</tr>
<tr>
<td>Order</td>
<td>Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
<tr>
<td>User Name and Password</td>
<td>The virtual server user name and password.</td>
</tr>
<tr>
<td>SSH passphrase and SSH private key</td>
<td>The private key and the passphrase that protects the key if the virtual server requires it.</td>
</tr>
<tr>
<td>Authentication Protocol and Authentication Key</td>
<td>The private key and the passphrase that protects the key if the virtual server requires it.</td>
</tr>
<tr>
<td>Privacy Protocol and Privacy Key</td>
<td>The encryption protocol used with the virtual server and enter the privacy key.</td>
</tr>

SNMP credentials

Discovery explores many kinds of devices (switches, routers, printers, etc.) using the SNMP protocol. Credentials for SNMP do not include a user name, just a password, called the community string.

The default read-only community string for many SNMP devices is public, and Discovery will try that automatically. Enter the appropriate SNMP credentials if they differ from the public community string.

Discovering SNMP uses all community strings that are configured. This behavior does not apply to discovering SNMPv3.

The default Orchestration activity SNMP Query returns the object identifier (OID) of a device and requires SNMP credentials.

SNMP community credentials

The SNMP Community credential type manages access to discover many kinds of devices (switches, routers, printers, etc.) using the SNMP protocol. This credential type is available for Discovery, Service Mapping, and Orchestration.

Credentials for SNMP do not include a user name, just a password (the community string). The default read-only community string for many SNMP devices is public, and the system will try that automatically. Enter the appropriate SNMP credentials if they differ from the public community string.

These fields are available in the Credentials form for SNMP community.

**SSH credentials**

Discovery, Orchestration, and IntegrationHub explore UNIX and Linux devices by using SSH credentials to execute commands over Secure Shell (SSH). SSH commands must run with root privileges, either with root credentials or through the use of sudo.

**Privileged commands**

The platform provides default privileged commands for the MID Server to use and the ability to add additional commands to the system. For details about using sudo and other privileged commands, see [MID Server privileged commands](#).
Commands that require root privileges for Discovery, Orchestration, and IntegrationHub

These examples assume that the user name is **Disco**. Substitute the actual user name and ensure that the paths for the commands match the paths on the system.

**Note:** Sudo commands do not work with private key credentials, because there is no password to supply to the sudo command. A solution is to add the **NOPASSWD** option to the sudo configuration. For example, you might enter: `disco ALL=(root) NOPASSWD: /usr/sbin/dmidecode,/usr/sbin/lsof,/sbin/ifconfig`.

<tr>
<td></td>
<td>• <strong>Used by:</strong> Discovery</td>
</tr>
</tbody>
</table>
Command | Purpose
---|---
/usr/ucb/ps | Lists running process. As an alternative to running with root access, add a proc_owner role.

The use of the /usr/ucb/ps command is deprecated as of Solaris 11. Because Discovery, Orchestration, and IntegrationHub require the use of this command for all Solaris versions, you must install the ucb utility manually on Solaris 11 systems. For instructions, see KB0564262.

- /etc/sudoers line example: Disco ALL=(root) /usr/ucb/ps
- Used by: Discovery

For a list of privileged commands that you need for Discovery and Service Mapping, see Service Mapping commands requiring a privileged user for a list of the commands that require elevated rights to discover and map Unix-based hosts in your organization.

Granting root privileges

Use either of these approaches to allow users to run SSH commands with root privileges:

- Give root credentials. These are obviously the most powerful credentials, but may not be desirable from a security perspective. If Discovery, Orchestration, or IntegrationHub have the root credentials to any UNIX or Linux system, no further configuration is required.
- Give other credentials for Discovery, Orchestration, or IntegrationHub, but grant the user in those credentials the right to execute certain commands with root privileges, using sudo. This is a secure way to grant limited privileges. Discovery, Orchestration, or IntegrationHub use sudo on any probe that has the must_sudo parameter set to true (it defaults to false). However, each system must be configured to allow sudo to work. This is done by editing the /etc/sudoers file using the visudo command.

Access Requirements for Non-Root Credentials

If you do not provide Discovery with root access credentials, you must provide credentials with the following access requirements.

<table>
<thead>
<tr>
<th>Application</th>
<th>File or Directory</th>

</thead>
<tbody>
<tr>
<td>Order</td>
<td>Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

**SSH private key credential type**

*Note: SSH private key credentials provide better security than SSH password credentials.*

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique and descriptive name for this credential. For example, you might call it <strong>SSH Atlanta</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter a UNIX or Linux user name. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the UNIX or Linux password. For <strong>SSH Private Key</strong> type credentials, enter the sudo password if one is required for the user name.</td>
</tr>
<tr>
<td>SSH passphrase</td>
<td>Type a secure SSH passphrase. This field is available only for <strong>SSH Private Key</strong> credentials.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| SSH private key           | Enter a secure, private key that can be used instead of a password for SSH logins. The private key must be entered in the proper format to ensure it is correctly encrypted. The private key must start with the string -----BEGIN. Here is an example of a correctly formatted private key:  
   -----BEGIN RSA PRIVATE KEY-----
   MIIEogIBAAKCAQEAsEK65scPssPSobpDFMpR+Btv3MS4Q7NP8ERaStRZsh31Wz+x...  
   ...?hrxV2dbSug60FahyupGWBGtPnXm5PaE2X5WPLuUj9-----END RSA PRIVATE KEY-----
   The Now Platform supports private keys in the PEM format generated by the OpenSSH ssh-keygen utility. To convert PPK keys that were generated by PuTTY:  
   - Open your private key in PuTTYGen.  
   - Export it in OpenSSH format from the menu Conversions > Export OpenSSH key.  
   - Save the new OpenSSH key. |
| Credential alias          | • Allow flow designers to use aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection. For more information, see Credentials and connection information.  
   • Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow. |
| External credential store | Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. Currently, the only supported external storage system is CyberArk. |
| MID servers               | Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field. |
### VMware credentials

The VMware credentials type manages access to vCenter credentials. Applications that access VMware cloud resources need access to VMware credentials. For example, the VMware credential type allows Discovery to explore VMware’s vCenter running on a Windows machine to discover ESX machines, virtual machines, and resource pools. The VMware Discovery and automation API (vCenter API) now provides the globally unique serial number for computer CIs. CIM credentials are not needed to allow access to each VMware host.

**Note:** Windows credentials are not necessary for vCenter Discovery, when valid VMware credentials are used.

**Important:** Do not use VMware Type credentials for Orchestration activities that perform work on the individual virtual machines cloned by vCenter (for example, restarting a Linux VM). For these activities, the credential Type depends on the operating system of the virtual machine (either SSH or Windows).

#### VMware credentials form

If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

**Windows credentials**

Windows credentials provide access to Windows computers. This credential type is available for Discovery and Orchestration.

**Credential requirements**

Discovery and Orchestration have the following requirements for Windows credentials:

- Install a MID Server on a Windows host as a service.
- Add Windows credentials to one of these locations:
  - An entry in the Credentials [windows_credentials] table
  - A MID Server service account to run as a specific Windows user or domain account.

**Granting proper permissions**

To provide sufficient permissions, Windows credentials must be one of the following:

- A domain user with local administrator access on the target Windows hosts.
- A local account that has administrator privileges and User Access Control (UAC) disabled on the same target host.
- A user who meets the requirements of Windows probes and permissions (Discovery only).
- A user who meets the requirements of the Orchestration activity to be run (Orchestration only).

**Workgroup computers**

To run Powershell commands to discover a Workgroup computer, configure the MID Server credentials for either of these users:

- Built-in administrator account on the Workgroup computer.
- Domain user on the Workgroup computer.
Multi-domain configuration

To enable Windows credentials to function across multiple domains, make sure to use the correct name formats and MID Server configuration.

Discovery and Orchestration support Windows domain credentials in both User Principal Name and Down-Level Logon Name user name formats. For example, Domain\UserName or UserName@example.domain.com. You can provide Windows workgroup credentials in the following format: WORKGROUP\UserName.

**Note:** You can also provide a local account by using the \ user name.

These additional actions are required to enable credentials to function across multiple Windows domains.

Windows credentials type

These fields are available in the Credentials form for Windows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique and descriptive name for this credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable these credentials for use.</td>
</tr>
<tr>
<td>User name</td>
<td>Enter the user name to create in the Credentials table. Avoid leading or trailing spaces in user names. A warning appears if the platform detects leading or trailing spaces in the user name. For CIM discovery, the user must have the admin role.</td>
</tr>
<tr>
<td>Password</td>
<td>Enter the password.</td>
</tr>
<tr>
<td>Credential ID</td>
<td>Enter the unique key configured for external credentials in the JAR file uploaded to the MID Server for an external credential system. The <strong>Credential ID</strong> field has a limit of 40 characters. This field is only visible when the <strong>External credential store</strong> check box is selected.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Allow workflow creators to assign individual credentials to any activity in an Orchestration workflow or assign different credentials to each occurrence of the same activity type in an Orchestration workflow. To use the credential for discovering CIs not belonging to this CI type using Service Mapping and Discovery patterns, enter the table name for the CI type to which the CI belongs, for example cmdb_ci_apache_web_server. For more information, see Change credentials to non-default.</td>
</tr>
<tr>
<td>External credential store</td>
<td>Select this check box to use an external credential storage system. When you select this option the User name and Password fields are replaced with the Credential ID field. External credential storage is only available when the External Credential Storage plugin in activated. <strong>Note:</strong> Currently, the only supported external storage system is CyberArk.</td>
</tr>
<tr>
<td>Applies to</td>
<td>Select whether to apply these credentials to All MID servers in your network, or to one or more Specific MID servers. Specify the MID Servers that should use these credentials in the MID servers field.</td>
</tr>
<tr>
<td>MID servers</td>
<td>Select one or more MID Servers from the list of available MID Servers. The credentials configured in this record are available to the MID Servers in this list. This field is available only when you select Specific MID servers from the Applies to field.</td>
</tr>
<tr>
<td>Order</td>
<td>Order (sequence) in which Discovery tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order.</td>
</tr>
</tbody>
</table>

**Configure Windows credentials for the MID Server**

Configure the MID Server to use either the credentials of its own Windows service or credentials from the Credentials (discovery_credentials) table.

Role required: admin

1. Configure the MID Server to use credentials from the MID Server service account.
   a) Set the MID Server service account to a user who meets the permission requirements.
b) Verify the user name meets the name format requirements.
c) Fill in the fields on the form, as appropriate.
d) Verify the credentials meet domain requirements.

2. Configure the MID Server use credentials from the Credentials (discovery_credentials) table.
a) Add individual Windows credentials to the Credentials [windows_credentials] table.
   • Verify each credential meets the permission requirements.
   • Verify each username meets the name format requirements.
   • Verify each credential meets the Windows domain requirements.

b) (Optional) Configure the MID Server to use Powershell by setting the mid.use_powershell parameter to true. See MID Server Configuration.
c) (Optional) By default, Discovery automatically uses the MID Server service account credentials if all credentials in the Credentials table fail. If you do not want to use the MID Server service credentials as a fall back, set the mid.powershell.local_mid_service_credential_fallback parameter to false.

Credential affinity for Discovery and Orchestration

Credential affinity is an association between a set of credentials and a device on your network. When Discovery or Orchestration first attempts to access a device, they try all available credentials until they find the correct ones. After identifying the credentials for a device, Discovery and Orchestration create an affinity between the credentials and the device using the Credential Affinity [dscy_credentials_affinity] table. All subsequent discoveries or Orchestration activities attempt to match the credentials in this table with a device for which an affinity exists. If credentials for a device change, Discovery and Orchestration try all available credentials again until they create a new affinity.

Note: If Orchestration and Discovery are installed, and credential alias is enabled, multiple affinities can exist. In this case, the platform looks up credentials for each affinity and inserts the credential for the affinity with the lowest order into the probe.
Credentials troubleshooting

Review the `<credentials_debug>` section of the ECC queue payload to troubleshoot issues with credentials.

Certain probes support credential debugging. Credential debugging inserts a `<credentials_debug>` section in the payload that the MID Server returns to the instance ECC queue. You can view the `<credentials_debug>` section to see detailed information about the credential lookup.

The `<credentials_debug>` section appears in the payload if:

- Credentials fail for WMIRunner probe, PowerShell probe, JMS, or SSHCommand probe.
- You set the `credentials_debug` parameter to true for the WMIRunner, PowerShell, or SSHCommand probes. If you set the parameter to true, the `<credentials_debug>` section appears even if the credential lookup is successful.

The `<credentials_debug>` section shows:

- Information about the credential search, such as the credential types, tags, and affinities.
- The IP address targeted.
- Information about each credential (in order) that the MID Server used, including the type, classification, tag, name, Sys ID, and external credential ID if present.
Sample payload showing invalid credentials

Details appear for the PowerShell parameter:

- If the local MID Server credentials were used after all the Windows credentials failed.
- If the credentials were skipped because you are trying to discover the same machine that the MID Server is on.
- If the `mid.powershell.use_credentials` parameter is set to `true`.

Details appear for the SSHCommand:

- If the credential search was skipped because the target IP is blacklisted.
- If the target IP was added to the blacklist.
**Note:** The MID Server saves IP addresses for failed credential searches in a blacklist in cache memory. This blacklist specifies which devices the MID Server should stop trying to access. IP addresses are added to the blacklist after every credential has failed. The IP addresses are cleared from the blacklist cache either after five minutes, if the MID Server is restarted, or if the credential records on the instance are updated.

### External credential storage

An instance can store credentials used by Discovery, Orchestration, and Service Mapping in an external credential repository rather than directly in a ServiceNow credentials record.

The instance maintains a unique identifier for each credential, the credential type (such as SSH, SNMP, or Windows), and any credential affinities. The MID Server obtains the credential identifier from the instance, and then uses a customer-provided JAR file to resolve the identifier from the repository into a usable credential. Currently, the ServiceNow® platform supports the use of the *CyberArk vault* for external credential storage.
External credential storage architecture
Credential process flow

The MID Server retrieves credentials from an external store using this process:

1. MID Server downloads credential objects from the ServiceNow Credentials (discovery_credentials) table that contain the corresponding credential ID from the target vault.
2. MID Server checks to see if there are probes to execute from Discovery or Orchestration jobs.
3. MID Server determines if the relevant credentials, such as SSH, Windows or SNMP, are available for the specified probe target. If not, the MID Server uses the Credential Resolver JAR to make a call to the vault to get the actual user name and password. The details about the correct credential object to retrieve from the vault are determined by the Credential Resolver JAR file. Information such as credential ID, target IP address, or credential type are available to the JAR file. If a credential has been retrieved from a previous probe, the credential is cached and is not retrieved again, unless the MID Server is restarted or specifically directed to flush the credential cache.
4. MID Server executes the probe with the appropriate credential.

Note: Credential affinity still applies. The mechanism remains the same, since the only real difference from the MID Server’s perspective is that the real credential details (user name and password) come from the third party vault.

External credential storage log

The MID Server posts log messages about external credential storage.

If the repository encounters an error while attempting to resolve a credentials request, the MID Server posts log messages with this prefix: `Problem with client's CredentialResolver:

Components installed with External Credential Storage

Business rule

The External Credential Storage business rule performs the following tasks when an administrator makes any change to the external credential storage property:

- Changes the view for the Credentials record list and form to the External Storage view. This view enables users to to see the Credential ID column in the list.
- Instructs the MID Server to refresh its credentials cache in preparation for a change in the way credentials are obtained.

Property

A property called Enable External Credential Storage (com.snc.use_external_credentials) enables or disables the External Credential Storage plugin after it is activated. The property is located in Discovery Definition > Properties and Orchestration > MID Server Properties, and is enabled when you activate the plugin.

If you disable external credential storage with the system property, the system automatically sets all the external credentials to inactive in the instance. If you re-enable the feature with this
property, the system does not reset the external credential records to active. You must reactivate each credential record manually.

**Request external credential storage for Discovery and Orchestration**

The External Credential Storage plugin is available by request.

Role required: admin

There are two ways to request a plugin:

- Access the HI Service Catalog directly by clicking **Service Catalog > Activate Plugin** on HI.
- Access the HI Service Catalog through the All Applications page on your instance by following these steps.

1. From your instance, navigate to **System Definition > Plugins**.
2. On the All Applications page, click **Request Plugin** to open the request form on HI.
3. On HI, select to be redirected to the HI Service Portal Service Catalog.
4. On the Activate Plugin request form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>Date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify it in the comments.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches each business day in the Pacific time zone, once in the morning and once in the evening. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

5. Click Submit.

**External credential storage configuration**

Configure your instance to obtain credentials from a remote repository.

These procedures assume that you already have an external repository configured with the credentials you want to protect. The credential identifier configured in the ServiceNow instance must be mapped to the actual credential in the repository through the JAR file.

To configure External Credential Storage, complete the following tasks in order.

*Create a JAR file to resolve credentials*
Create a JAR file to resolve credential identifiers sent from the MID Server into actual credentials from the repository.

Make sure to include all the credential elements that the instance expects, such as the private key.
To create a JAR file to resolve credentials:

Use this sample Java file as a template:

**Caution:** This sample is intended as a template only. Do NOT use this code in production without modifying it for your environment.

```java
package com.snc.discovery;

import java.util.*;
import java.io.*;

/**
 * Basic implementation of a CredentialResolver that uses a properties file.
 */

public class CredentialResolver {

    private static String ENV_VAR = "CREDENTIAL_RESOLVER_FILE";
    private static String DEFAULT_PROP_FILE_PATH = "C:\dummycredentials.properties";

    // These are the permissible names of arguments passed INTO the resolve() // method.
    // the string identifier as configured on the ServiceNow instance...
    public static final String ARG_ID = "id";
    // a dotted-form string IPv4 address (like "10.22.231.12") of the target // system...
    public static final String ARG_IP = "ip";
    // the string type (ssh, snmp, etc.) of credential as configured on the // instance...
    public static final String ARG_TYPE = "type";
    // the string MID server making the request, as configured on the // instance...
    public static final String ARG_MID = "mid";

    // These are the permissible names of values returned FROM the resolve() // method.
    // the string user name for the credential, if needed...
    public static final String VAL_USER = "user";
    // the string password for the credential, if needed...
    public static final String VAL_PSWD = "pswd";
    // the string pass phrase for the credential if needed:
    public static final String VAL_PASSPHRASE = "passphrase";
    // the string private key for the credential, if needed...
    public static final String VAL_PKEY = "pkey";
    // the string authentication protocol for the credential, if needed...
    public static final String VAL_AUTHPROTO = "authprotocol";
    // the string authentication key for the credential, if needed...
```
public static final String VAL_AUTHKEY = "authkey";

// the string privacy protocol for the credential, if needed...
public static final String VAL_PRIVPROTO = "privprotocol";

// the string privacy key for the credential, if needed...
public static final String VAL_PRIVKEY = "privkey";

private Properties fProps;

public CredentialResolver() {
}

private void loadProps() {
    if(fProps == null)
        fProps = new Properties();

    try {
        String propFilePath = System.getenv(ENV_VAR);
        if(propFilePath == null) {
            System.err.println("Environment var "+ENV_VAR+" not found. Using
default file: "+DEFAULT_PROP_FILE_PATH);
            propFilePath = DEFAULT_PROP_FILE_PATH;
        }
        File propFile = new File(propFilePath);
        if(!propFile.exists() || !propFile.canRead()) {
            System.err.println("Can't open "+propFile.getAbsolutePath());
        } else {
            InputStream propsIn = new FileInputStream(propFile);
            fProps.load(propsIn);
        }
        //
        fProps.load(CredentialResolver.class.getClassLoader().getResourceAsStream("dummycredentials.properties"));
    } catch (IOException e) {
        System.err.println("Problem loading credentials file:");
        e.printStackTrace();
    }
}

/**
 * Resolve a credential.
 */
public Map resolve(Map args) {
    loadProps();
    String id = (String) args.get(ARG_ID);
    String type = (String) args.get(ARG_TYPE);
    String keyPrefix = id+"."+type+".";

    if(id.equalsIgnoreCase("misbehave"))
        throw new RuntimeException("I've been a baaaaaaaad CredentialResolver");

    // the resolved credential is returned in a HashMap...
    Map result = new HashMap();
    result.put(VAL_USER, fProps.get(keyPrefix + VAL_USER));
    result.put(VAL_PSWD, fProps.get(keyPrefix + VAL_PSWD));
    result.put(VAL_PKEY, fProps.get(keyPrefix + VAL_PKEY));
    result.put(VAL_PASSPHRASE, fProps.get(keyPrefix + VAL_PASSPHRASE));
    result.put(VAL_AUTHPROTO, fProps.get(keyPrefix + VAL_AUTHPROTO));
    result.put(VAL_AUTHKEY, fProps.get(keyPrefix + VAL_AUTHKEY));
    result.put(VAL_PRIVPROTO, fProps.get(keyPrefix + VAL_PRIVPROTO));
result.put(VAL_PRIVKEY, fProps.get(keyPrefix + VAL_PRIVKEY));

System.err.println("Error while resolving credential id/type\["+id + "+\]+type]+\])");

return result;
}

/**  
 * Return the API version supported by this class.  
 */
public String getVersion() {
    return "1.0";
}

public static void main(String[] args) {
    CredentialResolver obj = new CredentialResolver();
    obj.loadProps();

    System.err.println("I spy the following credentials: ");
    for (Object key: obj.fProps.keySet()) {
        System.err.println(key+: "+obj.fProps.get(key));
    }
}

**Import a JAR file to resolve credentials**

Import a JAR file created to resolve credential identifiers sent from the MID Server into actual credentials from the repository.

After you *create the JAR file*, import it into the instance, where it becomes accessible to the MID Server.

1. After creating the JAR and properties files, copy the properties file to the MID Server.
2. Navigate to MID Server > JAR Files.
3. Click New.
4. Complete the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A unique and descriptive name for identifying the file in the instance.</td>
</tr>
<tr>
<td>Version</td>
<td>A version number for the file, if one is available.</td>
</tr>
<tr>
<td>Source</td>
<td>Location of the JAR file for reference purposes. Source information is not used by the system.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the JAR file and its purpose in the instance.</td>
</tr>
</tbody>
</table>

5. Click the paper clip icon in the banner and attach the JAR file to the record.
Attaching a JAR file

6. Click Submit.
7. Restart the MID Server service.
   The platform makes the JAR file available to any MID Server configured to communicate with
   the instance.

Configure the credential identifier
Configure the credential identifier in the instance.
Role required: admin
Verify the following items:

- The External Credential Storage plugin must be active.
- The Enable External Credential Storage Discovery property is enabled.

1. Navigate to Discovery > Credentials or Orchestration > Credentials.
2. Click New.
3. Select a credential type.
4. Select the External credential store check box.
   The User name and Password fields disappear, and the Credential ID field appears.
5. Complete the Credentials form using the fields from the table.
6. Click Submit.
