**Now Platform administration**

The Now Platform® is an application platform as a service that automates business processes across the enterprise. The Now Platform provides the infrastructure to help your organization develop, run, and manage applications.
**Provide a single system of engagement for the enterprise**

Use the Now Platform to deliver a common set of core capabilities and reusable components to the entire enterprise rather than individual departments or functions. Use the core capabilities to eliminate data silos by sharing information within a single data model. Extend the data model with a flexible table schema and reusable components.

View and download the full infocard for a highlight of Now Platform administration features.

<table>

<td>Prevent silos by sharing data across the enterprise from your instance. Extend the data model with a flexible table schema.</td>
</tr>
<tr>
<td><strong>Provide reliable and secure cloud services</strong></td>
<td>Provide reliable service from multi-instance cloud services. Secure data and communications with encryption.</td>
</tr>
</tbody>
</table>
Deliver a common set of core capabilities

The Now Platform supports your apps, business requirements, and workflows. With the Now Platform, you can configure global settings for the entire platform or specific applications.
Eliminate silos with a single data model
With the Now Platform, you can eliminate silos by sharing data between applications and departments. You can also configure and extend your data model with a flexible table schema.
Provide reliable and secure cloud services
The Now Platform meets your performance, reliability, privacy, and compliance requirements. With the cloud services of the Now Platform, you can ensure that your data is always secure, with each new release offering new security properties.

- Metrics
- Platform performance
- Platform security
- Search administration
- State Management
- System localization
- Table administration
- Time configuration
- Upgrades and conversions
- User administration

Core configuration

Core configuration encompasses changes made to the platform as well as supporting applications. These changes can affect global settings as well as settings for particular applications.

These settings include:

- Form administration and lists: change the behavior and appearance of forms and lists.
- Navigation and UI and search: configure how users browse and search in the platform.
- Time and performance: keep your organization running and on time.
- Localization and mobile device support: take the platform anywhere.
- Plugins and out-of-box appendix: expand the platform to fit your needs.
ServiceNow plugins

Plugins are software components that provide specific features and functionalities within a ServiceNow instance.

Activating plugins

If a plugin is not active by default on the Now Platform, you can activate it from the All Applications list in your instance. For more information, see Activate a plugin.

If you cannot find a plugin in the All Applications list for activation, the plugin may require activation by ServiceNow personnel. To get a plugin activated by ServiceNow personnel, follow the steps in Request a plugin.

Some plugins require a paid subscription before activation. To purchase a subscription, contact your ServiceNow account manager. When you purchase a subscription, certain plugins are activated automatically. If a paid plugin isn't activated automatically, you can manually activate it from the All Applications list in your instance. If the plugin doesn't appear in the instance, submit a request via the Now Support Service Catalog.

For more information on plugins that are associated with paid subscriptions, see View subscription applications and plugins.

**Note:** After a plugin is activated, you cannot disable or deactivate it. If needed, you can hide the functionality. You should thoroughly test, in a non-production instance, the specific features and functionalities that are installed when you activate the plugin before using them in a production instance.

Relationships between plugins

Some plugins depend on other plugins being activated.

Sometimes, a plugin cannot work at all unless one or more other plugins are installed. When you activate a plugin with dependent plugins, the system notifies you of the dependencies before it completes the activation. If you opt to continue with activation, the system automatically activates all the plugins required.

In other cases, the plugin works, but certain features that do not apply to your system are not installed. When you ask to activate a plugin in this category, the system notifies you of the dependencies before it completes the activation. If you opt to continue, the system activates the requested plugin but does not include the features that depend on other plugins.

Personal developer instances

You can test a plugin on your personal developer instance (PDI) before launching it in a production instance. If a plugin isn't active by default on a PDI, you can activate the plugin without requesting or purchasing it.

To activate a plugin on a PDI, use the All Applications page on your instance. If the plugin isn't available on the All Applications page, activate it from the . For more information, see Activate a plugin on a personal developer instance.

**Note:** Some plugins aren't available for activation on PDIs.

Activate a plugin

You can activate most plugins to expand features and functionalities in the Now Platform.

Role required: admin

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar. You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.

3. Click Install, and then in the Activate Plugin dialog box, click Activate.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### Activate a plugin on a personal developer instance

You can test a plugin on your personal developer instance (PDI) before launching it in a production instance.

Request a PDI on the ServiceNow® Developer Site.

If a plugin isn't active by default on a PDI, you can activate the plugin without requesting or purchasing it.

To activate a plugin on a PDI, use the All Applications page on your instance. If the plugin isn't available on the All Applications page, activate it from the .

**Note:** Some plugins aren't available for activation on PDIs.

Activate the plugin from the All Applications page or the Developer Site.

<table>
<thead>
<tr>
<th>Activation method</th>

Request a plugin

If a plugin does not appear on the All Applications page, you cannot activate it yourself. Request activation of the plugin by ServiceNow personnel.

Role required: admin

There are two ways to request a plugin:

• Access the Now Support Service Catalog directly by clicking Service Catalog > Activate Plugin on Now Support.
• Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

Watch this one-minute video to learn more about using the HI Service Catalog to request plugins.

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click **Request Plugin** to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

<table>
<thead>
<tr>
<th>Activate Plugin</th>
</tr>
</thead>
<tbody>
<tr>
<td>In order to enhance the user experience, we have redesigned Activate a Plugin service catalog. Please use the new HI Service Portal 'Activate a Plugin' service catalog item. You can also use Manage Instances page on Service Portal to Activate a Plugin.</td>
</tr>
<tr>
<td>Take me to the HI Service Portal Activate a Plugin Service Catalog.</td>
</tr>
</tbody>
</table>

4. On the form, fill in the fields.

**Activate Plugin request form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments. |

5. Click **Submit**.

**List of plugins (Quebec)**

List of all plugins that you can activate if you have the admin role.

If a plugin does not appear on this list, it may require activation by ServiceNow personnel. Request these plugins through the Now Support Customer Service System instead of activating them yourself.

- For steps on activating a plugin yourself, see **Activate a plugin**.
- For steps on requesting a plugin that you cannot activate yourself, see **Request a plugin**.

**Note:** For a list of all new and changed plugins for this release, see Changes to plugins in the Quebec release.

| Change Management - Core       | com.snc.change_management   | Core change management plugin which both Change Management State Model and Standard Change Catalog plugins depend on. This plugin updates the **Type** field on Change Request to have the values **Normal**, **Standard**, and **Emergency**. The Type value on existing Change Requests is updated:  
  • Routine  
    com.glide.context_help-> standard  
    (Standard)  
  • Comprehensive  
    -> normal  
    (Normal)  
  • Emergency  
    -> emergency  
    (Emergency)  
When creating a Change Request, an interceptor prompts you for the type of Change you want to create. | Active | true                      | • com.snc.change_request  
• com.snc.change_collision     |

### Find components installed with an application

Activating a plugin installs an application on your instance. Each application consists of components such as tables, user roles, and scheduled jobs. To view all components that are installed with an application, see the Application Files table.

- The application plugin must be activated.
- Roles required: admin or the application admin role

**Note:** The application admin role is only required for applications that use the Application administration feature. For example, Vulnerability Response.

In the Application Files table, look up the components that are installed with the plugin for the application. If the application comprises multiple plugins, look up each plugin individually.

1. In the navigation filter, enter: `sys_metadata.list`
   The list of Application Files records is displayed.
2. Click the personalize list icon
   ![Personalize list icon](image)
   and add the **Package** column to the list.
3. Filter the list with these conditions to show only the components for the plugin:
   ```plaintext
   [Package] [is] [<plugin name>]
   ```
4. In the **Class** column heading, click the menu icon
   ![Menu icon](image)
   and select **Group by Class**.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>ID</th>
<th>Description</th>
<th>State</th>
<th>Has Demo Data?</th>
<th>Dependencies</th>
</tr>
</thead>
<tbody>
<tr>
<td>XTM Translation Management System Spoke for Localization Framework (New in Quebec)</td>
<td>com.glide.localization_framework.xtm_spoke</td>
<td>Integrates Localization Framework with the XTM - Translation Management System. To activate this plugin, install the Localization Framework Installer plugin.</td>
<td>Active</td>
<td>false</td>
<td>com.glide.localization_framework</td>
</tr>
</tbody>
</table>
5. Select the class of information that you want to view.

For example, click **Class: Business Rule** to view all business rules installed with the application.
Using guided setup

Use guided setup to step through the initial configuration of any product or application that provides a Guided Setup module. Guided setup assists you with planning the roll-out of the product and performing the basic configuration to go live.

Guided setup organizes configuration activities into categories. Each category provides information, such as planning guidance, pre-setup steps, and links to useful help content. Categories also provide a set of links to the pages in your instance where you perform the configuration. The guided setup process keeps track of what you have completed, so you can stop and start again where you left off.

Guided setup home page

The home page for most guided setup modules contains an overview and descriptions of the categories and associated tasks. You can click either the home icon or the Get Started button to open the guided setup steps and begin configuration. Click the home icon on the left to return to this page.
Example layout of the guided setup home page
Guided setup categories page

1. Completion indicator

2. Get Started

3. In progress

4. Not started
The completion indicator shows all progress through guided setup steps at a glance. Each circle represents a category and its status.

- Empty circle: The task is not started.
- Circle with a lock: Feature is not activated. You can look at the setup tasks, but not perform them.
- Partial blue border: The percentage of tasks that are complete.
- Circle with curved arrow: Activity tasks were skipped.
- Green circle with check mark: Activity tasks are completed.

Point your cursor at any circle to see what it represents. The percentage at the top is updated as tasks are completed.

2. Category task completion status

For each category, you can view its completion status, which matches its indicator to the left. You can start or continue working on tasks, or edit the statuses of completed tasks.

3. Category information

The category name and description appear. The description often includes further planning information and links to additional content to help you with configuration.

4. Tasks

Lists the tasks and completion status for each activity. Click a task to go to the tasks for that category (same as clicking an action in the second column).

Use the filter above the task list to display only complete or incomplete tasks, as desired.
Guided setup task page

2 / 5 Tasks completed

Task 1
Completed just now by System Administrator

Task 2
Completed just now by System Administrator

Sub-task 1

Sub-task 2

Task 3
Last visited 1m ago by System Administrator
To perform a task, click the **Configure** button. This button opens the page in your instance where the configuration is completed. Embedded help is often available to assist you. If it does not open automatically, click the (?) icon on the upper right.

Other actions you can take include:

- **Breadcrumb**: Click `<Product> Guided Setup` to go back to the categories page.
- **Assign** (upper right): Provides a way to assign tasks to other administrators. All tasks in the category can be assigned to a single admin or each can be assigned individually. The list only displays users with the admin role. When a task is assigned, the admin receives a notification to the email address in their user file.
- **Accept Best Practices**: Click this action if the link appears. Accepting best practices completes some or all of the tasks for that category.
- **Skip**: Click to skip a task if it does not apply to your business process, or you want to implement the feature later.
- **Add Notes**: Click to comment the task, such as stating how far you got before you had to exit. Notes can help another administrator who continues the work.
- **Mark as Complete**: Click this button when the configuration was completed outside of guided setup. After a task is marked complete, the button changes to **Mark as Incomplete**, allowing you to start the task over.
- **More information**: Click this link to read more about the task. The page refreshes with more informative content to help you with the configuration. To return, click the category name in the breadcrumb.

Some tasks have subtasks, represented by tabs below the task information. Task 2 in the illustration is an example of a task with subtasks.

**Other guided setup features**

**Lock icon**

When it appears in front of an activity, task, or subtask, you cannot access the item. You may need to activate a plugin or complete a prerequisite task to unlock it.

**Unlock by activating plugins**

When a category is locked because the associated plugin is inactive, click the **View Plugins** link to see the details in a pop-up window.

**Action buttons**

After beginning guided setup tasks, **Get Started** buttons are changed to **Continue** buttons. Other action buttons change to prompt you to continue with or edit completed tasks.

**Task status and time stamp messages**

Below each task in a task page is a status message. It indicates when the task was last visited or completed and the user who took the action.

**Using Conversational Interfaces Guided Setup**

Use the Conversational Interfaces Guided Setup to create a personalized setup process for just the conversational interface features you need. The Conversational Interfaces Guided Setup starts with a survey and creates a personalized task list based on your survey responses.

Role required: admin
The system admin role is required to activate the plugins and store applications. However, AWA_admin and VA_admin can complete additional setup tasks for their respective solutions.

1. **Navigate to** Guided Setup > Conversational Interfaces Guided Setup.
   
The Conversational Interfaces Guided Setup screen appears.

   ![Conversational Interfaces Guided Setup screen](image)
2. Select **Get Started**.

The Customize Conversational Interfaces Experience > Get started screen appears.
3. On the Get started screen, select **Configure**.

The Customize Conversational Interfaces Experience screen appears.

Let's walk you through the steps you need to take to get your agents chatting.

Once you select which conversational experiences you want to set up, we'll give you specific tasks to complete your setup. [Learn more](#).

The **Workspace Agent Chat** experience allows live agents to communicate with your customers and is available for all subscriptions. The **Virtual Agent** experience uses automated conversations to quickly help your customers.

Select the conversational experiences from your subscription to get your setup steps.

- [ ] Workspace Agent Chat
- [ ] Virtual Agent for Customer Service Management (CSM)
- [ ] Virtual Agent for HR Service Delivery (HR)
- [ ] Virtual Agent for IT Business Management (ITBM)
- [ ] Virtual Agent for IT Service Management (ITSM)
- [ ] Virtual Agent for Instance Security Center (ISC)
4. Complete the survey to generate your personalized list of setup tasks. Choose from:
   - To generate a personalized list of setup tasks, select the solutions you want to activate and configure from the following options:
     a. Workspace Agent Chat
     b. Virtual Agent for Customer Service Management (CSM)
     c. Virtual Agent for HR Service Delivery (HR)
     d. Virtual Agent for IT Business Management (ITBM)
     e. Virtual Agent for IT Service Management (ITSM)
     f. Virtual Agent for Instance Security Center (ISC)

     The preceding Virtual Agent options include predefined chatbot conversations designed to help your users complete common tasks per workflow. For instance, Virtual Agent for IT Service Management includes conversations to support resetting a password and creating an incident.

     Next, select **See my Steps**.
     - To view the full list of every possible setup task for every solution option, select **Skip and see all steps**. You will have access to configure all solution options in your sub-production environment for testing purposes. However, you may not have access to or activate certain solution options unless you licensed for such options.

     **Note:** Make sure to pay attention to steps with asterisks in the title as well as notes within the steps that explain required plugins and store applications prerequisites.

     To learn more about the general guided setup solution, see **Guided Setup**.

**Domain separation and Guided Setup**

Domain separation is unsupported for Guided Setup. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Support level: No support**

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information, see **Application support for domain separation**.
Available system properties

Some properties are available on a system properties form, but some lesser-used properties are available only from the System Property [sys_properties] table. Sometimes, the property does not exist in a base instance, but can be added if you change the value.

Note: The Instance Security Hardening Settings content contains detailed descriptions, and compliance values, for the security-related system properties and plugins in the. To learn more about each of these properties, see Instance Security Hardening Settings.

cdu.record.watcher.timeout

Maximum waiting period for the Cloud Discovery schedule configuration wizard to stop watching the record watchers while validating account, member account Discovery, and logical database Discovery.

• Type: integer
• Default value: 120,000 milliseconds
• Location: System properties

com.cmdb.baseline.max_changes

Maximum number of changes and relationships for a CI that can appear in the baseline diff for the CI.

• Type: integer
• Default value: 100
• Location: Configuration > CMDB Properties > Baseline Properties

com.glide.attachment.max_size

Sets the maximum file attachment size in megabytes. A blank value in this field allows attachments up to a maximum of 1 KB.

• Type: integer
• Default value: 1024
• Location: System Properties > Security

com.glide.csv.loader.ignore_non_parseable_lines

Enables (true) or disables (false) ignoring one or more lines (rows) in an import set that contains bad data, such as a row that is missing a column of data.

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

com.glide.csv.loader.max_errors_allowed

Sets the maximum number of lines (rows) that an import can ignore before failing. If the import succeeds, the import lists the number of rows ignored due to errors.

• Type: integer
• Default value: 100
• Location: Add the property to the System Property [sys_properties] table.

com.glide.email.max_read

Specifies the maximum number of emails a POP3 reader should process concurrently.
• Type: integer  
• Default value: 20  
• Location: Add the property to the System Property [sys_properties] table.

**com.glide.loader.verify_target_field_size**

Controls whether import set fields can automatically increase in size during an import (true) or not (false). By default, data that exceeds the import field size is truncated. Set this property to true to allow any import set field to increase the column size to match the length of the data.

• Type: true | false  
• Default value: false  
• Location: Add the property to the System Property [sys_properties] table.

**com.glide.soap.include_non_db_fields**

Controls whether non-database fields, such as the sys_tags field, are included in WSDLs and SOAP responses (true) or not (false).

• Type: true | false  
• Default value: false  
• Location: Add the property to the System Property [sys_properties] table.

**com.glide.ssl.read.timeout**

Sets the time-out value in seconds for SSL connections during read operations. Typically, this setting is used as part of LDAPS. If you enter timeout values for both this system property and the LDAP Read timeout field, the lowest timeout value takes precedence.

• Type: integer  
• Default value: 10  
• Location: Add the property to the System Property [sys_properties] table.

**com.glideapp.canvas**

Enables (true) or disables (false) responsive canvas for dashboards. When enabled, all new dashboards use responsive canvas. Non-responsive dashboards are not converted to responsive dashboards.

• Type: true | false  
• Default value: true  
• Location: System Property [sys_properties] table

**com.snc.apps.publish.include_inactive_choices**

Specifies whether choice table selections marked as inactive (sys_choice inactive attribute = true) should be included when publishing an application (true) or not (false).

• Type: true | false  
• Default value: true
• Location: System Property [sys_properties] table

**com.snc.apps.publish.maxrows**
Defines the maximum number of data records to include when publishing an application.
• Type: integer
• Default value: 1,000
• Location: System Property [sys_properties] table

**com.snc.assessment.decision_matrix_filter_max_entries**
Defines the maximum number of items to show for a decision matrix field filter.
• Type: integer
• Default value: 1,000
• Location: System Property [sys_properties] table

**com.snc.assessment.signature_authentication**
Requires authentication for a user signature.
• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**com.snc.dd.publish_to_app_repo_enabled**
Enables (true) or disables (false) display of the Publish To App Repo permission in Manage Developers.
• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**com.snc.dd.publish_to_app_store_enabled**
Enables (true) or disables (false) display of the Publish To App Store permission in Manage Developers.
• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**com.snc.dd.publish_to_update_set_enabled**
Enables (true) or disables (false) display of the Publish To Update Set permission in Manage Developers.
• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

**com.snc.dd.upgrade_app_enabled**
Enables (true) or disables (false) display of the Update App permission in Manage Developers.
• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table
com.snc.hr.core.impersonateCheck

Allows a user to have identical permissions/access as the person they are impersonating. If **true**, access and restrictions apply when impersonating another user. If **false**, the user has identical permissions/access as the person they are impersonating.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

com.snc.iam.log_level

Logging level for the business rule MapUpstreamImpactedCI. Debug is the most detailed option with full trace of how the Impacted CI List is calculated. Error is the minimal logging option with only severe errors being logged.

- Type: string
- Default value: info
- Possible values: debug, info, error
- Location: System Property [sys_properties] table

com.snc.on_call_rotation.reminders.showtz

Specifies whether to show the user time zone (**true**) or not (**false**).

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.activate_kpi_signals

Create this property and set to 'false' to deactivate the KPI Signals feature.

- Type: Boolean true | false
- Default value: Does not exist but is treated as 'true'
- Location: Add the property to the System Property [sys_properties] table.

com.snc.pa.dc.batch_score_insert

When true, Performance Analytics data collection jobs insert indicator scores to the database in batches. When false, indicator scores are inserted one by one. Even when true, batch score insertion is performed only as a fallback when hierarchical data collection (com.snc.pa.dc.hierarchical_collection) has been disabled.

- Type: Boolean true | false
- Default value: true
- Location: System Properties [sys_properties] table

com.snc.pa.dc.flush_snapshot_count

Maximum number of Performance Analytics snapshots to store in the memory during data collection. When this number is reached, the snapshots are offloaded to the database, freeing memory.

- Type: integer
- Default value: 1000
- Location: System Properties [sys_properties] table

com.snc.pa.dc.hierarchical_collection

© 2021 ServiceNow, Inc. All rights reserved. 
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Activates a hierarchical approach to score collection, where Indicator > level 1 breakdown > level 2 breakdown. This approach is more resource efficient than a flat hierarchical approach, which creates redundant objects.

- **Type**: Boolean true | false
- **Default value**: true
- **Location**: System Properties [sys_properties] table

**com.snc.pa.dc.max_breakdown_elements_limit**

Maximum number of breakdown elements for a breakdown to be included in data collection.

- **Type**: integer
- **Default value**: 10000
- **Location**: System Property [sys_properties] table

**com.snc.pa.dc.max_error_count**

Maximum errors that may occur before data collection is stopped.

- **Type**: integer
- **Default value**: 500
- **Location**: System Property [sys_properties] table

**com.snc.pa.dc.max_records**

Maximum number of records that are stored during a data collection.

- **Type**: integer
- **Default value**: 5000
- **Location**: System Property [sys_properties] table

**com.snc.pa.dc.max_row_count_indicator_source**

Maximum number of rows that are allowed to be fetched from an Indicator Source.

- **Type**: integer
- **Default value**: 50000
- **Location**: System Property [sys_properties] table

**com.snc.pa.dc.script_timeout**

Maximum time in seconds that a script is allowed to run during a data collection cycle.

- **Type**: integer
- **Default value**: 30
- **Location**: System Property [sys_properties] table

**com.snc.pa.dc.use_hashcode_for_distinct**

Sets whether Count Distinct aggregations are stored as separate values in memory or as a HashCode. When the value of this property is True, a HashCode is used, which consumes less memory than storing individual values.

- **Type**: Boolean true | false
- **Default value**: true
- **Location**: Add the property to the System Property [sys_properties] table

**com.snc.project.default_schedule**
Stores the sys_id of the default schedule attached to projects.
- Type: string
- Location: System Property [sys_properties] table

**com.snc.project.loglevel**
Automatically resubmits timed-out Ajax requests.
- Type: choice list
- Default value: 0 (debugging disabled)
- Location: System Property [sys_properties] table

**com.snc.project.wbs_gantt**
Automatically resubmits timed-out Ajax requests.
- Type: true | false
- Default value: false
- Location: Project > Administration > Properties

**com.snc.task.associate_ci**
List of all task types where user wants to associate CIs using a List system.
- Type: string
- Default: incident,problem,change_request
- Location: System Property [sys_properties] table

**com.snc.task.refresh_impacted_services**
List of all task types where Refresh Impacted Services UI action is enabled.
- Type: string
- Default value: incident,change_request
- Location: System Property [sys_properties] table

**com.snc.time_card.default_rate**
(Cost Management plugin) Sets a default hourly rate to use if no labor rate cards apply to the user.
- Type: integer
- Default value: 50
- Location: System Property [sys_properties] table

**com.snc.time_worked.update_task_timer**
Enables (true) or disables (false) updating the task timer value based on changes to the task time worked records. Uses the Update task time business rule.
- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

**csm_auto_account_domain_generation**
When new account in Customer Service application is created, domain is created and placed under TOP domain. If parent field on account form is populated, and new record is inserted, it creates that account as a subdomain of the parent.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

**css.assessment.caption.background.color**

Sets the background color of the caption on assessment and survey questionnaires.

- Type: color
- Default value: #eee
- Location:
  - Assessments > Admin > Assessment Properties
  - Survey Management > Administration > Properties

**css.assessment.caption.font.color**

Sets the font color of the caption text on assessment and survey questionnaires.

- Type: color
- Default value: #ffffff
- Location:
  - Assessments > Admin > Assessment Properties
  - Survey Management > Administration > Properties

**css.assessment.question.header.background.color**

Sets the background color of question headers on assessment and survey questionnaires.

- Type: color
- Default value: #767676
- Location:
  - Assessments > Admin > Assessment Properties
  - Survey Management > Administration > Properties

**css.$nav-highlight-main**

Sets the color for the navigation expanded items highlight background.

- Type: color
- Default Value: #3D4853
- Location: System Property [sys_properties] table

**css.$nav-hr-color**

Sets the color for the navigation separator.

- Type: color
- Default Value: #303A46
- Location: System Property [sys_properties] table
css.$navpage-header-bg
Sets the color for the header background.
  • Type: color
  • Default Value: #303A46
  • Location: System Property [sys_properties] table

css.$navpage-header-color
Sets the color for the banner text.
  • Type: color
  • Default Value: #FFFFFF
  • Location: System Property [sys_properties] table

css.$navpage-nav-bg-sub
Sets the color for the background for navigator and sidebars.
  • Type: color
  • Default Value: #455464
  • Location: System Property [sys_properties] table

css.$navpage-nav-border
Sets the color for the border for UI16.
  • Type: color
  • Default Value: #DDD
  • Location: System Property [sys_properties] table

css.$navpage-nav-color-sub
Sets the color for module text in UI16.
  • Type: color
  • Default Value: #BEC1C6
  • Location: System Property [sys_properties] table

css.$navpage-nav-selected-bg
Sets the color for navigator selected tab background.
  • Type: color
  • Default Value: #4B545F
  • Location: System Property [sys_properties] table

css.$navpage-nav-selected-color
Sets the color for the currently selected navigation tab icon color for UI16.
  • Type: color
  • Default Value: #FFFFFF
  • Location: System Property [sys_properties] table

css.tablet.gradient.start
Start color of the gradient for the tablet UI header.
css.tablet.gradient.end
End color of the gradient for the tablet UI header.

- Type: color
- Default value: #111
- Location: System Properties > Tablet UI Properties

css.tablet.headerfooter.text.color
Color of the text and icons in the tablet UI header and footer.

- Type: color
- Default value: #ffffff
- Location: System Properties > Tablet UI Properties

glide.allow.new.cert_follow_on_task
Allow Desired State audit to create a new follow-on task for the same failure at each audit run.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.amb.session.logout.overlay.style
Specifies a cascading style sheet (css) that defines an overlay. The overlay masks all onscreen data on timeout, and the login screen appears on top of the overlay.
Limited to core Now Platform functions, not applications.

- **Type**: string
  
  - Example: background-color: #000; opacity: 0.5
  
- **Default value**: empty (no overlay)
  
- **Location**: System Property [sys_properties] table

### glide.angular.legacy

When true, enables legacy AngularJS behavior. When false, integrates AngularJS sanitizeUri and $http security patches. If you set this property to false, existing JSONP requests with cross-domain endpoints will fail. You can address this issue in your scripts by doing one of the following:

1. Add the domains of any newly failing requests to the `angular.jsonp.inclusion_list.urls` system property.
2. Opt out of this behavior by changing `angular.jsonp.inclusion_list.enabled` to false.

- **Type**: true | false
  
- **Default value**: true
  
- **Location**: System Property [sys_properties] table

### glide.applications.hub.current

URL of the team development parent instance.

- **Type**: string
  
- **Default value**: none
  
- **Location**: System Property [sys_properties] table

### glide.attachment.extensions

Comma-separated list of file extensions that can be attached. No value means that there are no restrictions.

- **Type**: string
  
- **Default value**: none
  
- **Location**: System Properties > Security

### glide.attachment.role

Comma-separated list of roles that can create attachments.

- **Type**: string
  
- **Default value**: public
  
- **Location**: System Properties > Security

### glide.authenticate.multisso.login_locate.user_field

Identifies a common login identifier.

- **Type**: string
  
- **Default value**: user_name
  
- **Location**: Add the property to the System Property [sys_properties] table.

### glide.authenticate.sso.saml2.require_signed_authnrequest

Enables the Identity Provider Single sign-on service to receive a signed AuthnRequest.

- **Type**: true | false
- Default value: false
- Location: System Property [sys_properties] table

**glide.banner.image.url**

URL used when clicking the banner image.

- Type: string
- Default value: home.do
- Location: System Property [sys_properties] table

**glide.banner.image.url_target**

Target frame used when clicking the banner image. Use gsft_main for the main frame, _top to replace the current browser window, _blank for a new window or tab.

- Type: string
- Default value: gsft_main
- Location: System Property [sys_properties] table

**glide.bsm.color.affect_neighbors**

Color of an affected neighbor node. When a node has a service issue, all nodes that depend on that node are considered affected nodes. In the map, the affected nodes are parents or grandparents of the node with the service issue.

- Type: color
- Default value: Beige
- Location: BSM Map > Map Properties

**glide.bsm.map.style.font_family**

Font family name used in the map text. If you designate a font that is not on the user system, the browser substitutes another font and the text may not render as you expect.

- Type: font name
- Default value: Arial
- Location: BSM Map > Map Properties

**glide.bsm.map.style.font_size**

Font size of the text that appears with a CI node. The default size is magnified for nodes with more connections and reduced for downstream nodes.

- Type: integer
- Default value: 14
- Location: BSM Map > Map Properties

**glide.bsm.map.style.selection_background_color**

Background color of a selected CI node. This color is also used with a node's Highlight Hierarchy option.

- Type: color
- Default value: RoyalBlue
- Location: BSM Map > Map Properties

**glide.bsm.map.style.selection_text_color**
Color of the text that appears under a selected CI node.

- **Type:** color
- **Default value:** White
- **Location:** BSM Map > Map Properties

**glide.bsm.map.style.text_color**

Color of the text that appears under an unselected CI node.

- **Type:** color
- **Default value:** Black
- **Location:** BSM Map > Map Properties

**glide.bsm.max_levels**

Maximum level depth from the root CI that can be initially displayed in business service maps. Level depth is the graph distance between the root CI and a node. This value must be an integer.

- **Type:** integer (1-10)
- **Default value:** 5
- **Location:** BSM Map > Map Properties

**glide.bsm.new_node_color**

Color for nodes that became viewable from the last expand operation.

- **Type:** color
- **Default value:** PaleGreen
- **Location:** BSM Map > Map Properties

**glide.bsm.max_nodes**

Maximum number of downstream nodes to retrieve from the database for a CI. If more nodes exist in the database, they are not displayed in the map.

- **Type:** integer
- **Default value:** 1000
- **Location:** BSM Map > Map Properties

**glide.bsm.refresh_interval**

Seconds between each automatic reloading of troubles and tasks.

- **Type:** integer
- **Default value:** 30
- **Range of possible values:** 1 to 3600
- **Location:** BSM Map > Map Properties

**glide.bsm.task_threshold**

Change the CI glyph color from orange to red when the number of tasks reaches this threshold.

- **Type:** integer
- **Default value:** 3
- **Location:** BSM Map > Map Properties
**glide.bsm.too_many_children**

Maximum number of child nodes to display. Nodes are collapsed for the map to meet this limit.

- Type: integer, valid values 1 or greater
- Default value: 10
- Location: **BSM Map > Map Properties**

**glide.businessrule.async_condition_check**

Specifies whether the instance checks the condition statement of async business rules (the **When** field is set to async) prior to running the business rule. If **true**, the instance evaluates the async business rule conditions a second time before running the rule. If **false** or missing, the instance does not evaluate the conditions a second time.

- Type: true | false
- Default value: false
- Location: **Add the property** to the System Property [sys_properties] table.

**glide.businessrule.callstack**

Specifies whether business rule executions are logged in the daily log when they start and finish (**true**) or are not logged (**false**). Logging is useful for troubleshooting a problem where you must know which business rules are running and in which order.

- Type: true | false
- Default value: false
- Location: **Add the property** to the System Property [sys_properties] table.

**glide.cache.size.service_cache**

- Type: integer
- Default value: 20
- Location: **Add the property** to the System Property [sys_properties] table.

**glide.canvas.grid.widget_render_concurrent_max**

Defines the maximum number of widgets that can render simultaneously on a dashboard. With smaller values, individual widgets load more quickly. With larger values, fewer Ajax requests to the server are needed. Set the value of this property to half of the number of widgets that are visible when your most-used dashboard loads. For example, if six widgets are visible on the dashboard set the value to 3.

**Note:** This system property applies to responsive dashboards only.

Two is the minimum value, and 1 is interpreted as 2. For values of zero or lower, all widgets load simultaneously.

- Type: integer
- Default value: none
- Location: System Property [sys_properties] table

**glide.cmdb.query.batch_time_limit_in_sec**

Time limit (in seconds) for running one batch to get one batch of query results (100 results).

- Type: integer
- Default value: 300
- Location: **Configuration > CMDB Properties > Query Builder Properties**
**glide.cmdb.query.max_results_limit**

Limits the number of results for a scheduled query and in the results section in the Query Builder when you click Load All Results.

- Type: integer
- Default value: 10,000
- Location: Configuration > CMDB Properties > Query Builder Properties

**glide.cmdb.query.non_cmdb.blacklisted_tables**

Exclusion list of non-CMDB tables that appear in the CMDB Query Builder when creating a CMDB query.

- Type: string
- Default value: empty
- Location: Configuration > CMDB Properties > Query Builder Properties

**glide.cmdb.query.query_time_limit_in_sec**

Time limit (in seconds) for running an entire query to get all results.

- Type: integer
- Default value: 1,800
- Location: Configuration > CMDB Properties > Query Builder Properties

**glide.cmdb.statemgmt.max_bulk_count**

Maximum number of CIs that CI Lifecycle Management can process in a bulk update operation.

- Type: integer
- Default value: 1000
- Location: System Property [sys_properties] table

**glide.cmdb.statemgmt.max_lease_expired_days**

Maximum number of days that lease expiration can be set with for CI Actions.

- Type: integer
- Default value: 15
- Location: System Property [sys_properties] table

**glide.cms.dashboards.sharing_with_secure_search**

When enabled, the list of users, user groups, and roles that are visible in the sharing panel is restricted. The restriction is based on the configuration of the sys_user, sys_user_group, and sys_user_role ACLs. For more information, see Access control list rules.

There is a performance penalty associated with enabling this property. Performance degradation may be based on the number and complexity of business rules and ACLs on your instance.

- Type: true | false
- Default value: false
- Location: System Properties > Dashboard Properties

**glide.cms.share_dashboards.role**

When this property is empty, all users can share their own dashboards.
Note: This property does not apply to users with the admin and dashboard_admin roles. Users with these roles can always share any dashboard.

- **Type:** string
- **Default value:** empty
- **Location:** System Properties > Dashboard Properties

**glide.chart.decimal.precision**

Controls the rounding precision of non-currency numeric values displayed on reports. A Decimal Precision value specified in a report’s style options overrides this property. Currency values always have a precision of 2.

- **Type:** integer
- **Default value:** 2
- **Maximum value:** 4
- **Location:** Add the property to the System Property [sys_properties] table.

**glide.chat.invite_fields**

(Chat plugin) Comma-separated list of fields (glide_list or references to sys_user or sys_group) used to generate the invitations when creating a chat room from a task. Users can select a check box for each of the specified fields to invite to the chat room users that are referenced by the fields.

- **Type:** string
- **Default value:** none
- **Location:** Social IT > Chat Administration > Properties

**glide.chat_room.create_roles**

(Chat plugin) Comma-separated list of roles that are allowed to create chat rooms.

- **Type:** string
- **Default value:** none
- **Location:** Social IT > Chat Administration > Properties

**glide.chat.show_emoticons**

(Chat plugin) Enables (true) or disables (false) rendering text emoticons as images.

- **Type:** true | false
- **Default value:** true
- **Location:** Social IT > Chat Administration > Properties

**glide.class.downgrade.enabled**

Flag for allowing class downgrade during identification and reconciliation.

- **Type:** true | false
- **Default value:** true
- **Location:** System Properties [sys_properties] table

**glide.class.switch.enabled**

Flag for allowing class switching during identification and reconciliation.

- **Type:** true | false
- **Default value:** true
gslide.class.upgrade.enabled
Flag for allowing class update during identification and reconciliation.
• Type: true | false
• Default value: true
• Location: System Properties [sys_properties] table

gslide.cmdb.health.metricProcessor.maxRunningTime
Max time in minutes for which individual metric processor runs in each scheduled cycle.
• Type: integer
• Default value: 120
• Location: Navigate to Configuration > Health Preference, and then click System Properties in the right hand-side navigator.

gslide.cmdb.health.src.cmdb_health_audit_only
When set to true, disables health results from sources other than CMDB Health audit (such as cloud discovery). Only results generated by CMDB Health audit appear in the CMDB dashboard.
For example, by default, if a CI is determined to be stale by Discovery, then that CI appears as stale in the CMDB dashboard even though CMDB Health audit did not determine that CI to be stale. To disable these stale CI health results, set the property to true.
• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

gslide.cmdb.health.staleness_exclude_dependent_cis
Exclude dependent CIs for the staleness CMDB Health metric.
When enabled, dependent CIs are not checked for staleness, regardless of any staleness or inclusion rules that are defined for the respective CI types.
• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

gslide.cmdb.logger.source.identification_engine
Enable and configure what type of details the system logs when using IRE outside the scope of identification simulation. For example, when using an API, ECC queue or scheduled jobs.
• Type: string
• Default value: info, warn, error, debug, or debugVerbose
• Location: Add the property to the System Property [sys_properties] table.

gslide.cmdb.logger.use_syslog.CMDBHealth
A comma-separated list that controls the level of logging of CMDB Health jobs. Logging creates entries in the system logs to capture messages generated by the health auditing process each time they run. This logging helps debugging if there is a failure.
• Type: string
• Default value: error
• Location: System Property [sys_properties] table

**glide.cmdb_model.display_name.shorten**

If `true`, generates shorter display names for product models if the name of the product model contains the manufacturer name.

• Type: `true` | `false`
• Default value: `false`
• Location: System Property [sys_properties] table

**glide.cookies.http_only**

Enables (`true`) or disables (`false`) the generation of HTTP-only cookies. Set this property to `false` to use Approval with E-Signature.

• Type: `true` | `false`
• Default value: `true`
• Location: System Property [sys_properties] table

**glide.cost_mgmt.calc_actual_cost**

(Cost Management plugin) When an expense line is created for any task with a Type of `Planned task`, sums all task expense lines and adds the total to the `Work cost` field on the task record.

• Type: `true` | `false`
• Default value: `true`
• Location: System Property [sys_properties] table

**glide.cost_mgmt.debug**

(Cost Management plugin) Enables debugging of cost management processing. All logging events are recorded in the Financial Management Log [fm_log] table.

**Note:** This feature can generate a large number of log records. Enable the feature only during initial testing or when troubleshooting.

• Type: `true` | `false`
• Default value: `false`
• Location: System Property [sys_properties] table

**glide.cost_mgmt.process_task_cis**

(Cost Management plugin) Creates expense lines affected configuration items when creating a task expense line.

• Type: `true` | `false`
• Default value: `false`
• Location: System Property [sys_properties] table

**glide.cost_mgmt.service_allocation.method**

(Cost Management plugin) Defines whether business service to cost center allocation costs should be calculated based on total units or allocated units.

For example, if the service supports 100 units but only has 50 units allocated, and cost center ABC is allocated 25 units. Using the **All units** method results in an allocation cost of 25/100, or 25% of the total cost of the service. In
In this case, we track unallocated costs separately. Using **Allocation units** method results in an allocation cost of 25/50, or 50% of the total cost of the service. In this case, all costs are allocated (recovered).

- **Type:** choice list
- **Default value:** all_units
- **Location:** System Property [sys_properties] table

**glide.csv.export.line_break**

Enables the user to control how exported CSV data appears in Notepad. Valid values are LF for a line feed between records and CRLF for a carriage return followed by a line feed.

- **Type:** string
- **Default value:** LF
- **Location:** System Property [sys_properties] table

**glide.csv.use_row_currency**

If false, exports currency and price field values in the user's currency. If true, exports currency and price field values in the currency of the row.

- **Type:** true | false
- **Default value:** false
- **Location:** System Property [sys_properties] table

**glide.custom.ip.authenticate.allow**

Comma-separated list or dash-separated range of IP addresses that are allowed access to view the stats.do, threads.do, and replication.do pages.

- **Type:** string
- **Default value:** none
- **Location:** Add the property **to the System Property [sys_properties] table.**
- **Instance Security Hardening Settings:** Performance monitoring IP restriction (instance security hardening)

**glide.db.aggregates.trend.use_iso_week**

If set to true, reports weekly trend by data according to ISO weeks. If false, data trended per week reports according to the first day of the week set by glide.ui.date_format.first_day_of_week.

- **Type:** true | false
- **Default value:** none
- **Location:** Add the property **to the System Property [sys_properties] table.**

**glide.db.audit.ignore.delete**

Specifies the tables where the sys_audit_delete file is not updated when records are deleted.

- **Type:** string — comma-separated list of tables
- **Location:** System Property [sys_properties] table

**glide.db.clone.allow_clone_target**

Enables (**true**) or disables (**false**) use of a non-production instance as the target for a system clone.

- **Type:** true | false
- **Default value:** **false** for production instances, **true** for non-production instances
**glide.db.impex.XMLLoader.max.file.size.mb**

Controls the maximum file size allowed when importing an XML file, in megabytes. Attempting to import an XML file larger than this limit results in an error.

- **Warning:** Use caution when modifying this property. Uploading a large XML file may impact performance and can cause an instance outage.
- Type: integer
- Default value: 100
- Location: System Properties > Import Export

**glide.db.large.threshold**

Sets the number of rows above which a table is considered large and uses a different method of querying for results. When this property is absent, the instance uses the default query method.

- Type: integer
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

**glide.db.loguser**

Display (true) or suppress display (false) of database errors (such as Unique Key violation detected by database (Duplicate entry 'ABC' for key 'name') to user.) to logged-in user.

- Type: true | false
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

**glide.db.max.aggregate.size**

Sets the maximum number of groups that a grouped report or list renders. Larger values may affect system performance.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

**glide.db.max_view_records**

Sets the maximum number of records returned when running a GlideRecord query in a script. Do not use values larger than the default because they may cause queries to consume excessive memory on the application server and can, in extreme cases, cause a system outage. This property does not control the maximum number of records that appear in a list, report, or exported file.

- Type: integer
- Default value: 10000
- Location: Add the property to the System Property [sys_properties] table.

**glide.db.table.update_inactive_choices_enabled**

Specifies whether choice table selections marked as inactive (sys_choice inactive attribute = true) should be loaded into client databases when applications are installed (true) or not (false).
• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**glide.debug.log_point**
Specifies whether the log points feature should be enabled or not.
• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

**glide.debugger.log.ui**
Specifies whether logs should be displayed under forms and lists and in the Session Log tab, or only in the Session Log tab.
• Type: choice list
• Default value: Page
• Location: System Property [sys_properties] table

**glide.discovery.application_mapping**
Enables or disables the Application Dependency Mapping (ADM) feature.
• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**glide.discovery.log_debug_info**
An optional property to populate debug information in Discovery log. If this property is set to true, the Discovery sensor extracts the debug information from ECC input message and writes this information to the Discovery log table, so that it is visible when inspecting discovery status.
• Type: true | false
• Default: false

**glide.discovery.log_message_chars**
When a log message is longer than this value, ServiceNow creates a preview of the message with an ellipsis at the end of the message to indicate that there is content that is not shown. The preview size prevents any one list row from taking up the entire screen.
• Type: integer
• Default value: 200 (characters)
• Location: Discovery Definition > Properties

**glide.discovery.multi_page_serial_mode**
This property controls the processing of multi-page pattern input records. false sets the pages to process in parallel and true sets the pages to process serially.
• Type: true | false
• Default value: false

**glide.discovery.sam_batch_update_size**
Enables batching the updates to table cmdb_sam_sw_install when only the field last_scanned in the table has changed. This optimizes the overall discovery execution as it reduces the multiple single update queries on the database. The default value is 100 which means 100 records at a time in the table are batched and updated. By setting this property to 1, this switches to sequential updates.

- Type: integer
- Default value: 100

**glide.discovery.use_cmdb_identifiers**

Controls whether Discovery uses the CMDB Identification and Reconciliation Framework (introduced with the Geneva release) or the legacy identifiers from previous releases.

- Type: true | false
- Default value: true
- Location: **Discovery Definition > Properties**

**glide.domain.notify_change**

Displays a notification message telling the user that the domain picker automatically changed.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

**glide.domain.notify_record_change**

Displays a notification message telling the user that the domain picker automatically changed because the record that the user is viewing changed the domain of the user.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.duplicate_ci_remediator.dry_run**

Determines whether the Duplicate CI Remediator actually remediates CI duplication by updating records in the CMDB, or not.

- Type: true | false
- Default value: false
- Location: **Configuration > CMDB Properties > Duplicate CI Remediator Properties**

**glide.duplicate_ci_remediator.max.cis**

Threshold for the number of duplicate CIs, which if exceeded, support for reconciliation in the Duplicate CI Remediator is limited (1,000 by default).

- Type: integer
- Default value: 1000
- Location: **Configuration > CMDB Properties > Duplicate CI Remediator Properties**

**Note:** This threshold never exceeds 5,000, even if you set the property to a value greater than 5,000.

**glide.duplicate_ci_remediator.max.field_length**
Attributes in which max_length exceeds this property value (4000 by default) are excluded from the Select Master CI, Merge Attribute Values, and Determine Duplicate CI Actions tabs in the Duplicate CI Remediator wizard.

- Type: integer
- Default value: 4000
- Location: Configuration > CMDB Properties > Duplicate CI Remediator Properties

**Note:** This property impacts the performance of de-duplication tasks, therefore be cautious about setting this value.

`glide.duplicate_ci_remediator.related_items_blacklist`
Comma-separated list of related tables in the format `<table>,<reference column>`, that are excluded from merging during duplicate CI remediation.

- Type: string
- Default value: `cert_task.cmdb_ci,cert_audit_result.configuration_item,discovery_log.cmdb_ci,alm_hardware.ci,alm_asset.ci,fm_expense_line.ci`
- Location: Configuration > CMDB Properties > Duplicate CI Remediator Properties

`glide.eccprobe.longrunner.class`
Identifies the name of a script include that manages long running commands.

- Type: string
- Default value: LongRunner
- Location: System Property [sys_properties] table

`glide.eccprobe.longrunner.retry_minutes`
Allows bursts of polling errors up to specified minutes in duration.

- Type: integer
- Default value: 10
- Location: System Property [sys_properties] table

`glide.eccprobe.longrunner.interval.initial_seconds`
Initial polling period for long running commands in seconds.

- Type: integer
- Default value: 20
- Location: System Property [sys_properties] table

`glide.eccprobe.longrunner.interval.backoff_percent`
Percentage that polling period grows per poll.

- Type: integer
- Default value: 15
- Location: System Property [sys_properties] table

`glide.eccprobe.longrunner.interval.max_seconds`
Maximum polling period. As the polling period decays, it gets longer until it reaches this maximum.
• Type: integer
• Default value: 300
• Location: System Property [sys_properties] table

glide.eccprobe.longrunner.debug
Allows LongRunner logs status on successful polls in addition to the usual messages on unsuccessful ones when set to true.
• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

glide.eccprobe.longrunner.max_poll_count
Maximum number of polls that is executed per 5-second polling period. This number is generally not relevant, but may be used to contain polling under extreme loading conditions.
• Type: integer
• Default value: unlimited
• Location: System Property [sys_properties] table

glide.ecmdb.all_relationship_role
An example value is: itil,asset,configuration.
• Type: string
• Default value: none
• Location: Add the property to the System Property [sys_properties] table.

glide.email_address_filter.max_domains
Sets the maximum number of domains that can be associated with a single email address filter.
• Type: integer
• Default value: 100

glide.email_address_filter.max_exceptions
Sets the maximum number of exceptions that can be associated with a single email address filter.
• Type: integer
• Default value: 1000

glide.email.append.timezone
Specifies whether to append the time zone to all dates and times in outbound emails (true) or not (false).
• Type: true | false
• Default value: true
• Location: System Properties > Email

glide.email_client.quick_message.insert
Controls how quick messages are inserted in the email client. If the property is set to true, quick message content is inserted at the place of the cursor. If false, quick message content replaces existing content in an email draft.
• Type: true | false
• Default value: true

**glide.email.forward_subject_prefix**

Specifies the comma-separated list of prefixes in the subject line that identify a forwarded email.

- Type: string
- Default value: fw:,fwd:
- Location: Add the property to the System Property [sys_properties] table.

**glide.email.journal.lines**

Specifies the number of entries from a journal field (such as Additional comments and Work notes) included in email notifications. A value of -1 includes all journal entries.

- Type: integer
- Default value: 3
- Location: System Properties > Email

**glide.email.mail_to**

Specifies the email address to send notifications that use the `$mailto:` variable.

- Type: string
- Default value: SMTP email address that is active by default
- Location: Add the property to the System Property [sys_properties] table.

**glide.email.name_split**

Delimiter between the first and last name in an email address to identify users from incoming emails. For example, a delimiter of "." in the email address john.smith@company.com tells the system to look for a user record for John Smith.

- Type: string
- Default value: period (.)
- Location: System Properties > Email

**glide.email.notification.save_when_no_recipients**

Controls whether (true) or not (false) a notification-generated sys_mail record is saved even if there are no recipients. Used in conjunction with other notification recipient logging properties, this property enables troubleshooting problems with notifications.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.email.override.url**

Sets the URL to use in emailed links in place of the instance URL. The URL should end with nav_to.do. An example value is: https://servicenow.customerdomain.com/production/nav_to.do.

- Type: string
- Default value: Instance URL
- Location: Add the property to the System Property [sys_properties] table.

**glide.email.read.active**
Enables (true) or disables (false) the inbound mail server.

- Type: true | false
- Default value: true
- Location: System Properties > Email

**glide.email.reply_subject_prefix**

Specifies the comma-separated list of prefixes in the subject line that identify an email reply.

- Type: string
- Default value: re:aw:,r:
- Location: System Property [sys_properties] table

**glide.email.smtp.active**

Specifies whether to enable (true) or disable (false) the outgoing mail server.

- Type: true | false
- Default value: true
- Location: System Properties > Email

**glide.email.smtp.max_recipients**

Specifies the maximum number of recipients the instance can list in the To: line for a single email notification. Notifications that would exceed this limit instead create duplicate email notifications addressed to a subset of the recipient list. Each email notification has the same maximum number of recipients.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

**glide.email.smtp.max_send**

Specifies how many emails to send through each new SMTP connection. The instance establishes a new SMTP connection if there are more emails to send than the specified value.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

**glide.email_system_address_filter.max_address_filters**

Sets the maximum number of email filters that can be associated with a single system address filter.

- Type: integer
- Default value: 100

**glide.email.test.user**

Specifies the comma-separated list of email addresses to which the instance sends all email messages. Typically used in non-production instances for testing purposes.

- Type: string
- Default value: none
- Location: System Properties > Email
glide.email.text_plain.strip_xhtml
Indicates whether both outbound and inbound emails that are shown in comments convert the XML to plain text (true) or preserve the XML (false).

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

Note: Glide emails are converted to plain text by default. Email clients that use the plain text version of the email show the watermark. Email clients that use the HTML version of an email do not display the watermark.

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

glide.email.watermark.visible
Indicates whether the watermark in email notifications is visible (true) or is wrapped in a hidden div tag (false).

Note: Glide emails are converted to plain text by default. Email clients that use the plain text version of the email show the watermark. Email clients that use the HTML version of an email do not display the watermark.

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

glide.email_client.show_sms_option
Specifies whether a check box appears in the email client for sending the message to the user's SMS device (true) or not (false). If no SMS device exists, the email client sends the message to the primary email device.

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

glide.entry.loggedin.page_ess
Specifies the page that an ESS user, who by definition has no roles, is redirected to when the user logs in.

• Type: string
• Default value: none
• Location: System Property [sys_properties] table

glide.excel.boolean.display_value
If true, translates columns of type boolean to the user's language when exporting records in Excel format. If false, exports the values in English, regardless of the user language.

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

glide.excel.max_cells
Sets the maximum number of cells in an Excel export.

• Type: integer
• Default value: 500000
• Location: Add the property to the System Property [sys_properties] table.

glide.excel.use_user_date_format
Specifies whether Excel exports use the date/time format specified in a user's profile (true) or not (false). If false, exports the instance date/time format defined by the glide.sys.date_format property.
• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.export.csv.charset**

Specifies the character set used to export CSV files. See Supported Character Encodings for a list of supported character encoding options.

• Type: string
• Default value: windows-1252
• Location: Add the property to the System Property [sys_properties] table.

**glide.export.csv.raw.value**

When true, raw database values are exported instead of the display values when you export to CSV. When false, display values are exported.

• Type: true | false
• Default value: false
• Location: System Properties > Import Export

**glide.export.escape_formulas**

When true, string values that start with the characters +, -, =, or @ are prepended with a single apostrophe when you export to CSV, XLS, or XLSX files.

• Type: true | false
• Default value: true for new instances starting with Istanbul
• Location: System Property [sys_properties] table for new instances starting with Istanbul. For upgraded instances, Add the property to the System Property [sys_properties] table.

**glide.export.excel.general_formatting**

When true, values in cells in exported Excel files have the general format. When false, the cells in exported Excel files have the text format.

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.export.excel.wrap_cells**

When true, values in cells in exported Excel files are wrapped automatically. When false, the width of exported Excel columns is resized to fit 256 characters and values are not wrapped.

• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

**glide.export.force_ui_list_behavior**

When true, journal fields such as worknotes and comments are not included when you export records. When false, these fields are included.

• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

**glide.fdih.retry.max_count**

Specifies the maximum number of retry attempts when no value is specified in Count for a retry policy.

- Type: Integer
- Default value: 0
- Location: System Property [sys_properties] table

**glide.glidesoap.proxy_host**

Specifies the proxy server hostname or IP address for SOAP clients.

- Type: string
- Default value: value of glide.http.proxy_host
- Location: System Property [sys_properties] table

**glide.glidesoap.proxy_port**

Specifies the port number for the proxy server for SOAP clients.

- Type: string
- Default value: value of glide.http.proxy_port
- Location: System Property [sys_properties] table

**glide.guest.session_timeout**

Sets the session timeout for a guest session, in minutes.

**Note:** This setting decouples a guest session timeout from the glide.ui.session_timeout property. Any changes to the glide.ui.session_timeout property do not affect a guest session timeout.

- Type: integer
- Default value: 30
- Location: System Property [sys_properties] table

**glide.help.default.page**

Sets the overall help URL for the system if you are using context-sensitive help. This URL is used when there is not any context-sensitive help available for the form, list, or record.

- Type: string
- Default value: http://wiki.servicenow.com/
- Location: System Property [sys_properties] table

**glide.history.max_entries**

Sets the number of characters to display as a preview of journal input fields.

- Type: integer
- Default value: 250
- Location: System Property [sys_properties] table

**glide.home.page**

Specifies which page to load when a user selects a homepage from the banner.
• Type: string
• Default value: `home_splash.do?sysparm_direct=true`
• Location: System Property [sys_properties] table

**glide.home.refresh_disabled**
Enables (true) or disables (false) homepage refresh.

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

**glide.home.refresh_intervals**
Comma-separated list of refresh intervals available on homepages.

• Type: string
• Default value: 300,900,1800,3600
• Location: Add the property to the System Property [sys_properties] table.

**glide.html.enable_media_sites**
Enables a URL option for media in the HTML Editor. The media attaches, but doesn't load in the HTML Editor.

• Type: string
• Default value: `youtube.com,player.vimeo.com,vimeo.com`
• Location: System Property [sys_properties] table

**glide.html.escape_script**
Enables (true) or disables (false) JavaScript tags in HTML fields.

• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**glide.html.sanitize_all_fields**
Specifies whether all HTML fields are sanitized to remove unwanted code (true) or not (false).

• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

- Instance Security Hardening Settings: HTML sanitizer (instance security hardening)

**glide.http.connection_timeout**
Specifies the maximum number of milliseconds an outbound HTTP request (such as Web Services) waits to establish a connection.

• Type: integer
• Default value: 10000 (10 seconds)
• Location: System Property [sys_properties] table

**glide.http.outbound.max_timeout**
Specifies the number of seconds that RESTMessageV2 and SOAPMessageV2 APIs wait for a response from a synchronous call. The maximum value is 30 seconds.
To define a timeout longer than 30 seconds, set the `glide.http.outbound.max_timeout.enabled` system property to `false` and use the `waitForResponse()` method to set the timeout. For examples, see [Asynchronous RESTMessageV2 example](#) and [Asynchronous SOAPMessageV2 example](#). If `glide.http.outbound.max_timeout.enabled` is set to `true` and a value is passed in the `waitForResponse()` method, the system uses the smallest value from either the `waitForResponse()` method or the `glide.http.outbound.max_timeout` system property.

- **Type:** `integer`
- **Default value:** 30
- **Location:** Add the property to the System Property `[sys_properties]` table.

### `glide.http.outbound.max_timeout.enabled`

Enables setting a timeout in the `glide.http.outbound.max_timeout` system property.

To define a timeout longer than 30 seconds, set the `glide.http.outbound.max_timeout.enabled` system property to `false` and use the `waitForResponse()` method to set the timeout. For examples, see [Asynchronous RESTMessageV2 example](#) and [Asynchronous SOAPMessageV2 example](#). If `glide.http.outbound.max_timeout.enabled` is set to `true` and a value is passed in the `waitForResponse()` method, the system uses the smallest value from either the `waitForResponse()` method or the `glide.http.outbound.max_timeout` system property.

- **Type:** `boolean`
- **Default value:** `true`
- **Location:** Add the property to the System Property `[sys_properties]` table.

### `glide.http.proxy_bypass_list`

Specifies the semicolon-separated list of addresses that bypass the proxy server. Use an asterisk (*) as a wildcard character to specify all or part of an address.

- **Type:** `string`
- **Default value:** `none`
- **Location:** System Property `[sys_properties]` table

### `glide.http.proxy_host`

Specifies the proxy server hostname or IP address.

- **Type:** `string`
- **Default value:** `none`
- **Location:** System Property `[sys_properties]` table

### `glide.http.proxy_ntdomain`

Specifies the domain used to authenticate the proxy server with NTLM authentication.

- **Type:** `string`
- **Default value:** `none`
- **Location:** System Property `[sys_properties]` table

### `glide.http.proxy_nthost`

Specifies the hostname used to authenticate the proxy server with NTLM authentication.

- **Type:** `string`
- **Default value:** `none`
• Location: System Property [sys_properties] table

**glide.http.proxy_ntpassword**

Specifies the password used to authenticate the proxy server with NTLM authentication.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

**glide.http.proxy_ntusername**

Specifies the user name used to authenticate the proxy server with NTLM authentication.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

**glide.http.proxy_port**

Specifies the port number for the proxy server.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

**glide.http.proxy_password**

Specifies the password used to authenticate the proxy server.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

**glide.http.proxy_username**

Specifies the username used to authenticate the proxy server.

- Type: string
- Default value: none
- Location: System Property [sys_properties] table

**glide.http.timeout**

(Web service Consumer Plugin) Specifies the maximum number of milliseconds to wait before an outbound transaction times out.

- Type: integer
- Default value: 175000 (175 seconds)
- Location: Add the property to the System Property [sys_properties] table.

**glide.i18n.force_index**

Enables (true) or disables (false) indexing all translated fields, regardless of the value of the table attribute text_index_translations.

- Type: true | false
- Default value: true
**glide.identification_engine.batch_update_last_discovered**

Controls batch update of last_discovered field in CIs that are being processed by the identification engine.

Set to **false** if there are business rules that apply to last_discovered field, and you want to trigger these rules when calling Identification and Reconciliation API.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

**glide.identification_engine.dependent_items_local_cache_count**

For optimization, a custom number of locally cached query result entries of dependent CIs.

- Type: integer
- Default value: 10000
- Location: Add the property to the System Property [sys_properties] table.

**Note:** If there is a memory issue due to optimization related to using local cache, set the **glide.identification_engine.related_items_local_cache_count** and the **glide.identification_engine.dependent_items_local_cache_count** properties to 0.

**glide.identification_engine.granular_insert_locking**

Determines whether to use multiple granular insert locks or single global insert lock.

Set to **false** if there are performance issues associated with the usage of multiple granular insert locks.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

**glide.identification_engine.independent_items_local_cache_count**

For optimization, a custom number of locally cached query result entries of independent CIs.

- Type: integer
- Default value: 100000
- Location: Add the property to the System Property [sys_properties] table.

**Note:** Setting the value to 0 avoids using local cache for independent CIs and might affect performance.

**glide.identification_engine.related_items_local_cache_count**

For optimization, a custom number of locally cached query result entries of related/lookup items.

- Type: integer
- Default value: 15000
- Location: Add the property to the System Property [sys_properties] table.

**Note:** If there is a memory issue due to optimization related to using local cache, set the **glide.identification_engine.related_items_local_cache_count** and the **glide.identification_engine.dependent_items_local_cache_count** properties to 0.
**glide.identification_engine.skip_duplicates**

Controls how identification processes a small set of duplicate CIs.

- **When true:** If the number of duplicate CIs is less than the threshold specified by `glide.identification_engine.skip_duplicates.threshold`, then one of the duplicate CIs is picked as a match and gets updated. The rest of the duplicate CIs are tagged as duplicates.
- **When false:** Matching a CI fails, and an error is logged.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

**glide.identification_engine.skip_duplicates.threshold**

Maximum number of CIs that can be in a set of duplicate CIs to allow identification to process the duplicate CIs according to the setting of `glide.identification_engine.skip_duplicates`. If the number of duplicate CIs exceeds the threshold, then identification processes the duplicate CIs as if `glide.identification_engine.skip_duplicates` is set to false, regardless of the setting.

- Type: integer
- Default value: 5
- Location: Add the property to the System Property [sys_properties] table.

**glide.identification_logs.max_run_ids**

Maximum number of log runs that can be displayed when navigating to Configuration > Identification Logs.

- Type: integer
- Default value: 1000
- Location: Configuration > CMDB Properties > Identification/Reconciliation Properties.

**glide.image_provider.security_enabled**

Controls the security settings for images. If true, images are visible only to authenticated and authorized users. If false, images are visible to anyone with a URL to the attachment.

- Type: true | false
- Default value: true
- New/zbooted instances: property is present and set to true
- Upgraded instances: false if property is not present, unchanged if property is present
- Location: System Property [sys_properties] table

**glide.imap.secure**

Enables (true) or disables (false) SSL encryption for connections to the IMAP server.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.imap.secure_port**

 Specifies the communications port for IMAP secure connections.

- Type: string
• Default value: 995
• Location: Add the property to the System Property [sys_properties] table.

**glide.imap.tls**
Enables (true) or disables (false) starting the IMAP server in Transport Layer Security (TLS) mode.
• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.import.debug**
Enables (true) or disables (false) debug logging for all import processes.
• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.import.error_message.generic**
Enables (true) or disables display (false), failed imports to display a generic error instead of a verbose SQL message. This property should be enabled.
• Type: true | false
• Default value:
  • New/zbooted instances: true for starting with Istanbul
  • Upgraded instances: false
• Location: System Property [sys_properties] table

**glide.import.excel.use_only_user_session_date_format**
If true, any Date or Date/Time value in an Excel spreadsheet is converted to a user session date format in the staging table upon Excel file import.
If false, any Date/Time explicit cell type in Excel is imported into a staging table with the user session date format, and any date value that is not explicitly in a Date/Time cell type in Excel is imported into a staging table using the system date format.
• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table if you want to change the value to false.

**glide.import.sftp.debug**
Enables (true) or disables (false) additional debug logging for SFTP imports. Enabling this property causes the instance to log all outgoing and incoming messages during the SSH session.
• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.importscp.debug**
Enables (true) or disables (false) additional debug logging for SCP imports. Enabling this property causes the instance to log all outgoing and incoming messages during the SSH session.
• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.import_set.preserve.leading.spaces**

Specifies whether the import process preserves leading spaces in Excel data cells (true) or not (false). When false, the import process removes leading spaces from Excel data cells.

Note: The import process always removes trailing spaces from Excel data cells.

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.import_set_row.dynamically_add_fields**

Specifies whether an import set can add new columns to the staging table (true) or not (false). Instances that contain large numbers of import sets can sometimes become unresponsive when an import adds a column because the instance must alter every row in the staging table. Sometimes the database alter table action causes an outage. Setting this property to false prevents an import set from adding columns to the staging table and produces a log message. As a workaround, administrators can manually add a column to the staging table by creating a new dictionary entry and then reimporting the import set.

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.ir.query_method**

Sets the query method for global text search. Only the Simple query method is supported.

• Type: choice list
• Default value: simple
• Location: System Properties > Global Text Search

**glide.integration.session_timeout**

Length of time, in minutes, that an inactive integration session is maintained before the session times out.

• Type: integer
• Default value: 1
• Location: Add the property to the System Property [sys_properties] table.

**glide.invalid_query.returns_no_rows**

Controls how invalid GlideRecord queries are handled with respect to invalid or undefined field names. When this property is true, invalid queries containing invalid or undefined field names always return no rows. When this property is false (default), if a query is incorrect, and includes invalid or undefined field names, the invalid part of the query condition is ignored and results are based on the valid part of the query.

To override this logic at the session level, execute `gs.getSession().setStrictQuery(false)`. To restore strict query, execute `gs.getSession().setStrictQuery(true)`. To use this property, change the line `gr.addQuery('table', arguments.length == 1 ? record.getRecordClassName() :`
gr.addQuery('table', (tableName) ? tableName : record.getRecordClassName() );

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

glide.itil.assign.number.on.insert

Controls whether (true) or not (false) a task number is generated and assigned on load (Create New) or when the task is submitted. This feature helps prevent unused task numbers.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.jdbcprobeloader.retry

Sets the number of times a JDBC probe attempts to connect to a JDBC data source.

- Type: integer
- Default value: 60
- Location: Add the property to the System Property [sys_properties] table.

glide.jdbcprobeloader.retry_millis

Sets the number of milliseconds a JDBC probe waits between retry attempts to a JDBC data source.

- Type: integer
- Default value: 5000
- Location: Add the property to the System Property [sys_properties] table.

glide.jquery.legacy

When true, enables legacy Jquery behavior. When false, integrates the Jquery 1.12.3 and 2.2.3 security patches. If you set this property to false, UI pages with incorrect HTML markup may render incorrectly. You can address this issue in your scripts by closing any html element tags that are self-closing and not in the valid list. For example, change <div /> to <div></div>. Valid self-closing elements that do not need to be updated include:

- <area />
- <base />
- <br />
- <col />
- <embed />
- <hr />
- <img />
- <input />
- <link />
- <meta />
- <param />
- <source />
- <track />
- <wbr />

- Type: true | false
- Default value: true
• Location: System Property [sys_properties] table

**glide.knowman.search.apply_role_based_security**

If **true**, honors read access of knowledge bases or articles specified for roles. If **false**, enables specified user criteria to override read access specified for roles.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

**glide.knowman.search.character_limit**

Minimum number of characters required for knowledge search. Search terms with fewer than this number of characters return no results.

- Type: integer
- Default value: 3
- Location: System Property [sys_properties] table

**glide.knowman.search.default_language**

(Knowledge Management Internationalization Plugin v2) Default language for knowledge articles. If empty, defaults to the language of the logged-in user.

- Type: string
- Default value: empty
- Location: System Property [sys_properties] table

**glide.knowman.show_language_option**

(Knowledge Management Internationalization Plugin v2) Specifies whether the **Language** box appears (true) or is hidden (false) on articles with multiple translations.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.knowman.show_language_option.roles**

(Knowledge Management Internationalization Plugin v2) Comma-separated list of roles that can see the Language box on articles with multiple translations.

- Type: string
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

**glide.knowman.show_links**

Specifies whether the **Link** line appears (true) or is hidden (false) in a knowledge article.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

**glide.ldap.allow_empty_group**

Specifies whether all members can be removed from an Active Directory security group (true) or not (false).
• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

**glide.ldap.binary_attributes**

Comma-separated list of LDAP attributes that should be converted from binary format to encoded64 strings. If you set this property, only the values listed are converted. The most common attributes are objectSID and objectGUID. These converted values are unique and can be used as the coalesce field on the LDAP import mapping. If this property is blank, ServiceNow tries to map these binary attributes without the conversion and they are not guaranteed to be unique since they are not properly converted to string values.

• Type: string
• Default value: objectsid,objectguid
• Location: System Property [sys_properties] table

**glide.ldap.paging**

 Enables (true) or disables (false) LDAP paging query support. LDAP paging is a more efficient LDAP querying method for environments with more than 1000 users.

• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**glide.legacy.excel.export**

 Enables (true) or disables (false) exporting to XLS format when exporting to an Excel file. By default, only XLSX export is enabled. This property does not affect the Excel web service. When true, this property also allows users to select XLS or XLSX as the Easy Import template format.

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.list.filter_max_length**

Sets a maximum character limit for the condition builder query.

• Type: integer
• Default value: 0
• Location: System Property [sys_properties] table

**glide.lists.live_list_enabled**

Enables a list refresh prompt.

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

**glide.live_feed.company_feed_exclude_groups**

Controls whether messages posted to a public group appear (true) or are omitted (false) on the Company Feed.

• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

glide.live_services
(Chat plugin) Enables (true) or disables (false) Live Services, such as chat support.
• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

glide.login.no_blank_password
Prevents (true) or allows (false) logins from users with blank passwords. Often, importing lists of users creates many users with blank passwords. By default, this property is set to true on production instances.
• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

glide.login.home
Sets the default homepage that users see after login. If blank, the last page visited is used. The format is <page>.do.
• Type: string
• Default value: home.do
• Location: System Property [sys_properties] table

glide.max_journal_list_size
Sets the maximum size, in megabytes, of journal input fields.
• Type: integer
• Default value: 10
• Location: Add the property to the System Property [sys_properties] table.

glide.messaging.reassign.enabled
Sets property that automatically reassigns messaging if the current agent is unavailable.
• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

glide.notification.recipient.include_logging
Master switch to enable/disable logging all reasons a recipient was included. If false, no include logging is performed.
• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

glide.notification.recipient.exclude_logging
Master switch to enable/disable logging all reasons a recipient was excluded. If false, no exclude logging is performed.
• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

**glide.notification.recipient.exclude_logging.device_inactive**
Logs recipients who are excluded because their chosen notification device record is marked as inactive.

• Type: true | false
• Default value: true

The glide.notification.recipient.exclude_logging property in the System Properties > Email module must be enabled to modify this property.

**glide.notification.recipient.exclude_logging.device_schedule**
Logs recipients who are excluded because the chosen notification device record’s schedule field excludes it.

• Type: true | false
• Default value: true

The glide.notification.recipient.exclude_logging property in the System Properties > Email module must be enabled to modify this property.

**glide.notification.recipient.exclude_logging.event_creator**
Logs recipients who are excluded because they initiated the notification event, such as updating an incident record, and the Send to Event Creator check box is cleared on the notification record.

• Type: true | false
• Default value: true

The glide.notification.recipient.exclude_logging property in the System Properties > Email module must be enabled to modify this property.

**glide.notification.recipient.exclude_logging.invalid_email**
Logs recipients who are excluded because the email address for that user is invalid, for example the @ is missing, or empty.

To modify this property, you must enable the glide.notification.recipient.exclude_logging property in the System Properties > Email module.

• Type: true | false
• Default value: true

**glide.notification.recipient.exclude_logging.user_calendar_integration_disabled**
Logs recipients of calendar invitations who are excluded because the Calendar Integration field is set to None on the user record.

• Type: true | false
• Default value: true

The glide.notification.recipient.exclude_logging property in the System Properties > Email module must be enabled to modify this property.

**glide.notification.recipient.exclude_logging.user_inactive**
Logs recipients who are excluded because the Active check box is cleared on the user record.

• Type: true | false
• Default value: true

The `glide.notification.recipient.exclude_logging` property in the [System Properties > Email](#) module must be enabled to modify this property.

### glide.notification.recipient.exclude_logging

Logs recipients who are excluded because the [Notification](#) field is set to [Disabled](#) on the user record.

To modify this property, you must enable the `glide.notification.recipient.exclude_logging` property in the [System Properties > Email](#) module.

- **Type:** true | false
- **Default value:** true

### glide.notification.recipient.include_logging

Enables or disables logging all reasons that a recipient was included. This property is a master switch. If **true**, the subsequent properties dealing with the inclusion of logging are enabled. If **false**, none of the subsequent properties relating to the inclusion of logging are enabled.

### glide.notification.recipient.include_logging.delegate

Logs recipients who are included because they are delegates of another user.

- **Type:** true | false
- **Default value:** true

The `glide.notification.recipient.include_logging` property in the [System Properties > Email](#) module must be enabled to modify this property.

### glide.notification.recipient.include_logging.event_parm

Logs recipients who are included because they are in the `parm1` or `parm2` fields of the event record.

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the [System Properties > Email](#) module.

- **Type:** true | false
- **Default value:** true

### glide.notification.recipient.include_logging.recipient_fields

Logs recipients who are included via a notification target record, such as an incident record, specified in the [Users/Groups in Field](#) field for the notification record. The `recipient_fields` are fields in the target record that contain a recipient to add. For example, if the record that triggered the notification is an incident, and the `assigned_to` field for the incident is listed in `recipient_fields`, that user is included as a recipient.

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the [System Properties > Email](#) module.

- **Type:** true | false
- **Default value:** true

### glide.notification.recipient.include_logging.recipient_groups.group_email

Logs recipients who are included in a group email for any group provided in the notification record’s `recipient_groups` or the event `parm1` or `parm2` field.
To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties > Email** module.

- **Type:** true | false
- **Default value:** true

**glide.notification.recipient.include_logging.recipient_groups.manager**

Logs recipients who are included because they manage any group provided in the notification record’s `recipient_groups` or the event `parm1` or `parm2` field.

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties > Email** module.

- **Type:** true | false
- **Default value:** true

**glide.notification.recipient.include_logging.recipient_groups.membership**

Logs recipients who are included via membership in any group provided in the notification record `recipient_groups` or the event `parm1` or `parm2` field.

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties > Email** module.

- **Type:** true | false
- **Default value:** true

**glide.notification.recipient.include_logging.recipient_users**

Logs recipients who are included via notification record’s `Users` field (`recipient_users`).

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties > Email** module.

- **Type:** true | false
- **Default value:** true

**glide.notification.recipient.include_logging.subscription**

Logs recipients because they are subscribed via User Notification Preferences.

To modify this property, you must enable the `glide.notification.recipient.include_logging` property in the **System Properties > Email** module.

- **Type:** true | false
- **Default value:** true

**glide.pdf_export_from_form_list.show_report_attrs**

Enables or disables displaying the PDF page header for all PDFs generated from a list.

- **Type:** true | false
- **Default value:** true
- **Location:** System Property [sys_properties] table

**glide.pdf.max_rows**

Sets the maximum number of rows in an exported PDF file.

- **Type:** integer
- Default value: 1000
- Location: Add the property to the System Property [sys_properties] table.

**glide.pdf.font.size**

Sets the font size for exported PDF files.
- Type: integer
- Default value: 8
- Location: Add the property to the System Property [sys_properties] table.

**glide.pg.any_rejection_rejects**

Controls the default process guide rejection handling. If `true`, the first rejection rejects the entity. If `false`, all users must reject the approval.
- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

**glide.phone_number_e164.allow_national_entry**

When `true`, users can enter phone numbers in the local format listed in the territory selector. When `false`, users must enter phone numbers in the international format listed in the territory selector.
- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

**glide.phone_number_e164.display_national**

When set to `true` or `form`, a Phone Number (E164) field displays phone numbers in a local format on forms but as an international format on lists. When set to `all`, a Phone Number (E164) field always displays phone numbers in a local format. When set to user, a Phone Number (E164) field only displays phone numbers in a local format when the phone number matches the locale setting of the current user.
- Type: string
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.phone_number_e164.display_territory_selector**

Specifies whether to display (true) or hide (false) the territory selector. Hiding the territory selector restricts users to entering only local or national phone numbers.
- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

**glide.phone_number_e164.display_territory_text**

When set to all, a Phone Number (E164) always displays the territory label. When set to national, a Phone Number (E164) displays the territory label only if the phone number is in local format. When set to read-only, a Phone Number (E164) displays the territory label in read-only mode regardless of whether the number is in local or global format. When set to read-only-national, a Phone Number (E164) displays the territory label in read-only mode only if the number is in local format. When set to list, a Phone Number (E164) displays the territory label in a list. When set to list-national, a Phone Number (E164) displays territory label in a list if the number is in national format. When set to none, a Phone Number (E164) does not display the territory label.
• Type: string
• Default value: read-only
• Location: Add the property to the System Property [sys_properties] table.

**glide.phone_number_e164.display_users_idd**

Specifies whether to display the international direct dialing prefix between the territory selector and the input box on forms (true) or not (false).

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.phone_number_e164.strict**

Specifies whether all phone number fields must match the display format of the field's select territory. When true, the phone number input box displays a red line underneath phone numbers that do not match the territory format listed in the territory selector. Users cannot save an invalid phone number. When false, the phone number input box displays a green line underneath phone numbers that do not match the territory format listed in the territory selector. Users can save an invalid phone number, and the territory selector offers the option to select an Other / Unknown territory format.

• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

**glide.pop3.ignore_headers**

Specifies the comma-separated list of email headers that cause the instance to ignore an email message. Use the format name:value to specify email header types and values. You can use a wildcard (*) for the subtype. For example, Content-Type:multipart/*; report-type=delivery-status; ignores emails containing a type of multipart and a parameter of report-type=delivery-status. For syntax specifications, see http://www.w3.org/Protocols/rfc1341/4_Content-Type.html.

• Type: string
• Default value: Auto-Submitted:auto-replied,X-FC-MachineGenerated:true,Content-Type:multipart/report; report-type=delivery-status;
• Location: System Properties > Email

**glide.pop3.ignore_senders**

Specifies the comma-separated list of senders that cause the instance to ignore an email message. Enter only the name before the at (@) sign.

• Type: string
• Default value: mailer-daemon, postmaster
• Location: System Properties > Email

**glide.pop3.ignore_subjects**

Specifies the comma-separated list of strings that cause the instance to ignore an email message if they are present at the start of a subject line. Values are case-insensitive.

• Type: string
• Default value: out of office autoreply, undeliverable:, delivery failure:,returned mail:,autoreply
• Location: System Properties > Email
**glide.pop3.parse_end**

[Legacy] Text indicating the end of the email body section where the instance should parse name:value pairs to change field values when processing inbound email actions. This property is no longer required to set field values from the email body.

- Type: string
- Default value: none
- Location: System Properties > Email

**glide.pop3.parse_start**

[Legacy] Text indicating the beginning of the email body section where the instance should parse name:value pairs to change field values when processing inbound email actions. This property is no longer required to set field values from the email body.

- Type: string
- Default value: none
- Location: System Properties > Email

**glide.pop3.process_locked_out**

Enables (true) or disables (false) the ability for locked out users to trigger inbound actions.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

**glide.pop3.reply_separators**

Comma-separated list of separators that cause the instance to disregard everything below the text string in the message body. This list is case-sensitive.

- Type: string
- Default value: \n\n-----Original Message-----,\n\n_____ 

From:
- Location: System Properties > Email

**glide.pop3readerjob.create_caller**

Controls the behavior when an instance receives an email from an email address not associated with a user record. If true, the instance creates a new user record for the email address and places that new user in the Caller field of any created tickets. If false, the instance associates the new ticket to the Guest user record.

- Type: true | false
- Default value: false
- Location: System Properties > Email

**glide.processor.json.row_limit**

Specifies the maximum number of rows a JSON query returns.

- Type: integer
- Default value: 250
- Location: Add the property to the System Property [sys_properties] table.

**glide.product.description**

The value of this property is displayed as text in the banner next to the company logo.
- Type: string
- Default value: Service Management
- Location: System Properties > Basic Configuration UI16

**glide.product.help_url**

Global setting for the URL that the help icon goes to. Value must be empty for context-sensitive help to work.

**glide.product.help_show**

Controls whether the help icon, help.gifx, appears in (true) or is omitted from (false) the welcome banner.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

**glide.product.image.light**

The Banner image displayed for UI16 Interface.

- Type: uploaded image
- Default value: none
- Location: System Properties > Basic Configuration UI16

**glide.product.icon**

Stores the favicon image displayed in bookmarks, tabs, and the browser address bar.

- Type: image
- Default value: favicon.ico?v=4
- Location: System Properties > System

**glide.product.name**

Specifies text to use in place of Service-now.com in the browser top title bar (and in browser tabs). This text is duplicated in the banner to the right of the logo unless you add display: none; to the end of the value field within the glide.product.name.style property.

- Type: string
- Default value: ServiceNow
- Location: System Property [sys_properties] table

**glide.product.name.style**

Specifies the CSS properties used to display the glide.product.name text in the banner to the right of the logo. To not display the text, add display: none; to the end of the value field in this property.

- Type: string
• Default value: padding-bottom: 0px; padding-top: 0px;
• Location: System Property [sys_properties] table

glide.quota.manager.debug
Controls whether to display (true) or hide (false) additional information related to the Quota Manager, such as running transactions, canceled transactions, and which quotas are matched to transactions.
• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

glide.quota.manager.heartbeat
Sets the number of seconds between the start of each Quota Manager heartbeat. This value determines how often the Quota Manager checks for transactions exceeding a quota and how often the Quota Manager writes status in the log file.
• Type: integer
• Default value: 1
• Location: Add the property to the System Property [sys_properties] table.

glide.quota.manager.minimum_transaction_time
Sets the minimum number of seconds that a transaction must run before the Quota Manager matches it to a transaction quota. You should set this value to at least 1 second because smaller values decrease performance, and because transactions shorter than 1 second are probably not worth canceling. For optimal performance, set this value to the value of your most restrictive quota. For example, if your most restrictive quota cancels transactions longer than 1 minute, set the minimum transaction time to 60 seconds.
• Type: integer
• Default value: 1
• Location: Add the property to the System Property [sys_properties] table.

glide.reconciliation.override.null
Flag for allowing or disallowing the update of an empty field by a lower priority data source.
• Type: true | false
• Default value: true
• Location: System Properties [sys_properties] table

glide.remote_glide_record.max_count
Control the maximum number of records that the GlideRecord query method returns when using the SOAP web service. The instance primarily uses this property to control the records returned when using a Perl API GlideRecord query.

⚠️ Warning: If you set this property to a large value, such as 10000, socket timeout errors might occur with MID Servers. Keep the value of this property less than 1000.
• Type: integer
• Default value: 250
• Location: Add the property to the System Property [sys_properties] table.

glide.report.add_to_list_supported
Sets whether to support the add_to_list ACL for reporting on specified columns from the Available columns list when creating or sharing a list report.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

**glide.report.calendar.max_more_events_per_day**

Specifies the maximum number of calendar events that can appear in the + <number> pop-up for:

- A calendar day when calendar is in month or year view
- The top 'full day' section of a calendar day when a calendar is in day or week view

When this number is exceeded, a + many link appears, which opens a list of events instead of a pop-up. For more information about the maximum number of events that can be displayed in a calendar day, see system property **glide.report.calendar.max_events_displayed_per_cell**.

- Type: integer
- Default value: 30
- Location: Add the property to the System Property [sys_properties] table.

**glide.report.calendar.max_events_displayed_per_cell**

Defines the maximum number of events that can appear in calendar report for:

- A calendar day when calendar is in month or year view
- The top 'full day' section of a calendar day when a calendar is in day or week view

Events that exceed this value are visible via a link in the calendar cell. See **glide.report.calendar.max_more_events_per_day** for more information.

- Type: integer
- Default value: 3
- Location: Add the property to the System Property [sys_properties] table.

**glide.report.new_calendar**

Enables (true) or disables (false) new calendar reports. Internet Explorer 7 and 8 do not support new calendars. If you open a calendar report in one of these browsers, the old version of calendar reports is always used.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

**glide.report_home.group_report.show_usr_grp**

Enables (true) or disables (false) the Reporting preferences link in the user profile.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

**glide.required.attribute.enabled**

Flag for enforcing required attributes (cannot be null) during identification and reconciliation.

- Type: true | false
• Default value: true
• Location: System Properties [sys_properties] table.

**glide.rest.apis.disabled**

Controls which REST APIs are available on the instance, along with glide.rest.apis.enabled. The value for this property is a comma-separated list of API names, such as Table API or Aggregate API. If neither this property nor glide.rest.apis.enabled is set, all REST APIs are available. If a particular API is specified in both properties, that API is disabled. If you disable specific APIs without explicitly enabling any APIs, all REST APIs except the disabled APIs are available.

• Type: string
• Default value: all REST APIs are enabled by default
• Location: System Property [sys_properties] table

**glide.rest.apis.enabled**

Controls which REST APIs are available on the instance, along with glide.rest.apis.enabled. The value for this property is a comma-separated list of API names, such as Table API or Aggregate API. If neither this property nor glide.rest.apis.disabled is set, all REST APIs are available. If a particular API is specified in both properties, that API is disabled. If you enable specific APIs, only those APIs are available.

• Type: string
• Default value: all REST APIs are enabled by default
• Location: Add the property to the System Property [sys_properties] table.

**glide.rest.choice.allow_non_existing_value**

Enables passing non-existing values to a choice field.

• Type: true | false
• Default value: false

  If true, the choice field is set to a passed value, even if the passed value does not exist in the choice field.
• Location: Add the property to the System Property [sys_properties] table.

**glide.rest.debug**

Logs all stages of REST processing, including processing times.

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.rollback.version**

Controls whether rollback behavior is used (true) or not (false).

• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

**glide.rss.max_rows**

Controls the maximum number of records returned by the RSS Feed Generator.

• Type: integer
• Default value: 1000
• Location: Add the property to the System Property [sys_properties] table.

**glide.sc.reset_cascade**

If **true**, forces variable cascading when navigating between pages in an order guide.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

**glide.schedules.repeat_nth**

Controls how a schedule entry with **Repeats** set to **Monthly** and **Monthly Type** set to **Day of the Week** is defined. Choices are **Week** or **Day**. The **Week** option is defined as choosing a day of the month in the nth week selects the nth day of the month. The **Day** option is defined as choosing the nth day of the month selects the nth day of the month.

- Type: choice list
- Default value: day
- Location: System Property [sys_properties] table

**glide.schedules.fifth**

Controls how a schedule entry that selects the fifth occurrence of a day in month behaves in a month containing only four occurrences of the day. Choices are **Last**, **Next**, and **Strict**. The **Last** option selects the last (fourth) occurrence of the day. The **Next** option selects the first day of the next month. The **Strict** option skips the day completely. This property is valid only when the **glide.schedules.repeat_nth** property is set to **Day**.

- Type: choice list
- Default value: last
- Location: System Property [sys_properties] table

**glide.script.ccsi.ispublic**

Provides privacy control over client-callable script includes that are accessed by public pages. If **false**, all client-callable script includes are private.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.script.log_level**

Controls the behavior of gs.log. Set this property to **none** to disable Glide script logging, or to **print** to save log data to the file system instead of the database. Use the default value **all** to save all Glide script logs to the database.

- Type: string
- Default value: all
- Location: Add the property to the System Property [sys_properties] table.

**glide.script_processor.admin**

Specifies the user role necessary to access the Scripts - Background module. To require administrators to elevate privileges to access the module, set the value to **security_admin**.

- Type: string
- Default value: admin
• Location: Add the property to the System Property [sys_properties] table.

**glide.script.vtable.log.debug**

Enables use of debug logs for remote table script definitions. Set this property to **true**. Prolonged use of this property can affect performance, so it is best to set its value to **false** when you finish a debugging session.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.search.suggestions.enabled**

Set it to **true** (default) to enable search suggestions, or set it to **false** to disable search suggestions everywhere. For more information about search suggestions, see Enable search suggestions.

**glide.secondary.query.sysid**

Controls whether a secondary sort using sys_id as a sort key is automatically applied when sorting requested database records on a list. This property is useful when sorting records that have multiple records found for a single value of the primary sort key. Use this property to ensure that the [Next / Previous] buttons on forms display the proper record. If **false**, there is no secondary sort, therefore records with the same primary sort value are returned as they are found in the database and may be inconsistent.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

**glide.security.auto.resubmit.ajax**

Automatically resubmits timed-out Ajax requests.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

**glide.security.checkacl.before.setvalue**

Controls how the high security setting glide.security.strict.updates processes ACLs. When **true**, the instance checks ACL rules for all columns before applying any updates to a row. When **false**, the instance applies ACL rules as each column is processed in alphabetical order. This behavior may result in one update preventing another update from occurring. For example, suppose that you create a custom ACL rule to prevent updates after a record is closed. If you attempt to close an incident and also add information to a custom resolution code field in the same update, the close action is applied first because it is controlled by the [incident.state] column and the custom field by the [incident.u_resolution_code] column. After the instance applies the close action, the custom ACL rule prevents further write updates to the row.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

**glide.security.csrf.handle.ajax.timeout**

Handles errors for timed out Ajax requests.

- Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

**glide.security.csrf.strict.validation.mode**

Enforces strict validation on CSRF tokens so that users cannot resubmit a request if the CSRF token does not match.

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table
• Instance Security Hardening Settings: CSRF strict validation (instance security hardening)

**glide.security.diag_txns_acl**

Controls who can view the stats.do, threads.do, and replication.do pages. If **true**, only administrators or users from a known IP address are allowed to view the pages. If **false**, all users have access to the pages.

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.
• Instance Security Hardening Settings: Performance monitoring (ACL) (instance security hardening)

**glide.security.disable_ui_pages_sysparm_client_script**

The system does not evaluate client scripts that are passed in URL parameters in UI pages. If you use URL parameters to load client scripts, you can add and disable this system property. Use this property only while you change the implementation to no longer depend on clients being passed in by URL parameters. Do not keep the system property disabled.

• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

**glide.security.mime_type.aliasset**

Creates customized mime type alias sets. For example, `image/png=image/x-png`.

• Type: string
• Location: Add the property to the System Property [sys_properties] table.

**glide.security.granular.create**

Requires users to have write access on all individual fields on a table before they can create a record in that table.

• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**glide.security.file.mime_type.validation**

Enables (**true**) or disables (**false**) MIME type validation for file attachments.

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table
• Instance Security Hardening Settings: Upload MIME type restriction (instance security hardening)
glide.security.strict_elevate_privilege

Forces all elevated roles to be treated equally for users with the administrator role. When enabled, administrators must explicitly, manually elevate themselves to any roles that are marked as elevated.

When disabled, administrators need only to manually elevate to the security_admin role. Other roles are automatically granted to administrators.

- Type: true | false
- Default value: true for new instances, false for upgraded instances
- Location: For new instances, this property is available on the System Property [sys_properties] table. For upgrades, Add the property to the System Property [sys_properties] table.

glide.service_portal.search_as_you_type_behavior

Select search suggestions (Suggestions) or type-ahead functionality (Typeahead). For more information about search suggestions, see Enable search suggestions.

glide.set_x_frame_options

Enables (true) or disables (false) the X-Frame-Options response header to SAMEORIGIN for all UI pages. The X-Frame-Options HTTP response header can be used to indicate whether a browser should be allowed to render a page in a <frame> or <iframe>. Set this property to true to avoid clickjacking attacks, by ensuring that CMS content cannot be embedded into other sites.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: X-Frame-Options: SAMEORIGIN (instance security hardening)

glide.short_poll_delay

(Chat plugin) Sets the short polling delay, in milliseconds, for XMPP requests. Polling is the method by which the browser gets information from the server to send instant messages in chat.

- Type: integer
- Default value: 1000 (1 second)
- Location: Social IT > Chat Administration > Properties

glide.shortened_journal_length

Sets the number of characters to display as a preview of journal input fields.

- Type: integer
- Default value: 512000
- Location: Add the property to the System Property [sys_properties] table.

glide.smtp.dateformat

Specifies the date format to use for outgoing email notifications

- Type: string
- Default value: date format [sys_user.date_format] listed in the user record of the email sender.
- Location: Add the property to the System Property [sys_properties] table.

glide.smtp.default_retry

Enables (true) or disables (false) resending email when an unknown SMTP error code is encountered. The instance recognizes only the SMTP error codes defined in the glide.smtp.defer_retry_ids property.
• Type: true | false
• Default value: true
• Location: **System Properties > Email**

### glide.smtp.defer_retry_ids
Specifies the comma-separated list of SMTP error codes that force the instance to resend email.

- Type: string
- Default value: 421,450,451,452
- Location: **System Properties > Email**

### glide.smtp.fail_message_ids
Specifies the comma-separated list of SMTP error codes that prevent the instance from resending email.

- Type: string
- Default value: 500,501,502,503,504,550,551,552,553,554
- Location: **System Properties > Email**

### glide.smtp.timeformat
Specifies the time format to use for outgoing email notifications.

- Type: string
- Default value: time format listed in email sender's user record [sys_user.time_format]
- Location: Add the property to the System Property [sys_properties] table.

### glide.soap.allow_null_numeric_output
When **true**, SOAP XML responses return an empty element for numeric fields with no value. When **false**, numeric fields with no value return a value of 0 in the SOAP response.

**Note:** The property **glide.wsdl.show_nillable** must be **true** to allow null values in SOAP responses.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

### glide.soap.default_security_policy
Specifies the name of SOAP security policy the instance uses when enforcing Web Services Security (WSS) for inbound requests.

- Type: string
- Default value: default security policy
- Location: Add the property to the System Property [sys_properties] table.

### glide.soap.import_set_insert Serialized
Controls the processing of web service inserts. If **true**, the instance processes multiple simultaneous inserts one at a time (serially across nodes) to ensure an accurate transform. Serialized processing slows the speed at which the instance processes inserts. If **false**, multiple simultaneous inserts into an import set table result in simultaneous transforms that may produce duplicate target records due to the coalesce value being created at the same time.
**Note:** Set this value to `false` only to optimize performance when the related transform map does not have a coalesce value that may be present simultaneously.

- **Type:** true | false
- **Default value:** true
- **Location:** Add the property to the System Property [sys_properties] table.

### glide.soap.request_processing_timeout

Sets the maximum number of seconds that a SOAP request has to finish processing before the connection times out. This property computes a default value from the value of the property `glide.http.timeout` divided by 1000. There might be network infrastructure (such as proxy servers) in place that implements a shorter timeout. In this case, a socket timeout may occur unless this property is set to a shorter value. In general, you should set this property to a value several seconds less than the shortest socket inactivity timeout in effect anywhere in the network path between the client application and the ServiceNow instance.

- **Type:** integer
- **Default value:** 175 (value of `glide.http.timeout` divided by 1000)
- **Location:** System Property [sys_properties] table

### glide.source_control.checksum_required

This property allows you to enable optional checksum validations and sanitizations. When set to `true`, continues to throw an error if the checksum validation of application files fails. This action prevents application developers on your instance from importing application files from source control that have been modified outside of an instance.

- **Type:** true | false
- **Default value:** false
- **Location:** System Property [sys_properties] table

### glide.source_control.checksum_quick_install

When set to `true`, bypasses the sanitization step(s) if the checksum matches. This action prevents an application developer from waiting for validation/sanitization steps to be processed if application files linked to a source control repository outside of your instance weren't modified.

- **Type:** true | false
- **Default value:** true
- **Location:** System Property [sys_properties] table

### glide.source_control.default_branch_name

Sets the default GIT repository branch to work in for application files linked to source control.

- **Type:** string
- **Default value:** sn_instances/<instance_name>
- **Location:** System Property [sys_properties] table

### glide.spell.dictionary.en

Sets the spell checker dictionary used in the system for English users. Dictionaries are available for Brazilian Portuguese (pb.dic), Czech (cs.dic), Dutch (nl.dic), English US (en.dic), English UK (en_uk.dic), Estonian (et.dic), Finnish (fi.dic), French (fr.dic), German (de.dic), Hebrew (he.dic), Hungarian (hu.dic), Italian (it.dic), Polish (pl.dic), Portuguese (pt.dic), Russian (ru.dic), Spanish (es.dic), and Thai (th.dic).

- **Type:** choice list
- **Default value:** en.dic (English US)
• Location: System Property [sys_properties] table

**glide.spell.dictionary.max_matches**

Specifies the maximum number of spelling errors that the spell-check should detect. By default, spell-check finds only 10 spelling errors. The instance ignores any additional errors after reaching the maximum value.

• Type: integer
• Default value: 10
• Location: System Property [sys_properties] table.

**glide.sys.activity_using_audit_direct**

[Not Supported] Controls whether the record’s history is generated using the Audit table (true) or not (false). [Required] Set the value to false to generate history with History Sets.

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

**glide.sys.audit_inserts**

Specifies whether the Audit table audits inserts (true) or not (false).

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

**glide.sys.date_format**

System date format for all users unless overridden in the user record.

• Type: date format
• Default value: yyyy-MM-dd
• Location: System Properties > Basic Configuration U116

**glide.sys.default.tz**

System timezone for all users unless overridden in the user's record.

• Type: timezone
• Default Value: none
• Location: System Properties > Basic Configuration U116

**glide.sys.domain.domain_change_notify**

Domain legacy

• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**glide.sys.domain.no_change_roles**

Domain legacy

• Type: string
• Default value: This field should be left empty.
• Location: System Property [sys_properties] table

**glide.sys.domain.use_record_domain**

Domain legacy
- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

**glide.sys.domain.use_record_domain_for_client_scripts**

Domain legacy
- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

**glide.sys.time_format**

System time format for all users unless overridden in the user's record.
- Type: time format
- Default Value: HH:mm:ss
- Location: System Properties > Basic Configuration UI16

**glide.sys_reference_row_check**

Specifies whether the script conditions of Access Control Rules apply to a table's reference fields (true) or not (false).
- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.template.max_context**

Specifies the maximum number of templates displayed in a form's context menu. If more than this number are available, users can click Apply Template on the context menu to open the reference list of templates.
- Type: integer
- Default value: 15
- Location: System Property [sys_properties] table

**glide.transform.reuse_coalesce_field_value**

If true, avoid re-evaluation of coalesce scripts to get the values.
- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

**glide.translate.learn**

Enables (true) or disables (false) adding the current language suffix to UI elements such as labels and messages. Enabling the language suffix assists with translating new customizations.
- Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.ts.index.attachment.debug**

If `true`, enables log messages for exceptions that occur when indexing attachments. You can leave this property enabled during normal operations to capture stack trace information about any exceptions.

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.ts.index.attachment.list_terms.debug**

If `true`, the system logs all indexed terms when an attachment is indexed.

For optimal performance, set this property to `false` during normal operations. Only enable this property when you are actively debugging an issue.

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.ts.reindex.sys_metadata.after.upgrade**

If `true`, the system automatically reindexes the sys_metadata table after an upgrade, without noticeable performance impact. To disable automatic reindexing, set the value to `false`.

• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

**glide.ui.activity.displayname**

Specifies whether the activity formatter shows `name` values (true) or `user_name` values (false).

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.ui.activity.email_roles**

Specifies the list of roles (comma-separated) that can view email in the Activity Formatter.

• Type: string
• Default value: itil
• Location: Add the property to the System Property [sys_properties] table.

**glide.ui.activity.email.use_display**

Specifies whether to display the email address or the user IDs (display value of the User table) in email headers (`true`) or not (`false`). If `true`, the instance searches for a user record with a matching email address. If the instance cannot find a matching user record, it displays the email address.

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.
glide.ui.activity_stream.form_button
Removes the activity stream button from forms.
- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity_stream.list_button
Removes the activity stream button from lists.
- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

glide.ui.activity_stream.page_size
Size of pages for UI16 form activity stream. A value of 0 means no paging.
- Type: integer
- Default value: 0
- Location: Still appears in the System Properties [sys_properties] table, but is no longer available.

glide.ui.activity_stream.scale_animated_gifs
Creates a thumbnail of animated .gif files. The maximum dimensions are 525 px width and 350 px height. The animation is not preserved in the thumbnail, but previewing the image displays the animation at its original size.
- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.ui.activity_stream.scale_images
Creates a thumbnail of large images to display in the activity stream. The maximum dimensions are 525 pixels wide and 350 pixels high. If the user clicks the image or attachment, the preview is at full size.
- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.ui.activity_stream.style.comments
Changes the color of the left bar in activity stream comments in UI16.
- Type: color entry, either a name, such as blue or a code, such as #0000FF.
- Default value: transparent
- Location: System Property [sys_properties] table

glide.ui.activity_stream.style.work_notes
Changes the color of the left bar in activity stream work notes in UI16.
- Type: color entry, either a name, such as blue or a code, such as #0000FF.
- Default value: gold
- Location: System Property [sys_properties] table
`glide.ui.activity.style.comments`
Changes the background color of the activity stream comments in UI15.
- Type: string
- Default value: background-color: background-color: WhiteSmoke
- Location: System Property [sys_properties] table

`glide.ui.activity.style.work_notes`
Changes the background color of the activity stream work notes in UI15.
- Type: string
- Default value: background-color: LightGoldenRodYellow
- Location: System Property [sys_properties] table

`glide.ui.allow.field.dependency.for.templates`
Checks dependency for choice fields at the time of applying template, preventing invalid values to be set to the dependent field. For example, a subcategory field which depends on category field.
- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

`glide.ui.allow_deep_html_validation`
Allows administrators to prevent users from saving invalid HTML in a journal field.
- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

Add the property to the System Property [sys_properties] table.

`glide.ui.attachment.force_download_all_mime_types`
Forces download of all MIME attachment files.
- Type: true | false
- Default value: true for new instances, false for upgraded instances
- Location: System Property [sys_properties] table
- Instance Security Hardening Settings: Force Download MIME types (instance security hardening)

`glide.ui.audit_deleted_tables`
Comma-separated list of system tables for which the audit history tracks deletions.
- Type: string
- Default value: sys_user, sys_user_group, sys_user_role, sys_user_has_role, sys_user_grmember, sys_group_has_role, sys_security_acl_role
- Location: System Property [sys_properties] table

`glide.ui.auto.recovery`
Allows users to recover unsaved changes while working in the Studio.
- Type: true | false
- Default value: true
• Location: **Auto Recovery > Properties**

**glide.ui.auto.recovery.exclude.field.types**
Comma-separated list of field types to exclude from automatic recovery.

• Type: string
• Default value: none

• Location: **Auto Recovery > Properties**

**glide.ui.auto.recovery.unsupported.field.types**
Comma-separated list of field types no supported for automatic recovery.

• Type: string
• Default value: password,password2,glide_encrypted,video,user_image,image

**glide.ui.auto.recovery.unsupported.tables**
Comma-separated list of tables to exclude from automatic recovery.

• Type: string
• Default value: v_ws_editor

• Location: **Auto Recovery > Properties**

**glide.ui.auto_req.extend.session**
If true, enables the user to extend their user session by selecting a homepage refresh time. If false, it enforces session timeout. The session timeout value is ignored when the user specifies an automatic refresh value.

For example, if the user selects 5 minutes for automatic homepage refresh, the session is renewed every five minutes. By adding this property and setting the value to false, administrators can force the user session to time out even if the user page refreshes every x number of minutes. The user session times out after the value specified in the session timeout, plus the selected refresh value. This property takes effect when the Remember me check box is not selected for the user. Tablet and mobile devices do not support this feature.

• Type: true | false
• Default value: true

• Location: Add the property to the System Property [sys_properties] table.

**glide.ui.buttons_bottom**
Controls whether UI actions appear at both the bottom and top of the form (true) or only at the top (false). This property only works in a deprecated version of the UI.

• Type: true | false
• Default value: false

• Location: System Property [sys_properties] table

**glide.ui.cert_task_activity.fields**
Defines which journal field is the task activity field.

• Type: string
• Default value: work_notes

• Location: Add the property to the System Property [sys_properties] table.

**glide.ui.chart.bar.horiz.max_col_slant_labels**
Sets the maximum number of columns in a horizontal bar chart before slanting (angling) the labels.

- **Type**: integer
- **Default value**: 5
- **Location**: Add the property to the System Property [sys_properties] table.

**glide.ui.chart.height**

Specifies the height of a chart in pixels.

- **Type**: integer
- **Default value**: 300
- **Location**: Add the property to the System Property [sys_properties] table.

**glide.ui.chart.pie.labels**

Enables (true) or disables (false) labels on pie chart slices.

- **Type**: true | false
- **Default value**: true
- **Location**: Add the property to the System Property [sys_properties] table.

**glide.ui.chart.pie.labels.max_items**

Sets the maximum number of pie chart slice values that can be returned to display their labels.

- **Type**: integer
- **Default value**: 8
- **Location**: Add the property to the System Property [sys_properties] table.

**glide.ui.clickthrough.popup**

- For reference fields, enables (true) or disables (false) display of the pop-up diamond icon for reference fields, and opening a new window when clicking the icon.
- For document ID fields, enables (true) or disables (false) displaying the information icon and opening a pop-up window with the document’s form. To learn more Document ID field.

**Note**: Related lists do not appear on forms opened in the pop-up window.

- **Type**: true | false
- **Default value**: false
- **Location**: System Property [sys_properties] table

**glide.ui.clickthrough.replace**

Enables (true) or disables (false) both the pop-up and click-through icons for reference fields.

- **Type**: true | false
- **Default value**: false
- **Location**: System Property [sys_properties] table

**glide.ui.concourse.onmessage_enforce_same_origin_whitelist**

Inclusion list of trusted origins for propagated messages (sent via `window.postMessage()` Web API) in the UI. Origins must include scheme and can be separated by comma, space, or new line. For example: `https://`

- Type: string
- Default: none
- Location: System Property [sys_properties] table

**glide.ui.concourse.onmessage_enforce_same_origin**

Enforces an origin check before propagating a message (sent via `window.postMessage()` Web API) in the UI. If set to `true`, only URLs from ServiceNow are allowed to propagate messages. If set to `false`, all URLs included in `glide.ui.concourse.onmessage_enforce_same_origin_whitelist` can propagate messages in the UI.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

**glide.ui.date_format.first_day_of_week**

Specifies which day of the week that weeks start on for calendar reports (1=Sunday, 2=Monday...).

- Type: integer
- Default value: 1
- Location: System Property [sys_properties] table

**glide.ui.date_picker.first_day_of_week**

Specifies the first (leftmost) day of the week for the date and date/time picker (1=Sunday, 2=Monday...).

- Type: integer
- Default value: 1
- Location: System Property [sys_properties] table

**glide.ui.default.applications**

Comma-separated list of application names that open by default in the navigation pane when nothing is opened via user preferences. If the property is specified and is blank, no applications are opened in the navigation pane when no applications are opened via user preferences. If the property is not specified, the first application that is authorized for the user opens if no applications are opened via user preferences.

- Type: string
- Default value: first authorized application for the user
- Location: Add the property to the System Property [sys_properties] table.

**glide.ui.dirty_form_support**

Enables (true) or disables (false) display of a confirmation message when a form has unsaved changes and the user leaves the form through any means except a submit (such as using the green back arrow, any form button, or other). This property is not supported in Safari.

- Type: true | false
- Default value: true
- Location: Add the property to the System Property [sys_properties] table.

**glide.ui.encode_module_uri**

Enables (true, the default) or disables (false) encoding of module URIs in the navigation pane. For information about how ServiceNow encodes module URIs, see Encoding module URIs.
**glide.ui.doctype**

Enables or disables the UI15 interface.

- **Type:** true | false
- **Default value:** true
- **Location:** System Property [sys_properties] table

**glide.ui.filter.first_day_of_week**

Identifies the first day of the calendar week for the company. By default, the start of the week is Monday, meaning that the calendar week begins with Monday and ends with Sunday. To change this behavior, add the property **glide.ui.filter.first_day_of_week** to the instance as an integer property. Set the value to the integer corresponding with the day of the week that the calendar begins on, where 1 is Sunday, 2 is Monday, and so on. The function impacts all charts and calculations where the day of the week is used as a parameter.

- **Type:** integer
- **Default value:** 2
- **Location:** Add the property to the System Property [sys_properties] table.

**glide.ui.first.field.reference**

Enables (true) or disables (false) having the first column in a list always link to the underlying record, even if it is a reference field. For example, if the first column on an Incident list is Assigned to, that value links to the Incident if this property is set to true.

- **Type:** true | false
- **Default value:** false
- **Location:** Add the property to the System Property [sys_properties] table.

**glide.ui.form_annotations**

Enables (true) or disables (false) form annotations, which allow you to add Custom, Section Separator, and Line Separator to a form.

- **Type:** true | false
- **Default value:** true
- **Location:** System Property [sys_properties] table

**glide.ui.form_multiple_splits**

Enables (true) or disables (false) multiple splits and end splits in the form layout configuration slushbucket.

- **Type:** true | false
- **Default value:** true
- **Location:** System Property [sys_properties] table

**glide.ui.gauge.view**

Defines which view you want to be the default for homepage gauges.

- **Type:** string
- **Default value:** portal
- **Location:** System Property [sys_properties] table

**glide.ui.glide_list.start.locked**

Controls whether a glide_list (like the watch list) starts out locked (true) or unlocked (false) on a form.
• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**glide.ui.goto_use_contains**
Controls whether the Go to navigation performs a "contains" query (true) or a "greater than" query (false) by default.

• Type: true | false
• Default value: false
• Location: Add the property to the System Property [sys_properties] table.

**glide.ui.homepage.parallel**
Enables (true) or disables (false) use of parallel rendering.

• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**glide.ui.homepage.parallelism**
Sets the maximum number of threads that should cooperate on rendering any given homepage.

• Type: integer
• Default value: 2
• Location: System Property [sys_properties] table

**glide.ui.homepage.preview**
Enables (true) or disables (false) displaying the preview icon for lists on the homepage.

• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**glide.ui.html.editor**
Specifies which HTML field editor to use, TinyMCE or htmlArea (legacy).

• Type: string
• Default value: tinymce
• Location: System Properties > UI Properties

**glide.ui.html.editor.extended_valid_elements**
Defines which elements remain in the TinyMCE text when the editor saves. This functionality can be useful to add or override specific elements that should be kept.

- Type: string
- Default value: blank
- Location: System property [sys_properties] table

**glide.ui.html.editor.toolbar.line1**

Configures the editing toolbar (first line) for HTML fields when TinyMCE is enabled. The spellchecker tool is not supported in UI16 or UI15.

- Type: string
- Location: System Properties > UI Properties

**glide.ui.html.editor.toolbar.line2**

Configures the editing toolbar (second line) for HTML fields when TinyMCE is enabled. The spellchecker tool is not supported in UI16 or UI15.

- Type: string
- Location: System Properties > UI Properties

**glide.ui.html.editor.v4.paste.html_import**

Controls how content being pasted from sources other than Microsoft Word is filtered. This includes content copied from TinyMCE itself.

- Type: choice list
- Default value: clean
- Location: System Property [sys_properties] table

**glide.ui.html.image.allow_url**

Enables (true) or disables (false) uploading an image via URL from HTML Fields.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

**glide.ui.html.editor.remove_trailing_brs**

Specifies whether an empty line containing a <br> tag is converted to a <div>&nbsp;</div> tag for TinyMCE HTML fields. If true, the tag is converted. If false, the tag is left as <br>.

- Type: true | false
- Default value: true
- Location: System Properties > UI Properties

**glide.ui.html.toolbar**

Configures the editing toolbar for HTML fields.

- Type: string
- Default value: list of buttons
- Location: System Properties > UI Properties
**glide.ui.incident_activity.fields**

Defines what fields are visible in the activity formatter. If the activities are customized, the system updates this property automatically.

- Type: string
- Default value: list of fields
- Location: **System Properties > UI Properties**

**glide.ui.incident_activity.max_addresses**

Specifies the maximum number of addresses to list in an email audit record. If the number of addresses exceeds this limit, the instance truncates the list after the maximum value and displays an ellipsis character (...).

- Type: string
- Default value: 5
- Location: **Add the property** to the System Property [sys_properties] table.

**glide.ui.incident_alert_activity.fields**

Incident communication plan activity formatter fields — the list of fields tracked from the Incident Communication Plan form in the activity formatter.

- Type: string
- Default value: opened_by, work_notes, comments, severity, estd_distruption_time, actual_disruption_time
- Location: **System Property [sys_properties] table**

**glide.ui.journal.use_html**

Specifies whether TinyMCE is available for journal fields (true) or not (false).

- Type: true | false
- Default value: false

**glide.ui.js_error_notify**

Displays client script errors to users with the **client_script_admin** role. Also displays a generic error message to other users who encounter a client script error.

- Type: true | false
- Default value: true
- Location: **System Properties > All Properties**

**glide.ui.label.enable**

Enables (true) or disables (false) using labels, such as Most Active, Most Recent, or user-created.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

**glide.ui.m.clear_pasteboard_when_backgrounded**

Clears the copy/paste clipboard when the application enters the background.

- Type: true | false
- Default value: false
• Location: Add the property to the System Property [sys_properties] table. In Categories, add the mobile_post_auth category.

**glide.ui.max_calendar_duration**

Maximum number of days that a single calendar report entry can display.

• Type: integer
• Default value: 90
• Range of possible values: 90 to 400
• Location: System Property [sys_properties] table

**glide.ui.max_calendar_records**

Maximum number of records saved in a calendar report.

• Type: integer
• Default value if the property is not configured: 10,000
• Location: System Property [sys_properties] table

**glide.ui.m_agents**

Comma-separated list of browser agents considered as mobile browsers for the Smartphone Interface. These browsers are directed to the mobile pages instead of the full browser pages.

• Type: string
• Default value: iphone,android_phone,IEMobile,Windows Phone,iPod,Windows CE,BlackBerry,BB10
• Location: System Property [sys_properties] table

**glide.ui.max_ref_dropdown**

Maximum number of records for a reference field that is displayed as a choice list. If the number of available records is greater than this value, the field appears as a reference field, not as a choice list.

• Type: integer
• Default value: 25
• Location: System Property [sys_properties] table

**glide.ui.mentions.default_limit**

Number of users with same name displayed in Activity Stream Compose editor. When set to true, the default limit takes in a number which determines how many users with the same name are displayed.

• Type: string
• Default value: true
• Location: System Property [sys_properties] table

**glide.ui.mobile_agents**

Comma-separated list of browser agents considered as mobile browsers for the Legacy Smartphone Interface. These browsers are directed to the mobile pages instead of the full browser pages.

• Type: string
• Default value: iPod,Windows CE,BlackBerry,Android,Opera Mini,IEMobile,Windows Phone,iphone
• Location: System Property [sys_properties] table

**glide.ui.nav.stripe.select.maxchars**
Numerical character limit for list menu choices within the nav stripe. The nav stripe appears at the top of the page when using UI11.

- Type: integer
- Default value: none
- Location: Add the property to the System Property [sys_properties] table.

**glide.ui.reference.readonly.clickthrough**

Enables (true) or disables (false) reference pop-ups on read-only reference fields. Reference pop-ups and click-throughs are hidden by default if a client script, UI policy, or ACL makes the field read-only. Being able to see or click through to the target record is unrelated to the reference field being writable.

If false, the administrator can override the system setting for a specific field by adding the `readonly.clickthrough=true` attribute to the dictionary entry.

- Type: true | false
- Default value: false
- Location: System Properties > UI Properties

**glide.ui.remember_view**

Enables (true) or disables (false) use of user preferences for the last view.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

**glide.ui.remember.me.default**

Controls whether the Remember me check box is selected (true) or cleared (false) by default.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

**glide.ui.report.extend_calendar_choices**

Controls which field styles are applied during calendar highlighting. If false, field styles in only the Task table are used. If true, the calendar first uses field styles from the table that the report is based on. If no applicable styles exist in that table, the calendar uses field styles from the Task table.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

**glide.ui.report.old_report_builder**

Enables (true) or disables (false) use of the old report builder UI.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.ui.section508**

Enables (true) or disables (false) rendering of alternate text in place of images.
• Type: true | false
• Default value: false
• Location: System Properties > UI Properties

**glide.ui.show_live_feed_activity**
Enables (true) or disables (false) live feed for a record in the activity formatter.

• Type: true | false
• Default value: false
• Location: System Properties > UI Properties

**glide.ui.show_template_bar**
Controls whether the template bar can be displayed on the specified table. For example:
`glide.ui.show_template_bar.incident = false`.

• Type: true | false
• Default value: true
• Location: Add the property to the System Property [sys_properties] table.

**glide.ui.session_timeout**
Sets the session timeout, in minutes.

• Type: integer
• Default value: 30
• Location: System Property [sys_properties] table

**glide.ui.stream_icon**
Toggles the displaying of the activity stream button on the specified table. For example:
`glide.ui.stream_icon.hr_case = true`.

• Type: true | false
• Default value: false

**glide.ui.syntax_editor.context_menu**
Enables disables the context menu in script editor.

• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**glide.ui.syntax_editor.linter.eslint_config**
Defines linting configurations using the ESLint utility.

• Type: string
• Default value: All recommended ESLint rules are enabled, except no-undef, no-unused-vars, no-empty, and semi.
• Location: System Property [sys_properties] table

**glide.ui.table.labels**
Controls whether the system uses verbose labels for table names (true) or literal table names (false).

• Type: true | false
• Default value: true
• Location: System Property [sys_properties] table

**glide.ui.tablet_enabled**

Enables (true) or disables (false) the tablet UI.

• Type: true | false
• Default value: true
• Location: System Properties > Tablet UI Properties

**glide.ui.tablet_agents**

Uses the tablet UI if one of the specified strings (comma-separated) appears in the browser user_agent header.

• Type: string
• Default value: ipad,android_tablet
• Location: System Properties > Tablet UI Properties

**glide.ui.tablet.title**

Displays the specified text as a brief page title for tablet UI.

• Type: string
• Default value: ServiceNow
• Location: System Properties > Tablet UI Properties

**glide.ui.tablet.title.ios_webapp**

Displays the specified text as the default home screen icon label used in iOS version 6 and later.

• Type: string
• Default value: ServiceNow
• Location: System Properties > Tablet UI Properties

**glide.ui.task.insert**

Enables (true) or disables (false) the use of Insert and Insert and Stay options on tables derived from Task (such as Incident, Change, and Problem).

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

**glide.ui.textarea.character_counter**

When true, displays a count of available characters for journal and multi-line text fields.

• Type: true | false
• Default value: false
• Location: System Property [sys_properties] table

**glide.ui.textarea_initial_rows**

Sets the number of rows initially displayed for multiline form elements. When the element is selected for editing, it is expanded. Set this value to 0 or blank to ignore this property. This functionality is used to conserve space on a form when multiline elements take up too much space.
**glide.ui.update_on_iterate**
Controls whether updates are saved (true) or discarded (false) when a user clicks the blue arrows on a form.
- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

**glide.ui.ui_policy_debug**
Enables (true) or disables (false) logging of UI policy processing in the JavaScript debug window
- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.ui.user_cookie.life_span_in_days**
Sets the expiration time period for the 'remember me' cookie.
- Type: integer
- Default value: 15 (days)

**Note:** When a user accesses an instance with 'remember me' enabled, the access resets the cookie expiration period until the maximum (glide.ui.user_cookie.max_life_span_in_days) life span limit is reached.
- Location: System Property [sys_properties] table

**glide.ui.user_cookie.max_life_span_in_days**
Sets a maximum cap for the glide.ui.user_cookie.life_span_in_days cookie to expire before forcing a user to re-authenticate into the instance.
- Type: integer
- Default value: 30 (days)

**Note:** Maximum value 30.
- Location: System Property [sys_properties] table

**glide.ui.welcome.profile_link**
Enables (true) or disables (false) allowing users to click their name in the welcome message and see their user profile.
- Type: true | false
- Default value: In new instances true. In existing instances false.
- Location: System Property [sys_properties] table
glide.ui11.show_switch_link

This property only affects a deprecated version of the UI. It is no longer supported. Displays (true) or hides (false) a banner link for switching between the UI11 and legacy interfaces.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

glide.update.suppress_update_version

Comma-separated list of tables for which updates are not tracked in the Versions [sys_update_version] table. You cannot compare and revert versions for tables in this list.

- Type: string
- Default value: sys_user,sys_import_set_row
- Location: Add the property to the System Property [sys_properties] table.

glide.user.default_password

Default password for new users created from incoming email. Users must reset the password at first login.

- Type: string
- Default value: password
- Location: System Properties > Email
- Instance Security Hardening Settings: Set complex default password (instance security hardening)

glide.userauthgate.extauth.check

Enables (true) or disables (false) the UserAuthenticationGate checks for both external and internal authentication mechanisms.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

glide.user.trusted_domain

Comma-separated list of trusted domains for which the instance automatically creates a guest user based on incoming emails. Use an asterisk (*) to trust all domains. If an email is not from a trusted domain, the instance processes the inbound email as a “guest user” but does not create a guest user in the instance.

- Type: string
- Default value: *
- Location: System Properties > Email

glide.workflow.model.cache.max

Maximum number of models held in the workflow cache. You must restart the instance after changing this property to apply the change.

- Type: integer
- Default value: 300
- Location: Workflow > Properties

glide.wsdl.definition.use_unique_namespace
Enables (true) or disables (false) use of a unique WSDL namespace value when publishing a ServiceNow table through web services. If true, the WSDL target namespace is www.service-now.com/<table name>.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.wsdl.maximum_hierarchy**

Maximum number of hierarchical levels returned in a WSDL when hierarchical SOAP web service is enabled. This property has a maximum value of 3.

- Type: integer
- Default value: 3
- Location: Add the property to the System Property [sys_properties] table.

**glide.wsdl.show_nullable**

Enables (true) or disables (false) allowing a WSDL element to be valid if it has no element content despite a {content type} which would otherwise require content.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.ws.use_row_lock**

If true, avoid using the current web service lock that applies before running the transform. Use the row lock that applies after the OnStart method.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**glide.xmlhttp.excessive**

Sets the number of items visible in the Available half of a many-to-many or one-to-many collection box.

- Type: integer
- Default value: 100
- Location: Add the property to the System Property [sys_properties] table.

**glide.xmlprocessor.use_unload_format**

Enables (true) or disables (false) unloading the XML using the display_value format. To unload using this format, add the parameter useUnloadFormat=true to the request URL.

- Type: true | false
- Default value: false
- Location: Add the property to the System Property [sys_properties] table.

**google.maps.auto_close**

If true, automatically closes the current info window before opening a new one. Clear the check box to enable multiple pop-up windows to remain open at once.

- Type: true | false
- Default value: true
• Location: System Properties > Google Maps

google.maps.client

Client ID for Google Maps API for Business. This client ID authorizes production use of Google Maps API for Business. By default, this ID is provided by ServiceNow. ServiceNow may require you to purchase a separate Client ID based on your usage.

• Type: string
• Default value: gme-servicenow
• Location: System Properties > Google Maps

google.maps.key

Map key from Google, tied to the URL of the server. This key is the private key authorizing development use of Google Maps.

• Type: string
• Default value: empty
• Location: System Properties > Google Maps

google.maps.latitude

Starting latitude of the map. This value determines the starting latitude displayed in Google Maps.

• Type: string
• Default value: 36.008522
• Location: System Properties > Google Maps

google.maps.longitude

Starting longitude of the map. This value determines the starting longitude displayed in Google Maps.

• Type: string
• Default value: -95.221764
• Location: System Properties > Google Maps

google.maps.max_items

Maximum number of items to display on the map. This setting determines how many icons can be displayed on a map.

• Type: integer
• Default value: 500
• Location: System Properties > Google Maps

google.maps.table

Table used by the map. This setting names the table containing the name, longitude, and latitude fields.

• Type: string
• Default value: cmn_location
• Location: System Properties > Google Maps

google.maps.zoom

Starting zoom level of the map (1 is the lowest).

• Type: integer
• Default value: 4
• Location: **System Properties > Google Maps**

**help.base.default**

(Context-Sensitive Help plugin) Sets the base URL for help contexts in which ServiceNow wiki is **false** and an absolute URL is not specified.

- Type: string
- Default value: `http://docs.servicenow.com/?context=`
- Location: System Property [sys_properties] table

**help.base.servicenow**

(Context-Sensitive Help plugin) Sets the base URL for help contexts in which ServiceNow wiki is **true**

- Type: string
- Default value: `http://docs.servicenow.com/?context=`
- Location: System Property [sys_properties] table

**mid.server.rba_debug_powershell**

Enables probe-level debugging for PowerShell probes. With this property enabled, PowerShell probes write detailed activity information to the MID Server log.

- Type: true | false
- Default value: false
- Location: **Orchestration > MID Server Properties**

**mid.version.override**

Sets an override condition for the current version for all MID Servers in your environment. For more information on version control, see **MID Server version control properties**.

- Type: string
- Default value: none (If this property is left empty, the MID Servers get their version information from the mid.buildstamp property.)
- Location: Add the property to the System Property [sys_properties] table.

**par_vis_config.data_source.can_select_indicator**

 Specifies roles (comma-separated) which can select indicators as data sources from the Data Visualization configuration panel. If empty, all users can select the indicator sources that they have access to.

- Type: string
- Default value: empty
- Location: System Property [sys_properties] table

**par_vis_config.live_refresh_rate_min_value**

Specifies the minimum interval in seconds for the **Live refresh rate** setting in the Data Visualization configuration. If set, a user can still set an empty or 0 value.

- Type: integer
- Default value: 30 (seconds)
- Location: System Property [sys_properties] table
password_reset.activity_monitor.incident_threshold

Specifies the maximum number of lockouts before an alert is issued.

- Type: integer
- Default value: 10 (lockouts)
- Location: System Property [sys_properties] table

password_reset.activity_monitor.incident_window

Specifies the amount of time that is used for recording and counting the number of user lockouts.

- Type: integer
- Default value: 60 (minutes)
- Location: Password Reset > Properties

password_reset.captcha.ignore

Enables and disables CAPTCHA functionality.

The password reset application uses Google re-CAPTCHA as the default CAPTCHA service. To use the base system CAPTCHA, change the password_reset.captcha.google.enabled system property to false.

- Type: true | false
- Default value: false
- Location: Password Reset > Properties

password_reset.qa.num_enroll

Specifies the number of questions a user must select and answer to be enrolled in the password reset program.

**Note:** This security question property can be overridden by adding a value for the num_enroll parameter in a security question verification.

- Type: integer
- Default value: 5 (questions)
- Location: Password Reset > Properties

password_reset.qa.num_reset

Specifies the number of questions a user must answer to verify their identity during the password reset process.

**Note:** This security question property can be overridden by adding a value for the num_reset parameter in a security question verification.

- Type: integer
- Default value: 3 (questions)
- Possible values: integers that are less than the number specified for the num_enroll property.
- Location: Password Reset > Properties

password_reset.request.max_attempt

Specifies the number of password reset attempts a user has before they are locked out for a period determined by the value in max_attempt_window.

- Type: integer
- Default value: 3 (attempts)
• Location: **Password Reset > Properties**

**password_reset.request.max_attempt_window**

Specifies how long a user is locked out or prevented from changing their password after trying the maximum number of times.

- Type: integer
- Default value: 1440 (minutes)
- Location: **Password Reset > Properties**

**password_reset.request.retry_window**

Specifies the length of time before the count for password reset attempts refreshes.

- Type: integer
- Default value: 1440 (minutes)
- Location: **Password Reset > Properties**

**password_reset.request.success_window**

Specifies how long a user is locked out after they have successfully reset their password.

- Type: integer
- Default value: 10 (minutes)
- Location: **Password Reset > Properties**

**password_reset.sms.default_complexity**

Specifies the number of characters in the SMS code that are required for a user to reset their password.

> **Note:** This SMS code property can be overridden by adding a value for the complexity parameter in an SMS code verification.

- Type: integer
- Default value: 4 (digits)
- Location: **Password Reset > Properties**

**password_reset.sms.expiry**

Specifies the amount of time, in minutes, until the SMS code sent to the user expires.

> **Note:** This SMS code property can be overridden by adding a value for the expiry parameter in an SMS code verification.

- Type: integer
- Default value: 5 (minutes)
- Location: **Password Reset > Properties**

**password_reset.sms.max_per_day**

Specifies the maximum number of SMS codes that are sent to a user within one 24-hour period. When a user clicks the **Send Verification Code** button, the 24-hour period begins.
**password_reset.sms.pause_window**

Specifies the amount of time to pass before another SMS code can be sent to a user.

- Type: integer
- Default value: 2 (minutes)
- Location: Password Reset > Properties

**password_reset.wf.refresh_rate**

Specifies how often to check status of the workflow. Represented in the password reset process progress bar.

- Type: integer
- Default value: 90000 (milliseconds)
- Location: Password Reset > Properties

**password_reset.wf.timeout**

Specifies the maximum wait time, in milliseconds, for the workflow to execute. The workflow is triggered during the password reset request when the user clicks **Submit**.

- Type: integer
- Default value: 500 (milliseconds)
- Location: Password Reset > Properties

**promin.show_records.limit**

Specifies the maximum number of records that can be returned for an arc or node for the **Show Records** link to display. If more records are returned than the set limit, the link does not display.

- Type: integer
- Default value: 100,000 (records)
- Location: Add the property to the System Property [sys_properties] table.

**remember_me.max_duration_in_days**

Sets a maximum cap for the **remember_me_cookie.duration_in_days** cookie to expire before forcing a user to reauthenticate into the instance.

- Type: integer
- Default value: 30 (days)

Note: Maximum value 365 days.
• Location: System Property [sys_properties] table

**remember_me_cookie.duration_in_days**
Sets the default expiration for the "remember me" cookie. When a user logs in with "remember me" enabled, each login within the expiration limit resets the expiration period.

- Type: integer
- Default value: 15 (days)

**Note:** Maximum value 30 days.

• Location: System Property [sys_properties] table

**sa_analytics.aggregation.include_service**
Includes all CIs for alert aggregation. If **false**, includes only CIs not related to a business service.

- Type: true | false
- Default value: true
- Location: Alert Aggregation and RCA > Properties

**sa_analytics.aggregation_enabled**
Enables alert aggregation. Enables aggregation of correlated alerts for services and alert groups.

- Type: true | false
- Default value: true
- Location: Alert Aggregation and RCA > Properties

**sa_analytics.alert.severity_threshold**
Alert severity threshold, above which alerts are included in analysis. Only alerts with severity that is above the threshold are included in alert aggregations and root cause CI analysis.

- Type: choice list
- Default value: Info
- Other possible values:
  - Warning
  - Minor
  - Major
  - Critical
- Location: Alert Aggregation and RCA > Properties

**sa_analytics.rca_enabled**
Enables (**true**) or disables (**false**) root cause analysis for business services. Enables RCA for alerts associated with business services, to identify root-cause CIs.

- Type: true | false
- Default value: false
- Location: Alert Aggregation and RCA > Properties

**sa_analytics.rca.input_purge_days**
Purge staging tables (in days). Number of days that RCA input is kept before it is purged.
• Type: integer
• Default value: 90
• Range of possible values: 30-180
• Location: Alert Aggregation and RCA > Properties

`sa_analytics.rca.learner_group_interval_secs`
Time interval (in seconds) criteria for grouping alerts. Interval that alerts must be created in, to be included in a group.
• Type: integer
• Default value: 300
• Range of possible values: 60-900
• Location: Alert Aggregation and RCA > Properties

`sa_analytics.rca.learner_query_interval_secs`
Length of time period (in seconds) from which to include alerts for analysis. Period of past time from which to include alerts in alert aggregation analysis.
• Type: integer
• Default value: 86400
• Range of possible values: 43200-86400
• Location: Alert Aggregation and RCA > Properties

`sa_analytics.rca.output_purge_days`
Number of days that RCA output is kept before it is purged.
• Type: integer
• Default value: 3
• Range of possible values: 3-5
• Location: System Property [sys_properties] table

`sa_analytics.rca.query_probability_threshold`
Confidence score % threshold, above which RCA correlated alert groups appear in the Event Management dashboard and alerts console. Confidence score that must be met by RCA correlated alert groups before the groups are displayed on the Event Management dashboard and alerts console.
• Type: integer
• Default value: 0
• Range of possible values: 0-100
• Location: Alert Aggregation and RCA > Properties

`sam.install_deletion_deadline`
Defines the number of days after which a software install is deleted if not discovered with the configuration item. Use a value that is greater than the number of days between consecutive Discovery runs.
• Type: integer
• Default value: 7
• Location: System Property [sys_properties] table

`security.list.internal.domains`
Other domains (excluding the ones in the comma-separated list in this property) are classified as external email domains. The counts of incoming emails from these external domains display in the External Incoming Emails metric in the Instance Security Center.

- Type: choice string
- Default value: None
- Other possible values: Comma-separated list of all internal email domains in the organization.
- Location: System Property [sys_properties] table

**sn_bm_client.dashboard_display_unit**

Time unit to use for KPI values on the Benchmarks dashboard. Options are Hours or Days.

- Type: choice list
- Default value: Days
- Location: System Property [sys_properties] table

**sn_chg_soc.change_soc_initial_limit**

Defines the number of change_request records to display on load of the Change Schedule.

- Type: Integer
- Default value: 40
- Location: System Property [sys_properties] table

**sn_chg_soc.change_soc_scroll_load_limit**

Defines the number of change_request records to display as the Change Schedule is scrolled.

- Type: Integer
- Default value: 20
- Location: System Property [sys_properties] table

**sn_chg_soc.change_soc_total_limit**

Defines the total number of change_request records that can be displayed on a Change Schedule.

- Type: Integer
- Default value: 1000
- Location: System Property [sys_properties] table

**sn_chg_soc.landing_page.pinned_notification**

Shows a message for pin or unpin a change schedule.

- Type: true | false
- Default value: true
- Location: System Property [sys_properties] table

**sn_chg_soc.schedule_window_days**

Specifies the number of days to be factored before and after the respective start/end of a change_request record when displaying blackout and maintenance window spans on the Change Schedule page.

- Type: Integer
- Default value: 30
- Location: System Property [sys_properties] table
sn_disco_cd.scheduled_job_time_out_in_mins

This property sets the value for the maximum run time of the scheduled job for Cloud Resources in minutes.

- Type: integer
- Default value: 120

sn_global_searchui.hide_results_count

Hides (true) or displays (false) the number of matching records for search groups and tables on the Global Search page.

To modify this property, select Enhanced Global Search UI from the application picker before opening the System Properties table.

- Type: true | false
- Default value: false
- Location: System Property [sys_properties] table

subscription.custom_table.enforce_entitlement

You can enable guardrails around custom tables when using certain applications, such as Mobile Studio, in a production or non-production environment.

When set to true, the property limits the list of custom tables available in applications such as Mobile Studio to those you are entitled to use, based on the active subscriptions present on your instance. If you want to remove these guardrails, setting the property to false enables you access to all custom tables, regardless of your active subscription entitlements.

- Type: Boolean
- Default value:
- Location: System Property [sys_properties] table

Note: Setting this property to false enables you to use applications with custom tables that may not be entitled. See the service description for your active subscriptions to determine which custom tables (if any) you are entitled to use with selected applications.

tablet.footer.text

Text that appears on the footer of the tablet UI.

- Type: string
- Default value: Copyright ServiceNow 2012
- Location: System Properties > Tablet UI Properties

tablet.header.text

Text that appears on the right-hand side of the tablet UI header.

- Type: string
- Default value: ServiceNow
- Location: System Properties > Tablet UI Properties
Add a system property

Add or create a property to control system behavior.

Role required: admin

For more information on creating system properties for your own applications, take the training on the ServiceNow® Developer Site.

Some properties in the system are not visible in an instance by default and must be added to the System Property [sys_properties] table. If a feature requires the addition of the property, you can add a system property.

**Important:** System properties store configuration information that rarely or never changes. Each time you change or add a system property, the system flushes the cache to keep all nodes in the cluster in synch. This cache flush has a very high performance cost for one to ten minutes, which can potentially cause an outage if done excessively. To prevent such outages, do not use a system property to store configuration information that changes more than once or twice a month. Instead, use a custom table to store regularly changing configuration information.

1. In the Navigation filter, enter `sys_properties.list`. The entire list of properties in the System Properties [sys_properties] table appears.
2. Verify that the property does not exist by searching for the property name.
3. Click New.
4. Complete the System Property form using the database name of the property.

Make sure to specify the correct data **Type** and add the new value that you want the property to use.

Properties that you add already contain default values. You add properties to change this value.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the property you are creating.</td>
</tr>
<tr>
<td>Description</td>
<td>Type a brief, descriptive phrase describing the function of the property.</td>
</tr>
<tr>
<td>Choices</td>
<td>Comma-separated values for a choice list. If you need a different choice list label and value, use an equal sign (=) to separate the label from the value. For example, Blue=0000FF, Red=FF0000, Green=00FF00 displays Blue, Red, and Green in the list, and saves the corresponding hex value in the property value field.</td>
</tr>
<tr>
<td>Type</td>
<td>Select the appropriate data type from the list (for example, integer, string, or true</td>
</tr>
<tr>
<td>Value</td>
<td>Set the desired value for property. All property values are stored as strings. When retrieving properties via the <code>gs.getProperty()</code> method, treat the results as strings. For example, a true</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Ignore cache</td>
<td>The system stores system property values in server-side caches to avoid querying the database for configuration settings. When you change a system property value, the system always flushes the cache for the sys_properties table. Use this field to determine whether to flush this property's value from all other server-side caches. The default value of false causes the system to not ignore flushing caches, which results in flushing all server-side caches and retrieving the current property value from the database. Set this field to false when you want to ensure all caches have the current property value. The true value causes the system to ignore flushing some server-side caches, which results in only flushing the cache for the sys_properties table and preserving the prior property value in all other caches. Set this field to true to avoid the performance cost of flushing all caches and retrieving new property values. Typically, you should only set this field to true when you have a system property that changes more frequently than once a month, and the property value is only stored in sys_properties table.</td>
</tr>
<tr>
<td>Private</td>
<td>Set this property to true to exclude this property from being imported via update sets. Keeping system properties private prevents settings in one instance from overwriting values in another instance. For example, you may not want a system property in a development instance to use the same value as a production instance.</td>
</tr>
<tr>
<td>Read roles</td>
<td>Define the roles that have read access to this property.</td>
</tr>
<tr>
<td>Write roles</td>
<td>Defines the roles that have write access to this property.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Depending on the property name, an administrator might be able to change its value only through a new module. It may also appear in one of the Properties pages in System Properties.

Note: If the Ignore cache check box is selected, the system flushes the server cache when the parameter is changed.

Create a system properties module

You can add a module in the application navigator to access the list of system properties. This module makes it easy to add properties to the System Properties table.

Role required: admin

1. Navigate to System Definition > Application Menus.
2. Search for the application you want to add the properties table to, for example System Properties.
   Select an application that is restricted to the admin role so that non-admin users cannot access it.
3. From the Modules related list, click New.
4. Complete the form fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Module name. For example, <strong>All Properties</strong>.</td>
</tr>
<tr>
<td>Application Menu</td>
<td>Specifies the name of the application menu the module appears under. This field should automatically be populated with the name of the application you accessed the Modules related list from.</td>
</tr>
<tr>
<td>Link type</td>
<td>Specifies the type of link this module opens. For a list of system properties, select <strong>List of Records</strong>.</td>
</tr>
<tr>
<td>Table</td>
<td>Specifies the table used by the module. Select <strong>System Properties [sys_properties]</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

6. Verify that the module was created. For example, navigate to **System Properties > All Properties**.

If you want to include additional parameters for the list of system properties module, see [Create a module](#).

**Handle HTTP 500 errors**

The HTTP 500 error is a generic error message that Internet Explorer passes to you when your web site errors for one reason or another, but it provides no useful information by itself.

We can change this setting, to allow you to see and read what the real error is. Good error information is essential to the debugging of any application, and the HTTP 500 error may in fact provide more information to the Customer Service and Support team.
To enable Internet Explorer to show you the root cause of any error in your code, you need to make a change in the Internet Options window. You can access the Internet Options window by selecting the Internet Options item from the Tools menu at the top of Internet Explorer.

1. Select the Advanced tab.
2. Accessing the Advanced options displays a window that contains many settings that can be changed within Internet Explorer. These settings are broken down into categories. The category we are interested in is the **Browsing** Category.

3. Scrolling down the window will bring you to the **Show friendly HTTP error messages** check box. By default this box is checked in order to hide the real error from users. Once you have located this check box, remove the check and click the **OK** button.

You can now report any problem pages that you have had difficulty with and see the real error message that is being generated. Once you can see what the real error message is, then providing debugging information to the Customer Service and Support team becomes so much easier.
Query join and complexity size limits

The platform uses a relational database to store data. Retrieving data can involve multiple joins to create a single result set. While these joins are usually simple, in certain cases the system may issue very large joins to bring together large numbers (>20) of tables.

Database engines normally handle multiple joins quite well. The relational model assumes joins are cheap and efficient, and this is usually true. Rarely, however, exceedingly large joins may cause a database performance issue.

To mitigate this potential complexity, use the following property to limit join complexity and size.

Navigate to **System Properties > System** and find the property with this description:

**Max number of database joins per query. Smaller values cause the system to issue a larger number of less complex queries. Larger values reduce the number of queries at the cost of additional complexity per query. In the absence of known database issues stemming from large join counts, this property should remain unchanged.**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.http.proxy_host</td>
<td>Specify the proxy server hostname or IP address.</td>
<td>proxy.company.com, 192.168.34.54</td>
</tr>
</tbody>
</table>

Note: In the absence of known database issues stemming from large join counts, this parameter should remain unchanged.

Query complexity limits

This property specifies the maximum number of joins the system prefers to do. In certain edge cases, more complex queries might need to be issued, but generally no more than this number of joins will be issued. e.g., a value of 10 will result in no more than 10 tables being joined together in any given query.

The system must compensate for the fewer joins by issuing more queries to retrieve necessary data, so tuning this number down will result in more queries being sent to the database. In most cases, tuning this parameter is counterproductive.

Web proxy

Several properties support Web proxy configuration.

Note: Set these properties in the **System Properties** [sys_properties] table.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.http.proxy_host</td>
<td>Specify the proxy server hostname or IP address.</td>
<td>proxy.company.com, 192.168.34.54</td>
</tr>
</tbody>
</table>

</tbody>
</table>

### NTLM authentication

NTLM is the most complex of the authentication protocols supported by a basic web server.

NTLM is the most complex of the authentication protocols supported by a basic web server such as HttpClient. It is a proprietary protocol designed by Microsoft with no publicly available specification. Early versions of NTLM were less secure than Digest authentication due to faults in the design. However, these were fixed in a service pack for Windows NT 4 and the protocol is now considered more secure than Digest authentication.

NTLM authentication requires that an instance of NTxCredentials be available for the domain name of the server or the default credentials. Since NTLM does not use the notion of realms, HttpClient uses the domain name of the server as the name of the realm. Also, the username provided to the NTxCredentials should not be prefixed with the domain:

- Correct: adrian
- Incorrect: DOMAIN\adrian

There are some significant differences in the way NTLM works compared with basic and digest authentication. These differences are generally handled by HttpClient. However, having an understanding of these differences can help you avoid problems when using NTLM authentication.

- NTLM authentication works almost exactly the same as any other form of authentication in terms of the HttpClient API. The only difference is that you need to supply NTxCredentials instead of UsernamePasswordCredentials (NTxCredentials actually extends UsernamePasswordCredentials so you can use NTxCredentials right throughout your application, if needed).
- The realm for NTLM authentication is the domain name of the computer being connected. This can be troublesome because servers often have multiple domain names. Only the domain name that HttpClient connects to, as specified by the HostConfiguration, is used to look up the credentials. While initially testing NTLM authentication, it is best to pass the realm in as null, which is used as the default.
- NTLM authenticates a connection and not a request. So you need to authenticate every time a new connection is made and keeping the connection open during authentication is vital. For this reason, NTLM cannot be used to authenticate with both a proxy server and the web server, nor can NTLM be used with HTTP 1.0 connections or web servers that do not support HTTP keep-alives.

**Note:** Set these properties from the System Properties `[sys_properties]` table.

### NTLM authentication

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>

</table>

### Proxy servers for SOAP clients

Administrators can specify separate proxy settings for SOAP clients, such as the MID Server or ODBC Driver.

To specify a proxy server for a MID Server, see [MID Server configuration](#).

To specify a proxy server for the ODBC driver, see [Configure ODBC to use proxy servers](#).

### Bypass the proxy server

Administrators can configure the instance to bypass the proxy server for specific URLs or URL patterns.

Typically, internal addresses do not need a proxy server for SOAP communications.
**Table administration**

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table.

Applications use tables and records to manage data and processes, such as Incident, Problem, and CMDB. Tables can extend other tables, creating parent tables and child tables.

Watch this nine-minute video for an introduction to tables, records, and fields in ServiceNow®.

Administrators can use these tools for viewing and modifying the database structure:

- Tables module: Provides a list of all tables in the database.
- Tables & Columns module: Provides a list of all existing tables, with columns, column attributes, and indexes.
- Schema map: Provides a graphical representation of the relationships between tables.
- Data dictionary tables: Contains additional information that defines database elements.

**Table extension and classes**

Enable one or more child tables to share fields and records with a parent table. Administrators and application developers can only extend tables during table creation.

Administrators and application developers typically extend tables to create a set of related records that share information. For example, in the base system, the Task and the Configuration Item tables have multiple extensions:

**Sample extended tables in the base system**

<table>
<thead>
<tr>
<th>Original table</th>
<th>Related tables extended from original table</th>
</tr>
</thead>
</table>
| Task [task]           | • Incident [incident]  
|                       | • Problem [problem]  
|                       | • Change Request [change_request]                                  |
| Configuration Item [cmdb_ci] | • Application [cmdb_ci_appl]  
|                       | • Computer [cmdb_ci_computer]  
|                       | • Database [cmdb_ci_database]                                      |
A table that extends another table is called a child class, and the table it extends is the parent class. A table can be both a parent and child class both extending and providing extensions for other tables. A parent class that is not an extension of another table is called a base class.

Administrators can use these tools to see the relationships between classes.

- Schema map
- System dictionary
- Tables module

Extending a table:

- Links the new table to the extending table.
- Creates system fields in the new table.
- Creates one or more database tables to store the parent and child classes. The number of tables the system creates depends upon the extension model selected during table creation.

Extension models

The Now Platform offers these extension models.

- Table per class
- Table per hierarchy
- Table per partition

The extension model determines these attributes.

- The number of database tables created
- The derivation of fields from parent classes
- The replication of records from child classes

Table per class

Tables created
Creates a separate database table for the parent class and each child class.

Fields derived from parent class
Child classes derive fields from parent classes.

Dictionary records created for parent class
A parent class has a Dictionary record for the collection and for each field that can be derived from it. For example, the Contract [ast_contract] table has 59 Dictionary records, which define the table and its fields.

Dictionary records created for child classes
Each child class only has Dictionary entries for fields unique to the class.

Records replicated
The parent class replicates each record stored in its child classes. Each child class only stores records unique to the class. Replicated records have the same Sys ID value in each table. The system replicates any change you make to a child record to the matching record in the parent table. For example, Contract [ast_contract] table replicates records from the Lease [ast_lease] and Warranty [ast_warranty] tables.
Table per hierarchy

Tables created
Creates one database table for the parent class, which stores all records for the parent and child classes. Child classes do not have separate database tables.

Fields derived from parent class
Child classes derive fields from parent classes. For example, the Incident table derives fields from the Task table.

Dictionary records created for parent class
A parent class has a Dictionary record for the collection and for each field that can be derived from it. For example, the Task table is a parent class that has 66 Dictionary records, which define the table and its fields.

The Dictionary entry for the parent class contains a sys_class_name column whose value indicates which child class each record belongs to. For example, Incident records have a sys_class_name value of incident, and change records have a sys_class_name value of change.

Dictionary records created for child classes
Each child class only has Dictionary entries for fields unique to the class. For example, the Incident table only has 22 Dictionary records, which are not already defined in the Task table.

Records replicated
Record replication is not needed, because the parent class stores all records that belong to the hierarchy. For example, the Task table contains all records from its child classes such as the Change, Incident, and Problem tables.

Table per partition

Tables created
Creates one database table for the parent class, which stores all records for the parent and child classes. Child classes do not have separate database tables. As the database table reaches a storage limit, the system dynamically adds storage tables (partitions) to store additional records.

Fields derived from parent class
Child classes do not derive fields from parent classes. Instead each child class has its own list of fields. For example, the Base Configuration Item [cmdb], Configuration Item [cmdb_ci], and Hardware [cmdb_ci_hardware] tables all have their own field definitions.

Dictionary records created for parent class
A parent class has a Dictionary record for the collection and for each field relevant to it. For example, the Base Configuration Item [cmdb] table is a parent class that has 48 Dictionary records.

The system replicates changes made to parent class Dictionary entries to child class Dictionary entries. For example, when you change the name column in the parent class Base Configuration Item [cmdb] table, the system replicates it to child class Dictionary entries such as the Configuration Item [cmdb_ci] and Hardware [cmdb_ci_hardware] tables.

The Dictionary entry for the parent class contains columns for sys_class_name and sys_class_path whose values indicate which child class each record belongs to. For example, Hardware records have a sys_class_name value of cmdb_ci_hardware, and computer records have a sys_class_name value of cmdb_ci_computer.

When the database table reaches a storage limit, the system updates the Dictionary entry for the parent class to include columns for sys_storage_alias and storage_table_name. These storage column Dictionary entries allow administrators to manage the parent class and its storage tables as a single logical unit.
Dictionary records created for child classes

Each child class has a Dictionary record for the collection and for each field relevant to it. For example, the Hardware table has 73 Dictionary records with some records duplicating columns in the parent class.

Records replicated

Record replication is not needed, because the parent class stores all records that belong to the hierarchy. For example, the Base Configuration Item [cmdb] table contains all records from its child classes such as the Application [cmdb_ci_appl], Computer [cmdb_ci_computer], and Hardware [cmdb_ci_hardware] tables.

Create a table

Administrators and application developers can create custom tables to store application data.

Role required: admin

Now Platform application subscriptions include custom table entitlements. You can create custom tables for any purpose, up to the entitlement limit in the subscription. To learn more about how your usage administrator allocates the custom tables that you create to subscriptions, see Allocating your custom tables to a subscription entitlement.

Note: To minimize the existence of unneeded and extraneous tables in an instance, don't overdo table creation. Create only those tables you need to minimize administration tasks and shorten upgrade times.

1. Navigate to System Definition > Tables.
2. Click New and complete the form.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Enter a unique label for the table (such as Laptops or Thin Clients). The label appears on list and form views for the table. Updating the Label field also updates the label record in the language file for the current language. See Field Labels in Data dictionary tables.</td>
</tr>
</tbody>
</table>
| Name    | Edit the table name, which is automatically populated based on the table label and a prefix as follows:  
• For a table in a scoped application, the name is prefixed with a namespace identifier to indicate that it is part of an application.  
• For a table in the global application, the name is prefixed with the string u_.  
• For a remote table in a scoped application, the name is prefixed with a namespace identifier and the string st__ to indicate that it is remote and part of an application.  
• For a remote table in the global application, the name is prefixed with the string u_st__.  
You cannot modify the prefix; however, you can modify the rest of the table name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_). |
### Control

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extends Table</td>
</tr>
<tr>
<td>Application</td>
</tr>
<tr>
<td>Remote Table</td>
</tr>
<tr>
<td>Create module</td>
</tr>
<tr>
<td>Add module to menu</td>
</tr>
</tbody>
</table>

### Column

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column label</td>
</tr>
</tbody>
</table>

3. In the **Columns** section, use the **Table Columns** embedded list to add columns to the table.
<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>[Mandatory] Define the field type for the column. See <em>Introduction to Fields</em> and <em>Field types</em>. To preserve existing data, only change fields between the same basic type (for example, <em>Choice</em> and <em>String</em>). A warning appears if a change to a custom field results in data loss. You cannot change a base system field, that results in data loss.</td>
</tr>
</tbody>
</table>
| **Reference** | Make the field into a reference field by entering the referenced table name.  

**Note:** Dynamic reference creation is enabled for this field. So, if you enter a table name that does not match an existing table, a new table is created when you save changes to the current table record. If the current table has a module in the application navigator, then a module for the newly created table is automatically created in the same application menu. |
| **Max length** | [String fields only] Limit the length of the field. A length of under 254 appears as a single-line text field. Anything 255 characters or over appears as a multi-line text box.  

**Note:**  
- You can only change this value if the *Type* of the field is *String*. Changes for any other type of field are ignored.  
- On an Oracle instance, you cannot increase the maximum length of a string field to greater than 4000 because it requires the CLOB datatype in Oracle. To increase beyond this size, log an incident with ServiceNow Technical Support to request the change.  
- To prevent data from being lost, only decrease the length of a string field when you are developing a new application and not when a field contains data. A warning appears if a change to a custom field results in data loss. For a base system field, you cannot make a change that results in data loss. |
| **Default value** | Specify the default value of the field for any new record. Ensure that this value uses the correct field type. For example, an integer field can use a default value of 2 but cannot use a default value of *two*. These values can be overridden with dictionary overrides. |
4. In the **Controls** section, define additional table options.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Extensible</td>
<td>Select the check box to enable other tables to extend this table. Clear the check box to prevent the creation of additional child tables; existing child tables remain unchanged.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Select the check box to enable record feeds for the table. This option adds the <strong>Show Live Feed</strong> icon in the form header.</td>
</tr>
<tr>
<td>Auto-number</td>
<td>Select the check box, and then define the number format to add an auto-numbered field to the table. The check box is available only when a number format does not exist for the table. Otherwise, you can edit the existing number format.</td>
</tr>
<tr>
<td>Create access controls</td>
<td>Select the check box and then complete the <strong>User role</strong> field to create basic security rules for the table.</td>
</tr>
<tr>
<td>User role</td>
<td>Enter a new name or select an existing user role that is required to access this table. This option is available only when the <strong>Create access controls</strong> check box is selected.</td>
</tr>
</tbody>
</table>

5. In the **Application Access** section, define the scope protection for the table. For more information, see Application access settings.

<table>
<thead>
<tr>
<th>Control</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessible from</td>
<td>Specify which application scopes can access the table:</td>
</tr>
<tr>
<td></td>
<td><strong>All application scopes</strong> Can be accessed from any application scope.</td>
</tr>
<tr>
<td></td>
<td><strong>This application scope only</strong> Can be accessed only from the current application scope.</td>
</tr>
<tr>
<td>Can read</td>
<td>Select the check box to enable script objects from other application scopes to read records stored in this table. This option offers runtime protection. For example, a script in another application can query data on this table. First select read access to grant any other API record operation.</td>
</tr>
<tr>
<td>Control</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Can create</td>
<td>Select the check box to enable script objects from other application scopes to create records in this table. This option offers runtime protection. For example, a script in another application can insert a new record in this table. This option is available only when the Can read check box is selected. Clear the check box to prevent script objects from other application scopes from creating records in this table.</td>
</tr>
<tr>
<td>Can update</td>
<td>Select the check box to enable script objects from other application scopes to modify records stored in this table. This option offers runtime protection. For example, a script in another application can modify a field value on this table. This option is available only when the Can read check box is selected. Clear the check box to prevent script objects from other application scopes from modifying data stored in this table.</td>
</tr>
<tr>
<td>Can delete</td>
<td>Select the check box to enable script objects from other application scopes to delete records from this table. This option offers runtime protection. For example, a script in another application can remove a record from this table. This option is available only when the Can read check box is selected. Clear the check box to prevent script objects from other application scopes from deleting records from this table.</td>
</tr>
<tr>
<td>Allow access to this table via web services</td>
<td>Select the check box to enable users to make inbound Web services web service queries to this table. This option offers both design-time and runtime protection. The user performing the query must have the correct permissions to access this table, even when this check box is selected. Clear the check box to prevent users from making web service queries to this table.</td>
</tr>
<tr>
<td>Allow configuration</td>
<td>Select the check box to enable applications from other application scopes to create configuration records for this table that change its functionality. For example, an application designer can select this table from the Tables list on business rules, client scripts, or UI actions. This option offers design-time protection. Clear the check box to prevent application designers from selecting this table when creating configuration records.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.
Global default fields

When you create a new custom table, several fields appear in the **Table Columns** embedded list. For all tables, required system fields are added automatically. You cannot delete or modify these fields.

For tables that extend another table, fields on the parent table also appear on the **Table Columns** embedded list for the current table. If you modify these fields, remember that all changes to fields on the parent table also affect all child tables, not just the current table.

These required system fields are added to all tables:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class [sys_class_name]</td>
<td>System Class Name</td>
<td>If the table is extensible, a string field that indicates which child table contains the record.</td>
</tr>
<tr>
<td>Created [sys_created_on]</td>
<td>Date/Time</td>
<td>A time-stamp field that indicates when a record was created.</td>
</tr>
<tr>
<td>Created by [sys_created_by]</td>
<td>String</td>
<td>A string field that indicates the user who created the record.</td>
</tr>
<tr>
<td>Sys_id [sys_id]</td>
<td>Sys ID</td>
<td>The unique record identifier for the record.</td>
</tr>
<tr>
<td>Updates [sys_mod_count]</td>
<td>Integer</td>
<td>A numeric field that counts the number of updates for this record since record creation.</td>
</tr>
<tr>
<td>Updated by [sys_updated_by]</td>
<td>String</td>
<td>A string field that indicates the user who most recently updated the record.</td>
</tr>
<tr>
<td>Updated [sys_updated_on]</td>
<td>Date/Time</td>
<td>A time-stamp field that indicates the date and time of the most recent update.</td>
</tr>
</tbody>
</table>

Tables module

The Tables [sys_db_object] table contains a record for each table in the database.

To view the list of tables, navigate to **System Definition > Tables**. For example, you can filter the list to see extended table relationships.
Extended Table Relationships

To open the record for an existing table, click a table label. You can:

- View, add, or modify columns with a searchable and sortable embedded list, define the auto-number format, make the table extendable by other tables, and create modules for the table.
- Launch a schema map for a table by clicking the Show Schema Map related link.
- Open the dictionary entries for the table by right-clicking the form header and selecting Show Dictionary Record.
- Navigate directly to the default list or form view for the table by clicking the Show List or Show Form related link.
- Delete all records from a table by clicking the Delete All Records.
Delete a table

Administrators can delete custom tables that are no longer needed. For example, delete a table from an application that is under development because the business requirements change.

A table is custom if an administrator created it and it is not part of a system upgrade or plugin activation. Custom table names always begin with `u_` or `x_` for scoped tables.

⚠️ **Warning:** You cannot delete base system tables. If you inadvertently delete such a table, it is automatically recreated when you upgrade an instance.

You cannot delete a table that has associated tables that extend from it.
You must first delete all records in the table before you delete the table itself. If you do not first delete the records, errors can result on the parent table if it references the records. Deleting the records removes any references from the parent table. To learn more, see delete the records in the table.

Delete a custom table

If you no longer need a custom table, you can delete it after you delete all the records in the table.

1. Navigate to System Definition > Tables.
2. Open the table to delete.
3. Click Delete All Records.

   Deleting all records before deleting the table ensures that the business logic is properly executed (for example, reference cascade rules or other delete business rules). If you do not delete all records from the table first, then you must manually fix any other records or tables that the table deletion impacts.

4. Click Delete.
5. In the confirmation dialog box, enter delete and click OK.

   The table and all items that reference the table are deleted, including:
   - Choice list items
   - Forms, form sections, lists, and related lists
   - Reports and Performance Analytics widgets
   - Reference fields that reference the table
   - Access controls

Delete all records from a table

You may decide to delete all the records on a table without deleting the table itself. For example, the administrator may want to delete all incidents on a test instance without deleting the incident table itself.

When you prepare to delete many records from a table, consider the following guidelines to minimize impact on performance.

- Limit the number of records to be deleted in a single delete action to prevent the table from being locked. Use the `setLimit()` method described at `setLimit`.
- Minimize triggering an excessive number of business rules as a result of this deletion. Use the `setWorkflow(Boolean e)` method described at `setWorkflow`.

**Note:** Deleting all records for a table also deletes records from tables that extend the table.

There are several methods for deleting table records. Depending on the number of records to be deleted, choose the method that would be most efficient in your environment. Use these methods with caution. Before performing this procedure, be sure that you do not need any of the records.
• From the **Tables and Columns** module, complete the following steps.
  a) Navigate to **System Definition > Tables and Columns**.
  b) Select the table for which to delete records.

  ![Table and Columns](image)

  **Tables & Columns**
  Click a button to create a new table or application, or browse all applications.

  ![Create Table](image)  ![Create Application](image)  ![Browse Applications](image)
c) Click **Delete all records**.

d) In the confirmation dialog box, enter `delete` and click **OK**.

- From a list view, complete the following steps.
  a) In List v2, navigate to the list view that displays the table records, click the context menu, and then navigate to **Show**.
  b) In List v3, click **<Number> rows per page** in the footer.
  c) Set the number of rows per page to display the max number.
  d) Select all the rows on the page.
  e) Click **Actions on selected rows**, and then click **Delete**.
  f) Continue deleting all rows on a page until all records are deleted.

The selected table is empty of records. The table still exists, and any references to the table on other tables (such as business rules or reference fields) are preserved.

### Roll back and delete recovery

Recover deleted records and roll back some actions.

Recover individual records and all related changes, and roll back certain actions such as a patch upgrade, a plugin activation, and background script executions. The recovery and roll backs both use rollback contexts.

The roll back and delete recovery features are available on instances that use MySQL and MariaDB databases. Instances that use Oracle databases only support roll back. Instances that use SQLServer do not support roll back or delete recovery.

#### Roll back and delete recovery database support

<table>
<thead>
<tr>
<th>Database type</th>
<th>Roll back</th>
<th>Delete recovery</th>
</tr>
</thead>
<tbody>
<tr>
<td>MySQL</td>
<td>yes</td>
<td>yes</td>
</tr>
<tr>
<td>MariaDB</td>
<td>yes</td>
<td>yes</td>
</tr>
<tr>
<td>Oracle</td>
<td>yes</td>
<td>no</td>
</tr>
</tbody>
</table>

### Deleted Records module

This module works on records in audited tables. Recovery of cascaded deleted records must be done within seven days of the record deletion. After seven days, only data records and references on tables that audit deletions can be recovered, which is the same functionality as prior releases.

To find this module, navigate to **System Definition > Deleted Records**.
Delete Recovery module

This module works for any deleted record. This recovery must be done within seven days of the record deletion.

To find this module, navigate to Rollback & Recovery > Delete Recovery.

Script Execution History module

This module works on scripts executed using the Scripts - Background module. This history only includes seven days of script executions.

To find this module, navigate to Rollback & Recovery > Script Execution History.

Rollback Contexts module

A rollback context is created for each patch upgrade within a family, and each plugin activation providing the plugin supports rollback contexts.

Note: Do not roll back a rollback context until checking with Customer Service and Support. A roll back deletes data and may remove evidence of the upgrade or activation issue preventing debugging of the problem.

The roll back must be done within seven days of the patch upgrade or plugin activation.

To find this module, navigate to Rollback & Recovery > Rollback Contexts.

Rollback contexts

Rollback contexts contain everything necessary to roll back a software upgrade or plugin activation. They include deleted records, patch updates, Scripts-Background script executions, database actions, and plugin activations.

Rollbacks are typically performed on pre-production instances where functionality must be restored before you can find the root cause of a problem in the upgrade. Rolling back deletes data, which can often make it hard if not impossible to discover the problem that made the rollback necessary.

A rollback context is created when:

• GlideRecord.delete() or GlideRecord.deleteMultiple() delete records.
• There is a patch upgrade.
• You activate a plugin that supports rollback contexts.
• A script executes using the Scripts-Background module, and rollback was enabled by selecting the Record for Rollback? check box.

Rollbacks do not impact other database activities. If a database activity modifies a record that is part of a rollback context, the rollback does not affect that record.

Because rollback contexts contain a significant amount of data, rollback contexts are deleted after seven days. Therefore, rollbacks must occur within seven days of the latest upgrade. Use the sys_property, glide.rollback.expiration_days to configure the number of days.

To use rollback contexts, activate the Restore Deleted Records and Delete Recovery plugins.

Rollback context excluded operations

If any of the following operations occur during a rollback, a rollback context is not created:
• Tables or columns are dropped from the schema.
  
  Index drops are okay.
• Table is truncated.
• Table or column is renamed.
• Column is reparented or promoted.
• Column type changes.
• Column width is decreased.

What happens on HI?

• The rollback process on HI updates the reported WAR to the rolled-back version.
• The assigned WAR remains set to the version before the rollback.
• `glide.war.no_upgrade` system property on the instance is set to the version before the rollback.
• The message, "Desired war matches reverted war specified by property [glide.war.no_upgrade]. Upgrade script will NOT run," appears during the rollback.
• Rollback context state says, "Expired."
• Rollback purges all stored data.

Roll back patch upgrades or plugin activations

Use the Rollback Contexts module to roll back patch upgrades and plugin activations.

• Rolling back is possible only between patches in the same software release.
  
  Rolling back is possible from London patch 2 to patch 1, but not from London to Kingston.
• Instances must be using Helsinki or later.
• Check with Customer Service and Support before rolling back pre-London instances.
• The rollback must be done within seven days of the most recent upgrade.

  Use the `glide.rollback.expiration_days sys_property` to configure the number of days. The default is seven.
• You can only roll back to the previous version.
  
  For example, rolling back from patch 3 to patch 1 requires two rollbacks.
• Rollback only supports MySQL.
• Restore Deleted Records and Delete Recovery plugins must be activated.
• You can only roll back one active instance at a time.
  
  Rolling back contexts on multiple nodes is not supported.
• A rollback deletes data and may remove evidence of an upgrade or activation record, which makes it difficult to debug the problem that made the rollback necessary.
• To roll back to a patch version before the Assigned WAR, submit a request for Customer Service and Support to do the rollback.

Role required: maint

2. Under **Related Links**, click **Rollback**.

![Rollback screenshot]

3. Confirm the rollback.
   
   An indicator appears showing the progress of the rollback. glide.war updates to the rolled-back version. App node stats.do updates shortly after the rollback completes. The log shows the stages of the rollback process.

4. After the rollback, restart the instance.
   
   Open a new tab and see if the context state changed to Rolled back.

### Use the Deleted Records module to restore a deleted record

You can recover deleted records that are in audited tables.

Role required: admin

The instance can track deletions on any table, and references on audited tables, with a few exceptions. Record deletions are not tracked in these circumstances.

- Record deletions are not tracked on tables with the **no_audit_delete=true** dictionary attribute.
- Deletions from tables with a sys prefix are not audited by default. You can configure specific system tables to audit deletions.
- References are restored only if the reference field is on an audited table and the Restore Deleted Record plugin is activated.

- References that use an Image field type are not restored.

1. Navigate to System Definition > Deleted Records.
2. Open the deleted record that you want to restore.

Note: You can only restore one deleted record and its associated references at a time.

3. Do one of the following to restore the record.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Undelete With Related</td>
<td>Recovers the record and all cascaded deletes and other database actions that resulted from the delete. This option appears when a rollback context is available for the delete.</td>
</tr>
<tr>
<td>Recover entire operation</td>
<td>If this record was deleted as part of another delete, all records from the parent delete are recovered including all cascaded deletes and other database actions that resulted from the parent delete. If this is the top level delete, then this is the same as Undelete with Related. This option appears when a rollback context is available for the delete.</td>
</tr>
<tr>
<td>Undelete Record</td>
<td>Recovers only this record.</td>
</tr>
</tbody>
</table>

An instructions page appears, explaining the process and its limitations.

4. Click Restore deleted record.
A Progress page shows the progress of the restore process, and shows a count of the references restored.

When the process completes, a Restore Summary itemizes the changes and provides links for viewing the restored record or returning to the deleted records list.

Use the Delete Recovery module to restore a deleted record

You can recover a deleted record and all related changes. The recovery must be done within seven days of the record being deleted.

Role required: admin

2. Click the item from the Delete Recoveries list to be recovered.
   The Delete Recovery form is shown.
3. Under Related Links, click Rollback....
4. In the Rollback entire operation form, enter yes, and click OK.
   A Progress page shows the progress of the restore process, and shows a count of the references restored.

When the process completes, a Restore Summary itemizes the changes and provides links for viewing the restored record or returning to the Delete Recoveries list.

Use the Script Execution History module to roll back a Scripts-Background execution

You can roll back the database actions of a script executed using the Scripts-Background module.

Role required: admin
When you executed the script using the Scripts-Background module, the Record for Rollback? item must have been checked.

If you are still in the Scripts-Background module after executing a script, you can use the Script execution history and recovery available here link to get to the Script Execution History form.

1. Navigate to Rollback & Recovery > Script Execution History.
2. Click the script execution to be rolled back.
3. In the Related Links, click Rollback Script Execution.

Create a table index

Constructing an effective index requires specialized knowledge in database architecture. If you do not have this expertise, you should consult someone who does.

Role required: admin

1. Navigate to System Definition > Tables & Columns.
2. In the list, find the table you want and click its label.
3. Navigate to the Database Indexes related list.
4. Click New.
5. Use the slushbucket to select the fields you want included in the index.
   The order in which you select the fields affects how the index works. If you do not have expertise in database design, you should consult someone who does.
6. To create a unique index, select the Unique Index check box.
7. Click Create Index.
   The Table Name field is there for your reference only. Overriding the default has no effect.

Task table

Task [task] is one of the core tables provided with the base system.

It provides a series of standard fields used on each of the tables that extend it, such as the Incident [incident] and Problem [problem] tables. In addition, any table which extends task can take advantage of task-specific functionality for driving tasks.

The Planned Task plugin provides the Planned Task [planned_task] table, which extends the Task [task] Table to provide more fields for tasks to measure duration and effort.

Create a task

Tasks are not created directly on the task table. Instead, tasks are created on task child tables.

1. Click the New button on the task record list, which launches the Task Interceptor.
2. Follow the on-screen instructions to locate the desired table that extends Task.

Define assignment rules

The instance can automatically assign a task to a user or group based on pre-defined conditions by using data lookup rules and assignment rules.
Assignment lookup rules example

In this example, the Data Lookup Plugin assignment lookup rule automatically assigns any incident with the Category of Request and Subcategory of Password Reset to Fred Luddy.

Assignment data lookup

Assignment rules module

The Assignment rules module allows you to automatically set a value in the assigned_to and assignment_group fields when a set of conditions occurs.

An assignment rule must also meet these additional criteria to run:

- The task record has been created or updated. Assignment rules do not apply to unsaved changes on a form.
- The task record must be unassigned. The record cannot have an existing value for either the assigned_to or assignment_group fields. Assignment rules cannot overwrite existing assignments (including assignments set by a default value or a previously run assignment rule).
- The assignment rule is the first rule that matches the table and conditions. If more than one assignment rule matches the conditions, only the rule with the lowest order value runs.

Condition editor example

In this example, the assignment rule uses a condition statement to automatically assign any incident opened in the Network category to the system administrator in the Network assignment group.

Assignment
Data lookup rules

Data lookup rules offer a generic way to change any field value, not just assignment fields.

Data lookup rules offer the following improvements over the Assignment module:

• Ability to change any field value not just an assignment field
• More options to define when a rule runs:
  • On form change (Allows assignment rules to apply to unsaved changes on a form)
  • On record insert
  • On record update
• Option to replace existing values (including default values)

Note: You can define data lookup and Assignment rules at the same time. The system ignores any duplicate rules after an incident has been assigned unless you are using a data lookup definition option to replace existing values.

Precedence between data lookup, assignment, and business rules

When creating new assignment rules, keep in mind that business rules can take precedence over assignment rules when they run after the assignment rule. Data lookup rules take precedence over assignment rules because they always run after.

Data lookup rules, assignment rules and business rules run in the following order:

1. All 'before' business rules that run on a record insert with an order value less than 1000.
2. All 'before' engines run, including assignment rules.
3. All 'after' engines run, including data lookup rules.
4. All 'before' business rules that run on a record insert with an order value greater than or equal to 1000.
5. All 'after' business rules that run on record insert.

Workflow assignments

An alternative to creating data lookup or assignment rules is to create one or more workflow tasks that assign a task record as part of a workflow.

Consider using a workflow for assignment if your process includes multiple steps or conditions such as requiring a particular group approve a request.

When using a workflow to manage task assignments, add a brief timer activity to the start of the workflow. Without this timer activity, the workflow runs before the parent record, the current record, is inserted into the database. After the timer activity completes, the workflow resumes using the parent record information from the database instead of the original current. Pausing a workflow in this way does not change a default workflow to a deferred workflow. For more information on how the workflow engine interacts with the database, see workflow engine operation order.
Baseline assignment rules example

A baseline instance contains certain assignment rules.

Baseline instance rules

<table>
<thead>
<tr>
<th>Name</th>
<th>Table</th>
<th>Conditions</th>
<th>Assigned to user, Assigned to group, or Script</th>
</tr>
</thead>
<tbody>
<tr>
<td>Networking</td>
<td>incident</td>
<td>Category is Network</td>
<td>User: System Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Group: Network</td>
</tr>
<tr>
<td>Database or Software</td>
<td>incident</td>
<td>Category is one of Request, Inquiry / Help, Software, Hardware</td>
<td>User: System Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Group: Software</td>
</tr>
<tr>
<td>SC Item fulfillment - Field Services</td>
<td>Ticket</td>
<td>Parent.Task.type is Request item</td>
<td>Group: Field Services</td>
</tr>
<tr>
<td>Release Planning</td>
<td>release_phase</td>
<td>Name is Plan</td>
<td>Script: current.release.product.service.assigned_to;</td>
</tr>
<tr>
<td>IT Hardware</td>
<td>sc_req_item</td>
<td>Approval is Approved and</td>
<td>User: System Administrator</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Item.Category is Request Computers and Hardware</td>
<td>Group: Hardware</td>
</tr>
<tr>
<td>Service Desk</td>
<td>incident</td>
<td>Active is true</td>
<td>Group: Service Desk</td>
</tr>
</tbody>
</table>

Create an assignment rule

Create an assignment rule and apply it to a single table. Assignment rules are designed to run at the time you open a record.

Role required: assignment_rule_admin or admin
Example assignment rule

**Note:** An administrator can configure the form to see all the fields.

1. Navigate to **System Policy > Rules > Assignment** and click **New**.
2. Complete the form.

### Assignment rule form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The descriptive name for the assignment rule.</td>
</tr>
<tr>
<td>Active</td>
<td>Specifies whether the assignment rule is active. Only active assignment rules take effect.</td>
</tr>
<tr>
<td>Applies to</td>
<td>The table with the records that the assignment rule applies to.</td>
</tr>
<tr>
<td>Table</td>
<td>The list shows only tables and database views that are in the same scope as the assignment rule. If you select a custom table that extends the task table, and for the assignment rule to work properly, you must clear the instance cache by navigating to https://&lt;instance_name&gt;.service-now.com/cache.do.</td>
</tr>
</tbody>
</table>

**Note:** Clearing the system cache can affect overall performance, and degrade system response times. Do not run cache flushes during business hours, and do not trigger cache flushes automatically.

<table>
<thead>
<tr>
<th>Conditions</th>
<th>The conditions under which the assignment rule applies. In the example, the assignment rule applies when an incident is in the Network category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign to</td>
<td>The user the event is assigned to.</td>
</tr>
<tr>
<td>User</td>
<td>The group the event is assigned to.</td>
</tr>
<tr>
<td>Group</td>
<td></td>
</tr>
<tr>
<td>Script</td>
<td>A script to specify advanced assignment rule functionality. The current.variable_pool set of variables is available.</td>
</tr>
</tbody>
</table>

**Note:** Make sure the input in the script is correct, and that the input type matches the field type in the Assignment Rule script. For example, if the assignment rule script sets the value of an Integer field, and the value in the script is set to String, the assignment rule may yield unexpected results.

Other fields
Data lookup rules

You can define an assignment rule with Data Lookup and Record Matching Support.

2. Click New.
3. Populate the assignment data lookup fields (see table).
4. Click Submit.

Assignment data lookup fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category</td>
<td>Select the category the data lookup matches against.</td>
</tr>
<tr>
<td>Subcategory</td>
<td>Select the subcategory the data lookup matches against.</td>
</tr>
<tr>
<td>Configuration item</td>
<td>Select the configuration item the data lookup matches against.</td>
</tr>
<tr>
<td>Location</td>
<td>Select the location the data lookup matches against.</td>
</tr>
<tr>
<td>Assignment group</td>
<td>Select the assignment group to assign the incident to.</td>
</tr>
<tr>
<td>Field</td>
<td>Input value</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assigned to</td>
<td>Select the user to assign the incident to.</td>
</tr>
<tr>
<td>Active</td>
<td>Set to Yes to run the rule or No to deactivate the rule.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter the order in which the rule runs compared to other rules on the same table. The Data Lookup Plugin runs the rule with the lowest order and matching values.</td>
</tr>
</tbody>
</table>

**Note:** The assignment lookup rule assigns incidents matching the values in the matcher fields (Category, Subcategory, Configuration Item, and Location) to the values in the setter fields (Assignment Group and Assigned To). A valid assignment lookup rule requires at least one matcher field and one setter field.

**Important Task table fields**

The Task table is a base class that provides fields for the core ITSM applications such as Incident, Problem, and Change Management. All applications that extend the Task table share these fields in common.

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>active</td>
<td>boolean</td>
<td>Specifies whether work is still being done on a task or whether the work for the task is complete. By default, only application-specific business rules set the value of this field. For example, the incident autoclose business rule closes resolved incidents that have not been updated for one day.</td>
</tr>
<tr>
<td>Additional comments</td>
<td>comments</td>
<td>journal_input</td>
<td>Displays and allows the entry of comments about the task record. Each comment is inserted into the Activity field. For more information, see Journal Fields.</td>
</tr>
<tr>
<td>Approval History</td>
<td>approval_history</td>
<td>journal</td>
<td>Displays the history of approvals for the record. For more information, see Approvals.</td>
</tr>
<tr>
<td>Label</td>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>------------</td>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Assigned To</td>
<td>assigned_to</td>
<td>reference</td>
<td>Specifies the user assigned to complete the task. By default, this field uses a reference qualifier to only display users with the itil role. Some applications override the parent reference qualifier to display relevant users. For example, the Service Order and Project Task tables filter users based on their skills.</td>
</tr>
<tr>
<td>Created</td>
<td>sys_created_on</td>
<td>glide_date_time</td>
<td>Displays the date and time when the task record was created.</td>
</tr>
<tr>
<td>Description</td>
<td>description</td>
<td>string</td>
<td>Displays and allows the entry of a multi-line description of the work to be done.</td>
</tr>
<tr>
<td>Escalation</td>
<td>escalation</td>
<td>integer</td>
<td>Indicates how long the task has been open. Escalations are dynamically populated using service level agreements, which specify how long a task remains in each escalation state. Escalation states go from Normal to Moderate to High, and finally to Overdue. Record lists color code each task by escalation state.</td>
</tr>
<tr>
<td>Number</td>
<td>number</td>
<td>string</td>
<td>Displays an identifying number for each task record. This field is the display value for the Task table. The system generates this number when the task is created. To manage number generation, see Number Maintenance.</td>
</tr>
<tr>
<td>Opened</td>
<td>opened_at</td>
<td>glide_date_time</td>
<td>Displays the date and time when a human opened the task record for the first time.</td>
</tr>
<tr>
<td>Label</td>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>----------------</td>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Priority</td>
<td>priority</td>
<td>integer</td>
<td>Specifies how high a priority the task should be for the assignee. By default, the calculatePriority business rule calculates this value based on the Impact and Urgency values. Record lists color code each task by degree of priority.</td>
</tr>
<tr>
<td>Short Description</td>
<td>short_description</td>
<td>String</td>
<td>Displays and allows the entry of a short description of the task, which is a human-readable title for the record.</td>
</tr>
<tr>
<td>State</td>
<td>state</td>
<td>Integer</td>
<td>Displays a choice list for status of the task:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Pending</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Open</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Work in Progress</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Closed Complete</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Closed Incomplete</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Closed Skipped</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Applications typically use Dictionary overrides to display application-specific states.</td>
</tr>
<tr>
<td>Sys ID</td>
<td>sys_id</td>
<td>GUID</td>
<td>Displays the unique record identifier.</td>
</tr>
<tr>
<td>Task Type</td>
<td>sys_class_name</td>
<td>sys_class_name</td>
<td>Specifies the type of task, which corresponds to the child class. The system populates this value when a record is created on a child table.</td>
</tr>
<tr>
<td>Time Worked</td>
<td>time_worked</td>
<td>timer</td>
<td>Display a timer which measures how long a record is open in the form view.</td>
</tr>
<tr>
<td>Watch list</td>
<td>watch_list</td>
<td>glide_list</td>
<td>Specifies users who receive email notifications when the record is updated. By default, only the Incident, Change, and Service Catalog applications notify users listed in this field. For other Task-based applications, you must create custom email notifications sent to the users listed in this field.</td>
</tr>
<tr>
<td>Label</td>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------</td>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Work notes</td>
<td>work_notes</td>
<td>journal_input</td>
<td>Displays and allows the entry of comments viewable only by ITIL users. Each comment is inserted into the Activity field. For more information, see Journal Fields.</td>
</tr>
<tr>
<td>Work notes list</td>
<td>work_notes_list</td>
<td>glide_list</td>
<td>Specifies users who receive email notifications when work notes are added to the record. By default, only the Change, Problem, and Service Catalog applications notify users listed in this field. For other Task-based applications, you must create custom email notifications sent to the users listed in this field.</td>
</tr>
</tbody>
</table>

**Journal fields**

Journal fields work together to create a log of changes and comments as tasks are worked on.

**Note:** Journal fields work on audited tables only.

Fields of the journal_input type are multi-line text boxes which, upon save, add the comments into the Activity field with a notation. If TinyMCE is enabled, you can use it to customize the field text on journal fields.

**Fields that accept input into the journal**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Additional comments</td>
<td>Any user can update.</td>
</tr>
<tr>
<td>Work notes</td>
<td>ITIL users can update.</td>
</tr>
</tbody>
</table>

These comments, as well as any changes to the record or email notifications sent out because of the record, are displayed in the activity formatter, which can be added to the form like a field.
Activity formatter for journal fields

Planned task

The Planned Task plugin provides a Planned Task [planned_task] table that extends the Task [task] table.

The Planned Task plugin cannot be activated independently. It gets activated when activating the Project Management plugin (through PPM Standard plugin).

Planned tasks provide additional fields for tasks pertaining to time and effort as part of a planned, multi-stage process.

Note: If the Planned Task_v2 (com.snc.planned_taskv2) plugin is active when you upgrade to the Geneva or later releases, the system adds the Task column to the Planned Task [planned_task] table. The Task column is of type Composite Field, and stores the Short Description and Number of the task. During the upgrade, the system updates all records in the Planned Task table.

Create a planned task

Planned Tasks are created on planned task child tables.

Clicking the New button on the Planned Task record list launches the Planned Task Interceptor, which prompts the user to select a child table to create the planned task on:

To modify the planned task interceptor:

1. Navigate to System Definition > Interceptors (this module may need to be activated).
2. Select the Planned Task Interceptor.
3. The Related List **Answers** specifies what choices are presented, and where the user is redirected to once they select the choice. Modify the list as desired.

![Image of the Related List](image.png)

**Create a baseline**

A Planned Task Baseline is a record of the start and end times of the planned task at a particular moment in time.

To create a baseline, navigate to the form of the top planned task and select the **Create a Baseline** related link:
Create baseline

To view the baseline, configure the related lists to add a related list of baselines:
Baselines tab

The baseline can be viewed on a Gantt Chart using the related link.

Measure time and effort

The Planned Task [planned_task] table provides standard fields for tracking duration and effort.

Duration measures the time from start to end date. Effort measures the hours of work exerted on the project.

Duration

- Planned duration: The projected length of time for the planned task.
- Actual duration: The actual length of time so far for the planned task.
- Remaining duration: The Planned duration minus the Actual duration, which represents the projected length of time left.

Effort

- Planned effort: The projected amount of time that will be spent on the planned task.
- Actual effort: The actual amount of time that has already been spent on the planned task.
- Remaining effort: The Planned effort minus the Actual effort, which represents the amount of project work left.
- Percent complete: For the parent task, the percent complete field is not editable and is rolled up from the percent completion of child tasks using the following formula:

  \[
  \text{Percent complete of parent task} = \frac{\text{sum (planned duration of child tasks } \times \text{ percent complete of child tasks)}}{\text{sum (planned duration of child tasks)}}
  \]

  For a child task, the percent complete is entered manually.

Date Calculation: All planned dates and actual dates of the child tasks are rolled up to the parent task automatically. Planned end date for a child task is calculated based on the planned start date and planned duration. If actual start is present, then planned end date is calculated from actual start date and planned duration.

Dependencies: All type of task dependencies, excluding external dependencies, are supported by the planned tasks. For more information about various dependency types, see Project task relationships and dependencies.
## Important planned task table fields

The Planned Task table has these fields.

### Important Planned Task Table Fields

<table>
<thead>
<tr>
<th>Label</th>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actual cost</td>
<td>work_cost</td>
<td>currency</td>
<td>The actual cost of the planned task, to be compared with the Estimated cost.</td>
</tr>
<tr>
<td>Actual duration</td>
<td>work_duration</td>
<td>glide_duration</td>
<td>The actual length of time (from start time to end time) of work on the planned task, to be compared with the Planned duration.</td>
</tr>
<tr>
<td>Actual effort</td>
<td>work_effort</td>
<td>glide_duration</td>
<td>The actual time spent working, to be compared to the Planned effort.</td>
</tr>
<tr>
<td>Critical Path</td>
<td>critical_path</td>
<td>boolean</td>
<td></td>
</tr>
<tr>
<td>Estimated cost</td>
<td>cost</td>
<td>currency</td>
<td>An estimation of the cost of the planned task, to be compared with the actual cost.</td>
</tr>
<tr>
<td>HTML Description</td>
<td>html_description</td>
<td>html</td>
<td>A description field that accepts HTML mark-up.</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>percent_complete</td>
<td>decimal</td>
<td>A percentage of the completed effort. Generated using the Planned effort and Actual effort fields.</td>
</tr>
<tr>
<td>Planned duration</td>
<td>duration</td>
<td>glide_duration</td>
<td>The estimated length of time (from start time to end time) of the planned task.</td>
</tr>
<tr>
<td>Planned effort</td>
<td>effort</td>
<td>glide_duration</td>
<td>The estimated amount of time spent working on the planned task.</td>
</tr>
<tr>
<td>Planned end date</td>
<td>end_date</td>
<td>glide_date_time</td>
<td>The estimated date and time for the planned task to end.</td>
</tr>
<tr>
<td>Planned start date</td>
<td>start_date</td>
<td>glide_date_time</td>
<td>The estimated date and time for the planned task to start.</td>
</tr>
<tr>
<td>Remaining duration</td>
<td>remaining_duration</td>
<td>glide_duration</td>
<td>The difference in planned and actual duration, representing the time left for the planned task.</td>
</tr>
<tr>
<td>Label</td>
<td>Name</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------</td>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Remaining effort</td>
<td>remaining_effort</td>
<td>glide_duration</td>
<td>The difference in planned and actual effort, representing the amount of work time left for the planned task.</td>
</tr>
<tr>
<td>Rollup</td>
<td>rollup</td>
<td>boolean</td>
<td>Read-only field managed by the system that identifies the task as having child tasks. A rollup task has several its fields calculated from the children so those fields are read-only.</td>
</tr>
<tr>
<td>Time constraint</td>
<td>time_constraint</td>
<td>string</td>
<td>A description of time constraints that apply to the planned task.</td>
</tr>
<tr>
<td>Top Task</td>
<td>top_task</td>
<td>reference (planned_task)</td>
<td>When different planned tasks are stacked in a hierarchy, this field populates with the highest-level parent task. For example, if Project A has a child Project B, and Project B has a child Project C, then the Top Task for Project C is Project A. The Top Task field for Project A is blank.</td>
</tr>
<tr>
<td>Actual start date</td>
<td>work_start</td>
<td>glide_date_time</td>
<td>The actual date when the work starts on the planned task.</td>
</tr>
<tr>
<td>Actual end date</td>
<td>work_end</td>
<td>glide_date_time</td>
<td>The actual date when the work ends on the planned task.</td>
</tr>
</tbody>
</table>

**Planned task scripts**

Several business rules and one script include determines the dynamic calculation of crucial Planned Task fields.

**Planned Task Scripts**

<table>
<thead>
<tr>
<th>Business Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set actual work start value</td>
<td>Sets the Actual Start Date of the planned task when State is set to the default work state.</td>
</tr>
<tr>
<td>Set close data on inactive</td>
<td>Sets the close data of the planned task when task becomes inactive.</td>
</tr>
<tr>
<td>Recalculate</td>
<td>Recalculates the planned task schedule fields when one of the schedule fields changes.</td>
</tr>
<tr>
<td>Planned task global events</td>
<td>Raises global event for every insert or update of planned task record. For more information, see Global events.</td>
</tr>
<tr>
<td>Business Rule</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Update parent actual effort</td>
<td>Rolls up actual effort from child task to parent task.</td>
</tr>
<tr>
<td>Update parent effort</td>
<td>Rolls up planned effort from child task to parent task.</td>
</tr>
<tr>
<td>Update parent percent complete</td>
<td>Rolls up percent complete from child task to parent task.</td>
</tr>
<tr>
<td>Validate duration</td>
<td>Validates the value in the planned duration field is not 0 or negative.</td>
</tr>
<tr>
<td>Validate percent complete</td>
<td>Validates the value in the percent complete field is between 0 and 100.</td>
</tr>
<tr>
<td>Validate work end before work start</td>
<td>Validates that the actual end date is not earlier than the actual start date.</td>
</tr>
<tr>
<td>Set top task</td>
<td>Sets top tasks to maintain hierarchy of tasks.</td>
</tr>
<tr>
<td>Set top task on children</td>
<td>Sets top tasks on child tasks to maintain hierarchy of tasks.</td>
</tr>
</tbody>
</table>

**Planned task hierarchy**

The **Task Hierarchy** tool available for Planned Task displays the relationship between parent and child planned tasks.

Out-of-box, the **Task Hierarchy** tool is available in both Project and Release Management.

Different **Planned Task** tables have different UI actions to launch the task hierarchy:

- To view the hierarchy of a Project, navigate to the use the **Task hierarchy** context menu action.
- To view the hierarchy of a Product in Release v2, navigate to the product and click the **Product hierarchy** related link.
- To view the hierarchy of a Release in Release v2, navigate to the release and click the **Release hierarchy** related link.
Rm2 Hierarchy

The Task Hierarchy can be added to any planned task table by:

1. Navigating to System UI > UI Actions.
2. Selecting one of the existing Task Hierarchy UI Actions (for example, Task hierarchy if Project Management is activated).
3. Change the table to the desired table and rename the UI Action if appropriate, and insert.

The hierarchy should now be available as a UI Action on the form of the new table.

Configure rollup for planned task fields

You can configure the planned task fields to roll up the field values in the parent entity.

By default the following fields are configured to roll up for any planned task and planned task derivatives:

**Cost, Budget, Effort, Actual date, Planned date, Duration, Percent Complete**

1. Navigate to System Definition > Tables.
2. Open the Planned task rollup table.
3. In the Related links, click Show List.
4. Click New.
5. Fill out the Planned task rollup form (see table).
6. Click Submit.

### Planned task rollup form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Child</td>
<td>Select the table you want to include or exclude.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field</td>
<td>Select the column name you want to include or exclude.</td>
</tr>
<tr>
<td>Navigator</td>
<td>The reference column of the parent to which the value must be rolled up.</td>
</tr>
<tr>
<td>Parent</td>
<td>Select the parent table.</td>
</tr>
<tr>
<td>Application</td>
<td>Auto-generated value.</td>
</tr>
<tr>
<td>Rollup</td>
<td>Select the check box to allow roll up. Leave the field unchecked to exclude the field from rollup.</td>
</tr>
</tbody>
</table>

**Reminder table**

The Reminder [reminder] table provides a way to auto-generate reminders for a task.

The Reminder [reminder] table is one of the child tables of the Task [task] table. Any table that extends the Task table, such as the Incident [incident] table, can use the Reminder [reminder] table.

Only the system administrator can create or modify a Reminder table. To access the Reminder table, type reminder.do in the filter navigator.

### Reminder table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task</td>
<td>Refers to the parent task record.</td>
</tr>
<tr>
<td>User</td>
<td>Specifies the user who has logged in to the system.</td>
</tr>
<tr>
<td>Remind me</td>
<td>Specifies the time before which the reminder must be sent. Available values are: <strong>15 minutes, 30 minutes, 1 hour, and 2 hours</strong>. You can add values to this field as required. Note: Internally in the system, the value is always converted to minutes and then stored in the Remind me field.</td>
</tr>
<tr>
<td>Before</td>
<td>Refers to the date from the date field of the parent task record. This date and the time that you mention in the Remind me field are considered to send a reminder. Available values are: Activity due, Due date, Follow up, and SLA due. Note: The Activity due field and the SLA due field are legacy fields with an UNKNOWN value that you cannot use. You can only use the Due date and Follow up fields.</td>
</tr>
<tr>
<td>Using</td>
<td>Specifies the method by which the reminder must be sent. Available options are: <strong>Send an Email</strong> and <strong>Outlook Calendar</strong>.</td>
</tr>
<tr>
<td>Subject</td>
<td>Specifies the subject or the reason of the reminder. Maximum number of characters allowed on this field is 100.</td>
</tr>
<tr>
<td>Notes</td>
<td>Provides a space where you can enter your comments regarding the reminder. Maximum number of characters allowed on this field is 8000.</td>
</tr>
</tbody>
</table>
Task table modifications

Modifications made to the Task table are applied to all child tables.

Be sure that the changes being made are appropriate for all the child tables. Adding fields is a low-impact change, because the field can be hidden on tables that do not need it. However, if the field is being used across tables, deleting fields may cause unwanted data loss.

**Note:** When adding choice list entries to a choice list on the Task table, make sure that the entry value is unique.

You can use dictionary overrides to change some parts of a field definition in a way that does not apply to all child tables.

Tasks workflow

An administrator can specify a specific workflow process to apply to tasks that meet certain conditions.

Once a task is created that meets the conditions, the workflow applies the process to the task, asking for approvals, notifying users, generating other tasks, running scripts, and so on.

Time Card Management

The Time Card Management feature enables time card users such as task assignees to report and track their time for the assigned tasks.

Time Card Management works with the Task table to record time worked on various task types, such as projects, incidents, problems, and change requests.

With the Time Card Management feature:

- The time card users can record the time worked on a task using time cards and time sheets. They can submit their time cards and time sheets for approval.
- Time cards and time sheets are routed for approval based on the Non-project time approver and Project time approver fields in the user time sheet policy. User managers with time card approver role can also log time and submit the time sheet of their resources.
- The time card approvers can perform the following tasks:
  - Review and approve or reject the time cards in a submitted time sheet.
  - Recall the approved time sheets or time cards to return them to the users for corrections.
  - Use dashboards to view reports of time card and time sheet exceptions, and categorize time reported by the users.
  - Delegate another time card approver to process time sheets from your resources when you might not have time or will be unavailable. Note the following points for delegation:
    - You cannot delegate approval only for an individual resource.
    - The delegated time card approver cannot further delegate your time sheet approvals.

The project_manager and the resource_manager roles contain the timecard_approver role in the base system. However, the timecard_approver role can also be used independently without these roles.

- The time card admin can create and manage time sheet policies, and can also approve or reject by exception and process the time sheets. Time card admin can also create or edit time cards of any users if the time cards are in Pending or Rejected state.

Watch this five-minute video to learn about setup of the time tracking feature, entering time and approvals.
**Note:** The Time Card Management plugin is required to use time cards. Some of the procedures require the project management feature, which activates time cards automatically. For more information, see Project Management (com.snc.financial_planning_pmo).

### Domain separation in Time Card Management

Domain separation provides complete data isolation for domain-specific users. Time card Management is domain separation compliant at the **Data only** level.

### Activate Time Card Management

Administrators can activate the Time Card Management plugin (com.snc.time_card). The plugin also activates the Performance Analytics - Content Pack - Project Portfolio Suite Dashboards plugin (com.snc.pa.time_card). However, you need a Performance Analytics license to use the dashboards.

Role required: admin

**Note:** The Time Card Management plugin also gets activated as part of PPM Standard plugin (com.snc.financial_planning_pmo).

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### Time sheet policies

Time sheet policies contain the policies to which a time sheet, or a time card must adhere.

By default, the Default time sheet policy is available with the system. As a Time card admin, you can create multiple time sheet policies based on different requirements and workflows in your organization. For example, specify a time sheet policy for each department or team and assign appropriate users to them.

Time sheet policies also provide an ability to specify appropriate approval workflow for project and non-project tasks.

A time sheet policy can be **set as a default policy**. The default policy is a global time sheet policy which applies to all the users who are not assigned to any other time sheet policy. Only one time sheet policy can be set as a default policy.

Navigate to **Time Sheets > Administration > Time Sheet Policies** to view the list of timesheet policies.

#### Create a time sheet policy

As a time card administrator, you can create a time sheet policy to define the requirements for time card users to record their time worked. The time card approvers must review and process time sheets under the applicable time sheet policy.

Role required: timecard_admin

1. Navigate to **Time Sheets > Administration > Time Sheet Policies**.
2. Click **New**.
3. On the form, fill in the fields.

**Time Sheet Policy form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the policy.</td>
</tr>
<tr>
<td>Allow blank time cards</td>
<td>Option to enable submission of blank time cards for approval. By default, this option is not selected.</td>
</tr>
</tbody>
</table>
| Auto create time card on planned task update  | Option to create a time card automatically when you update a planned task, if the following conditions are true:  
  • You are a time card user  
  • You are assigned to the task through **Assigned to** or **Additional assignee list** field  
  • The task is not in a pending state. By default, this option is not selected. |
| Auto fill time card with time worked entries  | Option to fill in time cards automatically when you enter time in the **Time worked** field on the Task form.  
  If a time card does not exist for the task, one is created when the time worked is updated if the following conditions are true:  
  • You are a time card user.  
  • You are assigned to the task through the **Assigned to** or **Additional assignee list** field. By default, this option is not selected. |
<p>| Auto create time cards every week             | Option to <strong>generate time cards automatically</strong> every week through a scheduled job for all users assigned to the time sheet policy. The time cards are generated based on the planned task assignments and hard-allocated resource plans of the users. By default, this option is selected. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Update actual hours and cost in resource plan/reports | Option to update actual hours and actual cost of the associated resource plan based on the hours entered in the approved time card. When selected, you can associate a resource plan related to the selected task with the time card in the following ways:  
  • If the task has multiple resource plans, you can select the appropriate plan.  
  • If the task has one resource plan, that plan is selected by default.  
  The hours from the time card entry and the hourly resource rate are used to update the **Actual hours** and **Actual cost** values of the associated resource plan.  
  **Note:** If the task has no resource plan, the associated records update the corresponding project.  
  By default, this option is not selected. |
| Allow recall                               | Option to enable the recall action on a time sheet or time card after it is approved and processed. By default, this option is selected.                                                                     |
| Recall period allowed (days)              | Number of days within which you can recall a time sheet or time card.  
  This field appears when the **Allow recall** option is selected.  
  The default value is 30.                                                                 |
| Week starts on                             | Start day of the week for the time sheet. The default value is Sunday.                                                                                                                                 |
| Maximum hours per day                     | Maximum number of hours that can be entered each day in a time sheet.  
  If set to -1, the resource can enter a value from 0 through 24 for the hours worked each day.  
  The default value is 24.                                                                 |
| Maximum hours per week                    | Maximum number of hours allowed in a week in a time sheet.  
  The value for total hours for a week in a time sheet is the sum of hours entered per day of that week. If set to -1, the total hours per week allowed is up to 168 (24 x 7) hours.  
  The default value is 40.                                                                 |
<table>
<thead>
<tr>

<tr>
<td></td>
<td>• <strong>Project Manager</strong>: Time cards for a project task are routed to the respective project manager for approval when submitted. The project manager is picked from the task against which you are submitting time.</td>
</tr>
<tr>
<td></td>
<td>• <strong>User Manager</strong>: Time cards are routed to the user manager for approval when submitted.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Both</strong>: Time cards are routed to both the user manager and project manager for approval when submitted.</td>
</tr>
<tr>
<td></td>
<td>A time card remains in the Submitted state when only one of the approvers approves the time card.</td>
</tr>
<tr>
<td></td>
<td>• <strong>None</strong>: A user with the time_card admin role can approve time cards.</td>
</tr>
</tbody>
</table>

**Note:**
- The project manager and the user manager can view only those time cards that are routed to them for approval.
- If the user manager or the project manager changes while the time card is still not approved, the system automatically updates the approver of the time card.
- If the name of the project manager or the user manager is not populated on the respective form, a user with the time_card admin role can approve time cards.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow multiple rate types</td>
<td>Option to provide a rate type in a time card to be used during expense line generation. When this option is selected, the Rate type field displays on the Time Card form to enable the selection of a rate type. For more information, see Rate type in labor rate card.</td>
</tr>
<tr>

<td>Rate type used by default for the time card. If you select none, the Standard rate type option is used. This field appears when the Allow multiple rate types check box is selected.</td>
</tr>
<tr>
<td>Default Policy</td>
<td>Option to set the time sheet policy as the default. The default policy is a global time sheet policy that applies to all users who are not assigned to any other time sheet policy. Only one time sheet policy can be set as the default. A time sheet policy set as the default policy cannot be deleted. You must first set another policy as the default policy.</td>
</tr>
</tbody>
</table>

4. Click Submit.

- Set the time sheet policy as the default policy, if required.
- Assign the time sheet policy to users.

**Set a time sheet policy as default policy**

As a time card administrator, you can set a time sheet policy as the default policy. The default policy is a global time sheet policy which applies to all the users who are not assigned to any other time sheet policy.

Role required: timecard_admin

Only one time sheet policy can be set as a default policy.

1. Navigate to Time Sheets > Administration > Time Sheet Policies.
2. Open the time sheet policy record.
3. Click the Set as default related link.

**Note:** The related link appears only for a time sheet policy which is not already set as the default policy.

The Default Policy option on the record form is selected to indicate that the current time sheet policy is set as the default policy. The Default Policy option on the earlier default time sheet policy is cleared.

You cannot delete a default time sheet policy. You must first mark another policy as the default policy to delete the current default policy.

**Assign a time sheet policy to a user**

As a time card administrator, you can assign a time sheet policy to a user.

Role required: timecard_admin
You can assign only one time sheet policy to a user.

1. Navigate to Time Sheets > Administration > Time Sheet Policies.
2. Open the time sheet policy record.
3. In the Users related list, click Edit.
4. On the Edit Members form, move the users to the User List.
5. Click Save.

The selected users appear on the Users related list. The time sheet policy is assigned to the selected users.

Create a rate type

You can create rate types using the Rate Types feature.

Role required: timecard_admin

The rate type functionality is used to categorize different types of work. For example, Standard versus Overtime. It can also instruct down-stream, third-party product about the nature of the work performed.

For example:

- A user works extra time during the day and must differentiate standard time from overtime.
- A technician may be paid at a higher rate based on different types of work involved in the execution of a task.
- An appliance repair task may be billed at one rate for the first hour and a different rate for the remaining hours.
- A service call may last four hours during which specialized equipment is used for one hour. The company must capture the use of the specialized equipment for purposes ranging from additional billing to legal compliance or warranty tracking.

1. Navigate to Time Sheets > Administration > Rate Types.
2. Click New and fill the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Provide a suitable name for the rate type.</td>
</tr>
<tr>
<td>Description</td>
<td>(Optional) Summarize the purpose of the rate type.</td>
</tr>
<tr>
<td>Active</td>
<td>Deselect the check box to mark the rate type as inactive.</td>
</tr>
</tbody>
</table>

3. Click Submit.

- The rate type is displayed in the Rate Types list.
- The rate type if active is also displayed in the Rate Type field in the Labor Rate Cards form, Time Worked form, Time Card form, and Time Sheet Portal.

Time Sheet Portal

Time Sheet Portal categorizes and displays all your assigned tasks in a single view for a given week. The portal enables you to record time spent on tasks on a day-to-day basis and submit the time sheet in a single action.

Time Sheet Portal works with the Task table to record the time that you spend on various task types, such as projects, incidents, problems, and change requests. It provides a complete breakdown of the time you enter for the task, task categories, and days in a week. It enables you to:
- Generate time cards for assigned projects or project tasks.
- Copy time cards from a previous time sheet.
- Search and create a time card for a task that is not displayed in the assigned tasks list.
- Edit, delete, or add notes to a time card.
- Submit, approve, reject, and recall a time sheet.
- View notifications for the submitted, rejected, and recalled time sheets or time cards.

Time Sheet Portal comprises of the following sections:

**Header**

![My Time Sheet]

The Time Sheet Portal header:

- Displays a date range of the time sheet for the selected week and provides options to navigate to the time sheet of previous or next week.
- Provides a calendar along with the date range. Clicking a date in the calendar displays the time sheet for the week of the selected date.
- Provides a link to navigate to the time sheet for the current week when a different time sheet is being viewed.
- Provides an option under *My Time Sheet* that enables you to open and edit the time sheets of your resources. The option is available only for a user manager.

- Provides an option to view the time sheet in the Form view using time sheet form view icon ( ).
• Displays the notifications for the submitted, rejected, and recalled time sheets under the show notifications icon (1). Each entry displays the number of time cards and their state. Click on a notification item to open the time sheet.
Tasks

The **Tasks** tab displays your assigned tasks as cards. Each card provides information about a task, such as short description, state, last updated date and time, and priority. Tasks are derived from the following filter conditions:

- All your assigned incidents, problems, or change requests that are active.
- All your assigned incidents, problems, or change requests that are closed in the selected week.
- All tasks for which you are hard-allocated during the selected week.
- All your assigned projects or project tasks that are active during the selected week. Project or project tasks are derived from the following conditions:
  - A project or project task that has started and its actual start date is before the end of the selected week.
  - A project or project task has closed and its actual end date is after the week has begun.
  - When there are no actual dates for a project, planned dates of the project must occur within the selected week.
- All active stories assigned to you.
- All active scrum tasks assigned to you or closed in the selected week.
- All active test plans assigned to you.
• All active defect and enhancements assigned to you or closed in the selected week.

**Note:** If the Customer Service Management plugin (com.sn_customerservice) is activated, your assigned tasks that are active and closed in the selected week are also derived from the following tables:

- Case [sn_customerservice_case]
- Work Order [wm_order]
- Work Order Task [wm_task]

On the **Tasks** tab, you can perform the following operations:

• Type a keyword in the search field to view only cards with details that match the keyword.
• Sort cards in ascending or descending order based on priority, irrespective of the task type.
• View cards based on a category, such as projects, project tasks, incident, problem, change, defect, enhancement, test plans, and scrum tasks.
• **Create time cards** for assigned tasks.

**Note:** Time sheet policies apply when you create or edit a time card.
The **Group Tasks** tab displays the tasks assigned to your **Assignment group**. The group tasks are displayed as cards in the tab. A card provides information about the task, such as short description, state, last updated date and time, and priority.
The **Other** tab displays cards used to log time for operational work, such as administration, meeting, and KTLO.

**Note:** The list of categories in the time card controls the list of cards displayed on the **Other** tab. If an administrator marks any of the categories as inactive in the time cards, those categories are not displayed on the **Other** tab.
The Time Sheet section:

- Displays the date range of the time sheet for the selected week.
- Indicates the state of the time sheet being viewed.
- Displays the total number of tasks and hours that you have entered for each day in a week. When you click a day in the time sheet, the column for that day is highlighted in both the Time Sheet and Logged Time Cards sections. The first day displayed in the Time Sheet section is based on the value specified in the Week starts on field in the users Time Sheet Policy. For example, if the Week starts on field is set to Friday, the Time Sheet section starts with Friday.
- Indicates the total number of hours that you entered in the time sheet. Time Sheet breakdown also displays a breakdown of user-entered hours in different work categories, such as project tasks, admin, meeting, follow on tasks, or change requests.
- Provides options that enable you to submit a time sheet and copy time cards from a previous time sheet. For an approver, options to approve or reject a submitted time sheet and recall a processed time sheet are available.
Logged Time Cards

Each row in the Logged Time Cards section represents a time card entry for a given week. It has details such as icon for state of the time card, short description of the task, project time category, rate type, resource plan, and logged time. Each row of the time card contains options that enable you to edit, delete, or add notes to a time card. For more information, see Create time cards and log time through Time Sheet Portal.

</tbody>
</table>

**Note:**
- The **Rate type** column is visible only when the **Allow multiple rate types** option in the time sheet policy of the user is selected.
- The **Resource plan** column is visible only when the **Update actual hours and cost in resource plan/reports** option in the time sheet policy of the user is selected.

The icon beside the short description of a row indicates a time card state. The merge icon in a time card row indicates that a duplicate time card for the same task exists in the time sheet and provides option to merge them into a single time card.
When there are no time cards, the Logged Time Cards section displays the **Generate Time Cards** and **Copy from previous time sheet** buttons to create time cards.

**Create time cards and log time through Time Sheet Portal**
After you create time cards in Time Sheet Portal, log time in the time cards.

Role required: timercard_user

1. Navigate to **Time Sheets > Time Sheet Portal**.
2. Create time cards in the **Logged Time Cards** section using any of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Steps</th>
</tr>
</thead>
</table>
| **Generate time cards for assigned projects or project tasks** | a. Click choice list next to **Submit**.  
   b. Select **Generate Time Cards**. The option also appears in the **Logged Time Cards** section when a user has no time cards for the selected week.  
   
   **Note:**  
   • If a time card exists for a project task during the selected week, a duplicate time card is not created.  
   • Time cards are generated only for those project tasks that are in progress or planned for the selected week.  
   • The **Allow time card reporting on** field on the project form determines the level at which the time cards are created for project tasks. |

| **Copy time cards from a previous time sheet** | a. Click choice list next to **Submit**.  
   b. Select **Copy from previous Time Sheet**. The option also appears in the **Logged Time Cards** section when a user has no time cards for the selected week.  
   
   **Note:**  
   • Time cards for all the project tasks that are in progress or planned in the current week are copied from the selected time sheet. If a time card for a project task exists, a duplicate time card is not created while copying.  
   • Time cards for all the non-task categories, such as meetings and trainings, are copied from the selected time sheet. If a time card for a non-task category exists, a duplicate time card is created while copying. |
<table>
<thead>
<tr>
<th>Option</th>
<th>Steps</th>
</tr>
</thead>
</table>
| Create a time card from the Tasks, Group Tasks, or Other tab | a. On the Tasks, Group Tasks, or Other tab, point to a task (card) that you want to create a time card for.  
   b. Click Add to Time Sheet. |
|                                             | Note: Add to Time Sheet creates a time card with the default rate type of the user, if it exists. |
| Create multiple time cards from the Tasks tab | a. On the Tasks tab, select multiple tasks that you want to create time cards for.  
   b. Click Add selected to Time Sheet. |
| Create a time card for unassigned task       | a. In the Logged Time Cards section, click Add unassigned tasks to Time Sheet.  
   b. Enter the task number or short description of the task you worked on during the selected week. |

Based on the Allow time card reporting on field settings in the Preferences tab of a project, the Add to Time Sheet and Add selected to Time Sheet options are displayed in Time Sheet Portal.

3. In the Logged Time Cards section, log time in a time card:

<table>
<thead>
<tr>
<th>Option</th>
<th>Steps</th>
</tr>
</thead>
</table>
| Through inline editing        | a. Select a row and press Enter. You can also double-click a row.  
   b. Edit the values as required. |
| Through time card form        | a. Point to a row and click the more actions icon  
   b. To open the Time Card form, click Open Form View.  
   c. Enter hours on the time card form.  
   d. Click Save. |
| Add notes to time cards       | a. Point to a row and click the more actions icon.  
   b. To add a note, click Add Note. |

Submit time sheet through Time Sheet Portal
Once you update the time sheet with time worked for a given week, submit it for approval.

Role required: timecard_user

When you submit a time sheet, time cards are verified against the assigned time sheet policy. If there is no time sheet policy assigned, time cards are verified against the default time sheet policy. Business rules prevent you from submitting a time sheet in case any violation is found.

1. Navigate to Time Sheets > Time Sheet Portal.
2. Click **Submit**.
   The time sheet moves to the Submitted state.

**Log time and submit time sheets of your resources**
As a user manager, you can log time and submit the time sheet of your resources.

A user manager must have time card approver role to create and edit time cards, and submit the time sheet of other time card users. The user manager has either of the required roles and is the one listed as the manager of the time card users.

Role required: timecard_approver

1. Navigate to **Time Sheets > Time Sheet Portal**.
2. Click **My Time Sheet** choice list and select the user for whom you want to approve or reject time sheet for under **My Resources**.

   The **My Resources** section lists the time card users reporting to you.

   **Note:** The choice list with **My Time Sheet** is available only for a user manager.

3. Create time cards and log time as required.
4. Click **Submit**.

   • The time sheet of the selected user moves to the Submitted state. The time sheet policy assigned to the time card user is used for validation when you submit the time sheet.
   • All the time cards associated with the time sheet are also submitted automatically and move to the Submitted state.
   • The **Approve** and **Reject** buttons appear in the Time Sheet section. The two buttons appear only for a user manager.

Once you have submitted the time sheet for your resource, you can click **Approve** or **Reject** to approve or reject it. Only the time cards that are routed to the user manager, are approved or rejected. The routing for approval happens based on the **Non-project time approver** and **Project time approver** fields in the time sheet policy of the time card user.

**Time Sheets**
A time sheet groups all the time cards for a user for the given week.

With time sheets:
• Time card users can submit all the time for their work week in a single step by using a time sheet.
• Time card approvers can approve all the time cards in a time sheet for a user in a single step by approving the time sheet. They do not need to approve multiple time cards for a given user individually.
• Track the activities of a time sheet, such as who submitted or approved a time sheet, in the Activities section on the Time Sheet form. This time sheet activity audit is useful for tracking when you delegate responsibility for your time card processing to another user. To track the activities, enable the **State** field of the Time Card [time_card] table for auditing the time card activities, if it is not already enabled. For more information, see Include a table field in auditing.

A time sheet can have any of the following states:
• Pending
• Submitted
• Approved
• Processed
• Rejected
• Recalled
Create a time sheet
As a time card user, you can create a time sheet to group all your time cards for the given week and submit them in a single step.

Role required: timecard_user
A user can create only one time sheet per week.

Note: When a user creates a time card for a week, a time sheet is also automatically created for that week.

1. Create the time sheet with one of these options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>From the time sheet menu</td>
<td>Navigate to Time Sheets &gt; My Time Sheets &gt; Current (This Week). The time sheet form for the current week opens.</td>
</tr>
<tr>
<td>From the time sheet list</td>
<td>a. Navigate to Time Sheets &gt; My Time Sheets &gt; All &gt; New. b. Click New.</td>
</tr>
</tbody>
</table>

2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Week starts on</td>
<td>Starting date of the week for which the time sheet is created.</td>
</tr>
<tr>
<td>Note:</td>
<td>The time sheet policy Week starts on controls the start day of the week.</td>
</tr>
<tr>
<td>Total Hours</td>
<td>Number of hours the user has worked in that week. This field is automatically populated from the hours recorded for the associated time cards.</td>
</tr>
<tr>
<td>User</td>
<td>Name of the user for which time sheet is created.</td>
</tr>
<tr>
<td>State</td>
<td>Current state of the time sheet. All new time sheets begin as Pending. Default states: Pending, Submitted, Approved, Processed, and Rejected.</td>
</tr>
<tr>
<td>Comments</td>
<td>Comments related to the time sheet.</td>
</tr>
<tr>
<td>Notes</td>
<td>Any additional information.</td>
</tr>
</tbody>
</table>

3. Click Submit.
Add time cards to the time sheet. You can use the related links and related list to add time cards. You can also add time cards using the Time Sheet Portal.
Submit a time sheet
Once the time sheet is updated with time worked, you can submit the time sheet for the week to submit all the time cards for the week together.

Role required: timecard_user

When a user submits a time sheet, the time sheet policy assigned to the user is used for validation. If there is no time sheet policy assigned to the user, the default time sheet policy is used. Business rules prevent a user from submitting a time sheet in case any violation is found.

Note: You can also perform this task from the Time Sheet Portal.

1. Navigate to the time sheet using one of the following options:
   • To submit a time sheet in the Pending state, navigate to **Time Sheets > My Time Sheets > Pending**.
   • To submit the time sheet for the current week, navigate to **Time Sheets > My Time Sheets > Current Time Sheet**.
   • To submit a time sheet in the Rejected state, **Time Sheets > My Time Sheets > Rejected**. You can make required changes as suggested in the rejection comments to resubmit a rejected time sheet.

2. To submit in the Time Sheets list, open the time sheet.
3. Add comments, if required.
4. Click **Submit Time Sheet**.

   • The time sheet moves to the Submitted state.
   • All the time cards associated with the time sheet are also submitted automatically and move to the Submitted state.

Approve or reject a time sheet
As a user manager, you can view and approve or reject a time sheet to approve or reject all the time cards for a user for the given week in a single step.

Role required: timecard_approver or timecard_admin

A user manager is the one who has either of the required roles and is selected in the Manager field on User form of the time card user.

During out-of-office time, the user manager can delegate another user with the required roles as the time sheet approver. For the specified time period, the delegated user also receives all the time sheets submitted by the time card users to process.

1. Navigate to **Time Sheets > Time Sheets > Pending Approval**.
2. In the Time Sheets list, open the time sheet to approve or reject.
3. If required, add comments.
4. Click Approve or Reject.

- The time sheet moves to the Approved or Rejected state.

**Note:** If a time sheet is rejected, it gets listed in the notifications for the rejected time sheets under the show notifications icon on Time Sheet Portal.

- All the time cards associated with the time sheet are also approved or rejected automatically.
- If any time cards in the time sheet are pending approval by one of the approvers as defined by the time sheet policy, the time sheet remains in the Submitted state.

**Note:**
- You can also approve or reject the time cards within a time sheet selectively by selecting one or more time cards and approving or rejecting them.
- If a time sheet is rejected, all the associated time cards in the Submitted state are also rejected automatically. The time cards in the Approved and Processed state for the time sheet remain unaffected.
- If all the time cards in a time sheet are approved, the time sheet automatically moves to the Approved state.
- If a time card in a time sheet is in the Rejected state, then irrespective of the state of other time cards in the time sheet, the time sheet also moves to the Rejected state.

**Time cards**

Time cards are used to record the time worked on a task by a task assignee.

The time card management feature works with the Task table to record time worked on Projects, Incidents, Problems, and Change Requests.

Task assignees can record time worked in the **Time worked** field on a task record or enter hours directly into their time card. Some tables support automatic time card creation based on start and end date fields.

Track the activities of a time card, such as who submitted or approved a time card, in the Activities section on the Time Card form. This time card activity audit is useful for tracking when you delegate responsibility for your time sheet processing to another user. To track the activities, enable the **State** field of the Time Card [time_card] table for auditing the time card activities, if it is not already enabled. For more information, see Include a table field in auditing.

You can associate time cards for the project tasks and other task categories, such as meeting and training, with relevant resource plans.

When you approve a time card, the time logged in the time card is saved day-wise in the Time Card Daily [time_card_daily] table. Using daily time logged data, you can generate time card reports by days for any period irrespective of the time sheet period to which the time cards belong. For example, you can create monthly time card report that includes time cards from the first day to the last day of the month.

Time cards also have an optional approval mechanism for project managers to approve the time cards. Administrators and time card approvers can see all the time cards for the week. All users who are in a role that is responsible for working on tasks also can access their personal time cards. A time card can have any of the following states:

- Pending
- Submitted
- Approved
Create a time card
You can create time cards to log time against the work you have done.

Role required: timecard_user

The **Allow time card reporting on** field on the **project form** determines the level at which the time cards for the project tasks can be created.

Time cards can be created automatically or manually.

- **Automatic**: Use the following options to automatically generate the time cards:
  - **By updating task**:
    - **Auto create time card on task update**
      Configure time cards to be created when a user updates a task record. The **Auto create time card on task update** setting in the assigned **time sheet policy** controls this behavior and is set to false by default.
    - **Auto fill time card with time worked entries**
      Configure time cards to be created when a user records **Time worked**. A time card is created if a time card does not exist for the task. The time sheet policy **Auto fill time card with time worked entries** controls this behavior and is set to false by default.

      In **Project Task**, **Incident**, **Problem**, and **Change** records, the **Time worked** field does not appear by default and must be configured on the form.

  - **By scheduled job**: Configure time cards for the project tasks to be generated automatically for users through a **scheduled job**. Only the admin can configure a scheduled job.

- **Manual**: Create a time card for each task and enter the time manually.

1. Create the time card using one of the following options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>From the Time Sheet Portal</strong></td>
<td>a. Navigate to <strong>Time Sheets &gt; Time Sheet Portal</strong>.</td>
</tr>
<tr>
<td></td>
<td>b. Open the week on the <strong>Calendar</strong> for which you want to create the time card.</td>
</tr>
<tr>
<td><strong>From a Time sheet related list</strong></td>
<td>a. Open the time sheet that you want to create the time card for.</td>
</tr>
<tr>
<td></td>
<td>b. In the <strong>Time Cards</strong> related list, click <strong>New</strong>.</td>
</tr>
</tbody>
</table>
Option | Steps
--- | ---
From a Time sheet related link | 

a. Open the time sheet for which you want to create the time card.

b. Click any of the following related links:

- **Generate Time Cards**: This option generates the time cards for all project tasks assigned to the user for the time sheet week. With this option, time cards are generated only for the project tasks that are in progress or planned in that week.

- **Copy from previous time sheet**: This option copies all the time cards (for project and non-project tasks) from a selected time sheet.

**Note:**

When using the related links for creating time cards:

- If a time card exists for a project task for the time card week, a duplicate time card is not created.

- Time cards are generated only for those project tasks that are in progress or planned in that week.

2. On the form, fill in the fields.

**Time card form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Week starts on | Starting date of the week of the time sheet. 

**Note:** The time sheet policy Week starts on controls the start day of the week. |
| State | Current state of the time card. All new time cards begin in the Pending state.  
Different states of a time card are Pending, Submitted, Approved, Processed, Rejected, and Recalled. |
| Category | Type of task for which the time card is created. |
| Task | Task that is associated to the time card. |
| Project time category | Type of activity in the project that time is reported for.  
This field appears when you select Project/Project Task or Task work in the Category field. |
| User | Name of the user that the time card is created for. |
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rate type</td>
<td>Rate type that is considered during the expense line generation. For more information, see Rate type in labor rate card.</td>
</tr>
<tr>
<td>Note:</td>
<td>This field appears when the Allow multiple rate types option is selected in the assigned time sheet policy of the user.</td>
</tr>
<tr>
<td>Resource Plan</td>
<td>Resource plan of the task associated with the time card. When the time card is approved, the hours from the time card entry and the hourly resource rate are used to update the Actual hours and Actual cost values of the associated resource plan. A resource plan is associated with the time card in the following ways:</td>
</tr>
<tr>
<td></td>
<td>• If the task has multiple resource plans, you can select the appropriate plan.</td>
</tr>
<tr>
<td></td>
<td>• If the task has one resource plan, that plan is selected by default.</td>
</tr>
<tr>
<td>Note:</td>
<td>If the task has no resource plan, the associated record updates the corresponding project.</td>
</tr>
<tr>
<td></td>
<td>This field appears when the Update actual hours and cost in resource plan/reports option is selected in the assigned time sheet policy of the user.</td>
</tr>
<tr>
<td>Remaining effort</td>
<td>Amount of work time left for the planned task. Remaining effort is the remaining effort in the planned task table and is calculated as: Remaining effort = Planned effort - Actual effort</td>
</tr>
<tr>
<td>Note:</td>
<td>The field is not available on the Time Card form by default. Configure the form to add this field if required.</td>
</tr>
</tbody>
</table>

3. Click Submit.

- The time card is created for the selected time card period.
- If the time sheet for the week does not exist, a time sheet is created for the time card week.

After the time card is created, the hours for that task can be incremented automatically from the Time worked field in the task record. The time sheet policy Auto fill time card with time worked entries controls the way the time is updated in time cards. The policy is set to false by default. If automatic updates for time worked are not configured, the user must manually update the time card.

Copy time cards from a previous time sheet.
Another option for creating time cards is to copy them from an existing timesheet, which copies all the time cards (for project as well as non-project tasks) from a selected time sheet.

Role required: timecard_user

You can also perform this task from the Time Sheet Portal.

1. Open the time sheet record that you want to create the time cards for.
2. Click the Copy from previous time sheet related link.
3. In the Select Time Sheet field, select a previous time sheet that you want to copy the time cards from.
4. Optionally, if you want to copy the time logged for the tasks in the previous time sheet, select the Copy time logged check box.
5. Click OK.

**Time cards for project tasks**

Time cards for all the project tasks that are in progress or planned in the current week are copied from the selected time sheet. If a time card for a project task exists, a duplicate time card is not created during copying.

**Time cards for non-task category**

Time cards for all non-task category such as meetings and trainings are copied from the selected time sheet. If a time card for a non-task category exists, a duplicate time card is created during copying.

- If the previous time sheet has rate types and the time sheet policy of the user allows rate types, then rate types are also copied into the current time sheet.
- If the previous time sheet has rate types, but the time sheet policy of the user no longer allows rate types, then rate types are not copied to the current time sheet.
- If the previous time sheet has a rate type that is inactive, that rate type is not copied. If necessary, the user can enter a different rate type before saving the individual time cards.

**Auto-generate time cards**

As an admin, you can configure a scheduled job to generate time cards automatically for project tasks assigned to time card users.

Role required: admin

In addition to the manual option Generate Time Cards, a scheduled job can be run to automatically generate the time cards for project tasks. A job can be scheduled to run every week, for example, on every Sunday to generate timesheets for all users for the next week. You can configure when to run the scheduled job based on the business process of the organization. By default, the scheduled job is turned off. For more information, see Schedule a script execution.

**Note:** The scheduled job auto-generates time cards only for those users who have the Auto create time cards every week option set to true in their assigned time sheet policy.

1. Navigate to System Definition > Scheduled Jobs.
2. In the Scheduled Jobs list, select Auto Generate Time Cards.
3. Configure the following parameters in the script as per the business requirements:
   - run for (CURRENT_WEEK, NEXT_WEEK, LAST_WEEK)
   - Group Name (includeGroups, excludeGroups)

**Note:**
• If a time card exists for a project task for the time card week, a duplicate time card is not created.
• Time cards are generated only for those project tasks that are in progress or planned in that week.
• The **Allow time card reporting on** field on the project form determines the level that the time cards for the project tasks are created at.

The following example script is executed when a scheduled job is run to generate time cards for the **Current week** for the **Database** and **Hardware** groups:

```javascript
// Clone this schedule job to run separately for different groups at different times
// One of the following values
// TimeCardConstants.CURRENT_WEEK
// TimeCardConstants.NEXT_WEEK
// TimeCardConstants.LAST_WEEK
var runFor = TimeCardConstants.CURRENT_WEEK;

// Comma separated group sys ids or group names. TimeSheet/TimeCards will be auto generated for time card users in the given groups.
var includeGroups = [Database, Hardware];
var excludeGroups = [];

var generator = new TimeCardGenerator();
generator.generateFromConfig(runFor, includeGroups, excludeGroups);
```

**Submit a time card**

As a time card user, once a time card for the week is updated with the time worked, you can submit the time card individually.

A time card in the Pending or Rejected state can be submitted.

Role required: timecard_user

When a user submits a time card, the **time sheet policy** assigned to the user is used for validation. If there is no time sheet policy assigned to the user, the default time sheet policy is used. Business rules prevent a user from submitting a time card in case any violation is found.

1. Navigate to:
   • **Time Sheets > My Time Cards > All**
   • The **Time cards** related list in a time sheet.

   **Note:** You can select multiple time cards to submit.

2. In the Time Card list, open the time card to submit.
3. Click **Submit Time Card**.

   • The time card moves to the Submitted state.
   • The time card is submitted to an approver based on the values set in the **Project time approver** and **Non-project time approver** fields in the time sheet policy assigned to the user.

   **Note:** If the project or user manager is changed after submitting the time card, the time card is automatically redirected to the new project or user manager for approval.
Approve or reject a time card
As a time card approver, you can view and approve or reject a submitted time card.

Role required: timecard_approver or timecard_admin

You can view only those time cards that are submitted to you for approval or you have been delegated as the time card approver by one of the other user managers. The time sheet policy assigned to the user governs the approval process.

1. Navigate to Time Sheets > Time Cards > Pending Approval.
2. Select the time card to approve or reject.
3. Click Approve or Reject.

- The time card moves to the Approved or Rejected state.
- For an approved time card, a Time Card Daily record is created.

Note:
- A user manager can also approve the time cards within a time sheet by selecting one or more time cards and approving them. When all the time cards in a time sheet are approved, the time sheet automatically moves to the Approved state.
- A user manager is one who is selected in the Manager field on User form of the time card user.
- If a time card is in the Rejected state, the associated time sheet also moves to the Rejected state irrespective of the state of other time cards in the time sheet.

Record time worked
The time card retrieves time accrued on a project or spent working on any record in the Task table from the Time worked field.

This field does not appear by default on the Project Task, Incident, Problem, and Change forms and must be added by personalizing the form. Time recorded in this field is used to populate an existing time card or to create a new time card if one does not exist. A time sheet policy controls this behavior.

Note:
- When time worked is updated, a time card is created only if:
  - the user is a time card user, AND
  - the user is assigned to the task through Assigned to or Additional assignee list field.

The Time worked field has a counter that acts like a stopwatch for the duration of the time spent in the record. A button in the field can stop and start the counter. By default, the Time worked counter is enabled and begins
recording the elapsed time when the record is opened. Stop the counter with the stop button and restart it with the play button.

Time counter started:

![Time worked](image)

**Time worked started**

Time counter stopped:

![Time worked](image)

**Time worked stopped**

If you are creating time cards from time worked entries, you can ask your admin to add the Time Worked related list to display the time worked records on the time card form. You will also notice an informational message on the time card to let you know that changes to time worked records overrides values in the time card. This is displayed using a **formatter**, which can be added or removed by configuring the form.

If you are creating time cards from time worked entries, you can ask your admin to add the Time Worked related list to display the time worked records on the time card form. You will also notice an informational message on the time card to let you know that changes to time worked records overrides values in the time card. This is displayed using a **formatter**, which can be added or removed by configuring the form.

**Manage costs**

When the cost management feature is enabled, time cards can be used to manage the cost of labor in the Cost Management application.

When a time card for a project task is approved, an expense line is generated for the corresponding labor cost associated with the project. If the project has a rate model associated, then the hourly rate for calculating labor cost for the expense lines is derived from the rate model. If no rate model is associated to the project, the rate listed in the **Labor Rate Card** is considered. If no Labor Rate Cards is applicable, the property **com.snc.time_card.default_rate** defines the default hourly rate.
Roles

The timecard_admin role enables users to approve, modify, and delete the time cards of other users.

Domain separation and Time Card

Domain separation is supported in Time Card. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see the SP's response.

To learn more, see Application support for domain separation.

Tools for driving tasks

There are several tools available to drive tasks to completion.

These tools can be run on any table which extends Task.

- Approvals
  Approvals can be generated to a list of Approvers, either manually or automatically, according to Approval Rules. Approvals can be incorporated into workflows or can stand alone. For more information, see Process approvals.
  Approvals can be used on tables that do not extend Task.
- Assignments
  Assignment rules can automatically assign tasks to users or groups, ensuring that the most appropriate team members handle the tasks. For more information, see Defining Assignment Rules.
- Service levels
  Service level agreements can track the amount of time that a task has been open, to ensure that tasks are completed within an allotted time.
- Inactivity monitors
  Inactivity monitors ensure that tasks do not fall by the wayside by notifying users when tasks have been untouched for a predefined period of time. For more information, see Setting Inactivity Monitors.
- **Workflow**

  An administrator can specify a specific workflow process to apply to tasks that meet certain conditions. After a task is created that meets the conditions, the workflow applies an automated process to the task. The process is defined in the graphical Workflow Editor.

  ![Graphical Workflow Editor](image)

  **Graphical Workflow Editor**

  As the process takes place, it updates any field designated as a workflow field.

  ![Workflow field](image)

  **Workflow field**

  Workflows are not specific to the tasks, but there are task-specific Workflow Activities (such as Task Activities and Approval Activities). For more information, see Workflow Overview.
Many to many task relations

By default, tasks can be related to each other using a parent/child relationship, such as a Problem with a group of child Incidents or a Catalog Request with a group of child Catalog Tasks.

However, it may prove useful to record exactly the nature of the relationship between the task records. When activated, the Many to Many Task Relations plugin allows administrators to define relationships between different tasks.

Request many to many task relations

The Many to Many Task Relations plugin is included with several plugins. You can request activation of the plugin by itself.

Role required: admin

- Planned Task
- Field Service Management
- Project Management
- Governance, Risk, and Compliance

1. Navigate to System Applications > All Available Applications > All.
2. On the All Applications page, click **Request Plugin** to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
<tr>
<td>would like this plugin to be</td>
<td></td>
</tr>
<tr>
<td>enabled</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

4. On the form, fill in the fields.

**Activate Plugin request form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason/Comments</td>
<td>Information that would be helpful for the ServiceNow personnel who are</td>
</tr>
<tr>
<td></td>
<td>activating the plugin. For example, if you need the plugin activated at a</td>
</tr>
<tr>
<td></td>
<td>specific time instead of during one of the default activation windows,</td>
</tr>
<tr>
<td></td>
<td>specify that in the comments.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Plugin manifest**

When the plugin is activated, the Task Relationships application is available with certain modules.

When the plugin is activated, the **Task Relationships** application is available with the following modules:
Task relationships

<table>
<thead>
<tr>
<th>Title</th>

</tr>
<tr>
<td>Relationship Types</td>
<td>Contains the definitions for the possible types of relationships between tasks.</td>
</tr>
<tr>
<td>Relationships</td>
<td>Contains all the defined relationships between existing tasks.</td>
</tr>
</tbody>
</table>

The following Relation Types are available by default:

- Knowledge Relation Types
  - Solution is documented in::Documenting solution for

- Relationship Types
  - Caused by::Causes
  - Contains::Task of
  - Documenting Solution for::Solution is documented in
  - Investigated by::Investigates
  - Permanent correction for::Permanently corrected by
  - Related to::Related to
  - Requesting::Requested by
  - Solved by::Solves

Define a relationship type

Create type codes that define the relationship between parent and child tasks.

The Many to Many Task Relations plugin must first be activated. To learn more, see Request many to many task relations.

1. Navigate to Task Relationships > Relation Types and click New.
2. Populate the Parent Descriptor and Child Descriptor fields with a short description of the relationship between the two tasks, such as a parent descriptor of Caused By and a child descriptor of Causes.
3. Right-click the form header bar and select Save. The Name field automatically populates with the Parent and Child descriptors.

Define a task relationship allowed from the task relationship type record

It is possible to define Task Relationships Allowed from the Task Relationship Type record.

1. Scroll down to the related list and click New.
2. Populate the parent and child tables to define which tables are able to accept the relationship.
3. If desired, it is possible to define scripts to run in the Parent and Child script fields. These scripts are run when a parent or child record is run to automatically generate the other task (child or parent). These scripts use the current value of the new record, as opposed to the source record which triggered the script.

Modify the displayed field

The list view of the Reference Lookup defines the fields displayed in the Task Relations field and editing interface. To modify the displayed fields:

1. Navigate to a form that has a reference to the table whose display values you would like to modify within Task Relations field.
2. Click the magnifying glass to display the Reference Lookup list view.
3. Right-click the list header and select Configure > List Layout. The selected List layout is used as the display value for records within the Task Relations field.

Mark as Solution button

This button gets added to the KB popup view and is displayed when you search the knowledge base from a task record. Clicking the button creates a record in the Task / KB Relationships [task_rel_kb] table to associate the KB article with a task. You can disable this button by marking the active field false on the 'solution_button' UI macro.

Define task relationships with UI actions

Once the task relationships are defined, it is possible to use UI Actions to define the task relationship as a new task is being created from an old task.
Below are a few examples.

**Warning:** These examples may not work on all instances. They are provided as illustrative examples.

### UI Actions examples

#### Cause an incident

This UI Action allows the change management team to log an incident directly from the change request and records that the change caused the incident.

Create a UI Action on the Change Request [change_request] table and place the following into the script:

```javascript
var inccaus = new GlideRecord("incident");
inccaus.short_description= current.short_description;
inccaus.comments= current.comments.getHTMLValue();
// inccaus.parent = current.sys_id;
inccaus.insert();
CauIncident();

gs.addInfoMessage("Incident " + inccaus.number+" created");
action.setRedirectURL(current);
action.setReturnURL(inccaus);

function CauIncident(){
  var m2m = new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child= current.sys_id;
m2m.parent= inccaus.sys_id;
m2m.type.setDisplayValue("Caused by::Causes");
m2m.insert();}
```

#### Cause a problem

This UI Action allows the change management team to record a problem from a change request and record that the change caused the problem.

Create a UI Action on the Change Request [change_request] table and paste the following script:

```javascript
var probcaus = new GlideRecord("problem");
probcaus.short_description= current.short_description;
probcaus.comments= current.comments.getHTMLValue();
// probcaus.parent = current.sys_id;
probcaus.insert();
CauProblem();

gs.addInfoMessage("Problem " + probcaus.number+" created");
action.setRedirectURL(current);
action.setReturnURL(probcaus);

function CauProblem(){
  var m2m = new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child= current.sys_id;
m2m.parent= probcaus.sys_id;
m2m.type.setDisplayValue("Caused by::Causes");
m2m.insert();}
```
Fix a problem

This UI Action allows a change request to be generated from a problem, recording that the change fixes the problem.

Create a UI Action on the Problem [problem] table, and paste the following code:

```javascript
var fixchg = new GlideRecord("change_request");
fixchg.short_description = current.short_description;
fixchg.comments = current.comments.getHTMLValue();
// fixchg.parent = current.sys_id;
fixchg.insert();
FixChange();
gs.addInfoMessage("Change " + fixchg.number + " created");
action.setRedirectURL(current);
action.setReturnURL(fixchg);

function FixChange(){
var m2m = new GlideRecord('task_rel_task');
m2m.initialize();
m2m.child = current.sys_id;
m2m.parent = fixchg.sys_id;
m2m.type.setDisplayValue("Fixes::Fixed by");
m2m.insert();}
```

Data dictionary tables

The system defines data dictionary, data modeling, and entity relationship information in multiple tables.

- Tables [sys_db_object]: Contains a record for each table.
- Dictionary Entries [sys_dictionary]: Contains additional details for each table and the definition for every column on each table. Each row represents either a column on a table or a table.
- Field Labels [sys_documentation]: Contains the human-readable labels and language information.

Tables

The Tables [sys_db_object] table contains a record for each table in the database.

Access the Tables list by navigating to System Definition > Tables. Administrators can create a custom table, add or modify columns in a searchable and sortable embedded list, and define the auto-number format.

The following image shows a list of the tables that extend the Task table.
Tables

Dictionary Entries

The Dictionary Entries [sys_dictionary] table, also called the **System Dictionary**, defines every table and field in the system. It contains information about data type, character limit, default value, dependency, and other attributes of a field.

Access the system dictionary in one of these ways:

- To see the system dictionary list view, navigate to **System Definition > Dictionary**.
- To view particular dictionary definition, right-click the list header, form header, or field label, and select **Configure Dictionary**.

The following image shows a filtered list of dictionary entries for the Incident table and the Task table, which it extends.
Dictionary Inc Task

Field Labels

The Field Labels [sys_documentation] table, also called the Language File, contains information about the labels and hints for each table and column in the system.

Access the language file in one of these ways:

- To see the list view, navigate to System Definition > Language File.
- To see the field label for a particular field, right-click the field label on the form.

The following image shows the language file filtered to display only labels on the Incident table.
The system dictionary is a table, called Dictionary Entry [sys_dictionary], that contains details for each table and the definition for every column on each table in an instance.

Each row in the system dictionary represents either a table or a column in one of the tables. The system dictionary provides options for administrators to modify tables and fields, which in turn define lists and forms.

Use caution when changing system dictionary records because changes can have a high impact on functionality. In particular, changes to dictionary entries for system tables, which are tables that begin with sys_, can create system-wide issues such as the inability to use update sets.

Dictionary changes are difficult to reverse. Also, dictionary changes automatically apply to all extended tables unless a dictionary override is defined. Be sure that changes are well-tested before applying them to a production instance.

**Creation options**

When you create a field from the system dictionary, it is automatically added at the end of the first section of the default form view.

In most cases, use the following interfaces rather than creating entries directly on the system dictionary:

- To create tables and fields, use the Tables module.

```
<table>
<thead>
<tr>
<th>Table</th>
<th>Element</th>
<th>Language</th>
<th>Label</th>
<th>Plural</th>
<th>Hint</th>
<th>Updated</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Business duration</td>

```
To create fields, configure the table form.

**Dictionary overrides**

Dictionary overrides provide the ability to define a field on an extended table differently from the field on the parent table.

For example, for a field on the Task [task] table, a dictionary override can change the default value on the Incident [incident] table without affecting the default value on Task [task] or on Change [change].

Administrators can override these aspects of a field:

- Reference qualifiers
- Dictionary attributes
- Default values
- Calculations
- Field dependencies
- Default column display values
- Mandatory and read-only status

**Define a dictionary override**

Use a dictionary override to allow a field in a child table to have a different value or behavior than the same field in a parent table. For example, a dictionary override changes the default value of the priority field from 4 in the parent table to 5 in the Incident table.

Dictionary overrides are only available for tables that support table extension. You can only add dictionary overrides on tables that are in the same scope as the parent table.

1. Navigate to **System Definition > Dictionary**.
2. Open the record for the field.
3. In the **Dictionary Overrides** related list, click **New**.
4. Fill in the fields on the form, as appropriate (see table).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>The application scope to which the record belongs.</td>
</tr>
<tr>
<td>Base table</td>
<td>The parent table containing the field to override.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the extended table to which the dictionary override applies.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the dictionary override.</td>
</tr>
<tr>
<td>Override reference qualifier</td>
<td>Select the check box to display the Reference qualifier field, which overrides the reference qualifier for the field on the extended table.</td>
</tr>
<tr>
<td>Override dependent</td>
<td>Select the check box to display the Dependent field, which overrides the field on which the current field depends.</td>
</tr>
<tr>
<td>Override attributes</td>
<td>Select the check box to display the Attributes field, which overrides the dictionary attributes for the field on the extended table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Note:</td>
<td>Any attributes defined on the base table are ignored. If there are attributes on the base table that should still apply to the extended table, make sure to include them in this field.</td>
</tr>
<tr>
<td>Override default value</td>
<td>Select the check box to display the Default Value field, which overrides the default value for the field on the extended table.</td>
</tr>
<tr>
<td>Override calculation</td>
<td>Select the check box to display the Calculation field, which overrides the calculation of the value for the field on the extended table.</td>
</tr>
<tr>
<td>Override mandatory</td>
<td>Select the check box to display the Mandatory field, which overrides whether the field on the extended table must contain a value to save a record.</td>
</tr>
<tr>
<td>Override read only</td>
<td>Select the check box to display the Read only field, which overrides whether a user can change the field value on the extended table.</td>
</tr>
<tr>
<td>Override display value</td>
<td>Select the check box to use this field as the display value on the extended table.</td>
</tr>
<tr>
<td></td>
<td>For example, the Story [rm_story] table uses the short description as the display value in reference fields instead of the number, as defined in the Task [task] table.</td>
</tr>
</tbody>
</table>

5. Click Submit.

**Modify dictionary entries**

You can modify dictionary entries by configuring a field on a form or from the Dictionary module.

1. Do one of the following steps:
   - Navigate to a field on a form, right-click the field, and select Configure Dictionary or Show <field name>. The system dictionary entry for the field opens.
   - Navigate to System Definition > Dictionary, and click an entry for a field or table. Entries for tables have Type set to Collection.

2. Update the dictionary entry fields.

3. Click Update.

**Dictionary entry form**

The Dictionary Entry form was redesigned to provide an Advanced view and additional fields. You might need to configure the form to see all fields.

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</thead>
<tbody>
<tr>
<td>Note:</td>
<td>This list shows only the tables that meet the scope protections for adding fields.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Defines the field type of the column or, if the <strong>Type</strong> is <strong>Collection</strong>, indicates that the dictionary entry represents the table. For more information, see Introduction to Fields. You can change the type of a field. To preserve existing data, only change between logical types that map to the same physical type on the database. For example, Choice and String.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Enables or disables the field. When this check box is cleared, the field is not used by the system.</td>
</tr>
<tr>
<td><strong>Function field</strong></td>
<td>If selected, creates a field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation. Once the new function record is saved, you cannot clear the check box to make the field a regular field.</td>
</tr>
<tr>
<td><strong>Read only</strong></td>
<td>Determines whether users can change the field value. When this check box is selected, users cannot change the value. The system calculates and displays the data for the field. <strong>Note:</strong> You can override this option for extended tables.</td>
</tr>
<tr>
<td><strong>Audit</strong></td>
<td>Enables or disables auditing for a table. Turning on Auditing (History) for a Table. <strong>Note:</strong> This option only applies to tables.</td>
</tr>
<tr>
<td><strong>Text index</strong></td>
<td>Determines whether searches index the text in a table. <strong>Note:</strong> This option only applies to tables. To exclude fields from indexing, see Remove an Index for a Specific Field.</td>
</tr>
<tr>
<td><strong>Column label</strong></td>
<td>Defines a unique label for the column. The label appears on list headers and form fields for the column. • Updating the <strong>Column label</strong> field also updates the label in the language file (for the current language). • When you create a new column, the column name is populated automatically based on the label, which is prefixed with <strong>u_</strong> to indicate that it is custom. For example, if you enter <strong>Activity Description</strong> as the column label, the column name defaults to <strong>u_activity_description</strong>.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Column name</td>
<td>Defines the field name of the column. When you create a new field, this name is populated automatically based on the label and a prefix as follows:</td>
</tr>
<tr>
<td></td>
<td>• For a field on a table in a different scope, the name is prefixed with the scope to indicate that it is custom and not part of that application.</td>
</tr>
<tr>
<td></td>
<td>• For a field on a table in the same scoped application, the name does not have a prefix, which indicates that it is part of the application.</td>
</tr>
<tr>
<td></td>
<td>• For a field in a global application, the name is prefixed with u_ to indicate that it is custom.</td>
</tr>
<tr>
<td></td>
<td>You cannot modify the prefix; however, you can modify the rest of the name. The name can contain only lowercase, alphanumeric ASCII characters and underscores (_). You cannot change the name of an existing dictionary record.</td>
</tr>
</tbody>
</table>

**Note:** You cannot enter consecutive (double) underscores in a column name. For example, if you enter my sample name as the column name, it is automatically changed to my_sample_name when you save the dictionary entry.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Max length</td>
<td>Provides a logical limit for the size of string fields to determine how the system displays them in the user interface and how to map them to physical database data types. String fields with a length under 255 characters appear as a single-line text fields. String fields with a length over 254 characters appear as a multi-line text box. The system maps the field length to the closest physical data type available on the database. Sometimes, this results in more available length than originally specified. For example, entering a length of 50 maps to the closest physical data type of VARCHAR(100), which provides up to a 100 character limit or double the requested field length. Likewise, entering a length of 1000 maps to the closest physical data type of MEDIUMTEXT, which provides up to a 4000 character limit or four times the requested field length.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong></td>
</tr>
<tr>
<td></td>
<td>• You can only change this value for a <strong>String</strong> field. Changes for any other type of field are ignored.</td>
</tr>
<tr>
<td></td>
<td>• Users on an Oracle instance cannot increase the maximum length of a string field to anything greater than 4000 through the application UI as this requires the CLOB datatype in Oracle. To increase beyond this size, log an incident with technical support to request the change.</td>
</tr>
<tr>
<td></td>
<td>• To prevent data from being lost, only decrease the length of a string field when you are developing a new application and not when a field contains data. A warning appears if a change to a custom field results in data loss. For a base system field, you cannot make a change that results in data loss.</td>
</tr>
</tbody>
</table>

<table>

<tr>
<td>Use dynamic default [Advanced view]</td>
<td>Allows you to specify a default value that is generated dynamically based on a dynamic filter.</td>
</tr>
<tr>
<td>Dynamic filter value [Advanced view]</td>
<td>Specifies the dynamic filter that determines the default value if the <strong>Use dynamic default</strong> option is selected.</td>
</tr>
<tr>
<td>Default value</td>
<td>Specifies the default value of the field for any new record. Ensure that this value uses the correct field type. For example, an integer field uses a default value of 2 but cannot use a default value of two. These values can be overridden with dictionary overrides.</td>
</tr>
</tbody>
</table>

**Note:**
- This option does not control whether a list or form displays this field as part of the layout. Instead, see List Configuration and Personalizing Forms.
- The display value becomes part of the form title when viewing an individual record from a table.
- You can set a different display value on an extended table than the display value on a parent table by using a dictionary override.

Note: Function parameters support dot walking. See Dot-walking to data in related tables.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reference</td>
<td>Makes the field into a reference field. If you enter a name that does not match an existing table, a new table is created when you save your changes to the dictionary record. If the current table has a module in the application navigator, a module for the new table is automatically created in the same application menu.</td>
</tr>
</tbody>
</table>
| Use reference qualifier [Advanced view] | Specifies the type of qualifier to use:  
• Simple: A set of choice lists where you can specify a reference qualifier condition.  
• Dynamic: A dynamic filter that you can use to build the qualifier.  
• Advanced: A static encoded query string or JavaScript code that you can use to build the qualifier. |
| Reference qual condition             | Specifies a condition when the reference qualifier runs if the Simple qualifier type is selected.                                                                                                           |
| Dynamic ref qual [Advanced view]     | Specifies the dynamic filter that determines the reference qualifier when the Dynamic qualifier type is selected.                                                                                          |
| Reference qual [Advanced view]       | Filters the records available for a reference field if the Advanced qualifier type is selected. Reference qualifiers can be overridden with dictionary overrides.                                               |
| Reference key [Advanced view]        | Identifies a field other than sys_id to use as the unique identifier for reference fields.                                                                                                                |
| Reference cascade rule [Advanced view] | Defines what happens to a record if the record it references is deleted. Select one of the following options:  
• Clear: Clears the references (default).  
• Delete: Deletes all referencing records.  
• Restrict: Prevents record deletion if there is a referencing record.  
• None: Does not change referencing records. |
<p>| Reference floats [Advanced view]      | Enables the Edit button on related lists for one-to-many relationships.                                                                                                                                 |
| Dynamic creation [Advanced view]     | For reference fields, determines whether entering a value that does not match an existing record creates a record on the referenced table. If selected, use the Dynamic creation script field to define how to create the record. |
| Dynamic creation script [Advanced view] | When the Dynamic creation field is selected, allows you to enter a script for creating a record on the referenced table.                                                                                     |
| Dependent Field                      | Specifies a field on which the current field depends. For more information, see Configuring Dependent Fields.                                                                                             |
| Dependent on field [Advanced view]   | Note: You can override this value for extended tables.                                                                                                                                                     |
| Choice List Specification            |                                                                                                                                                                                                           |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Choice                   | Allows users to see a list of suggested values in one of the following ways:  
  - List menu without -- None --  
  - List menu with -- None --  
  - Suggestion  
  
  If a choice is used, either define a choice list or use the fields Choice table and Choice field to copy choices from another field elsewhere in the dictionary.                                                                                                                                                                                                                                                                                                                                                      |
| Choice table [Advanced view] | Populates the field choices with the same values as another choice field. If the Choice field is set to anything besides None, select a table to draw choice values from. The field Choice field must also be populated.  
  
  For example, if Choice table is set to the Incident [incident] table, this field has the same choice list as one of the choice fields on Incident. Choice field (see below) determines which field.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Choice field [Advanced view] | Populates the field choices with the same values as another choice field. If the Choice field is set to anything besides None, select a field from the table you selected for Choice table. For example, if the Choice table field is set to the Incident [incident] table, and Choice Field is set to Priority, this field has the same choices as the Priority field on Incident, even if those choices change.  
  
  Note: This field must be a choice field.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Calculated Value         | Determines whether the value of the field is calculated from other values. If selected, use the Calculation field to define how the calculation is performed. When sorting or grouping by a calculated field, the sort order is based on the field value from the last time the field was updated, not the last time the field was displayed.  
  
  Note: In relation to business rules, calculated fields are populated first before any business rule, even a before business rule, is run. Calculated fields are then populated again if necessary after any before business rules run.                                                                                                                                                                                                                                                                                                                                 |

**Dictionary attributes**

Dictionary attributes alter the behavior of the table or element that the dictionary record describes. Administrators can add or modify dictionary attributes.

**Adding an attribute**

To add an attribute to a table or field, navigate to the System Dictionary record for the Dictionary entry, and add the attribute to the Attributes field. Attributes are comma-separated; if attributes exist on a dictionary record, add a comma, with no spaces, before adding an attribute.

For an attribute that accepts true/false values:

- To specify a value of true, you can either enter attribute or attribute=true.
• To specify a value of false, you can either ensure that the attribute does not appear or enter `attribute=false`. To maintain values during upgrades, do not remove an attribute that is on a table by default.

**Maintaining attribute values for upgrades**

If you remove an attribute that is part of the base system, it is automatically restored during an upgrade. To prevent upgrades from changing the desired behavior of your system, leave the attribute on the table or field, but set its value as desired.

For example, if a field has the attribute `knowledge_search=true` by default, do not remove the attribute to set it to false; rather set it to `knowledge_search=false`.

**Available dictionary attributes**

| approval_user | name of field containing the users for the approval type this field represents | integer field | Table fields are used to perform lookups using a matcher. You specify approvals as table fields that have an attribute of `approval_user=<field_name>`, where `<field_name>` indicates the field in the table that contains the users for this approval type.  
- Fields with this attribute contain an integer value that indicates the sequence for the approvals.  
- All approval fields with the same sequence number indicate that multiple approvals are required before continuing.  
- Approvals are requested in the order of the sequence numbers. For example, all approvals with sequence number 100 must be approved before approvals with sequence number 200 are requested. |
<p>| attachment_index | true/false | any table | If true, attachments on the table are indexed for search purposes. To learn more, see Index attachments on a table. |
| barcode | true/false | string field | Enables a string field in the ServiceNow Classic app to access a camera on a mobile device to scan and process a bar code. To learn more, see Using the ServiceNow Classic mobile app. |
| base_table | name of base table type | table_name field | A table_name field enables you to select any table derived from the table specified by this attribute. By default, the base table itself is also included in the list (but see <code>skip_root</code> to turn off this behavior). |</p>

</thead>
<tbody>
<tr>
<td>hasWorkflow</td>
<td>true/false</td>
<td>any table</td>
<td>Instructs the workflow engine to listen for changes to the table, firing events to a workflow when a record associated with a particular workflow has changed.</td>
</tr>
<tr>
<td>html_sanitize</td>
<td>true/false</td>
<td>any HTML or translated HTML field</td>
<td>If present or true, enables HTML sanitization for the selected HTML or Translated HTML field. By default, performs HTML Sanitization on all HTML and Translated HTML fields. Set this attribute to false to disable sanitization.</td>
</tr>
<tr>
<td>html_sanitize_config</td>
<td>name of custom sanitizer configuration file</td>
<td>any HTML or translated HTML field</td>
<td>If present, performs sanitization using the specified configuration file instead of the default platform sanitizer. For example, the Embedded Help [sys_embedded_help_content] table uses a specified file (EmbeddedHelpSanitizerConfig) for the help Content field.</td>
</tr>
<tr>
<td>icons</td>
<td>name of JavaScript class</td>
<td>any workflow field</td>
<td>Specifies a JavaScript class that produces workflow icons.</td>
</tr>
<tr>
<td>image</td>
<td>relative path of image file</td>
<td>any table</td>
<td>Specifies an image file to use when a module or BSM map uses this table. This specification overrides the icons that would otherwise be used for the table.</td>
</tr>
<tr>
<td>include_container_types</td>
<td>true/false</td>
<td>any internal_type field</td>
<td>Causes the field to render with container (split) types as well other types.</td>
</tr>
<tr>
<td>isOrder</td>
<td>true/false</td>
<td>any field</td>
<td>Sets the field as the default field used for the sort order in lists. Overridden by the ORDERBY URL parameter, or the user's sort preferences.</td>
</tr>
<tr>
<td>iterativeDelete</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, forces all row deletes to execute iteratively. Otherwise, you can perform some deletes using a more efficient bulk method.</td>
</tr>

<tr>
<td>maintain_order</td>
<td>true/false</td>
<td>any glide_list</td>
<td>If present or true, the up/down arrow order buttons appear to the right of the list of selected items.</td>
</tr>
<tr>
<td>mode_toggler</td>
<td>true/false</td>
<td>any composite_name</td>
<td>If present or true, causes a name mode toggle icon (a small right-pointing triangle) to appear to the right of the label. Clicking this icon causes the field's rendering to change from a text field accepting <code>&lt;tablename&gt;.&lt;fieldname&gt;</code> to a pair of reference choice boxes (one for the table, the other for the field). The latter is the default.</td>
</tr>
<tr>
<td>model_class</td>
<td>binary Java class name</td>
<td>any field of type glide_var</td>
<td>Specifies a model variable within Java code. The model must have a class that implements the IVariablesModel interface.</td>
</tr>
<tr>
<td>model_field</td>
<td>see description</td>
<td>any field of type glide_var</td>
<td>Identifies a reference field in the record that has the model defined for it. For example, a workflow activity is associated with an activity definition. The activity definition has a related list of questions that make up the model for that activity definition. By using the activity_definition as the model_field for the activity, it builds the workflow activity model by reading the questions that are defined for the referenced activity definition.</td>
</tr>
<tr>
<td>nibble_size</td>
<td>positive integer</td>
<td>any table affected by the table cleaner.</td>
<td>Specifies the maximum number of records the table cleaner can delete in a single operation. The default value for this attribute is 250.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------</td>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>nibble_sleep</td>
<td>true/false</td>
<td>any table affected by the table cleaner.</td>
<td>If false, causes the table cleaner to perform cleanup operations without a pause between each operation.</td>
</tr>
<tr>
<td>no_add_me</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, hides display of the Add Me icon that appears next to certain fields, such as the <strong>Watch List</strong> field.</td>
</tr>
<tr>
<td>no_attachment</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, prevents the attachment icon (a paperclip) from appearing on the form header.</td>
</tr>
<tr>
<td>no_attachments</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, attachments are not checked for and deleted when a record from this table is deleted. Meant for high-activity tables that never have attachments.</td>
</tr>
<tr>
<td>no_audit</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, this field is not audited, even if the table is being audited.</td>
</tr>
<tr>
<td>no_audit_delete</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, a sys_audit_delete record is never created when you delete a record from this table. Meant for high-activity tables that never need sys_audit_delete information.</td>
</tr>
<tr>
<td>no_auto_map</td>
<td>true/false</td>
<td>any table</td>
<td>If true, this field is not mapped during an import set. Primarily used for LDAP imports.</td>
</tr>
<tr>
<td>no_email</td>
<td>true/false</td>
<td>any glide_list field referencing sys_user</td>
<td>If present or true, the email box is removed from the glide_list field like the <strong>Watch list</strong> field.</td>
</tr>
<tr>
<td>no_multiple</td>
<td>true/false</td>
<td>any glide_list field</td>
<td>Hides the select multiple icons.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------</td>
<td>----------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>no_optimize</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, prevents the MySQL table compaction operation from running on the specified table. The table compaction operation normally runs after the table cleaner deletes at least 50% of the data in the specified table.</td>
</tr>
<tr>
<td>no_separation</td>
<td>true/false</td>
<td>any table</td>
<td>If present or true, marks this table as not participating in domain separation. To learn more, see Domain separation for service providers.</td>
</tr>
<tr>
<td>no_text_index</td>
<td>true/false</td>
<td>any field</td>
<td>If a table is text indexed, the no_text_index field attribute prevents this field or child table from being included in the text index.</td>
</tr>
<tr>
<td>no_truncate</td>
<td>true/false</td>
<td>any string field</td>
<td>In a list view, shows the entire text value of the multitext value in a list, without truncating it. Without this attribute, the string is truncated based on the UI property Number of characters displayed in list cells which is 40 by default.</td>
</tr>
<tr>
<td>no_update</td>
<td>true/false</td>
<td>table</td>
<td>True for tables in which records are inserted or deleted but not updated. Prevents the system from creating sys_mod_count, sys_updated_by, sys_updated_on fields in the table when created. Does not stop updates of the table. This attribute setting is used to save space on high volume system tables, such as syslog and sys_audit.</td>
</tr>
<tr>
<td>no_view</td>
<td>true/false</td>
<td>any glide_list field</td>
<td>Hides the view-selected item icon.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------</td>
<td>------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>onlineAlter</td>
<td>true/false</td>
<td>any table</td>
<td>Tables with the <strong>onlineAlter</strong> attribute perform MySQL database operations using online schema changes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Online schema changes provide a lock-free table upgrade when adding, modifying, or removing columns and when adding or dropping indexes. Without online schema changes, these changes to the database lock write access during execution.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Online schema changes use additional system resources. Oracle databases do not lock tables by default and do not use online schema changes.</td>
</tr>
<tr>
<td>order</td>
<td>numeric value</td>
<td>model variable fields</td>
<td>Used internally only (for model variables).</td>
</tr>
<tr>
<td>pop-up_processor</td>
<td>binary Java class name</td>
<td>any field or table</td>
<td>Specifies a custom pop-up processor for processing the field (or all fields in a table).</td>
</tr>
<tr>
<td>readable</td>
<td>true/false</td>
<td>any conditions field</td>
<td>When true, causes rendering of the conditions field in any list view as a human-readable condition (instead of the encoded query stored in the database).</td>
</tr>
<tr>
<td>ref_ac_columns</td>
<td>list of field names separated by semi-colons</td>
<td>any reference field with an auto completer (see ref_auto_completer)</td>
<td>Specifies the columns whose display values should appear in an auto completion list, in addition to the name. To learn more, see the cmdb_ci field (<em>Configuration Item</em>) on the Incident form for a working example.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ref_ac_columns_search</td>
<td>true/false</td>
<td>any reference field with an auto completer (see ref_auto_completer)</td>
<td>Causes auto-complete to work with all fields specified in the <code>ref_ac_columns</code> attribute. This attribute overrides the default behavior, which searches only the display value column. To learn more, see Configure auto-complete to match text from any reference field.</td>
</tr>
<tr>
<td>ref_ac_display_value</td>
<td>true/false</td>
<td>any reference field with an auto completer (see ref_auto_completer)</td>
<td>Causes the reference field to hide the display value column so that the auto-complete function only matches text from the columns listed in the <code>ref_ac_columns</code> attribute. This feature requires the use of the AJAXTableCompleter class and the <code>ref_ac_columns</code>, <code>ref_ac_columns_search</code>, and <code>ref_ac_display_value</code> attributes. To learn more, see Remove the display value column.</td>
</tr>
<tr>
<td>ref_ac_order_by</td>
<td>field name</td>
<td>any reference field with an auto completer (see ref_auto_completer)</td>
<td>Specifies the column that is used to order the auto completion list.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------</td>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ref_auto_completer</td>
<td>JavaScript class name</td>
<td>any reference field</td>
<td>Specifies the name of a JavaScript class (client side) that creates the list auto completion choices. Valid class values include:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• AJAXReferenceCompleter: Matching auto-complete choices appear as a list. Only the display value column of the reference table appears. If there is no other auto-completion class specified, reference fields automatically use this class.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• AJAXTableCompleter: Matching auto-complete choices appear as rows in a table. The display value column of the reference table appears, with any columns listed in the ref_ac_columns attribute.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• AJAXReferenceChoice: Displays matching auto-complete choices as a list. Only the display value column of the reference table, and up to 25 matching choices, appear. If there are more than 25 auto-complete choices, the choices for the AJAXTableCompleter class appear for the reference field instead.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For more information, see Auto-complete for reference fields.</td>
</tr>
<tr>
<td>ref_contributions</td>
<td>UI Macro name list, separated by semicolons (&quot;;&quot;)</td>
<td>any reference field</td>
<td>When the field renders on a form, it invokes the named UI macro.</td>
</tr>
<tr>
<td>ref_decoration_disabled</td>
<td>true/false</td>
<td>any reference field</td>
<td>When set to true, disables the display of the reference icon on a selected field.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------</td>
<td>----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ref_list_label</td>
<td>label text</td>
<td>any table</td>
<td>Specifies the title to use in a list banner.</td>
</tr>
<tr>
<td>ref_qual_elements</td>
<td>field name list, separated by semicolons (&quot;;&quot;)</td>
<td>any reference field with a reference_qual field</td>
<td>Specifies a list of fields to send back to the server to get an updated reference.</td>
</tr>
<tr>
<td>ref_sequence</td>
<td>list of fields in referenced table, separated by top hats (^)</td>
<td>any reference field</td>
<td>Specifies the fields in the referenced table used to order the list. This attribute works like an ORDER BY clause in SQL, with each element in ascending order.</td>
</tr>
<tr>
<td>reference_types</td>
<td>list of valid reference types that are clickable separated by semicolons (&quot;;&quot;)</td>
<td>field_name field</td>
<td>Limits the reference fields that appear in the tree to the specified types.</td>
</tr>
<tr>
<td>remoteDependent</td>
<td>name of database and table (like &quot;model.matcher&quot;)</td>
<td>any script field</td>
<td>Defines the remote (such as, in another database) table that the script depends on.</td>
</tr>
<tr>
<td>repeat_type_field</td>
<td>field name</td>
<td>a repeat count field for schedule rotation</td>
<td>Specifies the field that contains the repeat type (daily, weekly, monthly, or yearly).</td>
</tr>
<tr>
<td>ro_collapsible</td>
<td>true/false</td>
<td>any multiline field</td>
<td>If present or true, causes an icon (either a &quot;+&quot; or a &quot;:&quot;) to appear next to the field label, allowing the field itself to be expanded or collapsed.</td>
</tr>
<tr>
<td>Name</td>
<td>Value</td>
<td>Target Element</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------</td>
<td>----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>scale</td>
<td>integer</td>
<td>decimal field</td>
<td>Sets the number of decimal places to use on a Decimal field type. The default is 2. This attribute is applied to the max length attribute setting for the field. The decimal places for a field are a combination of the max length attribute setting and the scale attribute. For example, if you want four decimal places for the field, you'll need a max length attribute setting of 4, plus the default of 15, or 19. You would set the scale attribute to 4, to indicate the number of decimal places. Six decimal places would require a max length setting of 21, a scale attribute setting of 6, and so on.</td>
</tr>
<tr>
<td>script</td>
<td>a function that returns the contents of the field</td>
<td>any slushbucket field</td>
<td>Enables you to write a script to define what is loaded into the slush bucket field.</td>
</tr>
</tbody>
</table>

**Note:** Increase the max length attribute to a value greater than 15 to increase this attribute.
<table>
<thead>

<td>If present or true, causes any user preferences to be used instead of the normal default value.</td>
</tr>
</tbody>
</table>

**Modify the Glide durations format**

To convert fields that are displayed in milliseconds (such as 'Resolution Time' on the Incident table) to a duration format (Months/Days/Hours/Seconds), populate the attribute field on the dictionary with: `format=glide_duration`.

Now the value is displayed as a duration in lists and can be utilized in the Configure Calculations functions. This may be useful to illustrate ITIL KPIs such as Mean Time To Repair.

Field Dictionary:
Results in list:
### Schema map for tables

The schema map displays the details of tables and their relationships in a visual manner, allowing administrators to view and easily access different parts of the database schema.

The schema map can also be printed directly from a browser.

Schema relationship types supported, and the colors used for them, are:

<table>
<thead>
<tr>
<th>Relationship type</th>
<th>Color used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Referenced by</td>
<td>Red</td>
</tr>
<tr>
<td>Referencing</td>
<td>Orange</td>
</tr>
<tr>
<td>Extended by</td>
<td>Green</td>
</tr>
<tr>
<td>Extending</td>
<td>Blue</td>
</tr>
</tbody>
</table>

By default, all these types of relationship are displayed, but you can view or hide each type.

### Generate a schema map

Generate a schema map to view and easily access different parts of the database schema.

1. Navigate to **System Definition > Tables & Columns**.
2. In the **Table Names** pane, select a table.
3. Click **Schema map**.

   The schema map for the selected table opens in a separate tab or window.

   If required, you can print this map from the browser.
View the schema map

The schema map shows the selected table in yellow, typically centered, and all tables related to that table, typically shown at the sides.

From this map:

- The check boxes at the top allow you to control which relationships to display. Select or clear a relationship type to display or hide tables with that relationship to the selected table.
- Each related table has a colored bar indicating the relationship to the selected table.
- You can point to the connector lines to display the details of a relationship between the two tables.

**Note:** Since relationships are shown as single lines for simplicity, the diagrams rendered are not entity relationship diagrams.

Using the Table Selector:

To view a schema map as a list, point to the table selector in the right corner:
You can:
- Click a table in the list to scroll the schema map to that table.
- Click the eye icon beside a listed table to hide or show that table in the schema map.
- Click the pin icon in the selector to keep the list open.

Using Related Tables:
Right-click a table node header to display a context menu with these functions:
- **Focus on this table**: Make the selected table the new focus table and redraw the schema map based on the new selection.
  - The new focus table is added as a breadcrumb at the top, allowing you to return to the previous table at any time.
- **Go to list**: Display the list of records for the table.
- **Go to dictionary**: Display the system dictionary, filtered for the selected table.

To hide a related table from view, click the eye icon in the node header (the node can be made visible again with the table selector).

For tables that are part of their own derivation hierarchy, click the expand button (+) in the node header to add their derivation hierarchy to the schema map.

**Viewing More Information**

Click the expand button (+) beside **Columns** to expand the table fields.
The reference fields show a red notation of the table they refer to.

If any tables extend from a table, their columns are displayed in reverse derivation order. For example:

Here, the Server [cmdb_ci_server] table extends from Computer [cmdb_ci_computer], Hardware [cmdb_ci_hardware], and Configuration Item [cmdb_ci], and displays the columns from those tables.

Similarly, the Computer table displays the columns from the Hardware and Configuration Item tables.

**Create a many-to-many relationship**

Many-to-many relationships allow a list to point to a list of entries, rather than to single field.

For example, if a knowledge base article points to a list of related configuration items, it uses a related list. Not all lists can be used as related lists, however. For a list to be related to another list, a many-to-many relationship that refers to both tables must exist.

The Many to Many Definitions [sys_m2m] table allows administrators to create custom many-to-many relationships.

1. In the navigation filter, enter `sys_m2m.list`.
2. Click New.
3. In the **From table** field, specify a parent table.
4. In the **To table** field, specify a child table.
   The Many-to-Many form automatically populates the other fields with suggested values.
5. Optional: Edit other field values, if appropriate. Many-to-Many table names cannot exceed 30 characters.

**Reference default many-to-many relationships**

Some many-to-many relationships are defined by default.

To reference many-to-many relationships that are available in the base system, administrators can enter `sys_collection.list` in the navigation filter.

**Note:** Only use this table to view many-to-many relationships in the base system. To create a new relationship, always use the Many-to-Many Definitions table.

**Database views**

A database view defines table joins for reporting purposes.

For example, a database view can join the Incident table to the Metric Definition and Metric Instance tables. This view can be used to report on incident metrics and may include fields from any of these three tables.

A number of useful database views are installed with the Database View plugin and the Database Views for Service Management plugin. These database views cover most metric reporting needs and greatly reduce the need to define new ones.

**Note:** In general, as the number of tables that are included in the view and the number of records that those tables contain increases, the accumulated impact on performance grows. In addition, to optimize the performance of the database view ensure that the ‘where’ clauses that are defined in the database view are based on indexed fields.

**Limitations**

- Database views cannot be created on tables that participate in table rotation.
- It is not possible to edit data within a database view.
- In a clone request, database view tables cannot be added as a data preserver.

**ACLs and database views**

You do not need to create ACLs on fields in the view. The system honors contextual ACLs (ACLs with a condition or script) that already exist on the underlying table. Non-contextual ACLs (ACLs with only role checks) are still honored just as with previous releases.

To require explicit read ACLs be added to the database views, set the `glide.security.expander.view.legacy` property to `true`. On upgraded instances, add this system property and set it to `true`. See Add a system property.

You can still create additional ACLs on the database views. These ACLs are evaluated last and are always honored.
Database view reserved words

Using the terms may cause unintended or undesirable performance. For more information, see the MySQL reserved words document.

Database view creation

Create a database view to join tables. You can then create a report based on the database view.

Create a database view

Create the database view.
Role required: admin

1. Navigate to System Definition > Database Views.
2. Click New.
   The Database View form appears.
3. Name the view as you would name a new table.
   The application converts capital letters to lower case and spaces to underscores.
4. Provide a label and a plural.
   The Label and Plural fields define how the database view is labeled in lists and forms.

Database view configuration

5. Optional: Provide a description of the database view so that other users know its purpose.
6. Click **Submit**.
   The database view is added to the **Database Views** table.

**Add a table to the database view**

Specify the table to join to the database view.

The **Table** field in the View Table form specifies the table to join to the database view. Assign a **Variable prefix** if you specify a **Where clause** to define the conditions for the join. These conditions can refer to any field, but typically define the join by matching a field in the table to a field in another table that is part of the database view.

When you write the **Where clause**, add the field name to the **Variable prefix** of its table with an underscore. In the **Where clause** pictured below, `mi_id` refers to the **id** field in the Metric Instance [metric_instance] table (mi) and `inc_sys_id` refers to the **sys_id** field in the Incident [incident] table (inc).

**Note:**

- Database views can not be created on tables that participate in table rotation.
- Use only lowercase characters in the **Variable prefix**. Using uppercase characters may prevent you from viewing the database view in a list.

To see an example of using left joins to create a view, see Example left join in creating a database view.
The **Where clause** supports these JavaScript conditional operators:
1. From the Database View form, click **New** on the View Tables related list.
2. Configure the form and add the **Left join** field (a check box) to the form.
3. Click **Save**.
4. Complete the form and select the **Left join** check box.
   - Selecting **Left join** causes the left-hand table in the database view to display all records, even if the join condition does not find a matching record on the right-hand table. Select this check box to view tables that specify a **Where clause**. Selecting **Left join** for view tables without a **Where clause** does not affect the query.
   - Joined tables are ordered left to right from lowest to highest **Order** values. For example of how Order relates to joined tables, see the View Tables image in **Test the database view**.
5. Click **Submit**.
6. Personalize the **View Tables** related list to show the **Left join** column.
   - The **Left join** field is **true**.
7. Click a record to view a table.
   - The View Table form appears.
8. To add an OR to your Where clause, use ||.

For example, to query all incidents related to RFCs OR all incidents that are the parent of a change request, use the following syntax:

```
inc_rfc = chg_sys_id || chg_parent = inc_sys_id
```

### Database view where clause

<table>
<thead>
<tr>
<th>Table</th>
<th>Incident [incident]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>100</td>
</tr>
</tbody>
</table>

| Where clause | inc_rfc = chg_sys_id || chg_parent = inc_sys_id |

**Example left join in creating a database view**

This example shows the proper settings when using left-joins to add tables to a database view.

Role required: admin

The following procedure shows how to create a database view that includes a list of Catalog Tasks and their parents. Most of the steps take place on the following page.
1. Create a database view.
2. On the Database Views page, click the view you created. The Database View page appears. In the View Tables table, you specify the tables you want in the database view.

3. In the **View Tables** table, click **New**. The View Table form appears.

4. Add a **Left join** check box to the form by configuring it.

5. Add the Catalog Task [sc_task] table to the database view by filling in the form with the following data and then clicking **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Catalog Task [sc_task]</td>
</tr>
<tr>
<td>Variable prefix</td>
<td>cat</td>
</tr>
<tr>
<td>Order</td>
<td>100</td>
</tr>
<tr>
<td>Where clause</td>
<td>Leave blank</td>
</tr>
</tbody>
</table>

   The Database View page appears with the Catalog Task table in the View Tables table.

6. In the **View Tables** table, click **New** and add the Requested Item [sc_req_item] table to the database view by filling in the form with the following data and then clicking **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Requested Item [sc_req_item]</td>
</tr>
<tr>
<td>Variable prefix</td>
<td>item</td>
</tr>
<tr>
<td>Order</td>
<td>200</td>
</tr>
<tr>
<td>Where clause</td>
<td>cat_parent=item_sys_id</td>
</tr>
<tr>
<td>Left join check box</td>
<td>True</td>
</tr>
</tbody>
</table>

   The Database View page appears with the Requested Item table in the View Tables table.

7. In the **View Tables** table, click **New** and add the Request [sc_request] table to the database view by filling in the form with the following data and then clicking **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Request [sc_request]</td>
</tr>
<tr>
<td>Variable prefix</td>
<td>req</td>
</tr>
<tr>
<td>Order</td>
<td>300</td>
</tr>
<tr>
<td>Where clause</td>
<td>cat_parent=req_sys_id</td>
</tr>
<tr>
<td>Left join check box</td>
<td>True</td>
</tr>
</tbody>
</table>

   The Database View page appears with the Request table in the View Tables table.

8. In the **View Tables** table, click **New** and add the User [sys_user] table to the database view by filling in the form with the following data and then clicking **Submit**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Variable prefix</td>
<td>user</td>
</tr>
<tr>
<td>Order</td>
<td>400</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>Where clause</td>
<td>cat_opened_by=user_sys_id</td>
</tr>
<tr>
<td>Left join check box</td>
<td>False</td>
</tr>
</tbody>
</table>

- The Database View page appears with the User table in the View Tables table.
- If the parent record of Catalog Task is a Requested Item, all the fields in the Request table will be blank.
- If the parent record is a Request, all the fields in Requested Item will be blank.
- Because of the two left joins, the Catalog Task record returns even if the parent is empty or is not a Requested Item or Request.
- Because User is not a left join, there must be a matching user in sys_user for the row’s Opened By field for the Catalog Task row to return.

9. Optionally, perform the following steps to experiment and learn more about how left joins impact database views. If you make the left join in:

- User true, rows that have an empty **Created By** return.
- Requested Item false, only Catalog Tasks that have a Requested Item as a parent return.
- Request false, only Catalog Tasks that have a Request as a parent return.
- Requested Item and Request false, no rows return because nothing can have a Requested Item and a Request as parents.

### Specify a field to return

Use the View Field form to restrict or specify a field that you want returned by the joined table.

If no fields are defined in the View Fields list, all fields are returned. If any fields are defined, then only those fields are returned.

![View Field Form](image)

**View Fields list**

When you restrict the fields returned by creating View Field records, you must create a record for the join field from the **Where clause** in the parent record. If you omit a record for this field, it cannot be returned, and the join fails. In the previous example, the **Where clause** uses the **sys_id** field from the Incident table to establish the join. For the join to succeed with a restricted field list, you must include a record for the **sys_id** field.
Relabel a column

In some cases, two different tables may have fields of the same name that are both important (such as two tables with a sys_updated_on field). You must rename one of these fields.

To create clear reports, relabel the fields on the Database View [sys_db_view] table without changing the names of the fields.

1. Navigate to System Definition > Language File.
2. Click New.
3. Fill in the form as follows:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the database view</td>
</tr>
<tr>
<td>Label</td>
<td>Display label</td>
</tr>
<tr>
<td>Plural</td>
<td>Plural form of the display label</td>
</tr>
<tr>
<td>Element</td>
<td>Name of the field on the database view</td>
</tr>
</tbody>
</table>

Specify the number of records to return

Specify the number of records to return for a database view.

A property called glide.db.max_view_records controls the maximum number of rows returned when running a GlideRecord query in a script. The default value for this property is 10000. To change this value, add the property to the System Property [sys_properties] table and edit the number of rows to return.

This property only applies when querying a database view table in a script. When displaying the database view table in a list or report, this property does not apply.
Test the database view

Verify that the database view works correctly.

After the new view is defined, test it by clicking Try It under Related Links on the Database View form.

If you do not see the Try It link, the tables necessary for the view do not exist. If this occurs, it is possible that you did not activate the necessary plugins to create the supporting tables. When tables are present to support the view, the form looks like this:
**Database View**

**pm_project_sla**

<table>
<thead>
<tr>
<th>Name</th>
<th>pm_project_sla</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Join pm_project to sla(task_sla) to report on things like project names by sla.</td>
</tr>
</tbody>
</table>

**Related Links**

**Try It**

**View Tables**

<table>
<thead>
<tr>
<th>View = pm_project_sla</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table: task_sla</td>
</tr>
<tr>
<td>Table: pm_project</td>
</tr>
<tr>
<td>Order: taskslatable</td>
</tr>
<tr>
<td>Order: pmp</td>
</tr>
</tbody>
</table>

**Note:** Database views tables are not included in FTP exports.
Use disjunctions in complex queries

ServiceNow performs conjunction statements before disjunction statements in a query.

When you create a complex query, you must use parenthesis around disjunctions where appropriate to ensure proper grouping of query elements. For example, you must use parenthesis in the query `(md_table = 'incident' || md_table = 'task') && mi_definition = md_sys_id && mi_id = inc_sys_id`. Removing the parenthesis from this query returns all records where the md_table value is incident.

Database views in the base system

Certain views are included in the base system with the Database Views and Database Views for Service Management plugins.

### Database views

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>change_request_metric</td>
<td>Join change to metric definition to metric instance, creating a view that can be reported on for things like: Changes that were closed by category.</td>
<td>Change Metric</td>
</tr>
<tr>
<td>change_request_sla</td>
<td>Join change_request to sla(task_sla), creating a view that can be reported on for things things like change request resolved by sla per change category.</td>
<td>Change Request SLA</td>
</tr>
<tr>
<td>change_task_metric</td>
<td>Join change task to metric definition to metric instance, creating a view that can be reported on for things like: Change tasks that were closed by change state</td>
<td>Change Task Metric</td>
</tr>
<tr>
<td>change_task_sla</td>
<td>Join change_task to sla(task_sla), creating a view that can be reported on for things things like change tasks resolved by sla.</td>
<td>Change Task SLA</td>
</tr>

<td>pm_project_sla</td>
<td>Join pm_project to sla(task_sla) to report on things like project names by sla.</td>
<td>Project SLA</td>
</tr>
<tr>
<td>pm_project_task_metric</td>
<td>Join pm_project_task to metric definition to metric instance creating a view that can be reported on for things like: Project tasks that were closed by name or date.</td>
<td>Project Task Metric</td>
</tr>
<tr>
<td>pm_project_task_sla</td>
<td>Join pm_project to sla(task_sla) to report on things like release tasks by sla.</td>
<td>Project Task SLA</td>
</tr>
<tr>
<td>pm_project_task_time_worked</td>
<td>Join pm_project_task to task time worked to pull time worked entries associated with project tasks.</td>
<td>Project Task Time Worked</td>
</tr>
<tr>
<td>problem_metric</td>
<td>Join problem to metric definition to metric instance creating a view that can be reported on for things like: Problems that were resolved on the first call by category.</td>
<td>Problem Metric</td>
</tr>
<tr>
<td>problem_sla</td>
<td>Join problem to sla(task_sla) to report on things like problems resolved by sla per problem state.</td>
<td>Problem SLA</td>
</tr>
<tr>
<td>release_feature_metric</td>
<td>Join release_feature to metric definition to metric instance creating a view that can be reported on for things like: Release Features that were closed by product.</td>
<td>Release Feature Metric</td>
</tr>
<tr>
<td>release_project_metric</td>
<td>Join release_project to metric definition to metric instance creating a view that can be reported on for things like: Releases that were closed by category.</td>
<td>Release Metric</td>
</tr>
<tr>
<td>release_task_metric</td>
<td>Join release_task to metric definition to metric instance creating a view that can be reported on for things like: Release Features that were closed by feature.</td>
<td>Release Task Metric</td>
</tr>
<tr>
<td>release_task_sla</td>
<td>Join release_task to sla(task_sla) to report on things like release tasks by sla.</td>
<td>Release Task SLA</td>
</tr>
<tr>
<td>sc_request_metric</td>
<td>Join sc_request to metric definition to metric instance creating a view that can be reported on for things like: Requests that were closed by category.</td>
<td>Catalog Request Metric</td>
</tr>
</tbody>
</table>
List administration

Administrators control the data presented to end users in a list, the controls that appear, and the behavior of the controls.

Note: For information about using lists, see Lists.

List configuration

Users with the appropriate roles can configure various aspects of lists. Configuration changes apply to all users.

With list configuration, you can add, remove, and reorder list columns. You can configure calculations to appear under columns. You can also hide controls and define access conditions by role for existing list controls. Configuring lists is called personalizing lists in versions prior to the Fuji release.

Note: Configuring a list in this way modifies the list for all users. To make changes to a list that are visible to you only, see Personal lists.

Configure the list layout

You can configure a list to choose which columns appear in a list, create list views, and create fields on the table.

Role required: personalize_list

1. Navigate to the list you want to configure.
2. Select the view to configure by performing the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Open the list title menu and select View &gt; (view name).</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and select Change View, and then click the name of the view.</td>
</tr>
</tbody>
</table>
3. Open the list configuration page by performing the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click any column heading and select <strong>Configure &gt; List Layout</strong>.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and select <strong>List Layout</strong>.</td>
</tr>
</tbody>
</table>

4. Use the slushbucket to select the columns and the order of appearance.

   In lists using List v2, the first non-reference field automatically links to the form view of the record. For this reason, consider using the record number as the first column in the list layout.

   In lists using List v3, the first field automatically links to the form view of the record regardless of whether or not it is a reference field. In this cases, an icon appears to the right of the text. This icon links to the referenced record rather than the record displayed on the current list view.

5. Click **Save**.

   **Note:** If you create a personal list and then configure the list view differently, the changes do not appear until you reset your personal list to column defaults.

---

**Add an extended field to a base table list**

Administrators can configure a property that determines whether fields on extended tables can be added to a parent table list. For example, when this feature is enabled, you can view and filter on the **Caller** field, from the Incident table, on a Task table list.

Role required: admin

   **Note:** Enabling this property does not show the extended table fields in the personalize list.

1. Navigate to **System Properties > UI Properties**.
2. Locate the property **Allow base table lists (task, cmdb_ci, etc.) to include extended table fields (incident_state, os_version, etc.), and allow filtering on extended table fields (glide.ui.list.allow_extended_fields)**.
3. Select the check box to enable extended fields on parent table lists. Clear the check box to disable the feature.
4. Click **Save**.

---

**Configure list calculations in List v2**

In List v2, you can configure list calculations for columns, which calculate column totals, minimums, maximums, and averages.

Role required: personalize_list

You can configure list calculations for multiple columns in the same list. List calculations apply only to the view of the list in which they are configured. All users can see configured list calculations.
Note: List calculations are available in list reports.

1. In a list of records, right-click the header of a numeric column you want to evaluate with list calculations.
2. Select Configure > List Calculations.
   The list calculation window appears.

3. Select one or more of the following list calculation options:
   - Total value (not available for string, date, or date/time fields)
   - Minimum value
   - Maximum value
   - Average value (not available for string, date, or date/time fields)

4. Click OK.
   The calculations appear below the last record in the column. If the list is grouped, in addition to the overall calculations at the bottom of the list, group calculations appear below the last record in each group.

Omit record count in a list

Speed up how fast lists load by removing the calculation of the total number of records in a list.

Role required: workspace_admin

Calculating the total number of records included in a list that's filtered from large tables can take a long time. Platform displays the total number of records in the list.

To load lists faster, you can remove the page calculation for all or only specified filtered lists. When you remove the calculation, the total record count is not displayed and the double arrow icon is grayed out.
1. Open a list, for example navigate to Incident > All.
2. Right-click a header in the list and navigate to Configure > List Control.
3. Select Remove pagination count.
4. Optional: To omit the record count only in specific view:
   a) Select Remove pagination count for specific views.
   b) Beside Specific list of views prevented from getting full record count, click the lock icon.
   c) Click the search icon and select the view where platform omits the page count.
   d) Repeat the previous step for as many views as necessary.
5. Click Update.

Configure list controls
You can configure list controls, such as buttons and filters.
Role required: personalize_control
1. Open a list.
2. Open the list configuration page by performing the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click any column heading and select Configure &gt; List Control.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and select List Control.</td>
</tr>
</tbody>
</table>

The List Control form appears.
3. Complete the form.

Note: The list control fields that are available for embedded lists are more limited. Unless otherwise noted, the list control fields in the following table are available for both standard and embedded lists.

List Control form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the table for the list or related list. For example, Change Request [change_request]. The system automatically sets this value.</td>
</tr>
<tr>
<td>Related list</td>
<td>Name of the table and field that define the related list. For example, sysapproval_approver.sysapproval. The system automatically sets this value.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Label</td>
<td>Label to display for this list. Allows an admin to customize the label for a related list or list. If not supplied, the default plural label for the file is used. For example, the label for the Incident table would be <em>Incidents</em>.</td>
</tr>
<tr>
<td>Omit new button</td>
<td>Option to prevent the <strong>New</strong> button from displaying on this list. Clear the check box to display the <strong>New</strong> button or to control the <strong>New</strong> button with roles (<strong>New roles</strong> field). This field is available for standard lists only.</td>
</tr>
<tr>
<td>Omit edit button</td>
<td>Option to prevent the <strong>Edit</strong> button from displaying on this list. Clear this check box to display the <strong>Edit</strong> button or to control the <strong>Edit</strong> button with roles (<strong>New roles</strong> field). The <strong>Edit</strong> button does not apply to all lists. This field is available for standard lists only.</td>
</tr>
<tr>
<td>Omit if empty</td>
<td>Option to omit the Related List from the form entirely (no header) if there are no entries for the Related List.</td>
</tr>
<tr>
<td>Omit columns if empty</td>
<td>Option for a top-level list to omit the column headers AND filters/breadcrumbs for an empty column.</td>
</tr>
<tr>
<td>Omit filters</td>
<td>Option to hide filters or breadcrumbs for this list. Clear this check box if you always want filters or breadcrumbs or to control filters/breadcrumbs with roles (<strong>Filter roles</strong> field). This field is available for standard lists only.</td>
</tr>
<tr>
<td>Omit links</td>
<td>Option to hide links for fields that reference other files in this list. Leave this button unchecked to generate links or to control the use of links with roles (<strong>Link roles</strong> field).</td>
</tr>
<tr>
<td>Omit drill-down link</td>
<td>Option to disable the link to the record from the first column in list view. Users can still select the reference icon to access the record. This field is available for standard lists only.</td>
</tr>
<tr>
<td>Hierarchical lists</td>
<td><strong>Hierarchical list</strong> inserted into a record list. Hierarchical lists enable a user to view the contents of a record's related lists without leaving the record list form. This field is available for standard lists only.</td>
</tr>
</tbody>
</table>

**Note:** Enabling this setting renders the list incompatible with List v3. The list always renders in List v2, even if List v3 is enabled.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List edit type</td>
<td>Ability for the user to edit values directly in individual cells in a list. The options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Save immediately (cell edit mode):</strong> enables cell editing. The entire row is saved when the user enters a new value.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Save data by rows:</strong> enables cell editing. The row is saved only when the user navigates away from the row or selects the <strong>Save</strong> icon (✓).</td>
</tr>
<tr>
<td></td>
<td>- <strong>Disable list editing:</strong> prevents users from editing cells in the list.</td>
</tr>
<tr>
<td></td>
<td>This field is available for standard lists only.</td>
</tr>
<tr>
<td>List edit tag</td>
<td>Unique tag that is sent to a reference qualifier as the script variable <code>listEditRefQualTag</code>. Enter an arbitrary string of letters or numbers.</td>
</tr>
<tr>
<td>List edit insert row</td>
<td>Ability for a user to create records in list view. When it is enabled, an empty row appears at the bottom of the list.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Enabling this setting renders the list incompatible with List v3. The list always renders in List v2, even if List v3 is enabled.</td>
</tr>
<tr>
<td>Remove pagination count</td>
<td>Option to remove pagination count from the list.</td>
</tr>
<tr>
<td>Disable Natural Language Query (NLQ)</td>
<td>Option to disable the NLQ filter in specific lists when NLQ on lists is enabled in the instance. The NLQ filter enables you to use natural language to filter lists instead of using the condition builder. For more information on NLQ filters, see Natural Language Query.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> When the system property <code>(com.snc.listv2.nlq.lists.enabled)</code> is set to <code>false</code>, the query destructs. Text entered in the search replaces existing conditions.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of this setting's applicability. Global means that all workspaces can use this setting.</td>
</tr>
<tr>
<td>New roles</td>
<td>User roles that can access the <strong>New</strong> button on this list. Leave the field blank to enable all users to access the <strong>New</strong> button. This option does not apply to embedded lists, which do not contain <strong>New</strong> buttons.</td>
</tr>
<tr>
<td>Filter roles</td>
<td>User roles required to have the filter appear in the list. This field is available for standard lists only.</td>
</tr>
<tr>
<td>Link roles</td>
<td>User roles required to have links generated for fields that reference other files.</td>
</tr>
</tbody>
</table>

**Example of configuring list controls**

The following example shows how to configure a list of related incidents in a problem record to suit specific business needs.

Role required: personalize_control

In this example, a related list label is configured to say Child Incidents, not just Incidents. The related list is also configured to remove the **New** button to prevent users from creating incidents from the Problem form.

1. Navigate to a problem record.
2. Open the list context menu in the **Incidents** related list and select **Configure > List Control**.
3. On the List Control form, change the **Label** field to Child Incidents.
4. Select the **Omit new button** check box.
5. Select Submit to save your changes and return to the previous record, in this case, the problem record.

In the problem record, the label for the embedded incident list has changed and the **New** button is no longer available.

**Advanced list control with scripts**

You can write scripts to specify which list elements, such as links, filters, and buttons, are present.

These scripts can react to the record that is being displayed. For related list controls, the global variable `parent` identifies the parent record. For primary lists, there is no parent record.

Configure the List Control form and add the script field that you need:

- **Omit Columns Condition**: If there are no conditions, omit column headings.
- **Omit Edit Condition**: Omit the **Edit** button.
- **Omit Empty Condition**: If there are no conditions, omit the list header.
- **Omit Filter Condition**: Omit the list filter.
- **Omit Links Condition**: Omit related links.
- **Omit New Condition**: Omit the **New** button.

In these script fields, if the script evaluates to `true`, the item is omitted. The following script is an example that you can use on the **Affected CIs** related list to show only the **Edit** button if the parent task is active. This script is placed in the **Omit Edit Condition** script field.

```javascript
var answer;
if (parent.active == true) {
  // Add code here to set 'answer' to true or false
}
```
Configure a list UI action

You can create a UI action that opens the slushbucket interface to customize lists in the list view.

Role required: ui_action_admin

1. Navigate to System Definition > UI Actions.
2. Click New.
3. In the Table field, select the List [sys_ui_list] table.
4. Select the List context menu check box.
5. Ensure the Active check box is selected.
6. Paste the following script in the Script field:

   ```javascript
   var url = "slushbucket.do?sysparm_form=list&sysparm_list=" + current.
   name + "&sysparm_view=" + current. view. name;
   url += "&sysparm_collection=" + current. parent +
   "&sysparm_collection_relationship=" + current. relationship;
   url += "&sysparm_referring_url=sys_ui_view.do?sys_id=" + current. view.
   toString () ;
   action. setRedirectURL (url ) ;
   ```
7. Click Submit.

Controlling the sort sequence used to display lists

All lists have a default sort sequence based on the type of fields present in the list.

When a user displays a list for the first time, it is sorted by one of the following items.

- The ORDERBY arguments found the URL. (See the following section on source order control.)
- The <table>.db.order and <table>.db.order.direction user preferences.
- The isOrder dictionary attribute.
- The Order field if one is present in the table.
- The Number field if one is present in the table.
- The Name field if one is present in the table.
- The field specified as the display field for the table.

Note: The task table is an exception to the preceding sequence. Task and tables extended from task use the Number field when no URL arguments or user preferences are found.

Setting default order with user preferences

The <table>.db.order and <table>.db.order.direction user preferences determine the field and sort direction seen by the user. A default sort can be created by creating user preference records with no value in the User field and checking the System check box. This preference is applied to any users who do not have their own preference.
Setting the default sort order in the system dictionary

An administrator can set the sort order of records displayed for a table in the system dictionary when there is no other sort specified. This is done by adding an attribute called `isOrder` with a value of `true` to the dictionary entry of the desired field. This sort is the sort order presented to all users initially. Once a user sorts a list, that user preference is saved, and the list is always sorted for that user based on the previous sorting preference.

**Note:** `isOrder` can define which field is used for list sorting, but cannot control the sort direction.

Sort order control

For any list, if the user has clicked a column header to sort by that column, then that action is remembered. The next time that list is displayed, the same field is used to order the list.

This remembered sort field can be overridden by adding a `sysparm_order` specification to the definition of the module. For example, if each time News is displayed, you want the new items listed in order of importance, then the News module can be updated accordingly.

```
&sysparm_order=importance
```

Set module sort order to the Importance field value

The actual order (ascending or descending) can be specified by adding a `sysparm_order_direction` specification. Here are two examples of sorting a list by the `sys_created_on` field, one ascending and one descending:

```
&sysparm_order=sys_created_on &sysparm_order_direction=desc
&sysparm_order=sys_created_on &sysparm_order_direction=asc
```

Sort by multiple fields

To sort a list by multiple fields, remove everything from the filter field and place it in the arguments field. For example, if the filter specifies `[Active] [is] [true]` and you want to sort by category and subcategory, remove the condition and put the following in the module arguments:

```
active=true^ORDERBYcategory^ORDERBYsubcategory
```

This argument first orders by the category and then orders by the subcategory. If you want any field to be a descending sort, then change `ORDERBY` to be `ORDERBYDESC`.

List editor administration

The list editor allows users to edit field values directly from a list without navigating to a form.

Administrators can manage this feature by using the following options. Some of the options are not supported in List v3.

- Configure global properties
- Configure list control settings for a table
- Configure contextual security rules
- Manage user preferences (List v2 only)

**Warning:** In List v2, the list editor does not enforce client scripts or UI policies. In List v3, the list editor enforces UI policies and mandatory dictionary attributes, but not client scripts. Allowing list editing with client scripts running on fields in a form can result in incorrect data being saved to the record. For systems in which client scripts or UI policies apply to forms, consider disabling list editing or creating appropriate business rules or access control to control the setting of values in the list editor. See Use business rules and client scripts to control field values for information on managing form and list editing.

**Configure list editor properties**

You can configure list editor properties that control whether lists can be edited, and, for List v2, which field types cannot be edited.

Role required: admin

1. Navigate to System Properties > UI Properties.
2. To disable list editing, set the Enable list editing (glide.ui.list_edit) property to No by clearing the check box.
   - This property is enabled by default, and it globally enables list editing. When you disable it, the list editor is disabled globally.
3. To configure the field types that cannot be edited for v2 lists, complete the following steps.
   a) Locate the List of element types (comma-separated) that cannot be edited in the list editor (glide.ui.list_edit_ignore_types) property. It contains several element types that cannot be edited by default.
   
   **Note:** This property does not impact v3 lists. There is no equivalent property for List v3.

   The following field types are not editable from the list editor by default.
   - Conditions [conditions]
   - Currency [currency]
   - Document ID [document_id]
   - Field List [field_list]
   - HTML [html]
   - Image [user_image]
   - List [glide_list]
   - Price [price]
   - Template Value [template_value]
   - Time [glide_time]
   - User Roles [user_roles]
   - Video [video]
   
   b) Add any other field types you want to disable to the end of the list, separated by a comma.

4. Click Save.

**Configure list control settings for the list editor**

You can configure the list control settings that affect the list editor.

Role required: personalize_control
**List control settings** customize the behavior of list functions for a table.

1. Navigate to a list view for the desired table.
2. Open the list configuration page by performing the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click any column heading and select <strong>Configure &gt; List Control</strong>.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and select <strong>List Control</strong>.</td>
</tr>
</tbody>
</table>

3. On the List Control form, select the desired settings.

**List control settings for the list editor**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List edit type</td>
<td>Ability for the user to edit values directly in individual cells in a list. The options are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Save immediately (cell edit mode)</strong>: enables cell editing. The entire row is saved when the user enters a new value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Save data by rows</strong>: enables cell editing. The row is saved only when the user navigates away from the row or selects the <strong>Save</strong> icon (✔). This mode allows the user to modify multiple values before saving a record.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Disable list editing</strong>: prevents users from editing cells in the list.</td>
</tr>
<tr>
<td>List edit insert row</td>
<td>Ability for a user to create records in list view. When it is enabled, an empty row appears at the bottom of the list.</td>
</tr>
</tbody>
</table>

Note: Enabling this setting renders the list incompatible with List v3. The list always renders in List v2, even if List v3 is enabled.

4. Click **Update**.
Configuring contextual security for the list editor

The list editor enforces existing access control rules (ACLs) and additional security controls to restrict editing from a list.

The list_edit security operation specifically controls the ability to edit information in a list. Apply this operation in the same manner as the write operation to limit list editing for fields that require the user to navigate to the form. Reasons you may require a user to edit a field in a form include complex UI policy constraints or other policies you have in place.

The list_edit security operation specifically controls the ability to edit information in a list. Apply this operation in the same manner as the write operation to limit list editing for fields that require the user to navigate to the form. Reasons you may require a user to edit a field in a form include complex UI policy constraints or other policies you have in place.

• write and list_edit access to the field
• write and list_edit access to any dependent fields of the field
• write and list_edit access to any fields that depend on the field being edited

To configure access controls, navigate to System Security > Access Controls. The following examples use the list_edit security operation to restrict list editing in certain contexts.
Example - Restrict a table

This access control prevents everyone from editing all fields in the Incident table in a list.

Restrict the Incident Table

- **Type**: record
- **Operation**: list_edit
- **Name Incident**: [incident]
- **Admin overrides**: Clear the check box.
- **Script**: `answer = false;`
**Example - Restrict a field**

This access control prevents everyone except an administrator from editing the Short Description field of an incident record in a list.

**Restrict the Incident Short Description**

- **Type:** record
- **Operation:** list_edit
- **Name:** Incident [incident], Short Description
- **Admin overrides:** Select the check box.
- **Script:**

  ```javascript
  answer = false;
  ```
Example - Restrict a field with a script

This access control prevents everyone from editing an incident with a category of Software in a list. It is defined by a script.

Restrict Software Incidents

- **Type**: record
- **Operation**: list_edit
- **Name Incident**: [incident]
- **Admin overrides**: Clear the check box.
- **Script**:

```java
if (current.category == 'software')
    answer = false;
else
    answer = true;
```
Example - Restrict a field with a condition

This access control prevents everyone from editing a Critical Incident in a list. It is defined by a condition.

Restrict Critical Incidents

- **Type:** record
- **Operation:** list_edit
- **Name Incident:** [incident]
- **Admin overrides:** Clear the check box.
- **Condition:** Priority is not 1 - Critical

User preferences for v2 list editing

Users can set user preferences for v2 list editing by personalizing a list (available when the list mechanic is activated). To view and manage list editor user preferences, navigate to **User Administration > User Preferences.**

**Note:** These user preferences do not apply to v3 lists. There are no equivalent user preferences for List v3.
User preferences for v2 list editing

<table>
<thead>
<tr>
<th>User preference name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list_edit_enable</td>
<td>Set the value to <strong>true</strong> to enable or <strong>false</strong> to disable list editing. Default value is <strong>true</strong>.</td>
</tr>
<tr>
<td>list_edit_double</td>
<td>Set the value to <strong>true</strong> for double-click or <strong>false</strong> for single-click. Default value is <strong>true</strong>.</td>
</tr>
</tbody>
</table>

**Personal list administration**

Users can customize the layout for any list view by personalizing a list. Administrators can configure options related to list personalization.

In List v2, administrators can also disable or restrict access to list personalization. This functionality is not supported in List v3.

**Enable or disable personal lists in List v2**

You can enable or disable List v2 personal lists through the UI Macros module.

Role required: ui_macro_admin

**Note:** This functionality does not apply to List v3. Personal lists are not controlled by the list mechanic in List v3 and are always enabled.

1. Navigate to System UI > UI Macros.
2. Activate (or deactivate) the list_mechanic2 UI macro.

**Control which roles can personalize lists in List v2**

You can control who can create personal lists in List v2.

Role required: admin

**Note:** This functionality does not apply to List v3. All users can personalize v3 lists.

1. Navigate to System Properties > UI Properties.
2. Locate the property labeled List of roles (comma-separated) that can use Personal Lists. If blank, all can use (glide.ui.list_mechanic.roles).
3. Enter the roles for which personal lists are available, separated by commas, or leave the field blank to allow access for all users (default).

**Manage personal lists**

Administrators can manage personal lists.

Role required: admin

1. Navigate to System UI > Lists.
2. Personal lists have a user value in the **User** field.
Administer detail rows

Detail rows provide additional information about records in a list.

Role required: admin

To display detail rows, an administrator must enable them globally and add them to lists.

**Note:** Detail rows are supported in UI15 and up. Detail rows are not supported in List v3.

1. **To enable detail rows,** add a new system property with the following field values.

<table>
<thead>
<tr>
<th>Name</th>
<th>glide.ui.list.detail_row</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

2. **To add detail rows to a list,** complete the following steps.

   a) **Add the `detail_row` dictionary attribute** to the table.

      Specify the name of the field to display in the following format:** detail_row=short_description **

   b) **Use the `all_tables` element descriptor with the `detail_row` attribute** to display detail rows for all child tables that contain the designated field.

      For example, `all_tables.detail_row=short_description` is on the Task [task] table by default, so the short description detail row appears in lists for Incident [incident], Problem [problem], and other child tables unless you set `detail_row` to a different field for each one.

Restrict filters and breadcrumbs with fixed queries

The record list view allows users to navigate to different subsets of a table using breadcrumbs and filters. You can limit access to parts of the table by restricting active links in breadcrumbs or by suppressing breadcrumbs and filters for specific roles.

Role required: admin

A breadcrumb option enables an administrator to control the base view of a record list presented to users. By adding a fixed query to the argument for a module, an administrator can prevent users from expanding their view past a specified starting point. The argument for this fixed query is written as `&sysparm_fixed_query=active=true`. A use case for this query is to prevent users from using the breadcrumbs to switch a list of open incidents to a list of all incidents. When users select **Incident > Open**, they are limited to viewing and filtering a list of open (active=true) incidents.

**Note:** A new Create ACL allows all users to save filters by default. This overrides any custom ACLs in place if administrators are restricting filter access. The new ACL gives all users access to the User field by default, and access to the Group field only if users have the filter_group role and are in the currently selected group.

1. **Perform the appropriate action** for your version of the UI:

<table>
<thead>
<tr>
<th>UI16</th>
<th>Point to the application menu that contains the module to edit and click the edit application (pencil) icon.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>To open the module directly, point to the module and click the edit module (pencil) icon.</td>
</tr>
</tbody>
</table>
2. Select the module to edit.
   For example, select **Open**.

3. In the **Link Type** section of the Module form, select **List of Records** for the **Link type**.

4. Delete the **Active is true** filter, if present.
5. Add `&sysparm_fixed_query=active=true` to the **Arguments** field and update the record.
6. Navigate to **Incidents > Open** and examine the breadcrumbs.

The **Active=true** link is the widest view permitted in the list of Open incidents shown. The breadcrumb for **All** is not a link because of the fixed query.

---

**Suppress filters and breadcrumbs with list controls**

Use list controls to suppress filters and breadcrumbs on defined tables for users with specific roles.

Role required: personalize_control

1. Navigate to the list view of the table to restrict breadcrumbs.

2. Open list control by performing the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click any column header and select <strong>Configure &gt; List Control</strong>.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and select <strong>List Control</strong>.</td>
</tr>
</tbody>
</table>

You can also navigate to **System UI > List Control**.

3. On the List Control form, select the **Omit Filters** check box. Clear the check box to include filters.

The **Filter Roles** field allows an administrator to specify certain roles that can see the filters.

---

**Use script includes to suppress filters and breadcrumbs**

You can use a script to restrict filters and breadcrumbs to specific roles, either on a per-table or global basis. Using a script is an advanced option that offers additional flexibility compared to using list control.

Using a script include requires knowledge of JavaScript.
Role required: script_include_admin

1. Create a script include with the name <tablename>DisplayFilter.
   The script section contains one function with the same name as the script include.

2. Use your function to set the global variable `answer` to either true (show the filters and breadcrumbs) or false (hide them.)
   The following example restricts filters and breadcrumbs on the Incident table to users with any role. Be sure that the name of the script matches the function name exactly, including case.

   ```javascript
   var incidentDisplayFilter = Class.create();
   incidentDisplayFilter.prototype = {
       type: 'incidentDisplayFilter',
       initialize: function() {
       },
       incidentDisplayFilter: function() {
           var answer;
           if (gs.hasRole()) {
               answer = true;
           } else {
               answer = false;
           }
           return answer;
       }
   };  
   ```

3. Optional: To exclude a specific role from having access to filters and breadcrumbs, make the following change.

   ```javascript
   var incidentDisplayFilter = Class.create();
   incidentDisplayFilter.prototype = {
       type: 'incidentDisplayFilter',
       initialize: function() {
       },
       incidentDisplayFilter: function() {
           var answer;
           if (gs.hasRole() && !gs.hasRole('newrole')) {
               answer = true;
           } else {
               answer = false;
           }
           return answer;
       }
   };  
   ```

   Users with the role `newRole` do not have access to filters and breadcrumbs.

4. Optional: To let all users use filters and breadcrumbs on the Incident table, make the following change to your script.

   ```javascript
   var incidentDisplayFilter = Class.create();
   incidentDisplayFilter.prototype = {
       type: 'incidentDisplayFilter',
   ```
initialize: function() {
},
incidentDisplayFilter: function() {
var answer = true;
return answer;
};

5. Optional: To modify filter and breadcrumb access for another table, create a script include using the name of that table instead of Incident.

Increase the allowed number of breadcrumb entries

You can add a property to allow for a larger number of breadcrumb entries in the filter.

Role required: admin

1. Enter `sys_properties.list` in the Navigation filter.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. Verify that the property does not exist by searching for `glide.ui.breadcrumb_max_entries`.
3. Click New.
4. Complete the form as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.ui.breadcrumb_max_entries</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
<tr>
<td>Value</td>
<td>The number of breadcrumb entries you want to appear in the filter, for example, 15. The default number is 10.</td>
</tr>
</tbody>
</table>

5. To verify this property, go to any table and use the filter modifier `is one of` to search for any number of items. The number of entries you entered in the Value field displays before ending in a [...].

Breadcrumb entries

Enable a hierarchical list

You can enable hierarchical lists to make data from related lists directly accessible from within a v2 list.

Role required: personalize_control

Hierarchical lists enable a user to view the contents of the related lists of a record without leaving the record list form.
**Note:** You cannot enable a hierarchical list view for an embedded list. Hierarchical lists are not supported in List v3, even if they are enabled.

1. Right-click any column header, and select **Configure > List Control** from the context menu.
2. Select the **Hierarchical lists** check box in the List Control dialog box and then click **Submit** or **Update**.
3. Click the arrow for a record number to display the related lists for the record.
**Use list controls in hierarchical lists**

By default, no related list tabs are visible in a hierarchical list and only a single related list is displayed at a time. The column headers are hidden by default.

Role required: none

Note: Hierarchical lists are not supported in List v3.

1. To select a different related list, click the link in the list title.
2. Select a list from the menu.

If the related list is empty, the hierarchical list indicates that there are no records to display.

The platform remembers this preference and displays the last selected related list for each table when you open another hierarchical list within that table.
3. To display column headers in the related list, click the show/hide headers icon in the upper right corner of the hierarchical list.

The platform remembers this preference and opens all hierarchical lists with column headers enabled until the headers are hidden.

Context ranking

Context ranking allows a user to sort a collection of records preferentially, that is, independently of the attributes of those records.

For example, a Customer Support manager can organize a list of incidents in the order in which a technician should work on the tasks. Creating such an arbitrary list with a list filter is not possible.

Activate context ranking

If you have the admin role, you can activate the Context Ranking plugin (com.glide.sorting). This plugin activates related plugins if they are not already active.

Role required: admin

1. Navigate to System Applications > All Available Applications > All.

2. Find the Context Ranking plugin (com.glide.sorting) using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

---

### Create a ranking definition

Enable context ranking for a related list by creating a ranking definition.

Role required: admin

1. Navigate to **System Definition > Ranking Definitions**.
2. Click **New**.
3. Enter a **Name** for the ranking definition.
4. In the **Record table** field, select the table for which ranking is enabled.
   This is the table of the records in the ranked related list. For example, to enable ranking for a related list of incidents in the Problem form, select the Incident [incident] table.
5. In the **Context column** field, select the reference column providing the context in which ranking is to be performed.
   The context in this case is the form in which the related list appears and not a table name. For example, a related list with a **Record table** of Incident [incident] can have several contexts, including the **Problem** form or a **Configuration item** form.
6. Complete the relationship-based fields if the ranking is to be performed on a related list that is defined by a relationship.
   - **Relationship table**: select the table forming the other side of the relationship. In the case of the ranking definition for Product stories in scrum, you might use the Product Model [cmdb_model] table.
   - **Relationship column**: select the column from the relationship table to compare with the context column. To avoid adding a related list of user stories to the Product Model [cmdb_model] table, you might use the **Sys ID** column, which defines a subclass of the Product Model table (cmdb_model.sys_id).
7. In the **Attributes** field, enter attributes to change and restrict the contents of the Rank dialog box, as appropriate.
   - **visible_columns**: a semi-colon separated list of columns to be displayed in the Rank dialog box. If not specified, the Rank dialog box uses the default view of the related list you selected in the **Record table** field.
   - **extra_conditions**: an encoded query to restrict the records shown in the Rank dialog box. For example, the query `extra_conditions=^state!=7` displays all incidents whose state is not **Closed**. If not specified, the Rank dialog box shows all records for the relationship.
8. Click **Submit**.
   The index is generated automatically. The system completes these read-only fields:
   - Index column
   - Rank ui action
   - Context menu item

**Note:** After you submit a ranking definition, only the **Attributes** field can be edited. If additional changes are required, delete the record and create a new one with the revised settings.
The system does not generate indexes for ranking definitions inserted into the database by an update set. To use a ranking definition inserted by an update set, you must generate the indexes manually. To generate indexes, open the Ranking Definition form, and click **Generate Indexes**.

### Rank a list

After you create a ranking definition for a table, related lists based on that table and context include options for ranking the list and displaying the list by rank.

Role required: none
You can set the preferential order of records.

1. Click the **Rank** button in the related list to reorder the records.

The Rank dialog box appears, allowing you to sort the records in any order.
2. Click and drag the move icon ( ) to change the position of a record.

**Note:** Administrators can define which columns appear in the Rank dialog box in the Attributes field of the Ranking Definition form.
**Apply a new sort order to a list**

You can apply a new sort order to the records in a list.

Role required: none

1. Open the context menu from the list title and select **Sort by rank**.

![Sort by rank](image)

2. To remove the ranking and return to the original order of the list, click the label in any column that contains data.

**Scrum ranking definitions**

Ranking definitions for user stories are part of the SDLC (scrum process) application.

These ranking definitions enable scrum users with the proper roles to rank related lists of stories in these tables:

- Product stories: Application Model [cmdb_application_product_model] table
- Release stories: Release [rm_release] table
- Sprint stories: Sprint [rm_sprint] table

Users can rank stories in the scrum planning board by priority. Story lists ranked in the planning board appear in the new order in product, release, and sprint forms. Stories ranked in one of these scrum forms changes the order in the planning board.

Story points for each story are listed in a ranked view, which is useful for prioritizing stories.
Ranking story points

Rank stories in a related list

The Context Ranking feature enables all scrum users to manually sort a related list of stories by priority.

A product owner or release planner uses this tool to establish the order in which he or she wants the stories worked. Stories ranked in a related list (in the Product, Release, and Sprint forms) appear in the same order in the planning board when the appropriate backlog is displayed. Conversely, stories ranked in the planning board appear in that order when viewed in the related list in the form. Users can switch the view in a Stories related list from ranked to any sort order without changing the ranking in the planning board.

1. In the Stories related list, click Rank.
   A dialog box appears, allowing you to arrange the stories in any order, such as by priority.
2. Click and drag each story into position using the move icon to the left of the story number.

3. When you are done, click the X in the upper right corner to close the list.
   The Stories related list is not sorted by your ranking initially.
4. To view the related list in its ranked order, open the context menu from the related list and select **Sort by rank**.

![Sort by rank menu](image)

5. To return the sort order of the list to an unranked state, click once in the heading of any column that contains data.

The system uses this ranked list to display the appropriate backlog in the planning board. For example, if you rank stories in the **Stories** related list in the Release form, the release backlog in the planning board uses the same ranking to display the stories. Conversely, scrum masters, product owners, and release planners can create a new ranking order for the **Stories** related list by rearranging the list of stories in the planning board.

### Customize List v2 context menus

You can customize the content and behavior of List v2 context menus.

Role required: admin

For example, you might add an option to the list column heading menu for a specific table. You might also want to change the roles required to access a global context menu option.

**Note:** This functionality is not supported in List v3. Context menu options created this way do not appear in v3 lists. Administrators can create UI actions instead.

1. Navigate to **System UI > UI Context Menus**.
2. Click **New**.
3. Complete the form.

**Context menu form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table to which this context menu option is attached. The base system menu items are attached to the Global [global] table, which applies the context menu option to all lists for all tables. If you specify a particular table, the option is available only on context menus in lists from that table. <strong>Note:</strong> The list shows only tables and database views that are in the same scope as the context menu.</td>
</tr>
<tr>
<td>Menu</td>
<td>Select the list context menu in which this option appears.</td>
</tr>
<tr>
<td>• List title menus</td>
<td></td>
</tr>
<tr>
<td>• Column headings</td>
<td></td>
</tr>
<tr>
<td>• List row menu</td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>Select the type of menu option to create:</td>
</tr>
<tr>
<td>• <strong>Action</strong>: A menu option that performs an immediate action.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Menu</strong>: Creates a parent menu that can display a submenu.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Separator</strong>: Draws a line between groups of options on a menu. Menus do not display separator lines next to one another or at the bottom of a menu. If a condition that removes options for a role forces two separators together, one of the separators is removed from the view.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Label</strong>: Create an unlinked label for a menu or section of a menu.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Dynamic actions</strong>: Menu options dynamically created, such as the available views or user filters that can only be generated at the time the list is displayed.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Enter the label for the action as it will appear in the menu.</td>
</tr>
<tr>
<td>Parent</td>
<td>If this action is part of a submenu, type the name of the parent menu item. For example, in the base system, <strong>Configure</strong> is a parent.</td>
</tr>
<tr>
<td>Order</td>
<td>Assign an order number to this item, menu, or separator to specify where in the menu it appears.</td>
</tr>
<tr>
<td>Active</td>
<td>Enable or disable this context menu item. Only active items are shown in the context menu.</td>
</tr>
<tr>
<td>Run onShow script</td>
<td>Select this check box to display the <strong>onShow script</strong> field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Condition</td>
<td>Create the conditions under which this menu option appears. For example, define the role that has permission to see this item.</td>
</tr>
<tr>
<td>Action script</td>
<td>The action script runs when someone selects the context menu option. For more information, see Action script for List v2 context menus.</td>
</tr>
<tr>
<td>Dynamic actions script</td>
<td>The dynamic actions script populates the context menu with dynamic options, such as filters or views. For more information, see Dynamic actions script for List v2 context menus.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>onShow script</td>
<td>The onShow script runs before the context menu is displayed, to determine which options appear in the context menu. For more information, see onShow script for List v2 context menus.</td>
</tr>
</tbody>
</table>
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
4. Click **Submit**.

**Action script for List v2 context menus**

The **Action script** field, on the Context Menu form, defines a script. The script runs when someone selects the context menu option.

This script is client-side and runs in the user’s browser. The following JavaScript variables are available to the Action script when it is executed.

**Action script variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>g_list</td>
<td>GlideList2 against which the script runs.</td>
</tr>
<tr>
<td>g_fieldName</td>
<td>Name of the field against which the context menu runs.</td>
</tr>
<tr>
<td>g_fieldLabel</td>
<td>Label of the field against which the context menu runs.</td>
</tr>
<tr>
<td>g_sysId</td>
<td>The sys_id of the row or form against which the script runs.</td>
</tr>
</tbody>
</table>

The base system uses the following code in an action script to refresh the platform view.

```javascript
    g_list.refresh(1);
```

Another example is the use of these variables in a list header menu to sort a list by the selected field in descending order (z to a).

```javascript
    g_list.sortDescending(g_fieldName);
```

**Dynamic actions script for List v2 context menus**

The **Dynamic actions script** field, on the Context Menu form, defines a script. The script populates a list context menu with dynamic options, such as filters or views.

The following JavaScript variables are available to the dynamic actions script when it is executed.

**Dynamic actions script variables**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>g_tableName</td>
<td>Name of the current table.</td>
</tr>
<tr>
<td>g_listId</td>
<td>ID of the list for which the context menu is built.</td>
</tr>
<tr>
<td>g_itemName</td>
<td>Name defined in the UI context menu record.</td>
</tr>
<tr>
<td>g_itemOrder</td>
<td>Order defined in the UI context menu record. Use this variable to pass the value of the Order field to the dynamic actions script.</td>
</tr>
<tr>
<td>g_contextMenu.addAction(item_id, label, script_string, order)</td>
<td>Add options to the context menu and select the order in which they appear.</td>
</tr>
</tbody>
</table>
The following example displays a list title menu item that controls the number of records per page in the list view.

```javascript
g_contextMenu.addAction('50', g_itemName, 'showRowsPerPage("50");', g_itemOrder);
```

**Note:** The action script for this item must define the `showRowsPerPage` function so that when selecting this menu item, that function is called with an argument of 50.

### onShow script for List v2 context menus

The **onShow script** field defines a script that runs before the context menu is displayed to determine which options appear in the context menu.

Use this script to change the menu items on the list header menu based on the current field column. The following JavaScript variables are available to the **onShow** script when it is executed:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>g_menu</td>
<td>Context menu to be displayed.</td>
</tr>
<tr>
<td>g_item</td>
<td>Current context menu item.</td>
</tr>
<tr>
<td>g_list</td>
<td>GlideList2 against which the script runs.</td>
</tr>
<tr>
<td>g_fieldName</td>
<td>Name of the field against which the context menu runs.</td>
</tr>
<tr>
<td>g_fieldLabel</td>
<td>Label of the field against which the context menu runs.</td>
</tr>
<tr>
<td>g_sysId</td>
<td>The sys_id of the row or form against which the script runs.</td>
</tr>
</tbody>
</table>

An example of an **onShow** script is one that determines when to enable or disable the **Ungroup** option in a list column heading menu based on whether the list is grouped or not.

```javascript
if (g_list.getGroupBy()) {
    // list is grouped so enable to Ungroup menu item
    g_menu.setEnabled(g_item);
} else {
    // list is not grouped, so disable the Ungroup menu item
    g_menu.setDisabled(g_item);
}
```

### List v3 administration

List v3 is no longer available for new deployments. If you are already using List v3, you can continue to do so. There are several aspects of list administration that are specific to List v3.

#### Supported browsers for List v3

List v3 is supported on recent versions of most major browsers.

- The latest public release of Firefox or Firefox ESR
- The latest public release of Chrome
- Safari version 9.1 and later
- The latest public release of Microsoft Edge
• Internet Explorer version 11
  • Edge mode is supported.
  • Compatibility mode is not supported.
  • Setting Security Mode to High (via the Internet Options > Security tab) is not supported.

**Internet Explorer**

**Important:** Due to significant performance issues, ServiceNow recommends that customers migrate away from Internet Explorer 11. For more information, refer to KB0683275.

• Internet Explorer 11 is susceptible to memory leaks, which may impact performance, especially in Windows 7.
• In Jakarta and later, Internet Explorer versions prior to IE11 are no longer supported.
• Compatibility mode is not supported.
• Setting the Security Mode to High (in the Internet Options > Security tab) is not supported.

**List v3 compatibility**

Certain conditions prevent lists from displaying in List v3.

A list loads in List v2 under the following circumstances.

• List v3 is disabled globally. Disabling List v3 globally overrides all other conditions. By default, List v3 is enabled globally when the List v3 plugin is activated.
• The list is a related list and List v3 has not been enabled for related lists. By default, List v3 is disabled for related lists.
• The associated list control has any of the following fields set to true:
  • Disable list v3 (by default, this field is set to false for most tables)
  • Hierarchical lists
  • List edit insert row
• All the associated client-side list UI actions that are active have the List v3 Compatible field set to false. Client-side list UI actions have the Client and List action fields set to true.

**Note:** Embedded lists and list reports are not supported in List v3 and always display in List v2.

**Debug List v3 compatibility**

If a list displays in v2 when List v3 is enabled globally, you can debug compatibility and fix the issue quickly.

Role required: admin

The debug List v3 compatibility icon (🔧) appears in the title bar of v2 lists.

**Note:** Administrators can configure which roles can see the icon by modifying the glide.ui.list_v3.debug_compatibility.roles property. For more information, see Properties for List v3.

1. Click the debug List v3 compatibility icon.
   A compatibility checklist opens. Each applicable condition and its compatibility status, pass (√) or fail (❌), is listed. If there are client-side UI actions that are not compatible, each one is listed by name.
2. Point to the pass or fail icon to view an explanation of the condition criteria.
3. For failed conditions, click the link to navigate directly to the source of the problem.

**Properties for List v3**

Defines the properties that are available for List v3.

List v3 uses the following properties. These properties do not impact List v2 functionality.

**Note:** To open the System Property [sys_properties] table, enter `sys_properties.list` in the navigation filter.

<table>
<thead>
<tr>
<th>Property</th>
<th>Usage</th>
</tr>
</thead>
</table>
| glide.ui.admin_import_xml_roles | Determines which user roles are required to access the Import XML option in the list title menu. When the value is blank, no role is required.  
  - Type: string  
  - Default value: admin  
  - Location: System Property [sys_properties] table |
| glide.ui.list.allow_search_box  | Allows the search box to display even if the filter controls are restricted.  
  - Type: true | false  
  - Default value: false  
  - Location: Add to the System Property [sys_properties] table |
<table>
<thead>
<tr>
<th>Property</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.list_v3.append_module_title</td>
<td>Appends the name of the module from which a list was accessed to the list title when enabled. For example, if you open the Incident list by navigating to <strong>Incident &gt; All</strong>, the list title is <strong>Incidents (All)</strong>.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: System Property [sys_properties] table</td>
</tr>
<tr>
<td>glide.ui.list_v3.chart_limit</td>
<td>Sets the maximum number of groups to display in list grouping charts.</td>
</tr>
<tr>
<td></td>
<td>• Type: integer</td>
</tr>
<tr>
<td></td>
<td>• Default value: 12</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Property [sys_properties] table</td>
</tr>
<tr>
<td>glide.ui.list_v3.debug_compatibility.roles</td>
<td>Determines which user roles are required to access the debug List v3 compatibility icon, which appears in the title bar of v2 lists when List v3 is enabled globally. When the value is blank, no role is required.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: admin</td>
</tr>
<tr>
<td></td>
<td>• Location: Add to the System Property [sys_properties] table</td>
</tr>
<tr>
<td>Enable List v3</td>
<td>Determines whether List v3 is enabled globally. Additional conditions may prevent incompatible lists from loading in List v3, even when this property is enabled.</td>
</tr>
<tr>
<td>glide.ui.list_v3.enable</td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Location: <strong>System Properties &gt; List v3</strong></td>
</tr>
<tr>
<td></td>
<td>• Learn more: Disable List v3 globally</td>
</tr>
<tr>
<td>glide.ui.list_v3.limit_chart_data</td>
<td>Determines whether list grouping charts display the <strong>Other</strong> category when the number of groups exceeds the value set in the <strong>glide.ui.list_v3.chart_limit</strong> property.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>

<td>• Location: Add to the System Property [sys_properties] table</td>
</tr>
<tr>
<td>Property</td>
<td>Usage</td>
</tr>
<tr>
<td>----------</td>
<td>-------</td>
</tr>
</tbody>
</table>
| Enable List v3 for Related Lists on Forms<br>glide.ui.list_v3.related_list | Determines whether List v3 is enabled for related lists. The **glide.ui.list_v3.enable** property must be set to **true** to enable List v3 for related lists.  
  - Type: choice list  
  - Default value: enable_async_v2  
  - Available values:  
    - off: Disables List v3 for related lists. List v2 is used.  
    - enable_v3: Enables List v3 for related lists.  
    - enable_async_v2: Uses list v2 for related lists, but loads them asynchronously. When form tabs are enabled, only the lists on the visible tab are loaded.  
  - Location: **System Properties > List v3**  
  - Learn more: **Enable List v3 for related lists** |
| Enables real-time record updates on List v3 (Note: this may impact system performance)<br>glide.ui16.live_lists.enabled | Determines whether live updates are enabled for v3 lists. When live updates are enabled, record updates appear in real time, without the need to refresh the list manually. In Jakarta and after, live lists are enabled by default.  
  - Type: true | false  
  - Default value: true  
  - Location: **System Properties > List v3** |
| Allow related list query conditions to be added through the filter<br>glide.ui.list.related_list_search_filter | Determines whether the related list conditions builder is enabled for List v3 list views. The **glide.ui.list_v3.enable** property must be set to **true** to enable the related list conditions builder.  
  - Type: true | false  
  - Default value: true  
  - Location: **System Properties > List v3**  
  - Learn more: **Add related list conditions Add related list conditions** |
| Lowering the value of glide.ui.list.record_watcher_throttle property may impact system performance.<br>glide.ui.list.record_watcher_throttle | Time (ms) to wait between reacting to record watch events  
  - Type: integer  
  - Default value: 30000  
  - Location: **System Properties > List v3** |
| glide.ui.list_v3.enable_live_related_lists | Determines whether live updates are enabled for v3 related lists. When live updates are enabled, record updates appear in real time, without the need to refresh the list manually.  
  - Type: true | false  
  - Default value: true  
  - Location: System property [sys_properties] table |
Configure available related tables for the related list query

You can configure which related list tables are available to users in the related list query. The related list query is only available in List v3.

Role required: admin

Related Lists Conditions choice list

Users only see the related tables that they are authorized to view. The administrator can add a system property for any table and specify which related tables to exclude for everyone from the choice list.

1. To configure the related tables to exclude, add a new system property with the following field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>&lt;table&gt;.related_list_query.blacklist</td>
</tr>
<tr>
<td>Type</td>
<td>string</td>
</tr>
<tr>
<td>Value</td>
<td>comma-separated list of tables to exclude from the choice list.</td>
</tr>
<tr>
<td></td>
<td>Example: task_sla.task, task_ci.task</td>
</tr>
</tbody>
</table>

2. Click Submit.

Add this system property for every table for which you want to exclude related table choices.
Configure list calculations in List v3

In List v3, you can configure list calculations for columns, which calculate column totals, minimums, maximums, and averages.

Role required: personalize_list

You can configure list calculations for multiple columns in the same list. List calculations apply only to the view of the list in which they are configured. All users can see configured list calculations.

Note: List calculations are available in list reports, but the configuration instructions are different because list reports display v2 lists. For more information, see Configure list calculations in List v2.

1. In a list, click the list title menu icon and select **List Calculations**.

   The List Calculations window opens. It lists all columns that are visible in the current list.
2. Select the check box for one or more of the following calculation options for any column. You can only select calculation options that are available for a given column.
   - Average (not available for string, date, or date/time fields)
   - Minimum
   - Maximum
   - Total (not available for string, date, or date/time fields)

   A calculation preview appears by the check box.

3. To remove all list calculations, click **Clear Calculations**.

4. Close the List Calculations window.

   The calculations appear at the bottom of the list for each configured column.

---

### Enable List v3 for related lists

List v3 is disabled for related lists by default. You can enable List v3 for related lists by editing a property.

**Incompatible** related lists display in List v2, even when List v3 is enabled for related lists. If a form contains both v2 and v3 related lists, the differences in behavior and appearance may impact user experience. Evaluate how much work is required to ensure that each form displays related lists of the same version.

Role required: admin

1. Navigate to **System Properties > List v3**.
2. Locate the property called **Enable List v3 for Related Lists on Forms (glide.ui.list_v3.related_list)** and select **Enable V3** from the list.
3. Click **Save**.

   Assuming that List v3 is enabled globally, all compatible related lists display in List v3.

---

### Disable List v3 globally

You can disable List v3 globally by editing a property.

Role required: admin

When you disable List v3 globally, all lists load in List v2 for all users.

1. Navigate to **System Properties > List v3**.
2. Locate the property called **Enable List v3 (glide.ui.list_v3.enable)** and clear the check box.

3. Click **Save**.

**Disable List v3 for a specific list**

You can configure a specific list view to display v2 lists, even when the List v3 feature is enabled.

Role required: personalize_control
For example, you may need to disable List v3 for a list until you can train everyone who uses the application about the new location of the controls.

1. Navigate to the list for which you want to disable List v3.
2. Click the list title menu icon ( ).
3. Select Configure > List Control.
   The List Control form appears.
4. Select the Disable list v3 check box.
5. Click Update.

**Form configuration**

Form configuration involves changing the form layout and the related list layout. The form layout changes what appears on the form and the related list layout changes which related lists appear at the bottom of the form.

You change aspects of a form such as showing or hiding fields, embedding lists, and adding sections and annotations. This video highlights form layout and design.

**Using the form designer**

Administrators or users with the personalize_form role can use the form design feature to quickly create new or change existing form views.

With form design, you can accomplish the same tasks that you can with form layout in a graphical tool called the form designer. You can also access field properties and add information from macros or previously scripted UI elements.

Form design is an alternative to configuring forms that combines several configuration options into one tool. It is available by default for new instances and requires UI16 or UI15. Administrators who upgrade from a previous version must activate the Form Designer (com.glide.ui.ng.fd) plugin to use the feature.
Parts of the UI form design interface

The page header

The page header displays the current table and view being designed. Each form is tied to a unique table and view combination. For example, there can only be one form for the incident table default view. Select a different view to modify different form layouts for a table.
The field navigator

The field navigator allows you to manage fields on the form. It contains the following elements:

- **Filter**: Allows text search on the currently selected tab.
- **Fields**: Displays a list of existing fields you can add to the current form.
- **Field Types**: Displays a list of field types you can add to the current form. Adding a field type to the form layout creates fields in the selected table when the form layout is saved.
Field properties are accessed by clicking the gear icon that appears when you point to a field in the form layout.
The form layout displays a separate cell for each field, section, annotation, UI element, and related list that is on the form. Each cell has an identifying label and a handle icon to aid in selecting and moving it. The location of the cell in the form layout represents its relative position on the form. Only fields visible on the form layout are displayed on a form.
Form layout
Show or hide fields with the form designer

You can move fields to and from the form workspace to display the fields on the form.

Role required: personalize_form

Use the filter to quickly find fields in the field navigator.

1. Navigate to the form designer.
2. From the list of fields in the Field Navigator, select the field you want to display from the list of available fields.
3. Drag the field to the form layout.
4. Drag the field to the location you want it to be on the form.
5. To remove a field from the form layout, select the field and click the Remove this field (X) button beside the field label.
6. Click Save.

Add a form annotation with the form designer

Use annotations to provide instructions or additional information about fields on a form.

Role required: personalize_form

1. Navigate to the form designer.
2. Click the Field Types tab.
3. Select the Annotations field type.
4. Drag the annotation to the appropriate location on the form.
5. Point to the Annotations field and click the gear icon to open Properties dialog box.
6. In the Properties dialog box, enter a value for Annotation Text. You can use HTML tags to format the annotation text.
7. Click Save.

Add a new section with the form designer

Move sections to and from the form layout to display or remove the sections on the form.

Role required: personalize_form

Sections can have a one- or two-column layout.

By default, the first section on a form is always a read-only section displaying the label of the table. You cannot remove this section.

1. Navigate to the form designer.
2. Select an existing section.
3. Click the (+) button beside the section label to add a section.
4. Enter a label for the section.
5. Drag sections to reorder them.
   The label for the first section on the form designer is displayed as the form title.
6. To delete a section, click the (x) button beside the section label.
7. Click **Save**.

The following GIF shows how you would use form designer to add and then delete a form section.
Add a formatter with the form designer

Use formatters to add information from macros or previously scripted UI elements to a form.

Formatters are used to add information from macros or previously scripted UI elements to a form.

1. Navigate to the form designer.
2. Click the **Fields** tab.
3. In the filter, enter the string `Format`.
4. Select the formatter you want to add to the form.
5. Drag the formatter to the location you want it to be on the form.
6. Click **Save**.

Add a new field with the form designer

You can add a field to a form and the associated table.

Role required: personalize_form

Adding a field creates a dictionary entry for the new column in the current table. You can create a custom table and then use the form designer to add fields to the form.

Use the filter to quickly find field types in the field navigator.

1. Navigate to the form designer.
2. Click the **Field Types** tab.
3. Select the cell for the field type to create.
4. Drag the field type to the location you want it to be on the form.
5. Enter a label for the field.
6. Optional: Point to a field in the form design area and click the gear icon to access properties.
7. Click **Save**.

Configuring the form layout

Administrators or users with the personalize_form role can configure the form and related list layout.

Show or hide fields on a form

Configure form layout to change what appears on the form. You can perform tasks like changing what fields are visible, embedding lists, and adding sections and annotations.

Role required: personalize_form

1. Navigate to a form.
2. Click the context menu icon
   ( )
   and select **Configure > Form Layout**.
3. Using the slushbucket, select the fields and the order in which you want them to appear. Available items that appear in green followed by a plus (+) sign represent related tables. To access fields on these tables, use dot-walking.

In UI16, Form Layout is not responsible for the order of the Additional Comments and Work Notes fields. For more information on how to determine the order of these fields, see Customize activities.
4. Click **Save**.

**Warning:** Do not add the same field to more than one section of a form unless the field displays read-only data. Having two or more instances of an editable field can cause data loss and prevent the proper functioning of UI and data policies.

Through form configuration, you can also add new fields to the form, which creates columns to the table that underlies the form. See [Add and customize a field in a table](#) for more information.

### Add a related list to a form

You can configure related lists to appear on forms and in hierarchical lists.

Role required: personalize_form

Related lists display records in another table that have a relationship with the current record.

1. Open the form.
2. Click the form context menu icon and select **Configure > Related Lists**.
3. Using the slushbucket, select the related list to display on the form.
4. Click **Save**.
   
   Related lists appear at the bottom of the form.

### Add an annotation to a form

Highlight form elements by displaying blocks of colored text or separators between form elements.

Role required: personalize_form

1. Navigate to a form.
2. Click the context menu icon and select **Configure > Form Layout**.
3. Under **Form view and section**, select a section.
4. In the Available list, double-click *Annotation* to move it to the Selected list.

The Annotation Details section appears.

5. Place it above the field to annotate.
6. In Annotation Details, select the type of annotation. The available types of annotations include **Info Box Blue**, **Info Box Red**, **Line Separator** (any text you add appears beneath the line), **Section Details**, **Section Separator**, and **Text**.
7. Select either Plain Text or HTML for the data type and enter the annotation in the text box. All valid HTML tags are supported.

   For example, select the Text annotation type, the HTML data type, and enter `<span style="color:red">Select the primary location:</span>`. The text appears red on the form.

8. Click Save.

### Toggle annotations

Users can toggle annotations on a form in UI16 and UI15. The `glide.ui.show_annotations` user preference controls the visibility of annotations for each user.

1. Navigate to a form.
2. Perform the appropriate action for your version of the UI.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>UI16</td>
<td>Click the more options icon (omore_icon) to see the annotations icon. The icon is light gray and cannot be toggled when no annotations are available.</td>
</tr>
<tr>
<td>UI15</td>
<td>Click the annotation toggle icon (?_icon) to show or hide annotations.</td>
</tr>
</tbody>
</table>

### Create a form section

Create sections on forms to help group related fields together.

Role required: form_admin

Users can expand or collapse form sections to show or hide the fields they need. If you have tabs enabled, each form section appears on a separate tab. The default Change Request form is an example of a form with multiple sections as shown in the following image.
Change Request form sections

1. Right-click the form header and select **Configure > Form Layout**.
2. In the **Form view and section** area below the slushbucket, click **New** in the **Section** list.
3. In the **Section caption** field, give the new section a title, then click **OK**.
4. Select a form section name and click the up or down arrow to change the section order.

**Note:** The caption for the first section on the form becomes the form title.

5. Add fields to the new section using the slushbucket.
6. Click **Save** when you are finished.

The new section appears on the form with the fields you selected. If you do not add any fields to a section, the section stays empty.

If you want to delete the form section later, do the following:

a. Navigate to **System UI > Form Sections**.

b. Filter for the table that contains the section you want to delete. For example, the Incident table. The name of the form section to be deleted is displayed in the **Caption** field.

c. Select the check box beside the form section to delete, and then select **Delete** from the **Actions on selected rows** menu.

d. Click **OK** to confirm the deletion.

### Move form splits

Change the place where fields split on a form by moving the split section indicators in a slushbucket.

Role required: admin

1. Navigate to a form.
2. Click the context menu icon

   ![Context Menu Icon]

   and select **Configure > Form Layout**.
3. Move any of the following split section indicators:
   - `- begin_split -`
   - `- split -`
   - `- end_split -`
4. Click **Save**.
Display tabbed forms

Tabbed forms offer a useful way to make forms and related lists take up less space by reducing the scrolling that must be done to navigate the form.
Tabbed forms
Form sections and related lists are tabbed separately, each with their own tab line. A user always sees the first form section. All sections after that can be tabbed. Tabs are enabled by default for new instances.

Tabbed forms are enabled by default for new instances. A system user preference with the name `tabbed.forms` specifies whether the tabbed UI is used by default for all users. Users can change this preference as described in this procedure.

1. Click the gear icon in the banner frame.
2. Perform the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI16</td>
<td>Select the Forms tab and enable Tabbed forms.</td>
</tr>
<tr>
<td>UI15</td>
<td>Enable Tabbed forms.</td>
</tr>
</tbody>
</table>

An option is enabled when the switch appears green and is toggled to the right.

**Embed a list within a form**

You can embed lists within a form. When a list is embedded in a form, any changes made to the contents of the list are saved when the form is saved.

Role required: personalize_form

This allows the embedded list to be treated just like another element on the form. In addition, users can create records in the list view. After a row is added to the list, double-click any cell in the list to edit its value. You can add the same lists to a form as embedded lists or as related lists, depending on the path selected in the context menu.

You can also modify embedded list controls, such as the name of the related list and the roles required to create records in the embedded list.

1. Select a record from the list.
2. Right-click the form header and select **Configure > Form Layout**.
   The slushbucket shows the available fields and the lists that can be embedded in the form. Lists appear in red at the bottom of the **Available** list.
3. Select a list and move it to the **Selected** column.
4. Use the up and down arrow buttons to position the list in the form.
5. Click **Save**.

Lists adjust to fit the frames of the adjacent fields.
Configure customer updates indicator

You can configure the indicator for customer updates, which are changes that update sets, scripts, service catalog items, and other configuration tables track.

Role required: admin

The customer updates indicator icon (💬) may appear on the header of forms that have customer updates. Clicking the customer updates indicator opens the update set records for the item.

You can configure this indicator to appear for all or for specific administrators using the `owned_by_indicator.form` user preference.

1. Navigate to User Administration > User Preferences.
2. Perform one of the following actions.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable the indicator for all administrators</td>
<td>Set the <code>owned_by_indicator.form</code> preference to true.</td>
</tr>
</tbody>
</table>
| Enable the indicator for an individual administrator | a. Make sure the `owned_by_indicator.form` system user preference is set to false.  
|                                             | b. Create a user preference with the following values: |
|                                             | • Name: `owned_by_indicator.form`  
|                                             | • User: Select the administrator for which to enable the preference.  
|                                             | • Value: true |

Add a chart to a form

Add a chart to a form to show your users graphical data related to the form. For example, you could show an incident SLA-related chart on the Incident form so your users can see how well service level agreements are being met.

Role required: personalize_form

Note: The following report types are not supported on forms: List, Pivot, Multilevel Pivot, Calendar, and Single Score.
Chart on a form

1. Navigate to **System UI > Forms**.
2. Select the form you want to configure.
3. Click the context menu icon
   
   ![Chart icon]

   and select **Configure > Form Layout**.
4. Using the slushbucket, select *Chart*.
5. Enter a **Label** in the chart details.
6. Click **Save** to return to the form.
7. Click **Configure chart**.
8. Select a chart in the **Report** field and configure other options as desired.
9. Click **Update**.
Form administration

Administrators can configure several settings that control form functionality.

Form personalization
Control how users configure forms. You can also change the role that is necessary to configure a form and disable the form configurations that specific users already made.

See Administering form personalization for instructions.

Form annotations
Choose the types of annotations that are available on forms and save localized versions of form annotations.

See Administering form annotations for instructions.

Attachments
Control several aspects of form attachments, such as attachment size, allowed file extensions, and the roles that are allowed to attach files.

See Administering attachments for instructions.

Formatters
Create and edit formatters, such as the activity formatter, which displays information on the form that is not a field in the record. You can also configure formatter settings such as the maximum number of formatter entries.

See Formatters for more information.

Form templates
Create templates that automatically populate form fields based on settings you configure.

See Form templates for more information.

UI actions
Add buttons, links, and context menu items on forms to the UI more interactive, customizable, and specific to user activities.

See UI actions for more information.

UI policies
Configure the policies that dynamically change information on a form.

See Create a UI policy for more information.

Other advanced options
Configure advanced form features, such as form focus, form splits, and derived fields.

See Advanced form configuration for instructions.

Administering form personalization

Administrators can configure several aspects of form personalization, which allows users to customize the layout for any form view.

Administrators can manage this function using the following options.

• Activate or deactivate form personalization globally.
• Control user access to form personalization based on roles.
• Manage the personalized forms of users.

**Note:** Personalizing a form in this way modifies the form for you only. To make changes to a form that are visible to all users, you must configure the form.

### Activate form personalization

Form personalization is activated for new instances. To activate form personalization for upgraded instances, an administrator must activate the Form Personalization (com.glide.ui.personalize_form) plugin.

**Role required:** admin

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the Form Personalization (com.glide.ui.personalize_form) plugin using the filter criteria and search bar. You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see [Request a plugin](#).
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### Change form personalization role requirements

By default, the itil role is required to personalize forms, but you can change this requirement with a system property.

**Role required:** admin

1. Enter `sys_properties.list` in the navigation filter.
2. Locate the `glide.ui.personalize_form.role` property in the System Properties list.
3. In the **Value** field, specify the roles that can access form personalization.

### Manage personalized forms

When a user personalizes a form, the system stores the customizations as a user preference record. You can view and manage the user preferences.

**Role required:** admin

1. Navigate to **User Administration > User Preferences**.
2. Filter the list by `[Name] [contains] [personalize]`.
   There is a user preference for each form view each user personalizes. The name format combines the word personalize with the name of the table and the name of the view. For example, if a user personalizes the default view of the Asset [alm_asset] form, the user preference is called `personalize alm_asset_default`.
3. Delete a user preference to remove the customizations for the user.

### Disable form personalization

If you do not want your users to customize forms, you can disable form personalization.

**Role required:** admin
Activating the Personalize Forms plugin sets the `glide.ui.personalize_form` property to true. You can disable form personalization.

1. Enter `sys_properties.list` in the navigation filter.
2. Locate the `glide.ui.personalize_form` property in the System Properties list.
3. Set the Value field to `false`.

**Administering form annotations**

Form annotations are additional pieces of information on a form, such as a line or paragraph of text. Use form annotations to provide on-screen instructions to your users.

Form annotations are enabled by default in the base system. To disable them, set the `glide.ui.form_annotations` system property to false.

**Support multiple languages for a form annotation**

You can store multiple translations of form annotation text.

Role required: admin

To support multiple languages, use message records to translate annotation text.

1. Navigate to System UI > Messages.
2. Create a message record for each language you support.
3. On the Message form, set the Key field to a unique identifier for the annotation text. The annotation text is a good key. The key must be the same for each translation message for the annotation.
4. Select the appropriate Language.
5. In the Message field, enter the translated annotation text.
6. Edit the form annotation and reference the message key with a `gs.getMessage` call.
   
   For example, if the message key is `Message key text`, enter `$(gs.getMessage("Message key text"))` in the form annotation.

**Administer form annotation types**

You can define the form annotation types to control their appearance.

Role required: admin

1. Navigate to System UI > Form Annotation Types.
2. Set the Active field to `false` for any types you do not want to use.
3. Click New to add a type.

**Administering attachments**

Administrators can configure system properties for how files are uploaded and attached to records. Uploading, viewing, and deleting file attachments triggers a single event that can be used for notifications or in scripts.

**Attachment tables**

When you store an attachment to any table, a record is created in the Attachment [sys_attachment] table that contains attachment metadata. The file data is stored in the Attachment Document [sys_attachment_doc] table, in 4k chunks.
For example, if you attach a 12k file called `My_attachment.pdf`, then there is an Attachment entry with three related Attachment Document entries.

To learn how to upload attachments to records, see Add and manage attachments.

Activity stream thumbnail scaling

The `glide.ui.activity_stream.scale_images` property scales large images down and creates thumbnails for the activity stream view of the images. This property is active by default. It applies to images retroactively, so any attachments included in an activity stream in the past also see the effects.

- Maximum dimensions for thumbnails using this property are 525 pixels width by 350 pixels height. The system favors the pixel height first, so you can end up with images that are wider than 525 pixels.
- Attaching image files over 5 MB can create an out of memory error and cause the instance to restart. An out of memory error and restart occur when the system generates the thumbnail when you attach a new image. The error and restart can also occur the first time you load existing images on a record.
- The administrator can add the `com.glide.attachment.max_get_size` system property to control the maximum image scaling dimensions.

Enter the following information into the `[sys_properties.list]` table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>com.glide.attachment.max_get_size</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
<tr>
<td>Value</td>
<td>5242880</td>
</tr>
</tbody>
</table>

The value field represents the size in bytes.

- The base system value is 5242880 bytes (5 MB). You can change the value as necessary.
- With this property set, images that are larger than 5 MB are not scaled and the system creates a link instead. Images smaller than 5 MB are scaled down.

Configure the max image size property for Activity Streams

When attaching an image in an Activity Stream, the system controls the maximum size of the image. Use the `com.glide.attachment.max_get_size` property to control the maximum image scaling dimensions.

Attachment events and logging

A script action or notification can process attachment events. Only one event is created when action is taken on a record with attachments, even when the record has multiple attachments. The following events are provided.

Only one event is created when action is taken on a record with attachments, even when the record has multiple attachments. The following events are provided.

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment.read</td>
<td>An attachment has been read or downloaded.</td>
</tr>
</tbody>
</table>
### Event Logging

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment.uploaded</td>
<td>An attachment has been uploaded. If multiple attachments are uploaded to a record at one time, only one event is created.</td>
</tr>
<tr>
<td>attachment.deleted</td>
<td>An attachment has been deleted. This event is also triggered when the record containing the attachment is deleted. If a record is deleted that contains multiple attachments, a separate event is triggered for each attachment in the deleted record.</td>
</tr>
<tr>
<td>attachment.renamed</td>
<td>An attachment has been renamed.</td>
</tr>
</tbody>
</table>

### Attachment logging

When an attachment is downloaded, the `attachment.read` event record is written, and you can do something with this event. For example, you can record when and by whom certain attachments are downloaded. For this functionality, `current` is a `sys_attachment` record, and the event record uses the following parameters:

- **parm1**: File name
- **parm2**: Table name

### Debug attachment indexing

To change debugging options for attachment indexing, add these system properties.

- **glide.ts.index.attachment.debug**: When the value is set to `true`, enables log messages for exceptions that occur when indexing attachments (default is `false`).
  
  You can leave this property enabled during normal operations to capture stack trace information about any exceptions.

- **glide.ts.index.attachment.list_terms.debug**: When the value is set to `true`, logs all indexed terms when an attachment is indexed (default is `false`).

  [Recommended] For optimal performance, set this property to `false` during normal operations. Only enable this property when you are actively debugging an issue.

**Note**: To learn more about the properties that affect attachments processing, see Attachments (instance security hardening) in Instance Security Hardening Settings.

### Configure attachment system properties

You can disable the drag-and-drop feature. (Users can still upload attachments by browsing to the file.) You can also limit the attachment file size, restrict who can upload attachments, and restrict what file extensions can be uploaded.

Role required: admin

**Note**: To learn more about the properties that affect attachments processing, see Attachments (instance security hardening) in Instance Security Hardening Settings.

1. To disable the drag-and-drop features, navigate to **System Properties > UI Properties**.
2. Clear the check box for the **Allow attachment drag and drop in supported HTML5 browsers** property.
3. Click **Save**.

**Limit attachment file size**

You can specify the maximum size allowable for attachments to avoid issues with the user's active session on the instance. The maximum attachment size for email attachments is configured separately.

Role required: Admin.

Note: The maximum attachment size for email attachments is configured separately.

1. Navigate to **System Properties > Security**.
2. Enter a value in the **Maximum file attachment size in megabytes** property.
   The system only allows attachment sizes up to 1 GB. By default, this field is blank. If you leave this field blank, the system uses the default maximum limit of 1 GB.
3. Click **Save**.

**Require a role to attach files**

You can restrict who can upload attachments.

Role required: Admin.

1. Navigate to **System Properties > Security**.
2. In the **Attachment limits and behavior** section, locate the **List of roles (comma-separated) that can create attachments** property (**glide.attachment.role**).
3. Enter one or more roles separated by commas.
   Only roles listed in this property are able to upload attachments to a record. If no roles are entered, then all roles can upload attachments.
4. Click **Save**.

**Restrict attachment file extensions**

The **glide.attachment.extensions** property restricts the file extensions that users can upload as attachments.

Role required: Admin.

Use this property to improve security by preventing users from uploading harmful files, such as viruses, as attachments. Also, this capability can prevent the use of incompatible filetypes. For example, Internet Explorer does not support icons in .png format. This property does not restrict files based on the actual file type, but only based on the extension.

1. Navigate to **System Properties > Security**.
2. In the **Attachment limits and behavior** section, locate the **List of file extensions (comma-separated) that can be attached to documents via the attachment dialog** property.
3. Enter the file extensions and click **Save**.
   If no extensions are specified, then all extensions are allowed. However, if any extensions are specified, all unlisted extensions are restricted. Listed extensions should not include the dot (.) prefix or spaces after commas. For example, enter xls,xlsx,doc,docx.

**Disable attachments on a table**

You can prevent users from adding attachments to records on a specific table.
Role required: admin

1. Open a record in the table.
2. Right-click the form header and select **Configure > Dictionary**.
3. In the list of dictionary entries, select the first record in the list (the record with no **Column name** entry).
4. Add **no_attachment** to the **Attributes** field, separated by commas from any existing attributes.
   
   See **Dictionary attributes** for more information.

## Index attachments on a table

You can enable attachment indexing for a table so text searches can return matches from the record and its file attachments.

Role required: admin

By default, attachment indexing is enabled for the Knowledge Base. Enabling attachment indexing causes the platform to reindex the selected table, its parent table, and any children of the parent table. For large tables, such as the Task table, reindexing can take several hours and slows down the system until complete. Reindexing is best performed during non-peak times.

1. Open a record in the table.
2. Right-click the form header and select **Configure > Dictionary**.
3. On the Dictionary Entries list, open the first record.
   
   The first record has the record type **Collection** and doesn't have any entry for **Column name**.
4. Open the **Attributes** tab, and then click **New**.
5. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Select Attachment index.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter true.</td>
</tr>
</tbody>
</table>

**Note:** The attachment indexing attribute only applies to the tables on which you explicitly add it. It does not cascade to child tables. For example, indexing attachments on the Task table does not index attachments on the Incident table. Not all file types are supported for attachment indexing. For a list of supported file types, see Zing can include attachments in search results.

6. Click **Submit**.
7. On the Dictionary Entry form, click the **Generate Text Index** related link.
8. On the confirmation window, click **OK**.

In the confirmation window, you can select to have the system send you an email notification after the text indexing is complete.

The indexing process begins. When it is complete, attachments can be searched on that table.

### Hide the attachment [view] link

Users can open an attachment by clicking either the file name or the **[view]** link. The **[view]** link opens the file from within the browser, which executes JavaScript code as part of the attachment. You can hide the **[view]** link. Users can still view attachments by clicking the file name.

Role required: Admin.

1. Add the `glide.ui.disable_attachment_view` and `glide.ui.attachment_popup` properties.
   
   For instructions on adding properties to the platform, see [Add a system property](#).

2. For the `glide.ui.disable_attachment_view` property, set the **Type** to **true/false** and set the **Value** to **true**.

3. For the `glide.ui.attachment_popup` property, set the **Type** to **true/false** and set the **Value** to **false**.

4. To return to the default behavior (enable the link), set the `glide.ui.attachment_popup` property **Value** to **true**.

### Configure attachment icons

You can configure the icon that appears beside an attachment of a particular file type.

Role required: Admin

1. Determine the path of the image file. If desired, upload a new image.

2. Navigate to **System UI > Attachment Icon Rules**.

3. Open an existing rule or click **New** to create a new rule.
4. Enter the rule details.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select icon by</td>
<td>Select MIME Type or File Extension.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>If a file type has an icon specified by MIME Type and a different icon specified by File Extension, the MIME Type icon takes precedence.</td>
</tr>
</tbody>
</table>

| MIME type        | If Select icon by is MIME Type, enter the MIME type and subtype to associate with the icon, separated by a slash (example: application/pdf). |
| File extension   | If Select icon by is File Extension, enter the file extension to associate with the icon beginning with the period (example: .pdf). |
| Icon             | Enter the path to the icon image file (example: images/icons/attach_pdf.gifx) |

5. Click Submit or Update.

**Formatters**

A formatter is a form element used to display information that is not a field in the record. Add formatters to a form by configuring the form.

**Examples of formatters in the base platform**

<table>
<thead>
<tr>
<th>Formatter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activity formatter</td>
<td>Displays the list of activities, or history, on a task form.</td>
</tr>
<tr>
<td>Process flowformatter</td>
<td>Displays the different stages in a linear process flow across the top of a record.</td>
</tr>
<tr>
<td>Parent breadcrumbs formatter</td>
<td>Provides breadcrumbs to show the parent or parents of the current task.</td>
</tr>
<tr>
<td>Approval summarizer formatter</td>
<td>Displays dynamic summary information about the request being approved.</td>
</tr>
<tr>
<td>CI relations formatter</td>
<td>Displays on the CI form a toolbar for viewing the relationships between the current CI and related CIs.</td>
</tr>
</tbody>
</table>

**Note:** Formatter elements cannot be exported to PDF. When exporting PDF data from a form, any formatter elements added to the form are not displayed in the PDF output.

To create a custom formatter, create a UI macro to define content for the formatter, then create a formatter that refers to the UI macro. You can then add the formatter to a form.

**Create a UI macro for a formatter**

Create a UI macro to define the content that the formatter displays.

This functionality requires knowledge of Jelly script.
Role required: ui_macro_admin

1. Navigate to System UI > UI Macros.
2. Click New.
3. Complete the form.
4. In the XML script field, enter Jelly script to define the content to be displayed by the formatter.

**Note:** The UI Macro for the formatter represents a row in the UI. It must begin and end with `<TR></TR>` tags.

```xml
<?xml version = "1.0" encoding = "utf-8" ?>
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide" xmlns:j2="null" xmlns:g2="null">
<tr>
<td colspan="2">
Here  is some descriptive text  for the Priority field.
</td>
</tr>
</j:jelly>
```

This Jelly script is reproduced below in plain text that you can copy into the Macro form as a basis for your macro script.
5. Click **Submit**.

### Create a formatter and add it to a form

Create the formatter after creating the UI macro that defines the content.

Role required: admin

With the UI macro in place, create the formatter that references it, and add it to the form.

1. Navigate to **System UI > Formatters**.
2. Click **New**.
3. In the **Name** field, enter a descriptive name for the formatter.
4. In the **Formatter** field, enter the name of the UI macro with `.xml` appended to it.
5. In the **Table** field, select the table in which the formatter will be used.
6. In the **Type** field, select **Formatter**.
7. Click **Submit**.
8. To add the formatter to a form, configure the form.

   The formatter appears on the form according to your selections.

### Activity formatter

The activity formatter provides an easy way to track items not saved with a field in the record, for example, journal fields like comments and work notes.

The activity formatter is enabled by default on the Task [task] table and other tables that extend the Task table, such as the Incident [incident] table. It is also enabled on the Approvals [sysapproval_approver] table.

You can filter the content that appears on the activity formatter and participate in the record feeds on the record. You can create an activity formatter for any form and configure properties that control what fields appear in the formatter. The number next to activities indicates the number of entries in the record feed. The number updates when users use the filter.

Activity type and a time stamp display in the top of each entry.

In UI16, the activity formatter shows updates in real time so you can see the latest information without refreshing the form. User presence enables you to see when other users are entering comments.
Activities: 5

Assigned to: David Loo
Impact: High
Incident state: In Progress
Opened by: Don Goodlife
Priority: Critical
Create an activity formatter

You can create an activity formatter for any audited table.

Role required: admin

1. Navigate to **System UI > Formatters**.
2. Click **New**.
3. Enter a name for the formatter, such as **Activities (task)**.
4. Select a **Table**.
5. Enter **activity.xml** in the **Formatter** field.
6. Leave the **Type** as **Formatter**.
7. Click **Submit**.

**Note:** You can create more than one activity formatter for a table, however, the system does not allow you to add more than one activity formatter to a form.

Add the new activity formatter to forms as needed.

Add the activity formatter to a form

Add an activity formatter to any form to track journal fields on the form.

Role required: personalize_form

1. Verify that the table associated with the form is audited.
2. Configure the form layout to add **Activities (filtered)**.

**Note:** In UI16, you cannot place another field in between a journal field and the activities formatter. The Activity Stream is built to keep journal fields stacked on top of the activity formatter.

**Note:** Field styles are not applied to comments and work notes fields used with the activity formatter. Styles for these fields can be set using the `glide.ui.activity_stream.style.comments` and `glide.ui.activity_stream.style.work_notes` system properties located on the `sys_properties` table.

Enable the Live Feed-Activity toggle

The Live Feed-Activity toggle allows users to switch between the activity feed and the document feed for a record.

Role required: admin

Use live feed to interact with other users on a record by posting messages and adding attachments to the feed. Use the activity formatter to see an overall summary of activity for the record.
Live Feed/Activity toggle

- The `glide.ui.show_live_feed_activity` property is enabled. Navigate to Collaborate > Feed Administration > Properties and enable the Toggle the display of the live feed tab in the activity formatter option.

1. Verify that the live feed and record feed plugins are active.
2. View the form to ensure that the activity formatter is visible. If not, configure the form to add it.
3. Set the `live_feed` dictionary attribute to true on the form.
   This action adds live feed to the activity formatter.
4. Complete the following steps to enable the system property.
   a) Navigate to Collaborate > Feed Administration > Properties.
   b) Enable the Toggle the display of the live feed tab in the activity formatter option (`glide.ui.show_live_feed_activity` property).

Customize activities

You can customize which fields appear in the activity formatter. You can add or remove fields from the list of activities that users can select when they open the activity filter.

Role required: personalize_form and personalize_list
Customize the fields that appear in the activity filter

**Note:** In the UI15 interface, the number of updates to each field was shown in parentheses to the left of each field. This has been removed in UI16.

1. Perform the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>UI version</th>
<th>Action</th>
</tr>
</thead>
</table>
| UI16       | a. Click the activity filter icon ( ¶ ).  
|            | b. At the bottom of the list, click **Configure available fields**. |
| UI15       | Right-click the **Activity** header and select **Configure Activities**. |
2. In the slushbucket, select the desired fields in the **Available** column and move them to the **Selected** column. The activities appear in alphabetical order, regardless of the order in the **Selected** column.

   **Note:** In UI16, **Configure available fields** is responsible for the order of the Additional Comments and Work Notes fields.

3. Click **Save** to add them to the activity formatter and the filter.

Administrators can also modify the system property **Incident activity formatter fields(glide.ui.incident_activity.fields)**. Access this property through **System Properties > UI Properties**. The system automatically synchronizes the values in the system property and the selections you made.

**Configure roles for viewing emails in the activity formatter**

The system property **glide.ui.activity.email_roles** enables you to control which roles can see emails in the activity formatter.

Role required: admin

In the activity formatter, users see activity only for fields they have permission to read. For example, self-service users might see the activity formatter on the self-service view of the Incident form, but they do not see work notes, unless security rules have been customized to allow this.

If the **Sent/Received Emails** field is included in the activities list, all users see all emails. No determination is made whether an end user, for example, should see an email containing work notes. Configure this property to restrict this capability to specified roles.

   **Note:** Email does not appear as an activity until it is sent. If email properties are not configured for outbound delivery, the message can be found by navigating to **System Mailboxes > Outbox**.

1. Navigate to **System Properties > UI Properties**.
2. Locate the property labeled **List of roles (comma separated) that can view emails in the Activity Formatter when "Sent/Received Emails" are included.**
3. Add roles to the property, separated by commas.
   These are the only roles that can see email in the activity formatter. All other roles are prevented from seeing email. If no roles are listed, all users can see email. The itil role is on the list by default.
4. Click **Save**.

**Configure the max activity size property**

Use the **glide.max_activity_size** property to increase the amount of content that can be visible in the Activity Formatter.

Role required: admin

The default size for an activity is 100 * 1024, which causes large amounts of content to be hidden in the Activity Formatter. You can change the default value by adding the **glide.max_activity_size** property.

1. Type **sys_properties.list** in the Application Navigator.
2. Click **New** and enter the following values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.max_activity_size</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
</tbody>
</table>
Configure email reply for the activity formatter in UI16

The `glide.ui16.emailStreamResponseActions` system property determines whether a user can reply to email using the email reply button in the activity stream in UI16.

1. In the navigation filter, type `sys_properties.list`.
2. Add the following system property. For more information on adding a system property, see Add a system property.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Name</strong></td>
<td>glide.ui16.emailStreamResponseActions</td>
</tr>
<tr>
<td><strong>Description</strong></td>
<td>Add the email reply button to the activity stream.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>true</td>
</tr>
<tr>
<td><strong>Value</strong></td>
<td>Set the value to <strong>true</strong>. The default value if this property is not configured is false.</td>
</tr>
</tbody>
</table>

3. Click Submit.

Configure email reply for the activity formatter in UI15

The `email_reply` UI macro creates an email reply button in the activity stream in UI15. This UI macro can be deactivated to hide the button.

1. Navigate to **System UI > UI Macros**.
2. Open the `email_reply` UI macro record.
3. Check the check box in the **Active** field to enable the email reply button, or uncheck the field to disable it.
4. Click Submit

Process flow formatter

The process flow formatter provides a graphical summary of the stages in a process. The formatter is typically shown at the top of forms that are part of a process.

Each record on the Flow Formatter [sys_process_flow] table represents a process stage and can have a different condition applied to it. When specified conditions are fulfilled, the formatter highlights the current stage and places a check mark next to all previous stages.

These examples show a workflow in the UI15 and UI16 interfaces.

**UI15 process flow for an incident**
UI16 process flow for a change request

When any formatter stages are defined for a table, they appear on the form associated with that table in the order specified, assuming the formatter has been added to the form.

Activate the process flow formatter

You can activate the Process Flow Formatter plugin.

Role required: admin

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   - You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Create a process flow formatter

You can create a process flow formatter stage.

Role required: admin

2. Click New.
3. Complete the form, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table for this process flow formatter.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a name to identify the formatter.</td>
</tr>
<tr>
<td>Label</td>
<td>Enter the name to be displayed in the form configuration slushbucket.</td>
</tr>
</tbody>
</table>
Field | Description
---|---
Active | Select the check box to ensure that the formatter stage is active. When the check box is cleared, the formatter stage does not appear in the flow display.
Order | Enter a number to indicate where in the process flow the formatter will be displayed. Formatters are arranged with the lowest number on the left and the highest number on the right.
Condition | Use the condition builder to set the conditions under which the formatter is highlighted as current. Any field available in the condition builder, such as SLA or Impact, can be used to trigger a process flow stage.
Description | Describe the process flow formatter. This description does not appear on the actual formatter.

4. Repeat as necessary for each stage.

**Parent breadcrumbs formatter**

The parent breadcrumbs formatter on the Task table provides breadcrumbs that show the parent or parents of the current task. This formatter can be used also on any table that extends Task.

Role required: personalize_form

To add the parent breadcrumbs formatter to a form, configure the form and add **Parent Breadcrumbs** to the desired location. The breadcrumbs show only six levels of parents. If more levels exist, the breadcrumbs display an ellipsis ("...").

The **Parent** reference field also has to contain a value for the breadcrumbs to appear. You may need to configure the form to contain the **Parent** field as well.
Customize the parent breadcrumbs formatter

You can customize the parent breadcrumbs formatter to control what breadcrumbs appear.

**Role required:** admin

1. Navigate to **System UI > Formatters**.
2. Select **Parent Breadcrumbs**.
3. Click **View UI Macro for this Formatter** to view or modify the underlying formatter.

By default, the breadcrumb uses the default display field, `gr.getDisplayValue()`, as the link in the breadcrumb. To customize this, add the following line, replacing the `fieldName` parameter with the desired field name (not the field label):

```javascript
pc.setLabelField("fieldName")
```

If a user points to a breadcrumb, the short description for that record appears as a hint by default. To display alternate hints for the breadcrumb, add the following line, replacing the `fieldName` parameter with the desired field name (not the field label):

```javascript
pc.setTitleField("fieldName")
```

Be sure to add these lines in the proper location, as shown in the following example:

```javascript
//parent crumb functions - script include
var pc = new ParentCrumbs(now_GR);
pc.setLabelField("short_description");

//override the default display field to be used for label
pc.setTitleField("number");

//override default short_description hover text
var crumbs = pc.getCrumbs();
```

Use the parent breadcrumbs formatter on non-Task tables

The parent breadcrumbs formatter can be used on non-Task tables as long as the table has a reference to itself through a field called **parent**.

Role required: admin

To make the formatter available for a different table, duplicate the formatter used by the Task table:

1. Navigate to **System UI > Formatters**.
2. Select **Parent Breadcrumbs**.
3. Set the **Table** field to the appropriate table.
4. Right-click the form header and choose **Insert**.
5. Add the new formatter to the appropriate form.

Approval summarizer formatter

The approval summarizer formatter creates the summary at the bottom of an approval form.
The approval summarizer displays different information depending on what is being approved, such as a change request or a service catalog request. Following are two examples.
### Summary of Item being approved

#### Change Request

<table>
<thead>
<tr>
<th>Number</th>
<th>CHG0000001</th>
<th>Requested by</th>
<th>David Loo</th>
</tr>
</thead>
<tbody>
<tr>
<td>Affected CI</td>
<td>Sales Force Automation</td>
<td>Type</td>
<td>Normal</td>
</tr>
<tr>
<td>Planned start date</td>
<td>2016-07-27 16:00:00</td>
<td>Risk</td>
<td>High</td>
</tr>
<tr>
<td>Planned end date</td>
<td>2016-07-27 18:00:00</td>
<td>Impact</td>
<td>3 - Low</td>
</tr>
<tr>
<td>Short description</td>
<td>Rollback Oracle Version</td>
<td>Description</td>
<td>Performance of the Siebel SFA software has been severely degraded since the upgrade performed this weekend. We moved to an unsupported Oracle DB version. Need to rollback the Oracle Instance to a supported version.</td>
</tr>
</tbody>
</table>

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Summary of a catalog request

The **Reject** button allows the approver to deny one or more requested items in a multi-item request, before approving the overall request. If a requested item is denied, the workflow for that item never starts. The approver can then choose to **Accept** the item.

**Note:** When the overall request is approved, you must ensure this **Reject** button is hidden. If this button is used after request approval, the requested item workflow is canceled, leaving the stage in an inconsistent state. Similarly, the **Accept** button on requested items should only appear before the overall request is approved or rejected.

Override a formatter with macros

The system uses formatters to handle complex rendering of specific form elements.

Role required: `ui_macro_admin`

Examples of form elements rendered by formatters in the base platform are:

- Activity formatter: Displays the list of activities, or history, on a task form.
- Process flow formatter: Displays the different stages in a linear process flow across the top of a record.
- Task parent breadcrumbs formatter: Provides breadcrumbs to show the parent or parents of the current task.
- Approval summarizer formatter: Displays dynamic summary information about the element being approved.

A UI macro can override formatters provided in the base system.

1. Navigate to **System UI > UI Macros**.
2. Click **New**.
3. In the **Name** field, enter the same name as the formatter you want to override, but omit the `.xml` extension.
4. Complete the remaining fields on the form.
5. Click Submit.

This example shows the form that defines the existing approval summarizer formatter:

Here is the form for the UI macro that overrides the approval summarizer formatter:

Limit the number of activity stream entries

You can set a system property to limit the number of entries allowed in an activity stream.

Role required: admin

1. Enter `sys_properties.list` in the Navigation filter.
2. Search for the property `glide.history.max_entries`.
3. Edit the Value property to set the maximum number of entries that users can view in an activity stream.

Note: New entries do not count towards the max number until the form is refreshed.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.history.max_entries</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>Maximum number of entries allowed to display in an activity stream. The default number is 250. New entries do not count towards the max number until the form is refreshed.</td>
</tr>
<tr>
<td>Type</td>
<td>integer</td>
</tr>
<tr>
<td>Default value</td>
<td>250</td>
</tr>
</tbody>
</table>

### Form templates

Templates simplify the process of submitting new records by populating fields automatically.

To use a template, populate the most-used fields for a specific table, save it as a template, and then make the template accessible to your users. Users can manually apply a template when creating records, or an administrator can define scripts to apply templates automatically.

Create templates for the forms that you use frequently, such as incident, problem, and change. There is no limit to the number of templates that you can create or access, but having many templates for each form makes the templates more complex to manage.

You can create table-level access controls to restrict template creation. When applied, a user creating a new record from a template must satisfy the save_as_template access control for every field modified by the template.

### Automatically applied templates

You can make a template that automatically applies to new, user-created records on a specific table. To create this kind of template, set the template name to match the name of the table to which the template applies.

For example, imagine you want to apply a template automatically when a user creates a record on the Windows Server [cmdb_ci_win_server] table. Set the Name field to cmdb_ci_win_server and the Table field to Windows Server [cmdb_ci_win_server] on the Template form.

Automatic templates are always global. They do not honor the User and Group fields on the Template form. Automatic templates do not apply to records created by the system, such as those records generated by business rules, UI actions, or workflows.

### Create a template using the Template form

Create a template record for any table to automatically populate certain fields.

Role required: admin

1. Navigate to System Definition > Templates.
2. Click New.
3. On the form, fill in the fields.

#### Template form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of this template.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Table</strong></td>
<td>Table that this template applies to. Select <strong>Global</strong> to make the template available for use with all tables.</td>
</tr>
<tr>
<td><strong>Note</strong>:</td>
<td>The table list shows only the tables and database views that are in the same scope as the template.</td>
</tr>
<tr>
<td><strong>Active</strong></td>
<td>Option for making the template available for use. A template must be active to be used.</td>
</tr>
<tr>
<td><strong>User</strong></td>
<td>User who can configure and apply the template. If you define a user, no other users can see the template unless you select the <strong>Global</strong> option.</td>
</tr>
<tr>
<td><strong>Group</strong></td>
<td>Group whose members can configure and apply the template. If you define a group, no other groups can see the template unless you select the <strong>Global</strong> option.</td>
</tr>
<tr>
<td><strong>Global</strong></td>
<td>Option for allowing any user who can access the templates to view and apply this template.</td>
</tr>
<tr>
<td><strong>Short description</strong></td>
<td>Description of the template.</td>
</tr>
<tr>
<td><strong>Note</strong>:</td>
<td>Adding content to this field does not add that content to the <strong>Short description</strong> field of the forms that use this template.</td>
</tr>
<tr>
<td><strong>Template</strong></td>
<td>Content that automatically populates records that are based on this template. Select a field from the specified table in the left column and then enter the data to automatically populate in the right column.</td>
</tr>
<tr>
<td><strong>Note</strong>:</td>
<td>Even though you can select dot-walked fields in the template, they do not apply to fields that are on the form.</td>
</tr>
<tr>
<td><strong>Link element</strong></td>
<td>Template that links a child table with the template for the parent table. In the template for the child table, set the value to the field that references the parent table. After you set the value, the child template is explicitly linked to the parent table.</td>
</tr>
<tr>
<td><strong>Note</strong>:</td>
<td>This field does not appear by default. Configure the template form to add the field.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

See **Application scope**.

**Create templates for related task records**

Administrators can create a template for a Task table record that also creates one or more related records in the child Task table.

Role required: admin

Administrators must understand the parent-child relationships between Task tables. For example, the Change Task table is a child of the Change table and the Incident Task table is a child of the Incident table.
Note: Child templates can only be applied automatically if you first apply the parent template from a module.

1. From the parent Task table template, configure the form layout to add these fields.
   - Next Related Child Template
   - Next Related Template
   - Link element

2. Create a template for the parent Task table.
   For example, create this template for the Change table.

   **Sample Change template**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Add server to network</td>
</tr>
<tr>
<td>Table</td>
<td>Change [change_request]</td>
</tr>
<tr>
<td>Short description</td>
<td>Set up a server on the network</td>
</tr>
<tr>
<td>Template</td>
<td>• [Short description][Set up server on the network]</td>
</tr>
<tr>
<td></td>
<td>• [Category][Hardware]</td>
</tr>
<tr>
<td></td>
<td>• [Assignment group][Hardware]</td>
</tr>
</tbody>
</table>

3. Create a template for the first related task.
   For example, create this template for the Change Task table.

   **First sample Change Task template**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Order server</td>
</tr>
<tr>
<td>Table</td>
<td>Change Task [change_task]</td>
</tr>
<tr>
<td>Short description</td>
<td>Order server hardware</td>
</tr>
<tr>
<td>Template</td>
<td>• [Short description][Order server hardware]</td>
</tr>
<tr>
<td></td>
<td>• [Assignment group][Hardware]</td>
</tr>
<tr>
<td>Link element</td>
<td>Change request</td>
</tr>
</tbody>
</table>

4. Create a template for each additional related task.
   For example, create one additional template for the Change Task table.

   **Second sample Change Task template**

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Install server on network</td>
</tr>
<tr>
<td>Table</td>
<td>Change Task [change_task]</td>
</tr>
<tr>
<td>Short description</td>
<td>Install server on network</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td>Template</td>
<td>• [Short description] [Install server on network]</td>
</tr>
<tr>
<td></td>
<td>• [Assignment group] [Hardware]</td>
</tr>
<tr>
<td>Link element</td>
<td>Change request</td>
</tr>
</tbody>
</table>
5. From the parent Task table template, set **Next Related Child Template** to the first related child task.

For example, in the Add server to network template, select **Order server** in the **Next Related Child Template** field.
6. For each child related task, set **Next Related Template** to the next related task template. For example, in the Order server template, select **Install server on network** in the **Next Related Template** field.

**Note:** The last related task template does not have a value for **Next Related Template**. For example, the **Install server on network** template does not have a value in **Next Related Template**.
Create a module for the parent Task table template so that child templates can be applied to related task records. For example, create a module for Add server to network.

Create a template by saving a form

Save a populated form as a template.

Toggle the template bar so it is visible on forms.

Role required: none

1. Navigate to a form.
2. Complete the form as it should appear when a user applies the template.
3. In the template bar, click the plus icon (+).

4. Enter a descriptive name to make it easy for a user to select the correct template.

5. Make any additional changes as needed.

6. Click Save.
Create records based on a template

You can create and schedule a scheduled job to create records based on a template. For example, you can regularly create a populated task record to perform a weekly backup.

Role required: admin

1. Navigate to System Definition > Templates.
2. Select a template record.
3. Click Schedule.
   The Scheduled Entity Generation form appears.
4. In the Run choice list, select how frequently to create a record.
5. Complete the schedule information.
6. Click Submit.

Create a module for a template

You can create a module to open a form with pre-populated template data.

Role required: admin

Child templates are only applied if the parent template is applied from a module. Child templates are not applied by applying a template to a new form.

1. Perform the appropriate action for your version of the UI:

<table>
<thead>
<tr>
<th>UI16</th>
<th>Point to the application menu, such as Self-Service, and click the edit application (pencil) icon.</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI15</td>
<td>Right-click an application menu and select Edit Application Menu.</td>
</tr>
</tbody>
</table>

2. In the Modules related list, click New.
3. Fill in the Title and Order fields as appropriate.
4. In the Link Type form section, in the table field, select the table you want to create the form in.
5. In the Link Type field, select New Record.
6. In the Arguments field, enter `<table>.do?sys_id=-1&sysparm_template=<templatename>`
   The `<table>` is the name of the table you selected for the table field, for example incident. The `<templatename>` is the name of the template you want to use to pre-populate the form, for example Incident call type.
7. Click Submit.
8. Refresh the application navigator to view the new module.

Template bar

Use the template bar to apply, edit, and create templates.

The template bar appears at the bottom of the form. Click a template, which appears in blue text, to apply them to the form. Use the buttons to the right to add, edit, and access the complete list of templates.
Template Bar in UI16

**Template Bar Elements**

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Templates</td>
<td>Available templates appear in blue text on the template bar. Click a template to apply it to the form.</td>
</tr>
<tr>
<td>All Templates button</td>

<td>Enables or disables the template bar. To display the bar, see <strong>Toggle the template bar</strong>.</td>
</tr>
</tbody>
</table>

**Toggle the template bar**

The template bar appears at the bottom of forms. It provides shortcuts to apply, edit, and create templates.

Role required: none

You can toggle the template bar, which hides or shows it for all forms. The template bar is shown by default.

1. Navigate to a form.
2. Do the appropriate action for your version of the UI.

   **UI16**
   
   a. Click the more options icon in the form header.
   
   b. Select **Toggle Template Bar**.

   **UI15**
   
   a. Right-click the form header.
b. Select **Toggle Template Bar**.

The template bar is hidden or shown.

**Scripted templates**

You can apply an active template to a record using JavaScript.

**Apply a template to current**

To apply a template, use the `applyTemplate` method.

```javascript
current.applyTemplate("<templatename>");
```

**Apply a template to a GlideRecord**

To apply the template to a record other than current, change current to a GlideRecord variable. When using a GlideRecord variable, you may need to initialize it after declaring the variable.

```javascript
var rec1 = new GlideRecord("incident");
rec1.initialize();
rec1.applyTemplate("my_incident_template");
```

**Apply a template from a UI action**

The following script demonstrates a possible customization to the **Create Change** UI action on the Problem form. After you add this script to the UI action, a user can select the UI action to create a change record with information from both the problem record and the change template.

```javascript
var change = new GlideRecord("change_request");
change.initialize();
change.short_description = current.short_description;
change.description = current.u_details;
change.cmdb_ci = current.u_service;
change.priority = current.priority;
change.requested_by = current.caller_id;
change.assignments_group.setDisplayValue('Change & Release');
change.u_status = 'New';
change.parent = current.number;
change.applyTemplate("standard_rfc");
change.rfc = change.insert();
change.comments = 'Change ' + change.number + ' created.';
var mySysID = current.update();
gs.addInfoMessage("Change " + change.number + " created");
action.setRedirectURL(change);
action.setReturnURL(current);
```
Script a template with child templates

When using `applyTemplate` with a template that has one or more child templates, the system creates the parent record before applying the child templates. This behavior ensures that any references or dot-walked fields from the child record to the parent have a valid target.

For example, if a template for the Change Request table has a child template for the Change Task table, applying the Change Request template inserts a Change Request record into the database. It assigns this record as the Change request for the Change Task record, then applies the child template to the Change Task record.

UI actions

UI actions include the buttons, links, and context menu items on forms and lists. Configure UI actions to make the UI more interactive, customized, and specific to user activities.

Administrators and users with the `ui_action_admin` role can define UI actions.

UI action controls

You can create a UI action to provide any of these controls:

- A button on a form.
- A context menu item on a form that appears when you open the form context menu or right-click the form header.
- A related link in a form.
- A button in the banner on top of a list.
- A button at the bottom of a list.
- A context menu item on a list that appears when you open the list context menu or right-click the list header.
- A menu item for the action choice list at the bottom of a list.
- A related link at the bottom of a list.

Note: To hide or restrict the New or Edit UI action on related list, use list control.
<table>
<thead>
<tr>

- **Right-click list context menu**
- **List choice**
- **List bottom button**
Create a UI action

You can create a new UI action or edit an existing one.

Role required: ui_action_admin or admin

You can add UI actions to tables and database views that are in the same scope as the UI action and tables that allow UI actions from another application scope to run on them.

1. Navigate to **System Definition > UI Actions**.
2. Click **New** or open an existing record.
3. Define the UI action by completing the fields.
   You may need to configure the form to see all the fields.

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Defines the text that appears on the button, link, or context menu item.</td>
</tr>
<tr>
<td>Table</td>
<td>Defines the table on which the UI action is available. By default, the UI action also appears on tables that extend the selected table (for example, Task actions appear on the Incident table). Select <strong>Global</strong> to make the action available on all tables.</td>
</tr>
<tr>
<td>Order</td>
<td>Defines the order in which the UI action appears. The order applies to buttons from left to right and to menu actions from top to bottom.</td>
</tr>
<tr>
<td>Action name</td>
<td>Defines a name to use when referencing the UI action in scripts.</td>
</tr>
<tr>
<td>Active</td>
<td>Enables the UI action when selected. To disable a UI action, clear the check box.</td>
</tr>
<tr>
<td>Show insert</td>
<td>Shows a button on new records that have not been inserted.</td>
</tr>
<tr>
<td>Show update</td>
<td>Shows a button on existing records.</td>
</tr>
<tr>
<td>Client</td>
<td>The UI action executes its script in the user's browser, not on the server. When enabled, the <strong>OnClick</strong> field appears above the Condition field.</td>
</tr>
<tr>
<td>List v2 Compatible</td>
<td>Indicates that the UI action is compatible with v2 lists. This field must be enabled to display the UI action in a v2 list, but only if the <strong>List v3 Compatible</strong> field is enabled as well. If the <strong>List v3 Compatible</strong> field is not enabled, the UI action displays in v2 lists regardless of the <strong>List v2 Compatible</strong> field state.</td>
</tr>
<tr>
<td>List v3 Compatible</td>
<td>Indicates that the UI action is compatible with v3 lists. This field must be enabled to display the UI action in a v3 list.</td>
</tr>
<tr>
<td>Form button</td>
<td>Puts a button on a form.</td>
</tr>
<tr>
<td>Form context menu</td>
<td>Puts an item in a form context menu (right-click the form header).</td>
</tr>
<tr>
<td>Form link</td>
<td>Puts a link in the Related Links section of a form.</td>
</tr>
</tbody>
</table>
### Field | Description
---|---
List banner button | Puts a button in the banner of a list.
List bottom button | Puts a button at the bottom of a list.
List context menu | Puts an item in a list field context menu (right-click a cell in a list).
List choice | Puts an item in the action choice list at the bottom of a list.
List link | Puts a link in the Related Links section at the bottom of a list.
Overrides | Specifies a UI action that this UI action overrides.
Comments | Provides descriptive content regarding this UI action.
Hint | Defines the text that appears when a user points to the UI action control.
Onclick | The name of the JavaScript function to run when the UI action is executed. The function is defined in the **Script** field.
Condition | Defines the conditions that restrict when a UI action appears. See Using the condition builder to customize UI actions for Agent Workspace for examples.
Script | Defines the script to run when the UI action is executed.
Related lists on the form view:
UI Action Visibility | Specifies other views of the form that the UI action applies to. Use this option to restrict the UI action to form views that you specify.
Versions | Shows all versions of the UI action. Use this list to compare versions or to revert to a previous version.

4. Click **Submit** or **Update**.

**Note:** If the UI action is enabled to run on the client side, wrap it in a function. Otherwise, the contents of the **Script** field runs when the page loads.

As part of a UI action script, you can redirect a user to a URL. For example, you might add links to a form or open a new record after it is created from a UI action. To redirect a user to a URL from a UI action, use this syntax in the **Script** field to define the redirect link:

```javascript
action.setRedirectURL ('http://www.mysite.com/mypage.htm');
```

To direct a user to a record, use this syntax, where **new_record** is the variable name for the GlideRecord:

```javascript
action.setRedirectURL (new_record);
```
Using the condition builder to customize UI actions for Agent Workspace

Configure UI actions by adding conditions to a UI Action form.

Using the UI action condition builder

The following condition is configured for the Close Incident button:

For this action to appear on a form, these conditions must evaluate to true:

- `current.incident_state` must equal 6: The incident must already be in a Resolved state.
- `gs.hasRole("itil_admin")`: The current user must have the itil_admin role.

OR this condition must evaluate to true:

- `gs.getUserID() == current.caller_id`: The current user is the user who requested the change.
Note:

- The current object is not available for conditions on a list context menu. The list context menu option is selected. Any use of current on these actions is ignored.
- You can reference the parent record for the UI action conditions on a related list button. For example, to disable the New and Edit buttons on the Affected CIs related list for closed changes, copy the global m2m UI actions to the task_ci table and add a condition of parent.active.
- If you leave one of the fields empty that you specify in your condition statement, that condition defaults to true.

Restricting UI actions based on form views

You can restrict UI actions to appear only on specified form views.

Use the UI Action Visibility related list on the UI Action form to restrict a UI action by view. A UI action is available for the specified view according to the following rules:

1. If there are no visibility rules, the action appears on all views.
2. Any exclude rule on a given view means that the action does not appear on that view.
3. If there is at least one include rule, then the action appears only on views that are specifically included.

Example: Show an action everywhere except the Cost Management view

Add an exclude rule for the Cost management view.

Example exclusion UI action view
Example: Show an action on the Routine and ITIL views, but nowhere else

Add include rules for the Routine and ITIL views.

Override a UI action for an extended table

You can override or remove a UI action for a table that is extended from another table.

When a UI action is defined for the Task table, it applies to all tasks, including incidents, changes, problems, and any other tables that extend the Task table. Similarly, a global UI action applies to every table. However, you can override a UI action for a specific table. This example demonstrates how to override or remove a UI action on the Task [task] table for only the Incident [incident] table.

1. Complete the following steps to override a UI action on the Task table for just the Incident table.
   a) Create a UI action on the Incident table with the same Action name.
      If the Action name is not defined, update both the new UI action and the UI action to be overridden with the same Action name.
   b) Enter a script that is specific to the Incident table.

2. Complete the following steps to remove a UI action on the Task table for the Incident table.
   a) Navigate to the UI action definition for the Task table.
   b) Add the condition `current.getRecordClassName() != 'incident'`.
UI policies

UI policies dynamically change the behavior of information on a form and control custom process flows for tasks. For example, you can use UI policies to make the number field on a form read-only, make the short description field mandatory, and hide other fields. Basic UI policies do not require any scripting, however for more advanced actions, use the **Run scripts** option.

You can also use client scripts to perform all of these actions, but for faster load times use UI policies when possible.

Create a UI policy

Create a UI policy to define custom process flows for tasks.

Role required: **ui_policy_admin**

A UI policy condition evaluates all fields even if they are not visible on the form. This function removes the requirement that a field must be on a form for it to be evaluated.

**Note:**

- Policies carried over from versions prior to Fuji are evaluated differently. Fields that previously were not evaluated are evaluated.
- UI policies are not supported on search screens.
- UI Policies also apply to forms and lists displayed within Content Management System application.

1. Navigate to **System UI > UI Policies**.
2. Click **New**. The UI Policy [Advanced view] form opens
3. To change the view, in **Related Links** click **Default view**.
4. Complete the form, as appropriate.
   You may need to configure the form to see all the fields.

**UI policy fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table for the form to be modified.</td>
</tr>
<tr>
<td>Active</td>
<td>The active status of the UI policy. Only active UI policies are applied.</td>
</tr>
<tr>
<td>Short description</td>
<td>Short summary of the UI policy.</td>
</tr>
<tr>
<td>Order [Advanced view]</td>
<td>The processing sequence, from the lowest to highest number. If two policies conflict, the UI policy with the higher number executes. For inherited UI policies, the extended (child) table's UI policies are executed first. Then the base table UI policies are executed; both from lowest to highest specified value.</td>
</tr>
</tbody>
</table>

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>The conditions which, if fulfilled, cause the UI policy to be applied. Conditions are built with the condition builder. To set conditions using a script, use a client script instead. Conditions are only rechecked if a user manually changes a field on a form. If the change is made by a UI action, context menu action, or through the list editor, it is not evaluated.</td>
</tr>
<tr>
<td>Global [Advanced view]</td>
<td>Option for specifying whether the UI policy applies to all form views. If this check box is cleared, the UI policy is view-specific. By default, the Global UI policy applies to all form views. However, a UI policy can be specific to a view. For example, you can define a UI policy for only the itil view of a form. Use the View field to accomplish this.</td>
</tr>
<tr>
<td>View [Advanced view]</td>
<td>Option for indicating which form view the UI policy applies to. This field is visible only if Global is not selected. If Global is not selected and the View field is left blank, the script applies the default view. For more information on form views, see View management.</td>
</tr>
<tr>
<td>Reverse if false [Advanced view]</td>
<td>Option for specifying that the UI policy action should be reversed when the conditions of its UI policy evaluate to false. In other words, when the conditions are true, actions are taken and when they change back to false, the actions are reversed (undone).</td>
</tr>
</tbody>
</table>
| On load [Advanced view]       | Option for specifying that the UI policy behavior should be performed OnLoad as well as when the form changes. You can check or clear the On load check box in a UI policy to control whether it runs every time a form is loaded when the conditions are satisfied. In this example, an administrator does not want an incident to enter the Awaiting user info state unless the user provides an explanation to the customer. The administrator creates a UI policy with the following settings.  
• In the When to Apply section, adds the condition [State] [is] [Awaiting user info] and clears the On load check box. This condition means that the UI policy applies only when the state is changed to Awaiting user info.  
• In the UI Policy Actions related list, creates a record that makes the Additional comments field mandatory when the condition is met. |
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Inherit [Advanced view]                    | Option for specifying whether extended tables inherit this UI policy. When a child table has an inherited UI policy from its parent table, the UI policy on the child table always runs first. This event is true regardless of the **Order** of the UI policies. Consider the following example:  
  • A child table has a UI policy with **Order** value 500 that shows the Urgency field when its conditions are met.  
  • Its parent table has a UI policy with the same conditions that hides the Urgency field. The parent table UI policy has **Order** value 100.  
  • Although the parent table **Order** field has a lower value, the child UI policy runs first and then the parent UI policy runs. When the conditions are met, the Urgency field is hidden. |

### Script

<table>
<thead>
<tr>
<th>Run scripts [Advanced view]</th>
<th>Option for specifying whether advanced behavior can be scripted for both true and false conditions.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Execute if true [Advanced view]</td>
<td>A script that executes when the conditions of the UI policy are fulfilled. This field is available only if Run scripts is selected.</td>
</tr>
<tr>
<td>Execute if false [Advanced view]</td>
<td>A script that executes if the conditions of the UI policy are not fulfilled and the Reverse if false option is selected. This field is available only if Run scripts is selected.</td>
</tr>
</tbody>
</table>

### Other fields

<table>
<thead>
<tr>
<th>Run scripts in UI type</th>
<th>The UI type for this UI policy: Desktop, Mobile / Service Portal, or Both.</th>
</tr>
</thead>
</table>

### Related List: UI Policy Actions

<table>
<thead>
<tr>
<th>Table</th>
<th>[read-only] Field the UI policy action applies to.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field name</td>
<td>Field on the selected table to which the UI policy performs an action if true.</td>
</tr>
</tbody>
</table>

**Note:** If the specified field is not found on the form, the UI policy performs the action on the variable with the same name.

<table>
<thead>
<tr>
<th>Mandatory</th>
<th>Choice list for specifying how the UI policy affects the mandatory state of the field. Choices are:</th>
</tr>
</thead>
</table>
|           | • Leave alone  
|           | • True  
<p>|           | • False |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Visible            | Choice list for specifying how the UI policy affects the visible state of the field. Choices are:  
|                    | • Leave alone                                                               |
|                    | • True                                                                      |
|                    | • False                                                                     |
| Read only          | Choice list for specifying how the UI policy affects the read-only state of the field. Choices are:  
|                    | • Leave alone                                                               |
|                    | • True                                                                      |
|                    | • False                                                                     |

| Default view or Advanced view | Changes the form view to the default or advanced view. The fields change based on the view. |

5. Click **Submit**.

**Example: creating a UI policy**

Create a UI policy to implement controls in the Incident form when the state changes to **Resolved**.

Role required: **ui_policy_admin**

This example demonstrates how to implement the following controls.

- Make a **Close Notes** field mandatory.
- Hide the **Opened by** field.
- Make the **Priority**, **Severity**, and **Urgency** fields read-only.
- Run a client script that displays an alert message.

1. Navigate to **System UI > UI Policies**.
2. Click **New**.
3. Supply the following information.

**New UI policy**

<table>
<thead>
<tr>
<th>Name</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Incident</td>
</tr>
<tr>
<td>Conditions</td>
<td>[Incident state] [is] [Resolved]</td>
</tr>
<tr>
<td>Reverse if false</td>
<td>Select this check box. If the incident state is not <strong>Resolved</strong>, the UI policy is reversed.</td>
</tr>
<tr>
<td>On load</td>
<td>Select this check box to perform the actions when the form is loaded or when the condition changes.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and select **Save** from the context menu.

The **UI Policy Actions** related list appears.

5. In the related list, click **New**.
6. Provide the following information.

**New UI policy actions**

<table>
<thead>
<tr>
<th>Name</th>
<th>Input</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field name</td>
<td>Close notes. This UI action makes the Close notes field mandatory.</td>
</tr>
<tr>
<td>Mandatory</td>
<td>True</td>
</tr>
<tr>
<td>Visible</td>
<td>Leave alone</td>
</tr>
<tr>
<td>Read Only</td>
<td>Leave alone</td>
</tr>
</tbody>
</table>

7. Click **Submit**.

8. Repeat the process to create UI policy actions to hide the **Opened by** field, and to make the **Priority**, **Severity**, and **Urgency** fields read-only.

**Client scripts for UI policies**

Any scripts you create for UI policies run on the client side.

You can use different options in the UI Policy form to control when and how the UI policy is applied. These options include client scripts, OnLoad execution, and view-specific UI policies. Administrators can use the UI Policy form to create client scripts that run `onChange` when the UI policy conditions are met (`Execute if true`) or not met (`Execute if false`). To display these scripting fields in the UI Policy form, in the Script section, select the **Run scripts** check box.

For example, to display an alert to the user when the incident **State** field changes to **Resolved**, create the following script in the **Execute if true** field.

```javascript
function onCondition(){
  alert('You changed the "Incident state" to Resolved. Please enter your comments in the "Close notes" field.');
}
```

**Advanced form configuration**

Administrators can configure advanced form features, such as form focus, form splits, and derived fields.

**Allow insert options on task records**

The **Insert** and **Insert and Stay** options are disabled by default for task records such as incidents and change requests. You can set a system property to show these options for task records.

Role required: admin

1. Navigate to **System Properties > UI Properties**.
2. Locate the property **Allow the use of the "Insert" and "Insert and Stay" options on task derived tables**. (`glide.ui.task.insert`)
3. Select the check box to enable or clear the check box to disable (default) the options for tasks.
4. Click **Save**.
Disable first field form focus

By default, forms set focus on the first writable field on the form. An administrator can disable form focus with a system property to make the form more accessible to users who use screenreaders.

Role required: admin

1. Navigate to *System Properties > UI Properties.*
2. Set the property `glide.ui.focus_first_element` to `false`.

With first field focus disabled, the form focuses on the first element on the page instead. Focusing on the first element, instead of the first writable element, helps orient users who use screenreaders so they can find all the elements on a form.

Disable the template bar

Administrators can disable the template bar on a table by creating a system property.

Role required: admin

Creating a table-specific property and setting it to false prevents users from displaying the template bar on a record for the specified table.

1. Navigate to *sys_properties.list.*
2. with the following settings.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td><code>glide.ui.show_template_bar.&lt;TABLENAME&gt;</code></td>
</tr>
<tr>
<td>Type</td>
<td>`true</td>
</tr>
<tr>
<td>Value</td>
<td><code>false</code></td>
</tr>
</tbody>
</table>

3. Click *Submit.*

Modify form focus with a client script

By default, forms set focus on the first writable field on the form. An administrator can change that functionality to focus on other fields in the form for UI15 and earlier versions of the UI.

Modify the form focus with `onLoad()` client script on the form.

**Note:** The method `g_form.getElement` has been deprecated in UI16.

```javascript
function onLoad () {
  setTimeout ( function() {
    var refocus = g_form.getElement('table_name.field_name');
    refocus.focus();
  }, 0 );
}
```

Based on the nature of the field you are targeting, replace `table_name.field_name` with the appropriate value:

- For non-reference fields, enter the name of the field to focus on (for example, `short_description`).
- For reference fields, use the format `sys_display.table_name.field_name` (for example, `sys_display.incident.caller_id`).

Deactivate form submission with the Enter key

By default, when you press the Enter key in a simple one-line text field, a choice list, or a Boolean field, the form is submitted.

Role required: admin

You can use a system preference to deactivate this feature if you do not want the Enter key to submit the form.

1. From the left navigation pane, select User Administration > User Preferences.
2. Select the enter_submits_form preference.
3. Set the value to false.
4. Click Update.
   
   The change does not take effect until user preferences are reloaded either at login or when a session is created.

Enable multiple form splits

Form splits enable you to organize fields on a form into columns. Administrators must add a property to enable form splits.

Role required: admin
Configuration of two form splits

<table>
<thead>
<tr>
<th>Asset tag</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
</tr>
<tr>
<td>Serial number</td>
</tr>
<tr>

---
Example of the form with two form splits

When you organize fields in this manner and the user is viewing the form on a small mobile device, the fields within the first split are listed before the fields in the second split. In this example, the Asset tag, State, Serial number, and Substate field are listed before any of the fields below them. You can also create elements that span the form at the top of the form.

1. Enter sys_properties.list in the Navigation filter.
   The entire list of properties in the System Properties [sys_properties] table appears.
2. If the property does not exist, click New.
3. Enter the following information.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.ui.form_multiple_splits</td>
</tr>
<tr>
<td>Description</td>
<td>Enable multiple form splits</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

4. Click the form context menu icon and select Save.
   The Categories related list appears.
5. Click Edit and move UI to the Categories List.
6. Click Save.
   The System Property form reopens and the new property appears in the UI Properties page.
Define required fields

You can specify which form fields are required in forms. This action prevents users with the personalize_form role from removing the field by configuring the form layout.

Role required: admin

The Required Form Fields plugin must be active.

If present on a form, only an administrator can remove required fields. When you configure a form, required fields appear in a gray color and have a tooltip indicating they are required. Required fields are defined in the Required Form Fields [sys_ui_element_required] table.

The expected (although not the only) use case for this feature is as part of a delegated administration scheme. For example, you can grant branch offices the rights to modify forms by granting the personalize_form role, but not allow them to remove certain fields which are critical to overall business processing.

1. Navigate to sys_properties.list.
2. Locate the property named glide.ui.form.enforce_required_fields and make sure it is set to true.
3. Navigate to System UI > Required Form Fields.
4. Click New.
5. Select the table and field, and then select the Required check box.
   The following example sets the Short description field on the Incident form to be required.

   ![Required Form Field Configuration]

   If you decide later that you do not want to make the field required, clear the Required checkbox. This action is preferable to deleting the record.

6. Click Submit.

If the table specified has extension tables, then the Required Form Field record applies to forms of all extended tables. For example, if an administrator specifies that the Short description field is required for the Task table, then this configuration applies to the Incident form, Change Request form, Problem form, and so on.

An extended table can override the Required Form Field rule of its base table. For example, if the Short description field is required for the Task table, but not required for the Incident table, it is required for all Task tables except Incident.
Control the label type for derived fields

You can configure the type of label that appears for derived fields.

Role required: admin

An example would be displaying the email address for the caller when looking at an incident record. The email address is not stored in the Incident table, but is obtained by following the caller reference from the incident to the User table. You control the label type by setting a system property. For example, the field label for an incident email address can be either of the following strings.

- **Caller Email**, which represents the complete label to uniquely identify this field as the email from the caller user record. If you display the email address for the person the ticket is assigned to, its label would be **Assigned to Email**.
- **Email** which is the label for the target field. This label is not unique on the form if, for example, you are also displaying the email address of the person assigned to the incident. However, usually the placement of the field on the form makes it clear what the field represents.

1. Navigate to **System Properties > System**.
2. Locate the **Use short labels for all fields.** For example, if a form contains the caller’s email address, use the "Email" label rather than the full label of "Caller Email" (glide.short.labels) property.

   The default value is **true**, meaning that the short label is displayed in all forms.

3. If you want to display the complete label in forms, clear the check box.

4. Click **Save**.

---

**Field administration**

The individual pieces of data in a record are called fields. Users enter data in fields on the form or by using the list editor. Administrators can create new or modify existing fields.

Users can enter data in fields by using the list editor or by using a form. In form view, fields appear as fields in the form, and in list view they appear as columns of data in the table. Administrators can create new fields or change the type of existing fields.

**Field types**

These field types are available to administrators when creating new fields or changing the type of existing fields.

<table>
<thead>
<tr>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audio</td>
<td>Field for uploading and embedding .mp3 or .ogg audio files.</td>
</tr>
<tr>
<td>Choice</td>
<td>List of configurable choices.</td>
</tr>
<tr>
<td>Collection</td>
<td>Dictionary entries with the Collection type represent the table rather than a field on the table. Changes such as attributes or the Read only check box applied to this entry are applied to the table rather than a specific field. This entry is automatically created when a table is created. There should not be more than one entry for a table of this type.</td>
</tr>
<tr>
<td>Color</td>
<td>String field that accepts CSS color declarations (including hex or RGB notation) and displays a preview. To learn more, see <a href="https://developer.mozilla.org/en-US/docs/Web/CSS/color_value">https://developer.mozilla.org/en-US/docs/Web/CSS/color_value</a>.</td>
</tr>
<tr>
<td>Condition String</td>
<td>Text field that accepts a plain JavaScript condition statement that is validated automatically for correctness before an update.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Field that adds the condition builder to a form. You must specify a dependent field that references the table name.</td>
</tr>
</tbody>
</table>

**Note:** If you edit a field on a child table that is present on the parent table, it is also changed in the parent table and all other child tables.

**Note:** If a table column identifier is created using Kanji characters, it is ignored in any update or insert operation from a form. Kanji characters are not currently supported.
<table>
<thead>
<tr>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Currency</td>
<td>Decimal field with four digits after the decimal point. When displayed on a form, a currency field also includes an additional choice list for selecting the currency type. If there is no default value for the field, empty currency fields use the reference currency. Adding a value causes the field to use the session currency of the active user. See Change default currency decimal places for how to use two fraction digits.</td>
</tr>
<tr>
<td>Note: Once you assign this type to a field, you cannot change it to an FX Currency type.</td>
<td></td>
</tr>
<tr>
<td>Data Structure</td>
<td>Field that allows the selection of one of the following data structures and entry of values to organize particular information in the record.</td>
</tr>
<tr>
<td></td>
<td>- String</td>
</tr>
<tr>
<td></td>
<td>- Boolean</td>
</tr>
<tr>
<td></td>
<td>- Integer</td>
</tr>
<tr>
<td></td>
<td>- Decimal</td>
</tr>
<tr>
<td></td>
<td>- Object</td>
</tr>
<tr>
<td></td>
<td>- Array</td>
</tr>
<tr>
<td>Date</td>
<td>Day, which can be selected with a calendar widget.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Day and time of day, which can be selected with a calendar widget.</td>
</tr>
<tr>
<td>Decimal</td>
<td>Number with up to two digits after the decimal points (for example, 12.34).</td>
</tr>
<tr>
<td>Document ID</td>
<td>Reference to any record on any table.</td>
</tr>
<tr>
<td>Domain ID</td>
<td>System field that contains a reference to the domain.</td>
</tr>
<tr>
<td>Due Date</td>
<td>String input field that stores a date-time.</td>
</tr>
<tr>
<td>Duration</td>
<td>Length of time. Stored in the database as an integer number of milliseconds, but appears in days, hours, minutes, and seconds.</td>
</tr>
<tr>
<td>Encrypted Text</td>
<td>Field that is encrypted for security. Depending on the user's encryption context, the field may be hidden, the value may be hidden, or the field and value may display.</td>
</tr>
<tr>
<td>Field Name</td>
<td>Reference field for a field name in the table selected in a Table Name field type. Make this field dependent on the Table Name field.</td>
</tr>
<tr>
<td>File Attachment</td>
<td>Field for holding a file. A field holds one file. All file types are supported.</td>
</tr>
<tr>
<td>Floating Point Number</td>
<td>Number with up to seven digits after the decimal point.</td>
</tr>
<tr>
<td>Field Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FX Currency</td>
<td>Also known in internal code as Currency2 fields, this field type is an alternative to the standard (default) currency fields found in most Now Platform® applications. This type of currency field is highly configurable, supports custom rate tables, report aggregations, and provides for improved visibility into conversion calculations. To learn more about the FX Currency field type, see Setting up and using FX Currency fields.</td>
</tr>
<tr>
<td>Note:</td>
<td>Once you assign this type to a field, you cannot change it to an Currency type.</td>
</tr>
<tr>
<td>HTML</td>
<td>String field with a built-in HTML editor.</td>
</tr>
<tr>
<td>Icon</td>
<td>String field that provides the user access to an icon picker in a form. By default, the favorites icon set is used.</td>
</tr>
<tr>
<td>Image</td>
<td>Field for uploading and embedding images.</td>
</tr>
<tr>
<td>Integer</td>
<td>Number with zero decimal points.</td>
</tr>
<tr>
<td>IP address</td>
<td>Variable character field that stores IPv4 and IPv6 addresses. See IP address field type for more information.</td>
</tr>
<tr>
<td>Journal</td>
<td>Field that accepts text entries and displays previous entries with a user name and time stamp.</td>
</tr>
<tr>
<td>Journal Input</td>
<td>Field that accepts text entries but does not display previous entries.</td>
</tr>
<tr>
<td>Journal List</td>
<td>Field that displays the contents of journal fields. You must specify the journal fields as the dependent fields. If a journal list field depends on more than one journal field, the entries are displayed chronologically.</td>
</tr>
<tr>
<td>List</td>
<td>Reference field that accepts multiple references rather than just one.</td>
</tr>
<tr>
<td>Long</td>
<td>Integer field that can contain a longer number than the integer field.</td>
</tr>
<tr>
<td>Field Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Name-Value Pairs</td>
<td>Field that maps text values. Each mapping is one-to-one, however a single Name-Value Pairs field can contain multiple mappings. Each mapping must use a unique name, and the name cannot be empty. For example, you can use a Name-Value Pairs field to hold header information for a web service request. In this example, the name of each mapping is the header such as Content-Type and the value is the header value, such as Application/json. For information on scripting Name-Value Pairs fields, see Name-value pairs field type.</td>
</tr>
<tr>
<td>Password (1 Way Encrypted)</td>
<td>Text field that stores passwords with one-way encryption. One-way encryption stores the password as a secure hash value that cannot be decrypted.</td>
</tr>
<tr>
<td>Password (2 Way Encrypted)</td>
<td>Text field that stores passwords with two-way encryption. Two-way encryption stores the password as a secure encrypted value that can be decrypted programmatically within the instance. You can use Password 2 encryption with form variables. To encrypt text fields on forms, use Encryption Contexts. The length for password2 field values must be at least 255 characters.</td>
</tr>
<tr>
<td>Percent Complete</td>
<td>Decimal field that renders a percent complete bar in lists. You can convert any existing decimal field to a percent complete field.</td>
</tr>
<tr>
<td>Phone Number (E164)</td>
<td>String field that provides E164-compliant formatting and validation for telephone numbers.</td>
</tr>
<tr>
<td>Price</td>
<td>A currency field that enables control over conversions and display. See Price fields for more information.</td>
</tr>
<tr>
<td>Reference</td>
<td>Query that displays records from another table.</td>
</tr>
<tr>
<td>Script</td>
<td>Text field that accepts JavaScript code input and provides controls, such as syntax checking and formatting. It also provides a list of fields and server APIs. You must specify a dependent field that references the table name for the list of fields.</td>
</tr>
<tr>
<td>Script (Plain)</td>
<td>Text field that accepts JavaScript code input and provides controls, such as syntax checking and formatting.</td>
</tr>
<tr>
<td>Field Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>String</td>
<td>For 255 characters or less, the string field is a single-line text field. Anything 256 characters or over appears as a multi-line text box. Note: The database may translate the value that you provide in the Max length field to the closest matching database field type. For example, a max string length of 80 maps to the nearest database field type of VARCHAR(100). For Oracle instances, users are not able to increase the max length of a string field to a value greater than 4000 through the application UI. Changes greater than 4000 require the CLOB data type in Oracle. If you require a field to be larger than 4000 characters, log an incident to request the change.</td>
</tr>
<tr>
<td>String (Full UTF-8)</td>
<td>A string field that can contain UTF-8 character encoding. This field has the same restriction as the String data type as to maximum length that a user can define within the application UI. Emoji Support: The String (Full UTF-8) field type does, and should be used if we expect to use emojis in a field. There is slightly more overhead when using the Full UTF-8 type.</td>
</tr>
<tr>
<td>Suggestion</td>
<td>String field that provides suggested values but accepts free-form text. Available when you add a field by configuring a form or list. Otherwise, you must modify the dictionary entry of an existing string or journal field.</td>
</tr>
<tr>
<td>Table Name</td>
<td>String field that lets you select a table. If you use the Field Name field type, add this field type and make the Field Name field dependent on the Table Name field.</td>
</tr>
<tr>
<td>Time</td>
<td>Specific time. Stored in the database as a date/time field. Only the time part of this field is used. Note: This field always stores the date as 1970-01-01, which does not fall within the dates for Daylight Savings Time (DST). As a result, the time is not automatically adjusted for DST. If a custom feature uses time as a start time, it is the responsibility of the feature to adjust for DST, if necessary.</td>
</tr>
<tr>
<td>Translated HTML</td>
<td>HTML field that displays different translations that are based on the user's language.</td>
</tr>
<tr>
<td>Translated Text</td>
<td>Text field that displays different translations that are based on the user's language.</td>
</tr>
<tr>
<td>True/False</td>
<td>Boolean field that appears as a one-digit integer, typically 1 (true) or 0 (false).</td>
</tr>
</tbody>
</table>
### Field Type | Description
--- | ---
URL | String field that is a clickable URL field when locked. **Note:** In the mobile UI, this field appears as a multi-line text field. The field saves as a single line, with the line breaks removed.
Video | Field for uploading and embedding video.
Wiki | String field with a built-in Wiki text editor that accepts a simplified version of standard Wiki text formatting.
Workflow | Choice list field that displays a stage in a workflow.

**Note:** When you create a custom field, use one of these supported field types. Other field types, such as User Input, are for internal use only and are not supported for custom fields.

### Choice list field type

A choice list is a type of field that lets the user select from a pre-defined set of choices.

Administrators can define the available choices and customize the behavior and appearance of choice lists.

#### Incident state choice list

**Note:** Choice lists do not support a one to many relationship. Only one choice from a choice list can be selected at a time.

### Choice list security

You can use the personalize_choices security role to enable non-administrators modify Choice elements options on all tables.

If more granular control is desired, you can also create a custom ACL (security rule) governing the personalize_choices operation either for a particular field or for all fields (*) on a particular table. However, access to the personalize_choices operation on a particular field does not confer the ability to add new choices for that field.

To be able to create new choices for a particular field, an ACL that grants personalize_choices access for that field is required. For example, to give the hris_admin role the ability to personalize only the Category field for Human Resources KB articles, you need an ACL granting personalize_choices access to the hris_admin role on the Category field of the Knowledge (kb_knowledge) table.
There are predefined ACLs granting both types of access to the personalize_choices security role, for all fields on all tables. The personalize_choices security role also has read, write, and delete access to the sys_choices table. However, this additional access is not required when making just the Personalize Choices functionality available on a granular basis.

To be able to create new choices for a particular field, an ACL that grants personalize_choices access for that field is required. For example, to give the hris_admin role the ability to personalize only the Category field for Human Resources KB articles, you need an ACL granting personalize_choices access to the hris_admin role on the Category field of the Knowledge (kb_knowledge) table.

**Values to associate with choice labels for scripting**

When you write a script that references a choice list, you need to know the value that is associated with each choice.

For example, to check whether the incident_state field is active, you could not use the condition `current.incident_state == "active"` because the value associated with the choice labeled **Active** is the integer 2. Instead, you would use the condition `current.incident_state == 2`.

The **Type** field on the choice list dictionary entry determines the data type of the values.

To determine the value associated with a choice, right-click the field label and select **Show Choice List**, and then locate the choice for which you need to know the value.

<table>
<thead>
<tr>
<th>Table</th>

<td>7</td>
<td>Closed</td>
<td>false</td>
<td>7</td>
</tr>
</tbody>
</table>

**Show choices list values**

The **-- None --** option may not have a sys_choice record associated with it. A choice list field set to **-- None --** evaluates to these values, depending on the script context as listed below.

- For client-side scripts, such as client scripts: "" (empty string)
- For server-side scripts, such as business rules: "0" (string of the number zero)

**Integer values for default choice lists**

Choice provide four default values.

Some common choice lists use integer values that do not match the string labels. For example, the Problem table uses these default values for the **State** field.
State field default values

<table>
<thead>
<tr>
<th>Value</th>
<th>Label</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Open</td>
</tr>
<tr>
<td>2</td>
<td>Known Error</td>
</tr>
<tr>
<td>3</td>
<td>Pending Change</td>
</tr>
<tr>
<td>4</td>
<td>Closed/Resolved</td>
</tr>
</tbody>
</table>

These integer values are also used in several default business rules. For example, a business rule on the Incident table sets the active flag to false when the State field changes to 7, which is the default value for the Closed. If you change the values of your Incident state options, this business rule may no longer behave as desired or expected.

On the Incident table, the Active, State, and Incident state fields are affected by the following default business rules.

Default business rules

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mark_closed (incident)</td>
<td>If the incident_state changes to 7 (Closed), the Active field is set to false</td>
</tr>
<tr>
<td>incident reopen (incident)</td>
<td>If the incident_state is less than 7 (Closed) and the Active field is false, the Active field is set to true</td>
</tr>
<tr>
<td>mark closed (task)</td>
<td>If the state changes to either 3 (Closed Complete) or 4 (Closed Incomplete), the Active field is set to false</td>
</tr>
<tr>
<td>task closer (task)</td>
<td>If the Active flag changes from true to false and the state is neither 3 (Closed Complete) nor 4 (Closed Incomplete), the state is set to 3 (Closed Complete)</td>
</tr>
<tr>
<td>task reopener (task)</td>
<td>If the Active field changes from false to true and the state is either 3 (Closed Complete) or 4 (Closed Incomplete), the state is set to 1 (Open)</td>
</tr>
</tbody>
</table>

Note: Notice that these business rules do not change incident_state based on a change to either the Active field or the State field. Changes to incident_state drive the other two fields, not the other way around.

Configure state field choice values

State fields are a subset of choice list fields. Keep the following information in mind when you configure choice values for the state field.

- Use a negative value to add a new active state field.
- Search for and study the business rules that use a state number filter on the Script and Conditions fields. You can use the Debug tool to trace the order of the business rule execution.
- New values representing inactive states should have a value above 8.

You can define any of the following attributes for a state field by configuring the dictionary. If the attributes are not defined, the system uses the default values. The TaskStateUtil API uses the following attributes. For more information on the TaskStateUtil API, see TaskStateUtil.
Related Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>close_states</td>
<td>Semicolon delimited list of state values that are inactive, used to identify whether the task should be set to active or inactive. This is a required attribute to use the TaskStateUtil functionality.</td>
</tr>
<tr>
<td>default_close_state</td>
<td>Optional attribute to define the state value of the default close state if you want to define business rules that automatically close a task. Defaults to 3, typically Closed Complete if attribute is not defined.</td>
</tr>
<tr>
<td>default_work_state</td>
<td>Optional attribute to define the state value of the default working state if you want to define business rules that automatically set a task for working. Defaults to 2, typically Work in Progress if the attribute is not defined.</td>
</tr>
</tbody>
</table>

State modification examples

Follow these examples for modifying the states of incidents and change requests.

Role required: admin

1. Navigate to System Definition > Choice Lists.
2. At the top of the list, construct a list filter like the following:
   - Table: incident
   - Element: incident_state
3. Run the filter.
   Notice that the Closed state has a value of 7 and the Resolved state has a value of 6. Any state greater than or equal to 7 is assumed to be inactive. Therefore, you should use a positive integer greater than 7 if you want to add a new inactive-type of state. Use a negative value like -1 or -2 if you wish to add a new active-type of state field, such as Awaiting Vendor.
5. At the top of the list, construct a list filter like the following:
   - Table: change_request
   - Element: phase_state
6. Run the filter.
   Notice that the Complete state has a value of 8. Any state greater than or equal to 8 is assumed to be inactive. Therefore, you should use a positive integer greater than 8 if you want to add a new inactive-type of state, such as Cancelled. Use a negative value like -1 or -2 if you wish to add a new active-type of state field, such as Pending.

Troubleshoot change states and business rules

Business rules in the system make assumptions about state values. You can troubleshoot business rules to see the order in which they run and see how it affects changes you make to State field values.

Role required: admin

1. Navigate to System Definition > Business Rules.
2. Construct a filter like this one to view the scripts and conditions that pertain to the Resolved incident_state of 6 or the Closed incident_state value of 7:

   The **Script** field contains 7 OR the **Condition** field contains 7 OR the **Script** field contains 6 OR the **Condition** field contains 6 AND the **Table** field is incident AND the **Active** field is true.

See Debug Business Rule for information on how to trace the order of business rule execution. You can click **Debug All**, resolve an incident, and then check the trace at the bottom of form to watch the business rules execute. These two line examples show that the mark_closed business rule code is entered ==> and then exited <==

```plaintext
==> 'mark_closed' on incident
<= 'mark_closed' on incident
```

### View choice list definitions

The Choice Set [sys_choice_set] table contains a record for every field that uses a choice list.

Role required: personalize_choices

**Note:** The personalize_choices role must be explicitly granted to the user; it cannot be an ACL.

The choice set record is associated with an application file, which allows update sets and team development to track and transfer all choices for a field in a single update record.

Choice list values allow a maximum length of 40 characters. The range of allowable numerical values is [-999, 999].

1. Right-click the choice list field label and select **Show Choice List**.

   To view other choice list values, modify the filter at the top of the list.

   **Note:** When you use an ACL to grant personalize_choices on a particular field, **Show Choice List** is not available. It is only available if you explicitly grant the role to the user. **Configure Choices** continues to appear regardless of whether it is an ACL or an explicitly granted user role.

2. Review the items in the list.

   **Warning:** Do not add new choices to the list. To add new choices to a choice list field, use the **Configure Choices** option.

### Define an option for a choice list

You can personalize the options that are available in a choice list.

Role required: personalize_choices

1. Navigate to a form where the field appears.
2. If the choice list is dependent on another field, enter the choice value that the options depend on.

   For example, on the incident table, the **Subcategory** is dependent on the **Category**. To customize which subcategory choices are available for the hardware category, select **Hardware** in the **Category** field.

3. Right-click the field label and select **Configure Choices**.
4. Use the slushbucket to rearrange the order, add, or remove items or to create new items.
5. Click **Save**.

To dynamically add items to a choice list, use the `addOption` GlideForm method.

**Note:** Some business rules may be affected by changes to choice list options (for example, default Incident states).

---

**Reuse a choice list**

After defining a set of choice list values, you can reuse the values for another field in a different table.

Role required: personalize_choices

1. Right-click an existing choice field (Field A) and select **Configure Choices**.
2. Add the desired choice list values in the **Choices** related list.
3. To reuse the choice list values for another field (Field B) in a different table, right-click the label for Field B and select **Configure Dictionary**.
4. In the **Choice table** field, select the table where Field A resides.
5. In the **Choice field** field, select Field A.

---

6. Click **Update**.

The choice list values defined on Field A are displayed on Field B. When you add or remove choice list values on Field A, those changes are also reflected on Field B. After you specify a choice table and a choice field, the field no longer uses the defined choice list.

---

**Remove the None option from a choice list**

You can remove the **None** option from a choice list if it is not necessary.

Role required: personalize_dictionary

1. Navigate to a form where the field appears.
2. Right-click the field label and select **Configure Dictionary**.
3. Change the **Choice** field value to **Dropdown without -- None -- (must specify a default value)**.

![Choice field options](image)

4. Ensure that the **Default** field is populated to determine which choice is displayed by default.

   **Note:** If the field is dependent on another field, the **-- None --** option remains available.

**Change the None display value for a choice list**

You can change the default display label of the **None** option for a choice field.

Role required: personalize_choices

**Note:** The personalize_choices role must be explicitly granted to the user; it cannot be an ACL.

1. Navigate to a form on which the field appears.
2. Right-click the field label and select **Show Choice List**.
3. Click **New**.
4. Complete the form.

</tr>
<tr>
<td><strong>Hint</strong></td>
<td>Leave blank.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Delete all choice list options**
You can delete all choices for a choice field from the Choice Set record.

Role required: personalize

You may want to use this method when you are developing a new application and the business requirements change. If you are updating a choice list that is already in use, consider deactivating the options you no longer use to avoid conflicts with existing data or scripts that may rely on the previous options.

1. In the navigation filter, enter `sys_choice_set.list` and press Enter.
2. Open the choice set record for the field.
   For example, to locate the choice set for the incident subcategory, filter by [Table] [is] [Incident] AND [Element] [is] [subcategory].
3. Check the box beside the choice set record to delete and select Delete from the Actions choice list below the list.
4. Click Delete in the confirmation window.
   All choices for the field are deleted.

Create a choice list for another field type
You can create a choice list for a field with another type, such as an integer, string, or reference field.
Role required: personalize_dictionary
You can use this configuration to standardize data entry and limit available options for a field while still maintaining the original field type.
1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the field.

   Note: Reference fields with a large number of records in the reference table cannot be converted to look like choice fields. A reference field with too many records reverts to looking like a reference field.
3. Change the Choice value to Dropdown with --- None --- or Dropdown without --- None --- (must specify a default value).
4. Right-click the form header and select Save.
5. Click Create Choice List.
   • The Choices related list appears on the dictionary entry form.
   • If records on the table contains data for the field, a choice list value for each unique field value is created. For example, if three records exist on the table and each record has a unique value in the field, then three choices are created.
   • If no data exists in the field, a choice list value of --- New choice --- is created.

Display invalid choice list values
By default, inactive or invalid choice list values appear in blue text instead of black. You can disable the color indicator for invalid choices.
Role required: admin
In the following example, the Network category has been deactivated, so it appears in blue for records that still contain the inactive value.
1. Navigate to System Properties > UI Properties.
2. Clear the check box for the Display missing choice list entries property.

**Add search option to a choice field**
Add a search field to choice fields that have a long list of options.

Role required: admin

1. Navigate to a form that contains choice fields. For example, incident.
2. From a choice field on the form, for example State, right-click the field and select Configure Dictionary.
3. Switch to the advanced view for the dictionary entry form using the context menu by navigating to View > Advanced.
4. In the Attributes field, type is_searchable_choice=true. If there are other entries in the attributes field, use a comma to separate the entries.
5. Update the Dictionary Entry form and reload the page containing the choice list.

The choice list contains a search field that users can use to filter the list of choices.
Condition field types

A condition field specifies when to run business logic such as a business rule or workflow.

There are two types of condition field.

<table>
<thead>
<tr>
<th>Condition field type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition string</td>
<td>A text field that accepts a plain JavaScript condition statement. The system validates the condition syntax for correctness before an update.</td>
</tr>
<tr>
<td>Conditions</td>
<td>A field that adds a condition builder to a form. Condition builders require specifying a dependent field whose values the system uses to display choice list options. Typically, the dependent field is the Table field.</td>
</tr>
</tbody>
</table>

The system evaluates both types of condition field to determine if the conditions are true or false. When true, the system runs the business logic. When false, the system ignores the business logic.

To find dictionary attributes that affect condition fields, see Dictionary attributes.

Add the condition count to a condition field

The condition count widget can be activated on condition fields to display a preview of the records that would meet the current set of conditions. For fields where the condition count is activated, the number of records that match the conditions will automatically display. The count refreshes if the field the condition field depends on, such as Table, is changed. If the Table field is left blank, the widget is hidden.

Role required: personalize_dictionary

1. Right-click the field label and select Configure Dictionary.
2. Add show_condition_count=true to the Attributes field.
3. Submit.

In this example, a condition is run on the Incident table to look for incidents where Category is Network:

Condition count

The list shows that there are 112 records with Network as its category.

To refresh the preview, click the update count icon ( ).

To view details of the results, click the number of records to open the list view of the results:
Condition count results

Update a conditions field to use condition builder v2

In UI16, you can update a conditions field to display the version 2 condition builder.

Role required: admin

You add a dictionary attribute to the Conditions field to enable condition builder version 2 (v2).
Condition builder v2 configured in Approval Rules form

1. Open the form with the condition builder to configure.
2. Right-click the **Conditions** label and click **Configure Dictionary**.
3. In the **Attributes** field, enter `condition_builder=v2`.
   If attributes exist, add this string at the end separated by a comma.
4. Click **Update**.
   The form reloads with the v2 version of the condition builder.

Database field type

Several field types are available in the system.

This table shows field types and corresponding MySQL database types. Typically, it isn’t necessary to perform any actions at the database level. To learn about changing a field type, see System dictionary.
### Database field types

<table>
<thead>
<tr>
<th>Field types</th>
<th>Options</th>
<th>Dictionary XML type</th>
<th>MySQL DB type</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>small</td>
<td>string</td>
<td>VARCHAR(40)</td>
</tr>
<tr>
<td>String</td>
<td>medium</td>
<td>string</td>
<td>VARCHAR(100)</td>
</tr>
<tr>
<td>String</td>
<td>large</td>
<td>string</td>
<td>MEDIUMTEXT</td>
</tr>
<tr>
<td>String</td>
<td>extralarge</td>
<td>string</td>
<td>MEDIUMTEXT</td>
</tr>
<tr>
<td>Decimal</td>
<td></td>
<td>decimal</td>
<td>Decimal (15,2)</td>
</tr>
<tr>
<td>Integer</td>
<td></td>
<td>integer</td>
<td>Integer</td>
</tr>
<tr>
<td>True-False</td>
<td></td>
<td>boolean</td>
<td>TINYINT(1)</td>
</tr>
<tr>
<td>Date</td>
<td></td>

<td></td>
<td>url</td>
<td>MEDIUMTEXT</td>
</tr>
<tr>
<td>Image</td>
<td></td>
<td>user_image</td>
<td>VARCHAR(40)</td>
</tr>
<tr>
<td>Due-Date</td>
<td></td>
<td>due_date</td>
<td>DATETIME</td>
</tr>
</tbody>
</table>

### Dictionary entry data types

You can only change a dictionary entry's data type when the change does not result in data loss. Use the following guidelines to change a dictionary entry's data type.

**Valid data type changes**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Restrictions</th>
</tr>
</thead>
<tbody>
<tr>
<td>The field is empty in all table records.</td>
<td>None. You can convert an empty field from any data type to another without restriction.</td>
</tr>
<tr>
<td>The table contains existing data for the field.</td>
<td>You can only convert between logical data types that map to the same physical data type in the database. For example, you can convert a <em>glide duration</em> to a <em>glide datetime</em> since both logical data types map to the DATETIME physical data type in the database.</td>
</tr>
<tr>
<td>Condition</td>
<td>Restrictions</td>
</tr>
<tr>
<td>--------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>The field is a string field you are converting to another type of string field.</td>
<td>You can change between string-based data types as long as length changes do not cause any data loss from truncation. For example, you can change from a MEDIUM database type to a VARCHAR(100) database type if none of the existing data is greater than 100.</td>
</tr>
<tr>
<td>The field is a string field you are converting to a globally unique ID (GUID).</td>
<td>You can only convert a string field to a GUID if all of the exiting data in the field are already <strong>Sys ID</strong> values.</td>
</tr>
<tr>
<td>The field is a GUID field you are converting to a string field.</td>
<td>None. You can convert a GUID field to a string field without restriction.</td>
</tr>
</tbody>
</table>

**Document ID field**

You can create document ID fields to reference any record on any table.

Role required: personalize_dictionary

In comparison, a reference field references a record on a specific table. To reference records from any table, two fields need to work together—one to store the table reference and another to store the record reference.

You can select the document ID type when creating a new field.

1. Navigate to the form view for the table.
2. Right-click the header and select **Configure > Form Layout**.
3. Create a field to store the table name and click **Add**.
   - **Name**: any label (for example, **Model table**)
   - **Type**: String
4. Create a field to store the record reference and click **Add**.
   - **Name**: label for your document ID field (for example, **Model ID**)
   - **Type**: Document ID
5. Click **Save**.
6. Right-click the form header and select **Configure > Dictionary**.
7. Open the dictionary entry for the document ID field.
8. Under **Related Links**, click **Advanced view**.
9. In the **Dependent** field, enter the column name of the table reference field (for example, **u_model_table**).
10. Optional: In **Attributes**, add the **show_all_tables** dictionary attribute to display system tables.
11. Click **Update**. When users click the reference lookup for the document ID field, a dialog appears that allows them to select the table and then the record. The sys_id of the selected record is stored in the document ID field and the table name is stored in the table reference field.
12. Optional: **Configure the form** to remove the table reference field.

![Select the document dialog](image-url)
Function field

Create function fields and scripts in the Now Platform to perform common database transformations and calculations. Regular fields store a value in the database. Instead of storing data, a function field displays the results of a database query. Function fields do not have an associated database column. Instead, function fields generate a value based on simple computations of other fields and constants. They can be used like any other fields in the system: in forms, lists, query conditions, reports, and so on.

Use case

You want to identify all incidents with a probably useless short description of fewer than 10 characters.

Instead of querying all records to determine which record meets a given criteria, create a function field or function script that retrieves only the records that meet the criteria.

For a simple computation, it is better to use a function field or function script rather than store a computed value. The value is always calculated on retrieval. Another benefit of using function fields is that the database server performs the transformation rather than the application node.

Function fields versus calculated fields

The values of the calculated fields are stored in the database. The values of function fields or function scripts are not stored in the database, but are calculated at the time of retrieval. Function field values are always up to date.

Function fields versus business rules

Use function fields or scripts when business logic is based on a simple transformation of one or more existing fields. Function fields and scripts let you implement business logic without storing and maintaining the result of a transformation.

Function fields versus filters, query strings, and Rhino

Rather than calling Rhino to perform string transformations, you can use a function field or function script to perform the transformations for you. Function fields and function scripts are more efficient and result in up-to-date values that do not have to be stored or maintained.

Function field limitations

Because function field calculations are not stored in the database, some operations are not relevant.

- Function fields cannot be directly audited or indexed.

  Note: To index a function field as if it were a regular field, make sure the individual fields used by the function are indexed. Or for best performance, make sure that there is a composite index including all fields that are used in the function.

- Function fields cannot be encrypted, since a function field value is never stored in the database.
- Function fields cannot be converted to regular fields or vice versa.
- Function fields in reportiFunction fields that you create in the Reporting UI do not support dot-walking. For more information, see Configure function fields in Reporting.se views do not support function fields.
- Security is evaluated on the components of the function and on the calculated value of the field. When used in visualizations, sections that contain information that the user is not allowed to see are hidden from the user.
- Datediff is not supported in the Kagami database.
• Field function names must be unique.

**Defining platform functions**

Platform functions can be defined in two ways:

1. Use the following application programming interfaces (APIs) to build and use functions in a script.

**Function APIs**

<table>
<thead>
<tr>
<th>APIs</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scoped GlideDBFunctionBuilder</td>
<td>Construct the function to perform a SQL operation.</td>
</tr>
<tr>
<td>GlideRecord - addFunction(Object function)</td>
<td>Apply the function to a GlideRecord.</td>
</tr>
</tbody>
</table>
2. Create a field that holds the function definition, as shown in the following example.
The Dictionary Entry [sys_dictionary] form has a **Function field** check box which specifies that the field runs a function rather than stores a value.

### glidefunction operations

Function fields can perform the following operations using the `glidefunction:<operation>` syntax. When providing a field as an argument, you can dot-walk to related fields. For example, `cmdb_ci.name`.

#### Function field operations

The Function field operations table contains columns for the names of function field operations, a detailed description of what the operation does, and an example that includes both code and what the code returns.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>add()</td>
<td>Takes two number fields as input, adds them, and returns the results as a field value. This function also takes numerical values for either input. Place numerical values in single or double quotation marks.</td>
<td><code>glidefunction:add(child_incidents, parent_incident)</code>&lt;br&gt;Returns 6 if the incident has five child incidents and one parent incident.&lt;br&gt;Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number</td>
</tr>
<tr>
<td>subtract()</td>
<td>Takes two number fields as input, subtracts the second from the first, and returns the result as a field value. This function also takes numerical values for either input. Place numerical values in single or double quotation marks.</td>
<td><code>glidefunction:subtract(u_num1, u_num2)</code>&lt;br&gt;Returns 2 if num1 = 8 and num_2 = 6.&lt;br&gt;Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number</td>
</tr>
<tr>
<td>multiply()</td>
<td>Takes two number fields as input, performs the multiplication, and returns the results as a field value. This function also takes numerical values for either input. Place numerical values in single or double quotation marks.</td>
<td><code>glidefunction:multiply(u_num1, u_num2)</code>&lt;br&gt;Returns 48 if num1 = 8 and num_2 = 6.&lt;br&gt;Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number</td>
</tr>
<tr>
<td>divide()</td>
<td>Takes two number fields as input, divides the first by the second, and returns the result as a field value. This function also takes numerical values for either input. Place numerical values in single or double quotation marks.</td>
<td><code>glidefunction:divide(u_num2,u_num1)</code>&lt;br&gt;Returns 5 if num2 = 10 and num1 = 2.&lt;br&gt;Possible return types: Decimal, Floating Point Number, Large Whole Number, Whole Number</td>
</tr>
<tr>
<td>Operation</td>
<td>Description</td>
<td>Example</td>
</tr>
<tr>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>concat()</td>
<td>Takes any number of comma-separated fields and constants as input, concatenates the input, and returns a single string as a field value.</td>
<td><code>glidefunction:concat(incident_number, '/', short_description)</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Returns &quot;INC0001 / My client needs a new laptop.&quot; if the value of the number field is 'INC0001' and the short_description is 'My client needs a new laptop'.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Return type: Text</td>
</tr>
<tr>
<td>datediff()</td>
<td>Takes two date/time fields as input, calculates the difference between the dates in days, minutes, and seconds, and returns the results as a duration field value.</td>
<td><code>glidefunction:datediff(closed_at, sys_created_on)</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Returns the duration of an incident from the creation date to the close date. Example result: 10 days, 8 hours 23 minutes 11 seconds</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Return type: Duration</td>
</tr>
<tr>
<td>dayofweek()</td>
<td>Takes two arguments: A date field and a constant of either '1' (week starts on Sunday) or '2' (week starts on Monday). Returns the results as an integer value that represents the day of the week.</td>
<td><code>glidefunction:dayofweek(resolved_at, '1')</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If resolved_at occurs on a Wednesday, returns 4 if the integer is 1 and returns 3 if the integer is 2.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Return type: Whole number</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This function is not available for Kagami.</td>
<td></td>
</tr>
<tr>
<td>length()</td>
<td>Takes a string field as input, calculates the field length in characters, and returns the results as a field value.</td>
<td><code>glidefunction:length(short_description)</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Returns 37 if short_description = &quot;This application is performing a test&quot;.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Return type: Whole number</td>
</tr>
<tr>
<td>coalesce()</td>
<td>Takes any number of comma-separated fields as input and returns the first non-empty value.</td>
<td><code>glidefunction:coalesce(closed_at, resolved_at, sys_updated_on)</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the value of closed_at is empty, the function returns the value of resolved_at. If the value of resolved_at is also empty, the function returns the value of sys_updated_on.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Return type: Text</td>
</tr>
<tr>
<td>Operation</td>
<td>Description</td>
<td>Example</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| position()   | Takes two text fields or two text fields and a whole number as input. One or both of the text fields can also be strings.                                                                                                          | 1. `glidefunction:position('e', short_description)`  
If the value of the `short_description` field is "This computer is performing an upgrade", returns 12.  
2. `glidefunction:position('e', short_description, '14')`  
If the value of the `short_description` field is "This computer is performing an upgrade", returns 19.  
Return type: Whole number                                                                                                                                                         |
| substring()  | Takes a text field and two whole numbers as input. Returns the first instance of a string that starts at the position of the first whole number and is the length of the second.                                                      | `glidefunction:substring(short_description, '7', '2')`  
If the value of the `short_description` field is 'We're going to the store', returns 'go'.  
Return type: Text                                                                                                                                                                    |

### Create a function field to perform database functions

Create a field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation.

Role required: personalize_dictionary or admin.

1. Navigate to **System Definition > Dictionary**.  
2. Click **New**.  
3. Select **Function field**.  
4. Fill in these fields on the form.

#### Fields for function fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table to which the function field is added.</td>
</tr>
<tr>
<td>Type</td>
<td>Species the type of field: string, number, date, and so on.</td>
</tr>
<tr>
<td>Column label</td>
<td>Defines the label for the column.</td>
</tr>
<tr>
<td>Column name</td>
<td>Defines the name of the column. Created automatically based on <strong>Column label</strong>.</td>
</tr>
<tr>
<td>Max length</td>
<td>Defines the maximum length of the return value.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function field</td>
<td>If selected, creates a field that displays the results of a database function, such as a mathematical operation, field length computation, or day of the week calculation. Once the new function record is saved, you cannot clear the check box to make the field a regular field.</td>
</tr>
<tr>
<td>Function definition</td>
<td>Defines the function that the field performs. Starts with <code>glidefunction:</code> followed by the operation to be performed (for example, <code>concat</code>), followed by function parameters. Constants must be enclosed in single quotes. For example, the following function definition creates a field that shows the short description, followed by a space, followed by the caller name: <code>glidefunction:concat(short_description, ' ', caller_id.name)</code></td>
</tr>
</tbody>
</table>

**Note:** Function parameters support dot walking. See Dot-walking to data in related tables.

5. Click **Submit**. You return to the Dictionary Entry `[sys_dictionary]` table.
6. Navigate to the table to which you added the function field.
7. Add the function field to the list. See Configure items on forms or in lists using a list collector.

Use the function field like any other field. For example, add it to a form, use it in a filter, or use it in the condition builder.

If the function definition is invalid, instead of the expected value you receive the message **Invalid function** if the function field is a string type field, or an empty value for other field types.

### HTML field type

The HTML editor provides WYSIWYG (what you see is what you get) functionality and HTML source mode editing. Administrators can customize some of the functionality associated with HTML fields.

The HTML editors available depend on your version of the UI.

**UI support for available HTML editors**

<table>
<thead>
<tr>
<th>HTML editor</th>
<th>UI support</th>
</tr>
</thead>
<tbody>
<tr>
<td>TinyMCE version 4</td>
<td>UI16, UI15</td>
</tr>
<tr>
<td>htmlArea (legacy)</td>
<td>Basic support in UI16</td>
</tr>
</tbody>
</table>

Knowledge articles, service catalog item descriptions, release documentation, and HTML content blocks are common examples of HTML fields.

**Note:** The TinyMCE editor does not support converting Microsoft Word Shapes into HTML.
While HTML fields can be added to split forms, HTML fields are not intended for this use and can behave unexpectedly due to the limited available width in split pane forms.

If accessibility is enabled, a help icon appears with the HTML field. The help icon indicates how to use keys to access and escape the HTML field toolbar.

**Configure a field editor for the HTML field**

You can configure HTML fields to use TinyMCE or the legacy HtmlArea editor. This editor provides better stability and more editing functions than the legacy HtmlArea editor.

Role required: admin

There are two options for HTML editors.

- TinyMCE: A What You See Is What You Get (WYSIWYG) field that displays text as readers would see it on the screen. TinyMCE is the default editor.
- HtmlArea: The legacy editor, which offers a more basic WYSIWYG interface as well as a mode that shows only HTML markup.

1. Navigate to **System Properties > UI Properties**.
2. Locate the property called **HTML field editor to use (glide.ui.html.editor)**.
3. Select **TinyMCE** or **HtmlArea**.
4. Click **Save**.

**Configure the HTML toolbar**

When HTML fields are configured to use the HTML editor, follow this procedure to configure which buttons are available on the toolbar.

Role required: admin

1. Navigate to **System Properties > UI Properties**.
2. Locate the appropriate properties based on your version of the HTML editor.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TinyMCE</td>
<td>glide.ui.html.editor.v4.toolbar.line1 and glide.ui.html.editor.v4.toolbar.line2</td>
</tr>
<tr>
<td>HtmlArea</td>
<td>glide.ui.html.toolbar</td>
</tr>
</tbody>
</table>

3. Enter or remove buttons for each toolbar as a comma-separated list without spaces.

For the TinyMCE toolbar, use the following buttons. Use a vertical bar ("|") to add a section separator.

**TinyMCE button options**

<table>
<thead>
<tr>
<th>Button purpose</th>
<th>Accepted button names</th>
</tr>
</thead>
<tbody>
<tr>
<td>Formatting</td>
<td>newdocument, bold, italic, underline, strikethrough, justyleft, justifycenter, justifyright, justifyfull, formatselect, fontselect, fontsizeelect, bullist, numlist, outdent, indent, blockquote, forecolor, removeformat, backcolor, sub, sup</td>
</tr>
<tr>
<td>Table functions</td>
<td>tablecontrols</td>
</tr>
<tr>
<td>Editing</td>
<td>cut, copy, paste, pastetext, search, replace, undo, redo</td>
</tr>
</tbody>
</table>
### Button purpose | Accepted button names
--- | ---
Extended functions | link, unlink, cleanup, code, hr, visualaid, charmap, image, media, preview, spellchecker, fullscreen (not supported by Internet Explorer)
The **spellchecker** tool is not supported in UI16 or UI15.

For the htmlArea toolbar, use the following buttons. Use *separator* to add a section separator.

#### htmlArea button options

| Button purpose | Accepted button names |
--- | ---|
Formatting | formatblock, fontname, fontsize, bold, italic, underline, justifyleft, justifycenter, justifyright, justifyfull, insertorderedlist, insertunorderedlist, outdent, indent, forecolor, hilitecolor |
Editing | copy, paste, undo |
Extended functions | createlink, inserthorizontalrule, insertimage, insertvideo, inserttable, htmlmode |

4. **Click** **Save**.

![TinyMCE toolbar](image1)

![htmlArea toolbar](image2)

**Configure TinyMCE to allow deprecated tags**

You can set a dictionary attribute on a TinyMCE field to allow the use of deprecated HTML tags, such as `<b>` and `<i>`. By default, TinyMCE uses the `<strong>` and `<em>` tags for bold and italic formatting.

Role required: personalize_dictionary or admin

After you set the dictionary attribute, use code view to manually enter deprecated tags. The editor does not validate any tags you enter manually, for example, if you type an incorrect character.

1. Navigate to the form with an HTML field that uses TinyMCE.
2. Right-click the HTML field label and select **Configure dictionary**.

3. In the **Attributes** field, enter `tinymce_allow_all=true`, separated by a comma if needed. If other attributes are already listed, use a comma as a separator.

4. Click **Update**.

Configure TinyMCE to allow JavaScript in URLs
You can set a dictionary attribute on a TinyMCE field to allow the use of JavaScript in a URL.

Role required: personalize_dictionary or admin

1. Navigate to the form with an HTML field that uses TinyMCE.
2. Right-click the HTML field label and select Configure dictionary.

3. In the Attributes field, enter tinymce_allow_script_urls=true, separated by a comma if needed. If other attributes are already listed, use a comma as a separator.

4. Click Update.

**Formatting icons for the HTML field editors**

The formatting table displays how to control the way text appears.

The following table displays icons that are available in the TinyMCE and the htmlArea editors. Names marked with an asterisk (*) are not available with the htmlArea editor.

<table>
<thead>
<tr>
<th>htmlArea icon</th>
<th>TinyMCE icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>B</td>
<td>Bold</td>
<td>Applies bold formatting to the selected text or current word.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Keyboard shortcut: CTRL + B</td>
</tr>
<tr>
<td>I</td>
<td>I</td>
<td>Italic</td>
<td>Applies italics formatting to the selected text or current word.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Keyboard shortcut: CTRL + I</td>
</tr>
<tr>
<td>U</td>
<td>U</td>
<td>Underline</td>
<td>Applies underline formatting to the selected text or current word.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Keyboard shortcut: CTRL + U</td>
</tr>
<tr>
<td>htmlArea icon</td>
<td>TinyMCE icon</td>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------</td>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Align Right</strong></td>
<td><img src="image" alt="Align Right Icon" /></td>
<td><strong>Align Right</strong></td>
<td>Applies right alignment to the current paragraph. Code reference: <code>text-align:right</code></td>
</tr>
<tr>
<td><strong>Align Center</strong></td>
<td><img src="image" alt="Align Center Icon" /></td>
<td><strong>Align Center</strong></td>
<td>Applies center alignment to the current paragraph. Code reference: <code>text-align:center</code></td>
</tr>
<tr>
<td><strong>Align Left</strong></td>
<td><img src="image" alt="Align Left Icon" /></td>
<td><strong>Align Left</strong></td>
<td>Applies left alignment to the current paragraph. Code reference: <code>text-align:left</code></td>
</tr>
<tr>
<td><strong>Justify</strong></td>
<td><img src="image" alt="Justify Icon" /></td>
<td><strong>Justify</strong></td>
<td>Applies justified alignment, which stretches the lines to equal width, to the current paragraph. Code reference: <code>text-align:justify</code></td>
</tr>
<tr>
<td><strong>Format</strong></td>
<td><img src="image" alt="Format Icon" /></td>
<td><strong>Format</strong></td>
<td>Applies a paragraph style to the current paragraph, such as Paragraph, Heading 1, and Preformatted.</td>
</tr>
<tr>
<td><strong>Font Family</strong></td>
<td><img src="image" alt="Font Family Icon" /></td>
<td><strong>Font Family</strong></td>
<td>Applies a font family to the selected text or current word.</td>
</tr>
<tr>
<td><strong>Font Size</strong></td>
<td><img src="image" alt="Font Size Icon" /></td>
<td><strong>Font Size</strong></td>
<td>Applies a font size to the selected text or current word.</td>
</tr>
<tr>
<td><strong>Insert/Remove Bulleted List</strong></td>
<td><img src="image" alt="Insert/Remove Bulleted List Icon" /></td>
<td><strong>Insert/Remove Bulleted List</strong></td>
<td>Applies or removes unordered list tags for the selected paragraphs. Click the arrow beside the button to select a different bullet type.</td>
</tr>
<tr>
<td><strong>Insert/Remove Numbered List</strong></td>
<td><img src="image" alt="Insert/Remove Numbered List Icon" /></td>
<td><strong>Insert/Remove Numbered List</strong></td>
<td>Applies or removes ordered list tags for the selected paragraphs. Click the arrow beside the button to select a different number type.</td>
</tr>
</tbody>
</table>
### htmlArea icon

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decrease Indent</td>
<td>Removes indentation from the current or selected paragraphs (removes 30px of left padding; padding cannot be less than 0). Code reference: padding-left</td>
</tr>
<tr>
<td>Increase Indent</td>
<td>Applies indentation to the current or selected paragraphs (adds 30px of left padding). Code reference: padding-left</td>
</tr>
<tr>
<td>Select Text Color</td>
<td>Applies font color to the current word or selected text. Click the button to use the current color, or click the arrow next to the button to view more colors. Click More Colors... to view various color options and the hexadecimal codes.</td>
</tr>
<tr>
<td>Select Background Color</td>
<td>Applies background color to the current word or selected text. Click the button to use the current color, or click the arrow next to the button to view more colors. Click More Colors... to view various color options and the hexadecimal codes.</td>
</tr>
</tbody>
</table>

<td></td>
<td>Toggle Full Screen Mode*</td>
</tr>
</tbody>
</table>

*These options are not available with htmlArea.

**Editing functions in TinyMCE**

Several editing functions are built into TinyMCE.

You can add more edit functions to TinyMCE v4 using the `glide.ui.html.editor.toolbar.line1` and `glide.ui.html.editor.toolbar.line2` properties located on the UI Properties page. For more information on configuring the edit functions, see Configure the HTML toolbar.

**Editing functions**

<table>
<thead>
<tr>
<th>Icon</th>

<td>Find*</td>
<td>Allows you to locate text strings in the HTML field. Search above (up) or below (down) the cursor location.</td>
</tr>
</tbody>
</table>
| ![Find/Replace](image) |              | Find/Replace* | Allows you to replace the next (Replace) or all (Replace All) occurrences of a text string in the HTML field.  
Keyboard shortcuts: CTRL + F, Cmd + F |
| ![Undo](image) | ![Redo](image) | Undo* | Reverts the previous edit. |
| ![Redo](image) |              | Redo* | Reapplies the last reverted edit. |

*These options are not available with htmlArea.*
### Table functions in TinyMCE

TinyMCE version 4 uses menus and menu selections to create and edit tables.

#### TinyMCE version 4

<table>
<thead>
<tr>
<th>UI element</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table menu</td>
<td>Click the table icon ( ) to access the TinyMCE version 4 table menu. Use the table menu to:</td>
</tr>
<tr>
<td></td>
<td>• Insert or delete a table</td>
</tr>
<tr>
<td></td>
<td>• Modify table properties</td>
</tr>
<tr>
<td></td>
<td>• Add, move, or delete rows and columns</td>
</tr>
<tr>
<td></td>
<td>• Modify row and column properties</td>
</tr>
<tr>
<td></td>
<td>• Split and merge cells</td>
</tr>
</tbody>
</table>

**Table insert grid**

To insert a table in the HTML field, click **Insert table** and highlight squares in the grid to represent the desired number of rows and columns. Click the last highlighted square to insert the table.

After you insert the table, you can modify the size by clicking and dragging the handles at the table edges.
From the table menu, click **Table properties** to open the Table properties dialog box. From this box you can take any of the following actions.

- **General tab:**
  - Set table width and height
  - Set cell spacing and padding
  - Enable borders and captions
  - Set the table alignment

- **Advanced tab:**
  - Configure the table style
  - Select the border color
  - Select the background color
<table>
<thead>
<tr>
<th>UI element</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Cell properties</strong></td>
<td>With the cursor in the desired table cell, open the table menu and click <strong>Cell properties</strong>. From this box you can set the following properties for table cells.</td>
</tr>
<tr>
<td>General</td>
<td>• General tab:</td>
</tr>
<tr>
<td></td>
<td>• Width and height</td>
</tr>
<tr>
<td></td>
<td>• Type and scope</td>
</tr>
<tr>
<td></td>
<td>• Horizontal and vertical alignment</td>
</tr>
<tr>
<td>Advanced</td>
<td>• Advanced tab</td>
</tr>
<tr>
<td></td>
<td>• Configure the cell style</td>
</tr>
<tr>
<td></td>
<td>• Select the border color</td>
</tr>
<tr>
<td></td>
<td>• Select the background color</td>
</tr>
</tbody>
</table>

| **Row properties** | With the cursor in a table cell in the desired row, open the table menu and click **Row properties**. From this box you can set the following properties for rows. |
| General | • Row type |
| | • Alignment |
| | • Height |
| Advanced | • Advanced tab |
| | • Configure the row style |
| | • Select the border color |
| | • Select the background color |
You can also paste tables into HTML fields from table-based editors.

**Customize TinyMCE attributes**

Change TinyMCE toolbars and the default height of HTML fields to customize your journal field experience.

Add or remove TinyMCE attributes from the default TinyMCE toolbar. The TinyMCE attributes are applied to TinyMCE toolbars in the platform and workspaces, or to specific plugins in a record or specific tables in a record. You can also apply an attribute to increase the height of HTML fields, enlarging the HTML field that agents work with.

**Change the TinyMCE default toolbar**

Set the toolbar items in your system properties to enable or disable throughout Workspace.

Role required: admin

1. Navigate to **System Properties > UI Properties**.
2. Locate the appropriate properties based on your UI version.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI16 or UI15</td>
<td>(TinyMCE v.4.0.26) Configures the editing toolbar (first line) for HTML fields (glide.ui.html.editor.v4.toolbar.line1).&lt;br&gt;• (TinyMCE v.4.0.26) Configures the editing toolbar (second line) for HTML fields (glide.ui.html.editor.v4.toolbar.line2).</td>
</tr>
<tr>
<td>UI11</td>
<td>Configures the editing toolbar (first line) for HTML fields(glide.ui.html.editor.toolbar.line1).&lt;br&gt;• Configures the editing toolbar (second line) for HTML fields(glide.ui.html.editor.toolbar.line2).</td>
</tr>
</tbody>
</table>

3. Add or remove buttons for each toolbar.

**Note:**
- Separate attributes with commas.
- Use a vertical bar ("|") to add a section separator.

<table>
<thead>
<tr>
<th>Type</th>
<th>Button Names</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default buttons</td>
<td>bold italic underline undo redo fontselect fontsizeselect table forecolor backcolor link unlink image media code alignleft aligncenter alignright bullist numlist fullscreen</td>
</tr>
<tr>
<td>Type</td>
<td>Button Names</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Valid buttons</td>
<td>newdocument bold italic underline strikethrough alignleft aligncenter alignright align justify formatselect fontselect fontsizeselect table cut copy paste pastetext searchreplace bullist numlist outdent indent blockquote undo redo link unlink code forecolor backcolor removeformat hr visualblocks subscript superscript charmap image media fullscreen anchor toc codesample ltr rtl emoticons insertdatetime nonbreaking pagebreak print visualblocks visualchars cut copy</td>
</tr>
</tbody>
</table>

4. Click **Save**.

Change the TinyMCE toolbar for a specific table

Set the attributes in the TinyMCE dictionary to determine which TinyMCE attributes show in a specific table.

Role required: admin

1. In platform, select the record of an HTML field you want to change.
   For example, select an incident, problem, or knowledge record.
2. Right-click the field label (Article body) and select **Configure Dictionary**.

3. In Related Links, click **Advanced View**.

4. In the **Attributes** field, input `editor.toolbar.line1= or editor.toolbar.line2` followed by the plugin.

   **Note:** Separate attributes with a space.

5. Click **Update**.

Change TinyMCE plugins for a specific table

Set the attributes in the TinyMCE dictionary to enable or disable plugins in a specific HTML field.

Role required: admin

1. In platform, select the record of an HTML field you want to change.
   For example, select an incident, problem, or knowledge record.
2. Right-click the field label (Article body) and select **Configure Dictionary**.

3. In Related Links, click **Advanced View**.

4. In the **Attributes** field, input `editor.plugins=` followed by the plugin. For a list of plugins, click here.

   **Note:**
   - Include all toolbar items you want displayed and not just the toolbar items you want to add.
   - Separate plugins with a space.

5. Click **Update**.

Change the default height of an HTML field

Change the default height of a specific HTML field to expand the size of a journal field.

Role required: admin

HTML field height is configured per HTML field.

1. In platform, select the record of an HTML field you want to change.
   
   For example, select an incident, problem, or knowledge record.
2. Right-click the field label (Article body) and select **Configure Dictionary**.

3. In Related Links, click **Advanced View**.

4. In the **Attributes** field, enter `editor.height=X`.
   For example, `editor.height=250`

   **Note:**
   HTML fields can range from 72 to 2000. HTML fields are by default 64.

5. Click **Update**.

   **Highlight text in TinyMCE**
   On the bottom bar of TinyMCE, the path of HTML tags for the text at the cursor position is displayed.
   Click a tag in the path to highlight the text affected by the tag.

   **Insert a line break in the HTML editor**
   When you use the **Enter** key, the editor creates a paragraph element (`<p>`) tag, which appears as a double space.
   To enter a single-line space, use the **Shift + Enter** key combination, which inserts a line break (`<br>`) tag.
Add a table to the HTML field
This example uses HTML field controls to format a table in a knowledge article.

Table example html

To add the formatted table to a knowledge article:

1. Navigate to Knowledge > Edit and select the article to edit.
2. In the HTML field, position the cursor in the location for the table.
3. Click the table icon, click **Insert table**, and then select the number of rows and columns.

4. Complete the following steps to edit the table properties.
   a) Position your cursor in the table, click the table icon, and select **Table properties**.
   b) Enter the following values on the **General** tab.
      - Width: 75%
      - Cell spacing: 3
      - Cell padding: 3
      - Border: 1
      - Alignment: Left
   c) On the **Advanced** tab, click the text field next to **Border color** and enter **Gray**.
      The color picker box to the right turns gray to indicate the color that you entered. You can also click the box and select the color in the palette.
   d) Click **Ok**.

5. Complete the following steps to update the header table row.
   a) Select the cells in the first table row, click the table icon, and select **Row > Row properties**.
   b) Enter the following values on the **General** tab.
      - Row type: Header
      - Alignment: Center
   c) On the **Advanced** tab, enter `#87cef` in the text box beside **Background color** to set it to a light blue.
   d) Click **Ok**.
6. To set cell properties, complete the following steps.
   a) Select all table cells in the first column except those cells in the header row, click the table icon, and select Cell > Cell properties.
   b) Enter the following values on the General tab.
      • H Align: Left
      • V Align: Top
   c) Click Ok.
   d) Repeat these steps for the table cells in the second column.

7. To set the background color of the middle row, complete the following steps.
   a) Position your cursor in the middle table row, click the table icon, and select Row > Row properties.
   b) On the Advanced tab, enter Silver in the text box beside Background color to set it to color #c0c0c0.
   c) Click Ok.

Repeat this procedure for every other table row.

8. To set column width, complete the following steps.
   a) Click the first column of the table, click the table icon, and select Cell > Cell properties.
   b) On the General tab, enter 30% in the Width text field.
   c) Click Ok.

9. Right-click the form header and click Save.
10. Enter data in the table cells and then save the article.

**Embed images in HTML fields**
You can use the HTML field image picker to embed images into HTML fields, and to add images to the image library.

Role required: the role necessary to update the record that contains the HTML field. For example, any user with a role can create a knowledge article and embed an image in it.

**Note:** Administrators and users with the image_admin role manage the image library at System UI > Images. See Storing images in the database.

1. Open the form that contains the HTML field.
2. Click the position where the image is to appear, or to modify an existing image, click the image.
3. Click the insert/edit image icon (🖼) on the HTML editor toolbar.
4. In the Insert/Modify image form, enter information in each field.

**Insert/Modify Image form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td>Select the image type.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Image Library</strong>: Images stored in the db_image table. You can reuse images in the image library in multiple locations.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Attachment</strong>: Available in the current record only</td>
</tr>
<tr>
<td><strong>Image</strong></td>
<td>Begin typing a file name and select an image from the list, or click the reference lookup icon and select an image.</td>
</tr>
<tr>
<td></td>
<td>To upload a new image, click <strong>New</strong>, then <strong>Choose File</strong>, locate the image, and click <strong>Upload</strong>.</td>
</tr>
<tr>
<td></td>
<td>If you chose the <strong>Attachment</strong> type, click <strong>Choose File</strong>, locate the image, and click <strong>Attach</strong>.</td>
</tr>
<tr>
<td><strong>Tooltip</strong></td>
<td>Enter alternate text that appears when a user points to the image.</td>
</tr>
<tr>
<td><strong>Alt</strong></td>
<td>Enter alternate text that can be used to improve accessibility. For example, it could be used with a screen reader. If this field is left blank, it defaults to the text entered in the <strong>Tooltip</strong> field.</td>
</tr>
</tbody>
</table>

**Note:** To resize an embedded image, click the image. The sizing frame appears. Drag a sizing point until the image is the desired size. Corner points adjust the size proportionally. Depending on your browser, you may need to highlight the image before the sizing frame appears.

5. Optional: To provide additional control over the appearance of an image, click **Advanced options**.

**Advanced options**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Layout</strong></td>
<td>Select the image <strong>Alignment</strong> (default is <strong>Baseline</strong>) and enter the <strong>Border thickness</strong>.</td>
</tr>
<tr>
<td><strong>Spacing</strong></td>
<td>Enter the number of <strong>Horizontal</strong> and <strong>Vertical</strong> pixels around the image.</td>
</tr>
<tr>
<td><strong>Size</strong></td>
<td>Enter the <strong>Width</strong> and <strong>Height</strong> of the image (in pixels).</td>
</tr>
</tbody>
</table>

6. Click **OK**.

7. Optional: Paste an image into the HTML editor. To edit the image, save the entry then select the image. Click the insert/edit image icon and complete the form using the same tables for adding an image.

Pasted images are saved in the system as attachments.
Link to a website in HTML fields

You can insert a link to a website in an HTML field.

Role required: the role necessary to update the record that contains the HTML field. For example, any user with a role can create a knowledge article and link to a website in the article text.

1. Move the cursor to the position where the link is to appear.
2. Click the insert/edit link icon in the HTML toolbar.
3. Enter information in each field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>Enter the URL for the link. Copying and pasting is usually the easiest method.</td>
</tr>
<tr>
<td>Text</td>
<td>Enter the text you want to display for the link.</td>
</tr>
<tr>
<td>Target</td>
<td>Select the target window for the URL.</td>
</tr>
</tbody>
</table>

For files, the **None (use implicit)** selection is generally the best choice. However, if you are linking to a complete web page, choose **New window (_blank)** so the browser opens the link in a new tab or window.

4. Click **OK** to insert the link into the field.

Embed videos in HTML fields

You can insert videos into HTML fields. You can also add videos to the video library using the HTML Insert/Modify Video form.

Role required: The role necessary to update the record that contains the HTML field. For example, any user with a role can create a knowledge article and embed a video in it.

The following file formats are supported in the base system.

- MPEG-4 video .mp4
- WebM Video .webm

The larger the file size, the longer it takes to download before the video starts. To reduce file size, you can reduce the bit rate, but doing so reduces the quality of the video. The following bit rates optimize download speed and video quality:

<table>
<thead>
<tr>
<th>Video resolution</th>
<th>Recommended bitrate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard definition (480p)</td>
<td>1.5–2.5 megabits per second (mbps)</td>
</tr>
<tr>
<td>High definition (720p)</td>
<td>3–5 mbps</td>
</tr>
<tr>
<td>High definition (1080p)</td>
<td>6–8 mbps</td>
</tr>
</tbody>
</table>

Internet Explorer and Safari have difficulty streaming videos uploaded to the database. Attach a file rather than embedding if you intend to use one of these browsers or an unsupported file type. For more information on attaching files, see [Add and manage attachments](#).
Note: Administrators and users with the image_admin role can manage the video library at System UI > Videos.

1. Open the form that contains the HTML field.
2. Click the position where the video is to appear, or to modify an existing video, click the video.
3. Click the insert/edit video icon on the HTML editor toolbar.
4. Enter information in each field.

### Insert/Modify Video

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the video type.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Video Library</strong>: List of videos stored in the db_video table. You can reuse it.</td>
</tr>
<tr>
<td></td>
<td>• <strong>URL</strong>: from an external source</td>
</tr>
<tr>
<td></td>
<td>• <strong>Attachment</strong>: available in the current record only</td>
</tr>
<tr>
<td></td>
<td>For an attachment or video library file, select a video from the list or click New. For an external URL, enter the URL.</td>
</tr>
<tr>
<td>Size</td>
<td>Enter the <strong>Width</strong> and <strong>Height</strong> of the video in pixels.</td>
</tr>
</tbody>
</table>

5. Click OK.

**Define video file types for HTML fields**
You can define the types of video files that can be added to HTML fields.

Role required: image_admin

Users can add videos to HTML fields. By default, users can add one of the following types of videos to HTML fields: .mp4, .webm, and .swf video file types. You can inactivate video types that you do not want to allow users to add, or add new video types. .swf files are only minimally supported. .mp4 files might be limited by browser type.

Note: By default, the HTML Sanitizer removes videos from HTML fields. To allow video file types, see Embed videos in HTML fields

1. Navigate to System UI > Embed Object Types.
2. To deactivate a video type, set the **Active** field to false.
3. To add an additional video type, click New and complete the form.

Note: If you specify values for the Codebase or Pluginspage fields, which instruct the browser where to get the plugin, point to https pages to avoid warnings from Internet Explorer about unsecure content on the page.
Disable user access to the image library
By default, users can use and upload images to the image library from an HTML field. You can disable access to the image library from HTML fields.

Role required: admin

1. Navigate to System UI > UI Pages.
2. Select html_insert_image_dialog.
3. Locate the following lines of code in the HTML field and comment them out.

```xml
<g:evaluate var="jvar_use_dbimage">
  var imageGR = new GlideRecord('db_image');
  if(imageGR.isValid())
    imageGR.canRead();
</g:evaluate>

and

```xml
<j:if test="${jvar_write_dbimage}"
  <j:set var = "jvar_default_insert_image_type" value = "dbimage" />
  <g:ui_select_option text = "${gs.getMessage('Image Library')}" value = "dbimage" selected = "${jvar_default_insert_image_type}" />
</j:if>
```

4. Click Update.

To remove the Upload from URL option in the HTML editor, add a new property named glide.ui.html.image.allow_url and set the Value to false.

Paste content into the HTML editor
Paste content from a desktop application to the HTML editor. Content might not paste the same from every application.

Role required: admin

1. Navigate to an HTML field. For example, the Text field of a Knowledge article.
2. Paste in content from another application.
   Google Chrome and Mozilla Firefox do not support paste using the Paste icon. Use the command/control+V keyboard shortcut instead.
3. From the paste formatting options dialogue, choose to Keep or Remove the text formatting for the pasted content.

The HTML editor has some pasting limitations:

- Pasting images: Pasting images and text from OneNote works in Microsoft browsers. Pasting from OneNote into Chrome or Firefox works but styles and images are not included. You can still select images individually and paste them into the HTML field. Pasting images and text from Microsoft Word into any browser works as expected.
- Pasting tables: Pasting tables into Safari does not always work correctly. Pasting tables into Internet Explorer only works from Excel.

**Image field type**

Image fields enable you to add images to forms.

Role required: personalize_form

For example, you can add portraits to the user records in your system. The image type must be .gif, .jpg/.jpeg, or .png.
Image resizing is defined by the CSS. Larger images are resized to 250 pixels. For most browsers, the larger of the height and width measurements is reduced to 250 pixels and the proportion of the image is maintained. For example, an image with a size of 1508 x 663 pixels is resized to 250 x 110 pixels. Some browsers resize both the height and width measurements to 250 pixels, resulting in a square image.

You can add a new image field.

1. Open the desired form.
2. Create a new field with the Type set to Image.
   For instructions, see Add and customize a field in a table.
3. Add the new field to the form and save your customization.
   The form displays the new blank image field.
4. Click Click to add in the image field, select an image to upload, and click OK.
   The selected image is attached to the form and displayed in the image field.

**IP address field type**

The IP Address (Validated IPV4, IPV6) [ip_addr] field type stores valid IPv4 and IPv6 addresses.

**Support for IPv4 and IPv6**

Both dot-decimal and hex notation are supported for IPv4 and IPv6. For IPv6, you can use the double-colon notation to compress zeros. Familiarize yourself with IETF RFC5952 for examples and guidelines on text representation for IPv6 addresses.

The following are examples of valid IP addresses:

- **A standard IPv4 address in dot-decimal notation:**
  10.34.51.20

- **A same IPv4 address in hex notation:**
  0x0A223314 or 0A223314

  **Note:** The optional prefix 0x is supported.

- **A standard IPv6 address in dot-decimal notation:**
  1507:00d0:1002:0051:0000:0000:0000:0004
- The same IPv6 address above using the double-colon in place of zeros:
  1507:f0d0:1002:51::4

How IP addresses are stored in the database

The IP address `ip_addr` field is a Variable Character (VARCHAR) field with a length of 45 characters. The values are always stored in four-digit groupings in doc-decimal notation for both IPv4 or IPv6 addresses regardless of the notation you use when you input values in the field. For example:

- If you enter an IPv6 IP address in an using double-colons, the value in the database is actually expanded to its full IP address without compression: 1507:f0d0:1002:51::4 is saved in the database as 1507:f0d0:1002:0051:0000:0000:0000:0004
- If you enter an IPv4 address in hex notation, it is saved in the database as the standard dot-decimal notation: 0x0A223314 is saved as 10.34.51.20.

If you run a query on this field type in scripts, make sure to query on the full dot-decimal notation.

Journal field type

There are three types of journal field: journal, journal_list, and journal_input.

<table>
<thead>
<tr>
<th>Journal field types</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>journal</td>
<td>Allow and store input, and display the combined inputs below the input box. Journal fields display in the activity stream in the form and in the list view.</td>
</tr>
<tr>
<td>journal_input</td>
<td>Allow and store input, but do not display the combined inputs. Journal input fields only display with the record they are associated with, so they do not display in the activity stream on the list view.</td>
</tr>
<tr>
<td>journal_list</td>
<td>Do not allow or store input; they merely display the contents of other Journal fields upon which the journal_list field is dependent. If a journal_list field is dependent on more than one Journal field, it will chronologically interweave those fields' inputs. The journal_list field does not display content within the activity stream, but rather in a separate block.</td>
</tr>
</tbody>
</table>
The example image contains the three available journal field types. The first is a journal field, with its inputs displayed below the field. The second is a journal input field, which does not show its previous inputs. The third is Journal list field, which is configured to show the input from the journal input field above it.

**Journal fields examples on a form**

**Restricting journal entries sent in a notification**

Administrators can control the number of journal entries notifications include with the following system property.

<table>
<thead>
<tr>
<th>Property</th>
<th>Label</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.email.journal.lines</td>
<td>Number of journal entries (Additional comments, Work notes, etc.) included in email notifications (-1 means all).</td>
<td>Specifies the number of entries from a journal field (such as Additional comments and Work notes) included in email notifications. A value of -1 includes all journal entries.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Type: integer&lt;br&gt;• Default value: 3&lt;br&gt;• Location: System Properties &gt; Email</td>
</tr>
</tbody>
</table>
Code for getting the contents of a journal field into an array

To put the contents of a journal field into an array so that you can iterate through each entry, you can use the code in this page.

```javascript
// gets all journal entries as a string where each entry is delimited by '
 \n'
var notes = current.work_notes.getJournalEntry(-1);

// stores each entry into an array of strings
var na = notes.split("\n\n");

for (var i = 0; i < na.length; i++)
  gs.print(na[i]);
```

Journal field script values

The `setValue()` method is not supported for journal fields. Instead, assign values in script as in the following example.

```javascript
var now_GR = new GlideRecord('incident');

// query priority 1 incidents in the state of either 'new' or 'active'.
gr.addQuery('priority', 1);
var gc = gr.addQuery('state', 1);
gc.addOrCondition('state', 2);
gr.query();

while(gr.next())
{
  // print a list of the incident numbers updated
  gs.print(gr.number);

  // add an entry to the 'work notes' journal field for each incident
  gr.work_notes = "This is a high-priority incident. Please prioritize."
  gr.update();
}
```

Render journal field entries as HTML

Journal fields can render text enclosed within code tags as HTML.

- Role required: any role that grants write access to a journal field
- System property: the glide.ui.security.allow_codetag is set to the default value of `true`

Note:

To learn more about this property, see Allow JavaScript tags in embedded HTML (instance security hardening) in Instance Security Hardening Settings.
By default, a High Security Setting escapes any HTML code you type in a journal field by replacing it with its equivalent HTML entity value. Escaping causes the system to display HTML code as text rather than forwarding it to the browser as rendering instructions.

1. Enter `[code][/code]` tags around any code you want to render as HTML.

   **Note:** A single journal entry can contain multiple code tags as long as each code tag has a beginning and ending tag.

For example, enter these lines:

**Results of entering HTML code**

<table>
<thead>
<tr>
<th>Code entered</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>[code]&lt;b&gt;This text will be bold. &lt;/b&gt;[/code]</code></td>
<td>The system renders the sentence in bold.</td>
</tr>
<tr>
<td><code>&lt;b&gt;This text will not be bold.&lt;/b&gt;</code></td>
<td>The system escapes the bold tags and renders them as text.</td>
</tr>
<tr>
<td><code>[code]&lt;script&gt;gs.info(gs.getUserDisplayName());&lt;/script&gt;[/code]</code></td>
<td>The system escapes the content of the script tag.</td>
</tr>
</tbody>
</table>

**Note:** By default, the HTML Sanitizer prevents the entry of `<script>` elements.

For more examples of HTML formatting options, see the blog post [Formatting within Journal fields using HTML & `[code]`](https://community.servicenow.com) by a ServiceNow Technical Support Engineer in the Now Community.

2. Click *Post*.

   **Note:** You cannot edit previous journal entries.

The system renders the text within code tags as HTML.

**Restrict the CODE tag in journal fields**

You can prevent journal fields from rendering HTML code by disabling support for the `[code]` tag.

Role required: admin

1. Navigate to *System Properties > UI Properties*.
2. Clear the check box for *Allow support for embedding HTML code by using the [code] tag* (the `glide.ui.security.allow_codetag` property).

   **Note:** To learn more about this property, see [Allow embedded HTML code (instance security hardening)](https://community.servicenow.com) in the Instance Security Hardening Settings.

3. Click *Save*.

**Validate HTML in journal fields**

You can prevent users from saving invalid HTML in a journal field.

Role required: admin

1. Add the property `glide.ui.allow_deep_html_validation`. For instructions, see [Add a system property](https://community.servicenow.com).
2. Set the **Value** to **true** (it is false by default).
3. Click **Save**.

Users now see a warning in the activity formatter when they enter invalid HTML code in a journal field.

![Activity](https://via.placeholder.com/150)

### Journal field display limits

Journal fields can greatly increase the size of task records because they allow users to enter very large string values. Display limits prevent the instance from loading the entire journal field into memory. Administrators have the option to:

- Set the length at which journal fields stop displaying the entire field's contents and instead only display a portion (called a preview) of the field's contents. Users can still access the field's entire contents by clicking a **Show All** button.
- Set the size of the preview text the journal field displays.
- Set the maximum number of journal entries journal fields can display.

In UI16, journal fields and the activity formatter must be in the same form section. You cannot place another field in between a journal field and the activities formatter. The Activity Stream is built to keep journal fields stacked on top of the activity formatter.

**Note:** Journal field display limits are not supported in the legacy **Comments and Worknotes** field.

---

**Set the maximum display size for journal fields**

You can set the maximum display size for journal fields by adding a system property.

Role required: admin

When a journal field exceeds the length set in this property, the instance shows a preview of the journal field instead of the field's entire contents. The preview includes a **Show All** button to display the rest of the field's contents. A separate property determines the number of characters the preview displays.

1. **Add a system property** with the following settings.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.max_journal_list_size</td>
</tr>
<tr>
<td>Description</td>
<td>Size in megabytes when a journal field should display a preview rather than the field's entire contents.</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Value</td>
<td>10</td>
</tr>
</tbody>
</table>

2. Click **Submit**.
Set the journal preview size
When a journal field exceeds the size of the `glide.max_journal_list_size` property, the instance displays a preview rather than the field's entire contents.

Role required: admin

To specify the amount of text to display as a preview, set the following system property. Users can click the **Show All** button to see the rest of the field's contents.

- Add a system property with the following settings. For instructions, see Add a system property.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.shortened_journal_length</td>
</tr>
<tr>
<td>Description</td>
<td>Number of characters to display as a preview of journal fields.</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Value</td>
<td>512000</td>
</tr>
</tbody>
</table>

Set the maximum number of journal entries
To set the maximum number of entries the system shows in the activity formatter, edit the following system property. The activity formatter displays the entries starting with the most recent entry up to the maximum number.

Role required: admin

1. Enter `sys_properties.list` in the navigation filter.
2. Search for the property `glide.history.max_entries`.
3. Edit the **Value** of the property.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.history.max_entries</td>
</tr>
<tr>
<td>Description</td>
<td>Maximum number of entries the system shows in the activity formatter. The default is 250.</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Value</td>
<td>250</td>
</tr>
</tbody>
</table>

4. Click **Update**.

Enable the text field character counter
By default, multi-line text fields have a 4000 character limit. To help users see how many characters remain before they reach the limit, you can enable the `glide.ui.textarea.character_counter` property.

Role required: admin

This property adds a counter under text fields, such as the **Additional Comments** and **Work notes** fields. The counter is dynamically updated as users enter text.

1. Navigate to **System Properties > UI Properties**.
2. Select the check box next to **Character counter for textarea (journal and multi line text fields)**.
3. Click **Save**.

---

**Disable or enable spell checking on a journal field**

Spell checking is turned on by default on most input fields, except for single-line input fields. The spell checker highlights misspelled words.

Role required: personalize_dictionary

To enable the spell checking dictionary, install the appropriate language plugin. Localization plugins have the same name format, such as I18: German Translations.

The dictionaries available for spell checking include the following languages:

- Brazilian Portuguese
- Czech
- Dutch
- English US
- English UK
- Estonian
- Finnish
- French
- German
- Hebrew
- Hungarian
- Italian
- Polish
- Portuguese
- Russian
- Spanish
- Thai

**Note:** The words in the dictionary are part of the language plugin. You cannot add, remove, or modify the dictionary.

You can select a dictionary to use for a language that does not have a spell checker dictionary by navigating to **System Properties > System Localization**.
1. Navigate to **System Definition > Dictionary**.
2. Filter the list to view **journal** type fields and select a field to spell check.
   An example is the **comments** field in the Task table. This applies spell checking in the specified language to the multi-line **Comments** text box for incidents, problems, and changes.
3. Click the table name to open the Dictionary form.
4. Configure the form and add the **Spell check** check box.
5. Clear the check box to disable spell checking in every **Comments** field on the Task table.

**Name-value pairs field type**

You can access the values stored in a name-value pairs field in scripts using the name.

**Sample script**

The following example demonstrates how to add mappings to a name-value pairs field, and how to query existing values using the name.

```javascript
// Script example demonstrating setting and getting values
var now_GR = new GlideRecord('u_nv_table');
gr.initialize();

gr.nv_field.name1 = "value1"; //add a name-value Pair mapping with the name "name1" and value "value1"
gr.nv_field.name2 = "value2"; //add another name-value Pair mapping with the name "name2" and value "value2"

// Access by dot notation
gs.print("name1 = " + gr.nv_field.name1); // Expected output: name1 = value1

// Iterate over each property and print name and value
for(var name in gr.nv_field) {
    gs.print(name + " = " + gr.nv_field[name]);
}

gs.print(gr.nv_field); // Expected output:
{"name1":"value1","name2":"value2"}
```
Percent complete field type

Administrators can create percent complete fields, which accept decimal input and appear as progress bars when displayed in lists.

For example, use a percent complete field to set the completion percentage for a task or project in a form and then see that percentage displayed as a progress bar in a list.

Administrators can also configure views that compare actual progress with a target value to determine if goals are being met and then apply color to provide visual alerts where progress does not meet expectations.

Form view of a percent complete field

List view of a percent complete field

Target threshold colors attribute

If the target_field attribute is configured, a second attribute called target_threshold_colors enables an administrator to define additional parameters.

The parameters are:

- Different thresholds at which the colored bar should change color
- A specific color for each threshold

The format of this attribute's value is number1:color1;number2:color2 and so on. Use this attribute to apply warning colors to completion percentages that are lower than target percentages. These values are defined as the percentage of target accomplished. For example, a value of 0:red;50:yellow;90:green displays a red bar if the progress to target percentage is between 0-49. If the percent of target is between 50 and 89, the color is yellow. Percent of target 90 and above displays in green. Completion percentages that exceed target percentages also display in green. Order the color attributes from the smallest percentage to the largest.

If you do not specify a target_field, then a target of 100 is used, allowing you to use the color thresholds with a single field value.

target_field=percent_complete_target,target_threshold_colors=0:tomato;50:khaki;90:lightgreen

The following table lists examples of percent of target calculation using the colors defined above.

Target threshold colors attribute

<table>
<thead>
<tr>
<th>Target percent</th>
<th>Percent field value</th>
<th>Percent of target calculation</th>
<th>Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>40</td>
<td>40%</td>
<td>tomato</td>
</tr>
</tbody>
</table>
Percent complete color example

Add a target field attribute

Add an optional attribute (target_field) to a percent complete field to compare the actual completion percentage of a task or project with a target percentage in a different decimal field that specifies where the task should be at this point.

Role required: personalize_dictionary

If a target field is not specified, the target of 100 is assumed.

1. Right-click the % Complete field in a form.
2. Select Configure Dictionary from the pop-up menu.
3. In the Dictionary Entry form, add the following attribute:
   
   target_field=percent_complete_target

4. Update the dictionary record.

In the list, a gray bar appears behind the colored bar to indicate the target value. The gray target bar appears only if you defined a target field.
Phone number field type

The E.164 phone number standard ensures that all necessary information for a phone number is included and properly formatted to successfully route an international call over a territory's public telephone network.

When a user enters a phone number, it is received and stored as a string of numbers. An E.164 phone number field automatically formats and validates the numbers so that they are E.164-compliant when displayed as local and international numbers. The E.164 phone number field type does not replace the phone field type.

An E.164 phone number field displays:

- [Optional] A choice list for the phone number territory.
- [Always] An input box for entering phone numbers.
- [By Default] A red underline when a phone number does not match the format for the selected phone territory and cannot be saved.
- [Optional] A green underline when a phone number does not match the format for the selected phone territory but can be saved with Other / Unknown as the territory.

Territories assigned

Territories are assigned to locations, and are not assigned directly to users.

A user's territory, and so the user's E.164-compliant phone functionality, is based on the user's location. For example, if a user has a location of SHS quadra 5, Bloco E., Brasilia defined in the User [sys_user] table, the parent record for Brazil in the location table defines the phone territory. The phone territory may be assigned at any level of the location hierarchy, which is searched going up to the next parent until the territory is found or no parents remain.

Dependent fields

In the dictionary, you can specify a dependent field in the User or Location field, which displays the appropriate territory in the selector choice list when a user enters a phone number.

In the dictionary, you can specify a dependent field in the User or Location field, which displays the appropriate territory in the selector choice list when a user enters a phone number. For example, if you enter caller_id in the dependent field in the Incident table, the appropriate territory is added to the territory selector choice list when a user enters caller information.

E.164 phone number field configuration

Administrators can use the phone number system properties and dictionary attributes to do certain things.

The system properties apply the configuration option to all phone number fields that do not have a comparable dictionary attribute. The dictionary attributes apply the configuration only to the phone number field it is added to. Since dictionary attributes take precedence over system properties, administrators can set a global configuration with a property and then apply exceptions on a field-by-field basis.

Requiring territory format validation

By default, phone number fields require that a phone number match the display format of the selected territory.

By default, phone number fields require that a phone number match the display format of the selected territory. If a phone number does not match this format, the input box displays a red line underneath the phone number and users are prevented from saving it.
Setting the `glide.phone_number_e164.strict` system property to `false` or adding the `pn.strict` dictionary attribute allows the phone number input box to display a green line underneath numbers that do not match the territory format listed for the selected territory. In this case, a user can save a phone number in an invalid format, but the field continues to display a warning until the phone number matches the format required by the territory. You can use the `Other / Unknown` territory to store otherwise invalid phone numbers.

**Warning:** Switching from optional territory format validation to required territory format validation may result in some phone numbers failing validation altogether. In such cases, the E.164 phone number field displays an error message.

**Requiring entry of international format**

By default, users can enter phone numbers in their territory's local format and do not have to format the number for international dialing.

The phone number field automatically formats local phone numbers into E.164-compliant international phone numbers when the user finishes editing the field. As long as the phone number entered matches the territory's format for a local number, users can save the phone number.

Changing the `glide.phone_number_e164.allow_national_entry` system property or adding the `pn.allow_national_entry` dictionary attribute requires users to enter a phone number in the territory's international format, which starts with the plus (+) character. Users cannot save a locally formatted phone number, and the phone number input box displays a red line underneath phone numbers without the proper international formatting.

**Configure the display of the local format**

By default, an E.164 phone number field always displays phone numbers in an international format.
Change the E.164 phone number to use the local format in certain circumstances by adding the following system property:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.phone_number_e164.display_national | • **Type**: string  
• **Default value**: false  
• **Other possible values**:  
  • **true or form**: displays phone numbers in a local format on forms, but displays an international format on lists.  
  • **all**: always displays phone numbers in a local format.  
  • **user**: only displays phone numbers in a local format when the phone number matches the local setting of the current user.  
  • **false**: does not display phone numbers in local format. |

Select one of the possible values to determine how the system handles the E.164 phone number.

You can also add the following dictionary attribute to a specific field to override the system property:

<table>
<thead>
<tr>
<th>Dictionary attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| pn_display_national  | Overrides the glide.phone_number_e164.display_national property setting for how an E.164 phone number field displays phone numbers. Available values are identical to those described for the glide.phone_number_e164.display_national property.  
  • **Type**: string  
  • **Default value**: false  
  • **Example**: pn_display_national=all |

Configure the phone territory selector choice list
By default, an E.164 phone number field always displays the phone territory associated with the phone number.

Changing the system property or adding the dictionary attribute hides the territory selector choice list. If the territory selector choice list is hidden, users can only enter a local or national number.

Phone e164 hide selector

Add the following system property to show or hide the territory selector choice list.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| glide.phone_number_e164.display_territory_selector | Determines whether to display the territory selector choice list. Hiding the territory selector choice list restricts users to entering only local or national phone numbers.  
  • **Type**: true | false  
  • **Default value**: true |
You can also add the following dictionary attribute to a specific field to override the system property:

<table>
<thead>
<tr>
<th>Dictionary attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pn_display_territory_selector</td>
<td>Overrides the glide.phone_number_e164.display_territory_selector property setting that determines whether to display the territory selector choice list. Available values are identical to those described above for the glide.phone_number_e164.display_territory_selector property.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: true</td>
</tr>
<tr>
<td></td>
<td>• Example: pn_display_territory_selector=false</td>
</tr>
</tbody>
</table>

Configure the display of territory labels
A property controls how territory labels are displayed.

You can display territory labels to the right of the number in an E.164 phone number field by setting the system property or adding the dictionary attribute. This is useful if the territory selector choice list is turned off and you want the user to see the territory for the entered phone number.

Enabling territory labels also displays the phone territory in lists.

Add the following system property to display the territory label to the right of the number in an E.164 phone number.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.phone_number_e164.display_territory_text</td>
<td>Determines when an E.164 phone number field displays a territory label.</td>
</tr>
<tr>
<td></td>
<td>• Type: string</td>
</tr>
<tr>
<td></td>
<td>• Default value: read-only</td>
</tr>
<tr>
<td></td>
<td>• Other possible values:</td>
</tr>
<tr>
<td></td>
<td>• all: always displays the territory label.</td>
</tr>
<tr>
<td></td>
<td>• national: displays the territory label only if the phone number is in local format.</td>
</tr>
<tr>
<td></td>
<td>• read-only: displays the territory label in read-only mode, regardless of whether the number is in local or international format.</td>
</tr>
<tr>
<td></td>
<td>• read-only-national: displays the territory label in read-only mode only if the number is in local format.</td>
</tr>
<tr>
<td></td>
<td>• list: displays the territory label in a list.</td>
</tr>
<tr>
<td></td>
<td>• list-national: displays the territory label in a list if the number is in national format.</td>
</tr>
<tr>
<td></td>
<td>• none: does not display the territory label.</td>
</tr>
</tbody>
</table>

You can also add the following dictionary attribute to a specific field to override the system property:
Configure the international direct dialing prefixes

A property is available to control the display of prefixes.

You can enable the display of the international direct dialing prefix, which appears between the territory selector choice list and the input box for an E.164 phone number field on forms, by setting the system property or adding the dictionary attribute.

![E164 phone display idd](image)

Add the following system property to display the international direct dialing prefix.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.phone_number_e164.display_users_idd</td>
<td>Determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
</tbody>
</table>

You can also add the following dictionary attribute to a specific field to override the system property:

<table>
<thead>
<tr>
<th>Dictionary attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pn_display_users_idd</td>
<td>Overrides the glide.phone_number_e164.display_users_idd property that determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms. Available values are identical to those described above for the glide.phone_number_e164.display_users_idd property.</td>
</tr>
<tr>
<td></td>
<td>• Type: true</td>
</tr>
<tr>
<td></td>
<td>• Default value: false</td>
</tr>
<tr>
<td></td>
<td>• Example:pn_display_users_idd=false</td>
</tr>
</tbody>
</table>
E.164 phone number field system properties
Several properties are available to configure E.164 phone number fields.

Note: To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

e.164 phone number field system properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.phone_number_e164.strict</td>
<td>Determines whether all phone number fields must match the display format for the selected territory. When the value is <code>true</code>, the phone number input box displays a red line underneath phone numbers that do not match the format for the selected territory. Users cannot save the phone number. When the value is <code>false</code>, the phone number input box displays a green line underneath phone numbers that do not match the format for the selected territory. Users can save the phone number. The territory selector choice list offers the option to select an Other / Unknown territory format.</td>
</tr>
<tr>
<td>Type: true</td>
<td>false</td>

</table>
| glide.phone_number_e164.display_territory_text | Determines when an E.164 phone number field displays a territory label.  
  - **Type**: string  
  - **Default value**: read-only  
  - **Other possible values**:  
    - **all**: always displays the territory label.  
    - **national**: displays the territory label only if the phone number is in local format.  
    - **read-only**: displays the territory label in read-only mode, regardless of whether the number is in local or international format.  
    - **read-only-national**: displays the territory label in read-only mode only if the number is in local format.  
    - **list**: displays the territory label in a list.  
    - **list-national**: displays the territory label in a list if the number is in national format.  
    - **none**: does not display the territory label.  
  - **Location**: Add to the System Properties [sys_properties] table. |
| glide.phone_number_e164.display_users_idd | Determines whether to display the international direct dialing prefix between the territory selector choice list and the input box on forms.  
  - **Type**: true | false  
  - **Default value**: false  
  - **Location**: Add to the System Properties [sys_properties] table. |

Configure a territory phone display rule

The string of numbers that make up a phone number is automatically validated and formatted for a specific territory by applying a series of regular expressions.

Role required: admin

The number is first validated against the phone validations that have been defined for the territory, and in the order specified by the Order field. To be valid, the number must match the regular expression defined in the Condition field for at least one phone validation.

After a number has been validated, the Condition expression for each format defined for the territory is applied to the number in the order determined by the Order fields. The Pattern and Format regular expressions are applied to produce a phone number that is formatted correctly for the territory.

The Sys Phone Territory screen allows administrators to edit the display rules for a given territory. Administrators may want to modify the Active, Display, or Order fields. To edit the display rules for a territory:

2. Click a territory Name.
3. Edit the fields, as appropriate (see table).
4. Click Update.

## Territory phone display rules

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The unique name of the territory.</td>
</tr>
<tr>
<td>Country calling code</td>
<td>The country code for dialing numbers from outside the territory.</td>
</tr>
<tr>
<td>International direct dial</td>
<td>The prefix for calling internationally from the territory, such as 00 or 001.</td>
</tr>
<tr>
<td>STD</td>
<td>The subscriber trunk dialing code, also known as the direct distance dialing code, which is a sequence of numbers before the telephone number that indicate whether the call is to be routed outside of the local calling area.</td>
</tr>
<tr>
<td>International prefix</td>
<td>The prefix required to dial an international call, such as a plus sign (+).</td>
</tr>
<tr>
<td>National prefix</td>
<td>The prefix required to dial a local call.</td>
</tr>
<tr>
<td>Active</td>
<td>An indicator for whether the territory phone definition is active. If deactivated, this territory unavailable to users.</td>
</tr>
<tr>
<td>Trunk dialing code optional</td>
<td>An indicator for whether the STD code is optional.</td>
</tr>
<tr>
<td>STD follows country</td>
<td>An indicator for whether the STD code should be displayed to the right of the country calling code.</td>
</tr>
<tr>
<td>Display</td>
<td>An indicator for whether to display the territory in the choice list. Clearing this check box removes the territory from the choice list. If an international number is entered for a territory that is not displayed in the territory selector choice list, that territory is temporarily added to the selector choice list for that field only. For example, if the United Kingdom Display field is not selected, the United Kingdom does not appear in the territory selector choice list. However, if the user enters an international number beginning with +44, the United Kingdom is added to the list and the number is formatted and validated accordingly.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which a territory appears in a choice list. Territories are sorted numerically by the number assigned here. If more than one territory is assigned the same number, they are subsorted alphabetically. All territories are assigned a default value of 100. To display a territory at the top of the list, assign a value that is less than 100. To display a territory at the end of the list, assign a value that is greater than 100. For example, if a territory is assigned an order of 500, it is displayed at the end of the list, and if more than one territory is assigned an order of 500, they are listed alphabetically at the end of the list.</td>
</tr>
</tbody>
</table>
Phone validations

Phone validations are already configured for all territories and are automatically applied to the phone number to ensure that the number is valid for the territory.

Phone formats

Phone formats are already configured for all territories and are automatically applied to the phone number to ensure that the number is valid for the territory.

E164 phone formats

Reference field type

A reference field stores a reference to a field on another table. For example, the Caller field on the Incident table is a reference to the User [sys_user] table.

When you define a reference field, the system creates a relationship between the two tables. Adding a reference field to a form makes the other fields in the referenced table available to the form.
Administrators can create new reference fields and configure several options for reference fields.

**Reference field options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display values</td>
<td>Each reference field stores a sys_id for each referenced record in the database, but the sys_id is not shown. The reference field shows the specified display value.</td>
</tr>
<tr>
<td>Decorations</td>
<td>A reference decoration is an icon that appears next to a reference field.</td>
</tr>
<tr>
<td>Reference styles</td>
<td>Reference styles are specialized field styles that control the appearance of reference fields.</td>
</tr>
<tr>
<td>Reference qualifiers</td>
<td>Reference qualifiers restrict the records that are available for reference fields.</td>
</tr>
<tr>
<td>Cascade delete rules</td>
<td>Cascade delete rules specify what should happen to records that reference a record that is deleted.</td>
</tr>
<tr>
<td>Auto-complete</td>
<td>By default, a reference field auto-completes as the user types in the field. Administrators can configure auto-complete settings.</td>
</tr>
<tr>
<td>Reference key</td>
<td>A reference key saves a field other than sys_id as the unique identifier for a reference field.</td>
</tr>
<tr>
<td>Enable dynamic creation</td>
<td>When dynamic creation is enabled, entering a nonexistent value in a reference field creates a new record on the referenced table instead of returning an error.</td>
</tr>
</tbody>
</table>

**Add a reference field**

Add reference fields to a table using the same method as for any other field.

Role required: personalize_form

The related table also appears in the Available Tables list for future form customizations.

1. Open the desired form.
2. Right-click the header and select **Configure > Form Layout**.
3. Use **dot-walking** to locate and select the field in the referenced table that you want to add.
   It appears as **Table name.Field**. For example, the caller's email address appears as **Caller.Email**.
4. Click **Save**.

**Enable dynamic creation for reference fields**

When dynamic creation is enabled, entering a nonexistent value in a reference field creates a new record on the referenced table instead of returning an error.

Role required: personalize_dictionary

By default, a user must enter a value in a reference field that matches an existing record in the table that the reference field refers to. For example, the **Caller** field in an Incident must have a value that is an existing user. You can enable
dynamic creation to create a new record on the referenced table when a user enter a nonexistent value in a reference field instead of returning an error.

1. Right-click the field label in the form and select **Configure Dictionary**.
2. Populate the following fields (you may need to configure the Dictionary form):
   
   - **dynamic_creation**: Select the check box.
   - **dynamic_creation_script**: Enter a script that dynamically creates the record.

3. Click **Update**.

Examples:

You could use the following `dynamic_creation_script` to create a record on the referenced table.

```javascript
current.name = value;
current.insert();
```

**Note**: The parent object can be used to access anything from the parent record.

You could create a script include named `MyUserReferenceCreator` with the following contents:

```javascript
var MyUserReferenceCreator = Class.create();
MyUserReferenceCreator.prototype = {
   initialize: function() {
   },
   create: function(current, value) {
      current.name=value;
      return current.insert();
   },
   type: 'MyUserReferenceCreator'
}
```

When the script include is created, the following `dynamic_creation_script` generates a new location for an invalid reference field value:

```javascript
new MyUserReferenceCreator().create(current, value);
```

**Configure cascade delete rules**

When a record is deleted, there are different options for how the deletion will affect records that reference the deleted record. You can configure what happens to records that reference a record when that record is deleted.

Role required: personalize_dictionary

For example, if you delete a user record that is referenced in the **Caller ID** field on several incident records, you can configure what happens to those incident records. By default, the references are cleared, so the incident records are maintained with an empty **Caller ID** field.

1. Navigate to a reference field on a form.
2. Right-click the field label and select **Configure Dictionary**.
3. Under **Related Links**, click **Advanced view**.
5. In the **Reference cascade rule** field, select one of the following options.

   ![Note: The option for this field have no effect for tables with m2m relationships, meaning that in this example, if the tables have an m2m relationship, the user record is deleted.]

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clear or -- None --</td>
<td>Deleting a record clears references (default option).</td>
</tr>
<tr>
<td>Delete or Cascade</td>
<td>Deleting a record also deletes all referencing records. For example, when a user record is deleted, any incidents assigned to the user are also deleted. <strong>CAUTION:</strong> Use this method with caution.</td>
</tr>
<tr>
<td>Restrict</td>
<td>Deleting a record is restricted unless there are no references to the record. For example, prevent the user record from being deleted if any incident includes a reference to the user.</td>
</tr>
<tr>
<td>None</td>
<td>Deleting a record does not change records that reference the record.</td>
</tr>
</tbody>
</table>

6. Click **Update**.

**Define the reference key**

By default, reference fields store the sys_id of the record in the database.

Role required: personalize_dictionary

By defining a reference key, you can identify a field other than sys_id to use as the unique identifier for the reference field. The value of the reference key field, instead of the sys_id, is stored in the database for that reference field.

1. Navigate to **System Definition > Dictionary**.
2. Open the field record (for example, **resolved_by** on the Incident table).
3. In the **Reference key** field, enter a field name on the referenced table (for example, email on the sys_user table). 
   
   ![Note: Always choose a field from the referenced table that is both required and unique.]

4. Click **Update**.
Display a reference field as a choice list
You can display a reference field as a choice list instead of opening a lookup window.

Role required: personalize_dictionary

1. In the form, right-click the label for the reference field and select Configure Dictionary.
2. In the Choice List Specification section, select one of the following options in the Choice field.
   - Dropdown with --None--
   - Dropdown without --None--
3. Right-click the form header and click Save.
5. In the Attributes field, add the following attribute, separated from other attributes by a comma.
   

ref_auto_completer=AJAXReferenceChoice

6. Click Update.
The form reopens, with the reference field as a choice list.

Note:
The glide.ui.max_ref_dropdown system property determines whether a reference field is displayed as a choice list or a reference icon. When the number of available choices exceeds the value of this
property, a reference icon displays instead of a choice list. The default value of this property is 25. This property affects the entire instance, however you can override this property on an individual field by using the `max_ref_dropdown` dictionary attribute. Modifying dictionary attributes requires the personalize_dictionary role.

The `glide.xmlhttp.max_choices` system property determines how many choices display on a choice list. This property has a value of 15 by default, however, when the property is not present on the instance, the instance uses a hard coded value of 10.

### Display values

Reference fields store a sys_id for each referenced record in the database, but the sys_id is not shown.

The reference field shows the display value. For example, an incident's **Assigned to** field stores the sys_id of a particular user, but actually displays the user's name. The following example shows how **Charlie Witherspoon**, which is the display value of a user record, is shown in the **Assigned to** field.

```
<xml>
    <incident>
        <active>true</active>
        <activity_due/>
        <approval/>
        <approval_history/>
        <approval_set/>
        <assigned_to display_value="Charlie Witherspoon">46b87022a9fe198101a78787e40d7547</assigned_to>
    </incident>
</xml>
```

### Display value xml

<table>
<thead>
<tr>
<th>Reference field</th>
<th>Value stored in database</th>
<th>Display value field of source table</th>
<th>Value displayed in UI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assigned to [task.assigned_to]</td>
<td>46b87022a9fe198101a78787e40d7547</td>
<td><code>[sys_user.name]</code></td>
<td>Charlie Witherspoon</td>
</tr>
</tbody>
</table>

Reference fields show display values in:

- Lists
- Forms
- Reports
- Auto-complete suggestions
- Slushbuckets

**Select a field as the table display value**

Only one field can be defined as the display value for a table.

Role required: personalize_dictionary
When you set the **Display** value to **true**, a business rule sets the **Display** value to **false** for all other fields on the table. In previous versions, you must manually ensure that no other fields on the table have a value of **true** in the **Display** column.

**Note:** Extended tables inherit the display value of the parent table. Setting a separate display value for the extended table overrides the parent table’s display value.

1. Navigate to **System Definition > Dictionary**.
2. Filter on `[Table] [is] <name of the referenced table>`.
3. Locate the desired field and set **Display** to **true**.

For best results, choose a field that is required and unique in each record as the display value field.

Reference fields look for the display value in the following order:

a. A field with display=**true** in the system dictionary on the lowest sub-table for extended tables.

b. A field with display=**true** in the system dictionary on the parent table.

c. A field named **name** or **u_name**.

d. The **Created on** field of the referenced record.

**Decorations**

Reference decorations are icons which appear next to the reference field.

The reference lookup is always visible and is used to select a record to reference. Other reference decorations appear when a record is selected.

**Reference lookup**

On forms, the reference lookup icon (🔍) appears by editable reference fields. Clicking the reference lookup icon displays a list of records on the referenced table.

When List v3 is enabled, the list appears in a popover. Otherwise, the list appears in a pop-up window.
Reference lookup list popover
UI15 reference lookup list pop-up

Tree picker lookup

The reference lookup can be rendered in the tree picker format by modifying the dictionary and adding the attribute `tree_picker`.

You cannot customize the label names used in the tree picker. The label names are taken from the values in the table.
Reference field icon

On forms, the reference icon (i) appears by populated reference fields. Clicking the icon opens a read-only preview of the referenced record.
The preview remains open until you click somewhere else on the form.

Click **Open Record** to navigate to the referenced record.

**Note:** When using a reference icon in Service Portal, a form opens using the default view of the form rather than a popup view. Write permissions to this form are the same as opening the form in the default view in the standard UI.

Configure the reference icon view of fields

Use a table's sys_popup form view to configure the fields in the pop-up form that appear when pointing to a reference icon. If the table has no sys_popup view, the pop-up uses the default view.

Role required: personalize_form

The pop-up form displays in the top form section only.

1. To configure a reference field popup form for a table using the default sys_popup view, navigate to the following URL format, substituting the instance name and table name:

   `<your instance name>.service-now.com/<table name>.do?sysparm_view=sys_popup`

   **Note:** This URL format only shows a table and default sys_popup view. It does not work for records that use a different view.

   An example of an instance for Acme, the sys_user table, and the sys_popup default view:

   `acme.service-now.com/sys_user.do?sysparm_view=sys_popup`

2. Optional: To configure a reference field popup form for a table using a non-default sys_popup view, navigate to the following URL format, substituting the instance name, table name, and name of view:

   `<your instance name>.service-now.com/<table name>.do?sysparm_view=sys_popup,<name_of_view>`

   An example of an instance for Acme, the sys_user table, and the sys_popup ESS view:

   `acme.service-now.com/sys_user.do?sysparm_view=sys_popup,ess`

3. Configure the form to add or remove fields as appropriate.

Configure pop-ups on read-only fields

Reference pop-ups and click-throughs are hidden by default when a client script, UI policy, variable, or ACL makes the field read-only. The ability to see or click through to the target record does not depend on whether the reference field is writable. You can change the read-only setting.

Role required: admin

1. Navigate to **System Properties > UI Properties**.

2. Change the value of the **Enable click-through of a reference field when the reference field is read-only.** (*glide.ui.reference.readonly.clickthrough*) property.

   If set to true, the pop-up appears for read-only fields and for variables.

   If this system value is set to **false**, you can override the setting for a specific read-only reference field. Configure the dictionary entry and add the **readonly_clickthrough=true** attribute.
Configure the related incidents icon
You can configure an icon to appear beside a reference field in a form, such as the Caller field, to display related incidents.

Role required: admin

The show related incidents icon

displays other incidents related to the referenced record.

1. In the form, right-click the label for the reference field and select Configure Dictionary.
2. Add the ref_contributions=user_show_incidents dictionary attribute in the Attributes field.
3. Click Update.
   The form reopens and the related incidents icon appears beside the field on the right.

Configure the show workflow icon
You can configure an icon to appear beside a workflow field to display the related workflow in the Workflow Editor.

Role required: admin
The show workflow icon (⚠️) opens the workflow in the Workflow Editor.

1. In the form, right-click the label for the workflow field and select Configure > Configure Dictionary.
2. Add the ref_contributions=show_workflow dictionary attribute in the Attributes field.
3. Click Update.
   The form reopens and the show workflow icon appears beside the field on the right.

Reference qualifiers

Use reference qualifiers to create filters that restrict the data that is returned for a reference field.

A reference field stores a link (reference) to a field on another table, making the records/fields in the referenced table available to the form containing the reference field.

For example, the Assigned to field on the Incident table is a reference to the User [sys_user] table. By default, all values for the field that is being referenced appear in the reference lookup and can be directly accessed through the reference field (type ahead). Expanding on the prior example, if a reference qualifier is not defined, all users in the User table appear in the reference lookup. Including those users that are inactive. Sometimes, this might be the desired functionality. In other cases however, only a subset of the available values may be desired. In this case, create a reference qualifier to filter the available data so that only the desired values are returned and made available to the form. Such as only the active users or users that have a specific role. Reference qualifiers are robust and can consist of simple AND/OR conditions, inline JaveScript, or complex script include.

You can modify the reference qualifier for a table, and any table based on that table (parent or extended), by defining a reference qualifier through the Dictionary Entry form. You can also modify the reference qualifier only on an extended table and its children (not the parent table), through a dictionary override. You can only define a single reference qualifier per field, per form/table. Reference qualifiers are not applicable to condition builders. For information on using filtering in condition builders, see Create a dynamic filter option.

Note: Creating reference qualifiers requires knowledge of the underlying ServiceNow data model (tables and fields) and knowledge of the ServiceNow API and scripting.

You can define a reference qualifier using one of the following methods.

Simple reference qualifier

Simple reference qualifiers use AND/OR statements (conditions) to create simple filters. Use simple reference qualifiers when filtering on conditions such as whether a company is active, a user has a specific role, and/or a caller is in a specific time zone. Simple reference qualifiers can have a maximum of 13 reference qualifier conditions. For additional information on how to use condition builders, see Condition builder.
Dynamic reference qualifiers

Dynamic reference qualifiers enable you to use a dynamic filter option to run a query against a reference field to filter the returned data set. Dynamic filter options are stored filters that can contain encoded query strings, JavaScript, or script includes, and can be used in multiple dynamic reference qualifiers. Changes made to a dynamic filter option automatically apply to all reference qualifiers that use the same dynamic filter option. Use this type of reference qualifier when you want to use the same filter on multiple forms or to provide filter functionality to "non-code savvy" implementers.

The base instance provides several OOB dynamic filter options. If a dynamic filter option that meets your needs does not exist, you can create a new dynamic filter option that is specific to your requirements. An example of an OOB dynamic filter option is the reference qualifier on the Model ID field on a configuration item form, such as the Computer form. The reference qualifier calls the CI Model Qualifier dynamic filter option, which in turn calls the ModelAndCategoryFilters script include. This script include filters the data set based on the class of the CI. The only options for the model ID are options that belong to the same class as the current CI. For example, only CIs that belong to the Computer class are available in the Model ID field on the Computer form.

To locate the available dynamic filter options, navigate to System Definition # Dynamic Filter Options. In the right-corner of the Dynamic Filter Options list, click the filter icon and create the filter condition Available for ref qual is true. All dynamic filter options that can be used in dynamic reference qualifiers appear.
Dynamic reference qualifier example

Advanced reference qualifier

Advanced reference qualifiers enable you to define an inline encrypted query string or JavaScript (actual code or the name of an existing script include or business rule) filter directly in the Reference quali field of the reference qualifier. Similar to the other reference qualifier types, when the form loads, the filter is executed, and only the records that match the filter appear in the reference field. Use this type of reference qualifier for implementations that only require a simple, unique filter, that cannot be handled by a simple reference qualifier, and is not used across multiple reference fields.

Note: As a good practice, make JavaScript calls to functions in a script include instead of a global business rule.

An example of an encoded query string is vendor=true, which returns all companies that are designated as vendors. Entering this string is the same as using the condition builder as shown in the example for the simple reference qualifier. For additional information on valid encoded query string syntax and examples, see Encoded query strings.
Advanced reference qualifier examples

An example of a JavaScript call is `javascript:new myScriptInclude().my_refqual()`. This code calls the function `my_refqual()` in the script include `myScriptInclude()`. The function must return a query string that can filter the options available on a reference field.

**Note:** You can also use encoded JavaScript filters such as `javascript:'u_active=true^' + "u_hr_service="+current.hr_service` in reference qualifiers.

In another example, if you are trying to filter based on the current company, you don’t have use a lookup script but can simply add this line to your dynamic qualifier:

```javascript
return "company=" + current.company;
```

You can also simplify this and use an advanced reference qualifier instead of a dynamic one:

```javascript:"company=" + current.company
```
Related lists and reference qualifiers

When a field appears on multiple related lists on a single form view, it may be necessary to validate which related list is being referenced to properly build the reference qualifier for the field. In this situation, configure the list control for the related list and enter a unique tag in the List edit tag field. This tag value is available to filter scripts as a variable named listEditRefQualTag. The following script include code is an example of a function that uses this type of tag.

```javascript
// Advanced reference qualifier on the CI Relationship Child field that takes into account // the related list that we are editing the child field on, if the field is being edited // from a tagged related list.

cmdb_rel_ci_child_refQual:function(){
  if(listEditRefQualTag =="application") return "sys_class_name = cmdb_ci_appl";
}
```
Using Javascript current syntax in reference qualifiers

current is a JavaScript object that contains the fields and field values of the active (current) record. For forms, this is the record that is displayed (loaded) in the form. Within advanced and dynamic reference qualifiers, you can use the JavaScript current object to define filters such as javascript:”company=” + current.company.

This JavaScript, within a reference qualifier, only returns the records from the referenced table that are equal to the company field value of the current record. So, if the value that appears in the Company field is Acme, the JavaScript returns all reference field records whose company value is equal to Acme (company=“Acme”). If you then bring up a record whose company value is “ViewRite”, the JavaScript resolves to company=“ViewRite.”

All fields within the currently loaded form (tables) are available for use with the current object. Use dot-walking to access values in a table, including the referenced table. For example, on the Incident form, the Assigned To field references the User table. To access the email address of the user, use the following syntax: javascript:”emailAddress=” + current.assigned_to.email.

Configure reference qualifiers

System administrators can configure reference qualifiers that enable filtering of the associated reference field.

This task walks you through creating a reference qualifier in the system dictionary. When creating a reference qualifier in the system dictionary, it not only applies to that table, but also to all the children of the table.

Note: You can also create reference qualifiers on extended tables through dictionary overrides. Dictionary overrides only impact the extended table and any of its children, not the parent table.

1. Navigate to the reference field on the form or table on which you want to define a reference qualifier.
2. Right-click the reference field label and select Configure Dictionary.

   The simple reference qualifier is available in both the default view and the advanced view. The dynamic and advanced reference qualifiers are available only in the advanced view.

4. In the Reference Specification section, verify that the table in the Reference field contains the table that you want associated with the reference field, or select another table if necessary.
5. From the Use reference qualifier choice list, select the reference qualifier to implement.
6. Configure the qualifier based on the type of reference qualifier.

   • Simple: Build the condition using the choice lists.
   • Dynamic: Either select an existing dynamic filter option or define a new dynamic filter option.
   • Advanced: In the Reference qual field, enter an encoded query string, JavaScript that returns a query string, or the name of a script include or business rule to run.

7. Complete the Reference Specification — Additional Customization section, as appropriate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reference key</td>
<td>Identifies a field other than sys_ID to use as the unique identifier for the reference field.</td>
</tr>
</tbody>
</table>
### Field Description

**Reference cascade rule**

Defines what happens to a record if the record it references is deleted. Possible options include:

- None
- Cascade
- Clear
- Delete
- Delete no workflow
- Restrict

**Reference floats**

Flag that determines whether to configure the edit option for one-to-many relationships.

**Dynamic creation**

Flag that determines if the system should create a new record when a value for the reference field does not match an existing record. If you select this option, enter a script that specifies how to create the record in the **Dynamic creation script** field.

---

8. Click **Update**.

Constrain the assigned to field by role

This example shows how to use JavaScript and a business rule to restrict the incident **Assigned to** field choices to only the users with the `itil_admin` role.

Role required: personalize_dictionary or admin

You can also change `itil_admin` to any other role on a reference field that refers to the User table.

1. Open an incident.
2. Right-click the **Assigned to** field and select **Configure Dictionary**.
3. In the **Reference qual** field, enter
   
   javascript:"sys_idIN"+getRoledUsers("itil_admin").join(",").

4. Save the record.
5. To see the base system business rule that this JavaScript code calls, navigate to **System Definition > Business Rules**.
6. Open **getRoledUsers**.

   The business rule uses the following JavaScript code.

   ```javascript
   // Return an array of sys_ids of the users that have at least one role
   // optional parameters allow the exclusion (NOT IN) of some roles or
   // look for specific roles (IN)
   //
   // optional: queryCondition - 'IN' or 'NOT IN'
   // optional: roleList - a comma separated list of role names
   //
   function getRoledUsers(queryCondition, roleList) {
     var roleListIds;
     if (queryCondition && roleList) {
       roleListIds = getRoleListIds(roleList);
     }

     var users = {};
     var now_GR = new GlideRecord('sys_user_has_role');
     if (roleListIds) {
       now_GR.addQuery('role', queryCondition, roleListIds);
     }
     now_GR.query();
   }
   ```
Constrain the assignment group field

This example shows how to use an advanced reference qualifier with JavaScript and a script include to restrict the incident Assignment group choices to only the groups that contain the user specified in the Assigned to field.

Role required: personalize_dictionary or admin

1. Open an incident.
2. Right-click the Assignment group label and select Configure Dictionary.
3. If the form appears in Default view, under Related Links, click Advanced view.
4. In the Use reference qualifier field, ensure that the Advanced option is selected.
5. In the Reference qual field, enter javascript:new ReferenceQualifierHelper().backfillAssignmentGroup().
6. Save the record.
7. Navigate to System Definitions > Script Includes.
8. Click New.
9. Create a script include with the following JavaScript code. Ensure that the Accessible form field is properly set for the environment.

```javascript
var ReferenceQualifierHelper = Class.create();
ReferenceQualifierHelper.prototype = {

  backfillAssignmentGroup:function() {
    var assigneeGroupsQualifier = '';
    var assignee = current.assigned_to;

    //return if the assigned_to value is empty (this causes all groups to be returned)
    if(!assignee)
      return;

    //sys_user_grmember has the user to group relationship
    var grAssigneeGroups = new GlideRecord('sys_user_grmember');
    grAssigneeGroups.addQuery('user',assignee);
    grAssigneeGroups.query();

    while (gr.next()) {
      assigneeGroupsQualifier = assigneeGroupsQualifier + 'IN',assignee + ',
    }

    return assigneeGroupsQualifier;
  }

  // get sys_id's for the named roles
  getRoleListIds: function(roleList) {
    var ids = [];
    var now_GR = new GlideRecord('sys_user_role');
    now_GR.addQuery('name','IN',roleList);
    now_GR.query();
    while (now_GR.next()) {
      ids.push(now_GR.sys_id.toString());
    }
    return ids;
  }
}
```
while (grAssigneeGroups.next()) {
    if (assigneeGroupsQualifier.length == 0) {
        // Create the beginning of the qualifier and add the 1st group
        assigneeGroupsQualifier = 'sys_idIN' +
        grAssigneeGroups.getValue('group');
    } else {
        // build a comma separated string of groups if there is more than one
        assigneeGroupsQualifier += (',' + grAssigneeGroups.group);
    }
} // return Groups where assigned to is in those groups we use IN for lists
    gs.log('DP: RefQual = ' + assigneeGroupsQualifier);
    return assigneeGroupsQualifier;
}

To test, create an incident and select a user in the Assigned to field. Click the Assignment group lookup icon. Only the groups that contain the user you selected appear. For example, you assign an incident to Bob Smith, who belongs to the Database group and the Networking group. The only options that appear in the assignment group are Database and Networking.

The INSTANCEOF operator in reference qualifiers
You can use the INSTANCEOF operator in a reference qualifier to shorten or simplify a complex class qualifier.

For example, use the INSTANCEOF operator for a reference field to the cmdb_ci table to specify that all subclasses of a class are included in the results. The following reference qualifier returns all servers, including Linux, UNIX, Windows, and so on, because each of those subclasses extend the cmdb_ci_server class.

```
sys_class_nameINSTANCEOFcmdb_ci_server
```

In another example, you can simplify the following reference qualifier in a similar way.

```
u_active=true^sys_class_name=cmdb_ci_acc
^ORsys_class_name=cmdb_ci_computer
^ORsys_class_name=cmdb_ci_server
^ORsys_class_name=cmdb_ci_win_server
^ORsys_class_name=cmdb_ci_unix_server
^ORsys_class_name=cmdb_ci_linux_server
^ORsys_class_name=cmdb_ci_appl
^ORsys_class_name=cmdb_ci_netgear
```

Using the INSTANCEOF operator, the reference qualifier is rewritten as follows because the server subclasses extend the cmdb_ci_computer class.

```
u_active=true^sys_class_name=cmdb_ci_acc
^ORsys_class_nameINSTANCEOFcmdb_ci_computer
^ORsys_class_name=cmdb_ci_appl
^ORsys_class_name=cmdb_ci_netgear
```

Auto-complete for reference fields
By default, a reference field auto-completes as the user types in the field.

Administrators can configure additional auto-complete options. A user must have table-level read permission on the referenced table for auto-complete to display any options.
Dictionary attributes for auto-completion of reference fields

There are dictionary attributes that are specific to reference fields and that determine auto-complete behavior.

**Reference field auto-completion dictionary attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| ref_auto_completer | Specifies the name of the client-side JavaScript class that creates the drop-down auto completion choices. Valid class values include:  
  - **AJAXReferenceCompleter**: Displays matching auto-complete choices as a drop-down choice list. The list only displays the reference table's display value column. Reference fields automatically use this class if there is no other auto-completion class specified.  
  - **AJAXTableCompleter**: Displays matching auto-complete choices as rows in a table. The table displays the reference table's display value column and any columns listed in the `ref_ac_columns` attribute.  
  - **AJAXReferenceChoice**: Displays matching auto-complete choices as a drop-down choice-list. The list only displays the reference table's display value column. Furthermore, the list only displays up to 25 matching choices. If there are more than 25 auto-complete choices, the reference field instead displays the choices with the AJAXTableCompleter class. |
| ref_ac_columns    | Specifies the list of reference table columns to display. Separated column names with a semi-colon. For example, `ref_ac_columns=user_name;email;sys_created_on` allows auto-complete to match text from the user_name, email, and sys_created_on columns. |
| ref_ac_order_by   | Specifies the reference table column that sorts the auto-completion choices. For example, `ref_ac_order_by=name` sorts the auto-completion choices alphabetically by name. |

Administrators can also set a user preference to use a **contains** auto-complete search.

**Auto-complete UI features**

The AJAX table completer class has a number of UI improvements.
- The table completer always displays the number of records the auto-complete query finds.
- The table completer highlights the entire selected row by changing the color of the background and text.
- The table completer lists a value for every column.
  - The first time a value appears in a column, the table completer displays it in black text.
  - The table completer displays subsequent duplicate values in grey text. Previously, the table completer displayed an empty cell in a column containing a duplicate value.

```
Assigned to  b
Showing 1 through 4 of 4
Bow Ruggeri  Development
Bernard Laboy  IT
Beth Anglin  IT
Bud Richman  Sales
```

Selected row highlight

Set the `ref_autoCompleter=AJAXTableCompleter` dictionary attribute to use these improvements.

Define auto-complete attributes for all references to a table
A field inherits and uses the reference table's auto-complete attributes unless the field has its own value for the same attributes. You can define the attributes for references to a table, and it affects every form that references that table.

Role required: personalize_dictionary

A field-level attribute overrides a table-level attribute of the same name. If a field uses different reference attributes from those that are defined for the reference table, then the field uses both sets of attributes.

Use these steps to define auto-complete attributes for all fields in a table that do not already have their own auto-complete attributes. This example describes how to define auto-complete attributes for all references to the User [sys_user] table.

**Note:** A field's auto-complete attribute value supersedes a table's auto-complete attribute value. This means that any existing field-level value for an auto-complete attribute supersedes any value the administrator applies to the auto-complete attribute from the reference table.

1. Navigate to a list of the target table, such as **User Administration > Users**.
2. Perform the appropriate action for your list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click the column header and click <strong>Configure &gt; Dictionary</strong>.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and click <strong>Configure</strong>, and then click <strong>Dictionary</strong>.</td>
</tr>
</tbody>
</table>

3. Select the row that does not list a column name.
This row is typically the first row in the list. For example, select the first **sys_user** link.
4. Under **Related Links**, click **Advanced view**.
5. In the Attributes field, enter a comma-separated list of auto-complete attributes you want to apply to all fields in the table.
   For example, to display the user's department with all references to the sys_user table, enter:

   
   ```
   ref_auto_completer=AJAXTableCompleter,ref_ac_columns=department,ref_ac_order_by=department
   ```

6. Click Update.

To test the new auto-complete attributes, open a form that references the User [sys_user] table, such as an open incident. Enter a single character in the Assigned to field. The auto-complete options now include both the user name and department.

![Assigned to auto-complete options](image)

Remove the display value column
You can remove the display value column from a reference field by setting the `ref_ac_display_value` attribute to false.

Role required: personalize_dictionary
This causes the reference field to remove the display value column and only display the columns listed in the `ref_ac_columns` attribute. This feature requires the use of the AJAXTableCompleter class and the `ref_ac_columns, ref_ac_columns_search`, and `ref_ac_display_value` attributes.

![Auto-complete note](image)

This example describes how to remove the display value column from references to the User [sys_user] table and replace it with references to the first_name and last_name columns.

1. Navigate to a list of the target table, such as User Administration > Users.
2. Perform the appropriate action for your list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click the column header and click Configure &gt; Dictionary.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and click Configure, and then click Dictionary.</td>
</tr>
</tbody>
</table>

3. Select the row that does not list a column name.
   This row is typically the first row in the list. For example, select the first sys_user link.
5. In the Attributes field, add the `ref_auto_completer, ref_ac_columns, ref_ac_columns_search`, and `ref_ac_display_value` attributes.
   For example, to hide the display value column and only display the user's first and last names enter the following:

   ```
   ref_auto_completer=AJAXTableCompleter,ref_ac_columns=first_name;last_name,ref_ac_order_by=first_name
   ```
6. Click **Update**.

To test the new auto-complete attributes, open a form that references the User [sys_user] table, such as an open incident. Enter a single character in the **Assigned to** field. The auto-complete options now hide the display value column (user_name) and only display the first_name and last_name columns.

![Assigned to auto-complete options](image)

**Improve auto-complete queries**

By default, all reference fields use a `starts with` query to search for matching text in the reference table. This prevents auto-complete from executing inefficient `contains` queries every time a user searches a reference field. You can require all reference fields to use a `starts with` query.

Role required: admin

The following example illustrates a `contains` query. Note that the letter "d" appears anywhere in the user's first or last name.

![Assigned to search filter](image)

This procedure describes how to change the `glide.ui.ref_ac.startswith` system property to always use a `starts with` query.

1. In the navigation filter, enter `sys_properties.list` and press the Enter key.
2. Select the `glide.ui.ref_ac.startswith` property.
   To search for the property, enter `*startswith` in the Go to search filter for the **Name** column.
3. In the **Value** field, replace `false` with `true`.

   **Note:** Setting the `glide.ui.ref_ac.startswith` system property to `true` overrides any existing `autocomplete.contains` settings in both user and system level preferences. This property changes the autocomplete query method for all users regardless of preferences.

4. Click **Update**.
5. Test the change by opening a record with a reference field and entering a character in it, as illustrated in the example below.

![Assigned to field with auto-complete search](image)

**Configure auto-complete to match text from any reference field**

By default, auto-complete only matches text in the display value column. You can configure a reference field to match text from any additional column the reference field displays.

Role required: personalize_dictionary

You can add the `ref_ac_columns_search` attribute to enable auto-complete to match text in any column listed in the `ref_ac_columns` attribute. Set the `ref_ac_columns_search` attribute to `true` to match text from all reference field columns. By default (or when this attribute is `false`) auto-complete only matches text in the display value column.

1. Right-click the label of a reference field.
2. Select Configure Dictionary from the choice list.
4. In the **Attributes** field, add the desired auto-completion attributes. For example, these attributes add the department field to the caller list and sort callers by their department:

```
ref_auto_completer=AJAXTableCompleter, ref_ac_columns=department, ref_ac_order_by=department
```

5. Click **Update**.

The following example describes how to set the **Configuration Item** field display the CI class names from auto-complete choices for the Configuration item [cmdb_ci] table.

```
ref_auto_completer=AJAXTableCompleter, ref_ac_columns=sys_class_name, ref_ac_order_by=sys_class_name, ref_contributions=task_show_ci_map ; ci_show_incidents
```

*Note:* The **ref_contributions** attribute controls the icons that appear next to the reference field.
Enable contains auto-complete searches

By default, the reference auto-complete uses a **starts with** search. A user preference can be created to implement a **contains** search.

Role required: admin

1. Disable the `glide.ui.ref_ac.startswith` system property.
   
   For more information, see Improve auto-complete queries.

   **Note:** Setting the `glide.ui.ref_ac.startswith` system property to **true** overrides any existing "autocomplete.contains" settings in both user and system level preferences. This property changes the auto-complete query method for all users regardless of preferences.

2. Navigate to **User Administration > User Preferences**.
3. Select the preference """"<referenced table>.autocomplete.contains"""".
4. Set the **value** field to **true**.

5. Click **Update**.

Log out and log back in to display the updated search.

*Wildcards in reference auto-completes*

Wildcard searches use the auto-complete functionality.

Use an asterisk in the reference field for wildcard searches.

**One asterisk wildcard search**

If two asterisks are entered, a list of available records display in the auto-complete suggestions.
Two asterisk wildcard search

Recent selections

Reference fields store a list of each user's recent selections to allow users to quickly select past values when filling in a reference field.

By default, the system stores up to 15 selections from a reference field for each user in the Recent Selection [sys_ui_recent_selection] table. Users can see the recent selections list by selecting an empty reference field.

Note: The system does not store recent selections for service catalog reference variables.

Note: Recent selections are not available in the service portal or mobile user interfaces.

The system uses auto-complete to filter the list of recent selections to match values the user enters.
The system adds a Recent Selection record whenever a user inserts or updates a reference field value. Administrators can control the number of recent selections the system displays with the `glide.xmlhttp.max_choices` system property. Setting the property to zero disables recent selections.

**Note:** This property also controls how many entries the system displays in choice lists.

**Suggestion field type**

To help users find what they are looking for, you can add a suggestion field to any form.

Role required: personalize_dictionary

1. Open the form to which you are adding a suggestion field.
2. Add a new field or locate an existing field.
3. Right-click the field label and select Configure Dictionary.
4. In the Choice field, select Suggestion.
5. Click **Update**.

Suggestions are presented to the user.

Configure suggested text for string fields

You can configure the suggested text options for string fields.

Role required: personalize_choices

1. Right-click the field label and select **Configure Choices**.
2. Using the slushbucket, select options and the order in which you want them to appear.
   - To create a new option, enter the suggested text in the **Enter new item field** and click **Add**.
- The **Apply to Table** field is available when the current table extends another table (for example, Incident extends Task). This field allows suggested text options to be configured for all tables that extend the parent or for only the current (child) table.

3. Click **Save**.
4. To edit existing options, right-click the field label and select **Show Choice List**.

---

**Configure suggested text for journal fields**

You can configure the suggested text options for journal fields, such as work notes or the activity stream. Suggested text options for journal fields are unavailable in UI16.

Role required: personalize_responses

1. Right-click the field label and select **Configure Responses**.
2. Click **New**.
3. Enter a label, or brief description, for the option.
4. Enter the complete text in **Response text**.
5. Click **Save**.
Wiki field type

Wikitext fields use the basic wiki markup language and support links to external URLs and to sources within the system.

Some fields in the base system support Wikitext and administrators can add Wikitext fields on any form in the system.

Supported wiki tags

Basic tags are supported for Wikitext fields in the system.

<table>
<thead>
<tr>
<th>Format</th>
<th>Wiki tag</th>
</tr>
</thead>
<tbody>
<tr>
<td>Headers</td>
<td>= Header 1 =, == Header 2 ==, etc.</td>
</tr>
<tr>
<td>Numbered step</td>
<td>#Step 1</td>
</tr>
<tr>
<td>Bullets (multi-level)</td>
<td>*Bullet 1, **Bullet 2</td>
</tr>
<tr>
<td>Indentation</td>
<td>:Level 1, ::Level 2</td>
</tr>
<tr>
<td>Line break</td>
<td>&lt;br&gt;</td>
</tr>
<tr>
<td>Format</td>
<td>Wiki tag</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Tables</td>
<td>Full table support, including cell spacing, padding, borders, background shading, and width measurements. For example:</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>! Header 1</td>
</tr>
<tr>
<td></td>
<td>! Header 2</td>
</tr>
<tr>
<td></td>
<td>-</td>
</tr>
<tr>
<td></td>
<td>row 1, cell 1</td>
</tr>
<tr>
<td></td>
<td>row 1, cell 2</td>
</tr>
<tr>
<td></td>
<td>-</td>
</tr>
<tr>
<td></td>
<td>row 2, cell 1</td>
</tr>
<tr>
<td></td>
<td>row 2, cell 2</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Sortable tables are not supported (class=&quot;sortable&quot;).</td>
</tr>
<tr>
<td>Code blocks</td>
<td>&lt;pre&gt; Generic block &lt;/pre&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;javascript&gt; Javascript Syntax &lt;/javascript&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;xml&gt; XML Syntax &lt;/xml&gt;</td>
</tr>
<tr>
<td>Bold</td>
<td>'''text'''</td>
</tr>
<tr>
<td>Italics</td>
<td>&quot;text&quot;</td>
</tr>
<tr>
<td>Ignore Wiki and HTML formatting</td>
<td>&lt;nowiki&gt; wikitext &lt;/nowiki&gt;</td>
</tr>
<tr>
<td>Web link</td>
<td><a href="http://community.service-now.com/">http://community.service-now.com/</a></td>
</tr>
<tr>
<td>Placed images</td>
<td>[[Image:&lt;image name&gt;]] For more information on uploading images or files to the database, see Storing images in the database.</td>
</tr>
<tr>
<td>HTML</td>
<td>Most common HTML tags are supported &lt;b&gt;bold&lt;/b&gt;, &lt;strong&gt;strong&lt;/strong&gt;, &lt;i&gt;italics&lt;/i&gt;, &lt;h1&gt;header1&lt;/h1&gt;, &lt;h2&gt;header2&lt;/h2&gt;, &lt;h3&gt;header3&lt;/h3&gt;, &lt;p&gt;paragraph&lt;/p&gt;, &lt;sub&gt;sub&lt;/sub&gt;, &lt;sup&gt;sup&lt;/sup&gt;, &lt;center&gt;center&lt;/center&gt;</td>
</tr>
</tbody>
</table>

### Create a Wikitext field

You can create a Wikitext field on any form.

Role required: personalize_form

1. Create a new field with the **Type** set to **Wiki**.
2. Click **Wikitext** to begin editing.

The Wikitext field appears on the form.

**Extend the functionality of a Wikitext field**

Configure the Wikitext field to link to other sources within the system.

Role required: personalize_dictionary

1. Right-click in the header of the new Wikitext field.
2. Select **Configure Dictionary**
3. In the **Dependent** field of the dictionary form, enter the field you want to use for linking to other pages.

For example, on the Incident table, you might choose the **number** field.
This configuration enables you to link to any incident by using that incident's number. For example, to open INC0000002, you enter \[\{INC0000002\}\].

The following dictionary attributes are available for wiki_text fields.

- **preview_first=true** - sets the preview mode to display on page load, otherwise editor will be displayed
- **preview_selector=true** - enables the toggle button to switch between the editor and preview
- **dual_mode=true** - enables displaying both the editor and the preview simultaneously during edit mode.

**Add and customize a field in a table**

Administrators can add new fields to a table to store and display data.

Role required: admin

**Warning:** Do not add more than 10 medium-length or longer String fields to a single table. Attempting to save a large number of characters in 11 or more String fields can result in the following error: Syntax Error or Access Rule Violation detected by database (Row size too large (> 8126).

1. Navigate to any form.
2. Right-click the form header and select **Configure > Form Layout**.
3. In the **Create new field** section, fill in the following fields:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter the name of the field as you want it to appear on forms and lists.</td>
</tr>
<tr>
<td>Type</td>
<td>Select a field type.</td>
</tr>
<tr>
<td>Field length</td>
<td>Select a field length. This field is visible only for certain field types.</td>
</tr>
</tbody>
</table>

4. Click **Add**.
5. Use the slushbucket to place the field in the desired location on the form.
6. Click **Save**.

The field now appears on the form in the designated location.

**Make a field mandatory**

Fields can be marked as mandatory, meaning they must contain a value before the record can be saved. Mandatory fields are marked with a field status indicator before the label.

Role required: personalize_dictionary

A mandatory field that is pre-populated by the platform with default data, such as a value from a client script, does not display the indicator. If you delete this value from the field, however, the indicator appears. The color of the indicator depends on the field state.

Using a dictionary entry to make a field mandatory does not work when using WebServices. You can use a data policy instead. For more information on data policies, see Data policy.

1. Right-click the field's label in the form and select **Configure Dictionary**.
2. In the **Dictionary** form, select the **Mandatory** check box.
3. Click **Update**.

   The next time the form is opened, a field status indicator appears next to the field label, indicating that a value is mandatory. If the mandatory field is pre-populated for any reason, the mandatory field indicator does not appear.

   **Note:** Mandatory fields are global. The field is marked as mandatory everywhere it appears in a form.

   **Note:** Making a **True/False** mandatory will have no effect. **True/False** fields are always considered to have a value. A selected check box has a value of true and an unselected check box has a value of false. Either of these values satisfies the requirement of a mandatory field.

**Mandatory Reference Fields**

A form can be saved with an empty mandatory field if that field is a reference field, and if the parent field is also blank. However, if the mandatory reference field shows a value from the parent field, then the form cannot be saved if this value is deleted. If the value in the referenced field is changed, the value for that field is changed everywhere it appears.

**Change the field label or hint**

You can change a field's label or the text that appears as a hint when you point your cursor to the field.

Role required: personalize_dictionary

1. Navigate to the form the field appears on.
2. Right-click the field label and select **Configure Label**.
3. Update the form.

**Changing the Field Label or Hint**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table the label appears on.</td>
</tr>
<tr>
<td>Label</td>
<td>The label that the field displays. You can enter up to 80 characters for the label, but not all databases support this many characters. The recommended maximum is 30 or fewer characters. HTML in field labels is not supported.</td>
</tr>
<tr>
<td>Plural</td>
<td>The plural version of the field label.</td>
</tr>
<tr>
<td>Element</td>
<td>The dictionary name of the field.</td>
</tr>
<tr>
<td>Help</td>
<td>Helpful text stored in the record.</td>
</tr>
<tr>
<td>Hint</td>
<td>A short description of the field that displays when the user hovers over it.</td>
</tr>
<tr>
<td>URL</td>
<td>A URL link that displays on the label if this field is not blank.</td>
</tr>
<tr>
<td>URL target</td>
<td>A target attribute that determines where the URL will open. For information on the target attributes, see this W3Schools article.</td>
</tr>
</tbody>
</table>

4. Click **Update**.
Delete a field from a table

You can delete custom fields that you created. Custom fields begin with u_. It is recommended that you remove the field from forms and lists instead of deleting it.

Role required: admin

You cannot delete base system fields. In addition, any missing base system fields are recreated when the instance is upgraded.

1. Navigate to a form that contains a custom field to delete.
2. Right-click the field label and select Configure Dictionary.
3. Click Delete Column in the form header, and then click OK.
4. To delete multiple custom fields, complete the following steps.
   a) Navigate to System Definition > Dictionary.
   b) Locate the custom fields to delete.
      For example, search for column names that start with u_.
   c) Check the boxes next to the fields to delete and select Delete from the action list below the list.
      A confirmation dialog opens and reminds you that this may result in deletion of related records. If there are dependencies for the selected fields, they are listed.
   d) To proceed, click Delete.

Add users to a watch list

Watch lists allow multiple users to subscribe to notifications of a task. Expand the watch list and select users with the glide controls.

Role required: none

1. Expand the watch list by clicking the lock icon (🔒).
2. Select users with the glide list controls (see table).

<table>
<thead>
<tr>
<th>Glide controls</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Icon</strong></td>
</tr>
<tr>
<td>🗝️</td>
</tr>
<tr>
<td>✗</td>
</tr>
<tr>
<td>🔄</td>
</tr>
<tr>
<td>🗃️</td>
</tr>
<tr>
<td>🗃️</td>
</tr>
<tr>
<td>🔍</td>
</tr>
</tbody>
</table>
Configure email notifications for watch lists

Watch lists (glide_list field type) allow multiple users to subscribe to notifications of a task. You can specify conditions in an email notification to send email notifications to the members when the conditions are met.

Role required: admin

To receive these notifications, users must define an email address in their user record or enter an email address into the watch list email field.

Important: Administrators configure email notifications for watch lists (see Configure email notifications for watch lists).

An advanced configuration using watch lists involves placing two watch lists on a form, one for the general comments on a task and another for work notes or non-public comments. By configuring separate email notifications, separate users on each watch list can be notified about different information.

If users on a watch list are getting more than one email for each update to an incident, it can be because other recipients are replying all to an email notification. Recipients may be receiving email through their email system (Outlook, Groupwise, and so on) and through the base system. To stop this duplication, remove the names of other users from the email or the watch list.

1. Open the notification to configure.
2. In the Who will receive section, select the icon beside Users/groups in fields.
3. Double-click Watch list in the Available column to move it to the Selected column.
4. Click Update.

Hide email addresses in a watch list

You can remove the email address text entry element from a watch list by modifying the dictionary.

Role required: admin

1. Open a task record that displays the Watch list field.
2. Right-click the label and select Configure Dictionary.
3. In the Attributes related list, click New.
4. Enter or select the no_email attribute and enter true in the Value field.
5. Click Submit.

The email entry field is hidden. Users can select users from the reference field to add to the watchlist.

Configure order buttons on the watch list slushbucket

When you add multiple users to a glide_list, such as a watch list, the slushbucket does not display the order buttons for the list of selected members. You can set a dictionary attribute to display the order buttons.

Role required: admin

The slushbucket opens when the user clicks the add/remove multiple users icon.
By default the order buttons on the right are not displayed. Follow the procedure to display the order buttons.
1. Open a task record that displays the **Watch list** field.
2. Right-click the label and select **Configure Dictionary**.
3. Under **Related Links**, click **Advanced view**.
4. In the **Attributes** field, enter `maintain_order=true` separated by a comma if necessary.
5. Click **Update**.

**Highlight list fields**

Color fields in lists to call an agent's attention to them.

Role required: admin

Highlighted fields in lists appear colored and optionally, have a leading bullet.
The set up involves specifying the fields that gets highlighted and the conditions that trigger the highlighting.

**1. When you list records from this table**

**2. Highlight this field in each record**

**Priority = 1 - Critical**

**3. Where this condition is true**  
100  true

Available highlighting colors are:

- Critical
- High
- Warning
- Moderate
- Positive
- Info
- Low

You cannot highlight the following field types:

- Reference
- URL
• Document IDs

1. Navigate to Workspace Experience > Administration > Highlighted Values and click New.
2. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Name of the table that contains the fields you want to highlight.</td>
</tr>
<tr>
<td>Field</td>
<td>Name of the field you want to highlight if the triggering conditions are met.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of applications this highlighting pertains to.</td>
</tr>
<tr>
<td>Workspace</td>
<td>The workspace this highlighting applies to.</td>
</tr>
</tbody>
</table>

The **Field** value can be unrelated to the condition that triggers the highlighting. In the following example, if the **Caller** is Fred Luddy, Workspace highlights the **Priority** field, not the **Caller** field.

3. Right-click the header and click **Save**.
   You've specified the field where the highlights appear. Now, it's time to specify the conditions that trigger the highlighting.

4. In **Highlighted Value Conditions**, click **New**.
5. In the Highlighted Value Condition form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Conditions</td>
<td>Conditions that trigger the highlighting. The condition can be different from the field that gets highlighted. For example, you might highlight the <strong>Priority</strong> field in a record if the <strong>Caller</strong> in that record is Fred Luddy. A simpler example is highlighting the <strong>Priority</strong> field if the priority value is <strong>critical</strong>.</td>
</tr>
<tr>
<td>Status</td>
<td>The highlighting color.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Show Icon</td>
<td>Toggle to display (selected) or hide the leading bullet when highlighting.</td>
</tr>
<tr>
<td>Value Override</td>
<td>Text that replaces the field values from the table. If you don't supply a Value Override, Workspace highlights the field value from the table. If you supply a value, Workspace replaces the field value with your text and highlights that.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of applications this highlighting pertains to.</td>
</tr>
<tr>
<td>Order</td>
<td>The order in which to evaluate the conditions. When you have multiple conditions for highlighting the same field, they are evaluated in order from lowest to highest. If any of the conditions are True, Workspace highlights the field.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

In the following example, the highlighting was triggered on the **Priority** field because the priority value was critical.

<table>
<thead>
<tr>
<th>Number</th>
<th>Opened</th>
<th>Short description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INC0000002</td>
<td>2019-05-29 16:07:12</td>
<td>AGAIN UPDATED</td>
</tr>
<tr>
<td>INC0000031</td>
<td>2019-05-09 17:18:03</td>
<td>UPDATED VIA MULTI-EDIT</td>
</tr>
</tbody>
</table>

7. Optional: Click **New** on the **Highlighted Value Conditions** Related List and create another condition for highlighting the same field.

For example, highlight the **Priority** field associated with the Incident table when the **Priority** value is "critical," or when the **Caller** value is "Fred Luddy." The conditions are ranked according to the **Order** value. Workspace evaluates the lowest value first.

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Order</th>
<th>Show Icon</th>
</tr>
</thead>
<tbody>
<tr>
<td>Priority = 1 - Critical</td>
<td>30</td>
<td>true</td>
</tr>
<tr>
<td>Caller = Fred Luddy</td>
<td>50</td>
<td>true</td>
</tr>
</tbody>
</table>
8. Optional: Remove all highlighting from a filtered list that would otherwise have highlighting.

When setting up highlighting for a table, all filtered lists associated with the table display highlighted fields unless you disable highlighting for specific, filtered lists.

a) Navigate to `sys_aw_list.list`.

b) In the **Name** column, enter the name of the table with highlighted fields, for example, Incident. All filtered lists associated with the table appear.

c) Click the filtered list you want to remove highlighting from.

d) On the Workspace List form, if Global is the current application, click **here** in To edit this record click **here**.

e) Select the **Ignore Highlight in List** check box and click **Update**.

Now, regardless of the conditions, Workspace will not highlight any fields in the specified filtered list. This option does not work, however, for filtered lists in **My Lists**, which are the filtered lists agents create.

### Modify string field length

You can modify the maximum character limit for a string field.

**Role required:** personalize_dictionary

The URL type field hides the Max Length field on the Dictionary form by default. Browsers support URL length up to 2,083 characters. The URL field is a String field.

1. Right-click the field label in the form and select **Configure Dictionary**.

2. Change the **Max length** field to the desired length.

   **Note:** You can change between string-based data types as long as length changes do not cause any data loss from truncation. For example, you can change from a MEDIUM database type to a VARCHAR(100) database type if none of the existing data is greater than 100.

3. Click **Update**.

   The system cancels any length change that results in data loss due to truncation.

### Specify a default field value

A default value populates a value in a field when a new record is created.

**Role required:** personalize_dictionary

The default value populates the field on the blank form for a new record, and also subsequently when the new record is submitted if the field is empty. Default values can be specified as either a constant or generated through script.

1. Right-click the field's label in the form and select **Configure Dictionary**.

2. Enter the default value in the **Default value** field.

   To set a constant value, type it into the **Default value** text box field. To assign a default value using a more complex formula, use JavaScript to output a default value.

   **Note:** The default value should be the underlying value that would be present in the field, not the label. For example, in a choice list field, use the value of the choice as the default value, not the choice's name.
Default field value examples

Review the following examples about specifying default field values.

Constant default values

Here is an example that sets a default value for the **Priority** field.

![Dictionary Entry Priority]

**Default value constant**

Javascript default values

To view out-of-box examples of JavaScript default values, navigate to **System Definition > Dictionary** and enter this filter: **[Default value] [starts with] [javascript]**. Open some of the records and view the default value javascript entries.
Set a default value for assignment_group

The following example sets a default value in a [sys_user_group] reference field by getting the ID from the name of a group.

```javascript
javascript:GetIDValue('sys_user_group', 'Development');
```

Set a default value for assigned_to if user has the itil role

This example for the Task [task] table describes how to configure the default value for the [assigned_to] user equal to the current user id if the user has a role of itil.

- Column label: Assigned to
- Column name: [assigned_to]
- Reference Specification section
  - Reference: User [sys_user]
  - Reference qual condition: [Roles] [is] [itil]
- Default value script:

```javascript
javascript:if (gs.hasRole("itil"))current.assigned_to = gs.getUserId();
```

Set a default value for a duration field

To set a default value for a duration field, use the following in the Default value field of the duration field's dictionary entry:

```javascript
javascript:current.duration_field.setDisplayValue('3 04:30:14');
```

Avoid hard-coding a particular date-time. If the system date-time format changes, the value becomes invalid. Instead, select the Use dynamic default check box and assign a dynamic filter option. For more information on dynamic filters, see Create a dynamic filter option.

Make a field dependent

A choice or reference field can be declared dependent on another field on the same table. Dependent fields limit their available values based on the value in the dependent field.

Role required: personalize_dictionary

If a required dependency does not function as expected, as might happen if there is a many-to-many relationship between the fields, consider using reference qualifiers to accomplish the goal.

1. Right-click the field label in the form and select Configure Dictionary.
2. In the Dependent field, enter the name of the field that this field will depend on.
3. Click **Update** when done.

In the example below, the "subcategory" field is made dependent on "category". The "category" value in a form will determine which options appear for the "subcategory" field.

<table>
<thead>
<tr>
<th>Dictionary Entry</th>
<th>= Required field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table:</td>
<td>Incident [incident]</td>
</tr>
<tr>
<td>Column name:</td>
<td>subcategory</td>
</tr>
<tr>
<td>Type:</td>
<td>string</td>
</tr>
<tr>
<td>Choice:</td>
<td>Dropdown with -- None</td>
</tr>
<tr>
<td>Default value:</td>
<td></td>
</tr>
<tr>
<td>Attributes:</td>
<td></td>
</tr>
<tr>
<td>Dependent:</td>
<td>category</td>
</tr>
<tr>
<td>Table reference:</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**
Fields cannot be made dependent on derived fields.

---

**Require unique values for a field**

The system allows you to require that a field's values be unique. When this is done, the system will not let two records have the same value for that field.

Role required: personalize_dictionary

By default, fields are created without this constraint. A field can have unique values only if there are not already duplicate values in the database for that field. The system does not allow you to make a field unique while there are duplicate values in the table.

1. Verify that no records in the table for the field have values, or that they all have the same value.
2. Right-click the field label in the form and select **Configure Dictionary**.
3. Configure the form to add the **Unique** field if it does not already appear.
4. Select the **Unique** check box.

5. **Update.**

**Define field styles**

Field styles allow you to declare individual CSS styles for a field in a list or form.

Role required: personalize_styles or admin

The CSS lets you change the following attributes of a field.

- Change the color.
- Change the font attributes (bold, italics, underline).
- Change the padding and alignment of text.

You can define field styles for tables and database views that are in the same scope as the field style and for other tables that have at least one field in the same scope as the field style. Field styles defined for a table do not apply to database views that include the table. Create separate field styles for database views.

**Note:** Field styles are not applied to comments and work notes fields used with the activity formatter. Background color for these fields can be set using the `glide.ui.activity_stream.style.comments` and `glide.ui.activity_stream.style.work_notes` system properties located in the `sys_properties` table.

1. Navigate to the list of styles for the field in one of the following ways.
   - Right-click the field label on the form and select **Configure Styles**.
   - Navigate to **System UI > Field Styles**, and locate the field to apply a style (admin only).

2. Click **New**, or click the style to modify.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table that contains the field.</td>
</tr>
</tbody>
</table>

**Note:** The list shows only tables and database views that meet the scope protections for field styles.
<table>
<thead>
<tr>
<th>Field</th>
<th>Input Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field name</td>
<td>The field to which the style applies.</td>
</tr>
<tr>
<td>Value</td>
<td>The exact value or script-based-condition required to apply the style.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The value only affects list field styles. To apply field styles on both lists and forms, leave this field blank.</td>
</tr>
<tr>
<td>Style</td>
<td>The CSS style to apply. For example, to make the background of the Incident Category fields red in record lists, with a 24-px font size and white text color, enter the following code.</td>
</tr>
<tr>
<td></td>
<td>background-color:red; font-size:24px; color:white;</td>
</tr>
</tbody>
</table>

You can use a script-based-condition with the syntax `javascript:<script>` in the Value field to determine whether the system should apply a style to a field in the list. If the evaluated script returns true, the system applies the style to the list item.

The script has access to the current script object, which enables you to build conditions based on the field values of the current record. For example, this script checks for overdue items based on a field value:

```javascript
javascript: gs.dateDiff(gs.now(), current.u_datefield.getDisplayValue(), true) < 0
```

**Note:** In this example, `current.u_datefield` refers to the name of a custom date field.

The system only supports one `javascript:<script>` entry in a Value field. If you want to enter multiple JavaScript conditions, consolidate the conditions into one statement. For example, instead of this invalid entry:

```javascript
javascript: current.state == "Completed" javascript: current.error_tables > 0
```

Consolidate the conditions into one statement such as:

```javascript
javascript: current.state == "Completed" && current.error_tables > 0
```

4. Optional: To add alternative text for a style, configure the form to add the alternative text field.

   For styles like the VIP style icon, you can add alternative text so that screen readers can differentiate between the style and the text.

5. Click Submit or Update.
Record numbering

In the base system, several tables are numbered, including Incident, Problem, Change Request, and Knowledge. You can also use these numbers anywhere that script is present, for example to generate watermarks for emails. Records in tables can be numbered automatically.

Administrators can manage record numbering by navigating to **System Definition > Number Maintenance.** The current number format for a table, including the prefix (such as INC for incidents or CHG for changes), is stored in a record on the Number [sys_number] table.

![Number Maintenance Table](image)

**Number table**

You can renumber auto-incremented tables that extend the task table or manage numbering with a database field named **Number this field.** For information about renumbering custom tables, see KB0538764: Renumbering auto-incrementated custom tables in the ServiceNow knowledge base.

**Note:** If you reset numbering in Number Maintenance, it only renumbers new records. It leaves the numbering as-is for existing records in system tables.

**Add auto-numbering records in a table**

You can define one number format per table in the system.

Role required: admin

1. Navigate to **System Definition > Number Maintenance.**
2. Click a table name to view the number record for that table, or click **New.**
3. Define the number format by completing the fields (see table).
4. Click **Submit** or **Update.**

If an auto-numbered field does not already exist, a new field is automatically created on the table with the following values:

- Label: Number
• Name: u_number
• Default value:

```javascript
javascript:getNextObjNumberPadded();
```

**Note:** This script renumbers records when the Number of digits is updated. To use a script that does not renumber records when the Number of digits is updated, open the dictionary entry for the Number field and enter the following script in the Default value field.

```javascript
javascript:getNextObjNumber();
```

### Auto-numbering records in a table

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select a table.</td>
</tr>
<tr>
<td>Prefix</td>
<td>Enter a prefix for every number in the table (for example, INC for Incident).</td>
</tr>
<tr>
<td>Number</td>
<td>Enter the base number for this table (default value is 1000). Record numbers are automatically incremented, and the next number is maintained in the Counter [sys_number_counter] table. If you set the base number to a value higher than the current counter, the next record number uses the new base number. Otherwise the next record number uses the current counter. The counter does not reset to a base number lower than itself. To see the current counter, click the Show Counter related link.</td>
</tr>
</tbody>
</table>
| Number of digits | Enter the minimum number of digits to use after the prefix (default value is 7).  
  - Leading zeros are added to auto-numbers, if necessary. For example, INC0001001 contains three leading zeros.  
  - The number of digits can exceed the minimum length. For example, if Number of digits is 2 and more than 99 records are created on the table, the numbers continue past 100 (such as INC101). |

**Warning:** Changing this field may update all number values for existing records on a table. Take care when changing this field on a production instance.

**Note:** To change the default values for new number formats, change the Default value field on the system dictionary record for the Number or Number of digits field. These fields are on the Number table.
Prepare to left-pad number fields in custom tables

Before you configure left padding of number fields on a custom table or a table that does not extend the task table, you must prepare business rules and script includes.

Role required: admin

1. Duplicate the base system business rule named Pad Numbers: Click Insert and Stay. If Insert and Stay is not available on your instance, create a new business rule and manually copy all field values from Pad Numbers.
2. Give the business rule a new name and change the script field to read as follows:

```javascript
function padCurrentCategory()
    var target = new GlideRecord(current.category+"\n");
    if (!target.isValidField("u_number") || target.isValidField("number")) return;
    var nm = new UNumberManager();
    nm.padTableNumbers(current.category, current.maximum_digits);
} Save the changes.
```
3. Duplicate the base system script include named NumberManager.
4. Change the following two lines as indicated:

```javascript
105: currentNumber = records.u_number.toString();
117: records.u_number = prefix + currentNumber;
```
5. Name the new script include UNumberManager and save your changes.

You can now continue with the process of configuring left-padding and renumbering records.

Configure left padding of a system number in a table

You can configure the left padding of the system numbers on a table. For example, pad the Number field on an Incident, Problem, or Change Request.

If you are configuring numbers on a custom table or a table that does not extend the task table, then, before performing the following procedure, you must prepare business rules and script includes. For more information, see Prepare to left-pad number fields in custom tables.

Role required: admin

1. Navigate to the form, then right-click the Number field and select Configure Dictionary.
2. Enter the following script in the Default value field and click Update.

```javascript
g getNextObjNumberPadded();
```
3. Navigate to System Definition > Number Maintenance.
4. Open the table record.
5. Enter a value in the Number of digits field.
6. Click **Update**.

Number padding is applied to both existing and new records.

![Sys number](image)  
<table>
<thead>
<tr>
<th>Table:</th>
<th>incident</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number:</td>
<td>10,000</td>
</tr>
<tr>
<td>Prefix:</td>
<td>INC</td>
</tr>
<tr>
<td>Number of digits:</td>
<td>7</td>
</tr>
</tbody>
</table>

Update  Delete

The result of the configuration in the image is an Incident number that is left padded.

![Incident](image)

### Prevent numbering gaps

By default, numbers are generated every time a new record is created.

Role required: admin

When records are created but not saved, a gap in the numbering is created. You can prevent these numbering gaps by generating numbers only when records are saved.

1. Navigate to **System Properties > System**.
2. Set the property **Assign a task number only upon insert (prevents unused numbers)**, `glide.itil.assign.number.on.insert`, to `true`.
3. Click **Save**.

### Enforcing unique numbering

Although duplicate numbers are rare, numbering does not enforce uniqueness, by default.

To enforce uniqueness, you can:

- Create a before business rule on insert only to check for duplicate values and replace duplicates with the next available number.
- Enable a unique index on the table.

**Note:** While unique indexes ensure data integrity they also prevent any insert involving a duplicate number. This may cause unexpected errors during data entry.
Sample business rule

This sample script can be used as part of a before business rule on insert only to check for duplicate numbers and replace them with the next available number. The following script references a script created in Configure left padding of a system number in a table.

```javascript
var curNum = current.number + ''; 
if(curNum) {
    var recordClass = current.getRecordClassName();
    var now_GR = new GlideRecord(recordClass);
    gr.addQuery('number', curNum);
    gr.query();
    if(gr.getRowcount() > 0) { 
        var newNum = getNextObjNumberPadded();
        gs.addInfoMessage("The number "+ current.number + " was already used by another "+ recordClass + ". The " + recordClass + " number has been changed to " + newNum);
        current.number = newNum;
    }
}
```

Field normalization and transformation

Field Normalization includes normalization and transformation, which are two different ways to alter field values for increased data integrity and reduced duplication.

Normalization

Normalization searches for variations of the same field value and converts them into a single preferred value. By consolidating multiple variations of the same value into a single simple recognizable value, the system eliminates duplicate records and provides better search results. When a process or a user enters a value in a normalized field, the system determines whether to replace it with a normal value. Normalization also automatically adjusts queries to return normalized results and normalizes values in scripts.

While normalization is available for every field in the platform, it works best for descriptive values such as names or standard units of measurement. For example, you might create normalization rules to:

- Set the CPU type of a computer CI to a standard model name such as Xeon.
- Set the suffix used for the names of corporations to a standard format such as ServiceNow, Inc.

Transformation

Transformation converts raw field input values into standardized values that are more meaningful to an organization. Administrators control when transformation happens by defining rules and conditions for specific fields. For example, you might create transformation rules to:

- Remove suffixes from user names such as Jr. and II.
- Round computer CI RAM sizes to the nearest whole number such as rounding 4112 MB to 4000 MB.
Transform records make up the rules that define how a field transformation is executed. Order values determine the order in which each rule is evaluated. A check box on each transform enables an administrator to determine where processing stops when a rule evaluates to true.

**Enabling normalization and transformation by field type**

Field type records specify which data types are available for normalization and transformation. By default, the system supports normalization and transformation for these field types.

<table>
<thead>
<tr>
<th>Field type</th>
<th>Use to normalize</th>
<th>Use to transform</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decimal</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>Float</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>Integer</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>Numeric</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>String</td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td>URL</td>
<td>true</td>
<td>true</td>
</tr>
</tbody>
</table>

A field type entry applies to all fields whose dictionary entry data type matches the field type entry. Administrators can create additional field type records for other data types as needed.

**Warning:** Avoid creating field type records for fields that store a Sys ID value such as a reference field, field name field, or a table name field. Directly altering a Sys ID value is more likely to produce data corruption and broken references than to produce meaningful standard values. Instead, normalize or transform the display value associated with the Sys ID. For example, normalize the user name instead of the Sys ID of a specific user.

**Identifying normalized fields**

The system displays the normalization icon on fields with an associated normalization or transformation record. Users with the normalizer role can click the icon to access the associated normalization or transformation record. Users without the normalizer role instead see a help page. Administrators can configure who sees the normalization icon with a preference called **Restrict to roles**.

**Activate Field Normalization**

You can activate the Field Normalization plugin (com.snc.field_normalization) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

1. Navigate to **System Applications > All Available Applications > All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see **Request a plugin**.

© 2021 ServiceNow, Inc. All rights reserved.

3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### Installed with field normalization

Several components are installed with Field Normalization.

The following preferences (**Field Normalization > Administration > Preferences**) control features for normalization and transformation:

<table>
<thead>
<tr>
<th>Field Normalization preferences</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preference</td>
</tr>
<tr>
<td>Enable field normalization</td>
</tr>
<tr>
<td>Enable field normalization auditing</td>
</tr>
<tr>
<td>Logging</td>
</tr>
<tr>
<td>Decoration URL</td>
</tr>
<tr>
<td>Restrict decorations to roles</td>
</tr>
</tbody>
</table>
Normalization preferences

Business rules

The following business rules were created for this plugin:

- Ensure Rules Application Job
- Ensure Transform Application Job
- Ensure Rules and Alias Jobs
- Ensure Transform Application Job
- Ensure Decoration Attribute
- Cleanup on field or table change
- Prevent duplicates in class hierarchy
- Handle potential duplicates
- Run job
- Ensure Pending Value Collection Job
- Ensure name changer job
- Flush forms when activating

**Field Normalization roles**

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>normalizer</td>
<td>Person authorized to manage field normalization and transformation.</td>
</tr>
<tr>
<td>normalization_tester</td>
<td>Person authorized to create test records for normalizations and transformations. Only records opened by users with this role are available for testing normalization and transformation rules in Test mode.</td>
</tr>
</tbody>
</table>

**Field Normalization script includes**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FieldNormalizationAjax</td>
<td>Provides AJAX services for the Field Normalization plugin.</td>
</tr>
<tr>
<td>FNEnsureJob</td>
<td>Ensures that a job record exists for a particular extant data job target.</td>
</tr>
<tr>
<td>FNExtantDataJobChoices</td>
<td>Generates a list of tables for use in document_id field of the fn_extant_data_normalization table.</td>
</tr>
<tr>
<td>FNExtantDataJobUtil</td>
<td>Determines whether an extant data job is allowed to run.</td>
</tr>
<tr>
<td>FNFields</td>
<td>Returns valid fields for normalization.</td>
</tr>
<tr>
<td>FNTransformChooserUtil</td>
<td>Provides support for the fn_transform Chooser UI page.</td>
</tr>
<tr>
<td>Position</td>
<td>Finds a position within a given string.</td>
</tr>
<tr>
<td>Round</td>
<td>Rounds numbers with various rounding modes and intervals.</td>
</tr>
</tbody>
</table>

**Field Normalization UI pages**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aliases</td>
<td>Creates the slushbucket with pending values for choosing aliases for a normal value.</td>
</tr>
<tr>
<td>fn_transform Chooser</td>
<td>Displays available transforms. Invoked by the New button on the fn_transform related list.</td>
</tr>
</tbody>
</table>
Enable a field type for normalization or transformation

Create or modify a normalization field type record to enable a specific field data type for use with normalization or transformation.

To normalize or transform a value in a reference field, apply the processing to the field in the target table.

1. Navigate to Field Normalization > Administration > Normalization Field Types.
2. Click New in the record list.
3. Enter a Name for the field type that clearly describes the type in the dictionary.
   This value is for reference only and is not used in any processing. For example, you might enter IP Address for the field type of ip_address.
4. Enter the Type from the dictionary.
5. Select the appropriate check box to use this field type to normalize or transform fields.
   In the base system, only the String field type is used for normalization.
6. Right-click in the header bar and select Save from the choice list.
   The Transform Categories Related List appears.
7. If this field type is being used for transforms, click **Edit** to associate an existing Transform Category with this field type.

**Note:** If you create a custom field type that is used for normalizations only, a link to a transform category is not necessary.

The relationship of a field type to a category, and the category to a list of transformation definitions, is completely configurable.

The String field type is associated with the Text Transform Category, which contains these transform definitions. Any of these associations are configurable.
Create a raw field

A raw field is a custom field created by an administrator to show the original (raw) input in a field on a form after it has been normalized or transformed.

An administrator might add a custom field to a form to show the original, or raw, value of a normalized field.

This is a read-only field that might be called something like Raw CPU type or Original Name. In the following example, the CPU type field was normalized to Xeon from an original, raw value of Xeon L3350.

1. In the form containing the field that is being normalized or transformed, right-click in the header bar.
2. Select Personalize > Form Layout.
3. Complete the Create new field form at the bottom of the page, and then click Add.
   • Name: Type the field label. In this case, use Raw + <field label>.
   • Type: Select a data type from the list for this field.
   • Field length: Select the character limit for this field. The default is 40.
4. Move the new field adjacent to the normalized field using the direction arrows in the slushbucket.
5. Click Save.
### Normalization and transformation data jobs

The system uses data jobs to change field values during normalization and transformation.

Administrators must manually start data jobs that apply field changes. By default, which blocks administrators from running manual data jobs that apply changes to existing data. Most data jobs have a roll back option to revert changes after the job completes. By default, the system provides these data jobs.

#### Note:

If the Field Normalization plugin is active, the normalization engine executes on insert of records into a table according to normalization rules. To learn more about this plugin, see Activate Field Normalization.

If the Field Normalization plugin is not active, a data job runs to normalize the values. The data job saves the previous values in the rolled back fields to revert them if necessary.

<table>
<thead>
<tr>
<th>Name</th>
<th>Used for</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pending value collection</td>
<td>Normalization</td>
<td>The system runs this job to collect field values that will change during the next field normalization run. The system runs this job whenever you insert or update a field normalization record. Since this data job does not change any field values, there is no roll back option.</td>
</tr>
<tr>
<td>Normal value change</td>
<td>Normalization</td>
<td>Run this job to rerun field normalization and update field values when you change a normal value. The system creates this job whenever you change a normal value. Roll back the data job to revert the normalized fields to the previous normal value.</td>
</tr>
<tr>
<td>Alias application</td>
<td>Normalization</td>
<td>Run this job to normalize all field values that match an alias. The system creates this job whenever you create or update an alias. Roll back the data job to revert normalized fields to their previous values.</td>
</tr>
<tr>
<td>Rule application</td>
<td>Normalization</td>
<td>Run this job to normalize all field values that match a rule. The system creates this job whenever you create or update a rule. Roll back the data job to revert normalized fields to their previous values.</td>
</tr>
<tr>
<td>Coalesce too normal</td>
<td>Normalization</td>
<td>Run this job to normalize the reference field values by replacing references to multiple duplicate records with one reference to a normalized record. The system creates this job whenever you change a normal value that applies to a reference field. Roll back the data job to restore the duplicate records as valid options. The rollback does not restore references to the previous records.</td>
</tr>
</tbody>
</table>
### Run a single data job

Running the data job/jobs is the fourth step in transforming a field. This topic explains how to run a single data job.

1. Start the Transform application data job to apply the transform to all the appropriate records in the database.
2. Open the Transformation record and switch the Mode to Active.
3. Select the Data Jobs Related List.
4. Run the data job using one of the following methods.
   - In the list of data jobs, select the check box of the jobs you want to run, and then select Start from the Actions menu.
   - Click the link in the Created column to open the data job, and then click the Start Related Link.

The State of the jobs turns to Queued as it runs and to Completed when it finishes successfully.

### Run multiple data jobs

Running the data job/jobs is the fourth step in transforming a field. This topic explains how to run data jobs for multiple field transformations.

1. Start the Transform application data job to apply the transform to all the appropriate records in the database.
2. Navigate to Field Normalization > Data Jobs > All.
3. Select the check boxes for the jobs you want to start.
   - Note: These jobs must have the Mode set to Active.
4. Select Start from the Actions menu.
   - Note: The platform only runs data jobs from Active transformations. The Action menu indicates the number of Active data jobs that can run. For example, the menu might display Start (3 of 4).

### Rollback a data job

Use rollback to revert changes made by a normalization or transformation data job.

Role required: admin or normalizer

You can only rollback completed data jobs.

1. Navigate to Field Normalization > Data Jobs > All.
2. Select the completed data job to rollback.
   - The system displays the data normalization job record.
3. From Related Links, select Rollback.
   - The values in the Pending Values Related List are removed and the data job State indicates that it was rolled back.
Normal values

A normal value replaces similar but ambiguous field values with one standard value.

Field value variations

Records values can come from multiple sources such as:
- Automated entries made by Discovery.
- Automated entries made by importing records from external systems or files.
- Manual entries made by users.

Each of these sources may describe the same field value in several different forms. For example, the **CPU Type** field on a computer CI form might display any of the following similar values:

- **E3350 (Intel) 4.5.2234**
- **Intel Xeon 5.4.554**
- **Xeon L3350**
- **L3350**

Without normalization, these variant field values results in:
- Duplicate CPU types
- Poor search results
- Complex queries and conditions to apply business logic

Creating a normal value record solves these issues by consolidating on one standard value such as **Xeon**.

Identifying variations with aliases and rules

Each Normal value record specifies how to identify variations of a normal value using a combination of aliases and rules.

**Aliases**

Aliases are known variations of an input value that normalization converts to the normal value. Use aliases when there is a short list of variant values.

For example, you could create a normal value **Xeon** that has these aliases.

- **E3350 (Intel) 4.5.2234**
- **Intel Xeon 5.4.554**
- **Xeon L3350**
- **L3350**

Whenever a normalization data job or normalized query sees a field value matching an alias, it automatically replaces the field value with the normal value. Normalization data jobs and queries process aliases before rules.

**Note:** Aliases are logically equivalent to rules using the [is] operator in a condition where [Field name][is][Alias value]. For example, the sample aliases are equivalent to these rules: [CPU Type][is][E3350 (Intel) 4.5.2234] OR [CPU Type][is][Intel Xeon 5.4.554] OR [CPU Type][is][Xeon L3350] OR [CPU Type][is][L3350]
Rules

Rules specify the conditions under which normalization replaces an input value with the normal value. Use rules when there are a large number of possible variant values, or when you must create complex conditions.

For example, the normal value *Xeon* could have this rule.

```
[CPU Type][matches regex][.*\bxeon\b.*]
```

Whenever a normalization data job or normalized query sees a field value matching a rule, it automatically replaces the field value with the normal value. Normalization data jobs and queries process rules after aliases.

Rules and aliases can be combined to normalize a field. Make sure to test your normalization methods before applying them to all the existing records in the database.

Normalized queries

An administrator can configure normalization to apply to queries issued against normalized fields in lists. Select the **Normalize query** check box on the Normalization form to enable this functionality. In a list containing normalized values, create a filter using the original (raw) value for the normalized field in the query condition.

Normalized query example

The filtered list returns records with the normal value substituted for the raw value. However, the breadcrumbs for the filter display the original query conditions.
Scripting and normalization

Scripts that update or insert records into the database (GlideRecord) are normalized automatically when field normalization is applied. For example, if a script to insert a CI record contains a CPU type of Xeon L3350, the script is normalized to insert the CI with a CPU type of Xeon instead. Scripts that query the database for normalized field values (using the conditions of equals or not equals) can be configured to return the normal value (such as Xeon) rather than the original (raw) value.

Create the normalization record

Regardless of the normalization method selected, all field normalization requires a list of existing variants and a normal value that is configured to replace these variants in forms and in queries.

Normalize a field by selecting aliases for a normal field value or by creating rules that use condition statements to match field variants with a normal value.
Note: Users must have the normalizer role to create and manage normalization records.

Special Cases

- Reference fields cannot be normalized. To normalize values appearing in reference fields, normalize the field in the target table. Examples of this would be normalized values for the **Name** fields in the Company [core_company] and Location [cmn_location] tables, which are referenced by other tables in the platform. The normalized names are available to all fields that reference these tables.
- Fields in a choice list can be normalized if they are of a type **string**.

1. Activate the Field Normalization plugin.
2. Navigate to **Field Normalization > Configurations > Normalizations**.
3. Click **New**.
4. Create a normalization record.

### Normalization record fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Input value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this normalization record. This value is for reference only and is not used in any processing.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the ServiceNow table for the field being normalized.</td>
</tr>
<tr>
<td>Field</td>
<td>Select the field to normalize.</td>
</tr>
<tr>
<td>Mode</td>
<td>The three available modes are Off, Test, and Active. All normalization records are created in the test mode by default. If you are planning to select aliases for your normal values, change the Mode to Active. If you intend to normalize the field using rules, be sure to leave this record in the Test mode. To disable this normalization, switch the mode to Off.</td>
</tr>
<tr>
<td>Normalize query</td>
<td>Select this check box to apply the field value normalized by this record to all queries involving this field. Queries formed with the raw (original) field value return records displaying the normal value. Queries issued by a script using the conditions equals or not equals return normalized values. See Normalized Queries for details.</td>
</tr>
<tr>
<td>Coalesce each normal</td>
<td>Select this check box to normalize reference field values. This option resets all references to records containing an alias field value to the record using the normal value. See Coalesce Normal Values for details.</td>
</tr>
</tbody>
</table>
Select the field to use to display the original (non-normalized) input values on a form in which a field value has been normalized. For the selection to appear in the drop-down list, add a custom field to the form for the table selected. For instructions on adding a field for raw data, see Creating a Raw Field.

After the normalization record is submitted, the platform runs the Pending value collection job in the Data Jobs related list automatically to gather all the current values (Pending Values) for the field being normalized.

Click the Pending Values related list to view values for the normalized field that have been entered manually, imported into the platform, or created by Discovery.
Create a normal value

A normal value is a simplified, generic value for a field that replaces all the possible variants of that value that exist in the database.

Role required: admin or normalizer

Normal values should be clear and unambiguous.

After the platform runs the data job, the Pending Values related list on the Data normalization jobs form is populated with all the unique values for the field in the database. Examine the values in the list and decide which
normalizing method is best for the existing data. For example, define an alias for a small pool of values and a rule for a large pool of values. The following screenshot shows the pending values for CPU types in Linux servers in a network. The list contains several choices for Intel Xeon CPUs, which might be normalized as Xeon.

Normalization pending values 2

1. Navigate to Field Normalization > Normalizations.
2. Open the appropriate normalization record.
3. Click the Normal Values related list.
4. Click New.
5. In the Normal Value form, create normal values for the variants in the **Pending Values** related list. These are the values the platform uses to replace the variants configured as aliases.

### Create aliases

Aliases are the variants of a field value in the instance that will be replaced by the normal value.

Role required: admin or normalizer

The list of potential aliases is the contents of the **Pending Values** related list. After creating a normal value, assign aliases to this value if the pool of pending values is small. A normalized field can have a combination of aliases and rules.

1. Navigate to **Field Normalization > Configurations > Normalizations.**
2. Open a normalization record.
3. Click the **Normal Values** related list.
4. Select one of the values.
5. In the normal value record, click the **Aliases** related link.
6. Select aliases for this normal value from the available (pending) values that appear in the slushbucket, and then click **OK**.

![Aliases for: Xeon](image)

The aliases for this normal value now appear in the **Aliases** related list.

Apply the aliases by running the associated data jobs.

**Apply aliases**

After testing, aliases can be normalized in all new records or in existing records when they are updated.

Each time an alias is created for a normal value, a data job is created. The alias is not applied to values in the entire database until its data job is started manually. Run each job separately or run the jobs together to apply all aliases at once.

1. In a normalization record, ensure that the Mode is set to **Active**.

   Data jobs cannot run in the **Test** mode.

2. Click the **Normal value** related list.

3. Select a value from list.

4. In the Normal Value record, select the **Data Jobs** related list.

   A data job is listed for each alias configured for this normal value.

5. Run the extant data jobs to replace the aliases with the normal value in all existing records in the database.

   a. Select the check box next to a job, and then select **Start** from the Actions menu.

   b. To run all data jobs at once, select all the check boxes, and then select the **Start** action.

   c. Refresh the list to check the progress of the data jobs to ensure that they complete normally.
Create rules

The use of rules to normalize a field is intended for large lists of variant field values.

Always test your rules before applying them to all the existing records in the database. Prior to creating the rule, make sure to generate the list of Pending Values and create a normal value for the field. A normalized field can have a combination of aliases and rules.

The rules in this example are based on the following Pending Values:
Normalization rules 3

1. In a Normalization record, open the **Normal Values** related list.
2. Open a Normal Value record.
3. Open the **Rules** related list in the Normal Value form, and then click **New**.

The Field Normalization Rule form provides the following fields:

<table>
<thead>
<tr>
<th>Field normalization rule fields</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>Name</td>
</tr>
<tr>
<td>Order</td>
</tr>
<tr>
<td>Active</td>
</tr>
<tr>
<td>Make alias</td>
</tr>
<tr>
<td>Case sensitive</td>
</tr>
<tr>
<td>Rule</td>
</tr>
</tbody>
</table>

4. Create a set of rules to incorporate all the possible variants of the pending values.

For this example, the rules might be:

- **Intel Xeon**: CPU type matches pattern *Intel*\(^*\)Xeon*. This rule normalizes all variants in which Intel precedes Xeon, including **Intel Xeon**, **Intel(R) Xeon(TM) CPU 2.80GHz**, and **Intel(R) Xeon(TM) CPU 3.00GHz**.
- **Xeon**: CPU type contains Xeon
- **L3350**: CPU type contains L3350
- **E3350**: CPU type contains E3350

For every rule that is created, the platform generates a **Rule applier** data job. In the testing mode, the **Start** controls are not available, and the job cannot be run until the mode is changed to **Active**.

5. Test all the rules before making the normalization record **Active**.

Testing Rules

**Note:** Users must have the normalization_tester role to create test records.

Field normalization records are created in the **Test** mode by default, enabling administrators to test normalization rules thoroughly before applying them to the existing records in the database. In the testing mode, the **Start** controls are not available for the **Rule applier** data job. The job can be run only when testing is complete and the **Mode** has been changed to **Active**. In the testing mode, only records that have been created or updated by a user with the normalization_tester role are normalized. The normalizer and normalization_tester roles can be combined for a single user or granted separately.
Coalesce records on a normal value

Coalescence enables an administrator to redirect references to multiple records containing variants of the same field value to point to a single record, based on a normal value.

An example of this is the Company table that might have multiple variants of a company name, such as Hewlett-Packard, Hewlett-Packard, Inc., Hewlett-Packard Incorporated, HP, and so on. Potentially, thousands of records might reference each of these duplicate company records. Using the variants of the Hewlett-Packard name as aliases, coalescence unifies all these references into a single record that normalizes the Name field in the Company record to a normal value such as HP.

Note: Coalescing normal values changes the record values permanently. If a rollback is performed, records will be returned to the table, but the normalized values will not be rolled back to the original variants.

1. Navigate to Field Normalization > Configuration > Normalizations
2. Select a normalization record.
3. Enable Coalesce each normal.
   The system adds the Coalesce to field to the Normal Value form.
4. Create one or more normal value records for this normalization record.
   Create related aliases and rules as needed.
5. For each normal value record, set Coalesce to by selecting the record that contains the normal value.
   For example, suppose your Company table contains several variations of the name ServiceNow. When you create the Normal Value record, you select the Company record for ServiceNow, Inc. During normalization, the system updates any references to variant records to instead refer to the normal record.
   The system updates any references to records that match aliases and rules to instead point to the normal record.
   The system also deletes the duplicate records from the table.
6. Start all the Alias application data jobs to replace the aliases with the normal value in existing records in the database.
   The system starts the Coalesce to normal data jobs for each alias.

Transforms

Transforms update field values by applying a transformation definition to the field contents such as replace text, change case, or round value.

Transform definitions

Transform definitions define the transformation actions available for a given field type. Administrators select a definition when they transform a field, and then provide the definition with the specific parameters that are applied to the transformation. For example, a definition can round up an integer or insert a value at a defined position in a string.

The system provides a number of definitions that are designed to meet the needs of most organizations, but administrators can create new definitions as needed. Transform definitions can be associated with existing Transform Categories or to new categories.

Transform categories

Transform categories are used to group the transform definitions together appropriately to present to users when creating new field transforms. You can create new categories for existing definitions or change the default associations of categories to definitions.
Transform categories are associated with normalization field types to present the correct definition option list for the field being transformed. The base system provides two transform categories: Text and Numeric.

**Text**
Definitions in the Text category transform string type field values. Included in the Text category are:

- Left
- Right
- Constant
- Trim
- Prefix
- Suffix
- Change Case
- Delete
- Insert
- Substring
- Replace

**Numeric**
Definitions in the Numeric category arithmetically manipulate integer type field values. Included in the Numeric category are:

- Limit
- Round
- Constant

**Transformation testing mode**
Transformation is a powerful tool that can cause data issues if used incautiously. Test all transformations before committing the changes to the CMDB.

All transformation records open in **Test** mode by default, which blocks administrators from running manual data jobs that apply changes to existing data. Only users with the normalization_tester role can transform data when a record is in the **Test** mode. This is limited to new records opened by the tester or records in which the transformed field is updated by the tester.

To apply transformations to the CMDB after testing, change the mode to **Active** in the transformation record and run the appropriate data job. For information on testing transforms, see Test a transform.

**Transform a field**
Transform the contents of field using a set of rules and conditions.

Role required: admin or normalizer

1. Create a transformation record.
2. Create one or more related transform records.
3. Test the transform.
4. Runs data jobs.

If you want to also show what the original (raw) input value was prior to transformation, create a raw field to store this value.
Create a transformation record
Creating a transformation record is the first step in transforming a field.

1. Activate the Field Normalization plugin.
2. Navigate to **Field Normalization > Configurations > Transformations**.
3. Click **New**.
4. Create a transformation record.

### Transformation record fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for this transformation record. This value is for reference only and is not used in any processing.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the ServiceNow table containing the field being transformed. It is important to understand the table hierarchy when setting up a field transform. For example, if you configure transformation for a field in the Computer [cmdb_ci_computer] table, that field will be transformed for all workstation machines, Windows servers, Linux servers, and UNIX servers.</td>
</tr>
<tr>
<td>Field</td>
<td>Select the field to transform. The list presented contains only those field types (integer and string) from the table selected that can be transformed.</td>
</tr>
</tbody>
</table>

**Note:** The sys_user record that initiates the transform process must have its date format set to the default format of “yyyy-MM-dd.” Any other date format causes an error during transformation. This problem is only specific to transforming TO TARGET fields of type Date/Time. This problem is not an issue if the target field type is of type String or if the field mapping for the date field is changed to the same date format as the transformation process.

<table>
<thead>
<tr>
<th>Mode</th>
<th>The three available modes are <strong>Off</strong>, <strong>Test</strong>, and <strong>Active</strong>. All transformation records are created in the test mode by default. Do not change the mode until you have thoroughly tested the transformation. When testing is complete, change the mode to <strong>Active</strong>. To disable this transformation, switch the mode to <strong>Off</strong>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normalize query</td>
<td>Select this check box to apply the field value transformed by this record to all queries involving this field. Queries issued with the raw (original) field value will be edited to use the transformation value.</td>
</tr>
<tr>
<td>Raw field</td>
<td>Select the field to use to display the original input (non-normalized) values on a form in which a field value has been normalized. For the selection to appear in the drop-down list, add a custom field to the form for the table selected. For instructions on adding a field for raw data, see Create a raw field.</td>
</tr>
</tbody>
</table>
5. Click **Submit**.

The **Transforms** and **Data Jobs** Related Lists appear on the form.

**Create one or more related transform records**

Each related transform record performs a specific transformation type such as adding characters to the beginning of the value or replacing one string for another. You may need to create multiple related transform records to generate a preferred output field value.

1. In the Transformation record, select the **Transforms** Related List.
2. Click **New**.

A selection list of transform types appears, displaying only those transformations appropriate for the field type selected.

**Choose the type of transform you want to create:**

- **Text**
  - **Transforms that modify the text of the value.**
    - **Change Case**
      - Adjusts the case of characters in the value
    - **Constant**
      - Supply a constant value
    - **Delete**
      - Delete specified sequence of characters from the value
    - **Insert**
      - Insert a fixed character sequence into the value
    - **Left**
      - Keep or delete the leftmost 'n' characters
    - **Prefix**
      - Adds characters to the beginning of the value
    - **Replace**
      - Replaces occurrences of one string with another
    - **Right**
      - Keep or delete the rightmost 'n' characters
    - **Substring**
      - Keep or delete characters from a specified sub-sequence of characters in the value
    - **SUFFIX**
      - Append characters to the end of the value
    - **Trim**
      - Remove any leading or trailing spaces or tabs

**Transform types**

3. Select a transform type and provide the appropriate parameters.
4. Select an **Order** number for this transform.

**Note:** The conditions for the transforms are executed according to the order numbers assigned.

5. Select the **Final** check box to stop processing with this transform if the condition evaluates to true.
6. Select the **Case sensitive** check box to force case sensitivity in the condition statement.

The following transform example replaces the **INC** at the beginning of an incident number with the string **ENG** if the assignment group is **ITSM Engineering**.

![Transform Example](image)

Transformation record

7. Click **Submit**.

The new Transform appears in the Related List of the Transformation record.

When the Transform is created, a Transformation application data job is also created. This data job applies this transform to appropriate records in the entire database and should not be run until testing is complete.

8. Optional: Repeat steps 2 through 8 until the output value meets your desired criteria.

**Test a transform**

Verify the transform changes the field value as desired before applying them to existing records in the database.

- **Note:** Users must have the normalization_tester role to create test records.

New transformation records open in the **Test** mode by default, enabling administrators to test transforms thoroughly before applying them to the existing records in the database. In the test mode, the **Start** controls are not available for the Transformation application data job. There are two methods, listed below, for testing transforms before committing the transformations to existing data.

- Manually create or update test records.

In the test mode, only records that have been created or updated by a user with the normalization_tester role are transformed. Grant the normalizer and normalization_tester roles to the same user or grant them to separate users.
• Use the Test transforms utility to enter a raw value and see the resulting transformed value.

This feature enables a normalization tester to transform field values on the fly without opening or updating records. This utility tests all the transforms configured for this field.

a) Open a Transformation record.

b) Click the Test transforms Related Link.

A dialog box appears for testing field values.

c) Enter a value to transform in the Raw data field.

d) Click OK.

The platform transforms the raw value in the Transformed data field.

e) Enter new raw data to test other transforms.

f) Click Cancel to end the test.

g) When testing is complete, change the Mode to Active and run the data job.
### Default Transform Definitions

The system offers default transform definitions for fields containing text, text numeric, and numeric values.

#### Transform Definitions

<table>
<thead>
<tr>
<th>Transform Type</th>
<th>Category</th>
<th>Description</th>
<th>Parameters</th>
</tr>
</thead>
</table>
| Change case   | Text           | Changes the case of the characters in the field value.                      | **Mode:** Select one of the following modes:  
• **Upper:** Converts the value to all upper case characters  
• **Lower:** Converts the value to all lower case characters  
• **Proper:** Converts the value to title case, with the first character in each string in upper case, and the remaining characters of the string in lower case.  
• **Formal:** Converts the value to a string in which only the first letter of the first word is in upper case. |
| Constant      | Text Numeric   | Converts the value in this field to a constant.                             | **Constant:** The constant with which to replace the value in this field. |
| Delete        | Text           | Delete a specified sequence of characters from a field value.               | **Starting position:** Specifies the first character in a sequence of characters to delete from a string. See the discussion of position modes at the beginning of this section for details.  
• **Ending position:** Specifies the final character in a sequence of characters to delete from a string. See the discussion of position modes at the beginning of this section for details. |
| Insert        | Text           | Insert a fixed character sequence into a field value.                      | **Position:** The character position at which to insert the new value. See the discussion of position modes at the beginning of this section for details.  
• **Insert:** The value to insert into this field. |
| Left          | Text           | Deletes or keeps a specified number of characters from the left side of this field value. | **Position:** Specifies the number of characters to keep or delete from the left side of the value. See the discussion of position modes at the beginning of this section for details.  
• **Mode:** Select the mode for this transform: **Keep** or **Delete**. |
<p>| Prefix        | Text           | Adds characters to the beginning of a field value.                         | <strong>Prefix:</strong> Defines the characters to add to the beginning of the transformed field value. |</p>
<table>
<thead>
<tr>
<th>Transform Type</th>
<th>Category</th>
<th>Description</th>
<th>Parameters</th>
</tr>
</thead>
</table>
| Replace       | Text     | Replaces occurrences of one string with another string. The special characters backslash (\) and dollar sign ($) in the replacement string can cause the transform to be different than if the replacement string were being treated as a literal replacement string. Use a regular expression to replace a string or parts of a string. | • **Find**: Enter the string or regular expression to replace.  
  • **Replace with**: Enter the replacement string. |
| Right         | Text     | Retains or deletes a specified number of characters from the right side of a field value. | • **Position**: The number of characters to delete or keep from the right side of this transformed field. See the discussion of position modes at the beginning of this section for details.  
  • **Mode**: Select the mode for this transform: **Keep** or **Delete**. |
<table>
<thead>
<tr>
<th>Transform Type</th>
<th>Category</th>
<th>Description</th>
<th>Parameters</th>
</tr>
</thead>
</table>
| Round         | Numeric  | Rounds integers to a configured rounding interval using specific criteria. The interval must be appropriate to the value being transformed, such as an interval of 12 for a value expressed in dozens or 0.01 for decimal values expressed in hundredths. | - **Interval**: Select the rounding interval that is appropriate to the units of the field value. For example, an interval of 256 is appropriate for expressing RAM values in megabytes, but does not work for Disk space expressed in gigabytes. The rounding interval for the examples below is 1. - **Mode**: Criteria for applying the rounding interval.  
  - **Half up**: Always round up a value that is exactly half way between two intervals. For example, 3.5 is always rounded up to 4, and -3.5 is always rounded up to -3.  
  - **Half down**: Always round down a value that is exactly half way between two intervals. For example, 3.5 is always rounded down to 3, and -3.5 is always rounded down to -4.  
  - **Half away from zero**: Always round an integer that is half way between the specified interval away from zero. For example, 3.5 is always rounded to 4, and -3.5 is always rounded to -4.  
  - **Half toward zero**: Always round an integer that is half way between the specified interval toward zero. For example, 3.5 is always rounded to 3, and -3.5 is always rounded to -3.  
  - **Half to even**: Always round an integer that is half way between the specified interval to the nearest interval whose least significant digit is even. For example, 3.5 is always rounded to 4, and 4.5 is always rounded to 4.  
  - **Half to odd**: Always round an integer that is half way between the specified interval to the nearest interval whose least significant digit is odd. For example, 3.5 is always rounded to 3, and 4.5 is always rounded to 5.  
  - **Up**: Always round an integer up by the specified rounding interval. For example, 3.4 is always rounded up to 4 by a rounding interval of 1.0.  
  - **Down**: Always round an integer down by the specified rounding interval. For example, 4.6 is always rounded down to 4 by a rounding interval of 1.0.  
  - **Away from zero**: Always round an integer away from zero by the specified rounding interval. For example, 3.3 is always rounded to 4, and -3.3 is always rounded to -4 by a rounding interval of 1.0.  
  - **Toward zero**: Always round an integer toward zero by the specified rounding interval. For example, 3.3 is always rounded to 3, and -3.3 is always rounded to -3. |
### Create a transform definition

The following example describes the procedure for creating a new transform definition. In this example, we create a definition that transforms a number field to an odd or even integer. The transform category is **Numeric** and the normalization field type is **Integer**.

1. Navigate to **Field Normalization > Administration > Transform Definitions**.
2. Click **New** in the record list.
3. Enter a name for this definition.
   
   **Note:** In this example, we enter **Odd/Even**.
4. Enter a brief description of the action, such as, **Transforms an integer to an odd or even value**.
   
   This information appears in the definition choice list when a user selects a new transform.
5. Right-click in the header bar and select **Save** in the context menu.

   Two Related Lists appear in the form.

   - **Transform Categories:** Click **Edit** and select **Numeric** as the category to which this definition belongs. Currently, field transformation supports two categories: **Numeric** and **Text**. The **Integer** normalization field type is already associated with this category.
   - **Transform Variables:** Define any variables required by this transform definition to perform an action on a field value. Variables are not necessary if a script can perform the action alone.

### Create a transform variable for a transform definition

Transform variables enable an administrator to apply the same definition to different fields in different ways. Transform variables contain values used by a script to perform a field transformation. Scripts and variables can be created in either order, but the script must use the transform variables. Transform variables are populated with values when a user configures a transform type.

1. In the Transform Definition record, click **New** in the **Transform Variables** Related List.

---

<table>
<thead>
<tr>
<th>Transform Type</th>
<th>Category</th>
<th>Description</th>
<th>Parameters</th>
</tr>
</thead>
</table>
| Substring     | Text       | Keep or delete characters from a specified sub-sequence of characters in the field value. | - **Starting position**: Specifies the first character in a sub-sequence of characters within the value. See the discussion of position modes at the beginning of this section for details.
|               |            |                                                                            | - **Ending position**: Specifies the final character in a sub-sequence of characters within the value. See the discussion of position modes at the beginning of this section for details.
|               |            |                                                                            | - **Mode**: Select whether to **Delete** the sub-sequence selected or **Keep** only those characters defined. |
| Suffix        | Text       | Appends characters to the end of a field value.                           | **Suffix**: Defines the suffix to add to the end of the field value.       |
| Trim          | Text Numeric| Removes blank spaces from the field value.                                | No parameters                                                              |
2. Complete the form.

   Important considerations for completing a form:
   - The Column name is an entry in the fn_transform_var table for this variable. This becomes the variable in the script, in the form of variables.<variable name>. For example, odd_even.
   - The value in the Label field appears as the variable field label in the Transform form. For example, Odd/Even.
   - The field Type defines the field type of the variable value. Because the values for the variables used are even and odd, this is a type of string.
   - The Order of the variables controls the order in which they are displayed in lists and records.
   - This variable has a choice list with two options: Even and Odd. Select Dropdown without - None as the format for the list in the Choice field and define a Default value of even when the list is displayed.
   - Create a Hint that becomes a tooltip for the variable in the Transform record.

3. Right-click in the header bar and select Save from the context menu.

   The Variables Choice List Related List appears.

4. Click New in the Variables Choice List and define the list options.

5. Create records for Even and Odd.

   Note: The Element value is the same as the Column name in both selections for the choice list.

6. Save the choice list variables and return to the transform definition form to create the script.

Create a script for a transform definition

Create the script at any time during the configuration of a definition.

The script can perform a transform action without using a variable, but the action of the definition will be the same for all fields. Variables create more flexibility for the definition, enabling an administrator to use the same definition in different ways in different places. If a variable is defined, the script must reference the variable using the correct format.

There are three arguments in the script:
   - Variables: Contains the variables using the format variables.<variable name>.
   - Value: Contains the un-transformed value
   - Parameters: Special objects that set debug messages.

All position parameters (such as Starting position and Ending position) have three modes that apply to all the transform types that use this variable.

Position parameters

<table>
<thead>
<tr>
<th>Positive positions</th>
<th>If the position is expressed as a positive integer, the platform calculates the starting position beginning from the left side of the field value. For example, in the string ABCDE, a position of 3 places the starting point of the action after C.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Negative positions</td>
<td>If the position is expressed as a negative integer, the platform calculates the position beginning from the right side of the field value. For example, in the string ABCDE, a position of -3 places the starting point of the action before C.</td>
</tr>
</tbody>
</table>
If the position value starts with /regex/, everything after that is a regular expression that is used to calculate the starting position. For example, in the string ABCDE, a position of /regex/B.*D places the starting point of the action after C (B and all the characters between B and D).

1. Open the **Odd/Even** record in the Transform Definitions module.
2. Enter the following script to pass values with the odd_even variable.

```javascript
function(variables, value, parameters) {
    var odd = ('odd' == variables.odd_even);
    var val = value - 0;
    var val_odd = ((val & 1) == 1);
    if (odd != val_odd)
        val++;
    return '' + val;
}
```
The script references the variable in the form variables.odd_even.
Transforms an integer to an odd or even value

```javascript
function(variables, value, parameters) {
    var odd = ("odd" == variables.odd_even);
    var val = value - 0;
    var val_odd = ((val & 1) == 1);
    if (odd != val_odd)
        val++;
    return "" + val;
}
```
3. Update the record to complete the configuration.
   
The Odd/Even transform definition is now ready to use in a field transformation.

Create a transform category

Create a transform category to group the transform definitions together.

1. Navigate to Field Normalization > Administration > Transform Categories.
2. Click New in the Transform Categories Related List.
3. Enter the Name of this category and a description.
4. Select an Order for this category and save the record.
   
The order determines the display order of categories in lists and forms. Two Related lists appear:
   
   • Field Types: Click Edit to select an existing field type for this category or click New to create a new field type. The normalization field types provided are:
     • Decimal
     • Float
     • Integer
     • Numeric
     • String
     • URL
   
   • Transform Definitions: Click Edit to select the transform definitions that are included in this category.

Regular expressions and patterns in field normalization rules

Field Transformation definitions support the use of regular expressions (referred to in the platform as regex) and pattern matching for determining the position of characters in a string.

After identifying the target characters, field transformation can replace or delete the identified characters or insert other characters at that position.

Regex

Regular expressions can be used in transform parameters and in condition statements to determine which characters in a field value are transformed.

   • Transform parameters: Regular expressions used as parameters to locate characters in transformed field values must begin with /regex/. Everything after that is a regular expression that is used to calculate character position.

Example

The computer names in an organization's Windows network are expressed as domain\machine name, such as development\devlab01. The network administrator wants to simplify these names by removing the domain name and backslash. He creates a transformation record for the Computer [cmdb_ci_computer] table and selects the Name field to transform.
The network contains several domains, and each domain contains numerous computers. The only character common to each name is the backslash. To delete the domain name, the administrator decides to use a regular expression to replace the entire raw value in the field with the characters that appear after the backslash (the actual machine name). He creates a new Transform using Replace as the Transform Type and enters the following values:

- Find:/regex/.*/\((.*)
- Replace with:$1

Transformation regex example
The regular expression \\.*\(.*\) represents the entire raw value in the Name field - in this example development \devlab01. The first part of the expression, .*, represents everything before the backslash (the development domain name). The backslash by itself is the escape character in regular expressions and requires special syntax to retain its function in the computer name. The administrator must escape it by using another backslash (\ means \). The part of the expression after the backslash, (.*), represents the computer name (devlab01) and is grouped within parentheses for reference. The value in the Replace with field, $1, references this group and replaces the entire raw value of the field with the contents of the group, devlab01.

The administrator clicks Test transforms in the transformation record and enters development\devlab01 in the Raw data field. He then clicks OK to apply the transform to the test value. The transform replaces development\devlab01 with devlab01.

When the transforms for this field are tested successfully, the administrator changes the Mode in the transformation record to Active and runs the Transformation application data job to apply this transformation to existing records in the database.

Pattern matching

Pattern matching in Field Normalization uses special characters differently from regular expressions to create patterns that the platform recognizes when transforming field values.

Pattern matching can be used only in condition statements. When using pattern matching characters in a condition statement, make sure to select the matches pattern operator.

Use the following special characters to create patterns for searches.

- The asterisk in a search string (*) matches any number (including zero) of any character.
- The question mark (?) in a search string matches one of any character.
- Everything else in a search string matches itself.

Examples

- the story matches the story but not that story.
- *story matches the story and that story, but not that story is the best.
- st?ry matches story and stxry, but not my story or stairy.
- *b?gus* matches bogus, my bogus story, and His bagus machine, but not my bgus story or my baigus story.
Domain separation and Field Normalization

Domain separation is unsupported in Field Normalization. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information, see Application support for domain separation.

Data policy

Data policies enable you to enforce data consistency by setting mandatory and read-only states for fields.

Data policies are similar to UI policies, but UI policies only apply to data entered on a form through the standard browser. Data policies can apply rules to all data entered into the system, including data brought in through import sets or web services and data entered through the mobile UI.

For example, suppose that you are configuring a web service that allows users from outside the platform to update problems on the ServiceNow instance. Since these problems are not updated through the instance UI, they are not subject to the UI policies on the problem form. To ensure that the Close notes field is completed before a problem is marked Closed/Resolved, you can create a data policy that applies to server-side imports. Data that does not comply with this data policy produces an error. You can also apply the policy on the browser by selecting the Use as UI Policy on client check box in the data policy record.

Since UI policies can also manage the visibility of fields on a form, you may want to augment UI policies with data policies rather than replace them.

By default, data policies are applied to all GlideRecord operations including those used in Scripted REST APIs, and the REST Table API. You can opt out of applying the data policy to:

- Target records of SOAP web services
- Import sets
- Client-side UI policies

The admin role is required to edit data policies.

Note: Defining a data policy enforces the policy when a record is submitted from the UI. This behavior cannot be changed.

Installed with data policy

Data policy includes several components that are installed on the instance.

Tables

- Data Policy [sys_data_policy2]
- Data Policy Rule [sys_data_policy_rule]

Roles

The following role is available with data policy:
data_policy_admin: Allows you to grant access for maintaining data policy to specific users. You may have to grant this role access to the System Policy application.

Data Policy Module

The **System Policy > Data Policies** module displays a list of all data policies and where they apply.

**Create a data policy**

You can create a new data policy to define data rules for a table.

Create data policies to enforce consistency. You can create data policies only for tables and database views that are in the same scope as the data policy and for other tables that have at least one field in the same scope as the data policy. For tables that are in a different scope from the data policy record, you can create data policy rules only for fields in the same scope as the data policy and you cannot make a field mandatory.

1. Navigate to **Data Policies** by completing one of the following actions.
   - Navigate to **System Policy > Rules > Data Policies**.
   - From any form header, right-click the header bar and select **Configure > Data Policies**.
   - In List v2, open any column context menu and select **Configure > Data Policies**.
   - In List v3, open the list title menu and select **Configure > Data Policies**.
2. Click **New**.
3. Select any options for the data policy.
4. Create the condition that must exist for the platform to apply this policy.
   - For example, your conditions might include `[Problem state] is [Closed/Resolved]`
5. Right-click the header and select **Save**.
   - The **Data Policy Rules** related list appears.
6. Click **New** in the related list and create the record that identifies the field and the policy to apply.

It is possible to have multiple rules on a single field, but it is not recommended.
7. Click **Submit**.
8. Optional: Add more rules by repeating steps 6 and 7.

### Data policy fields

These fields appear on the Data Policy form and related forms.

#### Data policy fields

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table to which this policy applies.</td>
</tr>
<tr>
<td><strong>Note:</strong> The list shows only tables and database views that are in the same scope as the data policy.</td>
<td></td>
</tr>
<tr>
<td>Application</td>
<td>Application that contains this data policy.</td>
</tr>
<tr>
<td>Inherit</td>
<td>If selected, applies this data policy to tables that extend the specified table. For example, incident, problem, and change tables all extend the task table, therefore selecting Inherit on a data policy defined for task would apply the data policy to them as well.</td>
</tr>
<tr>
<td>Reverse if false</td>
<td>If selected, the data policy action is reversed when the conditions evaluate to false. For example, when the conditions are true, then actions are taken and when they change to false, the actions are reversed.</td>
</tr>
<tr>
<td>Active</td>
<td>If selected, the data policy is used.</td>
</tr>
<tr>
<td>Short description</td>
<td>A short description that identifies the policy.</td>
</tr>
<tr>
<td>Description</td>
<td>A detailed description of the policy.</td>
</tr>
<tr>
<td>Apply to import sets</td>
<td>If selected, the data policy applies to data brought into the system from import sets. This option also applies to web service import sets.</td>
</tr>
<tr>
<td>Apply to SOAP</td>
<td>If selected, the data policy applies to data brought into the system from a SOAP web service. Scripted SOAP web services are not affected. This field does not affect data policy interaction with REST web services.</td>
</tr>
<tr>
<td>Use as UI Policy on client</td>
<td>If selected, enforces the data policy on the UI using the UI policy engine.</td>
</tr>
</tbody>
</table>

#### Data policy rule fields

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>The table on which the data policy action applies.</td>
</tr>
<tr>
<td>Field name</td>
<td>The field from the specified table to which the data policy will apply.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Read Only</td>
<td>How the data policy affects the read only state of the field. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• Leave alone</td>
</tr>
<tr>
<td></td>
<td>• True</td>
</tr>
<tr>
<td></td>
<td>• False</td>
</tr>
<tr>
<td>Mandatory</td>
<td>How the data policy affects the mandatory state of the field. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• Leave alone</td>
</tr>
<tr>
<td></td>
<td>• True</td>
</tr>
<tr>
<td></td>
<td>• False</td>
</tr>
</tbody>
</table>

**Note:** For tables that are in a different scope than the data policy record, you cannot make a field mandatory.

**Convert a UI policy to a data policy**

To make a UI policy the default setting, convert the UI policy to a data policy.

Role required: ui_policy_admin

You can also apply a UI policy to import sets or to data imported by SOAP web services when you convert it to a data policy. Converting a UI policy to a data policy deactivates the UI policy. To retain the policy in the UI, ensure that the **Use as UI Policy on client** check box is selected on the data policy record.

For a UI policy to be eligible for conversion to a data policy, the following conditions must be met on the UI Policy form.

- The **Run scripts** check box must be cleared.
- The **Global** check box must be selected.
- None of the UI policy actions can have **Visible** set to **True** or set to **False**. **Visible** must be set to **Leave Alone**.

1. Navigate to **System UI > UI Policies**.
2. Open an existing UI policy.
3. Under **Related Links**, click **Convert this to Data Policy**.
   
   A new data policy record is created.
4. Edit the fields on the data policy record as necessary.

**Convert a data policy to a UI policy**

Converting a data policy to a UI policy is useful if a data policy already exists, but only needs to apply to records created or updated in the browser.

Role required: admin

Converting deactivates the data policy - the new UI policy is applied only at the UI layer only and not to import sets or data imported from SOAP web services.
Note: An alternative to converting from a data policy to a UI policy is to select the Use as UI Policy on client checkbox on the data policy record. This field extends the data policy to the UI. The main difference between converting and using the Use as UI Policy on client checkbox is that converting provides the Visible field on the UI policy record. Use the Visible field to select how the UI policy affects the visible state of the field.

2. Under Related Links, click Convert this to UI Policy.

A new UI policy record appears.

3. Edit the fields on the UI policy record as necessary. For details about the fields, see Create a UI Policy.

Data policy debugging

Debug messages can help administrators identify and resolve data policy problems. Debug messages can help you identify and resolve data policy problems. To view data policy debugging messages at the bottom of the screen, navigate to System Diagnostics > Session Debug > Debug Data Policies.
In the example, a data policy is in place to prevent the short description on an incident from being changed when the incident state is set to Open. A user edited the short description while the incident was open and tried to save the changes, but the data policy was enforced.

**Debug Output**

<table>
<thead>
<tr>
<th>Time</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>16:13:37.693</td>
<td>DataPolicies Found : 2</td>
</tr>
<tr>
<td>16:13:37.693</td>
<td>Running Data Policy on incident &quot;Users cannot edit the short description for a new incident&quot;</td>
</tr>
<tr>
<td>16:13:37.694</td>
<td>Evaluating Condition</td>
</tr>
<tr>
<td>16:13:37.696</td>
<td>incident_state=1*EQ - true</td>
</tr>
<tr>
<td>16:13:37.697</td>
<td>Field Short description is Read Only</td>
</tr>
<tr>
<td>16:13:37.697</td>
<td>Evaluating Condition</td>
</tr>
</tbody>
</table>

**Data policy debug messages**

**Data lookup and record matching support**

The data lookup and record matching feature enables administrators to define rules that automatically set one or more field values when certain conditions are met.

Data lookup rules allow administrators to specify the conditions and fields where they want data lookups to occur. For example, on Incident forms, there are priority lookup rules for the sample data that automatically set the incident **Priority** based on the incident **Impact** and **Urgency** values.

**Note:** Activating the Data Lookup and Record Matching Support plugin replaces the `calculatePriority` business rule with a priority data lookup definition, but does not transfer any custom logic. If you manually activate the plugin, you must recreate any custom business logic that uses the priority lookup rules.

**Create custom data lookups**

Creating custom data lookups involves adding a lookup value, creating the definition, and activating data lookup.

**Create a custom data lookup table**

Create a custom table to store lookup data.

The custom table must extend the Data Lookup Matcher Rules `[dl_matcher]` table. For example, this custom lookup table stores information about VIP callers and incident assignments.

**Custom data lookup table**

<table>
<thead>
<tr>
<th>Field</th>
<th>Sample value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>VIP Caller Lookup</td>
</tr>
<tr>
<td>Table name</td>
<td><code>u_vip_caller_lookup</code></td>
</tr>
</tbody>
</table>
Add a data lookup value to the data lookup table

The columns of a data lookup table contain both matcher and setter field data.

Each data lookup is a query that searches for a row containing values that match the matcher fields. The data lookup then returns the value listed in the setter fields. For example, this Priority Data Lookup [dl_u_priority] table lists the combinations of impact and urgency (matcher fields) that produce a particular priority value (setter field).

Lookup table

<table>
<thead>
<tr>
<th>Matcher fields</th>
<th>Setter field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Impact</td>
<td>Priority</td>
</tr>
<tr>
<td>1 - High</td>
<td>1 - Critical</td>
</tr>
<tr>
<td>1 - High</td>
<td>2 - High</td>
</tr>
<tr>
<td>1 - High</td>
<td>3 - Moderate</td>
</tr>
<tr>
<td>2 - Medium</td>
<td>1 - High</td>
</tr>
<tr>
<td>2 - Medium</td>
<td>2 - Medium</td>
</tr>
<tr>
<td>2 - Medium</td>
<td>3 - Low</td>
</tr>
<tr>
<td>3 - Low</td>
<td>1 - High</td>
</tr>
<tr>
<td>3 - Low</td>
<td>2 - Medium</td>
</tr>
<tr>
<td>3 - Low</td>
<td>3 - Low</td>
</tr>
</tbody>
</table>

1. In the navigation filter, enter the name of the new custom lookup table. For example, enter `u_vip_caller_lookup.list`.
2. Configure the list and create new fields, as appropriate. For this example, create the following new fields:

New fields

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Field length or Table to reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Caller</td>
<td>Reference</td>
<td>User [sys_user]</td>
</tr>
<tr>
<td>Priority</td>
<td>Integer</td>
<td></td>
</tr>
<tr>
<td>Assignment Group</td>
<td>Reference</td>
<td>Group [sys_user_group]</td>
</tr>
</tbody>
</table>

3. From the table list, click New and enter appropriate matcher and setter field values. For example:

New matcher and setter field values

<table>
<thead>
<tr>
<th>Matcher field</th>
<th>Setter fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Caller</td>
<td>Priority</td>
</tr>
<tr>
<td></td>
<td>Assignment Group</td>
</tr>
</tbody>
</table>
Create a data lookup definition record

Data lookup requires a definition record that specifies how to set one or more field values when specified conditions are met.

2. Click New.
3. Click Data Lookup Rule.
4. Complete the Data Lookup Rule form using the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a unique name to identify the definition record.</td>
</tr>
<tr>
<td>Source Table</td>
<td>Select the table containing the fields you want to automatically update with lookup values. Data Lookup Definitions are not inherited by extension tables. For example, a Data Lookup Definition on the Task table cannot match values on the Incident incident table.</td>
</tr>
<tr>
<td>Matcher Table</td>
<td>Select the table containing the lookup values. This table should always start with a u_ prefix.</td>
</tr>
<tr>
<td>Active</td>
<td>Select this check box to run this data lookup rule. Clear the check box to ignore this data lookup rule.</td>
</tr>
<tr>
<td>Run on form change</td>
<td>Select this check box to automatically look up values whenever a user or onChange client script changes a field value on a source table form.</td>
</tr>
</tbody>
</table>

**Note:** This does not include changes automatically made by other data lookup rules, such as the Priority Lookup Rules.
5. Right-click the form header and click **Save**.
6. From the **Matcher Field Definitions** related list, click **New**.
7. Complete the Matcher Field Definitions using the following table.

   A data lookup only occurs on fields with matcher field definitions. The data lookup uses the values of the source table fields to look up one or more values from the matcher table. Note that data lookup does not work with **Journal** type fields.

   **Matcher field definitions fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Lookup</td>
<td>Displays the name of the parent data lookup definition record.</td>
</tr>
<tr>
<td>Source table field</td>
<td>Select the field from the source table that contains the data to match.</td>
</tr>
<tr>
<td>Matcher table field</td>
<td>Select the field from the matcher table that contains the data to match.</td>
</tr>
<tr>
<td>Exact lookup match</td>
<td>Select this check box to require the matcher table to contain a matching row for every possible combination of values (including blank values). Clearing this check box means that any blank values in the matcher table match any value. For example, suppose the Priority field is blank in the matcher table. When this check box is selected, there is a match only when the Priority value is blank in the source table row. When this check box is cleared, the blank matcher field value matches any value in the source table field.</td>
</tr>
</tbody>
</table>

   **Note:** If the lookup does not require an exact match, matcher table rows containing blank values are treated as wild cards, matching all values.

8. Click **Submit**.
9. From the **Setter Field Definitions** related list, click **New**.
10. Complete the Setter Field Definitions form using the following table.

   **Setter field definitions fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data Lookup</td>
<td>Displays the name of the parent data lookup definitions record.</td>
</tr>
<tr>
<td>Source table field</td>
<td>Select the field from the source table that the data lookup updates.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Matcher table field</td>
<td>Select the field from the matcher table that provides the new value for the update.</td>
</tr>
<tr>
<td>Always replace</td>
<td>Select this check box to replace any existing value with a value from the data lookup. Clear this check box to ignore the update if the field has an existing value.</td>
</tr>
</tbody>
</table>

11. Click **Submit**.
12. Click **Update**.

For example, the following data lookup definition assigns incidents to the VIP Issues group based on the **Caller** field. In addition, the incidents are set to critical or high priority based on the caller.

Create a data lookup module

You can create a module for data lookup so it appears in the instance application navigator.

1. Navigate to **System Definition** > **Application Menus**, then select an application to add the module to.
2. In the Modules related list, click **New**.
3. Configure a module for the data lookup table you created using the following properties.
## Module properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Required value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the data lookup table you created in Step 2. For example <code>u_vip_caller_lookup</code>.</td>
</tr>
<tr>
<td>Link type</td>
<td>List of Records</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

**Troubleshooting data lookup**

If the custom data lookup definition rules are not behaving as expected, check for certain conditions.

- Verify that the data lookup definition is set to run on the appropriate events.
- Verify that the matcher field is not read-only. Since users cannot change read-only fields, user interactions cannot trigger an on form change event for read-only fields.
- Verify a client script is not changing a field value. Client scripts can trigger **Run on form change** events even on read-only fields.
- Verify that the data in the matcher table is correct.
- If the lookup requires an exact match, verify that there is a matcher table row for each possible combination (including blank values). The lookup fails if cannot find a matching value.
- Verify that you have not created a recursive rule, such as:
  - If Field A = 1, then Field B = 2. If Field B = 2, then Field A = 2

## State Management

State Management enables an administrator to define State Models and State Transitions that control how a record is allowed to transition through a predefined list of states.

An example of a state transition is when the **State** field in a facilities request is moved from the **Assigned** state to the **Work In Progress** state.

State Management is active for all instances.

### What is a state model?

A state model is a list of states that describe an expected record workflow through the lifecycle of the record. State models can be defined for any table that extends the task table. State models simplify defining the state transitions allowed for a specific task type.

In the State Model [sys_state_model] table, define the name of the state model and which task table the state model is applied to. Use the condition builder to specify any conditions for applying the state model to records and any required condition for moving between states.

For example, you could define a state model for a new custom application for airline reservations. The custom application has a Reservation Request [reservation_request] table with 4 states: **Held**, **Confirmed**, **Completed**, and **Canceled**. You could define the state model to target the Reservation Request table, and then define the state transitions for each of the 4 states. When you enable the state model, the choice list for the **State** field includes only the choices allowed by the conditions in the state transitions.

**Note:** State Management includes example state models that are copies of the normal, emergency, and standard change request state models. By default, these examples are not enabled. Use them only as examples.
to develop a state model and transitions for a task table that does not have a state model. Do not enable these example state models for change requests and then make changes to them. Doing so breaks existing transitions for change requests.

What is a state transition?

State transitions are a list of conditions for entering or exiting each state defined for a table. In the State Transitions [sys_state_transitions] table, use the condition builder to build a list of conditions required for entering or exiting each state.

To prevent users from choosing an invalid state, any attempt to update a record’s state is denied if it violates the state transitions, whether the attempt is through user input, a script, a Web API such as REST or SOAP, or any other source.

State transitions control the choice list for the State field on the target task table and prevent you from choosing any state value that does not adhere to the underlying process or does not meet the defined conditions for the transition.

For example, if the enter condition for the Completed state is State is Confirmed, only records in the Confirmed state can transition to the Complete state. When a record is in the Confirmed state, the only choice in the State field choice list is Completed.

Add a state model and transitions

Add a state model and transitions to specify conditions for moving between states.

Role required: state_model_admin or admin

Develop and test your state model in a non-production instance before deploying it in the production instance.

1. Navigate to State Management > State Models.
2. Click New.
3. Fill in the fields on the form.

State model fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Descriptive name for this state model.</td>
</tr>
<tr>
<td>Table</td>
<td>Table this state model applies to.</td>
</tr>
<tr>
<td>Application</td>
<td>Defaults to Global.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which this state model is evaluated for the target table. State models are evaluated in numerical order, from the lowest number to the highest number. Leave space between the numbers so that you can insert a new state model later, if necessary. For example, enter 10 for the first state model to be evaluated, 20 for the next state model to be evaluated, and so on.</td>
</tr>
<tr>
<td>Active</td>
<td>Indicates that this state model is enabled. Clear this check box until you define the state transitions for the state model.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this state model.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Condition | Condition builder that sets the conditions for applying this state model to records. For example, you could add the condition **Category is Networking** versus **Category is Security** if there are different state models for networking requests and security requests.

Common Exit Condition | Condition builder that sets any common condition required for moving from one state to another.

4. Open the form context menu and click **Save**. The **State Transitions** related list appears.
5. Click **New** on the **State transitions** related list.
6. Fill in the fields on the form.

**State transition fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State Model</td>
<td>State model that uses this state transition.</td>
</tr>
<tr>
<td>State</td>
<td>State this transition controls, for example <strong>Ready</strong> or <strong>In Progress</strong>.</td>
</tr>
<tr>
<td>Application</td>
<td>Defaults to <strong>Global</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which this state transition is evaluated. State transitions are evaluated in numerical order, from the lowest number to the highest number. For example, if the first predefined state is <strong>New</strong>, give that state the lowest order number so that the conditions for entering and leaving the state are evaluated first. Leave space between the numbers so that you can insert a new state transition later, if necessary. For example, enter 10 for the first state transition to be evaluated, 20 for the next state transition to be evaluated, and so on.</td>
</tr>
<tr>
<td>Terminal State</td>
<td>Selected if there are no transitions from this state.</td>
</tr>
<tr>
<td>Description</td>
<td>Description of this state transition. For example, the Description for the Assess state could be <strong>New state can move only to Assess state.</strong></td>
</tr>
<tr>
<td>Enter Condition</td>
<td>Condition builder that sets the conditions for entering this state.</td>
</tr>
<tr>
<td>Exit Condition</td>
<td>Condition builder that sets the conditions for exiting this state.</td>
</tr>
</tbody>
</table>

7. Click **Submit**. The state model form reopens, and the new transition is added to the related list.
8. Continue adding state transitions for the remaining states.
9. When finished adding state transitions in the state model form, select the **Active** check box and click **Update**.
Implement process flow and UI actions with a state model

You can implement a process flow and UI actions with a state model.

Role required: state_model_admin or admin

State models provide a way to limit the choices for moving between states in a form. If you set up only a state model, users manually change states in the form. Additional steps are required to add the process flow or UI actions, as illustrated in the following example.

1. Verify choices for the State field for the table and ensure that you created transitions for them. For more information about how to add State field choices, see Best practices for state field choice values.
2. After creating the state model, define the process flow. For more information about process flows, see Process flow formatter.
3. Define UI actions as desired to move between states. For more information about UI actions, see UI actions.

After the state model is enabled, only the defined state transitions are included in the choice list for the State field, and the process flow and UI actions are implemented.

Installed with State Model

Several types of components are installed with the State Model.

Tables installed with State Model

State Model adds the following tables.

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State Model</td>
<td>Defines the name of the state model and which table the state model targets. Also defines the condition for applying the state model to records and any common condition for moving from any state to any other state.</td>
</tr>
<tr>
<td>[sys_state_model]</td>
<td></td>
</tr>
<tr>
<td>State Model</td>
<td>Defines how each record in the target table transitions to (the enter condition) and/or from (the exit condition) each state predefined for that table.</td>
</tr>
<tr>
<td>[sys_state_model]</td>
<td></td>
</tr>
</tbody>
</table>
Roles installed with State Model

State Model adds the following role.

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Contains roles</th>
</tr>
</thead>
<tbody>
<tr>
<td>State Model Administrator</td>
<td>Allows users to add, modify, and delete state models for task tables.</td>
<td>• None</td>
</tr>
</tbody>
</table>

Script includes installed with State Model

State Model adds the following script include.

<table>
<thead>
<tr>
<th>Script include</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TableChoiceUtils</td>
<td>Utility class to get the choice list of a table field.</td>
</tr>
</tbody>
</table>

Client scripts installed with State Model

State Model adds the following client script.

<table>
<thead>
<tr>
<th>Client script</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Populate State Choices</td>
<td>State Transition [sys_state_transition]</td>
<td>Populates the State field choices in the targeted record.</td>
</tr>
</tbody>
</table>

Business rules installed with State Model

State Model adds the following business rules.

<table>
<thead>
<tr>
<th>Business rule</th>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set the display value for state</td>
<td>State Transition [sys_state_transition]</td>
<td>Sets the State field value based on the state model for the table.</td>
</tr>
<tr>
<td>Set the table to pick choices</td>
<td>State Transition [sys_state_transition]</td>
<td>Caches the State field value from the first table in the hierarchy for further rule processing.</td>
</tr>
</tbody>
</table>

Currency administration

Currency fields provide features for handling the calculation, conversion, and display of currency values.

The Now Platform® supports two types of currency fields:

**Default (standard) currency**

The default, or standard, currency fields that are delivered with the Now Platform.

**FX Currency**
FX Currency is an alternate type of currency field that is highly configurable, supports custom rate tables, and provides for improved visibility into conversion calculations. You can add FX Currency fields to base and custom applications, and they work independently of existing standard currency fields.

**Setting up and operating standard currency fields**

The standard, or default, currency fields are installed with the base system and used in most non-financial applications.

A standard currency field stores a currency value, a currency code, and a reference currency value.

- Three-letter ISO code that identifies the currency that you select for the currency amount. For example, USD for the US Dollar, or EUR for the Euro.
- The reference currency value is the currency value, expressed in the reference currency. When you save a currency value, the reference currency value is calculated using a rate conversion.

A price field is similar to a currency field, but with special features for conversion and display. To learn more, see Price fields.

**Locale settings**

There are two locale settings, system and user. The system locale determines the reference currency, and the user locale determines the session currency.

**System locale**

You set the system locale using the `glide.system.locale` property. The value is in the format Language.Country, where the:

- **Language** is an ISO 639 language code.
- **Country** is an ISO 3166 language code.

Internally, this value is used as specified by Java. The system locale setting should be in the Java supported locales list. Set the system locale once after a fresh zBoot, because reference currency values that appear in currency fields are in the currency implied by the system locale. To set this property, see Control default currency field configuration and use in an instance.

**Note:** Do not change the system locale after currency values have been entered into the instance. When you change the system locale, the reference currency values are not adjusted. There is no rate conversion. This persistence results in invalid aggregations and filtering.

**User locale**

The Now Platform® determines the user locale in the following sequence:

- User record in which the country, or both the country and language, are specified.
- System locale set using the `glide.system.locale` property.
- Browser locale.

Amounts in currency fields are composed of a currency code and amount. Amounts always appear in the session currency, and are formatted in the Java-specified format for the user locale.
Session and reference currency

The default, or standard, currency fields in the Now Platform® use two kinds of currency, Session and Reference.

Session currency

The session currency is defined for the user by the user’s locale or single-currency mode.

Reference

The system local determines the reference currency, and is the standard used across the entire instance.

Each time you enter a value into a currency or price field, the system stores three pieces of information:

- Value as entered, in the user's locale.
- Currency code, in the user's locale.
- Value converted to the reference currency using the current exchange rate.

Note: In multiple-currency mode, the currency code saved in the currency field may not be the same as the session currency code. For example, the session currency could be the Euro and the number entered could be the Japanese Yen.

Session currency

When users view a currency value, they can see the value as entered or in the session-currency format. The format contains the:

- Currency symbol
- Value converted to the session currency and shown in a localized number format.

The user's locale determines the session currency format.

The number format can differ in features such as the decimal separator based on the locale. For example, the US formatting is 1,234,567.89, while German formatting is 1.234.567,89. The Now Platform® determines the session currency in the following sequence:

- Single-currency mode setup using glide.i18n.single_currency and glide.i18n.single_currency.code.
- Default currency for the user’s locale.

Reference currency

To perform calculations on heterogeneous currency values, the Now Platform® stores currency values converted to a system currency, referred to as the reference currency. Every currency field contains a reference currency value. The system determines the reference currency in the following sequence:

- System locale set using the property glide.system.locale
- Java default locale, typically en.US

The filtering and aggregation features use the reference currency value to perform calculations on default currency fields. These features can yield inaccurate results because of conversion rate changes.
Issues with currency fields

Users are often confused by the results of filtering, sorting, and displaying currency fields because the system works with at least two currencies for each value: the session currency and the reference currency.

**Note:** Aggregations and filtering of currency fields use the reference currency, and the user sees the session currency. Because of changing conversion rates, the filtered reference currency values might not result in the same order as the session currency values would suggest. The same issue happens with aggregations.

The user might see the following issues:

- Lists filtered on currency fields might not be in the expected order. It uses the reference currency values for filtering but displays session currency values.
- Aggregation of currency fields may not produce the expected results because reference currency values are aggregated, and then converted to the session currency.
- Currency values may not appear as expected because currency values are formatted based on the user's locale and not on the currency code.

This confusion may be the result of the difference between session and reference currencies, changing conversion rates, and different session currencies used by different users.

Single-currency mode

Single-currency mode enables all users of the platform to view currency values in the same currency.

Before enabling single-currency mode, set the system locale. To configure single-currency mode, set the following properties:

- `glide.i18n.single_currency`: true or false
- `glide.i18n.single_currency.code`: the three-letter ISO currency code
- `glide.system.locale`: the system locale

**Note:** For detailed information about valid locale formats, see Locale settings.

Using the single-currency mode has the following limitations:

- The single-currency mode changes the currency that appears in the user views, but does not change the number formatting. Even though users in different countries see currency values in one currency, the number formatting, as determined by the user’s locale, might not be what they expect.
- Because currency value input is constrained to the single currency, price fields cannot be used.

You can avoid the effects of rate conversions by setting the system locale and the reference currency to be the single currency.

Price fields

A price field is a currency field that enables control over conversions and display. The Service Catalog uses price fields.

You can select conversion and display options per price field, and change them at any time. There are three variations:

**Calculated [Default]**
Behaves in the same way as the default currency field type. Whenever conversions are performed, it uses the latest currency conversion rates. The price field appears in the session currency for the user.

**Fixed**

When the price field appears, it is shown in the currency code used when you entered the value. Whenever conversions are performed, it uses the latest currency conversion rates.

**Multiple**

Enables you to enter multiple price values for an item using a different currency for each price. The field value is the value entered in the user’s session currency. Otherwise, the first price entered converts to the user’s session currency. Whenever conversions are performed, it uses the latest currency rates.

ℹ️ **Note:** The first value entered is used during display. The additional values are not used during calculations.

For examples of using price field, refer to the tables used in Service Catalog.

You can change the currency code and numeric value for a price field. When you click the Edit icon that appears next to the price field, a form appears that you use to edit the details for the price field:

**Price field currency details**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Currency</td>
<td>List of currencies enabled in the system in the combo box. In single currency mode, the currency is a label and cannot be changed.</td>
</tr>
<tr>
<td>Amount</td>
<td>Numeric value formatted in the user’s locale.</td>
</tr>
</tbody>
</table>
| Type    | Calculated, Fixed, Multiple.  
  - When you change the price type to Multiple, the system creates child records for all currencies enabled in the platform. The child records are populated with values converted from the amount field, using latest currency conversion rates.  
  - You cannot change the price type in single currency mode.  
  - You can modify the price type at any time. |

**Default currency values in forms**

In forms, currency values appear in the currency in which they were entered.

A combo box provides a list of available currencies, and the user’s locale determines its format. When entering or changing the numeric currency value, enter it in the same format specified by the user’s locale. In the form for a new record, the reference currency is pre-selected in the currency list, with the numeric value set to zero

- If the record is read only, the currency value appears in the Currency field as it was entered, and is formatted in the user’s locale. In the Price field, the session currency value appears.
• In Single currency mode, the currency is a label that cannot be changed, and the **Edit** icon does not appear.

**Editing the currency instance record**

If a currency instance record exists, an **Edit** icon appears next to the **Currency** field if you have edit rights for the fx_currency_instance table. Users with the financial_mgmt_user role can edit the values associated with the currency field.

**Note:** Normally, you should not edit the fx_currency_instance table directly. The Now Platform maintains these tables, and your changes could have unintended consequences.

**Default currency values in reports**

Currency values in reports appear in the user’s session currency, and are formatted in the user’s locale with a currency symbol.

The user determines how the report is run.

• Shared report: The user who runs the report.
• Scheduled report: Generally run as the user who scheduled the report.

The two user-specific values in the report are:

• User session currency
• Converted value

**Note:** A user that has a different session currency than the person who runs a report might receive unexpected results.

**Default currency values in lists**

In lists, default currency values appear in the user’s session currency, formatted for display in the user’s locale. Typically, a formatted number follows the currency symbol.

Different field types appear as follows in lists:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Currency field type</td>
<td>Value expressed in the user’s session currency.</td>
</tr>
<tr>
<td>Price field type</td>
<td>• <strong>Calculated:</strong> Value in the user’s session currency.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Fixed:</strong> Currency value, as entered by the user.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Multiple:</strong> Value associated with the user’s session currency if this value exists. Otherwise, the first value entered converts to the user’s session currency.</td>
</tr>
</tbody>
</table>

A Globe icon appears beside the currency value that enables you change to one of the following values:

• Value as entered by the user.
• Value in session currency.
• Value as entered and, in brackets, the value in reference currency.
The icon appears when the user’s session currency is different from the currency entered. Clicking the icon cycles through the listed displays. In the preview for the record, currency values appear as entered, formatted in the user’s locale.

**Aggregation**

Aggregation operations can be used on currency columns. Aggregation operations include total, group by, average, minimum, and maximum. Aggregation is done in two steps:

- Aggregate the reference currency values for all records.
- Convert this aggregate to the user’s session currency for display.

**Note:** The resulting value may not be what you expect. The conversion rate used for the value that appears for the currency field, and for its reference currency, that is used for the aggregation, may have changed.

This limitation extends to different price types.

- For price type fixed, the calculated reference value can be old.
- For price type multiple, the reference value of the first price entered is used. The other values are not used.

The aggregate value is shown formatted in user’s locale with a currency symbol. Currency fields are stored with four decimal places, and aggregates have four decimal places. For upgrades, you must set the `glide.currency_price.use_all_fraction_digits` property. See Change default currency decimal places for more information.

**Filtering**

You can set up filters on currency fields. The currency value is entered as a currency code and numeric value. Filtering is done in two steps:

- The filter currency value is converted to the reference currency.
- The filter’s calculated reference value is compared with the reference value in the records.

Matching records are shown in the list view.

**Note:** At times, the filtering results might not provide the expected result. The conversion rate used when you run the filter might be different than the conversion rate used when calculating the reference values in the individual records. This limitation extends to the following price types:

- For a Fixed price field type, the calculated reference value can be old.
- For a Multiple price field type, it uses the reference value of the first price, and does not use the other values.
Default currency values in import and export

In general, currency values crossing the boundaries of the platform are represented in the user’s session currency and formatted in the user’s locale.

Import

Currency values are imported as strings, just like other fields. The default transform mapping to a currency field uses `setDisplayValue()`. The expected format for this function is:

- A number formatted in the user’s locale. The number is taken as a value in the user’s session currency, for example, 1,234.56.
- The number prefixed by the three-letter currency code separated by a semicolon, for example, EUR 1.234,56.

This behavior can be customized in transform map scripts.

Export

Currency values are exported in the user’s session currency. They are formatted in the user’s locale, except when exporting as XML. When exporting currency in XML, the value is in the reference currency value with no formatting.

Default currency values in scripts

You can use currency fields in scripts.

These methods are available on GlideElement objects.

To display currency values, use the `getDisplayValue()` display API. To work with currency values in any way other than display, use the APIs that return/accept unformatted numbers.

**Note:** Before performing calculations on the value, do not use the `getDisplayValue()` methods and then process the string to remove formatting information.

Methods such as `getValue()` and `getCurrencyValue()` return unformatted numbers as strings. To obtain the floating point value, use the JavaScript function `parseFloat()`, and then use resulting value to perform calculations. To obtain the currency associated with these values, use the APIs that return the currency code. You can also use the `getCurrencyCode()` methods to determine a field’s currency.

```javascript
var rate = parseFloat(current.base_rate);
var currencyCode = current.base_rate.getCurrencyCode();

Use the `setValue()` method to set the value of a currency field. If this currency is the user’s session currency, use a plain number or the floating point number of a string containing it. Otherwise, prefix the value with the 3-letter ISO currency code.

```javascript
var totalCost = rate*current.hourly_rate;
current.total_cost.setValue(currencyCode + ";" + totalCost);
```  

You are working with the reference currency value when you use GlideAggregate on currency or price fields. Be sure to convert the aggregate values to the user's session currency for display. The resulting value may not be what you expect. The conversion rate used for the currency or price field value, and for its reference currency, which is used for the aggregation, may have changed.

When you delete a record containing a currency value, the platform deletes any associated currency records.
Note: Do not use `deleteMultiple()` on tables with currency fields. Always delete each record individually.

Currency values contain four decimal places.

- APIs that return values such as `getValue()` return up to four decimal places. Trailing zeros are always removed.
- APIs that return display values such as `getDisplayValue()` have at least two decimal places and up to four decimal places.
- GlideAggregate returns four decimal places.

You can have the system use two decimal places. When you set it to two decimal places, numeric values returned by the API contain two decimal places. Although currency conversion rates may have more decimal places, currency fields store only two decimal places. APIs that accept numeric values round decimal places to two places.

- APIs that return values such as `getValue()` return up to two decimal places. The trailing zeroes are removed for values read from the database, but if a value such as 00 is set later, 1.00 can be returned. The number of trailing zeros returned is not consistent.
- APIs that return display values such as `getDisplayValue()` contain up to two decimal places. It could sometimes return two places even for values such as 7.10, but could remove trailing zeros at other times. The number of trailing zeros returned is not consistent.
- GlideAggregate returns two decimal places.

Note: To learn how to change the number of decimal places used by the system, see Change default currency decimal places.

The following example, the user’s locale is set to German (de.DE), and the reference currency set to USD. The values use a currency value of 21345.67 in Japanese yen, 1563.72 in Euros, and 1152.48 in US dollars.

### Methods to access currency fields

<table>
<thead>
<tr>
<th>Method name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>getValue()</code></td>
<td>Returns the currency value in the user's session currency as an unformatted number.</td>
<td>1563.72</td>
</tr>
<tr>
<td><code>getReferenceValue()</code></td>
<td>Returns the currency value in the reference currency as an unformatted number.</td>
<td>1152.48</td>
</tr>
<tr>
<td><code>getSessionValue()</code></td>
<td>Returns the currency value in the user's session currency as and unformatted number.</td>
<td>1563.72</td>
</tr>
<tr>
<td><code>getCurrencyValue()</code></td>
<td>Returns the currency value as entered as an unformatted number.</td>
<td>21345.67</td>
</tr>

<td></td>
</tr>
<tr>
<td></td>
<td>• A number formatted in the user's locale prefixed by a 3-letter currency code separated by a semicolon.</td>
<td></td>
</tr>
</tbody>
</table>

**Default currency conversions**

Currency values can be converted to other currencies when stored and accessed. Conversions can happen in these situations.

- The currency value converts to the reference currency when stored, whether on insert or update. The reference currency value is saved as well as the currency value.
- The currency value converts to the user’s session currency for display.
- The value entered into a filter converts to the reference currency using the currency specified in the filter.

Conversion rates are stored in the fx_rate table. Each record contains the conversion rate from a given currency to the Euro. The rates are updated daily from the ECB website by a scheduled job called ECB Exchange Rate Load.

A currency conversion from one currency to another involves two rates.

- Actual: In the fx_rate table, each record contains the conversion rate from a given currency to the Euro.
- Expected: In the fx_rate table, each record contains the conversion rate from the Euro to the given currency.

Whenever you perform a conversion, it uses the latest conversion rates. Therefore, calculations can potentially yield unexpected results. For example:
• Different currency values can have different rates applied to them while storing the reference currency value. Therefore, aggregation can combine values at different rates and convert back at another rate.
• A filter value is converted at current rates while the values it filters in the database can be converted at different rates. A filter for $100 at today’s rate can match a value of $99 obtained at yesterday’s rates.

**Note:** For display purposes, the currency value used is what the user entered converted to session currency. However, for aggregation and filtering, the reference currency value is used. Using the reference currency enables currency values converted at different rates to be compared together.

### Schedule the rate update job

Schedule the Retrieve System Rates job to perform a nightly download of currency-conversion tables from the European Central Bank.

You can adjust the frequency of this behavior or disable it entirely. For information about turning off the regularly scheduled update and maintaining the Exchange Rate table manually, see Use your own currency-conversion rates.

1. Navigate to **System Scheduler > Scheduled Jobs**.
2. Open the job named **Retrieve System Rates**.
3. Modify the schedule, as needed.

   After the job runs, it stores and loads the rates from the Exchange Rate [fx_rate] table. Navigate to **System Localization > Exchange Rates** to see them.

### Use your own currency-conversion rates

All currency conversions are based on the rates stored in the Exchange Rate table. You can turn off the regularly scheduled update from the European Central Bank (ECB), and maintain the table manually.

ECB Exchange Rate Load loads exchange rates from the ECB for the following currencies:

[http://www.ecb.int/stats/eurofxref/eurofxref-daily.xml](http://www.ecb.int/stats/eurofxref/eurofxref-daily.xml)

If ECB does not supply the daily rates for a specific currency, you can manually enter rates into the Exchange Rate table. Use an import set, or another service (for example, JSON or SOAP) that offers upload of more currency rates. You can then add a similar scheduled job to update these currencies.

1. Navigate to **System Scheduler > Scheduled Jobs**.
2. Open the job named **ECB Exchange Rate Load**.
3. In the **Trigger type** field, select **-- None --**.
4. Enter new exchange rates either manually or with an Import Set.

### Setting up defaults required for standard currency use

Set up the defaults required for use of standard currency fields in your instance.

### Control default currency field configuration and use in an instance

You can control how currency fields are configured and used in your instance.

These properties are available for currency fields.

**Note:** To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.
### Properties for default currency fields

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>glide.sys.audit_currency_value</strong></td>
<td>When <em>true</em>, currency fields in audit records are the value entered by the user, in the format <strong>USD; 1234.56</strong>. When <em>false</em>, the value is the numeric value in the session currency.</td>
</tr>
<tr>

</tbody>
</table>

### Change default currency decimal places

You can specify the number of decimal places stored and used in currency fields and calculations.

Role required: admin

1. Navigate to sys_properties.list.
2. Find glide.currency_price.use_all_fraction_digits, and set to the desired value.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Uses two decimal places. This value is the default.</td>
</tr>
<tr>
<td>true</td>
<td>Uses four decimal places.</td>
</tr>
</tbody>
</table>

### Configure default currency fields in audit records

You can control what currency value is stored in audit records.

Role required: admin

1. Navigate to sys_properties.list.
2. Find glide.sys.audit_currency_value, and set to the desired value.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Value entered in the audit record is the numeric value in the session currency. It does not include the currency code. This value is the default.</td>
</tr>
<tr>
<td>true</td>
<td>Value as entered by the user in the format USD. For example, 1234.56.</td>
</tr>
</tbody>
</table>
Configure the currency optimizer

You can configure the system to use an optimizer for currency/price fields to speed up list view (reading currency/price values).

Role required: admin

1. Navigate to `sys_properties.list`.
2. To turn on the currency optimizer, find `glide.currency_price_optimizer.enabled`, and set to the desired value.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Optimizer is not used.</td>
</tr>
<tr>
<td>true</td>
<td>Optimizer is used. This value is the default.</td>
</tr>
</tbody>
</table>

3. To set the minimum number of rows needed by the currency optimizer, find `glide.currency_price_optimizer.min_rows`, and set to the desired value.
   The default value is 4.

Setting up and operating FX Currency fields

Use FX (Foreign Exchange) Currency fields as an alternative to the standard (default) currency fields found in most applications. They are highly configurable, support use of custom rate tables, report aggregations, and provide for improved visibility into conversion calculations.

**Note:** You don't have to install a plugin to use FX Currency functionality. It's activated by default.

Use considerations

Use the FX Currency field type in place of the standard currency fields when you must:

- Support values expressed in multiple currencies, for example, EUR 100, JPY 200, USD 30, as values in a field. FX Currency fields provide better support for multi-currency applications than do standard currency fields.
- Control how the FX Currency field is configured, including specifying its internal behavior and currency value formatting.

To learn more about currency configuration, see Configuring FX Currency field behavior.

- Create custom conversion rate tables.
  
  To learn more about custom table rates, see Add conversion rates using a custom rate table.
- Have more control over when the actual currency conversion occurs. FX Currency values convert on demand only, making the conversion results much more transparent.

To learn more about currency conversions, see Understanding how FX Currency field conversions work.

- Provide greater transparency into currency conversion calculations. You can view and configure the calculation components, including conversion dates, reference currency, and number of displayed decimals.
- Build query conditions using FX Currency field values. For available query conditions, see Operators available for filters and queries.
- Access FX Currency fields through richer scriptable APIs.
- Aggregate currency values as entered by users, or aggregate them in selected reference currencies, for reporting purposes.
Important: You can add FX Currency fields to base and custom applications, and they work independently of existing standard currency fields. However, you can't convert or change a standard currency field to an FX Currency type field. No functions are available to convert standard currency fields to FX Currency fields, then migrate the data from one to the other.

Understanding FX Currency values in forms

In forms, the FX Currency field behaves like a dot walkable field in script. It consists of an entry field, and an accompanying list for selection of a currency code.

Specifically, FX Currency fields that appear on forms contain the following:

- An empty field for entry of a numeric currency value, formatted according to your assigned user locale. For example, in the US, it is formatted with two decimal places, for entry of cents.
  
  If this is a new record, the field is empty. If it is an existing record, the previous currency amount that you entered appears.

- A selection list of active currencies from the Currency [fx_currency] table. The default currency code is based on your user locale. You can select another currency for use during the entry session.
  
  For example, in the US, the default currency value, based on the user locale, is USD. You can select another currency code to use in the current entry session.

- An edit icon

  (\). Users with an assigned currency_instance_admin role can click it to edit currency detail in the accompanying Currency Instance [fx_currency2_instance] record.
Updating the Currency Instance record

If you have an assigned role of currency_instance_admin, you can review and edit the details of a currency entry in an FX Currency field. You can't edit the reference currency and value because they are calculated automatically.

Role required: admin, currency_instance_admin, with ACL access to the FX Currency field.

1. Access the Currency Instance record using one of the following methods:

<table>
<thead>
<tr>
<th>Access method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direct access from an FX Currency field</td>
<td>Click the edit icon that appears next to the FX Currency field in a transaction record.</td>
</tr>
</tbody>
</table>
| From the navigator bar            | a. Navigate to System Localization > FX Currency Configuration.  
                                      b. Click the Currency Instance record to edit. |

Note: Only users with an assigned admin role can access this selection from the navigator.
2. On the form, fill in the fields.

### Currency Instance

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Amount</strong></td>
<td>Currency amount that you entered into the FX Currency field, formatted according to the currency code in your user locale. The amount stores internally as a currency code and a numerical value of up to 12 digits in length. For example, USD; 1234.56.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The currency value has two parts: the currency amount and a currency code. The amount stores as a decimal value, for example, 1234.56.</td>
</tr>
<tr>
<td><strong>Currency Code</strong></td>
<td>Three-letter ISO code that identifies the currency that you select for the currency amount. For example, USD for the US Dollar, or EUR for the Euro.</td>
</tr>
<tr>
<td><strong>Conversion Rate</strong></td>
<td>Conversion rate used to calculate the reference currency value. It converts a session currency value, expressed in one currency, to another, and stores as a reference to a record in the Currency Conversion Rate [fx_conversion_rate] table.  &lt;br&gt; &lt;br&gt; The conversion rate is based on the <strong>Conversion Rate Table</strong> and <strong>Conversion Date Source</strong> settings for the FX Currency field in the Rate tab of FX Currency Configuration. To learn more about these settings, see Configuring FX Currency field behavior. &lt;br&gt; &lt;br&gt; You change or select the conversion rate as needed.</td>
</tr>
<tr>
<td><strong>Reference Amount</strong></td>
<td>Calculated reference currency amount. The Now Platform converts the currency value entered into the <strong>Amount</strong> field into a common reference currency. It uses the settings in the <strong>Reference Currency Source</strong> and <strong>Reference Currency</strong> fields in <strong>System Localization &gt; FX Currency Configuration</strong> to do so. &lt;br&gt; &lt;br&gt; You can't change the calculated reference amount.</td>
</tr>
<tr>
<td><strong>Reference Currency Code</strong></td>
<td>Three-letter ISO code that identifies the reference currency, for example, USD, to which the entered currency value converted. You can't change the reference currency code.</td>
</tr>
</tbody>
</table>

3. Click **Save**.
Understanding how FX Currency field conversions work

You can use existing system currency rates or define a custom conversion rate table for use in FX Currency processing.

A currency conversion rate represents the conversion factor for exchanging one currency for another. The conversion rate is used when converting a currency value, expressed in one currency, to another currency. Conversions can occur for storage (for example, conversion to a reference currency) or for display (for example, conversion to a session currency).

When conversions occur

FX Currency fields expose the values inside the Currency Instance [fx_currency2_instance] record as dot walkable fields. You can access to all data held in an FX Currency field without any transformations. Conversions can happen in these situations:

1. Calculation of a reference value, calculated when you enter a currency value, whether on insert or update. The reference currency value is saved as well as the currency value as entered. Once this calculation takes place, the reference value is not recalculated.
2. Calculation of the session display value returned from `getDisplayValue()`, which performs conversions to the required currency.

The conversion rate is based on the settings of the Conversion Rate Table and Conversion Date Source fields in System Localization > FX Currency Configuration.

Note: To learn more about these settings, see Specify the rate table and date source for currency conversions.

Conversion rates

FX Currency conversion rates are stored in the following ways:

- System rate [fx_system_rate] table: Contains system conversion rates. Each record contains the conversion rate from the Euro to a given currency. The rates are downloaded daily from the ECB website by a scheduled job called Retrieve System Rates. To learn more, see Schedule the rate update job.
- Custom rate table: Contains custom currency conversion rates, and custom rate tables extend the Currency Conversion Rate [fx_conversion_rate] table. To learn more about creating custom rate tables, see Add conversion rates using a custom rate table.

Life cycle of records containing FX Currency fields

The behavior of FX Currency fields varies during the processing that occurs during the lifetime of a record containing them.

Insert / Update

The FX Currency field points to a Currency Instance [fx_currency2_instance] record. When you change the currency value in an FX Currency field, it determines the conversion rate and calculates the reference currency before:

- The before business rules run.
- The after business rules run, and it includes any further changes you may have made to the before business rules.
**Auditing**

Since an FX Currency field points to a Currency Instance record that stores multiple values, the audit string is a composite that contains this information. The string stored in the System Audit [sys_audit] table is in the format of `EUR;111.222;4555525f5553445f3230313931323033`, with the following values, separated by semicolons:

- Three letter ISO currency code. For example, `EUR`.
- Amount as an unformatted number. For example, `111.222`.
- System identifier (sys_id) for the conversion rate record in the Currency Conversion Rate [fx_conversion_rate] table. For example, `4555525f5553445f3230313931323033`.

When creating history lines for a user, the audited string is formatted, using the locale of the user. It's in the format of `€111.22;2019-12-03 17:00:00-3000-01-01 23:59:59;fx_system_rate`, with the following values, separated by semicolons:

- Formatted currency string in the user locale. For example, `€111.22`.
- Start span-End span, as expressed in the conversion rate record in the System Rate [fx_system_rate] table. For example, `2019-12-03 17:00:00-3000-01-01 23:59:59`.
- Name of the conversion rate table. For example, `fx_system_rate`.

**Dot-walkable Currency Instance fields**

You can dot-walk certain fields in the Currency Instance [fx_currency2_instance] record, and field values stored in the database are consistent with each other. However, in script, since fields can be changed individually, and you change only some of the fields, they can be inconsistent.

**Currency code**

The Currency field isn't a reference field, so you can set it to any value. However, if you enter an invalid currency code, an exception message is generated. An empty value is considered a session currency code.

**Query conditions**

You can add query conditions on dot-walked fields in the instance table. However, when the query condition value is in a special format with currency code and amount, it's treated as a compound condition on the dot walked fields. The value has to be in format `XYZ,abc` where:

- `XYZ` is a currency code, and
- `abc` is an amount.

For example, `USD, 12.34`.

A condition such as `cost>USD,12.34` is treated as `cost.currency>USD AND cost.amount12.34`.

When the second operand is another Currency2 field, the condition translates in a similar manner:

`cost1>cost2` is treated as `cost1.currency=cost2.currency AND cost1.amount>cost2.amount`. 
Understanding FX Currency values in lists and reports

By default, the currency values that appear in the FX Currency fields in lists and reports are the values that you directly enter into the FX Currency fields. For reports, the aggregations of FX Currency fields are, by default, reference currency values.

FX Currency values in list views

In lists, FX Currency values appear as a formatted currency string returned from `getDisplayValue()`.

- To learn more, see Identify the FX Currency field and its display parameters.

For an FX Currency field that depends on another FX Currency field, the currency value comes from the Currency Instance [fx_currency2_instance] record associated with the latter. The display value format is based on how you configured its display settings in System Localization > FX Currency Configuration.

Filtering FX Currency values in lists

In lists, FX Currency field filtering behaves differently than with standard currency fields. The filtering takes place using the currency type selected when a currency value is originally entered into an FX Currency field. It doesn't take reference currencies into account when you filter a list. So, if the unfiltered list contains FX Currency field entries in multiple currencies, a filtered list would only contain those records originally entered using the specified filtering currency.

- For example, if you entered a currency value in Euros (EUR) and the reference currency is US Dollars (USD), the reference currency value may appear in an unfiltered list.
- However, if you filter the list, and select USD as the currency, the currency value, originally entered in Euros, doesn't appear. In this case, only currency values originally entered in USD would appear.

Dependent FX Currency fields

Use of FX Currency view or dependent fields enable you to use alternate display configurations defined in System Localization > FX Currency Configuration for a particular FX Currency field. To learn more about FX Currency field configurations, see Configuring FX Currency field behavior.

When you create an FX Currency field, you can mark it as dependent on another FX Currency field. Marking an FX Currency field as dependent enables it to use the configuration settings for the original FX Currency field to display the amount values in different currency. Any changes that you make to the dependent field don't affect the original FX Currency field.

FX Currency reporting, aggregation, and group by

You can select FX Currency fields for inclusion on reports, and they display in the same manner as in list views.

- FX Currency fields appear as a formatted currency string returned from `getDisplayValue()`.
- If you set the Display Value Currency field in System Localization > All Properties to Display in Session Currency, the session currency assigned to the user running the report appears.

You can aggregate like reference currency values within a Currency Instance record. The following is the aggregated FX Currency data format in the Now Platform®:

© 2021 ServiceNow, Inc. All rights reserved.
Aggregate FX Currency value

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Value of the aggregation. If the values being aggregated are FX Currency values, the returned value is in the format currency_code:currency_value, such as:</td>
</tr>
<tr>
<td></td>
<td>USD:134.980000</td>
</tr>
<tr>
<td></td>
<td>Otherwise, the returned value is just the currency value, such as: 134.980000.</td>
</tr>
</tbody>
</table>

**Note:** If the field contains FX Currency values of mixed currency types, the values cannot be aggregated. The value is returned as a semicolon (;).

For example, if the **Cost** field on a transaction record is an FX Currency field, you can group by **cost.amount** or **cost.currency**.

- Aggregation operations, such as **SUM**, translate as **SUM(amount)** or **SUM(reference_amount)**. The aggregation source determines the translation when the currency associated with the currency values in the grouping is the same.

  For example, the aggregate value returned by **GlideAggregate.getAggregate()** is a string of the format USD; 1234.56. The total currency value is expressed in the single reference currency that is associated with all currency values in the grouping.

- If there are different currencies associated with currency values in the grouping, then the aggregate value is empty. For example, if some of the currency values are in US Dollars, some are in Euros, and others in Yen, the aggregate value would be empty.

You can also use a Group By command on FX Currency fields.

- It is equivalent to grouping by currency and amount, or by reference_currency and reference_amount, as dictated by the aggregation source.
- The value of the grouping is available by dot-walking on the FX Currency field, or using an API such as **getDisplayValue()**.

**Setting up defaults required for FX Currency use**

Set up the defaults required for use of FX Currency fields in your instance.

Perform the following setup tasks to enable FX Currency processing:

**Add conversion rates using a custom rate table**

You can create a custom rate table to ensure repeatable and consistent calculations. In a custom rate table, you control the conversion rates and the frequency of rate conversions. If you don't define custom rate tables, FX Currency fields use the System Conversion Currency Rate [fx_system_rate] table, which updates rates daily from the ECB (European Central Bank) website.

Role required: admin, currency_admin

A conversion rate can be quoted in different ways.

- Direct conversion rate (A -> B) that may or not be invertible (that is, given rate R for A -> B, the rate for B -> A can be derived as 1/R).
• Indirect conversion rate through some intermediate currency (A -> C and C -> B).

1. Navigate to **System Definition > Tables**.
2. Click **New**.
3. In **Label** field, enter the name of the conversion rate.
   For example, Convert-US-Euro.
4. In the **Extends** field, select the Currency Conversion Rate [fx_conversion_rate] table.
5. Complete the remaining fields to create the new extended table.
   For more details, see **Create a table** for details.
6. Click **Submit**.
7. Navigate to the new table and fill in the fields on the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Currency</td>
<td>Currency to convert the rate conversion table from. For example, USD if you are converting from US Dollars.</td>
</tr>
<tr>
<td>To Currency</td>
<td>Currency to convert the rate conversion table to. For example, EUR if you are converting to Euros.</td>
</tr>
<tr>
<td>Span start</td>
<td>Date/time from which this currency rate is valid, for example, January 1, 2020 00:00:00.</td>
</tr>
<tr>
<td>Span end</td>
<td>Date/time to which this currency rate is valid, for example, January 30, 2020 23:59:59.</td>
</tr>
<tr>
<td>Order</td>
<td>Order in which a currency conversion selects currency rates when their time spans overlap. For a date/time and a currency pair, if there are multiple rates with a Span start less than or equal to the date/time, and Span end greater than or equal to the date/time, the currency conversion selects the lowest order rate.</td>
</tr>
<tr>
<td>Rate</td>
<td>Actual conversion rate, stored as a decimal with six decimal places.</td>
</tr>
</tbody>
</table>

8. Click **Update**.

After you create the custom rate table:

1. Manually populate the table, or import data to populate it.
2. To use this rate table on a global basis, change the glide.currency2.system_rate_table system property.
   To use it for a specific FX Currency field, change the Conversion Rate Table field setting in **System Localization > FX Currency Configuration**.

**Configuring FX Currency global settings**

Before setting up and using FX Currency, review the related system properties to confirm or modify its default behavior.

Role required: admin

The global defaults you establish in system properties apply the configuration option to all FX Currency fields. You can then customize them for specific dictionary attributes in **System Localization > FX Currency Configuration**. When you create a currency configuration, it applies those settings only to the FX Currency field that you add it to. To learn more about FX Currency configurations, see **Configuring FX Currency field behavior**.
FX Currency configuration settings for specific FX Currency fields take precedence over system properties. Administrators can set a global configuration for a property, and then apply exceptions on a field-by-field basis.

- If you change system defaults, except for `display_digits` and `display_value`, the changes apply to updated and new values only.
- Existing values and data don't change but rather display differently, depending on configuration.

**CAUTION:** Don't edit the Currency [fx_currency] table directly. The system maintains this table and your changes could have unintended consequences.

1. Navigate to **System Localization > All Properties.**
2. Review the system defaults and make any desired changes.

### FX Currency field properties and attributes

<table>
<thead>

<td></td>
</tr>
</tbody>
</table>

### Add an FX Currency field to a table

Before using and configuring an FX Currency field, you first add it an existing table, or to a new one, in **System Definition > Tables**.

Role required: admin
For example, you create a new custom table, named `transactions`, that stores transactional information and contains an FX Currency field called `cost`.

1. Follow the normal procedures to add a table, or access an existing table. To learn more about creating and modifying tables in an instance, see Create a table.

2. In the **Columns** section, use the **Table Columns** embedded list to add columns to the table.

3. In the **Column label** field, enter the column name. For example, `cost`.

4. In the **Type** field, select **FX Currency** as the field type.

5. As needed, enter other required parameters.

6. Click **Submit**.
Configuring FX Currency field behavior

After establishing global currency defaults, you can create custom FX Currency configurations for specific table fields. Identify the table fields that use FX Currency, and define how currency conversion calculations should be performed, displayed, filtered, and aggregated.

For each selected field that uses FX Currency, you configure settings that:

- Govern decimal precision and currency display in lists, forms, and reports.
- Identify the reference currency code for converting currency values entered into an FX Currency field into a common currency for report aggregations.
- Identify the rate table and data source to use for currency conversions.
- Specify the rate and target fields to use for filtering custom conversion rates.

**Note:** When you create a currency configuration, it applies those settings only to the FX Currency field that you add it to. An FX Currency configuration takes precedence over global system properties that you established in `System Localization > All Properties`.

To learn more about global currency defaults, see Configuring FX Currency global settings.

You can change the defaults at any time. Doing so doesn't affect existing values, but it can make working with existing values difficult.

- For example, if you modify the **Reference Currency** field in the Currency tab, existing instance records have the old reference currency, but new instance records have the new reference currency. You can't perform an operation such as sum aggregation because the reference values are in different currencies.
- However, because the actual reference currency in the Currency Instance [fx_currency2_instance] table is accessible in an FX Currency field, you can use any script that performs this aggregation.

Identify the FX Currency field and its display parameters

Specify the table, and the field within the table (for example, cost), that the FX Currency configuration applies to. Then, select the decimal precision and currency display parameters for the field.

Role required: admin, currency_admin

2. Click **New**.
3. In the **Table** field, select the table that contains the FX Currency dictionary attribute.
   - For example, if you created a custom table that stores transactional information and contains an FX Currency field, select it from the table listing. To learn more about creating tables in an instance, see `Create a table`.
4. In the **Field** field, select the column with the FX Currency field type.
   - For example, if you created a custom table column for entry of the transaction cost, select it from the listing of fields for the table.
5. Click **Save**.
6. Click the Display tab.
7. In the **Display Digits** field, select the number of digits that should appear after the decimal point in lists and reports.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Currency Default</strong></td>
<td>Number of digits that appear on lists and forms, based on what is appropriate and customary for the specified currency itself. For example:</td>
</tr>
<tr>
<td></td>
<td>• USD: Two digits appear after the decimal, for example, 12.33.</td>
</tr>
<tr>
<td></td>
<td>• Dinar: Three digits appear after the decimal, for example, 69.535.</td>
</tr>
<tr>
<td></td>
<td>• Yen: No digits appear after the decimal, because the Yen uses no cents and numbers round to the next latest value. For example, a calculated currency value of 69.535 rounds up to, and appears as, 67 Yen.</td>
</tr>
<tr>
<td></td>
<td>0–12 Specific number of digits that should appear after the decimal, with selectable values from 0 through 12. If you select more than 1, it pads the values with zeroes.</td>
</tr>
<tr>
<td></td>
<td>• For example, if you select 3, and the calculated value is 1.1, the currency value appears as 1.100.</td>
</tr>
<tr>
<td></td>
<td>• If you select 5, this value appears as 1.10000.</td>
</tr>
</tbody>
</table>

Note: In a form, FX Currency fields display the number of digits as entered by the user, up to 12 digits in length.

8. In the **Display Value Currency** field, select what currency value appears in the designated FX Currency field on forms and lists.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Use Global Default</strong></td>
<td>Use the global default you established in the glide.currency2.display_value system property in System Localization &gt; All Properties.</td>
</tr>
<tr>
<td><strong>Display As Entered</strong></td>
<td>Currency value, as entered into the designated FX Currency field. For example, if the user locale is US Dollars, the value appears in Euros if they select the Euro as the currency during an entry session.</td>
</tr>
<tr>
<td><strong>Display in Session Currency</strong></td>
<td>Currency value entered into the designated FX Currency field, converted to the session currency.</td>
</tr>
<tr>
<td></td>
<td>• For example, if the user locale is the United States, the session currency appears in US Dollars.</td>
</tr>
<tr>
<td></td>
<td>• If the user locale is Japan, the session currency appears in the Yen.</td>
</tr>
<tr>
<td></td>
<td>To learn more about the user locale, see Locale settings.</td>
</tr>
<tr>
<td><strong>Display in Reference Currency</strong></td>
<td>Currency value entered into the designated FX Currency field, converted to the reference currency designated in the Reference Currency field in the Reference tab.</td>
</tr>
<tr>
<td></td>
<td>For example, if you enter the currency amount in Euros, it converts to and appears in US Dollars if that is the designated reference currency. To learn more the reference currency, see Set the reference currency.</td>
</tr>
</tbody>
</table>

9. In the **Aggregation Source** field, select the currency type to use when aggregating currency amounts for the designated field on reports.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Use Global Default</strong></td>
<td>Use the global default you established in the glide.currency2.default_reference_currency property in System Localization &gt; All Properties.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>As Entered Values</td>
<td>Currency values, as entered into the designated FX Currency field. <strong>Note:</strong> If you select this option, you may experience situations where amounts entered in dissimilar currencies can’t be aggregated on reports. For example, if you enter currency amounts in US Dollars, Yen, and Euros, the amounts can’t be properly aggregated, or may result in erroneous totals.</td>
</tr>
<tr>
<td>Reference values</td>
<td>Currency values, as entered into the designated FX Currency field, converted to the reference currency you designate in the Reference Currency field in the Reference tab. For example, if you designate USD as the reference currency, values entered into this field convert to the reference currency, regardless of the currency you entered them in. The currency values that appear on reports are the aggregated converted reference values.</td>
</tr>
</tbody>
</table>

10. **Click Save.**

**Set the reference currency**
Set the reference currency for the designated FX Currency field. The Now Platform uses the reference currency to convert values entered into the FX Currency field into a common currency for report aggregation purposes.

Roles required: admin

1. Click the Currency tab.

2. In the **Reference Currency** field, select the three-digit ISO currency code used for the reference currency. For example, select **USD** if the currency values expressed in various currencies convert into US Dollars for report aggregation.

To use the global reference currency default you established in the `glide.currency2.default_reference_currency` property in **System Localization > All Properties**.

3. In the **Reference Currency Source** field, designate the source of the reference currency.
   - To use as the source of its reference currency when creating or updating a currency value for this FX Currency field, select the dot-walked field.
   - For example, `Cost` is an FX Currency field, and `my_currency` is a reference or string field in the Currency [fx_currency] table that contains a currency code such as USD.
   - When you create an FX Currency configuration for the `Cost` field, you select `my_currency` as its reference currency.
   - If you do not want to select the reference currency from another field, select **--None--**.

4. **Click Save.**

**Specify the rate table and date source for currency conversions**
Identify the rate table and data source to use for currency conversions for the designated FX Currency field.

1. Click the Rate Table tab.

2. In the **Conversion Rate Table** field, select the rate table used for conversions of currency values in the FX Currency field:
   - To use the default system rate table you defined in the `glide.currency2.system_rate_table` property in System Localization > All Properties., select **System Currency Conversion Rate**. This table stores daily reference rates retrieved from the European Central Bank.

   To learn more about the system rate table, see Default currency conversions.
   - If you have defined a custom rate table, you can select it to use in currency conversions for the FX Currency field. To learn more about how to define custom rate tables, see Add conversion rates using a custom rate table.
3. In the **Conversion Date Source** field, select the field to use as the source of the date and time for the currency conversion for the FX Currency field:

   - To use the date and time at which the user performs the currency conversion, select **--None--**.
   - To use as the source of the date and time for the currency conversion, select the dot-walked field.

   For example, to perform the currency conversion based on the currency rates in effect, select a transaction date field. So, if you entered the transaction on July 15, and you perform the currency conversion on July 31, it uses the currency conversion rates in effect on July 15.

4. Click **Save**.

**Select the rate and target table fields used for filtering**

Optionally specify the rate table and target table fields to use for filtering conversion rate information.

For example, you maintain interfaces to several ERP systems, have currency conversion rates that are unique to each ERP, but you maintain all rates in a single table.

   - To identify rates for a specific ERP system, there is a **System** field in the rate table that contain entries identifying each ERP system, for example, ABC, XYZ. In the target table with the FX Currency field, you have a similarly named field for identifying the conversion rates required for specific ERP systems.
   - When you perform currency conversions, and the rate and target table field entries match, it uses the rates that are unique to that specific ERP.

1. Click the Rate Filter tab.
2. In the **Rate Table Field** field, select the field in the rate table to match against the specified target table field for conversion rate filtering.
   
   Select **--None--** skip use of a rate table field for conversion rate filtering.
3. In the **Target Table Field** field, select the field in the target table to match against the specified rate table field for rate filtering.
   
   Select **--None--** skip use of a target table field for rate filtering.

4. Click **Save**.

**FX Currency values in import and export**

In general, currency values crossing the boundaries of the platform represent whatever is returned by `getDisplayValue`. Usually this currency value is the default as entered by a user into an FX Currency field for a transaction.

**FX Currency import**

If using the default `setDisplayValue()` import method, FX Currency works in manner similar to the standard currency field. It imports a value such as `USD;1,234.56` as `setDisplayValue("USD;1,234.56")`. It then parses the value as a three letter ISO currency code, followed by a semi-colon, followed by a number formatted in the locale of the user. This method should work for most use cases.

Defaults for other Currency Instance fields come from FX Currency field configuration you defined in **System Localization > FX Currency Configuration**. To explicitly set these fields, you can use a custom import script that sets those fields to desired values, possibly using values from another import column.

There are various ways to import FX Currency data.
### FX Currency export

There are various ways to export FX Currency data.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show XML</td>
<td>Shows an XML file with instance records for each FX Currency field bundled inside the XML payload.</td>
</tr>
<tr>
<td>Export to XML</td>
<td>Shows an unload XML with unloads for all instance records.</td>
</tr>
<tr>
<td>Export to Excel/PDF</td>
<td>Uses the default method of exporting data that extracts data from fields using <code>getDisplayValue()</code>. For FX Currency fields, using this method returns a formatted currency string of the form $1,234.56. To access specific information inside an FX Currency field directly without any transformations, simply export that column using dot walking.</td>
</tr>
</tbody>
</table>

### System localization

Localization allows administrators to accommodate users from a variety of different countries, using different languages and currencies, within the same instance.

A digital guidebook for localization is available on the ServiceNow® Developer Site: ServiceNow Application Localization

### Define locales

The base system allows you to specify your locale so information such as dates, times, and currencies display properly based on your location.

**Note:** Functionality described here requires the Currency Support for Service Catalog Plugin plugin. This plugin is automatically installed for new instances.

By default, the base system uses US standard formatting where the current default is the US dollar sign ($) displayed with two decimal places: $100.00. By customizing your locale, you can make things such as currency appear as you expect. For example, in France, you may want to see 100,00 € instead of $100.00.

How you display and utilize various locale information within your application form depends on how you want to use the information. For example, if you make a country field a reference field, then users can select from predetermined options. Also, script logic can then use the predetermined values of those options. If you want to avoid bad values or want to run scripts based on these values, use a reference field. If the country field is a simple string field, then users can enter whatever information they desire. Most companies restrict such free-form input to administrators or implementers who are setting up features and core company data. For example, do you want the country name to be “United States of America”, “USA”, “United States”, or “US.”
Set the instance locale

Set the instance locale using a locale code.

Role required: admin

1. Navigate to System Properties > System Localization.
2. Enter the locale code to use under Locale code to use for localization. Format is [language code]. [country code] (e.g. en.GB for Britain, fr.FR for France, de.DE for Germany, or ja.JP for Japan).

<table>
<thead>
<tr>
<th>Country</th>
<th>Locale code</th>
</tr>
</thead>
<tbody>
<tr>
<td>United States</td>
<td>en.US</td>
</tr>
<tr>
<td>Great Britain</td>
<td>en.GB</td>
</tr>
<tr>
<td>France</td>
<td>fr.FR</td>
</tr>
<tr>
<td>Germany</td>
<td>de.DE</td>
</tr>
<tr>
<td>Japan</td>
<td>ja.JP</td>
</tr>
</tbody>
</table>

3. Click Save.

Language internationalization support

The ServiceNow platform supports multiple languages, using UTF-8 for international characters. Language support is available when at least one language plugin has been activated, as described in Activate a language.

When a user logs in, the language for the instance session is determined by the following logic:

1. If the language selection at login is enabled, that language is used.
2. If not, the language preference selected using the language picker in the header bar is used.
3. If not, the language setting in the User [sys_user] table is used.
4. If none of the above are true, the system default language is used.

Some areas of the system are not translated, including the following areas:

- Journal fields
- Report titles
- Any field that stores free-form text

These fields remain in the language used to create them.

Additionally, the following names are not translated:

- Product names
- Application names
- Plugin names
- Spoke names

The English version of these names is always kept, even when they are used in other contexts. For example, "Service Portal properties" might be translated into Dutch as "Service Portal eigenschappen." Feature names are translated, however.
When creating a custom field, you must add the labels in the Field Label table because they are not added automatically.

**FAQ**

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Will fields that I created or edited myself be translated?</td>
<td>The Now Platform does not perform translations. ServiceNow only provides translations of strings that the company itself has created. When you create a field, a message, or other textual UI content, translate this content manually.</td>
</tr>
<tr>
<td>I am not seeing journal fields translated.</td>
<td>Translation tables are not provided for user-defined string fields, such as short description, additional comments, and report titles. These fields can appear only in the language they were created in.</td>
</tr>
</tbody>
</table>

**Activate a language**

By default, the language supported by the platform is American English. You can activate the plugin for other supported languages if you have the admin role.

The following plugins are currently available:

- I18N: Brazilian Portuguese Translations
- I18N: Czech Translations
- I18N: Dutch Translations
- I18N: Finnish Translations
- I18N: French Canada Translations
- I18N: French Translations
- I18N: German Translations
- I18N: Hebrew Translations
- I18N: Hungarian Translations
- I18N: Italian Translations
- I18N: Japanese Translations
- I18N: Korean Translations
- I18N: Norwegian Translations
- I18N: Polish Translations
- I18N: Portuguese Translations
- I18N: Russian Translations
- I18N: Simplified Chinese Translations
- I18N: Spanish Translations
- I18N: Swedish Translations
- I18N: Thai Translations
- I18N: Traditional Chinese Translations
- I18N: Turkish Translations

In addition, the I18N: Internationalization plugin (com.glide.i18n) provides the elements necessary for translating an instance without any translation preloaded. This plugin is useful for translating an instance to a language other than those listed above. For more information on using the I18N: Internationalization plugin to translate an instance, see Translate to an unsupported language.

**Note:**

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Activating internationalization plugins for any of the available languages automatically activates the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2).

- Product and Application Names are kept in English in localization plugins. Feature names are translated.

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

### Set default language for an instance

You can set the default language for an instance. Do this after activating the plugin for the desired language.

Before selecting a new default language, activate the plugin for the desired language in System Definition > Plugins. The default global language for the system is set in System Properties > System Localization. This property defines the language that users with a role see if a language is not specified in their user record. Users without a role see the default guest language, as described in User specific language.

---

#### Default language for the system (two character values):

<table>
<thead>
<tr>
<th>Language</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>en</td>
<td>English US</td>
</tr>
<tr>
<td>fr</td>
<td>Francais</td>
</tr>
<tr>
<td>es</td>
<td>Español</td>
</tr>
<tr>
<td>it</td>
<td>Italiano</td>
</tr>
<tr>
<td>de</td>
<td>Deutsch</td>
</tr>
<tr>
<td>en</td>
<td>English US</td>
</tr>
</tbody>
</table>

**Default language**

### User specific language

The user has several choices for identifying the language to be used for the instance, as described here.

To enable user-specific languages, first activate the I18N Translation plugins for the desired languages.

- **Language picker at login:** If user-specific language is enabled, users see a choice list on the login page to select their language. To control display of the choice list on the login page, navigate to System Properties > UI Properties and use the property Show the language select box on the login page to allow the user to specify the language they would like to be logged in with.
- **Language picker in the welcome banner (UI15):** When an internationalization plugin is enabled, users can select their language in the language picker in the welcome banner.
• **Language picker in the System Settings window (UI16):** Users can select their language in the General tab of the System settings window. Access this window by clicking the gear icon on the right edge of the banner.

• **Language setting on the user table:** If you have users that require a different language in addition to the global language, you can specify a language for them in User Administration > Users. If the Language field isn’t already on the form, you can configure the form and add it.

The **Language** field in the User [sys_user] table overrides the default global language for that user’s sessions.

![User language](image)

**Note:** Setting the language for the system guest user sets the language for both the login page and all users without a user role.

**Translation tables**

ServiceNow stores translation information in these tables.

- Languages [sys_language]
- Translated Name / Field [sys_translated]
- Message [sys_ui_message]
- Field label [sys_documentation]
- Choice [sys_choice]
- Translated Text [sys_translated_text]

To see which table contains a specific translated label, enable the display of translation prefixes. For more information, see Debug translations.
Note: The Languages table is available only after at least one I18N:Internationalization plugin has been activated.

Languages table

The Languages [sys_language] table contains a list of the languages for which translated text is available. To enable translation to a new language, add a record to the Languages table. The main fields for this table are:

- Name: language name.
- ID: two-character ISO 639.1 code for the language.
- Text Direction: direction of text in this language.
- Active: indicator that shows whether the language has been activated (true) for this instance or not (false).

Languages table

Configure a language as reading from right to left

Use the Text Direction field to configure a language that reads from right to left, such as Hebrew.

Role required: admin
Right-to-left language support is available only in the main user interface and on live feed. Other user interfaces and applications, such as the graphical Workflow Editor, reporting, CMS, chat, and the ServiceNow documentation sites, are not supported.

1. Navigate to **System Localization > Languages**.
2. Click **New**.
3. Enter the **Name** of the language, such as Hebrew.
4. Enter the two-character ISO 639.1 ID for the language. For example, Hebrew is `he`.
5. In the Text Direction field, select **Right-to-Left**.
6. Click **Submit**.

**Translated Name / Field table**

The Translated Name / Fields [sys_translated] table stores translated values for text fields where the field type is translated_field (see the dictionary entry).

This option is available for text fields up to 255 characters in length. Some examples are names, titles, and short descriptions. The main fields for this table are:

- **Table**: name of the table this translation applies to.
- **Element**: name of the field this translation applies to.
- **Label (translate)**: translated text that users see on forms and lists.
- **Language**: two-character ISO language code for this translated text.
- **Value**: English value that causes this translated text to be displayed.
The Messages [sys_ui_message] table contains the translations for informational messages, confirmation messages, error messages, and other types of system messages.

ServiceNow checks this table for translated text when a client script contains a getMessage call or a server script contains a gs.getMessage call. The main fields for this table are:

- **Key**: internal unique identifier of this message.
- **Language**: language the message is translated into.
- **Message**: translated text that users see.

The Messages table contains custom translatable text from the following sources when these texts are wrapped correctly:

- HTML in a UI page in a customer-created application
- Service Portal widget messages (including in surveys)
For more information about translatable custom content in the Messages table, see Custom translations.

**Message list**

<table>
<thead>
<tr>
<th>Key</th>
<th>Language</th>
<th>Message</th>

</tr>
<tr>
<td>Business values are not populated as there is no schedule applied</td>
<td>Dutch</td>
<td>De bedrijfswaarden zijn niet ingevuld om...</td>
</tr>
</tbody>
</table>

**Translated message**

**Field Label table**

The Field Label [sys_documentation] table stores the text of table names along with the singular and plural labels for each field in the table.

For each table name and field label, the Field Label table contains a record for each installed language. ServiceNow uses the table and field names from this table to display lists and forms in the proper language. The main fields for this table are:

- Table: name of the table this translation applies to.
- Element: name of the field this translation applies to.
- Language: two-character ISO language code for the translated text.
- Label: translated text that users see.
- Plural: plural of the label.
- Help: reserved for future use.
- Hint: text that pops up when the cursor rests on the field.
- URL: URL for a web page that provides information about the field. When a URL is provided, the field label displays a help icon ( ).
Translated field

Choices table

The main fields for this table are:

- Table: name of the table this translation applies to.
- Element: name of the field this translation is used for.
- Language: two-character ISO language code for the translated choice.
- Value: English description of this choice.
- Label: translated text that users see for this choice.
### Choice list

<table>
<thead>
<tr>
<th>Choice</th>
<th>Element</th>
<th>Value</th>
<th>Language</th>
<th>Priority</th>
<th>Label</th>
</tr>
</thead>
<tbody>

<td>fr</td>
<td>1</td>
<td>1 - Critique</td>
</tr>
</tbody>
</table>
The Translated Text [sys_translated_text] table stores translations for fields with the field type translated_text or translated_html (see the dictionary entry).

This field type is typically used for long text fields, up to 6500 characters in length, such as survey name and introduction. The main fields for this table are:

- Document: internal identifier of the record this translation applies to.
- Field name: field this translated text appears in, for example, Close notes.
- Language: language the text is translated into.
- Table Name: table this translation applies to.
- Value: translated text that the user sees.
### Debug translations

To debug translated strings in the UI, show translation prefixes before the strings. These prefixes indicate which strings can be translated and which table contains the string and translations. You can set translation prefixes to appear only in the current session or to appear in all sessions.

Role required: admin

- To enable translation prefixes on field labels for the current user session, navigate to **System Localization > Enable I18N Debugging**.
• To enable translation prefixes on field labels for all sessions, navigate to System Properties > System Localization and set Display translation prefix on translatable strings to Yes.

- Displays translation prefix on translatable strings.
  - Yes | No

• To disable translation prefixes that are enabled for the current session, either log out of the session or navigate to System Localization > Disable I18N Debugging.
• To disable translation prefixes that are enabled for all sessions, navigate to System Properties > System Localization and set Display translation prefix on translatable strings to No.

To apply the change, refresh your browser.

Translation prefixes and tables
Translation prefixes map to translation tables as follows.

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Table</th>
<th>Navigation</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRF</td>
<td>Translated Name / Fields [sys_translated]</td>
<td>System Localization &gt; Translated Names / Fields</td>
</tr>
<tr>
<td>MSG</td>
<td>Messages [sys_ui_message]</td>
<td>System Localization &gt; Messages</td>
</tr>
<tr>
<td>GMLD</td>
<td>Field Label [sys_documentation]</td>
<td>System Localization &gt; Field Labels</td>
</tr>
<tr>
<td>TRT</td>
<td>Translated Text [sys_translated_text]</td>
<td>System Localization &gt; Translated Text</td>
</tr>
<tr>
<td>CHC</td>
<td>Choice [sys_choice]</td>
<td>System Localization &gt; Choices</td>
</tr>
</tbody>
</table>

Note: A few strings may not display translatable prefixes. In this case, the string is not stored on any of these four tables. Examples of this behavior include:

- Text embedded in images, such as the buttons in the Service Catalog.
- Text defined by properties, such as the text which follows the banner.

Localize price fields
You can localize currencies for item prices and options.

Note: The system has the concept of a reference currency based on the global locale property. All currency values are automatically converted to the reference currency before aggregation or conversion. Do not change the global locale setting after you have data in the system. Changing the global locale setting after adding data to the system can cause aggregations to calculate and display incorrectly. See Currency administration for more information.

See Price fields for information on the types of price fields supported.
See Default currency values in scripts for information on using currency fields in scripts.
Localization settings

Localization settings control translation, currency, and locale settings in the instance.

The platform supports internationalization of language and localization of currencies and prices wherever they appear.

A digital guidebook for localization is available on the ServiceNow® Developer Site: ServiceNow Application Localization

Set up locations

If your organization supports more than one distinct location, you can configure these locations in the platform to help further identify users, assets, and incidents.

1. In the application navigator, navigate to **User Administration > Locations**.
2. Click **New**.
3. Complete the form with the necessary information then click **Submit**.
   
The new location is available as a reference anywhere you can specify one.

System localization properties

System properties to localize the instance for users from multiple countries.

Role required: admin

Some localization properties only appear after the I18N: Internationalization plugin is activated.

Navigate to **System Properties > System Localization**.

### Properties for system localization

<table>
<thead>

  **glide.spell.dictionary.en**  
  **Options:** Brazilian Portuguese, Dutch, English US, English UK, French, German, Italian, Portuguese, Russian, Spanish, and Thai  
  **Default value:** English US  
  **Learn more:** Locale settings |
Custom translations

You provide your own translations of applications you create and of modifications you make to the Now Platform®. You can also provide any translations to languages that ServiceNow does not provide translations for. The translation process varies depending on the type of item that you are translating.

The Now Platform does not provide any automatic translation capability. Instead, ServiceNow provides translations of the default platform in supported languages, as described in Activate a language. If you customize an instance and you want translations of the custom content, you have to provide those translations yourself.

The method of translation depends on the material that you are translating. Repeat the translation method whenever you edit or update content.

Translation methods and use cases

<table>
<thead>
<tr>
<th>What needs translation</th>
<th>Approach to take</th>
<th>Resources</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field labels in a table for a customer-created application</td>
<td>First create English versions for all fields in the table. Then open the Field Labels translation table. Locate the records for the table in the application. Export the records, translate the appropriate fields, set the language field, and reimport through an import set.</td>
<td>Export and edit translation records. Alternatively, follow the procedure for translating individual labels in Translate a field label.</td>
</tr>
</tbody>
</table>
| HTML in a UI page in a customer-created application | 1. Create the English version. When creating the HTML in the UI Page form, wrap any translatable text in gs.getMessage calls.  
2. Create a Message [sys_ui_message] record for each English message with a corresponding key/value pair.  
3. Create additional Message records for each message for each other language. | Translate a client script message |
| Service Catalog items | 1. Navigate to System Properties > System Localization and set Display translation prefix on translatable strings to Yes.  
2. Create the item in English.  
3. Change the preferred language to a different language.  
4. Translate all the translatable items, now identified by translation prefix.  
5. Save the record. | To activate translation prefixes, see Debug translations. For translatable text fields, which are common in Service Catalog items, see Translating text fields. |
<table>
<thead>
<tr>
<th>What needs translation</th>
<th>Approach to take</th>

<td>Support Chat is mostly translated through the I18N language plugins. If you customize any Support Chat texts, follow the procedure for Service Portal widgets.</td>
<td></td>
</tr>
<tr>
<td>Emails and Surveys</td>
<td>System Localization does not cover email notifications or surveys. The usual approach is to create a separate version of each survey or notification in each language and use business rules to send the right language version to the right end user.</td>
<td></td>
</tr>
</tbody>
</table>

### Locate translatable strings

You have to provide your own translation of customer-created and customer-edited strings, such as field names and messages. In this case, locate the individual untranslated strings, translate them, and insert those translations into the correct tables.

The Internationalization language plugins contain translations of the UI string content that ServiceNow provides by default in your instance. The Now Platform does not perform translations. Whenever you have customized UI strings that you want to translate, you have to identify and translate these strings manually. To perform these translations, you must first take the following actions:

- Identify the strings that need to be translated.
- Identify which translation tables contain the strings.

#### Note:
Knowledge article translation uses a separate system which relies on the I18N:Knowledge Management Internationalization Plugin. If this plugin is not activated, Knowledge article translation falls back on the system described here, with translations kept in the Translated Text [sys_translated_text] table.
For more information about Knowledge Management internationalization, see Translation Management in the Knowledge Management documentation.

If you have a small amount of material to translate and you know where in the UI it is all displayed, consider using the debug functionality. This functionality consists of prefixes which you enable before all translatable strings. These prefixes show which translation table the strings are located in. For more information, see Debug translations.

For instances that contain a significant amount of customer-created UI, consider using one of the approaches described in the following topics:

**List non-translated items**

One method for easily translating customizations is to export the translated names and fields, messages, field labels, and choices that have records only for the English language. Export to any supported environment, translate the texts using your preferred translation environment, and reimport using import sets.

Role required: admin

Modules can be activated that correspond to the following translation tables, but list only records for which only an English version is available:

- Translated Name / Fields
- Messages
- Field Labels
- Choices

These modules are inactive by default. Activate them from the Activation Menu to make them available for export.

**Note:** This method does not identify strings that have been translated into at least one non-English language but are missing translations in other languages.

1. Navigate to System Definition > Application Menus.
2. Use the list editor to set the Active field to True for the modules whose order comes after Non-translated Items.
<table>
<thead>
<tr>
<th>Title</th>
<th>Table</th>
<th>Active</th>
<th>Order</th>
</tr>
</thead>
<tbody>
<tr>
<td>Languages</td>
<td>Languages [sys_language]</td>
<td>true</td>
<td></td>
</tr>
<tr>
<td>Translated Name / Fields</td>
<td>Translated Name / Field [sys_translated]</td>
<td>true</td>
<td>100</td>
</tr>
<tr>
<td>Messages</td>
<td>Message [sys_ui_message]</td>
<td>true</td>
<td>200</td>
</tr>
<tr>
<td>Field Labels</td>
<td>Field Label [sys_documentation]</td>
<td>true</td>
<td>300</td>
</tr>
<tr>
<td>Choices</td>
<td>Choice [sys_choice]</td>
<td>true</td>
<td>400</td>
</tr>
<tr>
<td>Translated Text</td>
<td>Translated Text [sys_translated_text]</td>
<td>true</td>
<td>450</td>
</tr>
<tr>
<td>Non-translated Items</td>
<td></td>
<td>true</td>
<td>500</td>
</tr>
<tr>
<td>Translated Name / Fields</td>
<td>Translated Name / Field [sys_translated]</td>
<td>true</td>
<td>600</td>
</tr>
<tr>
<td>Messages</td>
<td>Message [sys_ui_message]</td>
<td>false</td>
<td>700</td>
</tr>
<tr>
<td>Field Labels</td>
<td>Field Label [sys_documentation]</td>
<td>false</td>
<td>800</td>
</tr>
<tr>
<td>Choice</td>
<td>Choice [sys_choice]</td>
<td>false</td>
<td>900</td>
</tr>
</tbody>
</table>
Note: Instead of Non-translated Items, your list might show a record titled Customizations. Activate that record and Save. After saving, the title shows Non-translated Items.

After the application navigator refreshes, the modules appear in the filter navigator beneath Non-translated Items.
3. View each of the lists and export it to any supported format, such as Microsoft Excel. For example, open **Non-translated Items > Translated Name/Fields**, select any column, and export the list. Translate the fields in the external application and reload the translations as an update set.

**Use the translate and learn property**

When the **glide.translate.learn** system property is set to true, the instance creates stub records in the translation tables when it encounters strings that have only an English version.

Activate the I18N: Internationalization plugin (com.glide.i18n) and at least one language. For more information, see [Activate a language](#).

Role required: admin

The instance creates stub translation records for strings only in forms and records that ServiceNow provides or that have been opened at least once. In practice, you need to know which modules contain untranslated customer-created strings to use this approach with customer-created content.

**Note:** Using this method prevents the use of the Export Untranslated Strings method. This method creates stub translation records and the method of exporting untranslated strings identifies only missing translation records.

1. Navigate to **System Properties > System Localization**.
2. Activate **Display translation prefix on translatable strings**.

   Displays translation prefix on translatable strings.

   [Yes | No]
3. Scroll down and activate the Translate and Learn property, as follows:
   
   Add the labels, messages, or choices to the appropriate table in English with an ending of the language code for newly added customizations that are missing translations. (Translate and Learn)  
   
   Yes | No

4. Click Save

5. Change your user language to one of the non-English languages installed on your instance.

6. Open each of the customer-created or customer-modified UI forms.
   
   The instance creates stub translation records for each untranslated but translatable string. These records are marked with the target language in the Label (translate) field, such as [fr].

7. Open each translation table and find the stub translation records.

**Untranslated customer-created HR modules**

For example: A user switches to the French language and opens a record. When loading the form, the instance looks at the Translated Field table to find the French translation for each field. If an appropriate translation record is not found, the instance automatically generates a stub record for that missing data, which can be manually translated.

The following HR application is missing translations for two modules:

![Image of HR application missing translations]

The suffix [fr] indicates that there is a French translation missing.
Note: These modules have been opened at least once already. Otherwise, the [fr] suffix would not appear.

Because translation prefixes are enabled, the prefix \textit{TRF:} indicates that the entry can be found in the Translated Name / Fields table. The following image shows untranslated modules, located using the filter [Label (translate)] [contains] [fr]:

![Untranslated modules](image)

\textbf{Example untranslated modules}

\textbf{Translate individual field labels and values}

When translating just a few field labels or values, such as when you add customizations to a translated instance, use the procedure that applies to the type of text being translated.

Three types of ServiceNow fields store translated strings:
• **Translated_field**: Stores field labels, related list names, and certain field values. The value of the translated_field replaces the label, list name, or field value when the user selects the matching language. Translated_field values have a one-to-many relationship with their associated keys. As a result, multiple records can reference one translated_field value.

• **Translated_text**: Stores long text values in plain text. The value of the translated_text replaces the plain text when the user selects the matching language. Translated_text values have a one-to-one relationship with their associated keys. As a result, only one record can reference a translated_text value.

• **Translated_html**: Stores long text values in HTML. The value of the translated_html replaces the HTML when the user selects the matching language. Translated_html values have a one-to-one relationship with their associated keys. As a result, only one record can reference a translated_html value.

All three translated field types support list sorting. To determine the field type, right-click the field on the form, select **Configure Dictionary**, and check the **Type** field.

ServiceNow stores the translated values as separate records and displays the proper value according to the end user’s language. You can translate an entire instance by exporting the translation tables and then importing the translated strings as described under **Export and edit translation records**.

**Note:** In addition to translated field types, currency fields display the same price in different currencies based on the user's language.

### Create a new choice record

This record allows users to select the language as a valid option in a User record and the language picker.

You must create a choice record for a new translation in the Choices [sys_choice] table.

1. Navigate to **System Localization > Choices**.
2. Click **New**.
3. Enter the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>What to enter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sys_user</td>
</tr>
<tr>
<td>Element</td>
<td>preferred_language</td>
</tr>
<tr>
<td>Language</td>
<td>Enter the two-character ISO 639.1 code for the language that the user is currently using before they select the new language. The default is en.</td>
</tr>
<tr>
<td>Label</td>
<td>Enter the name of the new language selection as you want it to appear in the language picker. For example, Mongolian.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter the two-character ISO 639.1 code for the new language that the user is selecting. For example, mn.</td>
</tr>
<tr>
<td>Sequence</td>
<td>Enter a number to determine what order the option appears in the choice list if you do not want to list choices alphabetically. For example, 5.</td>
</tr>
</tbody>
</table>

The following record allows a user who is using the Dutch localization of their instance to change languages to Mongolian:

- **Table**: User [sys_user]
- **Element**: preferred_language
• **Language**: nl
• **Label**: Mongoolse
• **Value**: mn

4. Click **Submit**.

**Create a new language record**

You must create a language record for your new translation in the Languages [sys_language] table.

Role required: admin

1. Navigate to **System Localization > Languages**.
2. Click **New**.
3. Enter the following fields.
   - **Name**: Enter the name of the language. For example, Turkish.
   - **ID**: Enter the two-character ISO 639.1 code for the language. For example, tr.
   - **Text Direction**: Select the direction that the instance should display the language in. For example Left-to-Right.

4. Click **Submit**.

**Translate a client script message**

Client scripts include a multi-line **Messages** field.

Use this field to enter message strings that the client script can use as a key to look up a localized message alternative from the Message [sys_ui_message] table. Add each message key on a separate line. The instance looks for a localized message string anytime the client script makes a getMessage(msg) call where the msg string matches a key in the **Messages** field.

For example, if you add the string **Please populate the Reason field** to the **Messages** field, then the instance will look for a localized string from the Message [sys_ui_message] table any time the client script calls:

```getMessage("Please populate the Reason field")```

Add a new record to the Message [sys_ui_message] table for each localized string.

1. Navigate to **System Localization > Messages**.
2. Click **New**.
3. Enter the **Message** fields for the localized message.
4. Click **Submit**.

**Translate a field label**

Field labels are the names that appear on forms and lists to describe the type of information the field contains.

The following procedure works best for translating individual field labels, such as those added with a customization. To translate large numbers of field labels, use the procedure described in **Translate the Interface**.

1. Navigate to the field on the form.
2. Right-click the field label and select **Configure Label**.
3. In the **Field Label** form, replace the English text with the text of the target language in the **Label**, **Plural**, and **Hint** fields.
4. Enter the two-character **Language** code of the target language.
5. Right-click the header bar and select **Insert**.
Clicking **Insert** creates a new record in the Field Label table for this field label in the selected language.

**Translate a field value**

Field values are the text entries that are used for fields with the type `translated_field`, such as the **Title** or **Hint** field in the `Module [sys_app_module]` table.

The following procedure works best for translating values for individual fields, such as those added with a customization. To translate large numbers of field values, use the procedure described in [Export and edit translation records](#).

1. Use the language picker in the header bar to switch to the desired language.
2. Navigate to the field on the form.
3. Enter the text of the target language for this value.

![Translated from “My Approvals”](image)
4. Click **Submit**.

   This creates a new record in the Translated Name / Field table for the selected language or updates the existing record.

**Translating text fields**

You can translate long pieces of text into the language of the user.

Translated text fields allow the same field to display different content based on the language of the user.

There are two different translated text fields:

- Translated Text
- Translated HTML

These fields operate the same as text and HTML fields respectively, except that they can store multiple inputs in multiple languages.

The most frequent use of translated text fields is in the Service Catalog (e.g. names, descriptions, or variables). If the Knowledge Management Internationalization Plugin is disabled, translated text fields are also used for Knowledge Base articles. For more information about Knowledge Management internationalization, see Translation Management in the Knowledge Management documentation.

**Translate long text content**

You can translate the content of translated text fields directly in the form where the content is specified.

Use the following procedure to translate the content for untranslated customer-created text fields. To edit existing text translations, export the records from the Translated Text table and follow the procedure in Export and edit translation records.

1. Open the record with the field that you want to translate.
2. Verify that the field whose content you want to translate is a translated_text or translated_html field.
   The following steps are one possible way to verify a field type:
   a) Right-click the label of the field and select Configure dictionary.
      In this example, the context menu has been opened for the Name field for a record in the Record Producer [sc_cat_item_producer] table.

Context menu for field

b) In the Dictionary Entry record that opens, confirm that the Type field is Translated Text or Translated HTML.
   In this example, you see that the Name field is of the type Translated Text.

Dictionary entry for field

c) Click back to the form.

3. Use the language picker to switch to the desired language.
4. In the relevant field, replace the English text with the text of the target language.
5. Click Submit.
The platform creates a new record in the Translated Text table for the active language. When a user selects this language, the field displays the translated content for this language. When a user selects English or a language without an associated Translated Text record, the field displays English content.

**Administering translated text fields**

There is a slight performance penalty associated with changing a normal HTML or text field into a translated HTML or text field. It is best only to use translated fields if the translated capability is required.

English language text is stored in the main table, but the values of other are stored in the Translated Text [sys_translated_text] table. Each translated field on every row has one or more entries in the sys_translated_text, one per language for which ServiceNow provides a translation.

For more information about the Translated Text table, see Translated text table.

**Translate a related list name**

Related lists appear at the bottom of forms. You can translate a related list name by configuring the list control.

Role required: personalize_control

1. Use the language picker to switch to the desired language.
2. Navigate to the related list on the form.
3. Open the list control for the related list by performing the appropriate action for the list version.

<table>
<thead>
<tr>
<th>Version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>List v2</td>
<td>Right-click any column heading and select Configure &gt; List Control.</td>
</tr>
<tr>
<td>List v3</td>
<td>Open the list title menu and select List Control.</td>
</tr>
</tbody>
</table>

4. On the List Control form, replace the existing Label with the text of the target language.
5. Click Submit or Update.

The system creates a new entry in the Translated Name / Field [sys_translated] table or updates the existing entry for this language.

**Export and edit translation records**

Export the translations in a supported format. Work on the translations in your preferred translation environment, and import the new or edited translation records through import sets.

Role required: admin

In the following cases, translate strings in the UI outside of the Now Platform and import them through import sets:

- You have a significant amount of customer-created UI components and you want to translate these components into other languages.
- You want to modify translations that ServiceNow provides in internationalization plugins.
- You want to translate an instance into a language that ServiceNow does not support with internationalization plugins.

All translatable UI strings items are stored in translation table records. For more information, see Translation tables.

The only time you would translate UI directly in translation records is when you have a small amount of customer-created UI components and you know exactly where they are.

**Warning:** If you directly edit translation records that ServiceNow provides in internationalization plugins, your changes are lost when the instance is upgraded.

If you are translating customer-created components or you are modifying translations that ServiceNow provides in internationalization plugins, use the following steps.
**Note:** If you are translating an instance to a language that ServiceNow does not support with internationalization plugins, follow the procedure in Translate to an unsupported language.

1. If you are translating customer-created UI components, locate the translatable strings. Use the tools described in Locate translatable strings.
2. Export the relevant translation table records into a format (such as Excel) that can be easily manipulated. For more information about exporting a list of records, see List Export.
3. Within the exported document, translate the following fields in each row, depending on the translation table:

<table>
<thead>
<tr>
<th>Translation table</th>
<th>Fields to translate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Labels</td>
<td>Label, Plural, Hint</td>
</tr>
<tr>
<td>Translated Name/Field</td>
<td>Label (translate)</td>
</tr>
<tr>
<td>Message</td>
<td>Message</td>
</tr>
<tr>
<td>Choices</td>
<td>Label</td>
</tr>
<tr>
<td>Translated Text</td>
<td>Value</td>
</tr>
</tbody>
</table>

4. Within each row, change the "Language" column to the two-character ISO code of the new language. In Translated Text records, type the full name of the language instead of the ISO code.
5. Save your changes.
6. Import the translated document back into the instance as an import set.

**Import a translation from an Excel spreadsheet**

The System Import Sets application contains four import tables and corresponding transform maps to assist with importing translations from an Excel spreadsheet.

1. Navigate to System Import Sets > Load Data.
2. Select Use Existing and the Table name that matches the type of data being imported, as follows.
   - For choices, select the [u_sys_choice] table.
   - For field labels, select the [u_sys_documentation] table.
   - For translated names and fields, select the [u_sys_translated] table.
   - For messages, select the [u_sys_ui_message] table.
   - For translated text, select the [u_sys_translated_text] table.
3. Select Upload an Excel file, and then click Browse to select the source Excel spreadsheet.
4. If appropriate, specify the Work sheet and Header row number.
5. Click Go.

The translations are now available in the appropriate Import Set Table.
6. Navigate to System Import Sets > Table Name and review the imported information to verify that the import was successful.
7. To transform the imported data into the corresponding table, navigate to System Import Sets > Run Transform.
8. Select the appropriate transform map, as follows.

**Note:** Make sure you choose a transform map that has the Run Business Rule option selected. If the transform map does not have this option selected, any customized translations you have may be overwritten during the next upgrade.

- For choices, select the Sys Choice Translation Map.
• For field labels, select the **Sys Documentation Translation Map**.
• For translated names and fields, select the **Sys Translated Translation Map**.
• For messages, select the **Sys UI Message Translation Map**.
• For translated text, select the **Sys Translated Text Translation Map**.

9. Click **Transform**.

**Translate to an unsupported language**

You can translate the interface of an instance to a language for which ServiceNow does not provide an internationalization plugin. Request ServiceNow to provide a file containing strings from the interface in the English language. Translate this file into your preferred language and import it to the instance.

Role required: admin

All interface items are stored as translatable strings in the translation tables. For more information, see **Translation tables**.

By default, these translation tables only contain English strings. To populate these tables with translated strings:

1. Create a Choice [sys_choices] record so users on that language can choose the new language.
   a) Navigate to **System Localization > Choices** and click **New**.
   b) Fill in the following fields:

   **Choice record fields to select the new language**

<table>
<thead>
<tr>
<th>Field</th>
<th>What to enter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>sys_user</td>
</tr>
<tr>
<td>Element</td>
<td>preferred_language</td>
</tr>
<tr>
<td>Language</td>
<td>Enter the two-character ISO 639.1 code for the language that the user is currently using before they select the new language. The default is <strong>en</strong>.</td>
</tr>
<tr>
<td>Label</td>
<td>Enter the name of the new language selection as you want it to appear in the language picker. For example, Mongolian.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter the two-character ISO 639.1 code for the new language that the user is selecting. For example, <strong>mn</strong>.</td>
</tr>
<tr>
<td>Sequence</td>
<td>Enter a number to determine what order the option appears in the choice list if you do not want to list choices alphabetically. For example, <strong>5</strong>.</td>
</tr>
</tbody>
</table>

The following record allows a user who is using the Dutch localization of their instance to change languages to Mongolian:

- **Table**: User [sys_user]
- **Element**: preferred_language
- **Language**: nl
- **Label**: Mongoolse
- **Value**: mn

2. Export and translate those strings that you want to translate, as described in **Export and edit translation records**.
There is a very large number of translatable strings on the platform. Exporting all of them and translating them manually is probably not a realistic possibility. Consider exporting filtered subsets of the strings from each table and then translating them.

3. Import the translated document back into the instance as an import set, as described in Import a translation from an Excel spreadsheet.

Translating the knowledge base

The knowledge base has its own Translation Management system. When this is disabled, knowledge base articles use translated_html fields for translated content.

When any of the I18N internationalization plugins are enabled, the Knowledge Management Internationalization plugin is enabled. This plugin allows knowledge article authors to create language-specific articles and to translate and access articles. For more information about Knowledge Management internationalization, see Translation Management in the Knowledge Management documentation.

If the Knowledge Management Internationalization plugin is disabled, knowledge base articles use translated_html fields for article content. This type of field displays the translation based on the language of the user, if multiple translations are stored. To learn about using translated_html fields, see Translating text fields.

Translating Service Catalog cart labels

You can specify language-specific labels in these Service Catalog screens: Cart, Edit Cart, and Check Out (including workflows and approvals).

The text for the labels is stored on the Messages [sys_ui_message] table. Localized Message records for these labels are included in the I18N Internationalization language plugins. The application is Global. You can add a record for an unsupported language, or edit an existing record. If you edit an existing record, export the record to another application, edit it in that application, and re-import it. Otherwise, your edits may be overwritten when your instance is zbootted or updated. For more information about exporting translation records, see Export and edit translation records.
Localization Framework

ServiceNow Localization Framework standardizes and enhances the translation process of required artifacts such as ServiceNow® Service Catalog items and ServiceNow® Virtual Agent topics across the platform through configurable workflows.

Get started with Localization Framework

1. Procure any ServiceNow, Inc. subscription that is Standard or above.
3. Configure Localization Framework with the required artifacts. Service Catalog items and Virtual Agent topics are supported in the Quebec release. See Artifact configuration for more information.
4. Activate the required languages and configure them with Localization Framework. For more information, see Activate a language.

Activation of Localization Framework

When you activate the Localization Framework Installer plugin (com.glide.localization_framework.installer), Localization Framework is available by default for the Service Catalog items and Virtual Agent topics.

After you activate the Localization Framework Installer plugin (com.glide.localization_framework.installer), you can do the following tasks:
• Request translations of the artifacts into one or more languages.
• Translate artifacts using manual translation or any of the supported translation modes.
• Approve translations by proofreading the translated content.
• Publish the translated content.
• Analyze the localization health of the system using the Localization Insights dashboard.

For more information on activating this plugin, see Activate Localization Framework.

Activate Localization Framework

You can activate the Localization Framework Installer plugin (com.glide.localization_framework.installer) for Localization Framework if you have the admin role. The application installs related plugins if they are not already installed.

Role required: admin

The following items are installed with Localization Framework:
• Plugins
• Roles
• Scheduled jobs
• Tables

For more information, see Components installed with Localization Framework.

1. Navigate to System Applications > All Available Applications > All.
2. Find the Localization Framework Installer plugin (com.glide.localization_framework.installer) using the filter criteria and search bar.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

Components installed with Localization Framework

The Localization Framework Installer plugin (com.glide.localization_framework.installer) activates these related plugins that are not already active.

<table>
<thead>
<tr>
<th>Plugin</th>
<th>Description</th>
</tr>
</thead>
</table>
## Localization Framework Roles

Localization Framework uses roles to manage different aspects of the application.

### Localization Framework Roles

<table>
<thead>
<tr>
<th>Role Title [Name]</th>
<th>Role Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Localization administrator [localization_admin]</td>
<td>Manages the following aspects of the Localization Framework application:</td>
</tr>
<tr>
<td></td>
<td>• Configures the supported artifacts and custom artifacts for Localization Framework.</td>
</tr>
<tr>
<td></td>
<td>• Configures localization settings for the activated languages.</td>
</tr>
<tr>
<td></td>
<td>• Can request translations into multiple languages for Service Catalog items, Virtual Agent topics, or for any custom artifacts from their respective artifact tables.</td>
</tr>
<tr>
<td></td>
<td>• Can request translations for Service Catalog items, Virtual Agent topics, or for any custom artifact for a particular language from their respective artifact reports in the insights dashboard.</td>
</tr>
<tr>
<td></td>
<td>• Can configure SDL and XTM TMS and can create and configure a custom TMS by inheriting the following roles:</td>
</tr>
<tr>
<td></td>
<td>• flow_designer: localization_admin with this role can edit the TMS subflows and can create a new TMS configuration record.</td>
</tr>
<tr>
<td></td>
<td>• connection_admin: localization_admin with this role can access the connections and credentials tables and records.</td>
</tr>
<tr>
<td></td>
<td>• Owns the localization insights dashboard and reports, and can execute the scheduled jobs to display the reports on the dashboard.</td>
</tr>
<tr>
<td></td>
<td>• Views the localization health of the system.</td>
</tr>
<tr>
<td></td>
<td>• localization_admin role inherits the localization_requester and localization_fulfiller roles.</td>
</tr>
<tr>
<td>Localization requester [localization_requester]</td>
<td>Requests translations for all the configured artifacts into one or more languages.</td>
</tr>
</tbody>
</table>
Role Title [Name] | Role Description
--- | ---
Localization fulfiller [localization_fulfiller] | Provides translations for the requested artifact items. Uses the following ways to translate the artifacts:
- Manual translation, if understands both the source and the target language.
- Machine translation, using the translator configured in the translation preferences.
- Exports data to a third-party translator and imports it back after translations.
- Sends the data via email for translations and receives the translated data back via email.
- Sends translatable data to a translation management system (TMS) for translations.
- Verifies and approves the translations.
- Publishes the translations if the language setting workflow has no approval flow.

Artifact configuration

You can configure the required artifacts and use the Localization Framework to fulfill the translation requests. Artifact configuration is a table where every configured artifact has its own record in the instance.

With the activation of the Localization Framework Installer plugin (com.glide.localization_framework.installer), a record for a service catalog item is automatically created and configured with the Localization Framework.

A record for the Virtual Agent topic is created and configured only with the activation of the Glide Virtual Agent plugin (com.glide.cs.chatbot). For more information on activating this plugin, see Activate Virtual Agent.

You can also create and configure an artifact of your choice and a record for the same is created in the Artifact Configuration [snLf_config] table. For more information, see Create and configure a custom artifact.

Create and configure a custom artifact

Create and configure custom artifacts of your choice to use the Localization Framework functionality.

Role required: localization_admin

Ensure you have activated the Localization Framework Installer plugin (com.glide.localization_framework.installer) before configuring a custom artifact of your choice.

1. Navigate to Localization Framework > Artifact Configuration.
2. Click New.
3. In the Artifact Configuration form, fill the fields.

Artifact Configuration form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the artifact record.</td>
</tr>
<tr>
<td>Table Name</td>
<td>Identifier of the table where information of the artifact is stored. For example, Catalog Items [sc_cat_item] table.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Read Script   | Extracts the translatable content associated with the translation request. The script is run each time a translation is requested and returns the translatable content of the artifact in a standardized JSON. Provide the following input and output read script contracts to configure the artifact:  

- Syntax of the input read script:

```javascript
(function(tableName, sysId, language) {
    // Code to generate document content json
})(table_name, sysId, language);
```

- JSON format of the output read script:

```json
{
    "version": "v1",
    "content": [
        {
            "groupName": "",
            "label": "",
            "fieldInfo": [
                {
                    "originalValue": "",
                    "translatedValue": ""
                }
            ]
        },
        {
            ...
        }
    ]
}
```
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save Script</td>
<td>Saves the translations into the database. The script is run each time the translation of an artifact is published.</td>
</tr>
<tr>
<td></td>
<td>Note:</td>
</tr>
<tr>
<td></td>
<td>• If the application uses one or more standard platform tables to store the translations, the save script is not required. For more information, see Translation tables.</td>
</tr>
<tr>
<td></td>
<td>• The save script is required when the application uses tables other than the standard tables to store the translations.</td>
</tr>
<tr>
<td></td>
<td>Provide the following save script contract to configure the artifact:</td>
</tr>
<tr>
<td></td>
<td>(function(taskId) { // Code to store translations of the localization task when the translations are published. })(taskId);</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the application. The value is Global by default.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the configuration record.</td>
</tr>
</tbody>
</table>

4. Click Submit.

**Create a UI action for the custom artifact**

Create a UI action to request translations for the custom artifact.

Role required: localization_admin

1. Navigate to the custom artifact table.
   Find the table using its table name. For example, [sys_cs_topic] is the table name for Virtual Agent topics.

2. Click the hamburger icon ( ) at any of the columns and navigate to ConfigureUI Actions.

3. Click New.

4. In the UI Actions form, fill in the fields.

**UI Action form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name for the UI action. For example, Request Translations.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Client</td>
<td>Option to execute the script in the user's browser. When enabled, the <strong>Onclick</strong> field appears above the Condition field.</td>
</tr>
<tr>
<td>Condition</td>
<td>Name of the custom artifact table on which this UI action is being created.</td>
</tr>
<tr>
<td>Onclick</td>
<td>Provide the JavaScript function name as:</td>
</tr>
<tr>
<td></td>
<td><code>renderLanguagePickerModal();</code></td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Script</td>
<td>Option to execute the script to run the request translations function. The script varies for <strong>Form button</strong> and <strong>List choice</strong>.</td>
</tr>
<tr>
<td>Form button</td>
<td>Option to enable the UI action as a form button.</td>
</tr>
</tbody>
</table>

**Form Button**

```javascript
function renderLanguagePickerModal() {
    var dlg = new GlideModal('sn_lf_language_picker');
    dlg.setTitle(getMessage('Request Translations'));
    dlg.setPreference('sys_id', g_form.getUniqueValue());
    dlg.setPreference('table_name', g_form.getTableName());
    dlg.setPreference('request_type', "form");
    dlg.render();
}
```

**List choice**

```javascript
function renderLanguagePickerModal() {
    var sys_ids = g_list.getChecked();
    if (!sys_ids || sys_ids.length == 0) return;
    var dlg = new GlideModal('sn_lf_language_picker');
    dlg.setTitle(getMessage('Request Translations'));
    dlg.setPreference('sys_id', sys_ids);
    dlg.setPreference('table_name', g_list.getTableName());
    dlg.setPreference('request_type', "list");
    dlg.render();
}
```
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List choice</td>
<td>Option to enable the UI action in the choice list.</td>
</tr>
</tbody>
</table>

**Note:** Configure the form to see all the fields. For more information, see Create a UI action.

5. Click **Submit**.

**Read script helper functions for LFDocumentContentBuilder**

The *LFDocumentContentBuilder* provides utility functions to build document content JSON. These functions can be used while writing the read scripts only for artifacts that use standard tables for translation.

**initialize (version, targetLanguage)**

This function is a constructor for *LFDocumentContentBuilder* and includes the following parameters:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>String</td>
<td>The version type of the document content to be generated. For Quebec, this value is v1.</td>
</tr>
<tr>
<td>targetLanguage</td>
<td>String</td>
<td>The target language of the localization task document content. The target language is the same as the language available from the read script function argument.</td>
</tr>
</tbody>
</table>

**processString (string, groupName, label)**

This function adds an entry in the document content for the given string and includes the following parameters:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>String</td>
<td>The value for which a document content entry is created.</td>
</tr>
<tr>
<td>groupName</td>
<td>String</td>
<td>The group this string input belongs to.</td>
</tr>
<tr>
<td>label</td>
<td>String</td>
<td>The unique label identifier for this string input.</td>
</tr>
</tbody>
</table>

This function adds the following JSON object in document content:

```json
{
    'groupName': groupName,
    'label': label,
    'fieldInfo': [
        {
            "originalValue": string, translatedValue: <fetched from sys_ui_message table, if exists>}
    ]
}
```
**processStringArray (stringArray, groupName, label)**

This function adds an entry in the document content for the given string and includes the following parameters:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stringArray</td>
<td>List of Strings</td>
<td>The list of values for which document content entry is created.</td>
</tr>
<tr>
<td>groupName</td>
<td>String</td>
<td>The name of the group these strings belongs to.</td>
</tr>
<tr>
<td>label</td>
<td>String</td>
<td>The unique label identifier for these strings.</td>
</tr>
</tbody>
</table>

This function adds the following JSON object in document content:

```json
{
    'groupName': groupName,
    'label': label,
    'fieldInfo': [
        {
            "originalValue": string[0],
            "translatedValue": <fetched from sys_ui_message table, if exists>
        },
        {
            "originalValue": string[1],
            "translatedValue": <fetched from sys_ui_message table, if exists>
        },
        ...
    ]
}
```

**processScript (scriptContent, groupName, label)**

This function adds an entry in the document content for the strings present as input of `getMessage`, `gs.getMessage`, or `gs.getMessageLang` in the provided Script. It has the following parameters:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scriptContent</td>
<td>String</td>
<td>The Script to be processed to get the strings present as input of <code>getMessage</code>, <code>gs.getMessage</code>, or <code>gs.getMessageLang</code>.</td>
</tr>
<tr>
<td>groupName</td>
<td>String</td>
<td>The name of the group for this input.</td>
</tr>
<tr>
<td>label</td>
<td>String</td>
<td>The unique label identifier for this input.</td>
</tr>
</tbody>
</table>

For example,

```javascript
var documentContentBuilder = new LFDocumentContentBuilder("v1", language);
var name = "name";
documentContentBuilder .processScript("gs.getMessage('Hello {0}, How are you', name)",
"Script_Group", "Script_Label");
```
This function adds the following JSON in document content:
{
    'groupName': "Script_Group",
    'label': label, "Script_Label"
    'fieldInfo': [
        {"originalValue": "Hello {0}, How are you", translatedValue: <fetched from sys_ui_message table, if exists>},
        ...
    ]
}

**processTranslatableFieldsForSingleRecord (glideRecord, groupName)**

This function creates entries for the given glideRecord object, in document content for all its translatable fields. These translatable fields can be of translated_field, translated_text or translated_html types. It includes the following parameters:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glideRecord</td>
<td>GlideRecord</td>
<td>The GlideRecord object to be processed for translatable fields. The GlideRecord should be pointing to the valid table record.</td>
</tr>
<tr>
<td>groupName</td>
<td>String</td>
<td>The name of the group for this input.</td>
</tr>
</tbody>
</table>

**processTranslatableFieldsForMultipleRecords (tableName, encodedQuery, groupName)**

This function fetches all the qualified records for the given tableName and encodedQuery and adds entries in the document content for all the translatable fields. It includes the following parameters:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tableName</td>
<td>String</td>
<td>The table to fetch records.</td>
</tr>
<tr>
<td>encodedQuery</td>
<td>String</td>
<td>The encoded query for filtering records from the processTranslatableFieldsForSingleRecord table.</td>
</tr>
<tr>
<td>groupName</td>
<td>String</td>
<td>The name of the group for this input.</td>
</tr>
</tbody>
</table>

**getFinalJSON**

Returns the final built document content JSON.

**Localization Framework Settings**

You can define translation and workflow preferences for one or more activated languages with Localization Framework Settings.

Before you define the translation and workflow preferences, ensure to activate all the required languages in the instance to define the localization preferences. For more information, see [Activate a language](#).
You must configure at least one of the following translation modes to define the translation preferences. For more information, see Translation modes.

- Activate the required translator if you want to use machine translation.

  **Note:** Machine translation in the Localization Framework is powered by Dynamic Translation.

- Configure a TMS service of your choice if you want to send the content to a translation management system for translation. For more information, see Translation Management System configuration.

- Configure an email subflow if you want to use a subflow other than the default subflow for sending the translatable content file for translation via email. For more information, see Create a custom email subflow.

  **Note:** You cannot define the translation preferences for a language without enabling at least one of the translation modes.

### Create a custom email subflow

Create an email subflow according to your requirements. You can then select this subflow to define translation preferences for a language.

Roles required: localization_admin and flow_designer

The Localization Framework provides a default email subflow that you can customize.

Copy the existing email subflow configured for the Localization Framework and then customize it. Publish the customized subflow so that it is available for selection when setting up the translation preference for a language. For more information, see Create a subflow.

1. Navigate to **Process Automation > Flow Designer**.
2. In the Flow Designer window, click **Subflows**.
3. Click **Send LF Email for Translation** subflow.

   The Send LF Email for Translation subflow opens in the Flow Designer in read-only format. The inputs in this subflow are described in the following table:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>attachment_record</td>
<td>Contains a file related to the LFTASK that can be sent via Email for translation.</td>
<td>Reference.Attachment</td>
</tr>
<tr>
<td>send_to</td>
<td>Contains email addresses of the recipients to send the LF task file.</td>
<td>String</td>
</tr>
<tr>
<td>source_language</td>
<td>Language from which the localization task was created.</td>
<td>String</td>
</tr>
<tr>
<td>target_language</td>
<td>Language into which the content of the localization task gets translated into.</td>
<td>String</td>
</tr>
</tbody>
</table>
4. In the subflow header, click the more actions icon and select **Copy subflow**.

5. In the **New subflow name** field, enter the name of the new subflow.

6. To limit the application scope of the subflow, in the **Application** field, select the required application, otherwise select **Global**.

7. Click **Copy**.

The new subflow is created and opens in the subflow designer editor. The inputs from the copied subflow appear.

**Note:** Inputs are fixed and cannot be edited.

8. In the Actions section, click **Send Email**.

This expands the Send Email section. The fields in the Send Email section are described below:

<table>
<thead>
<tr>
<th>Field name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Name of the action.</td>
</tr>
<tr>
<td></td>
<td>Default: <strong>Send Email</strong></td>
</tr>
<tr>
<td>Target Record</td>
<td>Associated Localization Framework task record</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the table where the localization task resides.</td>
</tr>
<tr>
<td>Include Watermark</td>
<td>Adds a watermark in the file associated with the</td>
</tr>
<tr>
<td></td>
<td>localization task.</td>
</tr>
<tr>
<td>To</td>
<td>Contains email addresses of the recipients who should</td>
</tr>
<tr>
<td></td>
<td>be addressed directly.</td>
</tr>
<tr>
<td>CC</td>
<td>Contains email addresses of the recipients who should</td>
</tr>
<tr>
<td></td>
<td>see the list of recipients directly addressed in the</td>
</tr>
<tr>
<td></td>
<td>email.</td>
</tr>
<tr>
<td>BCC</td>
<td>Contains email addresses of the recipients who are</td>
</tr>
<tr>
<td></td>
<td>copied on the email but not displayed in the email.</td>
</tr>
<tr>
<td>Subject</td>
<td>The text about the email that its recipients can see.</td>
</tr>
<tr>
<td>Body</td>
<td>The text message about the localization task being</td>
</tr>
<tr>
<td></td>
<td>sent for translation.</td>
</tr>
</tbody>
</table>

9. Click **Done**, when you have modified the fields as per your requirement.

10. Click **Copy Attachment**.

The Copy Attachment action expands. The fields in the Copy Attachment section are described below:

<table>
<thead>
<tr>
<th>Field name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
<td>Name of the action.</td>
</tr>
<tr>
<td></td>
<td>Copy Attachment is displayed by default.</td>
</tr>
<tr>
<td>Source Attachment Record [Attachment]</td>
<td>Translatable content file of the localization task.</td>
</tr>
<tr>
<td>Field name</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Target Record</td>
<td>Represents the target record in the email.</td>
</tr>
<tr>
<td>Table</td>
<td>Represents the email table.</td>
</tr>
</tbody>
</table>

11. Click **Save**, to save the subflow in draft status.
12. Click **Publish**.

Use the published subflow to define the translation preference for a language.

**Translation Management System configuration**

The Localization Framework supports integration with a translation management system to localize the content. The TMS configuration table lists all the TMS services configured in the instance.

By default, SDL TMS and XTM TMS services are supported in Localization Framework with the activation of the Localization Framework Installer plugin (com.glide.localization_framework.installer) and appear in the TMS configuration [sn_lf_tms_config] table.

To use SDL TMS service for localization of the artifacts, you need to configure the connection and credentials. For more information about configuring SDL TMS, see **SDL Translation Management System spoke**.

To use XTM TMS service for localization of the artifacts, you need to configure the connection and credentials. For more information about configuring XTM TMS, see **XTM Translation Management System spoke**.

You can also sign up and create an account with a TMS service of your choice. To create and configure a custom TMS, see **Create a custom translation management system**.

**SDL Translation Management System spoke**

The SDL Translation Management System spoke provides subflows and actions to localize the artifacts using the SDL translation management system service.

**Subscription**

The SDL TMS spoke requires any ServiceNow subscription that is Standard or above and includes the Localization Framework.

**Supported versions**

Version v1

**Spoke Subflows**

The spoke provides subflows in the Published state to integrate with the SDL TMS service. These subflows can be used as part of other subflows and flows.
Spoke subflows

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request Translations [request_translations]</td>
<td>Contains set of inputs and outputs to request translations of the artifacts.</td>
</tr>
<tr>
<td>Retrieve Translations [retrieve_translations]</td>
<td>Contains set of inputs and outputs to retrieve translations of the translated artifacts.</td>
</tr>
</tbody>
</table>

Spoke actions

The spoke provides actions to integrate with the SDL TMS service.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Project [create_project_on_sdl]</td>
<td>Creates a project on SDL for translation.</td>
</tr>
<tr>
<td>Get Project Details [get_sdl_project_details]</td>
<td>Fetches the project's details for the translation request.</td>
</tr>
<tr>
<td>Get Translated File [get_translated_file_from_sdl]</td>
<td>Fetches the translated file from SDL TMS after translations.</td>
</tr>
<tr>
<td>Mark File As Complete [complete_file_on_sdl]</td>
<td>Marks the file as complete, after getting the translated content.</td>
</tr>
</tbody>
</table>

SDL Translation Management System account requirements

Ensure that you are registered with SDL TMS and obtain the credential information. For more information on SDL Managed Translation API, see SDL documentation.

Connection and Credential alias requirements

The IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection. For more information, see Connections and Credentials Information.

To use the spoke connection aliases, use an associated connection record and a credential record created with the SDL spoke installation.

This spoke uses the SDL TMS alias (sn_sdl_speak.SDL_TMS) to authorize actions.

- Connection alias requirements
  - Connection type: HTTP
  - Connection URL: For example, https://languagecloud.sdl.com. This is a sample URL. Users can have a different URL based on their geographical preference.

See Configure SDL TMS in the Localization Framework to connect to the SDL TMS services and use them to localize the artifacts.
Configure SDL TMS in the Localization Framework

Configure SDL TMS to use the SDL TMS service in the Localization Framework.

Roles required: connection_admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
   A credential record for SDL TMS is created when the SDL TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.

2. Open the SDL TMS credential record.
3. In the Connections related list, open the SDL connection record.
   A connection record for SDL is created when the SDL TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
   All the form fields are populated with the information that is fetched through the SDL spoke installation during the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.

4. In the Attributes section of the HTTP(s) Connection form, provide the project_option_id connection attribute, and save the form.
   SDL provides an option to create automated or reviewed projects and provides the respective option IDs during SDL account creation.

5. In the Credential field, click the information icon
   and open the record.
   A record for OAuth 2.0 credentials is created when the SDL TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.

6. In the OAuth Entity Profile field, click the information icon
   and open the record.
   An OAuth Entity profile is created when the SDL TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.

7. In the OAuth provider field, click the information icon
   and open the record.
   An Application Registries record is created when the SDL TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.

8. Provide the Client ID and Client Secret provided by SDL at the time of account creation, and save the form.
9. Open the OAuth 2.0 Credentials form again, and click the Get OAuth Token related link.
10. Provide the username and password.
    SDL supports resource owner password credentials as the grant type. Provide these credentials to generate the token for the first time.

   **Note:** The username and password do not persist in the ServiceNow instance.

11. Click Get OAuth Token.
    Once the OAuth token is created, the ServiceNow® platform regenerates the token until the refresh token expires.
XTM Translation Management System spoke

The XTM Translation Management System spoke provides subflows and actions to localize the artifacts using the XTM translation management system service.

Subscription

The XTM TMS spoke requires any ServiceNow subscription that is Standard or above and includes the Localization Framework.

Supported versions

Version v1

Spoke Subflows

The spoke provides subflows in the Published state to integrate with the XTM TMS service. These subflows can be used as part of other subflows and flows.

Spoke subflows

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request Translations</td>
<td>Contains set of inputs and outputs to request translations of the artifacts.</td>
</tr>
<tr>
<td>Retrieve Translations</td>
<td>Contains set of inputs and outputs to retrieve translations of the translated artifacts.</td>
</tr>
</tbody>
</table>

Spoke actions

The spoke provides actions to integrate with the XTM TMS service.

Spoke actions

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Project</td>
<td>Creates a project on XTM for translation.</td>
</tr>
<tr>
<td>Get Project Details</td>
<td>Fetches the project's details for the translation request.</td>
</tr>
<tr>
<td>Get Translated File</td>
<td>Fetches the translated file from XTM TMS after translations.</td>
</tr>
</tbody>
</table>
XTM Translation Management System account requirements

Ensure that you are registered with XTM TMS and obtain the credential information. For more information, see XTM documentation.

Connection and Credential alias requirements

The IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection. For more information, see Connections and Credentials Information.

To use the spoke connection aliases, use an associated connection record and a credential record created with the XTM TMS spoke installation.

This spoke uses the XTM TMS alias (sn_xtm_spoke.XTM_TMS) to authorize actions.

- Connection alias requirements
  - Connection type: HTTP
  - Connection URL: For example, https://api-test.xtm-intl.com. This is a sample URL. Users can have a different URL based on their geographical preference.

See Configure XTM TMS in the Localization Framework to connect to the XTM TMS services and use them to localize the artifacts.

Configure XTM TMS in the Localization Framework

Configure XTM TMS to use the XTM TMS service in the Localization Framework.

Roles required: connection_admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases. A credential record for XTM TMS is created when the XTM TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
2. Open the XTM TMS credential record.
3. In the Connections related list, open the XTM connection record. A connection record for XTM is created when the XTM TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
   All the form fields are populated with the information fetched through the XTM spoke installation during the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
4. In the Attributes section of the HTTP(s) Connection form, provide the *template_id* and *customer_id* connection attributes, and save the form.
5. In the Credential field, click the information icon and open the record. A record for OAuth 2.0 credentials is created when the XTM TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
6. In the OAuth Entity Profile field, click the information icon and open the record. An OAuth Entity Profile is created when the XTM TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.
7. In the **OAuth provider** field, click the information icon

![information icon](image)

and open the record.

An Application Registries record is created when the XTM TMS spoke is installed with the Localization Framework Installer plugin (com.glide.localization_framework.installer) activation.

8. Provide the Client ID and Client Secret provided by XTM at the time of account creation, and save the form.

9. Open the OAuth 2.0 Credentials form again, and click the **Get OAuth Token** related link.

10. Provide the username and password.

    XTM supports resource owner password credentials as the grant type. Provide these credentials to generate the token for the first time.

    **Note:** The username and password do not persist in the ServiceNow instance.

11. Click **Get OAuth Token**.

    Once the OAuth token is created, the ServiceNow® platform regenerates the token until the refresh token expires.

---

**Integrate with a translation management system**

Integrate with any translation management system of your choice to localize the artifacts requested for translations.

Role required: localization_admin

1. Create subflows to request translations and to retrieve the translated content. Use IntegrationHub subflows, actions, and connections and credentials.

   a) Ensure that the error messages and codes from the TMS provider are mapped correctly with the error messages and codes supported the ServiceNow platform.

   **Standard error codes and messages**

<table>
<thead>
<tr>
<th>Error code</th>
<th>Error message</th>
</tr>
</thead>
<tbody>
<tr>
<td>40510</td>
<td>Error while requesting translations.</td>
</tr>
<tr>
<td>40520</td>
<td>Error while retrieving translations.</td>
</tr>
<tr>
<td>40500</td>
<td>Authentication failed.</td>
</tr>
</tbody>
</table>

   b) Ensure that the input and output fields are in the following format for the subflows:

   **Request translation subflow**

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>lftask_number</td>
<td>Associated localization task number.</td>
<td>String</td>
</tr>
<tr>
<td>xliff_1_2_content</td>
<td>Content of an artifact which must be translated in XLIFF 1.2 format. For example,</td>
<td>String</td>
</tr>
<tr>
<td></td>
<td>'csv', 'xliff 1.2'</td>
<td></td>
</tr>
</tbody>
</table>
### ServiceNow

#### DocVersion

Now Platform administration

<table>

<td>The error code that populates when an error occurs.</td>
<td>String</td>
</tr>
</tbody>
</table>
2. Create and configure a custom translation management system and activate it. See Create a custom translation management system.

**Note:** Localization Framework depends on IntegrationHub to build integrations with third-party systems.

### Create a custom translation management system

Configure Localization Framework with a third-party translation management system of your choice to localize an artifact.

Roles required: localization_admin and flow_designer

Ensure that the Localization Framework Installer plugin (com.glide.localization_framework.installer) is activated.

1. Navigate to **Localization Framework > TMS Configuration**.

**Note:** By default, SDL and XTM translation management system configurations are available.

2. Click **New**.

3. In the TMS Configuration form, fill in the fields.

#### TMS Configuration form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the TMS configuration.</td>
</tr>
<tr>
<td>Request Translation Subflow</td>
<td>IntegrationHub subflow that interacts with the third-party translation management system to request translations.</td>
</tr>
<tr>
<td>Retrieve Translation Subflow</td>
<td>IntegrationHub subflow that interacts with the third-party translation management system to retrieve translated content.</td>
</tr>
<tr>
<td>Application</td>
<td>The scope of the application. The default value is Global.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the contract used in subflows. The default value is v1.</td>
</tr>
<tr>
<td>Enable auto retrieval</td>
<td>Option to retrieve the translated content automatically. When selected, the translations are retrieved as per the scheduled jobs which runs daily.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

### Define Translation and Workflow Preferences

Define translation and workflow preferences for one or more activated languages to request translations in Localization Framework.

Role required: localization_admin

1. Navigate to **Localization Framework > Settings**.

2. Click **New**.
3. On the form, fill the fields.

**Settings form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the translation settings.</td>
</tr>
<tr>
<td>Languages</td>
<td>Target records of the activated languages.</td>
</tr>
<tr>
<td>Application</td>
<td>Scope of the application. The default application scope is Global.</td>
</tr>
</tbody>
</table>

*Note:* Ensure to activate the languages before setting up the translation preferences and select one or more languages from the list.

4. Click the **Translation Preferences** tab and fill the fields.

**Translation Preferences form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Machine Translate</strong></td>
<td></td>
</tr>
<tr>
<td>Enable Machine Translate</td>
<td>Option to enable machine translation service for one or more selected languages.</td>
</tr>
<tr>
<td></td>
<td><em>Note:</em> Ensure that you install Dynamic Translation to use machine translation. For more information, see Activate Dynamic Translation.</td>
</tr>
<tr>
<td>Translator</td>
<td>Select a translator of your choice for machine translation.</td>
</tr>
<tr>
<td></td>
<td><em>Note:</em> Ensure that the corresponding translator configuration record is active and contains a translation subflow of version v3.</td>
</tr>
<tr>
<td><strong>Translation Management System</strong></td>
<td></td>
</tr>
<tr>
<td>Enable TMS</td>
<td>Option to enable Translation Management System for one or more selected languages.</td>
</tr>
<tr>
<td>TMS</td>
<td>Select a TMS service of your choice. By default, the SDL and the XTM TMS are available. You can also choose a configured custom TMS. For more information, see Create and configure a custom artifact.</td>
</tr>
<tr>
<td><strong>Send via Email</strong></td>
<td></td>
</tr>
<tr>
<td>Enable Send via Email</td>
<td>Option to enable email service for content localization for one or more selected languages.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Email Subflow</td>
<td>Select a subflow for your email.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> A subflow exists by default. If you want to choose another subflow, ensure that you've created the subflow before setting up the translation preference.</td>
</tr>
<tr>
<td>Default File Format</td>
<td>Select a file format to send and receive the content. By default, XLIFF 1.2 and CSV file formats are supported.</td>
</tr>
<tr>
<td>Default Recipients List</td>
<td>Provide the required recipient email addresses in the translation preferences for one or more selected languages to send an email.</td>
</tr>
<tr>
<td>Export/Import</td>
<td>Option to enable the export and import of content for translation for one or more selected languages.</td>
</tr>
<tr>
<td>Default File Format</td>
<td>Select a file format to send and receive the content. By default, XLIFF 1.2 and CSV file formats are supported.</td>
</tr>
</tbody>
</table>

5. Click the **Workflow Preferences** tab and fill the fields.

**Workflow Preferences form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workflow</td>
<td>Select a workflow for translations in one or more selected languages.</td>
</tr>
<tr>
<td></td>
<td><strong>For more information on the available workflows, see Workflows in the Localization Framework.</strong></td>
</tr>
<tr>
<td>Business Approver Group</td>
<td>Select the required business approver group from the available groups.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the business approver group contains the localization_fulfiller role.</td>
</tr>
<tr>
<td>Localization Fulfiller Group</td>
<td>Select the required localization fulfiller group from the available groups.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that the localization fulfiller group contains the localization_fulfiller role.</td>
</tr>
<tr>
<td>Auto Translation Mode</td>
<td>Select the required auto-translation mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Machine Translate, Send to TMS, and Send via Email</strong> are the available options.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Ensure that you've configured the Translation Preferences for the selected auto translation mode.</td>
</tr>
</tbody>
</table>
6. Click **Submit**.

### Workflows in the Localization Framework

Workflows define actions for completing a localization task. Each localization task undergoes the workflow configured for its target language to complete the task.

<table>
<thead>
<tr>
<th>Workflows</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Translation # Publish</td>
<td>The localization task undergoes translation manually or by using one of the translation modes. After translation, the content gets published manually.</td>
</tr>
<tr>
<td>Translation # Approval of Translations # Auto Publish</td>
<td>The localization task undergoes translation manually or by using one of the translation modes. After translation, the task undergoes translation approval and gets auto-published.</td>
</tr>
<tr>
<td>Auto Translation # Approval of Translations # Auto Publish</td>
<td>The localization task undergoes auto-translation. After translation, the task undergoes translation approval and gets auto-published.</td>
</tr>
<tr>
<td>Auto Translation # Publish</td>
<td>The localization task undergoes auto-translation and gets published manually.</td>
</tr>
</tbody>
</table>

**Note:** Ensure that you assign the **Localization Fulfiller Group** and **Translation Approver Group** for the workflow to localize the content.
<table>
<thead>
<tr>
<th>Workflows</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Auto Translation # Auto Publish</strong></td>
<td>The localization task undergoes auto-translation and gets auto-published.</td>
</tr>
<tr>
<td><strong>Note:</strong> Ensure that you assign the <strong>Localization Fulfiller Group</strong> and <strong>Auto Translation Mode</strong> for the workflow to localize the content.</td>
<td></td>
</tr>
<tr>
<td><strong>Business Approval # Translation # Publish</strong></td>
<td>The localization task needs business approval for localization. The content gets translated manually or translated by using one of the translation modes. The content gets manually published.</td>
</tr>
<tr>
<td><strong>Note:</strong> Ensure that you assign the <strong>Business Approver Group</strong> and <strong>Localization Fulfiller Group</strong> for the workflow to localize the content.</td>
<td></td>
</tr>
<tr>
<td><strong>Business Approval # Translation # Approval of Translations # Auto Publish</strong></td>
<td>The localization task needs business approval for localization, and the content gets translated manually or by using one of the translation modes. After translation, the task undergoes translation approval and gets auto-published.</td>
</tr>
<tr>
<td><strong>Note:</strong> Ensure that you assign the <strong>Business Approver Group</strong>, <strong>Localization Fulfiller Group</strong>, and <strong>Translation Approver Group</strong> for the workflow to localize the content.</td>
<td></td>
</tr>
<tr>
<td><strong>Business Approval # Auto Translation # Approval of Translations # Auto Publish</strong></td>
<td>The localization task needs business approval for localization, and the content gets auto-translated. After translation, the task undergoes translation approval and gets auto-published.</td>
</tr>
<tr>
<td><strong>Note:</strong> Ensure that you assign the <strong>Business Approver Group</strong>, <strong>Localization Fulfiller Group</strong>, <strong>Auto Translation Mode</strong>, and <strong>Translation Approver Group</strong> for the workflow to localize the content.</td>
<td></td>
</tr>
<tr>
<td><strong>Business Approval # Auto Translation # Publish</strong></td>
<td>The localization task needs business approval for localization. The content gets auto-translated but gets manually published.</td>
</tr>
<tr>
<td><strong>Note:</strong> Ensure that you assign the <strong>Business Approver Group</strong>, <strong>Localization Fulfiller Group</strong>, and <strong>Auto Translation Mode</strong> for the workflow to localize the content.</td>
<td></td>
</tr>
<tr>
<td>Workflows</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Business Approval # Auto Translation # Auto Publish</td>
<td>The localization task needs business approval for localization. The content gets auto-translated and auto-published.</td>
</tr>
</tbody>
</table>

**Note:** Ensure that you assign the **Business Approver Group, Localization Fulfiller Group, and Auto Translation Mode** for the workflow to localize the content.

---

**Request Translations UI**

The Localization Framework enables you to select one or more activated languages while requesting translations for artifacts.

**Request Translations UI in the Localization Framework**

- Needs localization preferences to be defined for activated languages to request translations.

**Note:** Languages without localization settings are disabled for selection while requesting translations.

- Lists all the activated languages in the instance to choose for localization of the content.
- Displays the translations status of the artifacts in each of the activated languages based on the generated insights dashboard reports.
- Enables you to request translations for artifacts into one or more activated languages from their artifact tables.

Request Translations

Choose languages to translate into. Learn more

- Chinese *not translated*
- Dutch *not translated*
- French *completely translated*
- German *translation in progress*
- Telugu *not translated*
- Brazilian Portuguese *not translated*
- French - Canada *not translated*

Translation status last updated on 2020-12-01.

Cancel  Submit

Request translations UI from an artifact table
Enables you to request translations in the selected language from the localization dashboard for the selected insights records.

Request translations from the Insights list view

**Request translations for a Service Catalog item**

Request translations for a single Service Catalog item to localize it into one or more languages.

Roles required:
- localization_requester: To request translations
- catalog_editor: To access the Service Catalog items [sc_cat_item] table.

1. Navigate to **Service Catalog > Catalog Definitions > Maintain Items**.
2. Open a catalog item.
3. Click **Request Translations** on the form header.
4. Select the languages.
5. Click **Submit**.
   
   A localization task is created for each selected language.

**Request translations for multiple Service Catalog items**

Request translations for multiple Service Catalog items to localize them into one or more languages.

Roles required:
- localization_requester: To request translations
- catalog_editor: To access the Service Catalog items [sc_cat_item] table.

1. Navigate to **Service Catalog > Catalog Definitions > Maintain Items**.
2. Select multiple items from the list or select the **Select All** check box.
3. From the **Actions on selected rows** list, select **Request Translations**.
4. Select the languages.
5. Click **Submit**.

   Localization tasks are created for the selected items in all the selected languages.
Request translations for a Virtual Agent topic

Request translations for a Virtual Agent topic to localize it into one or more languages.

Roles required:

- localization_requester: To request translations.
- virtual_agent_admin: To access the Virtual Agent topics [sys_cs_topic] table.

1. Navigate to the Virtual Agent topics [sys_cs_topic] table.
2. Open a published topic.
3. Click Request Translations on the form header.
4. Select languages for translation.
5. Click Submit.

A localization task is created for each selected language.

Request translations for multiple Virtual Agent topics

Request translations for multiple Virtual Agent topics to localize them into one or more languages.

Roles required:

- localization_requester: To request translations.
- virtual_agent_admin: To access the Virtual Agent topics [sys_cs_topic] table.

1. Navigate to the Virtual Agent topics [sys_cs_topic] table.
2. Select multiple topics from the list or select the Select All check box.
3. From the Actions on selected rows list, select Request Translations.
4. Select the languages.
5. Click Submit.

Localization tasks are created for the selected topics in all the selected languages.

Localization task states

The state of a localization task defines the status of the localization request. The states of the localization tasks change based on the workflow defined for the language into which translations are requested.

<table>
<thead>
<tr>
<th>Task States</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Awaiting Business Approval</td>
<td>The localization task is awaiting business approval.</td>
</tr>
<tr>
<td>Awaiting Translation</td>
<td>The localization task is waiting for translation by a localization fulfiller.</td>
</tr>
<tr>
<td>Translation in Progress</td>
<td>The localization task is undergoing translation.</td>
</tr>
<tr>
<td>Error in Translation</td>
<td>The localization task has encountered an error while translating the content.</td>
</tr>
<tr>
<td>Translations Approved</td>
<td>The localization task has been approved after translation.</td>
</tr>
</tbody>
</table>
## State

<table>
<thead>
<tr>
<th>State</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Awaiting Translation Approval</td>
<td>The localization task needs translation approval to publish. The translation approver verifies the translations and approves the translations or requests the translator to review the translations.</td>
</tr>
<tr>
<td>Closed Complete</td>
<td>The localization task has been fulfilled and the translations are published.</td>
</tr>
<tr>
<td>Error in Publishing Translations</td>
<td>The localization task has encountered an error while publishing the translations.</td>
</tr>
<tr>
<td>Closed Incomplete</td>
<td>The localization task has been closed without fulfilling the request.</td>
</tr>
</tbody>
</table>

### Translation modes

The Localization Framework offers various translation modes for content translation. Localization fulfiller can use one of the translation modes to translate the content and fulfill the localization request.

#### Machine Translate

Machine translation in the Localization Framework is powered by the Dynamic Translation.

Activate the required translation service provider in the instance to machine translate the content. For information, see Create a translator configuration.

#### Send to TMS

The Localization Framework integrates with third-party Translation Management Systems to localize the content. SDL and XTM Translation Management Systems are supported by default and requires configuration. For more information see, Configure SDL TMS in the Localization Framework and Configure XTM TMS in the Localization Framework.

You can configure a custom Translation Management System of your choice. For more information, see Create a custom translation management system.

#### Send via Email

The Localization Framework provides Send via Email as a translation mode which can be used to send the translatable content for translation to a TMS service via email.

You can configure the Send via Email mode as a translation preference for one or more activated languages. For more information see, Define Translation and Workflow Preferences.

### Fulfill a localization task

Fulfill a localization task created for each selected language in the translation request.

Role required: localization_fulfiller

2. Open a localization task with the state **Awaiting Translation**, **Translation in Progress** or **Error in Translation**.

3. Click **Translate** in the form header.

   • The **Translate** UI action is available only for localization tasks created for languages with the following workflow preferences:
     • Translation # Publish
     • Translation # Approval of Translations # Auto Publish
     • Business Approval # Translation # Publish
     • Business Approval # Translation # Approval of Translations # Auto Publish

   The form turns into a two-column comparison layout with **Source Language** column on the left and **Target Language** column on the right.

4. Translate the content manually or select one of the following translation modes from the task header:

<table>
<thead>
<tr>
<th>Translation Mode</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Machine Translate</strong></td>
<td>Translates content using the translation service provider configured in the translation preferences.</td>
</tr>
<tr>
<td><strong>Send to TMS</strong></td>
<td>Sends the artifact to the translation management system configured in translation preferences for translation.</td>
</tr>
<tr>
<td><strong>Export Source File</strong></td>
<td>Exports the source file in the file format configured in translation preferences for translation.</td>
</tr>
<tr>
<td><strong>Send Source File via Email</strong></td>
<td>Sends the source file to the email addresses configured in translation preferences for translation.</td>
</tr>
</tbody>
</table>

5. Optional: Click the **Lock** icon beside the field with verified translations only if you want to make any changes to the verified translations. Verified translations are pre-existing translations available in the database for the given text. The framework automatically fetches the existing translations and locks the fields.

6. Optional: Click **Save as Draft** to save the translated content and revisit later or to send for translation approval. This option moves the task state to **Translation in Progress**

7. Click **Submit for Approval**.

   **Note:** This option is available only for tasks where the workflow configured for the target language needs translation approval.

   The task is sent for translation approval.

8. Click **Publish Translations**.

   **Note:** This option is available only for tasks where the workflow configured for the target language has the **Publish** option.

   The translations of the localization task are published and the task is updated with **Closed Complete** state.
Approve a localization task

Proofread the translated content and approve a localization task.

Role required: localization_fulfiller

2. Open a localization task with the state Awaiting Translation Approval.
3. Click Verify Translations.
4. Proofread the translations.
5. If the translations need a review, click Request Changes.
6. Click Approve to approve and publish the translations.

Error messages in the Localization Framework

Error messages are displayed when the appropriate settings are not configured for the translation and workflow preferences.

**Error messages in Settings**

<table>
<thead>
<tr>
<th>Error message</th>
<th>Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contains invalid Email Address(es):</td>
<td>When some of the email addresses fail the validation.</td>
</tr>

### Request translations from Insights Dashboard

Request translations for Service Catalog items or Virtual Agent topics from the insights dashboard to localize them into the selected language based on their translation status.

Role required: localization_admin or localization_requester

1. Navigate to **Localization Framework > Insights Dashboard**.
   - The dashboard provides **Catalog Items Translations** report and **Virtual Agent Topic Translations** report by default using which you can request translations.
   - If you have created a report for your artifact to display in the dashboard, you can also request translations for the custom artifacts. For more information, see Create a report for custom artifact.

2. In the **Catalog Items Translations** report or **Virtual Agent Topic Translations** report, click the vertical bar of the language into which you want to request translations.
   - For example:
     - Select a language from the **Catalog Items Translations** report to request translations for the Service Catalog items in that language.
     - Select a language from the **Virtual Agent Topic Translations** report to request translations for the Virtual Agent topics in that language.
     - If you have a custom report created for an artifact, select a language from that report to request translations into the selected language.

3. Select one or more documents from the localization insights list.
   - You can click the **Select All** check box to request translations for all the items in the list.

4. From the **Actions on selected rows** list, select **Request Translations**.
5. Click **OK** in the Confirmation dialog box to submit the request.
Dynamic Translation

You can dynamically translate text entered in an application, such as a user-entered text on forms, for a seamless localization experience.

Get started with Dynamic Translation

1. Procure any ServiceNow, Inc. subscription that is Professional or above, and includes Dynamic Translation.
2. Activate the Dynamic Translation plugin (com.glide.dynamic_translation). For information, see Activation of Dynamic Translation.
3. Sign up and create an account with a translation service provider. By default, the following translation service providers are supported:
   - IBM. To sign up, see the IBM website.
   - Microsoft. To sign up, see the Microsoft documentation.
   - Google. To sign up, see the Google website and Set up Google Cloud Translator Service spoke.
   
   **Important:** Ensure that the Google Cloud Translator Service spoke is installed in ServiceNow Store.

4. Configure the Dynamic Translation framework for the translation service provider.

   **Note:**
   - To use the default translation service providers, you should create a connection, specify the credential information, and then activate the corresponding translator configuration.
   - Make at least one translator configuration as the default for detection to detect the language of the user-entered text.
   - Make at least one translator configuration as the default for translation to enable the Dynamic Translation experience on forms and activity streams.

You can configure your instance to use the following service providers.

   - IBM. For information about configurations for IBM, see IBM Watson Translator Service spoke.
   - Microsoft. For information about configurations for Microsoft, see Microsoft Azure Translator Service spoke.
   - Google. For information about configurations for Google, see Google Cloud Translator Service Spoke.
   - Any translation service provider of your choice. For information about configurations, see Integrate with a translation service provider.

Activation of Dynamic Translation

When you activate the Dynamic Translation plugin (com.glide.dynamic_translation), the Dynamic Translation framework is available to enable the Dynamic Translation experience on forms and activity streams. For translating the text, you can use any of the translation service providers that are available by default, or a translation service provider of your choice.

After you activate the Dynamic Translation plugin (com.glide.dynamic_translation), you can do the following tasks using a translation service provider:
• Translate user-entered text from a source language to a target language
• Detect the language of the input text

For information on activating this plugin, see Activate Dynamic Translation.

**Note:**
- If you activate the Microsoft Azure Translator Service Spoke plugin when the Dynamic Translation plugin (com.glide.dynamic_translation) is inactive, the subflows and actions of the Microsoft Azure Translator Service Spoke plugin are enabled. These subflows can be used in other flows and subflows. However, you cannot call Dynamic Translation APIs.
- If you activate the IBM Watson Translator Service Spoke plugin when the Dynamic Translation plugin is inactive, the subflows and actions of the IBM Watson Translator Service Spoke plugin are enabled. These subflows can be used in other flows and subflows. However, you cannot call Dynamic Translation APIs.

**Default Dynamic Translation framework**

By default, the Dynamic Translation plugin provides the following Dynamic Translation framework for Microsoft, IBM, and Google translation service providers.

- Connections and credential aliases and the corresponding connection attributes.

  **Note:** You should create a connection for each translation service provider and specify the credential information.

- IntegrationHub subflows and actions for these spokes.
  - IBM Watson Translator Service spoke
  - Microsoft Azure Translator Service spoke
  - Google Cloud Translator Service spoke

- Translator configurations

  **Note:** The Dynamic Translation framework is available for Google only when the Google Cloud Translator Service spoke is installed in ServiceNow Store.

**Activate Dynamic Translation**

Activate the Dynamic Translation plugin (com.glide.dynamic_translation) to enable all the required APIs.

Role required: admin

Dynamic Translation plugin (com.glide.dynamic_translation) activates these related plugins if they are not already active.

<table>
<thead>
<tr>

<tr>
<td>Dynamic Translation Spoke</td>
<td>Provides actions that enable the ability to translate text(s) from one language to other language(s) and to detect the language of given text.</td>
</tr>
<tr>
<td>[com.glide.dynamic_translation.spoke]</td>
<td></td>
</tr>
</tbody>
</table>

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar. You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see **Request a plugin**.
3. Click **Install**, and then in the Activate Plugin dialog box, click **Activate**.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

DynamicTranslation API

You can use the DynamicTranslation API to translate text in real time into multiple languages using translation service providers.

This API is available as part of Server APIs, Client APIs, and Service Portal APIs to interact with translation service providers. See **DynamicTranslation - Scoped** and **DynamicTranslation - Client**.

Irrespective of the translation service provider, this API works on a standard set of inputs and outputs, and displays standard error codes and messages.

Language support limitations in the Dynamic Translation implementation

The implementation of Dynamic Translation does not support the following language translations although the corresponding I18N plugins are activated.

- Traditional Chinese. The language code at ServiceNow is different from the code used by translation service providers.
- Simplified Chinese. The language code at ServiceNow is different from the code used by translation service providers.
- Brazilian Portuguese. This language is only supported by ServiceNow and not by any other translation service providers.
- French Canada. This language is only supported by ServiceNow and not by any other translation service providers.

For information on language support, see Language internationalization support.

Language support limitations for translation service providers

Not all source language translations are supported by translation service providers. For information about language translations supported by, see the documentation. For information about language translations supported by, see the documentation for identifiable languages, and the documentation for translation models. For information about language translations supported by, see the documentation.

Microsoft Azure Translator Service spoke

Microsoft Azure Translator Service spoke provides subflows and actions to dynamically translate the user-entered texts, and to detect the language of the user-entered texts using the Microsoft translation service. Dynamic Translation supports detection and translation of single text and multiple texts.

Activate the Dynamic Translation plugin (com.glide.dynamic_translation) or the Microsoft Azure Translator Service Spoke plugin (com.glide.microsoft_translation_spoke).

Subscription

This spoke requires any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.

Supported versions

API version v3

Spoke subflows

The spoke provides subflows in the Published state to integrate with Microsoft translation service. These subflows can be used as part of other subflows and flows.

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language [detect_language_v3]</td>
<td>Contains a set of inputs, actions, and output to detect the language of the input text.</td>
</tr>
<tr>
<td>Translate Text [translate_text_v3]</td>
<td>Contains a set of inputs, actions, and outputs to translate the input text to multiple languages.</td>
</tr>
</tbody>
</table>
Note: The following subflows are deprecated in the Quebec release. These subflows are still available on instances upgraded from a previous release but not available for new instances.

- Detect Language [Deprecated] [detect_language]
- Translate Text To Multiple Languages [Deprecated] [translate_text_to_multiple_languages]

Spoke actions

The spoke provides actions to integrate with Microsoft translation services.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language [detect_language_v3]</td>
<td>Detects the language of the input text.</td>
</tr>
<tr>
<td>Translate Text [translate_text_v3]</td>
<td>Translates the input text to multiple languages.</td>
</tr>
</tbody>
</table>

Note: The following actions are deprecated in the Quebec release. These actions are still available on instances upgraded from a previous release but not available for new instances.

- Detect Language [Deprecated] [detect_language]
- Translate Text To Multiple Languages [Deprecated] [translate_text_to_multiple_languages]

Microsoft account requirements

Ensure that you are registered with Microsoft and obtain the credential information. For more information, see Microsoft documentation.

For information on Microsoft Translator Text API, see the Microsoft documentation.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection. For more information, see Credentials and connection information.

To use the spoke connection aliases, create an associated connection record and a credential record for each alias. This spoke uses the MicrosoftTranslation alias (sn_ms_trans_spoke.MicrosoftTranslation) to authorize actions.

- Connection alias requirements
  - Connection type: HTTP
  - Connection URL: For example, https://api.cognitive.microsofttranslator.com. This is a sample URL. Users can have a different URL based on their geographical preference.

Perform the following tasks to connect to the Microsoft translation services and use them to translate the dynamically generated text.
Create a credential for the MicrosoftTranslation alias

Authorize actions of Microsoft Azure Translator Service spoke by creating a credential for the MicrosoftTranslation connection and credential alias.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
3. Select API Key Credentials.
4. In the API key Credentials form, fill the fields.

API key Credentials form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the credential.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the credential for use.</td>
</tr>
<tr>
<td>Applies to</td>
<td>MID servers for which the credentials are applicable. Possible options are:</td>
</tr>
<tr>
<td></td>
<td>• All MID servers in your network.</td>
</tr>
<tr>
<td></td>
<td>• Specific MID servers. In this case specify the servers in the MID servers field.</td>
</tr>
<tr>
<td>MID servers</td>
<td>Specific MID servers for which the credentials are applicable. This field is displayed only when you select Specific MID servers for the Applies to field.</td>
</tr>
<tr>
<td>Order</td>
<td>Sequence in which the credential is applied.</td>
</tr>
<tr>
<td>API Key</td>
<td>Unique code that is passed to an API to identify the connection.</td>
</tr>
<tr>
<td>Credential alias</td>
<td>Alias to use the credential.</td>
</tr>
</tbody>
</table>

5. Click Submit.

Create a connection for the MicrosoftTranslation alias

Connect to the Microsoft translation service by creating a connection. Provide information that is used by HTTP(s) actions or activities to connect to that service.

Role required: connection_admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Select the MicrosoftTranslation alias (sn_ms_trans_spoke.MicrosoftTranslation).
3. In the Connections tab, click New.
4. In the HTTP(S) Connection form, fill the fields.

HTTP(S) Connection form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the HTTP(s) connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record used to authorize the connection.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record to associate with the connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain where the connection is applicable.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Option to enable the system to build the connection URL. Clear this check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL to connect to the Microsoft's translation service. For example, <a href="https://api.cognitive.microsofttranslator.com">https://api.cognitive.microsofttranslator.com</a></td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server for this connection. Clear this check box.</td>
</tr>
<tr>
<td>Attributes</td>
<td></td>
</tr>
<tr>
<td>Version</td>
<td>API version that the related spokes are built for. The default value is v3. Do not edit this value.</td>
</tr>
<tr>
<td>Ocp-Apim-Subscription-Region</td>
<td>Value of the regional translator resource. This value is optional when using a global translator resource. For information on supported regions, see the Microsoft documentation.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

**Activate the Microsoft translator configuration**

Make the Microsoft translation service available for use by activating the Microsoft translator configuration.

Role required: admin

1. Navigate to **Dynamic Translation > Translator Configurations**.
2. Select **Microsoft**.
3. Select the **Active** check box.
4. In the **Preferences** section, choose a translator as default either for translation or detection, or for both.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mark as default for translation</td>
<td>Option to mark the translator as default for translation.</td>
</tr>
<tr>
<td>Mark as default for detection</td>
<td>Option to mark the translator as default for detection.</td>
</tr>
</tbody>
</table>

**Note:** Make at least one translator configuration as the default configuration either for translation to enable the Dynamic Translation experience on forms and activity streams.

5. Click **Update**.
IBM Watson Translator Service spoke

IBM Watson Translator Service Spoke provides subflows and actions to dynamically translate the user-entered texts, and to detect the language of the user-entered texts using the IBM translation service. Dynamic Translation supports detection and translation of single text and multiple texts.

Activate the Dynamic Translation plugin (com.glide.dynamic_translation) or the IBM Watson Translator Service Spoke plugin (com.glide.ibm_translation_spoke).

Subscription

This spoke requires any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.

Supported versions

API version v3

Spoke subflows

The spoke provides subflows in the Published state to integrate with the IBM translation services. These subflows can be used as part of other subflows and flows.

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language [detect_language_v3]</td>
<td>Contains a set of inputs, actions, and output to detect the language of the input text.</td>
</tr>
<tr>
<td>Translate Text [translate_text_v3]</td>
<td>Contains a set of inputs, actions, and outputs to translate the input text to multiple languages.</td>
</tr>
</tbody>
</table>

Note: The following subflows are deprecated in the Quebec release. These subflows are still available on instances upgraded from a previous release but not available for new instances.

- Detect Language [Deprecated] [detect_language]
- Translate Text To Multiple Languages [Deprecated] [translate_text_to_multiple_languages]

Spoke actions

The spoke provides actions to integrate with IBM translation services.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language [detect_language_v3]</td>
<td>Detects the language of the input text.</td>
</tr>
<tr>
<td>Translate Text [translate_text_v3]</td>
<td>Translates the input text to multiple languages.</td>
</tr>
</tbody>
</table>
Note: The following actions are deprecated in the Quebec release. These actions are still available on instances upgraded from a previous release but not available for new instances.

- Detect Language [Deprecated] [detect_language]
- Translate Text To Single Language [Deprecated] [translate_text_to_single_language]
- Translate Text To Multiple Languages [Deprecated] [translate_text_to_multiple_languages]

IBM account requirements

Ensure that you are registered with IBM and obtain the credential information. For more information, see IBM documentation.

For information on IBM Language Translator API, see the IBM documentation.

Connection and credential alias requirements

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you do not need to update any actions that use the connection. For more information, see Credentials and connection information.

To use the spoke connection aliases, create an associated connection record and a credential record for each alias.

This spoke uses the IBMTranslation alias (sn_ibm_trans_spoke.IBMTranslation) to authorize actions.

- Connection alias requirements
  - Connection type: HTTP
  - Connection URL: Base URL provided by IBM to connect to the language translator service. Users can have a different URL based on their geographical preference.

Perform the following tasks to connect to the IBM translation services and use them to translate the dynamically generated text.

Create a credential for the IBMTranslation alias

Authorize actions of the IBM Watson Translator Service spoke by creating a credential for the IBM connection and credential alias.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Click New.
3. Select Basic Auth Credentials.
4. In the Basic Auth Credentials form, fill the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the credential.</td>
</tr>
<tr>
<td>Order</td>
<td>Sequence in which the credential is applied.</td>
</tr>
</tbody>
</table>
Create a connection for the IBMTranslation alias

Connect to the IBM translation service by creating a connection. Provide information that is used by HTTP(s) actions or activities to connect to that service.

Role required: connection_admin

1. Navigate to Connections & Credentials > Connection & Credential Aliases.
2. Select the IBMTranslation alias (sn_ibm_trans_spoke.IBMTranslation).
3. In the Connections tab, click New.
4. In the HTTP(S) Connection form, fill the fields.

HTTP(S) Connection form fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the HTTP(s) connection.</td>
</tr>
<tr>
<td>Credential</td>
<td>Credential record used to authorize the connection.</td>
</tr>
<tr>
<td>Connection alias</td>
<td>Alias record to associate with the connection. Using an alias enables you to update the connection record without having to reconfigure any actions or activities that use the alias.</td>

<tr>
<td>Active</td>
<td>Option to activate the connection.</td>
</tr>
<tr>
<td>Domain</td>
<td>Domain where the connection is applicable.</td>
</tr>
<tr>
<td>URL builder</td>
<td>Option to enable the system to build the connection URL. Clear this check box.</td>
</tr>
<tr>
<td>Connection URL</td>
<td>Base URL provided by IBM to connect to the language translator service. Users can have a different URL based on their geographical preference.</td>
</tr>
<tr>
<td>Use MID server</td>
<td>Option to use a MID Server for this connection. Clear this check box.</td>
</tr>
<tr>
<td>Attributes</td>
<td></td>
</tr>
<tr>
<td>Learning Opt-Out</td>
<td>Attribute to specify if your data can be used as test data by IBM to train its models. If set to true, IBM does not use your data for any API request. By default, IBM services log requests and their results.</td>
</tr>
<tr>
<td>API Version Date</td>
<td>Release date of the API version you want to use. The default value is 2018-05-01. Do not edit this value.</td>
</tr>
</tbody>
</table>

5. Click Submit.
Activate the IBM translator configuration

Make the IBM translation service available for use by activating the IBM translator configuration.

Role required: admin

1. Navigate to Dynamic Translation > Translator Configurations.
2. Select IBM.
3. Select the Active check box.
4. In the Preferences section, choose a translator as default either for translation or detection, or for both.

**Preferences**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mark as default for translation</td>
<td>Option to mark the translator as default for translation.</td>
</tr>
<tr>
<td>Mark as default for detection</td>
<td>Option to mark the translator as default for detection.</td>
</tr>
</tbody>
</table>

**Note:** Make at least one translator configuration as the default for translation to enable the Dynamic Translation experience on forms and activity streams.

5. Click Update.

**Google Cloud Translator Service spoke**

Provides subflows and actions to dynamically translate the user-entered text, and to detect the language of the text using the Google translation service.

**Request apps on the Store**

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

**Subscription**

This spoke requires one of the following subscriptions:

- Any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.
- IntegrationHub Professional subscription package. For more information see, Request IntegrationHub.
**Supported versions**

Google Translate API version v3

**Scope of the spoke in the Dynamic Translation framework**

To use Google Cloud Translator Service spoke in the Dynamic Translation framework, ensure that the spoke is installed in ServiceNow Store and the Dynamic Translation plugin is active. For more information, see Dynamic Translation.

**Spoke flows**

This spoke has no sample flows.

**Spoke subflows**

The Google Cloud Translator Service spoke provides subflows in the Published state to integrate with the Google translation service. These subflows can be used as part of other subflows and flows.

<table>
<thead>
<tr>
<th>Subflow</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language</td>
<td>Contains a set of inputs, actions, and outputs to detect the language of the input text.</td>
</tr>
<tr>
<td>Translate Text To Multiple Languages</td>
<td>Contains a set of inputs, actions, and outputs to translate the input text to multiple languages.</td>
</tr>
</tbody>
</table>

**Spoke actions**

The Google Cloud Translator Service spoke provides actions to integrate with the Google translation service. Available actions include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language</td>
<td>Detects the language of the input text.</td>
</tr>
<tr>
<td>Translate Text To Single Language</td>
<td>Translates the input text to a single language.</td>
</tr>
<tr>
<td>Translate Text To Multiple Languages</td>
<td>Translates the input text to multiple languages.</td>
</tr>
</tbody>
</table>

**Google account requirements**

The Google Cloud Translator Service spoke requires configuring your Google Cloud account to generate an OAuth 2.0 JWT Bearer Grant token.

**Connection and credential alias requirements**

IntegrationHub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the
connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

This spoke uses the GoogleTranslation alias record (sn_google_trans.GoogleTranslation) to authorize actions.

**Set up Google Cloud Translator Service spoke**

Integrate your Google account with your ServiceNow instance.

- **Role required:** admin
- Create a service account on Google Cloud, generate a service account key of JSON type and download it. For information on creating the service account key, see the Google documentation.
- Enable the Cloud Translation API service. For information on enabling a service, see the Google documentation.

**Create a Java KeyStore certificate**

Encrypt the security certificates obtained by creating a Java KeyStore (JKS) file.

- **Role required:** admin
- Download a JSON file containing the service account key from Google. For information on downloading the JSON file, see the Google documentation. Following is a sample JSON file:

```json
{
  "type": "service_account",
  "project_id": "primeval-nectar-242610",

"client_email": "service-now-google-trans-v3@primeval-nectar-242610.iam.gserviceaccount.com",
"client_id": "12355944370425109391",
"auth_url": "https://accounts.google.com/o/oauth2/auth",
"token_url": "https://oauth2.googleapis.com/token",
"auth_provider_x509_cert_url": "https://accounts.google.com/x509_certs",
"auth_provider_x509_cert_url": "https://accounts.google.com/x509_certs"
}
```
1. In the JSON file, perform the following for the `private_key` value.
   a) Unescape the `\n` characters.
   b) Store the private key in a file with .pem extension.

2. In the JSON file, perform the following for the `client_x509_cert_url` value.
   a) Open the link specified for `client_x509_cert_url`.
   b) Unescape the `\n` characters for the certificate associated with the `private_key_id` mentioned in the JSON file.
   c) Store the certificate value in a file with .pem extension.

3. Use the `openssl` command to create a PKCS 12 file using the recently created private key and certificate files.

   ```bash
   ```

   For example, if `certificate.pem` is the certificate and `privatekey.pem` is the private key:

   ```bash
   openssl pkcs12 -export -in certificate.pem -inkey privatekey.pem -certfile certificate.pem -out testkeystore.p12
   ```

   A PKCS 12 file, `testkeystore.p12`, is created.

4. Specify an export password or source keystore password.

   **Note:** You should specify this password when creating a JWT key for Google Cloud Translator Service spoke.

5. Use the `keytool` command to create a JKS file from the PKCS 12 file.

   ```bash
   keytool -importkeystore -srckeystore testkeystore.p12 -srcstoretype pkcs12 -destkeystore wso2carbon.jks -deststoretype JKS
   ```

   **Note:** `testKeyStore.p12` is the PKCS 12 file and `wso2carbon.jks` is the JKS file.

6. Specify a destination keystore password.

   **Note:** You should specify this password when attaching a JKS certificate to Google Cloud Translator Service spoke.

**Attach a Java KeyStore certificate to Google Cloud Translator Service spoke**

Enable the JWT client authentication by attaching a valid Java KeyStore (JKS) certificate to Google Cloud Translator Service spoke.

- Role required: admin
- Valid Java KeyStore certificate

1. Navigate to **System Definition > Certificates**.
2. Click **New**.
3. On the form, fill in the fields.

**X.509 Certificate form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the certificate.</td>
</tr>
<tr>
<td>Notify on expiration</td>
<td>Users to be notified when the certificate expires.</td>
</tr>
<tr>
<td>Warn in days to expire</td>
<td>Number of days to send a notification before the certificate expires.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the certificate.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of the certificate. Select <strong>Java Key Store</strong>.</td>
</tr>
<tr>
<td>Expires in days</td>
<td>Number of days until the certificate expires.</td>
</tr>
<tr>
<td>Key store password</td>
<td>Password to access the certificate. Use the destination keystore password specified when creating the JKS certificate. For more information on this password, see <strong>Create a Java KeyStore certificate</strong>.</td>
</tr>
<tr>
<td>Short description</td>
<td>Summary about the certificate.</td>
</tr>
</tbody>
</table>

4. Click the manage attachments icon ( ) and attach a JKS certificate.

5. To validate the JKS certificate, click **Validate Stores/Certificates**.

6. Click **Submit**.

**Create a JWT signing key for Google Cloud Translator Service spoke**

Assign a JSON Web Token (JWT) signing key to your Java KeyStore certificate.

Role required: admin

1. Navigate to **System OAuth > JWT Keys**.

2. Click **New**.

3. On the form, fill in the fields.

**JWT Keys form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the JWT signing key.</td>
</tr>
<tr>
<td>Signing Keystore</td>
<td>Valid JKS certificate for which you want to assign the key.</td>
</tr>
<tr>
<td>Key Id</td>
<td>Key ID to identify which key is used when multiple keys are used to sign tokens.</td>
</tr>
<tr>
<td>Signing Algorithm</td>
<td>Algorithm to sign with the key.</td>
</tr>
<tr>
<td>Signing Key Password</td>
<td>Password associated with the key. Use the export password or the source keystore password specified when creating the JKS certificate. For more information on this password, see <strong>Create a Java KeyStore certificate</strong>.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the key.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.
Create a JWT provider for Google Cloud Translator Service spoke

Add a JSON Web Token (JWT) provider to Google Cloud Translator Service spoke.

Role required: admin

1. Navigate to System OAuth > JWT Providers.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the JWT provider.</td>
</tr>
<tr>
<td>Expiry Interval (sec)</td>
<td>Number of seconds that indicate the lifespan of the JWT provider token. Specify 3600.</td>
</tr>
<tr>
<td>Signing Configuration</td>
<td>JWT signing key.</td>
</tr>
</tbody>
</table>

4. Right-click the form header, and click Save.
5. In the Standard Claims related list, enter the values for these claims.

<table>
<thead>
<tr>
<th>Claim name</th>
<th>Claim value</th>
</tr>
</thead>
<tbody>
<tr>
<td>aud</td>
<td><a href="https://www.googleapis.com/oauth2/v4/token">https://www.googleapis.com/oauth2/v4/token</a></td>
</tr>
<tr>
<td>iss</td>
<td>client_email value from the JSON file.</td>
</tr>
</tbody>
</table>

6. In the Custom Claims related list, create the scope claim and enter its value as https://www.googleapis.com/auth/cloud-translation.
7. Click Update.

Configure the credential for the GoogleTranslation alias

Authorize actions of Google Cloud Translator Service spoke by configuring the Google OAuth 2.0 credential.

Role required: admin

1. Navigate to Connections & Credentials > Credentials.
2. Select the Google OAuth 2.0 credential.
3. Open the record specified in the OAuth Entity Profile field.
4. In the JWT Provider field, specify the JWT provider that you want to use.
5. Click Update.
6. To verify if an OAuth Access token is generated to connect to Google's translation services, click the Get OAuth Token related link of the Google OAuth 2.0 credential.

Configure the connection attributes for the GoogleTranslation alias

Connect to the Google's translation service by configuring the Google connection. Provide information that is used by HTTP(s) actions or activities to connect to that service.

Role required: connection_admin

1. Navigate to Connections & Credentials > Connections.
2. Open for the record for Google.
3. In the Attributes related list of the HTTP(S) Connection form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value required</th>
</tr>
</thead>
<tbody>
<tr>
<td>location</td>
<td>Location of the customer. If the value is not specified when creating an account on Google Cloud, then specify <code>global</code>.</td>
</tr>
<tr>
<td>project_id</td>
<td>Identifier of a project. Specify the <code>project_id</code> value from the JSON file.</td>
</tr>
<tr>
<td>version</td>
<td>API version that the related spokes are built for. The default value is <code>v3beta1</code>. Because Google now supports the v3 version, you can override this value as <code>v3</code>.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and click **Save**.

**Dynamic Translation spoke**

The Dynamic Translation spoke provides actions to enable the ability to translate multiple texts from one language into one or more languages and detect the language of multiple texts seamlessly.

The Dynamic Translation APIs are accessible across the ServiceNow platform through the following access points:

- Server
- Platform Client
- Portal Client

In the Quebec release, the Dynamic Translation spoke enables you to access the Dynamic Translation APIs from the Flow Designer.

The Dynamic Translation Spoke is a plugin (com.glide.dynamic_translation.spoke) that is available with activation of the Dynamic Translation plugin (com.glide.dynamic_translation).

The Dynamic Translation spoke contains actions that are built corresponding to the Dynamic Translation APIs. The following actions are built in the Quebec release in Dynamic Translation spoke:

<table>
<thead>
<tr>
<th>Action Name</th>
<th>API</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect Language</td>
<td><code>getDetectedLanguage()</code></td>
</tr>
<tr>
<td>Detect Languages</td>
<td><code>getDetectedLanguages()</code></td>
</tr>
<tr>
<td>Translate Text</td>
<td><code>getTranslation()</code></td>
</tr>
<tr>
<td>Translate Texts</td>
<td><code>getTranslations()</code></td>
</tr>
<tr>
<td>Is Dynamic Translation Enabled</td>
<td><code>isDynamicTranslationEnabled()</code></td>
</tr>
</tbody>
</table>

For more information about accessing the actions from the Flow Designer, see **Access Dynamic Translation spoke actions from the Flow Designer**.
Access Dynamic Translation spoke actions from the Flow Designer

Access Dynamic Translation spoke actions from the Flow Designer to dynamically detect and translate the given texts.

- Ensure that the Dynamic Translation spoke is activated with Dynamic Translation plugin (com.glide.dynamic_translation) activation and configure the Dynamic Translation framework for a translation service provider.
- Role required: admin

2. Click the Actions tab.
3. Search the actions using the filter criteria and search bar.
   You can search for the actions with the spoke’s name. For example, Dynamic Translation.
   All the actions built in the Dynamic Translation spoke are displayed.
   For more information, see Actions in Dynamic Translation spoke.

Actions in Dynamic Translation spoke

Actions in Dynamic Translation spoke are built to access the Dynamic Translation APIs from the Flow Designer.

<table>
<thead>
<tr>
<th>Dynamic Translation Spoke actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action</td>
</tr>
<tr>
<td>Detect Language [detect_language]</td>
</tr>
<tr>
<td>Detect Languages [detect_languages]</td>
</tr>
<tr>
<td>Is Dynamic Translation Enabled</td>
</tr>
<tr>
<td>Translate Text [translate_text]</td>
</tr>
<tr>
<td>Translate Texts [translate_texts]</td>
</tr>
</tbody>
</table>

Standard Error Codes

When an error occurs, error codes populate with the reason for the error. Refer to the following information for the standard error codes that appear while you work on the Dynamic Translation spoke actions corresponding to the Dynamic Translation APIs:

- Dynamic Translation- Scoped
Language Detection spoke

ServiceNow Language Detection Service spoke provides a single subflow and action to detect the language of the given text using the ServiceNow language detection service.

The ServiceNow Language Detection Service spoke is an in-house language detection service offered by ServiceNow platform in the Quebec release.

The ServiceNow Language Detection Service spoke plugin (com.glide.language_detection_spoke) is available with the activation of Dynamic Translation plugin (com.glide.dynamic_translation).

Subscription

This spoke requires any ServiceNow subscription that is Professional or above, and includes Dynamic Translation.

Supported versions

API version v3

Spoke subflow

The spoke provides the subflow in the Published state to integrate with the ServiceNow language detection service.

Spoke action

The spoke provides the action in the Published state to integrate with the ServiceNow language detection service.

The ServiceNow Language Detection service uses the following Dynamic Translation APIs to detect the language of the input texts:

- getDetectedLanguage: Provides text to identify the languages.
Integrate with a translation service provider

Integrate with any translation service provider of your choice to translate the dynamically generated text.

Role required: admin

1. Create subflows to detect the language of the input text, and translate the input text. Use IntegrationHub subflows, actions, and connections and credentials. See Flow Designer.
   a) Ensure that the mapping for error messages is done to map error codes from the translation service provider to the error codes and standardized error messages supported by ServiceNow.

<table>
<thead>
<tr>
<th>Error code</th>
<th>Error message</th>
</tr>
</thead>
<tbody>
<tr>
<td>40050</td>
<td>Error code to populate error messages from the translator service provider instead of standardized error messages.</td>
</tr>
<tr>
<td>40051</td>
<td>Unknown error occurred.</td>
</tr>
<tr>
<td>40052</td>
<td>Text ('text' field) has exceeded its maximum length.</td>
</tr>
<tr>
<td>40053</td>
<td>Source language is invalid.</td>
</tr>
<tr>
<td>40054</td>
<td>Target language is invalid.</td>
</tr>
<tr>
<td>40055</td>
<td>Request is not authorized because credentials are missing or invalid.</td>
</tr>
<tr>
<td>40056</td>
<td>Text cannot be translated to target languages.</td>
</tr>
</tbody>
</table>

b) Ensure that the inputs and output fields are in the following format for subflows.

**Note:** While you create subflows, you can refer to the subflows that are available by default if required. For example, Detect Language [detect_language_v3] and Translate Text To Multiple Languages [translate_text_to_multiple_languages_v3].
### Field name | Description | Type
---|---|---
detections | Information about the code and confidence of the languages detected by the translator and their respective alternatives, error codes, and error messages. | Array.Object. Each element of the Object is a String value.
  - **Code**: Language code of the detected language as specified by the translation service provider.
  - **Confidence**: Value that indicates the confidence in the result. The value is between zero and one. A low value indicates a low confidence.

For example, French text with confidence of 0.93

```json
{ 'code' : 'fr',
  'confidence' : '0.93' }
```

For more information refer to the `getDetectedLanguages` section of DynamicTranslation - Scoped.

status | Status of the request. | Choice

---

### Translate subflow

#### Field name | Description | Type
---|---|---
Inputs | | 
texts | Texts to be translated. In the Quebec release, version v3 supports bulk translation-translation of multiple texts input in a single string. | Array.String

target_languages | Array of language codes to which the text needs to be translated. For example, | Array.String. Each element of the array is a String value.

```python
['fr', 'it']
```

source_language | Language code of the source text. For example, | String

```python
'en'
```
### Field name | Description | Type
---|---|---
additional_parameters | Array of additional parameters. For example, 

```
[{'parameter_name': 'textType',
  'parameter_value': 'html'}]
```
| Array.Object. Each element of the array is an Object with String values. |

**Outputs**

<table>
<thead>
<tr>
<th>Field name</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
</table>
| translations | Translated texts in the specified target languages. Each element of the array is an Object containing target language and the translated text. For example, 

```
[
  {'target_language': 'fr',
   'translated_text': 'Bonjour'},
  {'target_language': 'it',
   'translated_text': 'ciao'}
]
```
| Array.Object. Each element of the array is an Object with String values. |

**Note:** For more information refer to the `getTranslations` section of `DynamicTranslation - Scoped`.

<table>
<thead>
<tr>
<th>Field name</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>Status of the request.</td>
<td>Choice</td>
</tr>
</tbody>
</table>

---

**Note:** Ensure that the Run As field is set to User who initiates session in the flow properties.

2. Create a translator configuration and activate it. See [Create a translator configuration](#).

**Create a translator configuration**

Configure the Dynamic Translation framework for a translation service provider of your choice to dynamically translate the user-entered text in the application.

**Role required:** admin

Ensure that the Dynamic Translation plugin (com.glide.dynamic_translation) is activated.

1. Navigate to Dynamic Translation > Translator Configurations.

   **Note:** By default, ServiceNow, Google, IBM, and Microsoft translator configurations are available.

2. Click New.
3. In the Translator Configuration form, fill the fields.

**Translator Configuration form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifier of the translator configuration.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Active | Activates the translator configuration.
Version | Version of the contract used in subflows. The default value is v3 that uses complex objects in the input and output fields of subflows.

**Note:** Versions v1 and v2 accept only a single string and are deprecated. It is recommended to use version v3 that accepts multiple strings for translation and detection.

Preferences

Choose a translate subflow | IntegrationHub subflow that interacts with the translation service provider to translate the input text.

Mark as default for translation | Specifies the translator configuration as the default configuration for translation.

When no translator configuration is specified while translating the text, then the default configuration is used.

**Note:**
- The configuration should be active to make it default.
- You can select only one configuration as default for translation.

Choose a detect subflow | IntegrationHub subflow that interacts with the translation service provider to detect the language of the input text.

Mark as default for detection | Specifies the translator configuration as the default configuration for detection.

When no translator configuration is specified while detecting the text, then the default configuration is used.

**Note:**
- The configuration should be active to make it default.
- You can select only one configuration as default for translation.

### 4. Click Submit.

**Migrate to version v3 of a translator configuration**

Implement the contract with subflows using complex objects in the input and output fields for dynamic translation of text.

Role required: admin
For a translator configuration that you added to integrate with a translation service provider of your choice, implement IntegrationHub subflows with complex objects in the input and output fields. These subflows are required to interact with the translation service provider for the following tasks:

- Translate the input text
- Detect the language of the input text

For information on implementing these subflows, see Integrate with a translation service provider.

After an upgrade to Quebec, the version of all translator configurations that are available by default but not customized is automatically updated to v3. The corresponding subflows have complex objects in the input and output fields.

However, you should migrate to version v3 for the following translator configurations:

- Translator configurations that are available by default but customized in New York
- Translator configuration that you added to integrate with a translation service provider of your choice

1. Navigate to Dynamic Translation > Translator Configurations.
2. Select a translator configuration.
3. In the Translator Configuration form, update these fields.

**Translator Configuration form fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Activates the translator configuration to integrate with Dynamic Translation.</td>
</tr>
<tr>
<td>Version</td>
<td>Version of the contract used in subflows. Select v3.</td>
</tr>
<tr>
<td>Choose a translate subflow</td>
<td>IntegrationHub subflow with complex objects in the input and output fields to translate the input text.</td>
</tr>
<tr>
<td></td>
<td>• For the translator configurations that are available by default but customized, select Translate Text [translate_text_v3].</td>
</tr>
<tr>
<td></td>
<td>• For the translator configuration that you added to integrate with a translation service provider of your choice, select the subflow that you implemented with complex objects. The contract now supports multiple texts in a single method call.</td>
</tr>
<tr>
<td>Choose a detect subflow</td>
<td>IntegrationHub subflow with complex objects in the input and output fields to detect the language of the input text.</td>
</tr>
<tr>
<td></td>
<td>• For the translator configurations that are available by default but customized, select Detect Language [detect_language_v3].</td>
</tr>
<tr>
<td></td>
<td>• For the translator configuration that you added to integrate with a translation service provider of your choice, select the subflow that you implemented with complex objects. The contract now supports multiple texts in a single method call.</td>
</tr>
<tr>
<td>Mark as default for translation</td>
<td>Marks the translator as the default configuration for dynamic translation of text.</td>
</tr>
</tbody>
</table>
4. Click **Update**.

**Limitations in Dynamic Translation**

You need to be aware of a few limitations when you integrate with a translation service provider to enable the Dynamic Translation experience.

**Length limitations for translation service providers**

Following are the length limitations for translation service providers:

- For Microsoft, the input text for translation cannot have more than 10000 characters including spaces. And the limit for the input text for detection is 50000. For more information, see [Microsoft Documentation](#).
- For IBM, the size of the input text cannot exceed 50KB. For more information, see [IBM Documentation](#).
- For Google, the recommended maximum length of each request is 5k characters. The maximum size of the input text cannot exceed 30K code points. For more information, see [Google Documentation](#).

**Language support limitations in the Dynamic Translation implementation**

The implementation of Dynamic Translation does not support the following language translations although the corresponding I18N plugins are activated.

- Traditional Chinese. The language code at ServiceNow is different from the code used by translation service providers.
- Simplified Chinese. The language code at ServiceNow is different from the code used by translation service providers.
- Brazilian Portuguese. This language is only supported by ServiceNow and not by any other translation service providers.
- French Canada. This language is only supported by ServiceNow and not by any other translation service providers.

For information on language support, see [Language internationalization support](#).

**Language support limitations for translation service providers**

Not all source language translations are supported by translation service providers.

For information about language translations supported by Microsoft, see the [documentation](#).

For information about language translations supported by IBM, see the [documentation](#) for identifiable languages, and the [documentation](#) for translation models.

For information about language translations supported by Google, see the [documentation](#).
Dynamic translation on forms and activity streams

For a seamless localization experience on forms and activity streams, you can dynamically translate text based on the preferred language of a user.

Dynamic translation on forms

You can translate the field values on forms in Platform.

To enable dynamic translation at the field-level on Platform forms, see Enable dynamic translation for a field. Once enabled, click to show or hide the translated content.

Dynamic translation in activity streams

You can translate activity streams both in Platform and Service Portal.

Dynamic translation is enabled by default for comments and work notes in the activity stream. Click translate to show or hide the translated content for each comment or work note.

Note: You cannot translate activity streams in Agent Workspace.

Length limitations for translation service providers

Following are the length limitations for translation service providers:

- For , the input text for translation cannot have more than 10000 characters including spaces. And the limit for the input text for detection is 50000. For more information, see Microsoft Documentation.
- For , the size of the input text cannot exceed 50KB. For more information, see IBM Documentation.
- For , the recommended maximum length of each request is 5k characters. The maximum size of the input text cannot exceed 30K code points. For more information, see Google Documentation.

Enable dynamic translation for a field

Translate the dynamically generated text for a field on Platform forms by enabling the field-level dynamic translation.

You can translate the text based on the preferred language of a user.

Role required: admin

Activate the Dynamic Translation plugin (com.glide.dynamic_translation).

Dynamic Translation supports only the following field types:

- String
- String (Full UTF-8)
- Multi Line Small Text Area
- Wide Text

Note:
• Following are the length limitations for translation service providers:
  • For , the input text for translation cannot have more than 10000 characters including spaces. And the limit for the input text for detection is 50000. For more information, see Microsoft Documentation.
  • For , the size of the input text cannot exceed 50KB. For more information, see IBM Documentation.
  • For , the recommended maximum length of each request is 5k characters. The maximum size of the input text cannot exceed 30K code points. For more information, see Google Documentation.
  • You cannot translate a field on Agent Workspace forms.

 1. Navigate to any form. For example, an Incident form.
  2. Right-click the required field and select Configure Dictionary.
  3. In the Attributes related list, click New.
  4. In the Dictionary Attribute form, fill the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Dynamic Translation Enabled</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

 5. Click Submit.
  6. Click Update.

A translate icon appears next to the field. The logged-in user can click this icon to translate the text to the user’s preferred language using the default translation service provider specified in the translator configurations. For information about error messages during translation, see Error messages for dynamic translation on forms and activity streams.

Note: If you do not have any default translator configuration, you cannot view the translate icon.
Error messages for dynamic translation on forms and activity streams

Error messages are displayed when the text cannot be dynamically translated on forms activity streams.

### Error messages

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Error message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field has no value.</td>
<td>No text to translate.</td>
</tr>
<tr>
<td><strong>Note:</strong> This scenario is applicable only for fields on the form.</td>
<td></td>
</tr>
<tr>
<td>Text to be translated is already in the logged-in user's preferred language.</td>
<td>This content is written in your preferred language. No need to translate.</td>
</tr>
<tr>
<td>Text cannot be translated to the user's preferred language by the default translation service provider.</td>
<td>Text cannot be translated to your preferred language.</td>
</tr>
<tr>
<td>Credentials configured for the translation service provider under Connections &amp; Credentials are not valid.</td>
<td>Credentials are missing or invalid. Contact your administrator.</td>
</tr>
<tr>
<td>Text to be translated has exceeded the maximum length supported by the default translation service provider.</td>
<td>Text has exceeded the maximum length.</td>
</tr>
<tr>
<td>Error during translation. Possible reasons are:</td>
<td>Unable to translate.</td>
</tr>
<tr>
<td>• Credentials configured for the translation service provider under the Connections &amp; Credentials sub module are missing.</td>
<td></td>
</tr>
<tr>
<td>• Translation got timed out.</td>
<td></td>
</tr>
<tr>
<td>• Any other issue with the translation service provider. For example, the exhaustion of credentials for more transactions.</td>
<td></td>
</tr>
</tbody>
</table>

### Translate a knowledge article

You can start translating articles once they are published and assigned to you for translation.

Role required: admin, knowledge_admin, or knowledge

1. Navigate to Knowledge > Translation Management > My Assigned Tasks.
2. In the Knowledge Translation Tasks page, select one of the listed translation tasks assigned to you. The Knowledge Translation Tasks page lists all knowledge translation tasks assigned to you.
3. Click **Translate**.

**Note:** If you want to do a translation directly from an article, use the **Translate** related link on the article page.

The **Translate from** and **Translate to** panes are side-by-side for easy viewing, as shown in the following figure.

4. Click **Machine translate**, which automatically translates to the targeted languages.

**Note:** A default translator configuration should be available. For configuring the translation API, see **Dynamic Translation**.

5. Click **Create draft article** to create a draft version of the translated article.

If a translated article is already present for that language, a new draft version overwrites an existing translated content.

6. Click **Publish**.

The newly created draft is listed in the **Translated Versions** tab.
Dynamic Translation for Agent Chat Overview

Dynamic Translation for Agent Chat (DTAC) translates chat messages from one language to another. DTAC enables agents and end users to have a chat conversation with each other, without the need of a shared language.

DTAC translates the chat text for the agent and the end user. For example, if the end user enters German text, the agent automatically receives that text translated into the agent’s preferred language, for example, English. Likewise, when the agent responds with English text, it appears to the end user in German. When DTAC is enabled, the end user only sees text translated into the end user’s language. The agent’s and end user’s preferred languages are specified in the instance configuration.

DTAC is disabled by default and can be enabled by the system administrator. If an agent turns off DTAC in their chat window session, DTAC stops translating the chat text for the agent and end user from that point on. DTAC will not translate the previous text. If the agent turns DTAC back on during the session, it translates the chat text from that point on for the agent and end user.

DTAC supports various translation services including Google Cloud Translator Service, IBM Translator Service, and Microsoft Azure Translator Service. DTAC can translate in the languages supported by these translation services. Even though the corresponding I18N plugins are activated, DTAC does not support the following language translations:

- simplified and traditional Chinese
- Brazilian Portuguese
- Canadian French

DTAC is also available for Agent Chat in mobile for iOS and Android.

Before installing the DTAC plugins, you must complete the Dynamic Translation setup steps. For more information, see Activate Dynamic Translation.

For an overview about how Agent Chat works, see Workspace Agent Chat.

For information about Dynamic Translation, see Dynamic Translation.

Domain separation and Dynamic Translation

Domain separation is supported in Dynamic Translation and is configured to apply to translator configurations. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see the SP's response.

To learn more, see Application support for domain separation.
**Activation information**

You should activate the Domain Support - Domain Extensions Installer plugin (com.glide.domain.msp_extensions.installer). For information on how you can request for the plugin activation, see Request for domain separation in Dynamic Translation.

**How domain separation works in Dynamic Translation**

A service provider with domain separated instances can implement the Dynamic Translation framework so that users can use the translation service providers configured in the translator configurations specific to their domain. Translator configurations are process-separated in Dynamic Translation. All translation service providers configured in the translator configurations of the parent domain are available in child domains.

A translator configuration in the global domain is visible in all other domains. In any domain, a user can only view the translator configurations configured in the following domains:

- Current domain
- Parent domains
- Global domain

**Note:** If there are multiple translator configurations in a domain for the same translation service provider, the translator configuration of the current domain or the closest parent domain is considered for dynamic translation.

Also, different connections can be configured for the same connection and credential alias of a translation service provider in multiple domains. However, Credentials and Connections are data-separated. So, a connection configured in a child domain is visible in parent domains. For information on domain separation for Connections and Credentials, see Domain separation for Credentials and Connections.

For example, consider the following scenario:
Different connections are configured for the same connection and credential alias of Google in multiple domains. When in Domain A, all the following connections are visible:

- Connection1
- Connection2
- Connection3

**Note:** When multiple active connections are visible for the same connection and credential alias in a domain, the connection with the highest order is given priority when the Support Multiple Active Connections check box is selected.

**Domain-separated table**

Translator Configuration [sn_dt_translator_configuration]

**Default translator configuration for a domain**

The default translator configuration of the current domain is always considered for dynamic translation. If the current domain does not have any default translator configuration, then the available default translator configuration of the nearest parent is considered.

A domain can have multiple default translator configurations. In this case also, the default translator configuration of the current domain is considered for dynamic translation. For example, let us consider the following scenario:

![Diagram of domains A, B, and C with TC1, TC2, and TC3]

**Domain separation in Dynamic Translation**

In Domain B, both TC1 and TC2 are visible. From Domain B, TC2 is first set as the default translator configuration. From Domain A, TC1 is then overridden and set as the default translator configuration. This results in multiple default translator configurations in Domain B. In this case, when in Domain B, TC2 is used as the default translator configuration for dynamic translation.
Overriding a translator configuration

In any domain, you can override the translator configuration of that domain or the parent domain. The overridden translator configuration of a parent domain is also visible in child domains. However, the overridden translator configuration of a child domain is not visible in the parent domain.

After you override a translator configuration of the same domain, only the overridden translator configuration is visible in that domain.

After you override a translator configuration of a parent domain, the following scenarios happen:

• Only the overridden translator configuration is visible in the child domain.
• The **Overrides** field of overridden translator configuration refers to the original translator configuration of the parent domain.

For example, consider the following scenario:

![Diagram of domain separation in Dynamic Translation](image)

**Domain separation in Dynamic Translation**

You can override a translator configuration TC1 from Domain B. After overriding, only the overridden configuration TC1 is available in Domain B and the **Overrides** field of TC1 refers to **TC1** of the parent domain.

**Request for domain separation in Dynamic Translation**

Enable the support for the Dynamic Translation framework in domain-separated instances.

Role required: admin

There are two ways to request a plugin:

• Access the Now Support Service Catalog directly by clicking **Service Catalog > Activate Plugin** on Now Support.
• Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

1. Navigate to **System Applications > All Available Applications > All.**
2. On the All Applications page, click **Request Plugin** to open the Request form on HI.
3. On Now Support, select the redirect link to access the Now Support Service Portal Service Catalog.

<table>
<thead>
<tr>
<th>Activate Plugin</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>In order to enhance the user experience, we have redesigned Activate a Plugin service catalog. Please use the new Hi Service Portal 'Activate a Plugin' service catalog item. You can also use Manage Instances page on Service Portal to Activate a Plugin.</td>
<td></td>
</tr>
<tr>
<td>Take me to the Hi Service Portal Activate a Plugin Service Catalog.</td>
<td></td>
</tr>
</tbody>
</table>

4. On the form, fill in the fields.

### Activate Plugin request form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Instance</td>
<td>Instance on which to activate the plugin.</td>
</tr>
<tr>
<td>Plugin Name</td>
<td>Name of the plugin to activate.</td>
</tr>
<tr>
<td>Specify the date and time you would like this plugin to be enabled</td>
<td>The date and time must be at least two business days from the current time.</td>
</tr>
</tbody>
</table>

**Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the Reason/Comments field.

| Reason/Comments | Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments. |

5. Click **Submit**.

### Time configuration

Time configuration includes the scheduling of events and tracking of time. There are several functions available that enable tracking of time and using that information across applications.

### Date and time fields

Time can be stored in different ways in records. Understanding how time is stored underlies efficient use of time functions. To learn more, see Use Date and Time Fields.
Time zones

The Now Platform stores time values in Universal Coordinated Time. Times appear globally based on the system time zone, but appear to users in their local time zone, based on their own user settings. To avoid calculation errors or confusing outputs, proper use of time zone information is critical.

- All dates and times gathered through web services appear in GMT.
- When you insert data using a web service, it uses the time zone defined for the active user.
- If the active user does not have a specified time zone, it instead uses the system time zone.

Business calendars and schedules

You create business calendars in the Now Platform so that you can schedule events for your users and track their time across applications. You can define several types of schedules and calendars, including fiscal calendars, in the Business Calendar menu. To learn more about business calendars, see Creating business calendars.

The legacy schedules functions consist of rules that include or exclude ranges of time for certain time-related functionality. For example, schedules can restrict SLAs to only count time during business hours. To learn more about legacy schedule definition, see Creating and using schedules.

Time display

There are several useful user interfaces that help represent time visually. To learn more, see Displaying Time.

Viewing logs

Logs within the system provide historical information as to what occurred in the instance when.

Scheduling events

Scheduling events enable other functionality to be triggered at particular times, or in response to specific events. To learn more, see Schedule Events.

Timing functionality

These functions gather information with regards to duration. They answer the question "How long?", and if time events can be based on that information. To learn more, see Timing Functionality.

Date and Date/Time fields

Records in the Now Platform store date and time values in several different types of fields. These values are stored as integer numbers, in milliseconds, and appear in the appropriate date or date/time format.

Date and Date/Time field types

The Now Platform stores date and date/time information in records using the following field types:
### Date and time field types

<table>
<thead>
<tr>
<th>Field type</th>
<th>Dictionary XML type</th>
<th>MySQL DB type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>glide_date</td>
<td>DATE</td>
</tr>
<tr>
<td>Date/Time</td>
<td>glide_date_time</td>
<td>DATETIME</td>
</tr>
<tr>
<td>Time</td>
<td>glide_time</td>
<td>DATETIME</td>
</tr>
<tr>
<td>Duration</td>
<td>glide_duration</td>
<td>DATETIME</td>
</tr>
<tr>
<td>Due date</td>
<td>due_date</td>
<td>DATETIME</td>
</tr>
</tbody>
</table>

For the full listing of field types, see Introduction to Fields.

### Global date and time field format

You define default date and time formats globally using system properties.

#### Date format

The `glide.sys.date_format` property defines the date format. An administrator can modify the property by navigating to **System Properties > System**. The default format is: yyyy-MM-dd.

**Note:** A user can override the global date or time format with a personal preference.

Modifying the `glide.sys.date_format` property changes the date or time format globally. When modifying the standard date format, also verify the format using a **Validate Date and Time** script. You can use the same pattern strings as the `java.text.SimpleDateFormat` class, with the following exception:

- You cannot append the 'z' character to include the time zone when adding it to a script.
- If the resulting time zone is not three characters, an **Invalid Date appears** error appears when you validate the script, because the Date/Time Validation Script (`sys_script_validator`) fails. This failure occurs even though the script debugger shows that the content of the value meets the requirement of 'g_user_date_time_format'.

**MM** is months, while **mm** indicates minutes. The format string consists of the following abbreviations.

<table>
<thead>
<tr>
<th>Field</th>
<th>Full form</th>
<th>Short form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Year</td>
<td>yyyy (4 digits)</td>
<td>yy (2 digits), y (2 or 4 digits)</td>
</tr>
<tr>
<td>Month</td>
<td>MMM (name or abbr.)</td>
<td>MM (2 digits), M (1 or 2 digits)</td>
</tr>
<tr>
<td>Day of Month</td>
<td>dd (2 digits)</td>
<td>d (1 or 2 digits)</td>
</tr>
</tbody>
</table>

**Note:** It is recommended that you use a yyyy format-based date. For example, use mm-dd-yyyy, yyyy-mm-dd, or dd-mm-yyyy.

- If your system date format is set to use the yy year format, the system considers dates 20 years later or 80 years earlier from the current date as a date in the past or future leading to an unexpected behavior.
- For example, if you set the year as 51 for 2051, the system considers the year as 1951. Similarly, if you set the year as 37 for 1937, the system considers the year as 2037.
Time format

An administrator can modify the property by navigating to **System Properties > System**. Modifying the property changes the date or time format globally. When modifying the standard time format, also verify the format using a Validate Date and Time script. You can use the same pattern strings as the java.text.SimpleDateFormat class, with minor exceptions. The format string consists of the following abbreviations.

<table>
<thead>
<tr>
<th>Field</th>
<th>Full form</th>
<th>Short form</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hour (1-12)</td>
<td>hh (2 digits)</td>
<td>h (1 or 2 digits)</td>
</tr>
<tr>
<td>Hour (0-23)</td>
<td>HH (2 digits)</td>
<td>H (1 or 2 digits)</td>
</tr>
<tr>
<td>Minute</td>
<td>mm (2 digits)</td>
<td>m (1 or 2 digits)</td>
</tr>
<tr>
<td>Second</td>
<td>ss (2 digits)</td>
<td>s (1 or 2 digits)</td>
</tr>
</tbody>
</table>

Add the character a to the end of the time format string to indicate AM or PM. This option shows AM or PM whether you are using 12-hour time (hh) or 24-hour time (HH).

The default format is: HH:mm:ss.

**Note:** A user can override the global date or time format with a personal preference.

Personalize the system date format

You can personalize the format in which date values appear in your instance.

Personalizing the date format does not change global settings or impact the way other users see date values.

**Note:** It is recommended that you use a yyyy format-based date. For example, use mm-dd-yyyy, yyyy-mm-dd, or dd-mm-yyyy.

- If your system date format is set to use the yy year format, the system considers dates 20 years later or 80 years earlier from the current date as a date in the past or future leading to an unexpected behavior.
- For example, if you set the year as 51 for 2051, the system considers the year as 1951. Similarly, if you set the year as 37 for 1937, the system considers the year as 2037.

1. Navigate to **Self-Service > My Profile**.
2. In the **Date format** field, select an option.
3. Click **Update**.

Personalize the system time format

You can personalize the format in which time values appear in your instance.

An administrator must add the **Time format** field to the Self-Service view of the User form. For more information, see **Configuring the form layout**.

Personalizing the time format does not change global settings or impact the way other users see time values.

1. Navigate to **Self-Service > My Profile**.
2. In the **Time format** field, select an option.
3. Click **Update**.
Configure the date picker for the list editor

A system property enables you to choose between two date picker configurations for the list editor.

Role required: admin

1. Navigate to `sys_properties.list`.
2. Search for the property named `glide.ui.list_edit.show_calendar_only`.
3. Set the property **Value** to either of the following options.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>Calendar as well as a field appears for a date picker for manual date entry.</td>
</tr>
<tr>
<td>true</td>
<td>Calendar only appears for a date picker, which is the default behavior in UI16 and UI15.</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Default date and time fields</strong></td>
<td>Certain time fields are provided by default to store particular date and time fields.</td>
</tr>
<tr>
<td><strong>Global timestamp fields</strong></td>
<td>All records inherit certain time stamp fields from the Global [global] table.</td>
</tr>
<tr>
<td>• Created</td>
<td></td>
</tr>
<tr>
<td>• Updated</td>
<td></td>
</tr>
<tr>
<td>These fields are automatically populated with the correct date and time, expressed in Greenwich Mean Time (GMT), rather than in the logged in user's local time zone.</td>
<td></td>
</tr>
<tr>
<td><strong>Planned Task time fields</strong></td>
<td>The Planned Task plugin provides a table (Planned Task [planned task]) with standard fields for measuring a planned task's time. For more information, see Planned Task.</td>
</tr>
<tr>
<td><strong>Task fields for measuring work time</strong></td>
<td>Use default task fields to measure progress and resolution for certain records.</td>
</tr>
<tr>
<td>The following base system fields are provided on certain tables to track how long it takes to close tickets:</td>
<td></td>
</tr>
<tr>
<td>• Time worked: A timer that runs when you view the record, and pauses while you close it, or when you manually pause it. Used to track the time spent by the help desk while working on the record.</td>
<td></td>
</tr>
<tr>
<td>• Resolve time: A calculated field that measures the time from the moment the record is opened, to the moment the record is closed. Used to track how long it takes to resolve the record.</td>
<td></td>
</tr>
</tbody>
</table>
These fields provide different metrics for request response.

The following additional tools are available for tracking work time:

- **Service level agreements (SLAs)**: Measures how long it takes a record to fulfill certain conditions (such as an incident being marked Resolved).
- **Time cards**: Use the Time worked field to break down how much time was spent by day of the week.

**Time worked**

The Task [task] table provides a time-tracking field called Time worked.

![Time worked field](image)

This field measures how long a record has been viewed to track work time on a ticket. Any table that extends Task can use this field. To add the field, configure the form.

As the record is viewed, the timer counts upward. To pause the timer, click the stop icon ( ).

To resume the timer, click the start icon ( ).

When you save a task, the amount of new time in the timer is used to generate a record on the Time Worked [task_time_worked] table. You can view this table as a related list on the task form.

By default, the time in the Time worked field is a cumulative value stored in the task record. If you modify a Time Worked record, the changes are not reflected in the task timer.

You can set the property `com.snc.time_worked.update_task_timer` to enable updating of the task timer value, based on changes to the Time worked records. You do this using the Update task timer business rule.

**Resolve time**

The Resolve time field is available on the Incident [incident] and Request [sc_request] tables. This field allows for easy reporting on how long it takes for requests to be closed, and is stored as an integer number of seconds.

### Business rule calculation

Specific business rules calculate the Resolve time field when the record is resolved or marked closed, and measures the difference between the Opened and Closed dates. The field is stored in the system as an integer number of seconds.

- On the Incident table, the field is calculated on closure by the business rule mark_closed. The following lines of code calculate the resolve time:

  ```java
  if (dataChange || current.calendar_stc.nil())
      current.calendar_stc = gs.dateDiff(opened, resolved, true);
  ```

- When the incident is closed directly, the calculation is based on the mark_closed business rule. The following lines of code calculate the resolve time:

  ```java
  if (dataChange || current.calendar_stc.nil())
      current.calendar_stc = gs.dateDiff(opened, closed, true);
  ```

Display resolve time as a duration
You can display the resolve time as a human-readable duration rather than an integer representing a duration in seconds.

1. From the Incident or Request form, right-click the form header and click Configure > Table.
2. From the Columns embedded list, click Resolve time.
3. From the Attributes related list, click New.
4. Enter these values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Format</td>
</tr>
<tr>
<td>Dictionary entry</td>
<td>Resolve time</td>
</tr>
<tr>
<td>Value</td>
<td>glide_duration</td>
</tr>
</tbody>
</table>

5. Click Submit.

The resolve time appears in forms and lists as a duration, expressed in days, hours, and minutes.

Note: This attribute does not change the field data format, which remains an integer representing a duration in seconds. In reports and data exports, it still appears as the actual number of seconds, rather than as a duration.

Export date and time formats

Because some export formats are intended for human consumption and others for database usage, various methods are used to provide date and time field information in different formats.

Excel

Date, Date-Time, and Time fields are all exported as their display values, and appear in a custom format, instead of the system date format. However, duration fields, export as the value stored in the database, which is an integer value of seconds.

Note: If the date and time format is \texttt{hh:mm:ss} in the \texttt{glide.sys.date_format} System Properties setting, and you export time values to Excel, they appear in 24-hour military time.

To display the exported values in standard 12-hour am/pm time formats, select the \texttt{1:30PM} time format in Format Cells > Time in Excel.

XML

All Date and Time fields export as the value stored in the database.

PDF

All Date and Time fields (including Duration) export as their display value.
CSV

All Date and Time fields export as the value stored in the database.

Time zones

All times are stored in Coordinated Universal Time (UTC) and appear globally based on the system time zone. However, times appear to users in their local time zone, according to their user preference settings.

Time zone representation

Time zones that have the Country/City format are primary time zone IDs. Other time zone IDs are links to the primary time zone.

- For example, US/Pacific is a link to the America/Los_Angeles time zone. Both America/Los_Angeles and US/Pacific represent Pacific Standard Time with the same zone offset and Daylight Savings Time (DST) schedule.
- Other than the representation, there is no impact on date and time functionality.

In the absence of a default time zone for the user or the system, JVM reads default time zone information from the server.

- Depending on how the server is configured, it might return the Country/City or link, for example, US/Pacific or America/Los_Angeles.
- Administrators should configure their system with a default time zone glide.sys.default.tz to avoid system dependencies. For more information, see Time zone representation.

Daylight Saving Time

In general, if you specify a time zone based on location (for example, America/Los_Angeles), the system automatically adjusts for daylight saving time.

- If you specify a time zone based on the time zone name (for example, GMT), which is discouraged, it does not typically adjust for daylight saving time. There are however exceptions to these guidelines.
- For more detailed information on how daylight saving time is handled in Java, see https://www.iana.org/time-zones and https://en.wikipedia.org/wiki/Tz_database.

User preferences

Once the System Time Zone is defined, users can also select their own time zone from their user form, accessed through Self-Service > My Profile.

- The System default appears as System ([name of the default time zone]).
  
  For example, if the System time zone is America/Los_Angeles, the user sees System (America/Los_Angeles).

Java time zone class

The Now Platform supports all Java time zone class time zones. To view a listing of these time zones:

1. In the Type filter text field, enter sys_user.list.
2. Open one of the user records in the listing.
3. Right-click the time zone field and select Show Choices.
   The resulting list is a complete listing of available time zone IDs.

Java returned for Asian time zone settings

When you set the system date format to HH:mm:ss z to display time zone, and users set their time zone as Asia/Taipei or Asia/Shangai, Java returns the time zone as CST. CST could mean both US Central Standard Time or China Standard time, but in this case, it refers to the latter.

Time zones in email notifications

The date and time stamp of a notification uses the system time zone and not the time zone of any recipient.

- The property glide.email.append.timezone in System Properties > Email controls whether to append the time zone.
  If true, the system time zone of the instance is appended to any dates or date/times in outbound email messages (for example, 2010-07-02 04:01:14 PST).

Time zones in service level agreements

Service level agreements have different options for which time zone to use. To set a time-zone for SLAs, navigate to Service Level Management > SLA Properties and locate the following property:

<table>
<thead>
<tr>
<th>Use the following time zone for SLA:</th>
</tr>
</thead>
<tbody>
<tr>
<td>The caller's time zone</td>
</tr>
<tr>
<td>The caller's time zone</td>
</tr>
<tr>
<td>The SLA definition's time zone</td>
</tr>
<tr>
<td>The CI's location's time zone</td>
</tr>
<tr>
<td>The task's location's time zone</td>
</tr>
<tr>
<td>The caller's location's time zone</td>
</tr>
</tbody>
</table>

Time zone for service level agreements

Some special considerations:

- If you select the time zone for the caller, unpredictable behavior can occur if the caller does not have a time zone defined.
- If you select the time zone for the SLA definition, you must manual specify the time zone on the form for the SLA.

Time zone in scripting

When you create scripting on the server, the script uses several GlideSystem date and time functions to obtain time values. For more information about specific methods and to learn the format in which each returns the requested time, see the GlideSystem API.
Enhancements

DST enhancement requires that reports and queries observe Daylight Saving Time rules. Changes affect trend charts, line charts, and filters using the "trend on" operation.

Time zone changer

The time zone changer is active by default. Users can change their time zone for the current session in the system settings (the gear on the top right of the banner). At the next login, the time zone setting reverts to the system default, or user profile setting for time zone.

Set a system time zone

Set your system time zone with a system property.

The Now Platform stores time values in Universal Coordinated Time. Times appear globally based on the system time zone (glide.sys.default.tz), or if specified, based on user settings.

1. Navigate to System Properties > System.
2. Locate the property System timezone for all users unless overridden in the user’s record [glide.sys.default.tz].

   System timezone for all users unless overridden in the user's record

   By default, the field is blank. If you have not defined a time zone for this property, America/Los Angeles is the default.
3. Add a time zone in the format Country/City or using the name of a time zone (for example, GMT) and click Save. For available values, see Time zone representation.

   The new system time zone automatically cascades to all users who do not already have a specified time zone. If a user selects a different time zone, or if the administrator selects a different time zone for them, the selected time zone is assigned to the user. The system time zone is not used.

Change the time zone choice list

Wherever users have a choice of time zone, the choices are populated using the Time Zone choice list on the User [sys_user] table. Not all time zones appear by default.

To add or remove time zones from the list of time zones:

1. Navigate to User Administration > Users and open any user record, or click New. Notice that the default time zone is System (America/Los_Angeles).
2. Right-click Time zone, and then select Personalize Choices.
3. Highlight the desired time zone from the Available or Selected lists, and then Add or Remove the time zones as needed.
Change a time zone in a scheduled report

By default, scheduled reports use the time zone of the user who runs them (the user in the Run As field) to evaluate the query parameters. You are able to change this time zone.

For example, a report on 'incidents open today' resolves 'today' based on the user's time zone. To manually specify the time zone used to resolve the parameters of the report:

1. Configure the form to add the Run As tz field to the Scheduled Report form.
2. Select the appropriate time zone.

Change a time zone in a scheduled data import

By default, scheduled data imports are run using the time zone of the user who creates them. However, there is a way to manually specify the time zone for the import.

To change the time zone of the scheduled data import:

1. Configure the form to add the Run As tz field to the Scheduled Data Import form.
2. Select the appropriate time zone.
3. Click Update.

Creating business calendars

Create business calendars in the Now Platform so that you can schedule events for your users and track their time across applications. You define schedules and calendars of all types, including fiscal calendars, in the Business Calendar menu.

Business calendar components

Use the following forms when you define calendars and schedules in the Business Calendar menu:

Business calendar definition record

Identifies an individual business calendar where you can specify a reference name, labeling, parent business calendar (if any), and a time zone. A business calendar can represent any time period, and its definition record is saved in the Business Calendar [business_calendar] table. A business calendar can represent any time period, and its definition record is saved in the Business Calendar [business_calendar] table.

To learn more about creating a business calendar definition, see Create a business calendar.

Business calendar entries

Defines the individual entries that make up a business calendar, and saves them in the Business Calendar Entry [business_calendar_span] and Business Calendar Entry Name (business_calendar_span_name) tables. In contrast to legacy schedule entries, which have repeating and excluding time spans, you must create individual business calendar entries for all time spans in the calendar.

To learn more about creating entries for a business calendar, see Define business calendar entries and Create business calendar entry names.

Business calendar filter options

Defines the date and time filtering options for the business calendar that you are creating. These filtering options are in addition to the standard date and time filtering in the Now Platform.

To learn more about creating filtering options for a business calendar, see Create a business calendar.
Calendars for package

Pairs a business calendar with a Now Platform package so that you can enable the calendar for use in that functional area. A package is a collection of scopes and applications that make up a functional area, such as HR Service Delivery.

To learn more about associating a business calendar with a package, see Pair business calendars with packages.

**Warning:** If you are using , use caution when changing time spans. Any change you make to the time span on a business or fiscal calendar can invalidate data. Consult with an administrator before making such changes.

Fiscal calendar example

In this example, you create a fiscal calendar with 4 quarters and 12 fiscal periods.
• When you navigate to Business Calendar > Business Calendars, you create:
  • A business calendar with a title of Fiscal Year.
  • A calendar for quarters that belong to the fiscal year.
  • A calendar for periods with a parent of Fiscal Year or Fiscal Quarter.

When you create the Fiscal Year Quarter child calendar, you designate that the Fiscal Year is its parent calendar. For the child Fiscal Year Period calendar, you designate Fiscal Year Quarter as its immediate parent.

• When you create each calendar, use the Business Calendar Entries related list, or navigate to Business Calendar > Business Calendar Entries to create business calendar entries for it. For each business calendar entry, create a reference name, for example, Fiscal Period 1, and designate start and end date times for each time span within the calendar.
  • For example, the parent Fiscal Year calendar has a business calendar entry for the time span of October 1, 20nn 12:00 a.m. through September 30, 20nn 23:59:59 p.m.
  • The child Fiscal Year Quarter calendar consists of four business calendar entries, each with the start and end dates of each quarter that makes up the fiscal year.

Note: You can also create 13 period, 445, 454 and 544 types of fiscal calendars. To learn more about these types of fiscal calendars, see Defining fiscal calendars.

• The child Fiscal Year Quarters calendar consists of multiple business calendar entries, with the start and end date times for each period in the fiscal year.

• Use Business Calendar > Calendars for Package to pair the parent Fiscal Year 20nn calendar with Now Platform packages, such as HR Service Delivery or Finance Close Automation.

Business calendar schedule example

In this example, you create a work schedule for the month of December.

• The work schedule consists of a parent calendar, a child calendar for the working weeks in December, and another child calendar for the working days in December.
• The December Workdays calendar consists of business calendar entries for each working day. You do not include non-work days such as Saturdays, Sundays, and company holidays.
• Use Business Calendar > Business Calendars to create a parent business calendar with a title of December Work Schedule, and a child business calendar for December work weeks. When you create the child calendar, you designate that the December Work Schedule is its parent calendar.

Note: You can make the December Work Schedule even more granular by creating a subordinate child calendar for December workdays. In this case, its immediate parent is the December Work Weeks calendar.

• When you create each calendar, use the Business Calendar Entries related list, or navigate to Business Calendar > Business Calendar Entries to create at least one business calendar entry for it. For each business
calendar entry, you give it a reference name, and designate the start and end date times for each time span within
the calendar.

- For example, the parent December Work Schedule calendar is for a time span of December 1, 20nn 12:00 a.m.
  through December 31, 20nn 23:59:59 p.m.
- The child December Work Week calendar consists of five business calendar entries. Each entry is for the start
  and end dates of each calendar week in December.
- The child December Workdays calendar consists of multiple business calendar entries. Each entry is for the
  start and end date times for each working day in December. You do not create business calendar entries for
  company holidays such as New Year's Eve or New Year's Day.

- Use Business Calendar > Calendars for Package to pair the parent business calendar December Work
  Schedule with the appropriate Now Platform packages, such as Customer Service Management.

Using business calendars in place of legacy calendar and schedule definitions

The legacy functions that you may have used, on the System Scheduler > Schedules and Fiscal Calendar menus,
to define schedules and fiscal calendars, continue to be supported. However, you should use the Business Calendar
menu in their places to define calendars and schedules and then associate them with specific Now Platform packages.

- If you use the legacy functions to create fiscal calendars and schedules, the resulting definition records are
  internally flagged as belonging to the legacy [cmn_schedule] table hierarchy. These records appear on the lists
  on the Business Calendar menu, as well as on the lists on the respective menus for the legacy functions used. For
  example, if you defined fiscal calendars using legacy fiscal calendar functions, the resulting records appear on lists
  on the Business Calendar Fiscal Calendar menus.
- If you select a legacy fiscal calendar or schedule from these lists, you can only modify it using the legacy function
  that you originally used to create it. For example, if you select a legacy fiscal calendar, you can only modify it by
  using the functions on the Fiscal Calendar menu. You can't modify it with the Business Calendar menu functions.

Create a business calendar

Create a definition record for an individual parent or child business calendar. You create this record so that you can
easily identify a specific business calendar when you use it in a Now Platform package or functional area. A business
calendar can represent any length of time, such as a week, a month, a year, or a fiscal period.

Role required: admin

When you create a business calendar, you specify a reference name, labeling, parent business calendar, if any, and a
time zone for it.

1. You first create a business calendar record and then create business calendar entries for it in the Business
   Calendar Entries related list. To learn more about how business calendar entries work, see Define business
   calendar entries and Create business calendar entry names.

2. Using the Business Calendar Filter Options related list, you can also define the date and time filtering options for
   the business calendar that you are creating.

Note: Fiscal calendars or schedules you may have created in the Fiscal Calendar or System
Scheduler > Schedules menu also appear on the lists on the Business Calendar menu. If you select a
fiscal calendar or schedule, it appears in the legacy function that you originally used to create it. You can't
view or update legacy fiscal calendars or schedules using this form.

1. Navigate to Business Calendar > Business Calendars.
2. Click New.
3. On the form, fill in the fields.

**Business calendar form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique reference name and identifier for the business calendar record. The name should be unique per domain.</td>
</tr>
<tr>
<td>Label</td>
<td>Unique singular label for identifying the business calendar when you perform filtering. For example, you can assign a week-long work calendar with a label of Workweek.</td>
</tr>
<tr>
<td>Plural Labels</td>
<td>Unique plural label for identifying the business calendar. For example, you can assign a week-long work calendar with a label of Workweeks. Use plural labels when you do filtering that is based on more than one unit in the past or future. For example, Last 2 Fiscal Quarters.</td>
</tr>
</tbody>
</table>
| Parent         | Parent business calendar to the current business calendar that you are creating. To search for an existing business calendar, click

  - For example, you created a business calendar for 2020, and an individual child calendar for each month within the year, each with its own business calendar entries. As you create a business calendar for each month, you would select 2020 as the parent calendar for each.

  - These entries create the relationship between a parent and its child business calendars. Leave this field blank if you are creating a parent business calendar itself. |
| Application    | Application that is associated with this business calendar. If you are working on an application or are creating a business calendar from an application record, the field defaults to that application. Otherwise, the field defaults to Global. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default. To learn more about application scoping, see Application scope |
### Time zone

Time zone to use for the business calendar when you specify the starting and ending times for each associated business calendar entry. Select a time zone entry:

- **-None-**: Use the time zone specified in the logged in user's profile.
- **Use System Time Zone**: Use the default system time zone specified for the instance.
- **- Floating --**: Time zone is relative to whatever is accessing the business calendar entry at any given time. For example, if an administrator in Amsterdam creates a floating business calendar for 08:00 a.m. to 5:00 p.m., a person in San Jose, California, sees it as 08:00 a.m. to 5:00 p.m. When you define a business calendar in a specific time zone, users in different time zones see the business calendar in their own time zone.
- **Actual time zone. For example, Europe/London, US/Pacific, US/Central.**

### Description

Description of the business calendar.

---

4. Click **Submit**.
5. In the Business Calendars list, select the business calendar that you created.
6. In the Business Calendar Entries related list, create entries that define each span of time within the business calendar.

Create at least one business calendar entry for the selected calendar.

**Note:** To learn more about creating business calendar entries, see [Define business calendar entries](#) and [Creating business calendars](#).

7. In the Business Calendar Filter Options related list, click **New** to create filtering options for the business calendar.

You can define the date and time filtering options for the business calendar that you are creating. These filtering options are in addition to the standard date and time filtering in the Now Platform.

**Note:** To learn more about creating business calendar filtering options, see [Define business calendar filtering options](#).

8. Click **Submit**.

A business calendar record is saved in the Business Calendar [business_calendar] table.

- If you create business calendar entries in the Business Calendar Entries related list, records are created in the Business Calendar Entry (business_calendar_span) table. The records are associated with the business calendar.
- If you created business calendar filter options in the Business Calendar Filter Options related list, a record is saved in the Business Calendar Filter Option (business_calendar_filter_option) table. The record is associated with the business calendar.
Create a business calendar group

For Performance Analytics and Reporting to use business calendars, organize several calendars into a business
calendar group. An application might also contain a business calendar group.

You can base a Performance Analytics indicator or a report on business calendars instead of the standard calendar.
The business calendars themselves are too granular in scale, and have to be grouped. The report or indicator then uses
that group. Work with your Performance Analytics team to design the business calendar groups.

Note: Fiscal calendars are also supported. When you generate a fiscal calendar, a corresponding business
calendar group is also generated automatically.

Role required: admin

1. Navigate to Business calendars > Business calendar group.
2. Select New.
3. Name the group and save it.
   The Business calendars related list appears.
4. In the Business calendars related list, select Edit.
5. Choose from existing business calendars to add to the group.
   You can also create a new business calendar from this list.

   Important: Do not select business calendars that cover a period shorter than a 24-hour day for use with
   Performance Analytics indicators. Performance Analytics does not store times, only dates. If only reports
   will use the group, you can select a shorter period.

6. Select Update when finished.

Gregorian calendar group

The Gregorian Calendar group comes with the base system. It includes the Week, Month, Quarter, and Year business
calendars, which also come with the base system.
## Business Calendar Group

**Gregorian calendar**

<table>

</tbody>
</table>

Actions on selected rows...
Each business calendar record also shows which groups it belongs to.
Define business calendar entries

Create business calendar entry records that define the individual time periods that make up a business calendar. You create a business calendar entry for every individual time span in the calendar.

Role required: admin

In contrast to legacy schedule entries that have repeating and excluding time spans, you have to create individual business calendar entries for every business calendar time span. For example, if you are creating a Fiscal Year 2020 business calendar with 13 fiscal periods, you have to create individual business calendar entries for each fiscal period. For each fiscal period, you specify start and end date times.

**Note:** Fiscal calendars or schedules you may have created in the Fiscal Calendar or System Scheduler > Schedules menu also appear on the lists on the Business Calendar menu. If you select a fiscal calendar or schedule, it appears in the legacy function that you originally used to create it. You can't view or update legacy fiscal calendars or schedules using this form.

**Note:** The easiest way to create business calendar entries and associate them with a business calendar is to use the Business Calendar Entries related list in the Business Calendar form. To learn more about creating a business calendar, see Create a business calendar.

1. Navigate to Business Calendar > Business Calendar Entries.
2. Click New.
3. On the form, fill in the fields.

### Business calendar entry form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Name      | Unique reference name for the business calendar entry. To select a business calendar name or create a new one:  
  a. To search for an existing business calendar entry name, click  
  
  b. If no business calendar entry name exists and you want to create a new business calendar entry name, click New. The Business Calendar Entry Name form appears.  
  
  **Note:** To learn how to create business calendar entry names, see Create business calendar entry names. |
| Start     | Start date and time for the business calendar period. It uses the time zone that you specified in the business calendar record that you associate with it. For example, if you are defining a fiscal period for the month of January, the starting date time is January 31, 2020 12:00 a.m. |
4. Click Submit.

Create business calendar entry names

Create a name for an individual business calendar entry. You create this record so you can easily identify a specific business calendar entry when you use it in a business calendar.

Role required: admin

1. Navigate to Business Calendar > Business Calendar Entry Names.

   Note: Alternately, you can create a business calendar entry name at the time you create the associated business calendar entry. To learn more about creating a business calendar entry, see Define business calendar entries.

2. Click New.
3. On the form, fill in the fields.

   Business calendar entry name form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short name</td>
<td>Abbreviated name for the business calendar entry. For example, January.</td>
</tr>
<tr>
<td>Long name</td>
<td>Longer name for the business calendar entry. For example, January fiscal period.</td>
</tr>
<tr>
<td>Label</td>
<td>Unique label for identification of the business calendar entry when you perform filtering.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Calendar | Name of the business calendar that you want the business calendar entry to belong to. This entry creates the relationship between a business calendar and the business calendar entries that define each individual time span with it. For example, if you are creating a business calendar entry for the January fiscal period, you select FY20 to associate it with Fiscal Year 2020. To select an existing business calendar:  
   a. Click or  
   b. Click inside the Calendar field to view and select from a listing of recent business calendars that are created in Business Calendar > Business Calendars. |
| Application | Application that is associated with this business calendar. If you are working on an application or are creating a business calendar from an application record, the field defaults to that application. Otherwise, the field defaults to Global. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default. To learn more about application scoping, see Application scope. |

4. Click **Submit**.

Records are created in the Business Calendar Entry (business_calendar_span) and the Business Calendar Entry Name (business_calendar_span_name) tables. If you create business calendar entries in the Business Calendar Entries related list in the Business Calendar form, these records are also associated with the specific business calendar.

**Define business calendar filtering options**

Define date and time filtering options for a business calendar. These filtering options are in addition to the standard date and time filtering in the Now Platform. You can provide your users with additional filtering options when they use the business calendar with Now Platform packages and functional areas.

Role required: admin

To learn more about standard filtering options, see Values for date/time fields.
1. Navigate to Business Calendar > Business Calendar Filter Options.
2. Click New.
3. On the form, fill in the fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Period</td>
<td>Number of periods that should be traversed forward, backward, or both, for the business calendar. For example, if the business calendar reflects a week:</td>
</tr>
<tr>
<td></td>
<td>• Provide a filter option for the current week by entering 0 for the base period.</td>
</tr>
<tr>
<td></td>
<td>• Provide a filter option for a previous period by entering a negative number that represents the number of periods that should be traversed from the base period. For example, enter −1 for the last period, or enter −2 for two periods ago.</td>
</tr>
<tr>
<td></td>
<td>• Provide a filter option for a future period by entering a positive number. For example, enter 1 for the next period, or enter 2 for the next two weeks.</td>
</tr>
</tbody>
</table>

If the business calendar reflects a week:

• Provide a filter option for the current week by entering 0 for the base period.

• Provide a filter option for a previous period by entering a negative number that represents the number of periods that should be traversed from the base period. For example, enter −1 for the last period, or enter −2 for two periods ago.

• Provide a filter option for a future period by entering a positive number. For example, enter 1 for the next period, or enter 2 for the next two weeks.

If the business calendar reflects a fiscal year with 13 periods:

• Provide a filter option for the current fiscal year by entering 0 for the base period.

• Provide a filter option for a previous fiscal year by entering a negative number that represents the number of periods that should be traversed from the base period. For example, enter −2 for two fiscal periods ago, or enter −13 for the last fiscal year.

• Provide a filter option for a future fiscal year by entering a positive number. For example, enter 13 for the next fiscal year.

If the business calendar reflects a fiscal year with four fiscal quarters:

• Provide a filter option for the current fiscal quarter by entering 0 for the base period.

• Provide a filter option for a previous fiscal quarter by entering a negative number that represents the number of periods that should be traversed from the base period. For example, enter −1 for the last fiscal quarter, or enter −2 for the last two fiscal quarters.

• Provide a filter option for a future fiscal quarter by entering a positive number. For example, enter 1 for the next fiscal quarter, or enter 2 for the next two fiscal quarters.
## Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendar</td>
<td>Name of the business calendar that you want the filter options to belong to.</td>
</tr>
<tr>
<td></td>
<td>To select a business calendar, or create a new one:</td>
</tr>
<tr>
<td></td>
<td>a. Search for an existing business calendar by clicking</td>
</tr>
<tr>
<td></td>
<td>b. If no business calendar exists, or if you want to create a new business calendar, click <strong>New</strong>.</td>
</tr>
<tr>
<td>Application</td>
<td>Application that is associated with this business calendar.</td>
</tr>
<tr>
<td></td>
<td>If you are working on an application or are creating a business calendar from an application record, the field defaults to that application. Otherwise, the field defaults to <strong>Global</strong>. Any records that are created from the table record, such as modules and security rules, are assigned to this application by default. To learn more about application scoping, see <strong>Application scope</strong>.</td>
</tr>
</tbody>
</table>

**Note:** Within a calendar filtering option record, you can only associate a business calendar with a single filter option. To create multiple filtering options, you have to create multiple filtering option records, each with its own period entry.

4. Click **Submit**.

Records are created in the Business Calendar Filter Option (business_calendar_filter_option) table. If you create business calendar filtering options in the Business Calendar Filter Options related list in the Business Calendar form, these records are also associated with the specific business calendar.

### Pair business calendars with packages

Pair a business calendar that you created with a package, or functional area, in the Now Platform. When you associate a business calendar with a package, it enables the use of the calendar in that specific functional area. Until you pair a business calendar definition with at least one package, it remains a definition record only.

Role required: admin

A package is an application, or generic set of functions, such as HR Service Delivery or Finance Close Automation, in the Now Platform. For example, if you created a fiscal calendar, you can associate it with the Finance Close Automation package.

**Note:** Within a single calendar package record, you can only associate a business calendar with a single package. To associate business calendars with multiple packages, you have to create multiple calendar package records. For example, if you created a fiscal calendar and want to associate it with the HR and Fixed Assets packages:

- In the first record you create, in the **Calendar** field, select the fiscal year, and in the **Package** field, select **HR**.
1. Navigate to Business Calendar > Calendars for Package.
2. Click New.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calendar</td>
<td>Name of the business calendar that you want to associate with a Now Platform package. Click to access Business Calendars where you can search for an existing business calendar. If there is no existing calendar, you can create a new one.</td>
</tr>
<tr>
<td>Package</td>
<td>Name of the Now Platform package that you want to associate with the selected business calendar. Click to access Packages where you can search for an existing package. If there is no existing package, you can create a new one.</td>
</tr>
</tbody>
</table>

4. Click Submit.

A record is created in the Calendars for Package (calendars_for_package) table that associates the selected business calendar with a Now Platform package.

**Defining fiscal calendars**

Create fiscal calendars with defined fiscal periods, for use with Financial Management applications, such as Finance Close Automation. You can define fiscal periods, such as one month long, four weeks long, Q1 2015, or July 2015.

To create a fiscal calendar, activate the Fiscal Calendar [com.snc.fiscal_calendar] plugin. You can then use the legacy functions on the Fiscal Calendar menu to generate and validate fiscal calendars and their associated fiscal periods. You can create one of these types:

<table>
<thead>
<tr>
<th>Calendar type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regular</td>
<td>A calendar with 12 periods, each of which is one month long.</td>
</tr>
<tr>
<td>13 Period</td>
<td>A calendar with 13 periods, each of which is four weeks long.</td>
</tr>
<tr>
<td>445</td>
<td>A calendar that divides a year into subsequent 4-week, 4-week, 5-week periods. The first and second periods have four weeks, and the last has five weeks. The application creates these periods for the calendar duration.</td>
</tr>
</tbody>
</table>

*Note:* This calendar is the only type that does not use quarters.
Calendar type | Description
--- | ---
454 | A calendar that divides a year into subsequent 4-week, 5-week, 4-week periods. The first period has four weeks, the second has five weeks, and the third has four weeks. The application creates these periods for the calendar duration.

544 | A calendar that divides a year into subsequent 5-week, 4-week, 4-week periods. The first period has five weeks, and the second and third have four weeks.

**Attention:** Once you start working with a set of financial data with a fiscal calendar type, you cannot change to another type of fiscal calendar. Verify that your fiscal calendar can be used with your financial data. If you import records into the Fiscal period [fiscal_period] table, you should validate that they are correct and do not contain any gaps.

**Note:** The legacy functions that you may have used, on the System Scheduler > Schedules and Fiscal Calendar menus, to define schedules and fiscal calendars, continue to be supported. However, you should use the Business Calendar menu in their places to define calendars and schedules and then associate them with specific Now Platform packages. To learn more about defining and using business calendars, see Creating business calendars.

**Activate Fiscal Calendar plugin**

If you have the admin role, you can activate the Fiscal Calendar plugin (com.snc.fiscal_calendar). This plugin includes demo data and activates related plugins if they are not already active.

Role required: admin

1. Navigate to System Applications > All Available Applications > All.
2. Find the plugin using the filter criteria and search bar.
   
   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel. For more information, see Request a plugin.
3. Click Install, and then in the Activate Plugin dialog box, click Activate.

**Note:** When domain separation and delegated admin are enabled in an instance, the administrative user must be in the global domain. Otherwise, the following error appears: Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.

**Generate a fiscal calendar**

You can generate a fiscal calendar for a specified time period.

Role required: fiscal_calendar_admin

**Attention:** Once you start working with a set of financial data with a fiscal calendar type, you cannot change to another type of fiscal calendar. Verify that your fiscal calendar can be used with your financial data.
Note: Instead of generating fiscal calendars, can also use the Business Calendar functions to create fiscal calendars. To learn more about creating business calendars, see Creating business calendars.

1. Navigate to Fiscal Calendar > Generate
2. Configure the form (see table).
3. Click Generate Calendar.
4. Navigate to System Definition > Fiscal Periods and verify that the monthly, quarterly, and annual fiscal period records exist.

### Fiscal Calendar Types

<table>
<thead>
<tr>
<th>Standard</th>
<th>13 Periods</th>
<th>445</th>
</tr>
</thead>
<tbody>
<tr>
<td>Year</td>
<td>Year</td>
<td>Year</td>
</tr>
<tr>
<td>4 Quarters</td>
<td>13 Periods</td>
<td>4 Quarters</td>
</tr>
<tr>
<td>12 Months</td>
<td></td>
<td>12 Periods</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Fiscal Calendar Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fiscal Unit</td>
</tr>
<tr>
<td>Start Month</td>
</tr>
<tr>
<td>Start Year</td>
</tr>
<tr>
<td>Prefix for Year</td>
</tr>
<tr>
<td>Prefix for Quarter</td>
</tr>
<tr>
<td>Start Day</td>
</tr>
<tr>
<td>End Year</td>
</tr>
<tr>
<td>Prefix for Period</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fiscal Calendar Types</td>
<td>Type of fiscal year calendar. Select the type of calendar by clicking it. The options in the lists update automatically.</td>
</tr>
<tr>
<td>Fiscal Unit</td>
<td>Base unit for the calendar.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Month</strong>: Generate fiscal calendar with monthly periods.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Quarter</strong>: Generate fiscal calendar with quarterly periods.</td>
</tr>
</tbody>
</table>
### View, modify, and validate fiscal periods

After you generate a fiscal calendar, you can view fiscal period records, modify the start and end date, deactivate a fiscal period if necessary, and validate.

Role required: fiscal_calendar_user

1. Navigate to **System Definition > Fiscal Periods**.
2. Open any of the fiscal periods (see table for field descriptions) to view, modify, or deactivate.

<table>
<thead>
<tr>
<th>Fiscal period form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the fiscal period.</td>
</tr>
<tr>
<td>Start date time</td>
<td>Date the fiscal period starts.</td>
</tr>
<tr>
<td>End date time</td>
<td>Date the fiscal period ends.</td>
</tr>
<tr>
<td>Fiscal Type</td>
<td>[Read-Only] Type of period, either <strong>Year</strong> or <strong>Quarter</strong>.</td>
</tr>
</tbody>
</table>

3. Validate the fiscal periods to ensure that there are no gaps and that they match a valid style of calendar.
   a) To validate, return to the list view of fiscal periods and click **Validate Periods**.

### Creating and using schedules

Use schedules to specify when service level agreements or inactivity monitors are active, or to specify when on-call rotations should take effect. Schedules are rules that include or exclude time for various actions or tasks.

For example, if a service level agreement is set to an 8-5 Weekdays schedule, the SLA only counts time during those hours. Generate and validate schedules in the **System Scheduler > Schedules** menu.

**Note:** The legacy functions that you may have used, on the **System Scheduler > Schedules** and Fiscal Calendar menus, to define schedules and fiscal calendars, continue to be supported. However, you should use the Business Calendar menu in their places to define calendars and schedules and then associate them with specific Now Platform packages. To learn more about defining and using business calendars, see Creating business calendars.
Default schedules

Default schedules are available in a base system.

<table>
<thead>
<tr>
<th>Name</th>
<th>Schedule</th>
</tr>
</thead>
<tbody>
<tr>
<td>8-5 weekdays</td>
<td>Repeats every week on weekdays Monday through Friday.</td>
</tr>
<tr>
<td>8-5 weekdays excluding holidays</td>
<td>Repeats every week on weekdays Monday through Friday. Includes the child schedule U.S. Holidays.</td>
</tr>
<tr>
<td>Application</td>
<td>Repeats every week on Sunday.</td>
</tr>
<tr>
<td>Application FLX</td>
<td>Repeats every week on Sunday.</td>
</tr>
<tr>
<td>Blackout Wednesdays (GMT)</td>
<td>Repeats every week on Wednesday.</td>
</tr>
<tr>
<td>Database Server FLX</td>
<td>Repeats every week on Saturday.</td>
</tr>
<tr>
<td>Default MS Project</td>
<td>Repeats every week on weekdays Monday through Friday from 8:00am to noon and 1:00-5:00pm. Default schedule for the Project Management application.</td>

<tr>
<td>WebServer FLX</td>
<td>Repeats every week on Sunday.</td>
</tr>
<tr>
<td>Weekends</td>
<td>Repeats every week on Saturday for two days.</td>
</tr>
</tbody>
</table>

Holidays

You can define each individual holiday as a schedule entry to create exceptions to existing schedules.

For instance, if an SLA requires an incident be resolved within three business days excluding Christmas, create a schedule entry for Christmas. Creating this entry ensures that the SLAs do not count Christmas when calculating elapsed time, even if it falls within the work week.

Because schedules can be included in other schedules through a parent-child relationship, it is also possible to create a holiday schedule and include it in other schedules to keep holidays consistent. The following example shows a holiday schedule.
### Schedule - U.S. Holidays

<table>
<thead>
<tr>
<th>Name</th>
<th>Starts</th>

</tr>
</tbody>
</table>
The following example shows a schedule that includes the preceding holiday schedule.

Child Schedule
Create a holiday schedule for multiple regions

You can create holiday schedules for multiple regions that follow the same work schedule but have different holidays.

The following method supports multiple regions with the same work schedule (for example, an 8-5 weekdays schedule) but with different holiday schedules.

1. Create a holiday schedule for each region. For example, U.S. Holidays, British Holidays, and Australian Holidays.
2. Add the work schedule as a child schedule to each region's holiday schedule.

This method requires making \(<\text{number of schedules}\> + 1\) total schedules. If you make the regional holiday schedule a child schedule of the work hours schedule, you must create a separate work hours schedule for each region. The total number of schedules in this case is \(<\text{number of schedules}\> \times 2\) schedules.

Parent and child schedules

Schedules can have one of two parent-child relationships with other schedules.

Parent field

When a schedule record lists a value for the Parent field, schedule entries from the parent schedule apply to both the parent schedule and the child schedule. By default, there are no sample schedules that use the Parent field.

Child schedule

When a schedule record has one or more child schedules in the Child Schedules related list, schedule entries from the child schedule apply to the containing schedule. By default, there are several sample schedules that use child schedules. For example, see the 8-5 weekdays excluding holidays schedule that includes the U.S. Holidays schedule.

Parent and child schedules cannot contain conflicting schedule entry types. For example, a schedule containing maintenance schedule entries cannot also contain blackout schedule entries. Nor can a maintenance schedule have a child schedule containing blackout schedule entries.

Note: To create a Holiday schedule and include it in a parent schedule, you must add it as a child schedule and with an Include type.

Parent schedules must have at least one entry that is not an Excluded type. If parent schedules are only exclusionary, they are invalid.

Note: The Show Schedule related link shows schedule entries from the current schedule and the child schedule record. For example, when showing the 8-5 weekdays excluding holidays schedule, holidays are also shown as excluded because the holiday schedule is a child schedule.

Define a schedule

You configure schedules using schedule and schedule entry records.

- Schedule records specify a time zone and a type of schedule and use one or more schedule entries. Schedule records are saved in the Schedule [cmn_schedule] table.
- Schedule entry records specify the time periods that are included or excluded from a schedule. Schedule entries are saved in the Schedule Entry [cmn_schedule_span] table.
1. Navigate to **System Scheduler > Schedules > Schedules**.
2. Click **New**, enter a unique and meaningful **Name** and **Description** and then fill in the form.
   For detailed information on Schedule form fields, see **Schedule fields**.

   **Note:** If there are no active entries defined for the current schedule, a warning message appears in the Schedule form. If your schedule is a child schedule that contains only exclusions, ignore the message because exclusions are non-active entries.

3. Right-click the header bar and click **Save**.

   **Note:** If you create a schedule of type **maintenance** and save the record, a UI policy hides the **Type** field from the form. To view or change the **Type** value, use the list of schedules instead of the schedule form. Add the **Type** column if necessary. You can click the cell for the value in the **Type** column and modify the value in the list view.
4. Configure one or more schedule entries.
   For detailed information on Schedule Entry form fields, see Schedule entry fields.

</table>
| Monthly type | Monthly schedule repetition frequency. This field is only visible when the Repeats field has a value of Monthly. Monthly repeat options include:  
• Repeat on a specific day of the month  
• Repeat on a specific day in a specific week of the month  
• Repeat on the last day of the month  
• Repeat on a specific weekday in the last week of the month |
| Yearly type | Yearly schedule repetition frequency. This field is only visible when the Repeats field has a value of Yearly. Yearly repeat options include:  
• Repeat on a specific day of the year  
• Repeat on a floating day |
| Float week | Week of the month a floating yearly schedule repeats on. This field is only visible when the Yearly type field has a value of Floating. |
| Float day | Day of the week a floating yearly schedule repeats on. This field is only visible when the Yearly type field has a value of Floating. |
| Month | Month of the year a floating yearly schedule repeats on. This field is only visible when the Yearly type field has a value of Floating. |
| Repeat until | Repetition end date. If you leave this field blank, the schedule repeats indefinitely. |
| Type | [Optional] Schedule entry description. |

**Schedule for the fifth instance of a week date**

You can select a date that computes to the fifth instance of a weekday for a date near the end of a month for a repeating monthly schedule,

Three options are available for handling months that do not have a matching Fifth instance of the selected day.

- Last: Selects the last instance of the weekday in the month.  
- Next: Selects the first instance of the weekday in the next month.  
- Strict: Skips any month without a matching Fifth instance and selects only months that have a matching Fifth instance.

Use the `glide.schedules.fifth` system property to control how a schedule entry that selects the fifth occurrence of a weekday behaves in months containing only four occurrences of that day.

- Use of this property is only valid when the `glide.schedules.repeat_nth` property is set to Day.  
- The following example illustrates computing what day of the month a schedule repeats on when the schedule starts on the Fifth instance of a weekday in the month.

1. Navigate to `sys_properties.list`. 
2. Open the `glide.schedules.fifth` property.
3. Verify that the **Value** is set to **last**.
4. Navigate to **System Scheduler > Schedules > Schedules**, define a new schedule, and click **Submit**.
5. Open the new schedule and in the **Schedule Entries** related list, create a new entry with the following parameters:
   - When: November 29, 2012 at 10:00 to November 29, 2012 at 11:00
   - Repeats: Monthly
   - Monthly type: Day of the Week
   - Starting: November 29

   **Note:** November 29 is the Fifth Thursday in the month.

6. Click **Submit**.
7. Open the same schedule entry.

   **Note:** The message **Every month on the Fifth Thu** appears on the form.

   The schedule for the first three months is computed as:
   - November 29, 2012 (Fifth Thursday of the month)
   - December 27, 2012 (Last Thursday of the month)
   - January 31, 2013 (Fifth Thursday of the month)
8. If you set the **Value** on the **glide.schedules.fifth** property to **next** instead of **last** in step 3, the schedule for the first three months is computed as:
   - November 29, 2012 (Fifth Thursday of the month)
   - January 3, 2012 (First Thursday of the next month since December 2012 does not have five Thursdays)
   - January 31, 2013 (Fifth Thursday of the month)

9. If the **Value** on the **glide.schedules.fifth** property is set to **strict** instead of **last** in step 3, the schedule for the first three months is computed as:
   - November 29, 2012 (Fifth Thursday of the month)
   - No meeting (December 2012 skipped because it does not have five Thursdays)
   - January 31, 2013 (Fifth Thursday of the month)

### Repeat a monthly schedule

Repeat a monthly schedule to reduce the amount of time required to define schedules and to provide consistency in scheduling.

You can specify the following options for monthly schedules that start on a particular day of the month (**Monthly type** is set to **Day of the month**). The following methods are available to compute what day of the week a monthly schedule repeats on:

- **Day**: Calculates the day of the week to repeat on by determining the order of the selected starting date within the month. For example, if you specified that the starting date appears on the first Monday in the month, the schedule repeats every first Monday of every month.
- **Week**: Calculates the day of the month to repeat on by determining what week number the selected starting date appears in the month. For example, if the starting date is a Monday during the second week of the month, the schedule repeats the second Monday of every month.

Use the system property **glide.schedules.repeat_nth** to determine what method your instance uses to compute what day a repeating monthly schedule occurs on. By default, instances use the more accurate **Day** method.

**Note:** Use the **Week** method to maintain backwards compatibility with customized schedule logic. To learn more about calculations for the starting day of each month, for monthly schedules that start on the fifth instance of a day, see Fifth Instance of a Day of the Week.

The following example illustrates computing what day of the week a monthly schedule repeats on.

1. Navigate to **sys_properties.list**.
2. Open the **glide.schedules.repeat_nth** property.
3. Verify that the **Value** is set to **day**.
4. Navigate to **System Scheduler > Schedules > Schedules**, define a new schedule, and click **Submit**.
5. Open the new schedule and in the **Schedule Entries** related list, create a new entry with the following parameters:
   - When: November 5, 2012 at 10:00 to November 5, 2012 at 11:00
   - Repeats: Monthly
   - Monthly type: Day of the Week
   - Starting: November 5

   **Note:** November 5 is the first Monday in the month, but it is in the second week.

6. Click **Submit**.

7. Open **Schedule Entry**.

   **Note:** The message *Every month on the first Mon* appears on the form. The first few dates this schedule runs on are:
   - November 5, 2012 (First Monday of the month)
   - December 3, 2012 (First Monday of the month)
   - January 7, 2012 (First Monday of the month)

8. If you set the **Value** on the `glide.schedules.repeat_nth` property to **week** instead of **day** in step 3, the first few dates this schedule run on are:
   - November 5, 2012 (Schedule starts on Monday in the second week of the month)
   - December 10, 2012 (Second Monday in the month)
   - January 14, 2012 (Second Monday in the month)

**Using schedules and calendars**

Specific applications within the Now Platform generate graphical calendar displays based on schedule pages. These schedule pages appear in daily, weekly, or monthly views. Currently, the applications using schedule pages include:
- Project Management
- Maintenance Schedules
- Group On-Call Rotation
- Field Service Management

Schedule pages are records that contain the scripts that determine the functionality of the graphical display.
Because of the heavy degree of scripting involved in a schedule page, you should, for most instances, use the default schedule pages in the base platform.

The schedule page uses a URL with a series of parameters attached to generate the graphical display.

A schedule page controls calendar content (cmn_schedule_page) record.

To access Schedule Pages, navigate to **System Scheduler > Schedules > Schedule Pages**. The Schedule Pages form provides the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>String</td>
<td>General name used to identity the current schedule page.</td>
</tr>
</tbody>
</table>
| Schedule type  | String     | Schedule type is a string that is used to uniquely identify the schedule page via the "sysparm_page_schedule_type" URI parameter. For example, a schedule page could be accessed as follows:  
/show_schedule_page.do?sysparm_page_schedule_type=gantt_chart&sysparm_timeline_task_id=d530bf907f0000015ce594fd929cf6a4  
Alternatively, you can access the schedule page can by setting the "sysparm_page_sys_id" URI parameter to the unique 32 character hexadecimal system identifier of the schedule page. |
| View Type      | Choice     | Each view type displays different field combinations. There are two options available:  
• Calendars  
• Timelines |
| Description    | String     | General description that provides additional information about the current schedule page. This field is not necessary. |
| Init function name | String | The init function name specifies the name of the JavaScript function to call inside the Client script function for calendar type schedule pages. |
## Field Type Reference

<table>
<thead>
<tr>
<th>Field</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTML</td>
<td>String</td>
<td>Jelly parses the HTML field, which is a scriptable section. It then injects it into the display page prior to the rest of the calendar. It can be used to pass in variables from the server and define extra fields are necessary.</td>
</tr>
<tr>
<td>Client script</td>
<td>String</td>
<td>The client script is a scriptable section that allows for configuring options of the schedule page display. The API is different depending on the schedule page view type.</td>
</tr>
<tr>
<td>Server AJAX processor</td>
<td>String</td>
<td>The Server AJAX processor is specific to calendar type schedule pages that is used to return a set of schedule items and spans that display.</td>
</tr>
</tbody>
</table>

### Invoke the Schedule page and view a calendar

You can use the URL from arguments module, a field decoration (dictionary attribute `ref_contributions`), or a UI Action linking to `show_schedule.doto` to invoke the Schedule page.

For example, the On-call calendar module generates the calendar from the following URL:

```
$ocf.do?
sysparm_start_date=2016-03-01&sysparm_current_view=monthly&sysparm_include_view=monthly,daily
```

This URL takes the user to the monthly calendar view dated March 1, 2016.

- The URL component `sysparm_current_view = monthly || weekly || daily` determines the current calendar view. If `sysparm_current_view` is given an invalid or empty value, it defaults to monthly view and rewrite the URL to that view. Valid values are monthly or weekly or daily.
- The URL component `sysparm_include_view = monthly,weekly,daily` determines which calendar views are available. If `sysparm_include_view` is given invalid or empty values, only the valid views appear. If all values are invalid, the default three views appears and rewrites the URL to those views. Valid values are monthly, weekly, and daily.

**Note:** The `sysparm_include_view` is only available for the new on-call calendar view.

- The URL component `sysparm_group_id=group_sys_id` determines the specified group to filter on. If `sysparm_group_id` is specified, it filters by the specified group. Valid value is a group sysId.
- The URL component `sysparm_start_date=2016-03-02` determines the date based on which every view appears. If `sysparm_start_date` is specified, it opens the calendar contesting that particular date in which
every view is selected. The format is YYYY-MM-DD. If an invalid format or date is specified, it uses the current date and rewrites the URL to that date.

Note: The `sysparm_zoom` URL component has been replaced with `sysparm_current_view` in OnCallRotation only.

Schedule calendar

Graphically represent a defined schedule and its related schedule spans.

The schedule calendar is available in day, week, or month views in calendar and timeline views.

To view the schedule calendar, click **Show Schedule** under related links in the Schedule form.

The and the icon at the upper left of the window helps you to navigate between the calendar view and the timeline view of schedules. By default, schedule appears in the **Month** view and the current day is highlighted. The calendar also provides **Day** and **Week** views. If you want to view the schedule and schedule spans of any specific day, week, or month, click and select the specific date. You can also combine the available functionalities to change the view of the calendar. For example, you can click to choose timeline view, select a particular date from
and select the **Day, Week, or Month** view.

If you want to view events for the current day, week or month, click **Today**. The left and the right arrow next to **Today** helps you to navigate to the previous or the next day, week, or month depending on the view type.

To add an event, double-click the time slot where you want to add the event. In the Add Event window, enter the required information. If you want to view the details of an event, click the event. A pop-up window appears with the details of the event.

**Event details**

To modify the start and end time for an existing non-recurring or recurring event:

- Click the event and in the Event pop-up window.
- Click **Edit** to modify the required fields.

<table>
<thead>
<tr>
<th>Modify event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>Name</td>
<td>Name of the event.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of event. For example, time off, appointment, meeting.</td>
</tr>
<tr>
<td>Show as</td>
<td>Status that is visible when the event starts.</td>
</tr>
<tr>
<td>When</td>
<td>Date and time when the event starts and ends.</td>
</tr>
<tr>
<td>All day</td>
<td>Check box that indicates that the event becomes a continuous event, irrespective of the date and time specified in the When field.</td>
</tr>
<tr>
<td>Repeats</td>
<td>Value when the event must be repeated.</td>
</tr>
<tr>
<td>Repeat until</td>
<td>Date until when the event is repeated.</td>
</tr>
</tbody>
</table>

Click **Update** if you want the event to be modified with the new value.

Click **Deactivate** if you want to delete the event from that specific day until the specified end day of the event.

Click **Delete** if you want to delete the event from the day the event had started.

You can also drag a specific event to the new date or time.
• When you drag a non-recurring event, a pop-up window appears to confirm whether you want to save the event change.
• When you drag a recurring event to a new date or time, a pop-up window appears. Use it to confirm whether you want to edit all occurrences, or only the current occurrence of the event. You can choose your option, as appropriate.

Schedule calendar also provides keyboard shortcuts to help you navigate quickly. The list of navigation shortcuts appear when you click

**Domain support and schedules**

Domain separation is supported in schedules. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data. Activate the Domain Support [com.glide.domain] plugin to enable the domain separation functionality for schedules.

**Support level: Basic**

• Business logic: Ensure that data goes into the proper domain for the application’s service provider use cases.
• The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
• The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer’s message, the client must be able to see the SP's response.

To learn more, see Application support for domain separation.

**Overview**

The records in the Schedule [cmn_schedule], Schedule Page [cmn_schedule_page], and Timeline Page [cmn_timeline_page] tables have a defined domain.

• The child tables use the domain_master attribute to derive the domain from the parent table.
• You can find the domain_master attribute on the dictionary record for the respective table.

The following diagram illustrates the scope of domain separation in different schedule tables:
Domain support for schedules

Custom domain support implementations

Domain separation support does not automatically occur when you migrate to a new release containing a custom implementation of domain support for tables such as Schedule Entry [cmn_schedule_span]. This action avoids changing any specific configurations that you may have in place.

To implement the base system domain support for schedules, a sys.script utility is provided. To run this utility, navigate to Background > Scripts – Background. The script is listed under the com.glide.schedules plugin as fix_schedule_domain_support.js.

- The utility attempts to add the Domain [sys_domain] column to the Schedule [cmn_schedule], Schedule Page [cmn_schedule_page], and Timeline page [cmn_timeline_page] tables.
- It then attempts to add the domain_master attribute to the Schedule Entry [cmn_schedule_span], Other Schedule [cmn_other_schedule], Timeline Sub Item [cmn_timeline_sub_item], and Timeline Page Span Style [cmn_timeline_page_style] tables.
- If the script finds existing records between a child and parent record that have differing domain, the script does not introduce the domain_master attribute to the child table.

For example, consider the relationship of the Schedule [cmn_schedule] (parent) and Schedule Entry [cmn_schedule_span] (child) tables. If the Domain [sys_domain] column is available on both tables in the upgrading instance, the utility must migrate to the base system implementation of domain support for schedules.

- If the script detects records where the child Schedule Entry [cmn_schedule_span] domain differs from its parent Schedule [cmn_schedule] domain, it stops executing and logs a warning message.
- If the script does not find differing records, it deactivates and limits read access to the Domain [sys_domain] and Domain Path [sys_domain_path] columns on the Schedule Entry [cmn_schedule_span] table.
- Finally, the script adds the domain_master=schedule attribute to the dictionary file for the Schedule Entry [cmn_schedule_span] table.

Note: The domain_master attribute ensures that the child and parent record domains remain the same as the domain for the child that is derived from the specified reference field.
System scheduler

The System Scheduler application contains two separate engines for scheduling: the Scheduled Jobs engine and the Schedules engine.

System scheduler

Scheduled jobs

Scheduled Jobs executes any work that must be performed at a specific time, or on a recurring basis. The Scheduled Jobs module links to the Schedule [sys_trigger] table. Manipulating records on the Schedule table is not recommended. Use this table to view existing base system scheduled jobs.

The Scheduled Jobs module in System Definition is an admin-friendly interface for scheduling work. Use this module to create new scheduled jobs. For more information, see Create a Scheduled Job.

Schedules

Schedules are rules that include or exclude time on a calendar. They are used by service levels, inactivity monitor, and group on-call rotation. For instance, you can define a schedule to restrict service levels to only apply to weekdays during business hours. You can also exclude holidays from an on-call rotation.

For more information, see Use Schedules.

Scheduled jobs

Scheduled Jobs are automated pieces of work that can be performed at a specific time or on a recurring schedule.

You can automate the following kinds of tasks:

- Automatically generate and distribute a report
- Automatically generate and schedule an entity of records, such as an incident, change item, configuration item, from a template
- Run scheduled jobs from scripts or business rules
- Scheduling at the end of the month
- Scheduling for weekdays

For developer training, see Scheduled Script Executions and Events Objectives on the ServiceNow Developer Site.
Scheduled job states

A scheduled job can be in any one of the following states.

**Ready**
Job is ready to run at the next scheduled interval.

**Running**
Job is in the process of carrying out a task.

**Queued**
Job has been added to the scheduler queue and is waiting to run.

**Error**
Error occurred while running the job.

Create a scheduled job

Create a scheduled job on the Schedule Job [sysauto] table.

Create all new scheduled jobs using this method.

1. Navigate to **System Definition > Scheduled Jobs**.
2. Click **New**.
3. Select the appropriate type of scheduled job.

The fields presented depend on the type of scheduled job required.
Automate generation and distribution of a report
Generate and distribute scheduled reports via email.

Roles required: admin or schedule_admin

Data may not appear on reports created by an individual whose user account is deactivated. To ensure that the desired data appears, an active user must recreate the scheduled report.

1. Navigate to **System Definition > Scheduled Jobs**.
2. Click **New**.
3. Select **Automate the generation and distribution of a report**.
4. Populate the following fields:

   **Schedule a report**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name that identifies this scheduled job.</td>
</tr>
<tr>
<td>Report</td>
<td>Reference to the report you are scheduling.</td>
</tr>
<tr>
<td>Note:</td>
<td>Automatic email support is not available for Calendar, Map, and Single Score reports.</td>
</tr>
<tr>
<td>Users</td>
<td>Names of the users to send the report to at the scheduled date and time. Users must have Notification set to Enabled on their user records to receive reports.</td>
</tr>
<tr>
<td>Groups</td>
<td>Names of the groups to send the report to at the scheduled date and time.</td>
</tr>
<tr>
<td>Email addresses</td>
<td>Other email addresses to send the report to, separated by commas. If a matching user record for that address is flagged as Do not notify, this flag is respected. The user does not receive the report.</td>
</tr>
<tr>
<td>Application</td>
<td>Name of the application that contains the report. Global appears if the report is in the global scope.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that indicates that scheduled job is active and should be executed at the specified date and time.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Run</td>
<td>Time interval to use for running the scheduled job:</td>
</tr>
<tr>
<td></td>
<td>• Daily: Runs daily, at a designated time.</td>
</tr>
<tr>
<td></td>
<td>• Weekly: Runs on a weekly basis, at a designated time and day of the week.</td>
</tr>
<tr>
<td></td>
<td>• Monthly: Runs on a monthly basis, at a designated time and day of the month.</td>
</tr>
<tr>
<td></td>
<td>• Periodically: Runs on a designated repeating interval.</td>
</tr>
<tr>
<td></td>
<td>• Once: Runs for a single occurrence only.</td>
</tr>
<tr>
<td></td>
<td>• On Demand: Runs immediately on demand.</td>
</tr>
<tr>
<td></td>
<td>• Business Calendar: Entry Start: Runs on the starting entry dates for the business calendar you select in the Business Calendar field. A scheduled job runs for the starting date of each of the business entries you defined for the business calendar.</td>
</tr>
<tr>
<td></td>
<td>For example, if the business calendar represents a fiscal year, and the starting date of each entry is a fiscal month, the scheduled job runs on the first day of each month.</td>
</tr>
<tr>
<td></td>
<td>• Business Calendar: Entry End: Runs for the ending date for the business calendar you select in the Business Calendar field. This selection runs in the same manner as Business Calendar: Entry Start, but for end dates of associated business calendar entries.</td>
</tr>
</tbody>
</table>

**Note:** When you select Business Calendar: Entry Start or Business Calendar: Entry End, you can apply an offset factor to schedule the job to run before or after the time span of the selected business calendar. To learn more, see the Offset type and Offset fields.

To learn more about creating and using business calendars and defining business calendar entries, see Creating business calendars and Define business calendar entries.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time zone</td>
<td>Time zone to use with the <strong>Time</strong> field entry when you specify the time at which the scheduled job run. Select a time zone entry:</td>
</tr>
<tr>
<td></td>
<td>• <strong>-None-</strong>: Use the default time zone for the logged in user who is creating the scheduled job.</td>
</tr>
<tr>
<td></td>
<td>For example, the scheduled job runs at 04:45 p.m. US/Pacific time if it is the user’s assigned time zone, and you enter 16:45 into the <strong>Time</strong> field.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Use System Time Zone</strong>: Use the default system time zone specified for the instance in which it runs.</td>
</tr>
<tr>
<td></td>
<td>For example, the scheduled job runs at 10:15 p.m. London time if Europe/London is the default system time zone for the instance, and you enter 22:15 into the <strong>Time</strong> field.</td>
</tr>
<tr>
<td></td>
<td>• Actual time zone.</td>
</tr>
<tr>
<td></td>
<td>For example, the scheduled job runs at 1:30 p.m. in the US Eastern time zone if you select <strong>US/Eastern</strong>, and enter 13:30 into the <strong>Time</strong> field.</td>
</tr>
<tr>
<td>Time</td>
<td>Time of day at which the scheduled job should run, expressed in hours, minutes, and seconds on a 24-hour clock. The selection you make in the <strong>Time zone</strong> field determines the time zone for this entry.</td>
</tr>
<tr>
<td>Day</td>
<td>Day on which the scheduled job should run.</td>
</tr>
<tr>
<td></td>
<td>• If <strong>Run</strong> is set to <strong>Weekly</strong>, select the day of the week. For example, select Wednesday.</td>
</tr>
<tr>
<td></td>
<td>• If <strong>Run</strong> is set to <strong>Monthly</strong>, select the day of the month. For example, select 25 for the 25th day of the month.</td>
</tr>
<tr>
<td></td>
<td>This field only appears if you select <strong>Monthly</strong> or <strong>Weekly</strong> in the <strong>Run</strong> field.</td>
</tr>
<tr>
<td>Repeat Interval</td>
<td>Duration of the repeat interval for each scheduled job execution. Enter the duration in the number of days, hours, or minutes. For example:</td>
</tr>
<tr>
<td></td>
<td>• To run the scheduled job every four days, enter 04 into the <strong>Days</strong> field.</td>
</tr>
<tr>
<td></td>
<td>• To run it every 26 hours, enter 26 into the <strong>Hours</strong> field.</td>
</tr>
<tr>
<td></td>
<td>• If it should repeat at an interval of 13:30:25, enter 13 into the <strong>Hours</strong> field, then 30 and 25 into the two unlabeled fields after it.</td>
</tr>
<tr>
<td>Starting</td>
<td>Date and time of the first scheduled job generation. Select the calendar date and time. This field only appears if you select <strong>Periodically</strong> in the <strong>Run</strong> field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Business Calendar</td>
<td>Business calendar entry you are using to determine the business calendar start or end date for the scheduled job. This field appears only if you select Business Entry: Start Date or Business Entry: End Date in the Time field.</td>
</tr>
<tr>
<td>Offset type</td>
<td>Type of time offset, if any, to apply to the business calendar you selected for scheduling this job.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Past</strong>: Apply an offset factor to schedule the job to run before the start of the time span of the selected business calendar.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Future</strong>: Apply an offset factor to schedule the job to run after the end of the time span of the selected business calendar.</td>
</tr>
<tr>
<td></td>
<td>• <strong>--None--</strong>: Do not apply a time offset when scheduling this job.</td>
</tr>
<tr>
<td>Offset</td>
<td>Amount of time offset, expressed in days, hours, minutes, and seconds, to apply to the business calendar you selected for scheduling this job. For example, if you want to schedule the job to start three days, 14 hours, 10 minutes, and 45 seconds before the business calendar start date:</td>
</tr>
<tr>
<td></td>
<td>• Select <strong>Past</strong> in the Offset type field.</td>
</tr>
<tr>
<td></td>
<td>• Enter 3 into the Days field.</td>
</tr>
<tr>
<td></td>
<td>• Enter 14, 10, and 45 into the Hours field.</td>
</tr>
<tr>
<td>Priority</td>
<td>Numerical priority for the scheduled job.</td>
</tr>
<tr>
<td></td>
<td>• Set essential jobs to a priority value below 100.</td>
</tr>
<tr>
<td></td>
<td>• Set nonessential jobs to a priority above 100.</td>
</tr>
<tr>
<td></td>
<td>• If 70% or more of all scheduled jobs are <strong>Overdue</strong>, any jobs marked with a value above 100 do not run.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Option for enabling the running of the scheduled job if certain conditions are met in the associated script.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Omit if no records</td>
<td>Check box that designates that generation of a scheduled job should not occur when there are no records to generate it for.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditional script that determines if a scheduled job should run. The last expression of the script should evaluate to a Boolean (true/false) value. This text box appears only if you select <strong>Conditional</strong>.</td>
</tr>
<tr>
<td>Subject</td>
<td>Subject line for the email.</td>
</tr>
<tr>
<td>Introductory Message</td>
<td>Body of the email.</td>
</tr>
<tr>
<td>Type</td>
<td>File type for the attached report. Choices are:</td>
</tr>
<tr>
<td></td>
<td>• PDF-landscape</td>
</tr>
<tr>
<td></td>
<td>• PDF</td>
</tr>
<tr>
<td></td>
<td>• Excel</td>
</tr>
<tr>
<td></td>
<td>• CSV</td>
</tr>
<tr>
<td></td>
<td>• PNG</td>
</tr>
<tr>
<td>Zip Output</td>
<td>Select to compress the scheduled report to a .zip file.</td>
</tr>
<tr>
<td>Include with</td>
<td>Click the magnifier icon to choose another active scheduled report to include with this scheduled report.</td>
</tr>
</tbody>
</table>

**Note:** An alternative for scheduling calendar and pivot table reports for email distribution is using the Publish option.

- This option creates a URL for the report, and the address appears above the report form.
- You can create an email notification with this URL and send the link to people who must see the report.
- You can also send the URL for the calendar report to a distribution list.

**Automatically generate something from a template**

Schedule the generation of entities, which include changes, incidents, and CIs.

Roles required: admin or schedule_admin

1. Navigate to **System Definition > Scheduled Jobs**.
2. Click **New**.
3. Select **Automatically generate something (a change, an incident, a CI, etc) from a template**.
4. Populate the following fields:

**Schedule entity generation**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name that identifies this scheduled job.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that indicates that scheduled job is active and should be executed at the specified date and time.</td>
</tr>
<tr>
<td>Application</td>
<td>Name of the application that contains the entity. <strong>Global</strong> appears if the entity is in the global scope.</td>
</tr>
<tr>

<td>Reference to the template record from which you are generating a scheduled job.</td>
</tr>
</tbody>
</table>

**Automatically run a script of your choosing**

Schedule both conditional and non-conditional scripts. If Domain Separation is installed in the instance, you can also select, filter, sort, and schedule scripts based on their assigned domains.

Roles required: admin or schedule_admin

The following is an example of a conditional script. It runs the scheduled job only if there are active incidents older than 30 days.

```javascript
// Only run this Scheduled Job if there are active Incidents over 30 days old
var ga = new GlideAggregate('incident');
ga.addAggregate('COUNT');
ga.addQuery('active', 'true');
```
1. Navigate to **System Definition > Scheduled Jobs**.
2. Click **New**.
3. Select **Automatically run a script of your choosing**.
4. On the form, fill in the fields.

**Schedule script execution**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name that identifies this scheduled job.</td>
</tr>
<tr>
<td>Active</td>
<td>Option that indicates that scheduled job is active and should be executed at the specified date and time.</td>
</tr>
<tr>
<td>Application</td>
<td>Name of the application that contains the script. Global appears if the script is in the global scope.</td>
</tr>
<tr>
<td>Conditional</td>
<td>Option for enabling the running of the scheduled job if certain conditions are met in the associated script.</td>
</tr>
<tr>
<td>Condition</td>
<td>Conditional script that determines if a scheduled job should run. The last expression of the script should evaluate to a Boolean (true/false) value. This text box appears only if you select <strong>Conditional</strong>.</td>
</tr>
</tbody>
</table>
### Field: Run

Time interval to use for running the scheduled job:

- **Daily**: Runs daily, at a designated time.
- **Weekly**: Runs on a weekly basis, at a designated time and day of the week.
- **Monthly**: Runs on a monthly basis, at a designated time and day of the month.
- **Periodically**: Runs on a designated repeating interval.
- **Once**: Runs for a single occurrence only.
- **On Demand**: Runs immediately on demand.
- **Business Calendar: Entry Start**: Runs on the starting entry dates for the business calendar you select in the *Business Calendar* field. A scheduled job runs for the starting date of each of the business entries you defined for the business calendar.

For example, if the business calendar represents a fiscal year, and the starting date of each entry is a fiscal month, the scheduled job runs on the first day of each month.

- **Business Calendar: Entry End**: Runs for the ending date for the business calendar you select in the *Business Calendar* field. This selection runs in the same manner as *Business Calendar: Entry Start*, but for end dates of associated business calendar entries.

**Note:** When you select *Business Calendar: Entry Start* or *Business Calendar: Entry End*, you can apply an offset factor to schedule the job to run before or after the time span of the selected business calendar. To learn more, see the *Offset type* and *Offset* fields.

To learn more about creating and using business calendars and defining business calendar entries, see [Creating business calendars](#) and [Define business calendar entries](#).

A scheduled job runs for the starting date of each of the business entries you defined for the business calendar. For example, if the business calendar represents a fiscal year, and the starting date of each entry is a fiscal month, the scheduled job runs on the first day of each month.  
  - **Business Calendar: Entry End**: Runs for the ending date for the business calendar you select in the *Business Calendar* field. This selection runs in the same manner as *Business Calendar: Entry Start*, but for end dates of associated business calendar entries. |
| Day   | Day on which the scheduled job should run.  
  - If *Run* is set to **Weekly**, select the day of the week. For example, select Wednesday.  
  - If *Run* is set to **Monthly**, select the day of the month. For example, select 25 for the 25th day of the month.  
  
  This field only appears if you select **Monthly** or **Weekly** in the *Run* field. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Repeat Interval | Duration of the repeat interval for each scheduled job execution. Enter the duration in the number of days, hours, or minutes. For example:  
  • To run the scheduled job every four days, enter 04 into the **Days** field.  
  • To run it every 26 hours, enter 26 into the **Hours** field.  
  • If it should repeat at an interval of 13:30:25, enter 13 into the **Hours** field, then 30 and 25 into the two unlabeled fields after it.                                                                                                                                                                                                                                                                                                                                 |
| Time zone     | Time zone to use with the **Time** field entry when you specify the time at which the scheduled job run. Select a time zone entry:  
  • **-None-**: Use the default time zone for the logged in user who is creating the scheduled job.  
    For example, the scheduled job runs at 04:45 p.m. US/Pacific time if it is the user’s assigned time zone, and you enter 16:45 into the **Time** field.  
  • **Use System Time Zone**: Use the default system time zone specified for the instance in which it runs.  
    For example, the scheduled job runs at 10:15 p.m. London time if Europe/London is the default system time zone for the instance, and you enter 22:15 into the **Time** field.  
  • Actual time zone.  
    For example, the scheduled job runs at 1:30 p.m. in the US Eastern time zone if you select **US/Eastern**, and enter 13:30 into the **Time** field.                                                                                                                                                                                                                           |
| Time          | Time of day at which the scheduled job should run, expressed in hours, minutes, and seconds on a 24-hour clock. The selection you make in the **Time zone** field determines the time zone for this entry.                                                                                                                                                                                                                                                  |
| Day           | Day on which the scheduled job should run.  
  • If **Run** is set to **Weekly**, select the day of the week. For example, select Wednesday.  
  • If **Run** is set to **Monthly**, select the day of the month. For example, select 25 for the 25th day of the month.                                                                                                                                                                                                                                                                                                                |

This field only appears if you select **Monthly** or **Weekly** in the **Run** field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Repeat Interval</td>
<td>Duration of the repeat interval for each scheduled job execution. Enter the duration in the number of days, hours, or minutes. For example:</td>
</tr>
<tr>
<td></td>
<td>- To run the scheduled job every four days, enter 04 into the <strong>Days</strong> field.</td>
</tr>
<tr>
<td></td>
<td>- To run it every 26 hours, enter 26 into the <strong>Hours</strong> field.</td>
</tr>
<tr>
<td></td>
<td>- If it should repeat at an interval of 13:30:25, enter 13 into the <strong>Hours</strong> field, then 30 and 25 into the two unlabeled fields after it.</td>
</tr>
<tr>
<td>Starting</td>
<td>Date and time of the first scheduled job generation. Select the calendar date and time. This field only appears if you select <strong>Periodically</strong> in the <strong>Run</strong> field.</td>
</tr>
<tr>
<td>Business Calendar</td>
<td>Business calendar entry you are using to determine the business calendar start or end date for the scheduled job. This field appears only if you select <strong>Business Entry: Start Date</strong> or <strong>Business Entry: End Date</strong> in the <strong>Time</strong> field.</td>
</tr>
<tr>
<td>Offset type</td>
<td>Type of time offset, if any, to apply to the business calendar you selected for scheduling this job.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Past</strong>: Apply an offset factor to schedule the job to run before the start of the time span of the selected business calendar.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Future</strong>: Apply an offset factor to schedule the job to run after the end of the time span of the selected business calendar.</td>
</tr>
<tr>
<td></td>
<td>- <strong>--None--</strong>: Do not apply a time offset when scheduling this job.</td>
</tr>
</tbody>
</table>

Adding an offset factor enables scheduling of the job to run before, or after, the formal time span defined in the business calendar for the following use cases:

- Schedule a job at a certain time, outside of the time span for the selected business calendar.
- Arrange multiple jobs to run in sequence, around the time span of the selected business calendar.

The **Offset type** and **Offset** fields only appear if you select **Business Calendar: Entry Start** or **Business Calendar: Entry End** in the **Run** field.
Field | Description
---|---
Offset | Amount of time offset, expressed in days, hours, minutes, and seconds, to apply to the business calendar you selected for scheduling this job. For example, if you want to schedule the job to start three days, 14 hours, 10 minutes, and 45 seconds before the business calendar start date:
- Select Past in the Offset type field.
- Enter 3 into the Days field.
- Enter 14, 10, and 45 into the Hours field.
The Offset Days and Hours fields only appear if you select Business Calendar: Entry Start or Business Calendar: Entry End in the Run field, and Past or Future in the Offset type field.
Run as [Optional] | Select another user to run the script execution as. Configure the form to add this field if it is not present.
Run this script | Name of the script to run at the scheduled date and time. For example, copy script logic from a business rule, or call a script include.

5. If Domain Separation is installed in this instance, the following fields also appear for selecting, sorting, and scheduling jobs by domain.

**Note:** The Domain Support - Domain Extensions Installer plugin installs these fields. To learn more, see Request domain separation.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain iterator</td>
<td>Check box that enables this job to run across multiple domains. If selected, the Domain source table and Domain source filter fields appear.</td>
</tr>
<tr>
<td>Domain source table</td>
<td>Name of the domain-separated table that is the source of the domains in which the scheduled job should run. For example, select Department (cmn_department) if you want to use it as the source of the assigned domains used to schedule scripts. The scheduled job determines these domains from the sys_domain field of the source table records. To learn more, see Domain assignment.</td>
</tr>
</tbody>
</table>

**Note:** It's a good idea to create a domain-separated table solely dedicated to sourcing domains, unless you have a use case that warrants using an existing one. If you do create a new one, simply select it using this field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain source filter</td>
<td>Optional condition you can specify to filter the records queried from the selected domain source table.</td>
</tr>
<tr>
<td></td>
<td>a. Select the field to use for filtering records.</td>
</tr>
<tr>
<td></td>
<td>b. Add filtering conditions and operators to narrow the domain selection criteria. To learn more, see Filters.</td>
</tr>
</tbody>
</table>

The following processing takes place when scheduling a job in a domain-separated instance:

- It first queries the selected domain source table.
- If you specified a condition in the **Domain source filter** field, it applies the filtering condition to narrow down the resulting set of records.
- Finally, it retrieves its list of unique domains from the sys_domain columns of these records.

6. Click **Update** to update the scheduled job, **Execute Now** to execute the scheduled script immediately, or **Delete** to delete the job.

**Special cases in job schedules**

Some special cases require care in job scheduling.

**End of the month schedules**

Because months have different lengths, take care when scheduling jobs for the end of the month.

- Scheduling an event for the 29th or 30th is not recommended, because the scheduled job is executed in months (like February) which are shorter than those dates.
- If an event is scheduled for the 31st, it executes on the last day of the month, even if the month is shorter.

For example, something scheduled to run on the 31st of the month runs on February 28 or February 29 in a leap year.

**Weekday schedules**

For scheduled scripts, use the following script to run only on weekdays:

```javascript
(function isWeekday() {
    var gDate = new GlideDate(); //Uses your Timezone!
    var day = gDate.getByFormat('EEEE'); //Gets name of day
    switch(day) {
        case "Saturday":
        case "Sunday":
            isWeekday = false;
            break;
        default:
            isWeekday = true;
    }
    return isWeekday;
})();
```
Scheduled jobs from scripts

To execute a scheduled job triggered by an event, use the following script:

```javascript
//Execute a scheduled script job
var rec = new GlideRecord('sysauto_script');
rec.get('name', 'YOUR_JOB_NAME_HERE');
SncTriggerSynchronizer.executeNow(rec);
```

You can run the script using one of several tables:
- scheduled_import_set (Scheduled Import Sets)
- sysauto_script (Scheduled Script Execution)
- sysauto_template (Scheduled Template Generation)
- sysauto_report (Scheduled Report)

**Note:** `SncTriggerSynchronizer` does not provide methods to execute scheduled jobs in the future.

Running schedule jobs imported from another instance

To prevent unexpected data changes, Schedule Item [sys_trigger] records are not created for Scheduled Jobs [sysauto] imported from an XML file such as an update set. To run a scheduled job imported from another instance, update the scheduled job record.

View a schedule item

You can view scheduled items, which are individual instances of a scheduled job, from the system scheduler.

Navigate to System Scheduler > Today's Scheduled Jobs.

**Note:** It is inadvisable to modify the schedule items themselves. It is best to modify the scheduled jobs that contain them.

Each schedule item appears on the table listing.

Event scheduling

You can use various tools for scheduling actions or tasks to happen in the future.

**Maintenance schedules**

Changes to the CMDB can be managed through the Maintenance Schedules plugin, which enables changes to be proposed and viewed through a timeline.

**On-call rotation**

The Group On-Call Rotation plugin enables a schedule to be defined to determine what users are primary contacts during particular hours of the day.

**Scheduled reports**

Once you define reports, you can schedule them for emailing at a specific time, or at regular intervals, using the reporting interface.

**Scheduled workflows**
Workflows provide a robust system for automating advanced multi-step processes. Workflows are triggered by conditions, like business rules, or they can be scheduled for a particular time/recurring schedule, like scheduled jobs.

**Scheduled jobs**

Scheduled jobs are scripts you can specify should automatically generate at a specific date and time, or on a repeating basis.

**Event registry**

You can use events to schedule actions or tasks to occur when conditions are fulfilled.

For example:

- **kb.view**
  An event triggered when a user views a Knowledge Base article. You use it to trigger the script action Knowledge View that create a Knowledge Use record every time an article is viewed.

- **incident.commented**
  An event triggered when a user comments on an article, used by two incidents commented email notifications.

**Inactivity Monitors**

If a record has not been updated for a defined length of time, an inactivity monitor triggers an event.

**Script Actions**

Scripts that trigger when an event is recorded in the log. You can set scripts to execute whenever a particular activity occurs in the platform, rather than at a particular time, such as scheduled jobs, or in response to particular conditions, such as Business rules.

**Notifications**

You can also use events to trigger Email Notifications when an event is recorded in the log.

**Register an event**

You can register an event for a specific table and a business rule that fires the event.

1. To register an event, browse to **System Policy > Events > Registry**, and then click **New**.
2. On the form fill in the fields.

**Event Registration Form Completion**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of your new event.</td>
</tr>
<tr>
<td>Table</td>
<td>Database table for this event.</td>
</tr>
<tr>
<td>Description</td>
<td>Short description of the purpose of the event.</td>
</tr>
<tr>
<td>Fired by</td>
<td>Name of the business rule that runs the event.</td>
</tr>
</tbody>
</table>

Note: Only tables and database views that are in the same scope as the event appear on the listing.
### Set an inactivity monitor

You can set an inactivity monitor that triggers an event for a task record when the task has been inactive for a certain amount of time.

If the task remains inactive, the monitor repeats at regular intervals. User updates to the task record restart the monitor. If reset conditions you defined for it have not been met, the monitor does not restart when you update the task record. Inactivity monitors only apply to records on tables that extend the `Task` table, or the `Task` table itself.

When an inactivity monitor triggers, it generates an event in the form `<tablename>.inactivity` (for example, `incident.inactivity`). Define an email notification or script action to drive further action for the inactivity monitor.

A record's activity is only based on user updates. System updates do not count as activity.

1. Navigate to **System Policy > SLA > Inactivity Monitors** and click **New**.
2. Give the inactivity monitor a name.
3. Specify the type of record to monitor in the **Table** field.
4. Specify how long the inactivity monitor should wait before sending each notification in the **Wait** field.
5. Specify any additional conditions in the **Condition** field.

   At least one condition must be specified for the inactivity monitor to work.
   - If you are using incident auto-close, add a Reset condition because, if you don't, auto-close won't work properly. To prevent this reset, set a **Reset Condition** on your inactivity monitor. To learn more about Incident auto-close, see [Configure incidents to close automatically](#).
   - All conditions need to be True per user update for the Inactivity Monitor to start running. For example, Set this condition only works if the due date is earlier than the current date when user updates the task.

6. Specify an **Order** if multiple inactivity monitors might have their conditions met for a given record - the one with the lowest order is used.
7. Click **Save**.

**Note:** If you change conditions on an inactivity monitor, the monitor stops tracking previously tracked records. It does not track records that you created before the inactivity monitor, even if the record meets all other conditions.

### Escalation intervals and pause conditions

Escalation Intervals and Pause Conditions are not relevant to an inactivity monitor.

The related list and field are available because the inactivity monitor table extends the table used for SLAs, but these elements are not used in any way when an inactivity monitor attaches or is triggered.
Viewing record information over time

You can use three different interfaces to view record information over time: reports and performance analytics, timeline pages, schedule pages.

Reports and performance analytics

![Incidents Resolved per Month by Assignment Group (column chart)](chart)

Report example

You can visualize data in two ways:
- **Reporting** enables users to generate charts from data within the platform in various formats. Reporting is available as a standard part of the platform and offers a snapshot of current data.
- **Performance Analytics** enable you to track and aggregate data over time. For example, you can measure how many tickets are resolved each week per assignment group. Performance Analytics is enabled for the Incident table by default. To track data for other tables and applications you must license [Activating your Performance Analytics subscription](#).
Timeline pages

Timeline pages example

This type of page enables you to define linear time lines from records with time information.
Schedule pages

Timeline pages

Use timeline pages to track any activity bounded by two dates, such as change request start and end dates, or incident open and close dates. Administrators can create timeline pages, which are user interactive.

Features

- Make selected timelines available to users by role.
- Select perspective from daily to yearly views.
- Create dynamic labels for timeline spans.
- Configure tooltips for each span.
- Permit span dragging and resizing by users.
- Lock timelines to prevent editing.
Viewing timelines

By default, only administrators have a module to access timeline records. ITIL users can only view timelines by selecting a context menu item from an incident record.
Administrator role users

Users with an administrator role can view timelines from the timeline page records.

1. Navigate to System UI > Timeline Pages.
2. Select a timeline record to view.
3. Click View Timeline.

Other users

By default, timeline metrics only appear for incident records. ITIL users can view timelines associated with any task record where the metrics are set to appear as timeline records. To view the Assigned to duration and the State duration metric timelines, ITIL users can select the Metrics Timeline context menu UI action.

1. Navigate to active task record, such as an incident.
2. Right-click the banner, and select Metrics Timeline.

To enable non-administrators to view other timelines, create a custom module.

Timing functionality

Timing functionality are tools that exist to answer the question "How Long?"

Metric definitions

Defined metrics can track how long an audited field holds a certain value.

For instance, a metric can track how long an incident is assigned to an individual, or how long an incident is in the state Active.

Time configuration SLAs

Service Level Agreements time how long a task meets a certain condition, and is primarily used to ensure that tasks are handled within a pre-determined time limit.

SLAs define the following conditions:

• Start Conditions
• Pause Conditions
• Stop Conditions

Once a task meets the Start Conditions, the SLA will time how long the task remains in that condition (unless it meets Pause Conditions). The timer will end if the Stop Conditions are met. If the time-limit is passed, the SLA will be marked breached.

Notifications can be driven off of the SLA to warn interested parties as the time limit approaches.

For more information on SLA configuration, see Configure SLAs.

Time worked fields

The Task [task] table provides a time-tracking field called Time worked. This field measures how long a record has been viewed in order to measure work time on a ticket.
Any table that extends Task can use this field. To add the field, configure the form.

As the record is viewed, the timer counts upward. To pause the timer, click the stop icon ( ].

To resume the timer, click the start icon ( ].

When the task is saved, the amount of new time in the timer is used to generate a record on the Time Worked table. This table can be viewed as a related list on the task form.

By default, the time displayed in the Time worked field displays a cumulative value stored in the task record. If you modify a Time Worked record, the changes will not be reflected in the task timer.

You can set the property com.snc.time_worked.update_task_timer to enable updating of the task timer value based on changes to the time worked records. This is accomplished through the Update task timer business rule.

Create a timeline page

Create a timeline page to track any activity bounded by two dates.

Navigate to System UI > Timeline Pages and create a new record (see table for field descriptions).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name that describes the function of this timeline. For example, High Priority Change Requests.</td>
</tr>
<tr>
<td>Table</td>
<td>Name of the table associated with this timeline, such as Change Request [change_request].</td>
</tr>
<tr>
<td>Start date field</td>
<td>Time-related field from the specified table to use as the start date for the timeline. The timeline begins with the span for the record with the earliest start date from this field, after it applies the filter and sort order. For example, you can select Updated as the start date field. It then starts the span for each active change request on the date it was updated to a high priority.</td>
</tr>
<tr>
<td>End date field</td>
<td>Time-related field from the specified table to use as the end date for the timeline. The timeline ends with the span for the record with the latest date from this field, after it applies the filter and sort order. For example, you can select Closed as the end date field and display all high priority change requests by the date on which they were closed.</td>
</tr>
</tbody>
</table>

Display Options

Show grid lines     | Select this check box to show horizontal background shading to highlight alternate spans. |
Show left pane      | Select this check box to show label text in a pane on the left of the timeline. The text that appears in this pane is defined in Span text fields. |
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show summary pane</td>
<td>Select this check box to show the pink, perspective slider at the bottom of the timeline. Move the slider from right to left to scroll across the chart. Adjust the end points of the slider to change the magnification. A narrow slider zooms in on the spans and provides a more detailed view. A wide slider pulls the view out and makes more of the timeline visible on the screen.</td>
</tr>
<tr>
<td>Auto refresh</td>
<td>Select an automatic refresh interval or disable automatic refresh. When auto refresh is disabled, the timeline adjusts only when the browser is manually refreshed or when a start or end date field is updated in a record.</td>
</tr>
<tr>
<td>CSS span color</td>
<td>Enter a custom span color using any CSS color format, such as RGB or hexadecimal. If this field is blank, the default span color, light blue, is used. The dark blue color indicates tasks that have a planned start date only, with no planned end date. Adding a planned end date updates the color to light blue.</td>
</tr>
<tr>
<td>Show span text</td>
<td>Select this check box to display the content of the <strong>Span text fields</strong> as labels below each span.</td>
</tr>
<tr>
<td>Span text fields</td>
<td>Select fields from the specified table to have those values appear as span labels. For example, you might select <strong>Number</strong> and <strong>Short description</strong>. The span labels also appear in the left pane if the left pane is visible.</td>
</tr>
<tr>
<td>Show tooltips</td>
<td>Select this check box to display tooltips when the cursor rests on a span.</td>
</tr>
<tr>
<td>Tooltip text fields</td>
<td>Select from the specified table the fields whose values appear as tooltips. For example, you might select <strong>Category</strong>, <strong>Assigned to</strong>, and <strong>Due date</strong>.</td>
</tr>
</tbody>
</table>

**Filtering and Sorting**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Create a condition to filter the results that appear in the timeline. For example, a condition that displays only active, high priority incidents. Add the condition count to a condition field to preview what records will be returned by this condition set.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perform custom sort?</td>
<td>Select this check box to enable custom sorting. Configure the sort order by selecting fields in the <strong>Sort by</strong> and <strong>Sort by order</strong> fields.</td>
</tr>
<tr>
<td>Sort by</td>
<td>Select any field in the list for sorting the spans in the timeline. Common practice is to select either the <strong>Start date field</strong> or the <strong>End date field</strong> as the sorting field. If you select a different sorting field, also include that field in the list of <strong>Tooltip text fields</strong> to give users a way of discovering the sort criteria.</td>
</tr>
<tr>
<td>Sort by order</td>
<td>Select the sort order for the sorting fields selected.</td>
</tr>
<tr>
<td>Interactive Options</td>
<td></td>
</tr>
<tr>
<td>Allow horizontal moving?</td>
<td>Select this check box to permit users to drag timeline spans horizontally. Dragging changes the start and end dates and updates the record.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow start time dragging?</td>
<td>Select this check box to permit users to update the record by dragging the start time of a span.</td>
</tr>
<tr>
<td>Allow end time dragging?</td>
<td>Select this check box to permit users to update the record by dragging the end time of a span.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>Range calculator</td>
<td>Specify a script include that calculates range restrictions and processes parent updates, if appropriate.</td>
</tr>
</tbody>
</table>

A completed Timeline Page record looks like this.
Customize the timeline page span style

The Timeline Page Span Styles related list allows you to define conditional span styles.

1. Navigate to **System UI > Timeline Pages**.
2. Open the timeline page for which you want to define the span style.
3. Go to the Timeline Page Span Styles related list and click **New**.
4. Fill in the form and click **Submit**.

### Customizing timeline page span styles

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition</td>
<td><strong>Condition Builder</strong> that filters the results that appear in the timeline.</td>
</tr>
<tr>
<td>Label color</td>
<td>Color for the text under each span.</td>
</tr>
<tr>
<td>Label decoration</td>
<td>Character style for the text under each span: <strong>Bold</strong>, <strong>Italic</strong>, <strong>Underline</strong>, or <strong>Line-through</strong>.</td>
</tr>
<tr>
<td>Order</td>
<td>Number to determine the sequence in which the style conditions are evaluated. Style conditions with a lower order are evaluated first.</td>
</tr>
<tr>
<td>Span color</td>
<td>Color of each span.</td>
</tr>
<tr>
<td>Timeline page</td>
<td>Timeline page to which the span style applies. By default, the span applies to the current timeline.</td>
</tr>
</tbody>
</table>

### Timeline sub item

Use the Timeline Sub Items related list to define child spans for the timeline, based on records in a table that references the parent timeline’s table.

You can create a timeline sub item generate a hierarchical relationship, starting from a timeline page to any number of levels. For example, if there is a timeline page for a release, the sub item might be sprints, and the sprint might have stories as a sub item.

1. Navigate to **System UI > Timeline Pages**.
2. Open the timeline page for which you want to add a sub item.
3. Go to the Timeline Sub Items related list and click **New**.
4. Fill in the form (see table for field descriptions) and click **Submit**.

### Timeline Sub Items

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent</td>
<td>[Read-only] Identifies the parent of the timeline sub item.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a unique name that describes the function of this timeline. For example, Sprints for late Priority Changes.</td>
</tr>
<tr>
<td>Table</td>
<td>Select the table called by this timeline. The selected table must contain at least one field that references the table you selected for the parent timeline page. For example, if the parent timeline page uses the Scrum Release [rm_release_scrum] table, you might choose the Sprint [rm_sprint] table for a timeline sub item.</td>
</tr>
<tr>
<td>Field</td>
<td>Definition</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Start date field</td>
<td>Select a time-related field from the specified table to use as the start date for the timeline. For example, Planned start date.</td>
</tr>
<tr>
<td>End date field</td>
<td>Select a time-related field from the specified table to use as the end date for the timeline. For example, Planned end date.</td>
</tr>
<tr>
<td>Parent Reference Column</td>
<td>Select a reference field on which to base the timeline connection between the sub item records and the parent records.</td>
</tr>
<tr>
<td></td>
<td>• If multiple reference fields are available, choose the reference field that forms part of the hierarchy modeled by this timeline.</td>
</tr>
<tr>
<td></td>
<td>• If this list is blank, the sub item table contains no reference fields to the parent table. In this case, you must choose a different table</td>
</tr>
<tr>
<td></td>
<td>for the sub item. ServiceNow uses the parent reference column to determine which records appear at each level of the timeline.</td>
</tr>
</tbody>
</table>

**Display Options**

| CSS span color               | Enter a custom span color using any CSS color format, such as RGB or hexadecimal. If this field is blank, it uses the default span color, light blue. The dark blue color indicates tasks with a planned start date only, with no planned end date. Adding a planned end date updates the color to light blue. |
| Span text fields             | Select fields from the specified table to have those values appear as span labels. For example, you might select **Number** and **Short description**. If the timeline displays the left pane, span labels also appear in the left pane. |
| Tooltip text fields          | Select fields from the specified table to have those values appear as tooltips. For example, you might select **Category**, **Assigned to**, and **Due date**. |

**Filtering and Sorting**

| Condition builder            | Create a condition to filter the results that appear in the sub item. For example, you might create a condition that displays only active, high priority incidents. |
| Perform custom sort          | Select this check box to enable custom sorting. Configure the sort order by selecting fields in the **Sort by** and **Sort by order** fields. |
| Sort by                      | Select any field in the list for sorting the spans in the timeline. Common practice is to select either the **Start date field** or the **End date field** as the sorting field. If you select a different sorting field, also include that field in the list of tooltip text fields to give users a way of discovering the sort criteria. |
| Sort by order                | Select the sort order for the sorting fields selected.                                                                                       |

**Interactive options**
### ServiceNow

#### DocVersion

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow horizontal moving?</td>
<td>Select this check box to permit users to drag timeline spans horizontally. Dragging changes the start and end dates and updates the record.</td>
</tr>
<tr>
<td>Allow start time dragging?</td>
<td>Select this check box to permit users to update the record by dragging the start time of a span.</td>
</tr>
<tr>
<td>Allow end time dragging?</td>
<td>Select this check box to permit users to update the record by dragging the end time of a span.</td>
</tr>
</tbody>
</table>

**Restriction**

Specify the behavior when you drag a child span. This option is available only if you did not specify Range calculator for the parent timeline page.

- **None**: No restriction is in place.
- **Restrict by parent**: Move the child span only within the time frame defined by the parent span.
- **Update parent**: Update the span when you move the child span outside the time frame defined by the parent span.

---

**Display a metric as a timeline**

Administrators can enable users to display any metric on a timeline by activating the **Timeline Metrics** UI action.

1. Navigate to **Metrics > Definitions**.
2. Select the metric you want to display on a timeline. For example, Problem State Duration.
3. Select the **Timeline** check box.
4. **Click Update.**

The UI action is available on the same table as the metric. By default, only Incident metrics are available.

**Make a timeline visible to a selected user**

Create a custom module within an application and defining the roles that can access it, to make selected timelines available to users.

To permit these users to update task records directly from the timeline, configure the timeline to enable span dragging.

**Note:** Timelines delivered by a custom module are not entirely dynamic. The left pane, summary pane, auto-refresh feature, and the grid lines are not dynamic, and do not reflect updates to the timeline record after creating the module link. However, the data represented by the spans, labels, and tooltips display all updates in the custom module.

To create a timeline page module:

1. **Click the Edit application** icon on an application (such as Incident) in the navigation pane.
2. In the application Modules related list, click **New**.
3. **Configure the Module form to add the Timeline page field.**
4. **Fill in the form as described in the table and click Submit.**

The Module form provides the following fields.
# Making timelines visible to selected users

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Name of the module as it appears in the navigation pane. For example, you might use Planning Timeline.</td>
</tr>
<tr>
<td>Order</td>
<td>Number to determine the sequence in which this condition should be evaluated if more than one matching condition exists. Conditions with a lower order are evaluated first.</td>
</tr>
<tr>
<td>Application</td>
<td>Application for the new module.</td>
</tr>
<tr>
<td>Hint</td>
<td>Brief description of the module that appears when the user places the cursor over the module name. For example, you might enter Weekly view of high priority changes.</td>
</tr>
<tr>
<td>Active</td>
<td>Check box that enables the module for the defined roles. Clear this check box to disable the module for all users.</td>
</tr>
<tr>
<td>Image</td>
<td>Icon that should appear with the module name.</td>
</tr>
<tr>
<td>Link type</td>
<td>Select Timeline Page. When you select this link, the Timeline Page field appears.</td>
</tr>
<tr>
<td>Timeline Page</td>
<td>Timeline page you want to appear in this module. For example, for the Change application select a change-related timeline, for the Incident application select an incident-related timeline.</td>
</tr>
<tr>
<td>Roles</td>
<td>Roles that can access this module.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Override application menu roles</td>
<td>Check box that indicates that this module should appear when the user has the specified roles. Otherwise, the user must have the roles specified by both the application menu and the module.</td>
</tr>
</tbody>
</table>

The completed module form looks like this.
A module is a link or separator in the application menu. A link gives users quick access to items like a homepage or a list of records. A separator is a horizontal line that you can use to separate modules into sections. More info

Title: Planning Timeline
Application: Global
Application menu: Incident
Hint: Weekly view of high priority changes
Order:

Visibility
Roles: Itil_admin
Override application menu roles: 
Active: 

Link Type
Select the type of link for the module or select separator to create a horizontal line. The fields below change depending on your selection.
Link type: Timeline Page
Timeline page: Change Schedule

Submit
**Range calculator scripts**

You can specify a script include that calculates range restrictions and processes parent updates in a timeline page.

**Range Calculator Scripts**

Following are three examples of script includes that help specify range restrictions.

**ExampleUpdateParentsRangeCalculator**

Updates parent records when a child record span is moved or resized in the timeline.

```javascript
var ExampleUpdateParentsRangeCalculator = Class.create();
ExampleUpdateParentsRangeCalculator.prototype = {
    initialize: function() { },
    updateParents: function(id, table, startDate, endDate){
        if (table == "rm_sprint"){
            var releaseID;
            var sprint = new GlideRecord(table);
            sprint.addQuery('sys_id', id);
            sprint.query();
            if (sprint.next())
                releaseID = sprint.release + "";
            if (releaseID) {
                var now_GR = new GlideRecord("rm_release_scrum");
                gr.addQuery("sys_id", releaseID);
                gr.query();
                if (gr.next()) {
                    if (startDate && startDate < this.getTimeMs(gr.start_date))
                        gr.start_date = this.getTimeObject(startDate);
                    if (endDate && endDate > this.getTimeMs(gr.end_date))
                        gr.end_date = this.getTimeObject(endDate);
                    gr.update();
                }
            }
        }
        },
    getMinRangeDetails: function(id, table){ return [-1, -1, "", "];
},
    getMaxRangeDetails: function(id, table){ return [-1, -1, ""];
},
    getTimeMs: function(date){
        return new GlideScheduleDateTime(date).getMS();
},
    getTimeObject: function(timeMS) {
        var gdt = new GlideDateTime();
        gdt.setNumericValue(timeMS);
        return gdt;
    },
    logMessage: function(message){ gs.log(message); },
    type: 'ExampleUpdateParentsRangeCalculator'
}
```

In this example, the span is identified based on the id and table from function(id, table, startDate, endDate).

**ExampleMinRangeCalculator**

Defines the earliest start date and the latest end date for a specified span.

```javascript
var ExampleMinRangeCalculator = Class.create();
ExampleMinRangeCalculator.prototype = {
    initialize: function() { },
    updateParents: function(id, table, startDate, endDate){
    },
    getMinRangeDetails: function(id, table){ return [-1, -1, "", ""];
},
    getMaxRangeDetails: function(id, table){ return [-1, -1, ""];
},
    getTimeMs: function(date){
        return new GlideScheduleDateTime(date).getMS();
},
    getTimeObject: function(timeMS) {
        var gdt = new GlideDateTime();
        gdt.setNumericValue(timeMS);
        return gdt;
    },
    logMessage: function(message){ gs.log(message); },
    type: 'ExampleMinRangeCalculator'
}
```

In this example, the span is identified based on the id and table from function(id, table, startDate, endDate).
var minID = "";
var maxID = "";
if (table == "rm_release_scrum"){
  var now_GR = new GlideRecord("rm_sprint");
  gr.addQuery("release", id);
  gr.query();
  while(gr.next()){
    var start = this.getTimeMs(gr["start_date"]);
    var end = this.getTimeMs(gr["end_date"]);
    var id = gr["sys_id"];
    if (min == -1 || start <= min){
      if (start != min)
        minID = "";
      min = start;
      minID +="," + id;
    }
    if (max == -1 || end >= max){
      if (end != max)
        maxID = "";
      max = end;
      maxID += "," + id;
    }
  }
}
return [min, max, minID, maxID];
}

getMaxRangeDetails: function(id, table){ return [-1, -1, "", ""]; },
getTimeMs: function(date){ return new GlideScheduleDateTime(date).getMS(); },
getTimeObject: function(timeMS) {
  var gdt = new GlideDateTime();
  gdt.setNumericValue(timeMS);
  return gdt; },
logMessage: function(message){ gs.log(message); },
type: 'ExampleUpdateParentsRangeCalculator'
}

ExampleMaxRangeCalculator

Defines the earliest start date and the latest end date for a specified span.

var ExampleMaxRangeCalculator = Class.create();
ExampleMaxRangeCalculator.prototype = {
  initialize: function() { },
  updateParents: function(id, table, startDate, endDate){ },
  getMinRangeDetails: function(id, table){ return [-1, -1, "", ""]; },
  getMaxRangeDetails: function(id, table){
    if (table == "rm_sprint"){
      var sprint = new GlideRecord(table);
      sprint.addQuery('sys_id', id);
      sprint.query();
      if (sprint.next())
        releaseID = sprint.release + "";
      if (releaseID) {
        var now_GR = new GlideRecord("rm_release_scrum");
        gr.addQuery("sys_id", releaseID);
        gr.query();
        if (gr.next())
          return [this.getTimeMs(gr.start_date),
                  this.getTimeMs(gr.end_date), gr.sys_id];
    }
  }
  return [-1, -1, ""];
Timelines

Timelines display a linear calendar of tasks, such as incidents and change requests, defined by their start and end dates.

A span represents each task on the timeline, which is displayed as a horizontal bar and may have distinctive color coding. Each span has a label and can have tooltip text containing additional information about the task. You can also change the perspective of the calendar for a more granular view of the data.

Changes in perspective

Use the range selectors at the top of the timeline to change the perspective.

The increments go from one day to one year. To limit the timeline to an increment between the start date of the first span and the end date of the last span, click Max. Use the starting and ending calendar fields to select the timeline perspective. These fields control the same perspective as the slider at the bottom of the timeline. The green, vertical line indicates the current date and time, and sweeps across the timeline automatically.

Timeline Perspective Slider

The pink slider at the bottom of the timeline offers another way to change the perspective. Move the slider from right to left to view all the spans on a long timeline. Adjust the end points of the slider to make arbitrary changes to the magnification. A narrow slider zooms in on the spans and provides a more detailed view of complex timelines. A wide slider pulls the view out and makes more of the timeline visible on the screen.
Managing spans
You can view span details, focus and zoom spans, and edit spans.

A span represents each task on the timeline, which is displayed as a horizontal bar and may have distinctive color coding. Each span has a label and can have tooltip text containing additional information about the task. You can also change the perspective of the calendar for a more granular view of the data.

Span details
If the left navigation pane is visible, the span label is visible in the left pane.
If the left pane is hidden, point the cursor over a span to view the tooltip.

Timeline Tooltip

Span focus and zoom
You can use keyboard shortcuts when using timelines.

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td>Macintosh</td>
<td>Command + Click</td>
</tr>
<tr>
<td>Windows</td>
<td>Control + Click</td>
</tr>
</tbody>
</table>

Span edits
If the timeline has been configured for editing (horizontal moving, start and end date dragging), use the mouse to adjust the spans to suit your needs.
Move the start or end dates to change the duration of the task.
Client transaction timings

The Client Transaction Timings plugin enhances the system logs by providing additional information about the durations of transactions taking place between the client and the server.

You can track down performance issues to their source by viewing where the time is being consumed, and how time was spent during a transaction.

This plugin requires the Response Time Indicator Response Time Indicator to be enabled, and collects information from the following browsers:

- Firefox
- Internet Explorer
- Chrome
Client Transactions Information

Installing the plugin adds the **Client Transactions** module to the **System Logs** application. It provides a list of every logged transaction between client and server within the last day:

### Client Transactions Information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created</td>
<td>Moment the transaction was recorded.</td>
</tr>
<tr>
<td>Response Time</td>
<td>Number of ms spent by the server in fulfilling the transaction.</td>
</tr>
<tr>
<td>Business Rule Time</td>
<td>Number of ms spent by business rules triggered by the transaction.</td>
</tr>
<tr>
<td>SQL Time</td>
<td>Number of ms spent by the SQL database.</td>
</tr>
<tr>
<td>Client Response Time</td>
<td>(Load_completion_time) - (start_time). It is inclusive of server time.</td>
</tr>
<tr>
<td>Client Network Time</td>
<td>Number of ms spent by the network the client is connecting through.</td>
</tr>
<tr>
<td>Browser Time</td>
<td>Number of ms spent by the browser during the transaction.</td>
</tr>
<tr>
<td>Client Script Time</td>
<td>The number of ms spent executing client scripts.</td>
</tr>
<tr>
<td>UI Policy Time</td>
<td>Number of ms spent executing ui policy.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of transaction:</td>
</tr>
<tr>
<td></td>
<td>• Form</td>
</tr>
<tr>
<td></td>
<td>• List</td>
</tr>
<tr>
<td></td>
<td>• Other</td>
</tr>
<tr>
<td>Table</td>
<td>Name of table that appeared. For example, incident, change_request.</td>
</tr>
<tr>
<td>View</td>
<td>View for this form/list.</td>
</tr>
</tbody>
</table>

### Client Detailed Information

A more detailed breakdown of the client timings for all Form rendering (but not list rendering) is also tracked. To see details, drill into a particular client transaction record and observe the related list at the base of the screen.

### Client Detailed Information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order</td>
<td>Order during the load in which this operation occurred.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of operation.</td>
</tr>
<tr>
<td>Name</td>
<td>Descriptive name of this particular operation</td>
</tr>
<tr>
<td>Duration</td>
<td>Number of ms this operation took to complete.</td>
</tr>
</tbody>
</table>
Components installed with Client Transaction Timings

The Client Transaction Timings plugin installs several components.

Database Table Structure

The plugin adds the table `syslog_client_transaction`.

Scripts

The plugin relies on the new script include `AJAXClientTiming`. This script gathers the information required and populates them on the `syslog_client_transaction` table.

Dependencies

This plugin does not require any other plugins, but does not gather information unless the Response Time Indicator `Response Time Indicator` is enabled.

Activating the Plugin

To activate the plugin, navigate to `System Definition > Plugins` and activate the plugin.

Note: New instances have the plugin activated by default.

Timing values

Timing values are broken down into several sections.

Client Transaction Timing

The variables in this diagram are defined as follows:
### Timing Values

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_time</td>
<td>Date and time the user requests a page (the user clicks on a link). This value is set by hooking into the <strong>beforeunload</strong> event of the previous page. WebKit browsers do not properly support the <strong>beforeunload</strong> event, which is why the client timings are not supported in Safari orChrome.</td>
</tr>
<tr>
<td>load_time</td>
<td>Date and time that the current page starts loading in the browser. An inline javascript that runs as the first script in the HTML body sets this value.</td>
</tr>
<tr>
<td>server_time</td>
<td>Time in ms spent by the server processing the transaction. The server reports this value to the client.</td>
</tr>
<tr>
<td>load_completion_time</td>
<td>Date and time that the page is fully rendered in the browser. This operation is performed as the last script on the page and identifies the time the page completed loading.</td>
</tr>
</tbody>
</table>

The following timings are reported at the bottom right of many forms and lists:

### Timing Values

<table>
<thead>
<tr>
<th>Label</th>
<th>Element</th>
<th>Description</th>
<th>Calculation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response Time</td>
<td>client_response_time</td>
<td>Overall time to deliver the page by subtracting the time the user requests the page from the time the page is fully rendered in the browser.</td>
<td>load_completion_time - start_time</td>
</tr>
<tr>
<td>Server Time</td>
<td>client_server_time</td>
<td>Time the server takes to process the transaction.</td>
<td>server_time</td>
</tr>
<tr>
<td>Network Time</td>
<td>client_network_time</td>
<td>Time the network takes to process the request. Calculated by subtracting the time of the user's request, from the time the page starts loading in the browser, and then subtracting the server processing time.</td>
<td>load_time - start_time - server_time</td>
</tr>
<tr>
<td>Browser Time</td>
<td>browser_time</td>
<td>Time the browser takes to deliver the page by subtracting the time the page is fully rendered from the time the page starts loading in the browser.</td>
<td>load_completion_time - load_time</td>
</tr>
</tbody>
</table>
Define a relative duration

You can define a relative duration to work out duration time for SLAs.

- From the left navigation pane, select **System Scheduler > Relative Durations**.

  Four base Relative Durations are available:
  
  - Two business days by 4pm
  - Three business days by 4pm
  - Next business day by 4pm
  - End of next business day

  **Note:** The business schedule you use defines business day durations. If you define no schedule, by default the durations are 24 X 7.

Look at the End of next business day Relative Duration. From the Relative Durations list, select the **End of next business day** Relative Duration. The variable `days` is set to one, because the result of this calculation should land one day in the future. The rest of the script is as in the screenshot. If desired, you can customize the time at which you want the Relative Duration to end (currently set to 5pm).

```javascript
// Next business day by 5pm
var days = 1;

calculator.calcRelativeDueDate(calculator.startDate, days, '17:00:00');
```

There is one more important Relative Duration design aspect that is used by the other three out-of-box Relative Durations. To illustrate this design let's look at **2 business days by 4pm**.

As you can see in the image, within the script there is an if-statement. This if-statement is checking to see if the calculated time is after 10am. If it is, then an extra day is added to the calculation. Hence the description of **2 business days by 4pm if before 10am.**
The "End of the business day" has nothing to do with the associated schedule. The end time of 17:00 is hard-coded into this Relative Duration script. If you want the time to be different than 5pm, you must change it in the script.

Use a relative duration

When you define an SLA, you can set the Duration type to be a relative duration.

When using relative durations, you can also use the Relative duration works on field. It calculates against the SLA record, or the task record that the SLA record is used for.

This example demonstrates how a relative duration of End of next business day works.

1. Create an SLA that has a relative duration of End of next business day.
2. Complete the rest of the fields of this SLA with the values as shown, also setting a Schedule and a Timezone if you want.
3. To show how this Relative Duration works, create a new incident. The SLA starts for this incident. If you look at the **Planned End Date** field, notice that the date is the next business day at 5pm (See image).

![Incident Details]

**Note:** Pause conditions are not compatible with Relative Durations.

---

**Search administration**

The Now Platform includes multiple search engines and interfaces to help users easily and quickly find the information they need.

**Search engines**

The Now Platform includes two search engines:

- **Zing text indexing and search engine**
  Default search engine which provides fast results and emphasizes relevancy scoring.

- **AI Search**
  Provides consumer-grade search capabilities for , , and .

**Search plugins**

These search plugins offer specialized search experiences for particular search contexts.

**Contextual Search**

The Contextual Search plugin enables search that focuses on query context and user intent to fetch the most relevant set of results. Contextual search displays related results within a form or record producer based on the text you enter in a field.
CMDB Search

The CMDB Search plugin enables users to query CMDB CIs and relationships through the global text search field. CMDB depends upon the Zing text indexing and search engine.

Search interfaces and widgets

These are search fields and widgets offered in the Now Platform UI or in Now Platform applications.

Global text search

The global text search field in the Now Platform UI enables search of multiple tables from a single search field.

Service Portal

The Service Portal framework displays search data within a widget on the search page.

Service Portal search widgets

Service Portal includes widgets for multiple forms of search.

Now Mobile app

The Now® Mobile app provides global text search, voice search, and photo search.

Mobile Agent

The Mobile Agent app enables service desk agents to promptly manage and resolve end user issues from their mobile devices.

Virtual Agent

The Virtual Agent platform uses search to help parse user statements and intents.

Agent assist

The Agent assist feature in Workspace automatically displays possible solutions for records that agents open.

Machine learning solutions for Search administration

Machine learning in Search administration helps to enhance business scalability and improve business operations for organizations.

Businesses face a challenge with growing volumes of data, in extracting meaningful information from a huge set of raw data, and in deriving meaningful business insights. Machine learning can serve as a solution to a variety of business complexities as its algorithm is built using historical data. It helps avoid duplicate and inaccurate data being entered into the database and enables businesses to compute and process information much faster.

Predictive Intelligence for Contextual Search

The Predictive Intelligence for Contextual Search capability uses machine-learning algorithms to search for Similar Incidents, Similar Knowledge Articles, Similar Open Incidents, and Similar Resolved Incidents.

Predictive Intelligence suggests related results to help you solve an issue or resolve a question.

The sources such as Similar Incidents, Similar Knowledge Articles, Similar Open Incidents, and Similar Resolved Incidents are available only when the Predictive Intelligence plugin (com.glide.platform_ml) and the Predictive Intelligence for Contextual Search plugin (com.snc.contextual_search_ml) are available.
Features of Search administration

Enable and configure Search administration features.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>Top tasks</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>

Search Suggestions

The Search Suggestions application displays possible search completions or results to users as they enter terms into a search field. Search Suggestions supports the Service Portal, Now Mobile, and Virtual Agent search applications.

Search Suggestions stores search strings entered by users in the Search Event [sys_search_event] table. It periodically runs the **Build Search Suggestions** script to convert these search strings into search and auto-complete suggestions and store them in the Search Suggestion [sys_search_suggestion] table.

Display search suggestions for Zing users

The Zing text indexing and search engine use Search Suggestions to provide search suggestions to users as they enter search terms. Search suggestions indicate possible completions of the user’s search query.

Zing displays search suggestions in the Service Portal and Now Mobile search applications.

**Note:** If either of these search applications has the AI Search engine enabled, it displays auto-complete suggestions instead, as described in the following section.

For more details on Zing search suggestions, see Zing displays search suggestions as users enter search terms.

Display auto-complete suggestions for AI Search users

The **AI Search** engine uses Search Suggestions to provide auto-complete suggestions to users as they enter search terms. Unlike search suggestions, auto-complete suggestions can include possible search results as well as possible search query completions.

Auto-complete suggestions appear in search applications that have AI Search enabled. These typically include Service Portal, Now Mobile, and Virtual Agent.

For details on AI Search auto-complete suggestions and instructions for configuring them in search applications, see Auto-complete suggestions in AI Search applications.
Search Suggestions rules

In both Zing and AI Search, suggestions offered by the Search Suggestions application obey the following rules:

• Suggestions are search source-specific. For example, if you use the Service Catalog homepage search feature in the Service Portal, you only receive suggestions generated from users who were also searching within the Service Catalog.
• Suggestions are interface-specific. For example, if you use the search feature in the Service Portal, you only receive suggestions generated from search queries in the Service Portal, not, for example, from Now Mobile. Each unique Service Portal has its own suggestions, and they are not shared with other portals.
• Suggestions are in the same language as the current user’s language.
• Suggestions for external users are not shared with internal users, and conversely.

Schedule the Build Search Suggestions script

Specify when to run the script that builds search and auto-complete suggestions from user search strings.

Role required: admin

Search Suggestions stores search strings entered by users in the Search Event [sys_search_event] table. The Build Search Suggestions script turns those search strings into search and auto-complete suggestions and stores them in the Search Suggestion [sys_search_suggestion] table.

By default, this script runs daily. You can customize how often and at what time the script runs. How often you run the script depends on how frequently you want to update suggestions for users. When you run the script might depend on performance considerations.

1. Navigate to Scheduled jobs and click Build Search Suggestions.
2. In the Scheduled Search Execution form, edit how often the script runs in the Run field.
3. Edit the time of day the script runs in the Time field.
4. Click Update.
5. Optional: Click Execute Now to run the script immediately.

Prevent the creation of suggestions in special cases

Disable generation of suggestions from specific search strings to keep expletives from appearing in search results or to prevent disclosure of personal or secure information.

Role required: admin

Search Suggestions generates search and auto-complete suggestions from the search strings that users enter. You may not want to create suggestions from all search strings. You can prevent the generation of suggestions using one of the following approaches:

• Exclude words or regular expressions from search and auto-complete suggestions.

For example, a user might search on KB2938272. This search string is too opaque to provide a meaningful suggestion. Or, someone might enter a social security number or phone number as search strings which should not be surfaced as suggestions to anyone else. So, you might exclude all search strings that contain multiple numbers. Likewise, if someone uses an expletive in a search string, you may not want to surface that word in suggestions. The Search Suggestion Exclusion List [sys_search_suggestion_blacklist] table contains the list of excluded words.

• Assign roles to users that prevent the generation of suggestions from their search strings.

There may be individuals whose searches should not appear in search or auto-complete suggestions for privacy or security reasons. To prevent their searches from generating suggestions, assign them the suggestion_exempt role.
This role is unnecessary in most situations. Search Suggestions never shows who performed the initial search. To prevent people from seeing search and auto-complete suggestions, assign them the cannot_read_suggestions role.

Search Suggestions comes with a table of excluded words and regular expressions in these languages:

- Chinese
- Czech
- Dutch
- Finnish
- French
- German
- Hebrew
- Hungarian
- Italian
- Japanese
- Norwegian
- Polish
- Portuguese
- Russian
- Spanish
- Swedish
- Thai
- Turkish

1. In a browser, navigate to https://<instance name>.service-now.com/sys_search_suggestion_blacklist_list.

2. To make a word or regular expression active or inactive:
   a) Click the term in the list that you want to activate or deactivate.
   b) In the Search Suggestion Exclusion List form that appears, select or clear the Active option.

3. To add a new excluded word or regular expression:
   a) Click New.
   b) On the form, fill in the fields.

**Search Suggestion Exclusion List form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phrase</td>
<td>Word or regular expression to exclude.</td>
</tr>
<tr>
<td>Language</td>
<td>The language that the excluded word is in. Use the ISO 639-1 code for the language, such as &quot;en&quot; for English. Because regular expressions work for all languages, search suggestions ignores this field for regular expressions.</td>
</tr>
<tr>
<td>Description</td>
<td>Explanation of why you excluded the word or regular expression if it's not obvious. This field is especially important for regular expressions.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to remove the excluded word or regular expression from suggestions.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Type</td>
<td>Option that specifies whether the Phrase field represents one word or a regular expression.</td>
</tr>
</tbody>
</table>

**Note:** If you use regular expressions, you should verify that they exclude the words you want. For more information, see Test regular expressions in Search Suggestion Exclusion List entries.

4. To assign someone a role that prevents them from seeing search and auto-complete suggestions, or to prevent their search strings from becoming suggestions:
   a) Navigate to **User Administration > Users** and click the name of a user.
   b) In the Roles related list, click **Edit**.
   c) To prevent a user from seeing search and auto-complete suggestions, move **cannot_read_suggestions** from the Collections column to the Roles List column and click **Save**.
   d) To prevent a user's search strings from generating search and auto-complete suggestions, move **suggestion_exempt** from the Collections column to the Roles List column and click **Save**.

---

**Test regular expressions in Search Suggestion Exclusion List entries**

Regular expressions are powerful and often require editing to get the correct behavior. When using regular expressions to exclude search strings, test the expressions thoroughly so as not to have unintended results.

Role required: admin

The Exclusion List Rule and Search Suggestion Relations \([m2m\_blacklist\_search\_suggestion]\) table lists the suggestions eliminated from the Search Suggestion \([sys\_search\_suggestion]\) table by entries in the Search Suggestion Exclusion List \([sys\_search\_suggestion\_blacklist]\) table.

1. In your browser, navigate to https://<instance name>.service-now.com/m2m\_blacklist\_search\_suggestion\_list.
   A list of words excluded from search suggestions appears in the Exclusion List Rule and Search Suggestion Relations table. The Suggestion column shows the search string that was eliminated in the creation of suggestions.
2. Add a regular expression to the exclusion list table.
   For more information, see Preventing suggestions in special cases.
3. In a search field, for example, on the ServiceNow\® Service Portal, enter words that satisfy the regular expression.
4. Run the script that builds the search suggestions.
   For more information, see Schedule the Build Search Suggestions script. Click **Execute Now** to run the script immediately.
5. In the m2m\_blacklist\_search\_suggestion\_list table, click the menu icon (≡) for the Exclusion List column heading and then select **Group By Exclusion List** to see the regular expressions and what they eliminated.
6. Review the suggestions in the table to see if the regular expressions removed the suggestions they should have and no more.
7. In the sys\_search\_suggestion\_blacklist table, set an excluded regular expression's **Active** field to **false**, then run the Build Search Suggestions script again to make sure that only excluded suggestions were removed.
8. Revise the regular expressions if necessary and repeat the procedure.
Schedule suggestion pruning

Search Suggestions limits the number of search and auto-complete suggestions stored in the sys_search_suggestion table to 500,000. A periodic pruning job removes the least relevant suggestions and increases the overall relevancy of suggestions.

Role required: admin

By default, the pruning job runs once a week and limits the sys_search_suggestion table to 500,000 suggestions. Once the table reaches that limit, the pruning job removes the lowest-rated search and auto-complete suggestions to keep the maximum number of suggestions at 500,000. Pruning the least relevant suggestions improves the relevancy of the suggestions.

How often you run the pruning job might depend on how quickly you generate suggestions from the sys_search_event table, and how quickly the sys_search_suggestion table exceeds 500,000 suggestions.

1. Navigate to System Definition > Scheduled Jobs.
2. Edit the Prune Search Suggestions job.
3. On the form, edit the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run</td>
<td>Frequency of execution for the pruning job. To execute the job manually, select On Demand and click Execute Now.</td>
</tr>
<tr>
<td>Day</td>
<td>Day of the week to run the pruning job.</td>
</tr>
<tr>
<td>Time zone</td>
<td>Time zone to use when interpreting the Time field value.</td>
</tr>
<tr>
<td>Time</td>
<td>Time of day to run the pruning job. Specify hours (00–23), minutes (00–59), and seconds (00–59).</td>
</tr>
<tr>
<td>Repeat interval</td>
<td>Interval between executions of the pruning job when Run is set to Periodically. Specify days (01–07, where 01 is Sunday), hours (00–23), minutes (00–59), and seconds (00–59).</td>
</tr>
<tr>
<td>Conditional</td>
<td>Script to run when executing the pruning job.</td>
</tr>
</tbody>
</table>

Note: The fields on the form change with the choice of the Run value.

4. Click Update.

Setting historical limitations for generating suggestions

Limiting the number of search strings stored in the sys_search_event table limits how far back you can go to create search and auto-complete suggestions. Set the Auto Flush parameter to how far back in time you want to go.

Role required: admin

The sys_search_event table contains all of the strings used in searches. Scripts use this table to generate search and auto-complete suggestions. A system property sets the maximum age for records in the table. The default is 180 days. If you want to review analytics and generate search and auto-complete suggestions from search strings that are more than six months old, increase the number of days. Longer durations increase the size of the table and disk consumption.

1. In Filter Navigator, enter sys_auto_flush.list.
2. Search on *search and edit the sys_search_event record.
3. On the Auto Flush form, edit the **Age in seconds** value.
   The default is 15,552,000 seconds, which is 180 days.

### Analyze search relevancy

Analyze data from the Search Suggestions tables to understand how your users interact with search.

Role required: admin

Search Suggestions uses the following tables:

- **Search Event** [sys_search_event]: Stores all search strings and search results.
- **Search Source Event** [sys_search_source_event]: Stores search strings and search results and ties them to a data source, for example, the suggestion came from the knowledge base table rather than the catalog table.
- **Search Suggestion** [sys_search_suggestion]: Stores suggestions for searches.

For details on the Search Suggestions tables, see [Understanding Search Suggestions tables](#).

1. Display the Search Event [sys_search_event] table by navigating in your browser to `https://<instance name>.service-now.com/sys_search_event_list.do`.

2. In the **Number of results** column, find search queries that had zero results.
   A value of 0 means that someone searched but didn’t get any search results. You can choose to create information, such as a knowledge article, to provide search results in the future, create synonyms for the search words that would surface a search result, or not provide information if the question is irrelevant.

3. Average the numbers in the **Click Rank** column. Goal: the lower the better.
   Click rank shows which suggestion in the list of suggestions you selected. If you click the first suggestion in the list of suggestions, the click rank value is 1. If you click the 6th suggestion listed, the click rank value is 6. If you click multiple search results, the click rank is the highest listing value. For example, if you click the first listing, return to the search page and click the 6th listing, return to the search page and click the 4th listing and find an answer, the click rank is 6 (not 4). The goal is to reduce the average of these numbers, which indicates the top suggestions are the most relevant.

4. Determine the click-through-rate by dividing the number of records where the click rank is not zero by the total number of records. Goal: the higher the number, the better.
   Click-through-rate is a good indicator of how often users find relevant results, but it doesn’t reveal how much effort it took to find those results. That’s where click rank comes in. Click rank describes how much effort it took the user to find what they perceived to be a relevant result.

5. Average the numbers in the **Refinement** column. Goal: the lower the better.
   Refinement is the number of actions a user took to reduce the number of search results. Actions include sorting and filtering. More refinements means more effort to find relevant search results.

7. In the **Has results** column, find any search queries where the result is **false**.
   False means that someone searched but didn't get any search results from a particular source table, for example, the Knowledge Base table. You can choose to create information, such as a knowledge article, on the source to provide search results in the future, create synonyms for the search words that would surface a search result in that source table, or not provide information if the question is irrelevant.
**Understanding Search Suggestions tables**

Search Suggestions uses tables to generate relevant search suggestions. By understanding these tables, you can improve the relevancy of search suggestions in your system.

**Search Event table**

The Search Event [sys_search_event] table stores search strings and their search results.

**sys_search_event table**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search query</td>
<td>Search string that the user entered.</td>
</tr>
<tr>
<td>Has results</td>
<td>Boolean value that specifies whether the search did (true) or didn't (false) return results. For all false values, consider adding information so that the same search would return suggestions in the future.</td>
</tr>
<tr>
<td>Click rank</td>
<td>Click rank shows which suggestion in the list of suggestions you selected. If you click the first suggestion in the list of suggestions, the click rank value is 1. If you click the 6th suggestion listed, the click rank value is 6. If you click multiple search results, the click rank is the highest listing value. For example, if you click the first listing, return to the search page and click the 6th listing, return to the search page and click the 4th listing and find an answer, the click rank is 6 (not 4). The goal is to reduce the average of these numbers, which indicates the top suggestions are the most relevant.</td>
</tr>
<tr>
<td>User</td>
<td>User who performed the search.</td>
</tr>
<tr>
<td>Application ID</td>
<td>Application where the search feature was used, for example, you did a search in the Service Portal. See UI source.</td>
</tr>
<tr>
<td>Language</td>
<td>Language of the query. Search only returns suggestions that are in the same language as the search query.</td>
</tr>
<tr>
<td>Refinements</td>
<td>Number of actions that you took to reduce the number of search results. Actions include sorting and filtering. The goal is to reduce this number.</td>
</tr>
<tr>
<td>UI source</td>
<td>Specific screen (mobile) or page (portal) where the search query came from. See Application ID.</td>
</tr>
<tr>
<td>Session</td>
<td>ID of the session, which specifies when the search happened.</td>
</tr>
<tr>
<td>AI Search Profile</td>
<td>Name of the search profile used for the search. Only applicable for searches made with the AI Search engine.</td>
</tr>
</tbody>
</table>

**Search Event per source table**

The Search Event per source [sys_search_source_event] table stores records correlating search strings with results from a specific table, here called a data source. A search can query multiple tables. The sys_search_event table lists one record for the entire search, while the sys_search_source_event table lists one record for each data source (table) queried.
### sys_search_source_event

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search query</td>
<td>Search string that you entered.</td>
</tr>
<tr>
<td>Source</td>
<td>System ID of the data source. For example, the system ID of the Knowledge Base might be c45067sample3c82eef3e. Suggestions from one source are used as suggestions for that source only. For example, a suggestion derived from the Service Portal would not be used as a suggestion in Now Mobile.</td>
</tr>
<tr>
<td>Has results</td>
<td>Boolean value that specifies whether the source did (true) or didn't (false) supply search results. For all false values, consider adding information so that the same search query would return suggestions in the future.</td>
</tr>
<tr>
<td>Created</td>
<td>Time stamp of the search query.</td>
</tr>
</tbody>
</table>

### Search Suggestion table

The Search Suggestion [sys_search_suggestion] table stores search and auto-complete suggestions. A scheduled job uses the sys_search_event table to build the content of the suggestion table. This job segregates generated suggestions by source. Suggestions generated from searches on the Service Portal, for example, are only returned for other Service Portal searches. These suggestions are not returned for Now Mobile queries.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application ID</td>
<td>Application where the search feature was used, for example, you did a search in the Service Portal.</td>
</tr>
<tr>
<td>User group</td>
<td>Specifies whether an internal or external user generated the search query. Suggestions for internal users are not shared with external users and vice versa.</td>
</tr>
<tr>
<td>Language</td>
<td>Language of the query. Search only returns suggestions that are in the same language as the search query.</td>
</tr>
<tr>
<td>Score</td>
<td>Suggestion rank. The higher the score, the more relevant the suggestion. Once all suggestions are returned for a search query, the suggestions are sorted by Score, the highest listed first. Scores reflect how often you selected a suggestion. A popular suggestion implies that it answers the query.</td>
</tr>
<tr>
<td>Source</td>
<td>System ID of the data source. For example, the system ID of the Knowledge Base might be c45067sample3c82eef3e. Suggestions from one source are used as suggestions for that source only. For example, a suggestion derived from the Service Portal would not be used as a suggestion in Now Mobile.</td>
</tr>
</tbody>
</table>

### Domain separation and Search Suggestions

Domain separation is unsupported in the Search Suggestions application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

**Support level: No support**

- The domain field may exist on data tables but there is no business logic to manage the data.
• This level is not considered domain-separated.

For more information, see Application support for domain separation.

Overview

Domain separation provides complete data isolation for domain-specific users.

How domain separation works with Search Suggestion

By default, Search Suggestion results are limited to the specific domain of the logged-in user. Search and auto-complete suggestions are not shared in parent or child domains.

Search signals

Search stores signal data from user searches. The aggregated signal data helps improve search result relevancy in your system.

Signals record details of user searches, search refinements, and interactions with search results.

AI Search machine learning relevancy analyzes aggregated signal data and automatically tunes search relevancy scoring to reflect user behavior patterns. This tuning helps improve result relevancy for search users.

To learn more about AI Search machine learning relevancy, see Machine learning relevancy in AI Search.

Understanding search signal tables

Search uses tables to store details from user searches, search refinements, and interactions with search results. These details are called search signals. Data from the search signal tables helps improve the relevancy of search results in your system.

Search signals refer to user, query, and similar data stored in columns on search suggestion tables. For a guide to search suggestion tables and their columns, see Understanding Search Suggestion tables.

Search Signal Event table

The Search Signal Event [sys_search_signal_event] table stores signal data produced when users submit a search.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Browser</td>
<td>User browser agent string.</td>
</tr>
<tr>
<td>Latitude</td>
<td>Latitude coordinate of the user location in decimal degrees.</td>
</tr>
<tr>
<td>Longitude</td>
<td>Longitude coordinate of the user location in decimal degrees.</td>
</tr>
<tr>
<td>Column</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>First page results</td>
<td>JSON array of objects in which each node represents a single result returned in the first page of results for the search. The result order is preserved. Each object includes the unique record identifier (sys_id) of a result and the table where the result is located.</td>
</tr>
</tbody>
</table>

**Note:** The first page results are not updated when you refine a search.

---

**Search Signal Result Event table**

The Search Signal Result Event [sys_search_signal_result_event] table stores signal data for search results that users select.

### sys_search_signal_result_event

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Result DocID</td>
<td>The source table and record names for the selected search result.</td>
</tr>
<tr>
<td>Source Table</td>
<td>The source table for the selected search result.</td>
</tr>
<tr>
<td>AIS DocID</td>
<td>The source table name and record sys_id for the selected search result.</td>
</tr>
<tr>
<td>Result Type</td>
<td>The type of search result selected. For example, <strong>REGULAR</strong> for a regular search result or <strong>GENIUS</strong> for a Genius Result answer card.</td>
</tr>
<tr>
<td>Search Signal Event</td>
<td>Reference to the record for the search on the Search Signal Event [sys_search_signal_event] table.</td>
</tr>
</tbody>
</table>

---

**Search Signal Result Event Action table**

The Search Signal Result Event Action [sys_search_signal_result_event_action] table stores signal data for user interactions with search results.

### sys_search_signal_result_event_action

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signal Type</td>
<td>The type of user interaction signal recorded for the search result. For example, <strong>CLICK</strong> indicates that the user clicked a search result.</td>
</tr>
<tr>
<td>Signal Value</td>
<td>The value for the user interaction signal. For example, when the signal type is <strong>CLICK</strong>, the signal value is the numeric index for the search result that the user clicked.</td>
</tr>
<tr>
<td>Column</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Search Signal Result Event</td>
<td>Reference to the record for the search result on the Search Signal Result Event [sys_search_signal_result_event] table.</td>
</tr>
</tbody>
</table>

### Search Autocomplete Query Event table

The Search Autocomplete Query Event [sys_search_autocomplete_query_event] table stores signal data for auto-complete suggestions that users select from the search input field.

**sys_search_autocomplete_query_event**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected Query</td>
<td>The auto-complete suggested query that the user selected in the search input field.</td>
</tr>
<tr>
<td>Click Index</td>
<td>The numeric index of the auto-complete suggestion that the user selected in the search input field.</td>
</tr>
<tr>
<td>Latitude</td>
<td>Latitude coordinate of the user location in decimal degrees.</td>
</tr>
<tr>
<td>Longitude</td>
<td>Longitude coordinate of the user location in decimal degrees.</td>
</tr>
<tr>
<td>Search Profile</td>
<td>Reference to the search profile used for the search query.</td>
</tr>
</tbody>
</table>

### Genius Result Event Action table

**sys_search_genius_result_event_action**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action Id</td>
<td>The identifier for this Genius Result event action signal.</td>
</tr>
<tr>
<td>Action Type</td>
<td>The type of action taken from the Genius Result answer card.</td>
</tr>
<tr>
<td>Card Type</td>
<td>The type of Genius Result answer card that the user interacted with.</td>
</tr>
<tr>
<td>Search Signal Result Event</td>
<td>Reference to the record for the Genius Result answer card on the Search Signal Result Event [sys_search_signal_result_event] table.</td>
</tr>
</tbody>
</table>

### Zing text indexing and search engine

Index and search record data by table.

The ServiceNow® Zing text indexing and search engine is the default search engine used to search Now Platform® record data. Its engine is created entirely with ServiceNow code and implemented within the relational model.
The Zing text search index is split into multiple database shards for parallel querying. Its search engine logic yields fast results and emphasizes relevancy scoring. Relevancy scores include frequency and proximity weighting. Scores also include weighting for specific indexed fields such as title, short description, and metadata.

Zing provides type-ahead search suggestions and Did you mean: global search suggestions.

Administrators and users with the ts_admin role can configure the following Zing text search settings:

- match relevance
- relevancy field weights for each indexed table
- global stop words
- stop words for each index
- synonym dictionaries for each table
- tables with attachment indexing

### Features of Zing text indexing and search engine

Enable and configure Zing text indexing and search engine features.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>Top tasks</th>
<th>State</th>
</tr>
</thead>
</table>
| Zing indexes words                         | Index documents by dividing them into words. Depending on the languages your instance supports, a word may be a single character such as a Chinese or Japanese pictogram or a sequence of characters separated by spaces such as with Latin, Arabic, and Pinyin languages. | - Enable text indexing for a table
- Regenerate a text index for a table
- Configure tables to use the Japanese tokenizer | Active |
| Zing computes document scores using three components | Compute document scores based on the frequency, sequence, and weight of search terms in the document. | - Score search terms by inverse document frequency (IDF)
- Set the relative weight of a field | Active |
### Available search options

Zing offers users several search interfaces and search operators to conduct text searches.

#### Available search interfaces

<table>
<thead>
<tr>
<th>Search interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global text search</td>
<td>Find records in multiple tables from a single search field.</td>
</tr>
<tr>
<td>Lists</td>
<td>Find records in a list; search in a specific field (Go to), all fields (Search), or in a specific column.</td>
</tr>
<tr>
<td>Knowledge Base</td>
<td>Find knowledge articles.</td>
</tr>
<tr>
<td>Navigation filter</td>
<td>Filter the items in the application navigator.</td>
</tr>
<tr>
<td>Live feed</td>
<td>Filter, search, or sort messages in live feed.</td>
</tr>
</tbody>
</table>
**Search interface**

| UI pages | Create a custom UI page to search for records in a table. |

**Available search operators**

<table>
<thead>
<tr>
<th>Search operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boolean operators</td>
<td>Include or exclude search terms in global text searches.</td>
</tr>
<tr>
<td>Quotation marks</td>
<td>Filter search results to only include matches to an exact phrase consisting of one or more words.</td>
</tr>
<tr>
<td>Wildcard characters</td>
<td>Expand search results to match any non-space character. The system supports both single-character and multiple-character wildcards.</td>
</tr>
</tbody>
</table>

**Global text search finds records from multiple tables**

Search multiple record types from a single search field.

To perform a global text search, perform one of the following actions based on the UI version you are using.

<table>
<thead>
<tr>
<th>UI version</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>UI16</td>
<td>Click the search icon in the banner on the upper right of the System settings for the user interface (UI), and then enter the search term.</td>
</tr>
<tr>
<td>UI15</td>
<td>Enter the search term in the search box in the upper right of the UI15 banner frame and Edge buttons.</td>
</tr>
</tbody>
</table>

All UI versions also have a global text search keyboard shortcut. The `ui_global_text_search` UI Macro provides the global text search field.

By default, the system returns results for tasks, Live Feed, policy, people, places, knowledge, and catalog records.
Global text search displays results dynamically
Display global text search results for each table as Zing generates them.

Global text search results UI

Zing displays search results in a dedicated page consisting of these elements.

Elements of the global search results UI

<table>
<thead>
<tr>
<th>UI element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Search terms</td>
<td>The current search terms and a field to enter new search terms.</td>
</tr>
<tr>
<td>2. Total results</td>
<td>The total number of matching records.</td>
</tr>
<tr>
<td>UI element</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>3. Search group name</td>
<td>The name of the search group.</td>
</tr>
<tr>
<td>4. Preview of matching records</td>
<td>The partial list of matching records up to the preview limit. By default, the system displays up to 10 matching records per table, sorted from highest to lowest document score. The system displays a separate list for each table in the search group. By default, the system uses the table text_search list view if available. Otherwise, it displays fields with the default list view. Users with the admin role can set the preview results limit and the search results view from the global text search properties.</td>
</tr>
<tr>
<td>5. Table name</td>
<td>The name of the search group table and the number of matching records in the table. Click the link to launch a filtered list view based on the query. Users with the admin role can hide matching record counts by setting the <code>sn_global_searchui.hide_results_count</code> property to <code>true</code> in the System Properties table.</td>
</tr>
<tr>
<td>6. Table filter</td>
<td>The current filter applied to search results from this table. Pointing to the information icon displays a pop-up containing the search filter applied. See Add a search group for information on applying a table filter to a search group.</td>
</tr>
<tr>
<td>7. Progress bar</td>
<td>The current percentage of tables searched. The system hides this element after the search is complete.</td>
</tr>
<tr>
<td>8. Link to all table results</td>
<td>The link to see all matching records from the search group table. Click the link to launch a filtered list view based on the query.</td>
</tr>
<tr>
<td>10. Results summary</td>
<td>The list of search groups and tables with the number of search results per group and table. Click the table name to display the associated preview list results.</td>
</tr>
</tbody>
</table>

**Text search views format search results**

Configure how the system displays global text search results with a text search view.

Each search result listing consists of these elements.

1. **Number:** C:\G0000072 | **Type:** Normal | **State:** Authorize | **Planned start date:** 2017-05-19 19:30:00 | **Planned end date:** 2017-05-19 19:45:00
2. **Requested by:** System Administrator | **Assign to:** Bow Ruggeri
3. **We need to add additional redundant name servers to Linux100, Linux101 and PS LinuxApp01.**

**Sample search result listing**

Search result elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
<th>Matching criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Title</td>
<td>The title is the first line of the search result block. The title links to the matching record of the search result.</td>
<td>Global search uses the first string field in the text search view that is not the number field. If there is no matching string field or the contents of the field is empty, the system displays the text &quot;No title&quot; in the session language. For example, in the default incident table view the short description field meets the criteria to be the title.</td>
</tr>
<tr>
<td>2. Field list</td>
<td>The field list is the second line of the search results. The field lists contains a name-value pair for each field in the text search view separated by a pipe character. The system displays the field list in gray text.</td>
<td>All fields in the text search view that do not match the title or description criteria.</td>
</tr>
<tr>
<td>3. Description</td>
<td>The description is an optional third line of the search results. The system displays the description in black text.</td>
<td>Global search uses the first string field in the text search view that is not the title and is over 100 characters in length. If no field matches this criteria, the search results omit this line. For example, there is no matching description field in the text search view of the Incident table.</td>
</tr>
</tbody>
</table>

By default, the system uses the text_search list view to format global text search results. If a text_search view doesn't exist, the system instead formats search results using the default form view. Implementers can specify which view the system uses to format search results with the system property `glide.ui.text_search.view`.

**Search groups filter search results by table**

The system displays search results by search group, which are collections of related tables.

Within each search group, the system divides search results by table. A user must have read access to a table to see search results for it.

**Default search groups**

**Default system search groups**

<table>
<thead>
<tr>
<th>Search group</th>
<th>Example tables</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tasks</td>
<td>Incident, Change Request, Problem</td>
</tr>
<tr>
<td>Live Feed</td>
<td>Live Feed Message</td>
</tr>
<tr>
<td>Policy</td>
<td>Business Rule, UI Policy, Client Script</td>
</tr>
<tr>
<td>People &amp; Places</td>
<td>User, Group, Location, Company</td>
</tr>
<tr>
<td>Knowledge &amp; Catalog</td>
<td>Knowledge Base, Service Catalog</td>
</tr>
</tbody>
</table>
Displaying search results by group

The system displays knowledge and service catalog search results within their respective search results pages. The system displays other results in list format.

For exact match searches, the system only returns records from the Task (task) and Knowledge (kb_knowledge) tables.

**Note:** The system filters global search results to display only knowledge articles that are in the same language as the preferred language setting.
Example global search results

Options for administrators

Administrators can customize these search groups settings for all users:

- Specifying which tables are part of the group.
- Specifying whether the search group is available for use.
• Specifying whether searches include results from this search group by default.
• Creating new search groups.

Enabling a search groups allows users to see records from the search group's tables. Disabling a search group hides records from the search group's tables.

Add a search group
You can add a search group to filter global search results.

Role required: text_search_admin

1. Navigate to System Definition > Search Groups.
2. Click New.
3. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name of the search group.</td>
</tr>
<tr>
<td>Roles</td>
<td>Select one or more user roles if you want to restrict access to the search group to those roles.</td>
</tr>
<tr>
<td>User group</td>
<td>Select a user group if you want to restrict access to the search group to users in that user group.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter text to display as a tooltip for the search group.</td>
</tr>
<tr>
<td>Active</td>
<td>Ensure the check box is selected to make the search group available.</td>
</tr>
<tr>
<td>Searched</td>
<td>Clear the check box if you want to exclude results from this search group by default. A user can manually choose to show results from this search group on the search results page.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to determine the order in which this search group is listed relative to other search groups.</td>
</tr>
</tbody>
</table>

4. Right-click the form header and select Save.
5. In the Text Search Tables related list, click New.
6. Complete the form.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Select the table to search.</td>
</tr>
<tr>
<td>Active</td>
<td>Ensure the check box is selected to search the table.</td>
</tr>
<tr>
<td>Searched</td>
<td>Clear the check box if you want to exclude results from this table by default. A user can manually choose to show results from this table on the search results page.</td>
</tr>
<tr>
<td>Order</td>
<td>Enter a number to determine the order in which this table is listed relative to other tables in the search group.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Select one or more conditions to determine which records on the selected Table are searched.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional label</td>
<td>Enter the label to display for the table. For example, for a search group intended for your Sales team, display <strong>Contacts</strong> instead of Users for the User [sys_user] table.</td>
</tr>
</tbody>
</table>

7. Click **Submit**.
8. Add any other text search tables to include in the search group.

**Set global text search properties**

Administrators can control how global text search behaves with system properties.

**Role required: admin**

1. Navigate to **System Properties > Global Text Search**.
2. Set these properties.

**UI properties for global text search**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>glide.ui.text_search.enable</strong></td>
<td>Default value is true. Clear this option to disable the global text search capability.</td>
</tr>
<tr>
<td><strong>glide.ui.can_search</strong></td>
<td>Default value is itil, text_search_admin, admin. Add a role to enable it to use search.</td>
</tr>
<tr>
<td><strong>glide.ui.no_text_search</strong></td>
<td>Default value is sys_audit, sys_event, ecc_queue, ecc_event, syslog, syslog_transaction, sys_journal_field, sys_audit_relation, ecc_agent_log, ecc_mi_result, sysrule_escalate_history, sys_user_token, sys_time_dimension, sys_attachment_doc, sys_audit_delete. Tables that do not appear as options when defining search groups. Examples are system or maintenance tables.</td>
</tr>
<tr>
<td><strong>glide.ui.text_search.rowcount</strong></td>
<td>Default value is 10. Users can click through to see all results for a specific table.</td>
</tr>
<tr>
<td><strong>css.textsearch.kb.background.color</strong></td>
<td>This property only applies to the legacy global search results page. Default value is #FFFFDD.</td>
</tr>
<tr>
<td><strong>css.textsearch.catalog.background.color</strong></td>
<td>This property only applies to the legacy global search results page. Default value is #F0F7F9.</td>
</tr>
<tr>
<td><strong>glide.ui.text_search.match_view</strong></td>
<td>Default value is blank.</td>
</tr>
</tbody>
</table>

### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>glide.ui.text_search.view</td>
<td>List and form view to use for Global Text Search results. Blank means default view. Default value is the <code>text_search</code> view. If you do not have a <code>text_search</code> view, you can create it.</td>
</tr>
<tr>
<td>glide.ir.query_method</td>
<td>Query method for global text search. Run a query for each table, for each base class (parent table), against a single index regardless of table (requires text index regeneration), or let GlideRecord handle the query (simple). With the Zing text search engine, the preferred value is &quot;simple&quot;. Default value is Simple query.</td>
</tr>
<tr>
<td>glide.lucene.base_result_max</td>
<td>Maximum number of results that will be returned during a text index search. This limits the number of records that are extracted from the text index and appear. Default value is 100. This property is not supported by the Simple query method and is ignored.</td>
</tr>
<tr>
<td>glide.lucene.base_hits_max</td>
<td>Maximum number of entries that will be retrieved from the text index. Only the table that is involved will be returned from the text index for all entries that are between the value specified for maximum results and this value. This is done so that you can indicate that more results exists for any given table that are going to appear. Default value is 500. This property is not supported by the Simple query method and is ignored.</td>
</tr>
<tr>
<td>glide.ts.global_search.parallelism</td>
<td>Number of simultaneous processes (1 to 16) used when searching though multiple groups in a global search. Default value is 4. Each search group uses one thread to render results. Set this value to yield optimal results for your search group configuration. For example, if you have five search groups and four threads, the first four groups run in parallel and the fifth group starts when one of the first four groups finishes. This setup may work well if one of the groups is much larger than another. Similarly, if you have five search groups, setting this value higher than five yields no benefits.</td>
</tr>
</tbody>
</table>

3. Click **Save**.

The business rule **Text Search Property Change Rationally** validates the new values and aborts the update if they are outside its acceptable ranges.

4. **Open the System Properties table** and search for the property **glide.ts.max_wildcard_expansion**.

### UI properties for global text search

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.ts.max_wildcard_expansion</td>
</tr>
<tr>
<td>Description</td>
<td>Maximum number of matches for a wildcard term that are allowed as unambiguous.</td>
</tr>
<tr>
<td>Type</td>
<td>Integer</td>
</tr>
<tr>
<td>Value</td>
<td>500</td>
</tr>
</tbody>
</table>
5. Edit the **Value**.
   If a wildcard search matches more words than this value, the system displays a message asking the user to refine the search.

6. Click **Update**.

7. To set the text search stemming language, install an internationalization (i18n) plugin.

8. Navigate to **System Properties > System Localization**.

9. Set this property.

### Text stemming property

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text Search stemming language</td>
<td>Default value is <strong>English</strong>. The system supports stemming in English, German, and French.</td>
</tr>
<tr>
<td>glide.ts.stemming_language</td>
<td></td>
</tr>
</tbody>
</table>

Enable the simple query method

Configure the simple query method to allow GlideRecord to handle queries and is supported by Zing Text Search.

1. Navigate to **System Properties > Global Text Search**.
2. Locate **Query method for global text search** (the glide.ir.query_method property).
3. Select **Simple query**.
4. Click **Save**.

The following properties are not supported:

- Maximum number of results that are displayed per table (glide.lucene.base_result_max)
- Maximum number of results counted per base class (glide.lucene.base_hits_max)

Configure parallel processing of search groups

To improve performance, only activate search groups and tables that are necessary to meet business needs.

For example, if you do not need Change Task results, deactivate that table in the Tasks search group. If only one group of users needs Change Task results, set up a separate search group that includes Change Tasks. Other users search using a group that does not contain Change Tasks.

Global text search can render results in parallel to improve performance. To configure the number of parallel processes:

1. Navigate to **System Properties > Global Text Search**.
2. Locate the property called **Number of simultaneous processes (1 to 16) used when searching through multiple groups in a global search**.
3. Enter the number of processes to run in parallel.
   Each search group uses one thread to render results. Set this value to yield optimal results for your search group configuration. For example, if you have five search groups and four threads, the first four groups run in parallel and the fifth group starts when one of the first four groups finishes. This setup may work well if one of the groups is much larger than another. Similarly, if you have five search groups, setting this value higher than five yields no benefits.
4. Click **Save**.

Enable or disable the junk filter
When its junk filter is enabled, Zing does not index or search for 2-digit numbers or single-character words (unless they are Chinese or Japanese characters). You can enable or disable the junk filter for individual tables.

For example, to disable matches for search terms like a or 40 in the Knowledge Base, turn on junk filtering for the kb_knowledge table.

1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the table.
3. In the Attributes related list field, set the value of the Text index filter junk attribute:
   a) If you want Zing to include 2-digit numbers and single-character words when indexing and searching the table, set the attribute value to false.
   b) If you want Zing to ignore 2-digit numbers and single-character words when indexing and searching the table, set the attribute value to true.
4. Right-click the header and select Save.
5. Click the Generate Text Index related link and click OK.

**Note:**
- To have the desired effect, you may also need to reconfigure the automatic stop words. For example, if a specific 2-digit number appears in all of your problem numbers (92-0001, 92-0002, and so on), the automatic stop word threshold is quickly exceeded and the word is no longer found in searches. To find that 2-digit number in the problem table, you must disable both junk filtering and automatic stop words.
- Disabling the junk filter results in a larger table index. For optimal performance, do not apply this attribute unless it is required.

**Debug Zing**

Debugging messages create a log of search processes as they occur. These messages may help administrators configure optimal performance settings.

- To view debugging messages, navigate to System Diagnostics > Session Debug > Debug Text Search. The search log messages appear at the bottom of the results page for the remainder of your session.

**Debugging Messages**

- To debug text indexing problems, you may want to view text_index events in the system log.
In rare cases, you may need to reset the text search caches after regenerating a text index. If text search fails for known words, diagnose and fix this problem:

1. Enable text search debugging messages.
2. In any table with search problems, search for the problem text.
3. In the debug output, note the numbers used for the Stemmed terms.
4. Enter `ts_word.list` in the navigation filter.
5. Locate the stemmed terms and compare the numbers in the list to the debug output (Step 3). If the numbers are different, the UI node's cache is stale.
7. Click the Reset Text Search Caches related link and click OK.

Revert to the legacy global search UI
Disable the dynamic global search UI to preserve customizations you made to the legacy global search UI.

Role required: admin

1. Enter `sys_properties.list` in the Navigation filter.
2. The entire list of properties in the System Properties [sys_properties] table appears.
3. Click New.
4. Enter these field values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>glide.ui.use_legacy_global_search</td>
</tr>
<tr>
<td>Type</td>
<td>true</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

4. Click Submit.

The system displays the global search UI and uses the legacy display logic.

Legacy global search user preferences
The global text search results page allows users to set several user preferences for global text search.

The following search preferences are available from the Search tips and preferences link.
Search preferences

- Use remembered expand / collapse preferences
- In search group header, list tables with no search matches
- Show selectable search groups
- Show groups with no search matches
- Return task record if searching for exact number

Results are sorted by relevancy per table:
- computer AND Linux: Results contain both "computer" and "Linux"
- email OR network: Results contain either "email" or "network"
- server NOT Windows: Results contain "server" but not "Windows"
- "LDAP server is down": Results contain the phrase "LDAP server is down"
## Search preferences

<table>
<thead>
<tr>
<th>User preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Label</strong></td>
<td>Use remembered expand / collapse preferences</td>
</tr>
<tr>
<td><strong>Preference</strong></td>
<td>ts.remember.expanded</td>
</tr>
<tr>
<td></td>
<td>Specifies whether you want the collapse state of any search groups/tables remembered for your next search. If selected and you collapse the search results for the People &amp; Places search group for example, that group will be collapsed on your next search. If cleared, all groups and tables are expanded for every search.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Label</th>
<th>Show list of tables with no search matches</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Preference</strong></td>
<td>ts.show_negative_result_info</td>
</tr>
<tr>
<td></td>
<td>Specifies whether or not you want to see a summary of tables that had no search matches. For example: No matches for Requests, Catalog Tasks, Tickets.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Label</th>
<th>Show selectable search groups</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td></td>
<td>Shows or hides the search group check box row.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Label</th>
<th>Show groups with no search matches</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Preference</strong></td>
<td>ts.show_empty_groups</td>
</tr>
<tr>
<td></td>
<td>Shows or hides a search group if it returns no matches. If selected, the search results display a placeholder row stating there were no matches for that group.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Label</th>
<th>Return task record if searching for exact number</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Preference</strong></td>
<td>ts.match</td>
</tr>
<tr>
<td></td>
<td>Shows or hides the full search results page if the search term matches a task record number. When selected, an exact match to a record number causes the system to hide the full search results and instead display the record with an exact match message. Exact search matches ignore most additional search conditions normally applied to the record such as the currently selected search groups or the knowledge article published state. For example, an exact search match for a knowledge article returns the article in any state as long as the current user has read access to it.</td>
</tr>
</tbody>
</table>

| Note: | The system filters exact search results to display only knowledge records that are in the same language as the preferred language setting. |
Global text search suggestions
Global text search offers two types of search suggestions.

The knowledge base and global text searches provide suggestions as you type. Type-ahead suggestions appear under the search box. Suggestions are based on similar searches that begin with the same characters.

Type-ahead search suggestions

The knowledge base and global text searches also provide suggestions for alternate search terms. Suggestions appear if your original search does not return any results and an alternate spelling or similar recent search does. For example, if you misspell a search term (such as eail), the correct spelling (email) may appear as an alternate search suggestion. Suggestions appear beneath the search box on the results page.

Alternate search suggestions

Note: The type-ahead search suggestions feature is only available in the UI15 interface.

Update a type-ahead suggestion

The knowledge base and global text searches provide suggestions as you type. These type-ahead suggestions are compiled on a nightly basis by a scheduled job.

Use the following procedure if you need to refresh this list sooner.

1. Navigate to System Scheduler > Scheduled Jobs.
2. Open TS Search Stats.
3. Run the scheduled job.

For more about how suggestions are generated and maintained, see the blog post Global Text Search Suggestions by a ServiceNow Technical Support Engineer in the Now Community.

Note: The type-ahead search suggestions feature is only available in the UI15 interface.

Configure a "Did You Mean?" suggestion

The Knowledge Base and global text searches can provide "Did you mean?" suggestions. Suggestions appear if a search does not return any results and an alternate spelling or similar recent search does. This feature is disabled by default.

1. Navigate to System Properties > Text Search.
2. Select any of the following check boxes:
   - **Suggest alternate search spellings for knowledge or global search** (the `glide.ts.dym.enable_spell_correct` property).
   - **Suggest related searches for knowledge or global search** (the `glide.ts.dym.enable_chain_suggest` property); uses search chains, which generate suggestions by tracking occurrences of similar searches, in order, over time.

   **Note:** The global search references in these check boxes only apply to the legacy global search functionality. They do not apply to the global search functionality introduced in the New York release, because the Did you mean? functionality is not available.

3. Click **Save**.

**List search finds records from the current table**

Search records from a table list view.

Indexed tables display the **for text** option in the list title bar, which searches all records for matching field values.
The list search field accepts **Boolean operators** (AND, OR, and NOT) in search queries. When a user adds a Boolean operator to a search query, the system only returns records that match all search conditions of the query.

The system also converts any search query into an equivalent keyword condition in the list breadcrumbs and filter. For example, searching for the text "Oracle OR SAP" produces the condition `[Keywords] [are] [Oracle OR SAP]`. The standard list controls can modify or remove these breadcrumbs and conditions.

**Boolean operators allow conditional search results**

Include or exclude search terms in global text searches.

All global text search interfaces support Boolean operators.

- Global text search field
- Knowledge Base search
- List search for text

**Note:** Boolean operators are case-sensitive. For example, **OR** is a Boolean operator while *Or* and *or* are search terms that may be stop words.
### Boolean operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OR or vertical bar symbol (|)</td>
<td>Finds a match if any of the terms exist in a document (a union using sets). For example, to find documents that contain either email password or just email, search for &quot;email password&quot; OR email or &quot;email password&quot;</td>
</tr>
</tbody>
</table>

When you use filter lists on keywords, OR and | produce the same results. For example, these two filters produce the same result by searching for records that contain either SAML or SSO:

*Searching with the OR operator*

However, using the .or. operator, which the system uses when you create OR condition groups for fields other than Keywords with the condition builder, can produce different results. For example, this filter searches for records with short descriptions containing SAML and then searches separately for records with short descriptions containing SSO:

*Searching with the pipe operator*
<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
</table>
| AND                          | Finds a match if all terms exist in a document (an intersection of sets). For example, to find documents that contain "CPU load" and "10 minutes", search for "CPU load" AND "10 minutes". By default, Zing applies an AND operator between all search terms regardless of whether the user entered them or not. For example, the system converts a search for the text "email server down" to [Keywords [are] [email] AND [Keywords [are] [server] AND [Keywords [are] [down].  

Note: For Knowledge Base searches, if the default AND search returns poor results, the search is automatically re-run with the OR operator. Administrators can configure the knowledge base search to always use OR by modifying the glide.knowman.search.operator system property. |
| NOT, minus (-), or exclamation point (!) | Excludes documents that contain the term after the NOT operator (a difference of sets). For example, to find documents that contain "CPU load" but not "10 minutes", search for "CPU load" NOT "10 minutes", "CPU load" -"10 minutes", or "CPU load" !"10 minutes". The NOT operator cannot be used with just one term. For example, the following search returns no results: NOT "10 minutes". NOT must be a stand-alone word. For example, atom NOT ion excludes the term ion. Whereas NOTION searches for the term notion. Minus and exclamation point must immediately precede the excluded term. For example, email !Joe excludes the term Joe but email ! Joe includes the term Joe. |

Quotation marks allow exact phrase searches

Filter search results to only include matches to an exact phrase consisting of one or more words.

Zing only matches documents that contain the exact words in the exact order you specify. An exact phrase search ignores:

- stop words
- punctuation marks
- wildcard characters

Note: Wildcard characters are ignored as punctuation.

For example, searching for the phrase "email password" returns the same search results as these phrases:

- "email the password" because the stop word "the" is ignored.
- "email password?" because the punctuation "?" is ignored.
*email password*" because the wildcard "*" is ignored as punctuation.

**Wildcard characters allow searching for patterns and variations**

Expand search results to match any non-space character. The system supports both single-character and multiple-character wildcards.

The following searches support wildcard characters.

- Global text search
- Knowledge Base

**Note:** To enable wildcard search in the Knowledge context, navigate to **Contextual Search > Search Contexts > Knowledge Base Search** and select the **Enable wildcard searches** check box.

- Search a list

**Note:** To perform a wildcard text search of a list, you must select **for text** as the search field. If you select a list field instead of **for text**, wildcard characters in search terms will be interpreted as list search wildcards.

- Reference fields

To perform a single-character wildcard search, use the percent sign (%) character. This wildcard finds words that contain any one character in place the percent-sign-character. For example, to find words such as **text** or **test**, search for **te%t**.

To perform a multiple-character wildcard search, use the asterisk (*) character. This wildcard finds words that contain zero or more characters in place of the asterisk-character. For example, to find words such as **planned** or **placed**, search for **pl*d**.

You can use wildcard characters anywhere in a search string, and can include multiple wildcards in the same word. For example, to find words including **affordable**, **effort**, and **offering**, search for **%ff%r***.

If a wildcard search returns too many hits, the system displays a message asking you to refine the search. Administrators can set a global text search property to change the limit for wildcard search results.

**Note:** Wildcard text searches are only effective with multiple character words. A wildcard within a sequence of pictogram characters returns too many options for an efficient search. Wildcards are best used with letter-based words.

**Zing generates search results in four phases**

Generate search results by dividing documents among shards, searching shard documents, scoring shard documents, and merging scores into an index.

Zing generates search results in four phases:

1. Divide searchable documents among index shards.
2. Search and filter shard documents.
3. Score shard documents.
4. Merge shard document scores into an index.
Phase 1: Divide searchable documents among index shards

When a search is executed, the system equally divides all searchable documents among 10 index shards. Each shard has a unique list of documents.

To maximize search efficiency, the system creates 10 query threads to simultaneously search each index shard.

Phase 2: Search and filter shard documents

Each query thread searches through its list of shard documents to identify documents that match the search criteria. For example, if you search for "wifi network," the system returns all documents containing both "wifi" and "network" in no particular order.

**Note:** A multiple word search is equivalent to multiple single word searches connected by an AND operator. For example, `[contains][wifi][AND][contains][network].`
The query thread assigns each matching document a numeric value (a document ID) to uniquely identify it. All other documents are ignored.

**Phase 3: Score shard documents**

The query thread scores each matching shard document.
Query threads search, filter, and score shard documents

1. Query Thread 0
   - Searches Shard 0
     - Filters Shard 0
       - Scores Documents in Shard 0

2. Query Thread 1
   - Searches Shard 1
     - Filters Shard 1
       - Scores Documents in Shard 1

   ... (Repeat for queries 2 to 9)

3. Query Thread 9
   - Searches Shard 9
     - Filters Shard 9
       - Scores Documents in Shard 9

© 2021 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
Phase 4: Merge and sort shard document scores

The system merges the document scores into a single index and sorts the documents from highest to lowest document score. The documents with the highest document score are most relevant to the search query.
Zing filters search results with access controls

Zing filters search results to only display records the user can access.

For example, suppose you index the System Properties [sys_properties] table. When the ITIL User searches for a term in the system properties table, Zing returns no search results because the ITIL user does not meet the ACL rule requirements.

ITIL User Search

When a system administrator searches for the same property, Zing returns search results from the System Properties tables because the administrator meets the ACL rule requirements.
Zing computes document scores using three components

The Zing search engine computes document scores based on the frequency, sequence, and weight of search terms in the document.

Document scores

The components of a document score for a search query are:

• Frequency: how often the search terms appear in the document.
• Sequence: how often the search terms appear in the same order as the search query.
• Weight: how heavily weighted the source field is in which the search terms appear.

Sample document score computation
Frequency points

Zing awards one point whenever a search term appears anywhere in the document. For example, when searching for distributed database server, a document that contains distributed three times, database five times, and server 17 times would have 25 frequency points.

To increase search result scores of search terms that appear more frequently in a document, but less frequently in a document set, you can Score search terms by inverse document frequency (IDF). When TF-IDF is enabled, search term scores are calculated by multiplying the term frequency score by the inverse document frequency score. Because enabling TF-IDF increases the weight of less common search terms, search results for that table are more likely to be relevant. For example, when searching for distributed database server, the term distributed might receive a higher score than server if it appears frequently in one document but less frequently in the document set as a whole.

Zing applies a multiplier to frequency points based on the value of the ts_weight attribute for the field in which the search term appears. A field with a text search scoring weight of 30 (ts_weight=30) would add 30 points for each inclusion of a search term.

Sequence points

Zing awards a document more points when it contains the search terms in the same order in which they were typed. The more search terms in sequence there are, the exponentially higher the score becomes. Zing awards sequence points as 10^x, where x is the number of search terms that appear in sequence.

In the distributed database server search example, Zing awards a document 100 (10^2) sequence points for each time it includes the two-term string database server. Likewise, Zing awards a document 1000 (10^3) sequence points each time it includes the three-term string distributed database server.

Zing applies a multiplier to sequence points based on the value of the ts_weight attribute for the field in which the sequence appears. The sequence points use the calculation (10^x * field ts_weight attribute).

Field scoring weights

The system elevates the default scoring weight of Knowledge record numbers, Knowledge short descriptions and metadata, task record numbers, and task short descriptions. Default ts_weight attributes for these fields are as follows:

- kb_knowledge.number = 50
- kb_knowledge.short_description = 10
- kb_knowledge.meta = 10
- task.number = 50
- task.short_description = 10

All other fields have a default ts_weight attribute of 1. The maximum possible weight value is 255.

Score search terms by inverse document frequency (IDF)

Enable term frequency–inverse document frequency (TF-IDF) to increase the search result scores of search terms that appear more frequently in a document, but less frequently in the whole collection of searchable documents.

Role required: admin

To enable TF-IDF scoring, a text index must be present for the table. Make sure that text indexing is enabled for the table before changing the query mode. See Enable text indexing for a table.

Administrators can enable TF-IDF scoring on a table to improve search results. The Knowledge table [kb_knowledge] has TF-IDF scoring enabled by default.
1. Navigate to the system dictionary and open the entry for the desired table.
2. In the Attributes related list, click New.
3. In the Attributes field, select Text search Enable IDF.
4. Click Submit.
The Enable IDF Score check box in the table's text index record can now be configured.
5. Navigate to System Definition > Text Indexes.
6. Open the text index created for the table.
7. Select Enable IDF Score.
   Regenerating document frequency is a one-time task. Regenerate document frequency when TF-IDF scoring is first enabled for a table.
9. Configure the desired notification and click OK.

Set the relative weight of a field

To improve search results, the Zing search engine assigns to each potential match a numeric score that represents its relevancy to the query.

Role required: admin

Administrators can control the relative importance of a match for each field in a table with the ts_weight attribute. The default weight of a field is 1.

1. Open the system dictionary entry for the field.
2. In the Attributes field, enter ts_weight=<value>, where <value> is the relative weight of the field.
   The following fields have elevated scoring weights by default:
   - kb_knowledge.number = 50
   - kb_knowledge.short_description = 10
   - kb_knowledge.meta = 10
   - task.number = 50
   - task.short_description = 10

   For example, if the Title field has a ts_weight=50 and the Description field has a ts_weight=10, then a match in the title is weighted 5 times more relevant than a match in the description and 50 times more relevant than a field without the ts_weight attribute.
3. Click Update.

   Note: To view the complete scoring system, see Document Scoring.

Zing indexes words

Index documents by dividing them into words. Depending on the languages your instance supports, a word may be a single character such as a Chinese or Japanese pictogram or a sequence of characters separated by spaces such as with Latin, Arabic, and Pinyin languages.

Zing uses spaces to define the basic unit of word separation. Zing uses the following rules to index words.
### Zing word indexing rules

<table>
<thead>
<tr>
<th>Rule</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Punctuation</td>
<td>Zing indexes some punctuation marks as part of some words to improve search results for common search terms. Zing converts any non-indexed punctuation characters to spaces. See Zing indexes punctuation as part of some words.</td>
</tr>
<tr>
<td>Pictograms</td>
<td>Zing supports the full range of Unicode pictogram characters. Each Chinese or Japanese pictogram is indexed as a separate word as if it were a single Latin-1 character surrounded by spaces.</td>
</tr>
<tr>
<td>Letter</td>
<td>Zing treats Latin-1, Arabic, and Pinyin characters as individual letters of space-separated-words. Sequences of letters define indexable words.</td>
</tr>
</tbody>
</table>

### Zing indexes punctuation as part of some words

Zing indexes some punctuation marks as part of some words to improve search results for common search terms.

#### Punctuation indexed as part of a word

<table>
<thead>
<tr>
<th>Punctuation</th>
<th>Indexed to find</th>
<th>Search behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ampersands [&amp;]</td>
<td>Company names</td>
<td>Zing locates terms containing punctuation characters that are common in company names: ampersands (&amp;), plus signs (+), or hyphens (-). For example, a search for H&amp;R Block locates exact matches to the search term.</td>
</tr>
<tr>
<td>Apostrophes [']</td>
<td>Proper names</td>
<td>Zing ignores trailing possessives and retains most others to find company names. For example, a search for O'Reilly's locates matches to O'Reilly and O'Reilly's.</td>
</tr>
<tr>
<td>Hyphens [-]</td>
<td>Company names</td>
<td>Zing locates terms containing punctuation characters that are common in company names: ampersands (&amp;), plus signs (+), or hyphens (-). For example, a search for Coca-Cola locates exact matches to the search term.</td>
</tr>
<tr>
<td>Product numbers</td>
<td>Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for PROD-10-987 locates exact matches to the search term.</td>
<td></td>
</tr>
<tr>
<td>Numbers [123]</td>
<td>Product numbers</td>
<td>Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for PROD10987 locates exact matches to the search term.</td>
</tr>
<tr>
<td>Punctuation</td>
<td>Indexed to find</td>
<td>Search behavior</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Record numbers</td>
<td>Zing locates record numbers that follow a typical pattern. To meet this pattern, search terms must start with a recognized record number prefix. For example, a search for INT1234567 locates exact matches to the Incident record.</td>
<td></td>
</tr>
<tr>
<td>Periods [.]</td>
<td>Acronyms</td>
<td>Zing locates acronyms whether they are separated by periods or not. For example, a search for u.s.a. locates matches to usa or u.s.a.. Note that wildcard searches may affect acronym handling. In another example, a search for u.s.* may yield better results than a search for u.s.a.*.</td>
</tr>
<tr>
<td>Host names</td>
<td>Zing locates sequences of letters and numbers separated only by periods. For example, a search for en.myhost123.com locates exact matches to the search term.</td>
<td></td>
</tr>
<tr>
<td>IP addresses</td>
<td>Zing locates numbers that follow a typical IPv4 address pattern. For example, a search for 10.0.0.1 locates exact matches to the search term.</td>
<td></td>
</tr>
<tr>
<td>Product numbers</td>
<td>Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for PROD_10_987 locates exact matches to the search term.</td>
<td></td>
</tr>
<tr>
<td>Plus signs [+]</td>
<td>Company names</td>
<td>Zing locates terms containing punctuation characters that are common in company names: ampersands (&amp;), plus signs (+), or hyphens (-). For example, a search for Google+ locates exact matches to the search term.</td>
</tr>
<tr>
<td>Underscores [_]</td>
<td>Product numbers</td>
<td>Zing locates product numbers that follow a typical pattern. To meet this pattern, search terms must contain frequent numbers and only include underscores (_), hyphens (-), or periods for punctuation. For example, a search for PROD_10_987 locates exact matches to the search term.</td>
</tr>
</tbody>
</table>

**Note:** The punctuation handling described here does not affect wildcard and boolean operators. These operators provide separate Zing functions.
Zing indexes some HTML elements

Zing indexes the contents of certain HTML elements to improve document search results. This indexing is addition to the normal indexing by word.

**Indexed HTML elements**

<table>
<thead>
<tr>
<th>HTML element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title attribute</td>
<td>Zing indexes the contents of the <em>title</em> attribute of any HTML element. This is separate from the <em>title</em> element, which Zing already indexes when identifying the words of the document.</td>
</tr>
<tr>
<td>Anchor link target</td>
<td>Zing indexes the target URL specified in the <em>href</em> attribute of any anchor element.</td>
</tr>
<tr>
<td>Alt text for an image</td>
<td>Zing indexes the alternative text of any image element.</td>
</tr>
</tbody>
</table>

**Enable text indexing for a table**

Administrators can enable text indexing on a table to allow users to search for string values from table records.

Role required: admin

By default, the system creates text indexes for the tables with a Text index record (*System Definition > Text Indexes*). For example:

- Knowledge-related tables
- Core-data-related tables
- Connect-related tables
- Task table
- User table

**Note:** Whenever you create an index table, the system also creates Access Control Roles (ACLs) for new tables.

Text indexing can be a resource-intensive task that may take a while to complete. You may notice performance degradation or incomplete search results during index generation. To estimate text indexing duration, you can view historical statistics.

**Note:**

New tables created by update set transfers have text indexing disabled, even if it is enabled for the tables included in the update set.

To enable users to search tables created by update set transfers, you must manually enable text indexing for those tables.

1. Navigate to *System Definition > Dictionary*. 
2. Click the table name to open the dictionary entry.

A table in the System Dictionary is a record that has a **Table** name but no **Column name**.

![Dictionary Entry](image)

The `sys_user` table has no Column name.
3. Select the **Text index** check box to enable text indexing for text fields on the table.

4. Click **Update**.

5. Click **Generate Text Index**.

   The system schedules the table for text indexing, typically within a minute.

The Search **for text** option appears on the list view for the table.

- **Fields excluded from text indexing**
  - Text indexing excludes fields that meet certain name, type, attribute, or encryption conditions. User searches do not match or return values from excluded fields.

Text indexing excludes a field if it meets any of the conditions in the following table.

<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field name</td>
<td>Text indexing includes the <strong>sys_class_name</strong> and <strong>sys_tags</strong> fields but excludes all other fields whose names begin with <strong>sys_</strong>.</td>
</tr>
<tr>
<td>Field type</td>
<td>Text indexing excludes fields of these types:</td>
</tr>
<tr>
<td></td>
<td>- Date</td>
</tr>
<tr>
<td></td>
<td>- Date/Time</td>
</tr>
<tr>
<td></td>
<td>- Duration</td>
</tr>
<tr>
<td></td>
<td>- True/False</td>
</tr>
<tr>
<td></td>
<td>- Workflow</td>
</tr>
<tr>
<td></td>
<td>For more information on these types, see <strong>Field types</strong>.</td>
</tr>
</tbody>
</table>
Configure a single table for indexing and searching

Configure a table with search attributes to index it.

Role required: admin, ts_admin

1. Navigate to **Text Index Configurations** and click **New**.
2. In **Applies to**, select **Table**.
3. In **Table**, select a table to configure.
4. Optional: Upgrade the indexing format to V4 if you intend to use this table in multi-table searches or if you want to use the BM25 scoring algorithm on this table.
   a) If the value in **Format** is not grayed out, you can select the indexing format, for example, V4, click **Submit**, and skip to step 5.
   b) If the value in **Format** is grayed out, the table has already been indexed. To reformat an indexed table, click **Submit**.
   c) Navigate to **Text Index Configurations** and click the table you submitted.
   d) Under **Related Links**, click **Show index name record**.
   e) Under **Related Links**, click **Upgrade to V4** and click **Submit**.

The specified table's indexing is upgraded from V3 to V4. Now, this table can be part of multiple-table indexing and BM25 is used to score the table's relevance score. Optionally, click **Show Configuration** under **Related Links** to show the table indexing format on the **Text Index Configuration** page.

5. Configure the indexing and search attributes on the selected table.
   a) Navigate to **Text Index Configurations** and click the table you configured.
   b) On the **Text Index Table Attribute Maps** tab, click **New**.
      Attributes either pertain to the way Zing indexes documents or ranks documents returned in search results.
   c) On the Text Index Table Attribute Maps form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table to define attributes for.</td>
</tr>
<tr>
<td>Attribute name</td>
<td>Search engine attribute. For a list of the attributes and valid values, see Zing index and search attributes.</td>
</tr>
<tr>
<td>Value</td>
<td>Value for attribute.</td>
</tr>
</tbody>
</table>
e) Under Related Links, click Generate Text Index.

6. Configure column-level attributes.
   a) Navigate to Text Index Configurations and click a table.
   b) On the Text Index Column Attribute Maps tab, click New.
   c) On the form, fill in the fields. In Table, select a table to define attributes for. Only tables in the index group and their child tables display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table</td>
<td>Table that contains the column you want to define attributes for.</td>
</tr>
<tr>
<td>Attribute name</td>
<td>Attribute. For a list of the attributes and valid values, see Zing index and search attributes.</td>
</tr>
<tr>
<td>Column</td>
<td>The name of the column in the selected table you want to apply the search attribute to.</td>
</tr>
<tr>
<td>Value</td>
<td>Value for attribute.</td>
</tr>
</tbody>
</table>

d) Click Submit.

e) Repeat this procedure to define additional search engine parameters for table columns in the index group.

f) Under Related Links, click Generate Text Index.

7. Optional: Add stop words.
   Stop words are words that you do not want to index, such as the, or, an. There is a global list of common stop words. So, you only have to add stop words specific to your situation. To see the global list of stop words, navigate in your browser to https://<instance name>.service-now.com/ts_stop_list.do.
   a) On the Index Stop Words tab, click New.
   b) In Index, select the index to add the stop word to.
   c) In Word, enter a single word you don't want to index and click Submit.

   Specifying a synonym dictionary searches on the search term as well as synonyms of the search term, such as car, and its synonym, auto. Zing provides a default synonym dictionary.
   a) On the Index synonym Dictionaries tab, click New.
   b) In Index, select the index to add the stop words to.
   c) In Synonym dictionary, select the synonym dictionary to use on the specified table.
      To add a dictionary, click New and follow the procedure in Create synonym dictionaries.

You have configured this table with an indexing format and attributes for indexing and searching. Now, you can search the table using glideRecord.addQuery(name, value), or glideRecord.addEncodedQuery(name, value). For more information about searching, see Querying tables in script.

Configure multiple tables for indexing and searching

Update tables to the V4 indexing format to include them in multiple table searches.

Role required: admin, ts_admin
Performing searches across multiple tables requires normalizing the tables first so the relevance scores mean the same thing for all tables. V4 indexing provides that normalization. Zing uses the Okapi BM25 ranking function to calculate the relevancy score of search results.

The V4 table indexing format is optimized for documentation, such as knowledge base articles. You do not need to reindex tables that use this format when you change the value of an indexing attribute, such as the weight of a field. If you want to use the BM25 ranking function on a single table, you can convert it to the V4 format.

To search across multiple tables, you:

1. Configure all of your chosen tables to use the V4 index format if they do not already use it.

   Note: In new instances, the Catalog Item [sc_cat_item], Knowledge [kb_knowledge], Social Q&A Questions [kb_social_qa_question], and User [sys_user] tables use the V4 index format. If you upgrade your instance from a previous release, the indexing format of these tables remains the same as it was in the older release.

2. Add the tables to an index group so they can be indexed and searched together.

   Note: You cannot add the Task [task] table or any tables that extend it to an index group.

3. Perform the search using `glideRecord.addQuery(name, value)` or `glideRecord.addEncodedQuery(value)`, where `name` is the special value 123TEXTINDEXGROUP321. For more information about searching, see Querying tables in script.

   1. Configure the tables that you want to include in multiple table searches to use the V4 index format.

      Note: Upgrading from V3 to V4 is easy. Downgrading from V4 to V3 is more difficult and discouraged.

      a) Navigate to System Definition > Text Index Configurations.
      b) Edit the record for the table that you want to upgrade to the V4 index format.
      c) If Format is not disabled, select V4, click Submit, and skip to step 2.
         You can choose index formatting in this step because no index exists for the table.
      d) If Format is disabled, an index already exists for the table and you must explicitly update the index format.
         Click the Show index name record related link.
         The Text Index page displays.
      e) Click the Upgrade to V4 related link, then click OK.
         The system schedules a task to upgrade the text index from V3 to V4, enabling this table to participate in multiple-table indexing.

2. Create an index group that specifies the tables you want to index together so you can search them together.

   a) Navigate to System Definition > Text Index Groups.
   b) Click New.
   c) Enter the following field values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Name for the group of tables that you want to index and search together.</td>
</tr>
</tbody>
</table>
You can add tables formatted with V3 and V4 to index groups. If you add V3 tables, the index group remains inactive.

d) Click **Submit**.

3. Configure the indexing and search attributes on tables in an index group.
   a) Navigate to **System Definition > Text Index Configurations**.
   b) Click **New**.
      The Text Index configuration form displays. If you already have an index group in the list, skip to step 3.d.
   c) In **Applies to**, select **Index Group**.
   d) In **Index group**, click the magnifying glass and select the index group you created, then click **Submit**.
      The only index groups that display are the ones you have already created.
      The Text Index Configuration table displays.
   e) Edit the record for your index group.
   f) On the **Text Index Table Attribute Maps** tab, click **New**.
      The Text Index Table Attribute Map form displays. Attributes pertain to the way Zing indexes or searches individual tables in the index group.
   g) In **Table**, select a table to define attributes for.
      Only tables in the specified index group and their child tables display.
   h) In **Attribute name**, click the magnifying glass and select an attribute.
      To see the list of attributes, enter `ts_configuration_attribute.list` in the application navigator. For attribute definitions, see **Zing index and search attributes**.
   i) In **Value** enter a value and click **Submit**.
      Valid values depend on the attribute. For information on valid values, see **Zing index and search attributes**.
   j) Repeat this procedure to define additional search engine parameters for other tables in the index group.
   k) Under **Related Links**, click **Generate Text Index**.
4. Configure search parameters on individual table columns in the index group.
   a) Navigate to **System Definition > Text Index Configurations**.
   b) Edit the record for your index group.
   c) On the **Text Index Column Attribute Maps** tab, click **New**.
      The Text Index Column Attribute Map form displays. Attributes pertain to the way Zing indexes or
      searches individual table columns in the index group.
   d) In **Table**, select a table to define attributes for.
      Only tables in the index group and their child tables display.
   e) In **Attribute name**, select a search engine parameter, enter a value for that parameter in **Value**, and click **Submit**.
      To see the list of attributes, enter `ts_configuration_attribute.list` in the application
      navigator. For attribute definitions, see **Zing index and search attributes**.
   f) In **Column**, specify the name of the column in the selected table you want to apply the search attribute to.
   g) In **Value**, specify the attribute's value that governs the search.
   h) Click **Submit**.
   i) Repeat this procedure to define additional search engine parameters for table columns in the index group.
   j) Under **Related Links**, click **Generate Text Index**.

5. Optional: Add a synonym dictionary.
   Specifying a dictionary enables searches on the search term and synonyms of the search term, such as **car** and
   its synonym **auto**. Zing provides a default synonym dictionary.
   a) Navigate to **System Definition > Text Index Configurations**.
   b) Edit the record for your index group.
   c) On the **Index synonym Dictionaries** tab, click **New**.
   d) In **Index**, select the table index to add the stop words to.
   e) In **Synonym dictionary**, select the dictionary to use.
      To add a dictionary, click **New** and follow the procedure in Create synonym dictionaries.
   f) Click **Submit**.
   g) Under **Related Links**, click **Generate Text Index**.

6. Click **Update**.

Perform the search using `glideRecord.addQuery(name, value)` or
`glideRecord.addEncodedQuery(value)`. For more information about searching, see Querying tables in
script.

**Zing index and search dictionary attributes**

The following dictionary attributes either affect the way Zing indexes tables or ranks search results.

**Index and search dictionary attributes**

Zing uses dictionary attributes set at the table or field level to configure the following settings:

- indexing behavior
- ranking of search results
- the BM25 relevancy ranking algorithm

### Zing index and search dictionary attributes

<table>
<thead>
<tr>
<th>Name</th>

**text_index_scorer_bm25_b**

This dictionary attribute is part of the BM25 algorithm. The attribute impacts the importance of the length of a document in search results. If this attribute is 0, the length has no bearing. In this case, a document of two words would be valued equally as a document with 1000 words. Very short documents are often weighted lower than longer documents. The default is 0.75.

**text_index_scorer_bm25_k1**

This dictionary attribute is part of the BM25 algorithm. The attribute helps determine term frequency saturation characteristics, that is, having the search term appear in a document increases the relevancy of the document, but the increase is less impactful as the numbers climb. For example, a search term occurring 10 times in a document makes it more relevant than a document that has only one occurrence. However, a document that has 100 occurrences of the search term may not be ten times more impactful than a document that has 10 occurrences. The relevance approaches a maximum effect asymptote. The higher the attribute value, the lower the maximum effect of multiple occurrences. Typical values are between 1.25 - 2.0.

**Regenerate a text index for a table**

You can regenerate a table text index when you change table stop words or display values.

Role required: admin

By default, the system maintains text indexes on a daily schedule. Typically, you only need to manually regenerate a text index when you change these values.

- You change the list of table-specific stop words.
- You change the display value of a record such as changing a user or group name.

Until you regenerate the index, text searches for old display values will still produce results and searches for the new display value will not show results.

Text indexing can be a resource-intensive task that may take a while to complete. You may notice performance degradation or incomplete search results during index generation. To estimate text indexing duration, you can view historical statistics.

*Note:* This index regeneration process purges the existing text search index for the table before it regenerates it. While it is processing, no search results are returned if you perform a text search before the regeneration is complete. An alternate method is available that does not impact use of text searches for the table while the regeneration is in process. See [Reindex a table text search without impacting returned results](#).

1. Navigate to **System Definition > Text Indexes**.
2. Open the text index for the table.

For example, select task.
The system displays the Text Index record for the table.
3. Click the **Regenerate Text Index** related link and click **OK**.
The system schedules the table for text indexing.

Reindex a table without impacting text search results

Rebuild text search indexes without adversely impacting search results. You can continue to perform text searches on a table while the index regeneration takes place.

This method does not purge the entire text search index before the rebuild takes place. It rebuilds the text search table index one record at a time, and reindexes the target table hierarchy only. For example, if you select the sc_cat_item table, only the sc_cat_item table is reindexed.

1. Navigate to System Definition > Scripts - Background.
2. In Run script box, type the following syntax for the background script, being sure to enclose both arguments in quotes as shown:

   new GlideTextIndexEvent ().indexUpdate('tableName', 'emailAddress');

   Where:
   • tableName is the name of the table you want to reindex.
   • emailAddress is the address to which an email notification should be sent when the table reindex completes. Type null for no email notification.

   For example, to regenerate the kb_knowledge table text search index, and specify that no email notification is required after the rebuild completes, create the following background script:

   new GlideTextIndexEvent ().indexUpdate('kb_knowledge', 'null');

   The script creates an event that the index handler processes so the script completes almost instantly.
3. Click the Run script button.

   The system reindexes the text search for the specified table. For large files, such as sys_metadata, reindexing can take a couple of hours, but you can still perform text searches on the table while the script is running.

Regenerate a corrupt index

Typically, a corrupt index regenerates itself. If the system does not start the regeneration process, you must issue a script command to delete the existing index and regenerate it.

1. Navigate to System Definition > Scripts - Background.
2. In Run Script box, type the syntax for the background script:

   To regenerate the task text index, the following could be used as a background script:

   ```javascript
   var indexer = new GlideLuceneTextIndexEvent();
   indexer.createIndex("task", "my_email@service-now.com");
   ```

   Change the email address to the address that receives the notification when the index is completed. The script creates an event that the index handler processes so the script completes almost instantly.
3. Click the Run script button.
4. When the scheduled job picks up the event, you can check the Component Status page and see that the index is being generated. An entry also appears in the log, as shown in the following example:

   10/28/09 15:36:19 (521) worker.1 worker.1 TextIndexGenerator: Text index generation starting for: task
As each extended table completes, it is logged:

```
10/28/09 15:37:13 (213) worker.1 worker.1 [0:00:01.462] TextIndex
generation complete for: problem, rows indexed: 11
```

After all the extended tables are completed, the Component Status page entry is updated to "completed" and a final log entry is made. The log entry shows how long the process took.

```
10/28/09 15:37:20 (794) worker.1 worker.1 TextIndexGenerator: Text index
generation complete for: task, in: 0:01:02.669
```

**Remove an index**

You can remove the index for a table if you no longer want the search engine to return results for that table. This procedure also removes the index for all tables that extend the specified table.

**Role required:** admin

1. Navigate to System Definition > Dictionary.
2. Open the dictionary entry for the table.
3. Clear the Text index check box and click Update.

The system no longer indexes or queries the table for text search results.

**Remove an index for a specific field**

You can remove the index for a specific field in a table if you no longer want the search engine to return results for that field.

**Role required:** admin

1. Navigate to System Definition > Dictionary.
2. Edit the dictionary entry for the table field.
3. In the Attributes related list, click New.
4. On the Dictionary Attribute form, fill in the fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>No text index</td>
</tr>
<tr>
<td>Value</td>
<td>true</td>
</tr>
</tbody>
</table>

5. Click Submit.
6. Click Update.

The system no longer indexes or queries the table field for text search results.

**Remove an index for a child table**

You can remove the index for a child table if you no longer want the search engine to return results for that child table.

**Role required:** admin

1. Navigate to System Definition > Dictionary.
2. Edit the dictionary entry for the child table.
3. In the Attributes related list, click New.
4. On the Dictionary Attribute form, fill in the fields:
5. Click **Submit**.
6. Click **Update**.

The system no longer indexes or queries the child table for text search results.

**Change the query mode of an indexed table**

Set the query mode to specify whether searches on an indexed table must match all or only some of the search terms.

Role required: admin

To change the query mode of an indexed table, a text index must be present for the table. Make sure that text indexing is enabled for the table before changing the query mode. See Enable text indexing for a table.

Once a table is indexed, the data within the table can be searched through the global search bar. Change the query mode for the indexed table to allow global search to match all or only some of the searched terms. Enable a partial match rule to return results that partially match the searched terms.

1. Navigate to **System Definition > Text Indexes**.
2. Select the table you want to configure from the list of indexed tables.
3. Use the combo box to select a **Default query mode**.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>The default query mode for a table is an AND query.</td>
</tr>
<tr>
<td>AND</td>
<td>Matches all search terms.</td>
</tr>
<tr>
<td>OR</td>
<td>Matches one or more search terms.</td>
</tr>
<tr>
<td>AND OR</td>
<td>Matches all search terms. If no results are found, matches one or more search terms.</td>
</tr>
</tbody>
</table>

4. To enable partial matching of search terms, configure the partial match rule in the **Partial Match Rule** field.

Partial match rules return results that partially match the search terms. Use a partial match rule if queries often include many keywords (if, for example, users cut and paste phrases into the global search bar).

**Partial match rules**

<table>
<thead>
<tr>
<th>Input type</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer</td>
<td>3</td>
<td>Indicates the minimum number of search terms to be matched.</td>
</tr>
<tr>
<td>Negative integer</td>
<td>-2</td>
<td>Indicates that the number of search terms, minus this number, should be matched.</td>
</tr>
<tr>
<td>Percentage</td>
<td>75%</td>
<td>Indicates the minimum percentage of search terms to be matched. The minimum number of search terms is the number computed from the percentage rounded down.</td>
</tr>
<tr>
<td>Negative percentage</td>
<td>-25%</td>
<td>Indicates that the number of search terms, minus this percentage, should be matched. The minimum number of search terms is the number computed from the percentage rounded down and subtracted from the total number of search terms.</td>
</tr>
</tbody>
</table>
### Input type

<table>
<thead>
<tr>
<th>Input type</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Combination</td>
<td>3&lt;70%</td>
<td>A positive integer, followed by a less than symbol, followed by any of the previously mentioned input types. Indicates that if the number of search terms is equal to or less than the integer, all search terms are required. If the number of search terms is greater than the integer, the specification applies. In this example: if there are 1–3 search terms, all are required. If there are 4 or more search terms, only 70% are required.</td>
</tr>
<tr>
<td>Multiple combinations</td>
<td>3&lt;-25%, 9&lt;-5</td>
<td>Multiple conditional specifications separated by commas. In this example: if there are 1–3 search terms, all are required. If there are 4–9 search terms, all but 25% are required. If there are more than 9 search terms, all but 5 are required.</td>
</tr>
</tbody>
</table>

### Text indexing statistics and status

To view text indexing statistics and status, navigate to **System Definition > Text Indexes**.

- If text indexing is in progress, view the status of each index in the **State** field. Refresh the list to view updates.
  - Tables are indexed one at a time.
- To see how long it takes to index a specific table, view the **Last indexing duration** field for the table entry. Although each process varies based on activity and data, historical data can provide a good estimate.
- View statistics (such as the number of indexed rows, terms, and queries in the past week) in the list or on the form for a specific table.
### Text Index Status

<table>
<thead>
<tr>
<th>Text Index</th>
<th>State</th>
<th>Format</th>
<th>Indexed rows</th>

</tbody>
</table>
Configure tables to use the Japanese tokenizer

Improve search results in Japanese language searches by configuring individual tables to use the Japanese tokenizer.

Role required: admin

Japanese language searches use the Kuromoji Japanese tokenizer in Zing. The Japanese tokenizer attribute is active by default, but you must configure individual tables to use it and then regenerate the text index.

1. Navigate to **System Definition > Dictionary**.
2. Search for the table name.
3. In the search results, open the table, which is the list item that has an empty **Column name** and a **Type** of **Collection**.
4. Scroll down the page and click the **Attributes** tab, and then click **New**.
5. Fill in the fields on the form.

**Attributes fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Enter <strong>Text index tokenizer language.</strong></td>
</tr>
<tr>
<td>Dictionary entry</td>
<td>Defaults to the name of the table.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter <code>ja</code> for the Japanese tokenizer.</td>
</tr>
</tbody>
</table>

6. Click **Submit**.

7. Regenerate a text index for a table.

**Note:** Text indexing can be a resource-intensive task that may take a while to complete. You may notice performance degradation or incomplete search results during index generation. To estimate text indexing duration, you can view historical statistics.

When the text index is generated and you go to the table you just configured, the table now uses the Japanese tokenizer.
Zing can include attachments in search results

Expand search results to include attachments from indexed tables. Display attachments for search results from the kb_knowledge table.

Sample Knowledge search showing attachments
By default, only searches of Knowledge Base records include attachments. Administrators can enable searching attachments for other tables, but doing so causes the platform to re-index the selected table, its parent table, and any children of the parent table.

**Warning:** For large tables, such as the Task table, re-indexing can take several hours and slows down the system until complete. Re-indexing is best performed during non-peak times.

The search results page only displays attachments for search results from the Knowledge [kb_knowledge] table, even if other tables have attachment search enabled.

Global search displays attachments for Knowledge search results but not for search results from other tables

Zing supports indexing and searching these attachment file types.

- .doc
- .htm
- .html

- .reg
- .txt
- .xls

- .pptx
- .potx
- .pot
Index attachments on a table

You can enable attachment indexing for a table so text searches can return matches from the record and its file attachments.

Role required: admin

By default, attachment indexing is enabled for the Knowledge Base. Enabling attachment indexing causes the platform to reindex the selected table, its parent table, and any children of the parent table. For large tables, such as the Task table, reindexing can take several hours and slows down the system until complete. Reindexing is best performed during non-peak times.

1. Open a record in the table.
2. Right-click the form header and select Configure > Dictionary.
3. On the Dictionary Entries list, open the first record.
   The first record has the record type Collection and doesn't have any entry for Column name.
4. Open the Attributes tab, and then click New.
5. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attribute</td>
<td>Select Attachment index.</td>
</tr>
<tr>
<td>Value</td>
<td>Enter true.</td>
</tr>
</tbody>
</table>

**Note:** The attachment indexing attribute only applies to the tables on which you explicitly add it. It does not cascade to child tables. For example, indexing attachments on the Task table does not index attachments on the Incident table. Not all file types are supported for attachment indexing. For a list of supported file types, see Zing can include attachments in search results.

6. Click Submit.
7. On the Dictionary Entry form, click the Generate Text Index related link.
8. On the confirmation window, click OK.

In the confirmation window, you can select to have the system send you an email notification after the text indexing is complete.

The indexing process begins. When it is complete, attachments can be searched on that table.

**Zing removes stop words from queries**

Remove common words from search queries that do not produce meaningful results.

Stop words are common words that are not indexed because they are not meaningful in search results. Articles, conjunctions, personal pronouns, and prepositions are examples of stop words that are not used in keyword searches. Administrators can configure stop words for all indexed tables and for specific tables.

By default, the system maintains two types of stop words.

**Types of stop words**

<table>
<thead>
<tr>
<th>Stop word type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System-wide text index stop words</td>
<td>The system always ignores system-wide text index stop words when generating text indexes. Any search for a system-wide stop word returns no search results.</td>
</tr>
<tr>
<td>Table-specific stop words</td>
<td>The system uses the table-specific Text Index record to determine whether to index the stop word or to just remove it from keyword search queries against the table.</td>
</tr>
</tbody>
</table>

By default, the system has stops words for common English words. Search administrators typically create stop words from search terms that produce too many search results such as articles, conjunctions, personal pronouns, and prepositions.
Configure a global stop word

Configure stop words that should not be indexed by the search.

1. Navigate to **System Definition > Text Index Stop Words**.
2. Add or remove stop words from the list.
3. If a message appears at the top of the list, contact Technical Support to regenerate all indexes.
   You must regenerate indexes whenever words may be missing from an index. For example, if you delete, inactivate, or change an active global stop word, the word may be missing from the index. An after business rule checks these conditions and generates the notification message when index regeneration is necessary.

Configure a table-specific stop word

You can configure stop words for a specific table.

1. Navigate to **System Definition > Text Indexes**.
2. Open the text index entry for the table.
3. Add or remove stop words from the **Index Stop Words** related list.
   For each word, select the desired **Stop mode** (Not a Stop Word (inactivates the stop word), Neither Index nor Query, or Index but do not Query).
4. If a message appears at the top of the form, click **Regenerate Text Index** and click **OK**.
   You must regenerate indexes whenever words may be missing from an index. For example, if you delete or change a stop word for which the mode was Neither Index nor Query, the word may be missing from the index.
An after business rule checks these conditions and generates the notification message when index regeneration is necessary.

**Note:** Text search uses the global list plus the table-specific list of stop words when indexing the table.

---

**Enable automatic stop words for a table**

The system can identify and generate stop words when a search term exceeds an occurrence threshold.

- Role required: admin
- Enable text indexing for the table

By default, the TS Index Stats scheduled job identifies and creates stop words for tables with text indexes on a nightly basis. Automatically adding stop words improves your search results by removing search terms that return too many search results.

1. Navigate to **System Definition > Text Indexes**.
2. Open the text index entry for the table.
3. Select the **Auto stop** check box.
4. In **Auto threshold**, enter the maximum number of occurrences a search term can have in search results. When a search term generates more search results than the threshold, the system automatically creates a stop word for the search term.

For example, to create stop words for the task table, see the blog post [Configuring auto stop words and regenerating text indexes](#) from a ServiceNow employee on the Now Community.

5. Click **Update**.

The job identifies and creates stop words for the table with a **Stop mode** value of *Index but do not Query* and inserts a **Comment** to indicate that the stop word was generated automatically.

**Zing matches derived words with stemming**

Convert any multiple-character search keyword to its stem form to find derived versions of the word.

Stemming removes a variety of common word inflections, such as plurals and past tense forms. Zing treats all words with a common stem as synonyms of the original search term. Stemming does not apply to searches involving single-character words such as Chinese and Japanese pictograms.

Zing uses the [Porter Stemming Algorithm](https://en.wikipedia.org/wiki/Porter_stemming), which is most effective for English text, but supports stemming in these languages.

- English
- French
- German

The stemming language determines how the system generates indexes of record data. The system only supports one stemming language at a time regardless of how many languages the instance supports. When you change the stemming language, the system creates any new index entries based on the new language stemming rules, but does not regenerate any existing index records. You must manually regenerate indexes for tables you want to use the new stemming language.

**Zing can expand search results with synonyms**

Expand search results to include additional search terms.

By default, Zing includes a sample synonym dictionary consisting of a list of synonym sets (synsets). Zing supports two types of synonym sets.

**Synonym set types**

<table>
<thead>
<tr>
<th>Synonym set type</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synonym list</td>
<td>A synonym list is a list of words separated by commas. When a search uses any word from the list, Zing expands the search to include all words in the list.</td>
<td>Cyber,Internet,Cybercafe</td>
</tr>
<tr>
<td>Synonym map</td>
<td>A synonym map is two word lists separated by the equal and greater than characters =&gt; . When a search uses any word from the list on the left, Zing expands the search to include all words from the list on the right. When a search uses a word from the list on the right, Zing does not expand the search to include terms from the list on the left.</td>
<td>IOT,Internet of Things=&gt;Chip,Nest thermostat,RFID,IOT</td>
</tr>
</tbody>
</table>
Search administrators can create synonym sets for search terms that produce no or low-scoring search results. See the Top Searches homepage for information about your user's search behavior.

**Search results, synonym expansion and weighting**

In search results, documents containing the original search keywords having a higher score than documents containing the search synonyms. For example, documents with the keyword IOT have a higher score than documents with the synonym Internet of Things.

- One-way synonym expansion to/from multiple terms (blork, cork => malork, elastic) works as expected. Blork and cork both expand to malork and elastic.
- Multi-level one-way expansion (blork => cork => malork) does not work transitively. Neither blork nor cork expands to malork.
- Multi-level one-way expansion split between multiple synonym set records (blork => cork) (cork => malork) does not work transitively. Only cork expands to malork, blork only expands to cork but not malork.

By default, synonyms do not use the same weight as regular search terms. Synonyms are only weighted at 10% of the default search weight. Additionally, multiple instances of a synonym in a single doc/field do not increase the search weight. The weight of synonyms is controlled by the property `glide.ts.synonym.expanded.boost`. When this property value = 1, synonyms are weighted equally to normal search terms. 0.5 = 50% weight etc.

**Enable search synonyms**

Enabling text index synonyms allows Zing to expand text searches with additional search keywords.

Role required: admin or ts_admin

By default, text searches do not use text index synonyms.

1. Navigate to System Properties > Text Search.
2. Scroll down to Enable Synonym, and click Yes.

Text searches use active synonym dictionaries to expand keyword searches.

**Create synonym dictionaries**

You can create synonym dictionaries to expand text searches with additional search keywords.

Role required: admin or ts_admin

By default, the system provides a sample synonym search dictionary called Example synonym dictionary.

1. Navigate to System Definition > Text Index Synonym Dictionaries.
2. Click New, and create a new record. See the table for field descriptions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A name for the dictionary.</td>
</tr>
<tr>
<td>Active</td>
<td>When checked the dictionary is active. The default is checked.</td>
</tr>
<tr>
<td>Global</td>
<td>When checked the dictionary is to be used on all tables that have not been individually configured. The default is checked.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the dictionary.</td>
</tr>
</tbody>
</table>
3. Add a Synonym set.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Synset</td>
<td>A synonym definition, either a list or a map. Separate multiple synset words with commas. For example: medicalise, médicalisé</td>
</tr>
<tr>
<td>Active</td>
<td>When true the synonym set is used. Default is true.</td>
</tr>
<tr>
<td>Description</td>
<td>A description or notes about the synonym.</td>
</tr>
</tbody>
</table>

4. Click Submit or Update.
5. Click Publish Dictionary, under Related Links.
   The State changes from draft to Published.

Select synonym dictionaries for a table

Search administrators can specify one or more synonym dictionaries available to a particular table.

Role required: admin or ts_admin

1. Navigate to System Definition > Text Indexes.
2. Click the table for which you want to change search behavior.
   The system displays the Text index record for the table.
3. Click the Index Synonym Dictionaries tab.
4. Click New.
6. Click Submit.

Text searches on this table use the selected synonym dictionaries.

Disable synonyms for a table

By default, Zing uses all active synonym dictionaries when a user performs a text search. Search administrators can disable synonym dictionary usage on a per-table basis.

Role required: admin or ts_admin

1. Navigate to System Definition > Text Indexes.
2. Click the table for which you want to change search behavior.
   The system displays the Text index record for the table.
3. Click Disable synonym, so the check appears.
4. Click Update.

Debug synonym searches

You can view debug messages to determine if synonym searches are working as expected.

Role required: admin

1. Navigate to System Diagnostics > Session Debug > Debug Text Search.
2. Perform a search using a term in a synonym dictionary.
3. View the session debug output.
Zing displays search suggestions as users enter search terms

Display possible search query completions as users enter search terms.

To use the Search Suggestions application, activate the com.glide.search.suggestions plugin if it's not already installed. For information, see Request a plugin and Activate a plugin.

Once you enable Search Suggestions, suggestions appear automatically when users enter text into Zing search fields in the Service Portal or Now Mobile.

Automatic search suggestions

If there are any matching suggestions from the user’s own previous searches, those suggestions appear first, with a clock icon. The remaining suggestions are those suggestions coming from the searches of other users.

In the Service Portal, you can use Search Suggestions or type-ahead functionality, but not both at the same time. In Now Mobile, only Search Suggestions is available. By default, new ServiceNow instances use Search Suggestions in the Service Portal. Upgraded instances use whatever was previously enabled. You can easily enable Search Suggestions on upgraded instances. To learn more, see Enable and disable Search Suggestions in Zing.

For full details on configuration and use of the Search Suggestions application, see Search Suggestions.

Enable and disable Search Suggestions in Zing

Enable the Search Suggestions application to improve the Zing search user experience.

- ServiceNow personnel installed and activated the com.glide.search.suggestions plugin.
- Role required: admin

The Search Suggestions application is available on new instances by default. On upgraded instances, Search Suggestions is enabled for Now Mobile and disabled for Service Portal by default.

The following system properties enable and disable Search Suggestions:
• `glide.search.suggestions.enabled`: Set to `true` (default) to enable Search Suggestions in Zing, or set to `false` to disable Search Suggestions in Zing.

• `glide.service_portal.search_as_you_type_behavior`: Select `Suggestions` or `Typeahead` functionality in the Service Portal.

On new instances, the first parameter is set to `true` and the second is set to `Suggestions`. In upgraded instances, the parameters are set to whatever was previously enabled.

1. In the **Filter Navigator**, enter `sys_properties.list`.
2. To switch between Search Suggestions and type-ahead functionality in Service Portal, follow these steps.
   a) In the **Name** search column, enter `glide.service_portal.search_as_you_type_behavior`.
   b) On the System Property page, in the **Value** field, enter `Suggestions` to enable Search Suggestions, or `Typeahead` to enable type-ahead functionality. You can't enable both.

3. To turn Search Suggestions on or off globally, follow these steps.
   a) In the **Name** search column, enter `glide.search.suggestions.enabled`.
   b) In the **Value** field, double-click the value and select `true` to enable suggestions, or `false` to disable Search Suggestions globally.

---

**Set the maximum number of suggestions Zing displays**

Set the maximum number of search suggestions Zing displays when users enter search strings in Now Mobile and Service Portal.

Role required: admin

Zing displays suggestions generated by the Search Suggestions application when users enter text in a search field in a supported search application. You can control the number of suggested search strings displayed using the `sys_search_context_config_list` table for Now Mobile, and instance options for the Typeahead Search widget in Service Portal.

1. Set the maximum number of search strings displayed in Now Mobile.
   a) In the **Filter Navigator**, enter `sys_search_context_config_list`.

---

© 2021 ServiceNow, Inc. All rights reserved.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.
b) In the Search Context Configurations list, in the row where Application ID equals ServiceNow Mobile Request Native Application, double-click the number in the Suggestions limit column.

c) Update the number and click the green check mark.

2. Set the maximum number of search strings displayed for Knowledge Base searches.
   a) Navigate to Service Portal: https://<instance name>/service-now.com/sp.
   b) Click the Knowledge Base link.
   c) Place your cursor in the search field.
   d) While holding down the Control key, press the left mouse key.
      A context menu appears.
   e) Click Widget Options Schema.
   f) Scroll down to the section where Label is Limit, enter the maximum number of search suggestions to display in the Default value field, then click Save at the bottom of the form.

   Note: You can limit the number of search suggestions on any form that uses the Typeahead Search widget. For example, the System Status tab also uses the typeahead widget but the Catalog tab does not. For more information, see Typeahead Search widget

Installed with Zing

Several types of components are installed with Zing.

<table>

AI Search

The application provides a modern consumer-grade search engine for , , and . Intelligent query features enable users to quickly find the answers they need.

Get started

Troubleshoot and get help

• Ask or answer questions about AI Search in the Now Community
• Search the Known Error Portal for known error articles
• Contact Customer Service and Support

Extend AI Search with apps from the ServiceNow® Store

• Analyze search query traffic trends, review indexed record counts and configuration settings, and preview search query results with Advanced Management Tools.

Exploring AI Search

Learn about AI Search features that enable you to provide consumer-grade search experiences for your users.

Index searchable content from Now Platform tables

Make record content searchable by adding it to the AI Search index.

Define an indexed source for each Now Platform table that you want to index records from. Search administrators can configure settings for each indexed source:

• Enable indexing for child tables of the source table.
• Configure indexing of source record tags, attachments, translated fields, and referenced fields.
• Map source table fields to AI Search index fields for ease of search.
The base system includes indexed sources for Knowledge Base articles, CMDB Catalog Items, and user records. You can create indexed sources to index records from almost any other Now Platform table.

Search administrators define indexed sources and use them to index content. To learn more about indexed sources, see Indexed sources.

Control access to searchable content using search sources

A search source defines a subset of indexed content that users can search using a search profile. Create search sources by applying filter conditions to content from indexed sources.

Search administrators link search sources to search profiles, enabling precise control of the content that users can search. For details on creating search sources, see Search sources.

Define search experience settings in search profiles

Search profiles define search sources and settings for linguistic search query features. Each search profile represents an individual search experience that you want to offer users in a supported Now Platform.

Each search profile can include the following settings:

- One or more search sources defining content that users can search using the profile.
- Dictionaries of synonyms, stop words, and typo handling auto-correction terms applied to searches using the profile.
- Genius Result configurations applied to searches using the profile.
- Result improvement rules applied to searches using the profile.

Search administrators create search profiles, link search sources to them, configure their settings, and publish them. For information on creating, configuring, and publishing search profiles, see Search profiles.

Enable AI Search in supported Now Platform applications

Provide multiple search entry points across your organization by enabling AI Search as the search engine for , , and .

Search administrators define search application configurations for Now Platform applications. Each configuration links to a search profile defining the search experience for the application. Administrators can configure the application's behavior in the following ways:

- Enable or disable typo handling auto-correction for search queries.
- Configure navigation tab and facet filters to enable users to refine search results.
- Limit the maximum number of search suggestions and Genius Result cards the application can display for a search.
- Limit the number of search results the application displays on each result page.
- Enable or disable highlighting of search query terms in the application's search results.

To learn more about configuring and enabling AI Search in supported Now Platform applications, see Search application configurations and Enabling and configuring AI Search in Now Platform applications.

Provide users with powerful and flexible search

AI Search includes search features that help users find the answers they need.

**Powerful query language**

Query for indexed terms and phrases. Control query logic with Boolean operators. Match a range of indexed terms using wildcard operators.

For a complete guide to supported query language syntax and operators, see AI Search query language.

**Auto-complete search queries**
Display suggestions in the input field as users compose their searches. Suggestions include recent and popular search queries and results as well as entries from the user's personal search history.

Auto-complete suggestions are linguistic features that search administrators configure in search application configurations. For more information on auto-complete suggestion type settings, see Configure an auto-complete suggestion type in an AI Search application configuration.

**Language-sensitive lemma and Unicode normalization of search query terms**

Support natural language search by expanding search query terms to match alternate inflections and forms.

Lemma and Unicode normalization are linguistic features that do not require configuration. For more details on normalization behavior, see Lemma and Unicode normalization.

**Expand search query terms using configurable synonyms**

Improve search recall by configuring language-specific dictionaries of terms with equivalent meanings or usage. When a search query includes any of these terms, AI Search expands it to include all equivalent terms, providing users with a more natural search experience.

Synonyms are linguistic features that search administrators configure in search profiles. For details on synonyms and synonym dictionaries, see Synonyms.

**Remove excessively frequent search terms using configurable stop words**

Increase search precision by configuring language-specific dictionaries of frequently appearing terms that dilute search relevancy. AI Search removes these stop words from user search queries to exclude irrelevant results.

Stop words are linguistic features that search administrators configure in search profiles. For details on stop words and stop word dictionaries, see Stop words.

**Auto-correct typos in search query terms**

Automatically replace misspelled search query terms with spellings found in indexed content. Typo corrections are displayed above search results. Users can always choose to repeat the search with their original query terms.

Typo handling auto-correction is a linguistic feature that search administrators configure in search profiles. For details on controlling the set of available auto-correction terms, see Typo handling.

**Enable search result refinement filters**

AI Search enables users to refine searches by filtering their results. Use navigation tabs to filter results by source, or select facets to apply filters dynamically generated from the result set.

**Filter results by source using navigation tabs**

Display pre-defined categories that users can select to immediately exclude unwanted search results.

Search administrators configure navigation tabs in search application configurations. For details on available settings, see Configure navigation tabs in an AI Search application configuration.

**Filter results dynamically using facets**

Display field value-based filter selections generated dynamically from the search query's result set. Users can select multiple facet values to narrow their area of focus. Facets only display when they produce results, so users never need to worry about dead ends.

Search administrators define facets in search application configurations. For details on creating and configuring facets, see Create a facet in an AI Search application configuration.
Display relevant and actionable search results

AI Search provides users with clear answers for their search queries.

Display the most relevant results first with machine learning relevancy

AI Search orders search results in decreasing order of relevancy. Machine learning automatically tunes and improves search result relevancy scoring based on aggregated signal data from user interactions with search.

Machine learning relevancy is automatically enabled and not configurable. For more details on automatic relevancy score tuning, see Machine learning relevancy in AI Search.

Display the best answers as actionable Genius Result cards

Configure optional Genius Results to analyze search query intent and put the best answers first. Search users can read a Knowledge article, view a user's profile or organization chart, or request a Catalog Item directly from a Genius Result answer card.

Search administrators can link Genius Results to search profiles, modify their settings, and create new configurations. For details on Genius Results configurations, see Genius Results.

Boost, block, or promote search results

Define result improvement rules with configurable trigger conditions. A rule can boost search result relevancy based on the search query or user context, or can block or promote specific results for a particular search query.

Search administrators define result improvement rules in search profiles. For details on creating rules and configuring their boost, block, or promote actions, see Result improvement rules.

Hit highlighting

AI Search highlights search query terms that appear in search results. This highlighting enables users to see which query terms contributed to record matches.

Search administrators configure hit highlighting in search application configurations. For details on controlling this setting, see Enable or disable hit-highlighting for an AI Search application.

Content security in AI Search

When indexing records, AI Search preserves their Now Platform security features. At query time, AI Search filters search query results and displays only records that the user can access.

For more information on how AI Search handles security features for Now Platform table records, see Content security in AI Search.

Internationalization support

Index and search for content in any language supported by the Now Platform. Configure linguistic search features in English, French Canada, French, German, Japanese, and Spanish.

For more details on language support in AI Search indexing, search, and linguistic query features, see Internationalization support for AI Search.

Deflect incidents in Service Portal with the AI Search Assist widget

Improve incident deflection for Service Portal users by displaying the most relevant search results within a record producer.

AI Search Assist can help an agent or user find the most relevant items in a search on your portal. For example:

- An agent, working on an Incident record, can use AI Search Assist to find and attach knowledge articles, order a catalog item on behalf of the caller, or search for an article and link it to a related incident or problem.
• A user, creating an Incident via the Service Portal, can see related Catalog Items that the user can order. The user can also view related knowledge articles to help them resolve the issue on their own without involving the service desk operators.

AI Search Assist helps with incident deflection for the following areas:
• Incident record producers: Deflect incidents by helping end users resolve issues before they raise an incident.
• Incident forms: Help service desk staff resolve incidents quickly by providing relevant knowledge.
• Incident email notifications: Help end users resolve their incidents themselves without requiring manual intervention from service desk staff.

To learn more about configuring and using the AI Search Assist widget in Service Portal, see AI Search Assist.

Configuring AI Search
Plan and configure your AI Search implementation.

Configuration overview

<table>
<thead>

### Using guided setup to implement AI Search

Guided setup provides a sequence of tasks that help you configure AI Search on your ServiceNow instance. To open AI Search guided setup, navigate to **AI Search > Guided Setup**.

For more information about using the guided setup interface, see Using guided setup.

### Assign roles to AI Search administrators

Grant users the ais_admin and search_application_admin roles so they can configure and manage settings for AI Search and search applications.

Role required: admin

Users with the following roles can access and configure settings for the AI Search application.
<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
</table>
| administrator [ais_admin]                 | Manages configuration settings for the application, including the following:  
  • Creates, reads, updates, and deletes indexed sources  
  • Creates, reads, updates, and deletes search sources  
  • Creates and deletes mappings between search sources and search profiles  
  • Creates, reads, updates, and deletes search profiles  
  • Creates, reads, updates, and deletes synonym and stop word dictionaries  
  • Creates and deletes mappings between dictionaries and search profiles  
  • Reads and updates typo handling auto-correction dictionaries linked to search profiles  
  • Creates, reads, updates, and deletes Genius Result configurations  
  • Creates and deletes mappings between Genius Result configurations and search profiles  
  • Creates, reads, updates, and deletes result improvement rules  
  • Creates and deletes mappings between result improvement rules and search profiles  
  This role is included in the Search application administrator [search_application_admin] role.                                                                                                                                                                                                                     |
| Search application administrator [search_application_admin] | Creates, reads, updates, and deletes search application configurations.  
   This role includes the ais_admin and personalize_dictionary roles.                                                                                                                                                                                                                                                                                                                                                               |

Assign these roles to users and groups to enable them as search administrators for AI Search.

- Assign a role to a user
- Assign a role to a group

**Indexed sources**

Indexed sources enable AI Search to retrieve records from Now Platform tables. Index a source table's records to make their content searchable in AI Search.

Each indexed source includes a unique name and a reference to a Now Platform table. AI Search extracts searchable content from records in this table, and in any of its child tables that you configure for indexing.

When you define a new indexed source, automatically begins indexing changes made to records in the selected source table and its specified child tables. It doesn't index content from existing records in these tables until you perform a full table index.

**Note:** excludes some tables from indexing. You cannot define these excluded tables or their derived tables as indexed sources. For a list of excluded tables, see Now Platform tables excluded from AI Search indexing.

You can configure attributes and field settings for an indexed source to control indexing behavior for source records.
Create an indexed source
Define an indexed source to make content from records on a Now Platform table searchable using AI Search.

Role required: ais_admin

1. Navigate to **AI Search > AI Search Index > Indexed Sources**.
2. Click **New**.
3. On the form, fill in the fields.

### AI Search Indexed Sources form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name for the indexed source.</td>
</tr>
<tr>
<td>Source</td>
<td>The Now Platform table to index.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the indexed source. Only active indexed sources can index content from Now Platform tables.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the indexed source. This field is automatically set.</td>
</tr>
</tbody>
</table>

**Note:** excludes some tables from indexing. You cannot define these excluded tables or their derived tables as indexed sources. For a list of excluded tables, see Now Platform tables excluded from AI Search indexing.

4. Click **Submit**.
   The new indexed source appears in the AI Search Indexed Sources list with the **State** set to **New**. If the new indexed source requires manual indexing, an informational message and an alert triangle icon (⚠️) appear.

5. Optional: To configure indexing for child tables of the selected source table, edit the new indexed source and follow these steps for each child table:
   a) In the Child Tables related list, click **New**.
   b) On the form, fill in the fields.

### Child Table form

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indexed Source</td>
<td>Reference to the indexed source. This field is automatically set.</td>
</tr>
<tr>
<td>Table</td>
<td>Label and name for the child table that you want to enable content indexing for. You can only select from tables that extend the indexed source table.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate indexing for the child table.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the child table indexing configuration. This field is automatically set.</td>
</tr>
</tbody>
</table>
c) Click **Submit**.
   The new child table appears in the Child Tables related list.

Perform a full table reindex for the indexed source to make content from existing records searchable. For details on this procedure, see **Perform a full table index or reindex for a single indexed source.**

*Indexed source attributes*

An indexed source attribute defines indexing behavior for all records from an indexed source.

Examples of how you might use indexed source attributes include the following.

- Define a filter to limit the set of records indexed from the source table
- Modify default indexing behavior for attachments or tags found on source table records
- Specify whether to index translated fields from source table records

Indexed source attributes appear in the indexed source's Advanced Configuration related list.

Create an indexed source attribute

Define an indexed source attribute to configure the AI Search content indexing behavior for all records on a source table.

Role required: ais_admin

For details on available indexed source attributes and values, see **List of AI Search indexed source attributes.**

1. Navigate to **AI Search > AI Search Index > Indexed Sources.**
2. Edit the indexed source that you want to define an attribute for.
3. In the Advanced Configuration related list, click **New.**
4. On the form, fill in the fields.

**Indexed Source Attribute form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indexed Source</td>
<td>Indexed source the attribute applies to.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Attribute to set for all records indexed from the selected source table.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the indexed source attribute. This field is automatically set.</td>
</tr>
<tr>
<td>Source</td>
<td>Specific table from the indexed source that the attribute applies to.</td>
</tr>
<tr>
<td>Value</td>
<td>Value for the specified attribute.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

The new indexed source attribute appears in the Advanced Configuration related list.

To make the new indexed source attribute take effect, perform a full table reindex for the indexed source. For details on this procedure, see **Perform a full table index or reindex for a single indexed source.**

Enable indexing of tags for an indexed source

Configure an indexed source attribute to enable indexing of content from tags found on records from an indexed source.

Role required: ais_admin

By default, AI Search indexing ignores tags from source records. You can enable indexing of tags for all records from an indexed source. Choose whether you want to index all shared and globally visible tags or just globally visible tags. Private tags are never indexed.
For more general instructions on defining indexed source attributes, see Create an indexed source attribute.

1. Navigate to **AI Search > AI Search Index > Indexed Sources**.
2. Edit the indexed source that you want to enable tag indexing for.
3. In the Advanced Configuration related list, click **New**.
4. On the form, fill in the fields.
   a) In the **Attribute** field, enter `index_tags`.
   b) In the **Value** field, enter one of the following options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>everyone_only</td>
<td>Only tags shared with everyone are indexed.</td>
</tr>
<tr>
<td>all_shared</td>
<td>All shared tags (Everyone, Groups and Users) are indexed.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

The new **index_tags** indexed source attribute appears in the Advanced Configuration related list.

To make the new **index_tags** attribute take effect, perform a full table reindex for the indexed source. For details on this procedure, see Perform a full table index or reindex for a single indexed source.

List of AI Search indexed source attributes

You can adjust indexing behavior for an AI Search indexed source by configuring indexed source attributes and values.

For instructions on defining AI Search indexed source attributes, see Create an indexed source attribute.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter</td>
<td>Specify a filter condition that applies on the indexed source table and all of its child tables configured for indexing. Indexing ignores source records that do not pass this filter condition.</td>
</tr>
</tbody>
</table>
| index_attachments | Control indexing behavior for attachments from indexed records. Supported values:  
|                 | • **false**: Disable indexing of attachments for this table.  
|                 | • **true**: Enable indexing of attachments for this table. |
| index_tags     | Control indexing behavior for tags from indexed records. Supported values:  
|                 | • **all_shared**: Index shared tags and globally visible tags.  
|                 | • **everyone_only**: Only index globally visible tags.  
|                 | • **none**: Disable indexing of tags. |

**Note:** Search results display indexed tags based on the visibility of the result record instead of the visibility of the tag.
### Field settings

A field setting controls indexing behavior for a specified field (column) on all records from an indexed source.

Examples of how you might use field settings include the following:

- Disable text indexing for a specified field found on source table records
- Modify mappings between a specified source table and an AI Search field
- Add a field to the index by dot-walking from reference fields on source table records

Field settings appear in the indexed source's Field Settings & Mapping related list.

**Create a field setting for an indexed source**

Define an indexed source field setting to configure AI Search content indexing behavior for a specific field on source table records.

Role required: ais_admin

For details on available field settings and values, see [List of AI Search indexed source field settings](#).

1. Navigate to **AI Search > AI Search Index > Indexed Sources**.
2. Edit the indexed source that you want to define a field setting for.
3. In the Field Settings & Mapping related list, click **New**.
4. On the form, fill in the fields.

5. **Click Submit.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indexed Source</td>
<td>Indexed source that the field setting applies to.</td>
</tr>
<tr>
<td>Source</td>
<td>Specific table from the indexed source that the field setting applies to.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Field setting to apply for the selected field on all records indexed from the selected source table.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the field setting. This field is automatically set.</td>
</tr>
<tr>
<td>Field</td>
<td>Record field that the field setting operates on.</td>
</tr>
<tr>
<td>Value</td>
<td>Value for the specified field setting.</td>
</tr>
</tbody>
</table>
The new field setting appears in the Field Settings & Mapping related list.

To make the new field setting take effect, perform a full table reindex for the indexed source. For details on this procedure, see Perform a full table index or reindex for a single indexed source.

List of AI Search indexed source field settings

You can adjust indexing behavior for source record fields in an AI Search indexed source by configuring field setting attributes and values.

For more information on creating field settings, see Create a field setting for an indexed source.

<table>

<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>not_searchable</td>
<td>Option to disable search matching for content indexed from the selected field.</td>
</tr>
<tr>
<td></td>
<td>Supported values:</td>
</tr>
<tr>
<td></td>
<td>• <strong>true</strong>: Disable search matching for content indexed from the selected field. Search cannot match the field's value. Filters (such as for content security, navigation tabs, and facets) can still match the field's value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>false</strong>: Enable search matching for content indexed from the selected field. Search and filters can match the field's value.</td>
</tr>
</tbody>
</table>

This example shows how to map `short_description` display field values from an indexed source's records to the AI Search `title` field.

**Indexing content from indexed sources**

AI Search indexes records on indexed source tables to make their content searchable.

When you define a new indexed source, automatically begins indexing changes made to records in the selected source table and its specified child tables. It doesn't index content from existing records in these tables until you perform a full table index.

**Indexing content from referenced tables**

When an indexed source table includes a reference field, AI Search defaults to indexing values for the reference field but not for other fields on the referenced record.

You can configure a `dot_walk_fields` field setting to index additional fields from referenced tables. For more information on field settings, see Field settings.
Indexing content from source record attachments

AI Search indexes searchable content and metadata (such as file size and date) for attachments found on source table records. Indexing supports the following attachment file formats:

• Hypertext Markup Language (.html, .htm)
• Excel (.xls, .xlsx)
• PowerPoint (.pot, .potx, .ppt, .pptm, .pptx)
• Word (.doc, .docx, .dot, .dotx)
• Plain Text (.txt)
• Portable Document Format (.pdf)

AI Search provides limited support for encrypted record attachments:

• When indexing an encrypted attachment, AI Search extracts metadata such as file size and date, but doesn't extract searchable content.
• The encrypted attachment's MIME type is detected as application/octet-stream.
• No feedback for the encrypted attachment appears in ingestion log messages.

Indexing content from source record tags

AI Search can index tags found on source table records. Search results display indexed tags based on the visibility of the result record instead of the visibility of the tag.

By default, indexing ignores tags from source records. You can enable indexing of tags for each indexed source. Choose whether you want to index all shared and globally visible tags or just globally visible tags.

For details on enabling tag indexing for an indexed source, see Enable indexing of tags for an indexed source.

Reindexing content

You must perform a full table reindex for an indexed source under the following circumstances:

• After you add, modify, or delete an indexed source attribute or a field setting for the indexed source.
• If you want to update indexed values for fields on records referenced from source table records.

Perform a full table index or reindex for a single indexed source

Make content from an indexed source searchable by performing a full table index. This procedure indexes existing records from the source table and any child tables configured for indexing. You can manually reindex content from an indexed source by repeating these steps.

Role required: ais_admin

When you define a new indexed source, automatically begins indexing changes made to records in the selected source table and its specified child tables. It doesn't index content from existing records in these tables until you perform a full table index.

Follow these steps to index searchable content from existing records in an indexed source. Use the same steps to manually reindex existing content for an indexed source that has already been indexed.

If an indexed source contains unindexed records, the Indexed Sources list displays an informational message and marks the new source with an alert triangle icon (⚠️). A similar informational message appears on the Indexed Source form. Make sure to perform a full table index for each indexed source that displays the alert triangle icon.

1. Navigate to **AI Search > AI Search Index > Indexed Sources.**
2. Edit the indexed source with content that you want to make searchable.
3. Click **Index All Tables**.
   The Indexed Source History page appears. A message reports that AI Search has queued an indexing task for the indexed source.
4. Optional: Refresh the Indexed Source History form page to monitor the progress of the indexing task.
   When the task completes, the **Ingestion State** field shows **indexed**.
5. To return to the list of indexed sources, click the back icon ( ).

AI Search indexes content from existing records in the indexed source. Indexing continues on a scheduled basis. You don't need to repeat this task for the indexed source unless you want to reindex its content before the next scheduled indexing run.

Define search sources to make searchable content from the indexed source available in user search experiences. For details on creating search sources, see **Create a search source**.

Role required: ais_admin

When you define a new indexed source, **automatically begins indexing changes made to records in the selected source table and its specified child tables. It doesn't index content from existing records in these tables until you perform a full table index.**

Follow these steps to index searchable content from existing records in indexed sources. Use the same steps to manually reindex content for indexed sources that have already been indexed.

If an indexed source contains unindexed records, the Indexed Sources list displays an informational message and marks the new source with an alert triangle icon ( ). A similar informational message appears on the Indexed Source form. Make sure to perform a full table index for each indexed source that displays the alert triangle icon.

1. Navigate to **AI Search > AI Search Index > Indexed Sources**.
2. Select the action options next to the indexed sources with content that you want to make searchable. To select all indexed sources on the page, follow the instructions for your list version in **Perform actions on selected items in a list**.
3. In the Actions on selected rows menu at the bottom of the list, click **Index All Tables**.
   The Indexed Source History page for the last selected index appears. A message reports that AI Search has queued an indexing task for the indexed source.
4. Optional: Refresh the Indexed Source History form page to monitor the progress of the indexing task.
   When the task completes, the **Ingestion State** field shows **indexed**.
5. To return to the list of indexed sources, click the back icon ( ).

AI Search indexes content from existing records in the indexed sources. Indexing continues on a scheduled basis. You don't need to repeat this task for the indexed sources unless you want to reindex their content before the next scheduled indexing run.

Define search sources to make searchable content from indexed sources available in user search experiences. For details on creating search sources, see **Create a search source**.
Search sources

Define search sources to make your searchable content available in search experiences. Choose an indexed source and configure optional filter conditions to limit the content that users can search.

Search source structure

A search source includes two elements:

- A reference to an indexed source. By default, search queries using the search source can return all records from the referenced indexed source. For more information on indexed sources, see Indexed sources.
- An optional set of filter conditions applied to the indexed source's records. Indexed source records must pass all of these filter conditions to be returned as search results for queries using the search source. For more information on filter conditions, see Filters.

You can define multiple search sources that reference the same indexed source, specifying distinct filter conditions for each.

Linking search sources to search profiles

To make your search source's content available to users, link it to one or more search profiles. You can link multiple search sources to a single search profile.

For more information, see Link a search source to a search profile.

Viewing search sources

You can view or edit search sources from any of the following locations:

- To view all defined search sources, navigate to AI Search > Search Experience > Search Sources.
- To view search sources that reference a particular indexed source, navigate to AI Search > Al Search Index > Indexed Sources. Edit the indexed source and select its Search Source Mappings related list.
- To view search sources linked to a particular search profile, navigate to AI Search > Search Experience > Search Profiles. Edit the search profile and select its Search Sources related list.

Create a search source

Make searchable content from an indexed source available in user search experiences by defining a search source.

You must have an indexed source defined. For more details on setting up indexed sources, see Create an indexed source.

Role required: ais_admin

Define at least one search source for each of your indexed sources. You can define multiple search sources that reference the same indexed source, specifying distinct filter conditions for each.

1. Navigate to AI Search > Al Search Index > Indexed Sources.
2. In the Search Source Mappings related list, click New.
3. On the form, fill in the fields.

**AI Search Source form**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indexed source</td>
<td>Reference to an indexed source. For more details on indexed sources, see Indexed sources.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Set of filter conditions that documents from the indexed source must meet to be included in the search source. For more details on filter conditions, see Filters.</td>
</tr>
</tbody>
</table>

4. Click **Submit**.

The new search source appears in the Search Sources related list.

**Preview matching records for a search source**

View the Now Platform table records that match a search source’s indexed source table and filter conditions.

Role required: ais_admin

1. Navigate to **AI Search > Search Experience > Search Sources**.
2. Edit the search source that you want to preview matching records for.
3. On the Search Source form, click the **preview** link in the informational message that reports the number of matching records.

The Now Platform table specified in the search source's indexed source appears, with filter conditions applied to match conditions from the search source. This filtered view displays all records that are searchable through the search source.

**Note:** Preview uses the saved conditions from the search source. If you change a search source's conditions, preview does not reflect your changes until you save them.

**Search profiles**

AI Search stores search experience settings in search profiles. Define a search profile for each unique search experience that you want to offer users in a Now Platform application. Create and populate synonym and stop word dictionaries. Configure typo handling dictionary settings. Define Genius Results and result improvement rules.

The following table describes the search experience settings that you can configure in a search profile.

**Search profile settings**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search sources</td>
<td>Link one or more search sources to a search profile. Search sources give administrators precise control over the searchable content available to users.</td>
</tr>
<tr>
<td>Synonyms</td>
<td>Define language-specific dictionaries of terms that AI Search treats as equivalent in search queries. Synonyms improve search recall and provide a more natural search experience for users.</td>
</tr>
<tr>
<td>Setting</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Stop words</td>
<td>Define language-specific dictionaries of common terms for AI Search to remove from search queries. Stop words improve search precision and result relevancy by discarding irrelevant matches.</td>
</tr>
<tr>
<td>Typo handling</td>
<td>Configure settings for derivation of auto-correction terms from search source indexed content. AI Search replaces misspelled search query terms with auto-correction terms.</td>
</tr>
<tr>
<td>Genius Results</td>
<td>Analyze search query intent and display the best answers as Genius Result answer cards. Genius Results enable users to act directly on their search results.</td>
</tr>
<tr>
<td>Result improvement rules</td>
<td>Define rules with configurable triggers to modify search results for specific search queries. Result improvement rules enable administrators to boost, block, or promote records in a search query's result set.</td>
</tr>
</tbody>
</table>

**Publishing search profile settings**

To make a search profile's settings active in search queries, you must publish it. Publishing propagates the following settings to search application configurations that reference the search profile:

- The set of synonym and stop word dictionaries linked to the search profile
- Settings, blocked terms, and derived auto-correction terms for typo handling dictionaries linked to the search profile
- Result improvement rules and actions defined in the search profile

A search profile can have one of these states:

- **New**: The search profile has never been published.
- **Draft**: The search profile is saved with unpublished changes.
- **Published**: The search profile is saved with all changes published.

In the **Al Search > Search Experience > Search Profiles** list, search profiles with the **New** state display an alert triangle icon (⚠️). An informational message notifies you to publish these search profiles.

*Create a search profile*

Create a new search profile to store search experience settings for a search application.

Role required: ais_admin

1. Navigate to **Al Search > Search Experience > Search Profiles**.
2. Click **New**.
3. On the form, fill in the fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label for the search profile.</td>
</tr>
<tr>
<td>Description</td>
<td>Text description for the search profile.</td>
</tr>
<tr>
<td>Application</td>
<td>Application scope for the search profile. This field is automatically set.</td>
</tr>
<tr>
<td>Updated</td>
<td>Last update date for the search profile. This field is automatically set.</td>
</tr>
<tr>
<td>Updated by</td>
<td>User who most recently updated the search profile. This field is automatically set.</td>
</tr>
<tr>
<td>Active</td>
<td>Option to activate the search profile.</td>
</tr>
<tr>
<td>State</td>
<td>State of the search profile.</td>
</tr>
<tr>
<td></td>
<td>• <strong>New</strong>: The search profile has never been published.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Draft</strong>: The search profile is saved with unpublished changes.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Published</strong>: The search profile is saved with all changes published.</td>
</tr>
</tbody>
</table>

4. Click **Submit**. The new search profile appears in the AI Search Search Profiles list with **State** set to **New**. An informational message and an alert triangle icon (⚠️) indicate that the new search profile has never been published.

To make content searchable using your new search profile, link one or more search sources to it. For instructions on linking search sources, see **Link a search source to a search profile**.

Your new search profile includes sample synonym and stop word dictionaries and a default typo handling dictionary. For more details on configuring and populating these dictionaries, see **Synonyms**, **Stop words**, and **Typo handling**.

**Link a search source to a search profile**

Link search sources to a search profile to specify the content users can search through that profile.

You must have already created at least one search source. For instructions on creating search sources, see **Create a search source**.

Role required: ais_admin

1. Navigate to **AI Search > Search Experience > Search Profiles**.
2. Edit the search profile that you want to link the search source to.
3. In the Search Sources related list, click **Link Existing**.
4. On the Search Profile - Search Source Mapping form, fill in the **Search source** field. Enter or look up the name for the search source you want to link to the search profile.
5. Click **Submit**.

The new search source appears in the Search Sources related list. Search query results immediately reflect changes to the set of records searchable through the search profile.
Derived auto-correction term lists for the search profile's typo handling dictionary do not automatically update to reflect changes to the set of searchable records. To update these auto-correction term lists, publish the search profile you edited. For details on publishing a search profile, see Publish a search profile.

**Publish a search profile**

Publish a search profile to make pending changes to its settings take effect in linked search applications.

Role required: ais_admin

To make a search profile's settings active in search queries, you must publish it. Publishing propagates the following settings to search application configurations that reference the search profile.

- The set of synonym and stop word dictionaries linked to the search profile
- Settings, blocked terms, and derived auto-correction terms for typo handling dictionaries linked to the search profile
- Result improvement rules and actions defined in the search profile

1. Navigate to **AI Search > Search Experience > Search Profiles**.

   **Note:** Search profiles with the **New** state display an alert triangle icon (⚠️). An informational message notifies you to publish these search profiles.

2. Edit the search profile that you want to publish.

3. Click **Publish**.

The search profile appears in the AI Search Search Profiles list with **State** set to **Published**.

**Synonyms**

Synonyms expand search queries to include additional terms with equivalent meaning or usage. Improve search recall by configuring synonym dictionaries and defining synonyms.

To define synonyms, modify the default synonym dictionary for a search profile or create a new synonym dictionary linked to one or more search profiles. Create and publish synonyms for each dictionary. Publish the dictionary to make your synonyms take effect for searches that use linked search profiles.

You can delete synonym dictionaries that are not linked to any search profiles.

**Synonym usage in search**

When a search query includes a term defined in a synonym, AI Search expands the search to include all equivalent terms defined in the synonym.

For example, a synonym might expand the search query term **vacation** to **vacation OR holiday OR pto**. The expanded query returns records that contain any of the three equivalent terms.

**Conditions for synonym eligibility**

To operate on a search query, a synonym must satisfy the following conditions:

- It must be active.
- It must be included in a published synonym dictionary.
- The parent synonym dictionary must be linked to the search profile specified for the search query.
- The language of the parent synonym dictionary must match the language of the search query.
Synonym terms and payloads

Each synonym includes two or more equivalent terms, defined in two fields. The Term field contains one term designated as the synonym's label. The Payload field contains the remaining equivalent terms, formatted as a JSON array.

Synonym term expansion is bidirectional. AI Search treats all terms defined in the Term and Payload fields as equivalent, as illustrated in the following table.

<table>
<thead>
<tr>
<th>Use case</th>
<th>Synonym expansion behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search query term matches the term from a synonym's Term field</td>
<td>AI Search expands the search query term to match all equivalent terms from the Payload field.</td>
</tr>
<tr>
<td>Search query term matches a term from the Payload field</td>
<td>AI Search expands the search query term to match the term from the Term field and all remaining equivalent terms from the Payload field.</td>
</tr>
</tbody>
</table>

Multi-word phrases

A synonym term can include either a single word or a multi-word phrase. AI Search expands multi-word phrases when the search query terms exactly match the order and proximity of the words in the synonym definition. If a user searches with these words in a different arrangement, no expansion occurs.

For example, the following table describes AI Search search expansion behavior for a synonym that includes the single word 401k and the multi-word phrase retirement account.

<table>
<thead>
<tr>
<th>Search query terms</th>
<th>Synonym expansion behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>401k</td>
<td>AI Search expands the search query to match either 401k or retirement account.</td>
</tr>
<tr>
<td>retirement account</td>
<td>AI Search expands the search query to match either 401k or retirement account.</td>
</tr>
<tr>
<td>retirement account bank</td>
<td>AI Search expands the search query to match either 401k or retirement account in addition to bank.</td>
</tr>
<tr>
<td>account retirement</td>
<td>AI Search does not expand the search query terms.</td>
</tr>
<tr>
<td>retirement bank account</td>
<td>AI Search does not expand the search query terms.</td>
</tr>
</tbody>
</table>

Case sensitivity

By default, synonym expansion ignores letter case when comparing synonyms with search query terms. You can enable case sensitivity for a synonym dictionary. This option affects all synonyms defined in the dictionary.

When case sensitivity is enabled, synonyms in the dictionary only match search query terms or phrases that include the same combination of uppercase and lowercase letters.

For example, if you define a synonym including the word CASE and the phrase Computer-Aided Software Engineering, AI Search expands searches for CASE but not searches for case.
**Punctuation sensitivity**

By default, synonym expansion ignores punctuation when comparing synonyms with search query terms. You can enable punctuation sensitivity for a synonym dictionary. This option affects all synonyms defined in the dictionary.

When punctuation sensitivity is enabled, synonyms in the dictionary only match search query terms or phrases that include the same punctuation.

For example, suppose you define a synonym equating U-S-A with University of South Australia and another synonym equating U.S.A. with United States of America. Without punctuation sensitivity enabled, a search for U.S.A. expands to match both University of South Australia and United States of America. When punctuation sensitivity is enabled, the same search only expands to match United States of America.

**Language dependence**

Synonym expansion is language-dependent. You specify a language for each synonym dictionary, and this language applies to all synonyms defined in the dictionary. Only synonyms from dictionaries with the same language as the search query are eligible for expansion.

AI Search supports synonym dictionaries for English, French Canada, French, German, Japanese, and Spanish.

**Interaction with other features**

The following table describes interactions between synonyms and other features that modify search queries or results.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Interaction with synonyms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Genius Results</td>
<td>Synonym expansion terms cannot trigger Genius Result configurations with Term trigger conditions.</td>
</tr>
<tr>
<td>Lemma and Unicode normalization</td>
<td>If a search query term is defined as a synonym, does not normalize it.</td>
</tr>
<tr>
<td>Result improvement rules</td>
<td>By default, a synonym expansion term can activate a result improvement rule if it matches the rule's Query trigger. You can prevent synonym expansion terms from activating a rule with a Query trigger by clearing the <strong>Expand Synonyms For Query Conditions</strong> option that appears when you define the Query trigger.</td>
</tr>
<tr>
<td>Stop words</td>
<td>If a synonym expands a search query's terms to include a term defined as a stop word, removes the stop word before computing results for the expanded search query. For example, suppose you define paas as a stop word and saas##paas as a synonym. If a user searches for saas, the synonym expands the search query term to saas OR paas, but removes the paas stop word before computing the search's results.</td>
</tr>
<tr>
<td>Typo handling</td>
<td>If a misspelled search query term is defined as a synonym, expands the synonym without auto-correcting it.</td>
</tr>
</tbody>
</table>
Publishing synonym dictionaries

Publishing a synonym dictionary makes its settings and active synonyms take effect in all linked search profiles.

Publishing a search profile updates the profile’s synonym dictionary links but does not update the dictionary’s settings or active synonyms in AI Search.

Create a synonym dictionary linked to a search profile

Define a new synonym dictionary and link it to a search profile.

Role required: ais_admin

To make a synonym dictionary affect search behavior, you must link it to a search profile, either at creation time or afterward. To learn about linking a saved dictionary to a search profile, see Link a synonym dictionary to a search profile.

1. Navigate to **AI Search > Search Experience > Search Profiles**.
2. Edit the search profile that you want to link the new synonym dictionary to.
3. In the Synonyms related list, click **Create and Link**.
4. On the form, fill in the fields.

### AI Search Dictionary form fields for synonym dictionary

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>Unique label for the synonym dictionary.</td>
</tr>
<tr>
<td>Dictionary name</td>
<td>Name for the synonym dictionary. This field is automatically set based on the <strong>Label</strong> field value.</td>
</tr>
<tr>
<td>Language</td>
<td>Language for all terms defined in the synonym dictionary.</td>
</tr>
<tr>
<td>Type</td>
<td>Dictionary type. This field is automatically set to <strong>Synonym</strong>.</td>
</tr>
<tr>
<td>State</td>
<td>Current state of the dictionary.</td>
</tr>
<tr>

<tr>
<td></td>
<td>For more details on punctuation sensitivity, see <strong>Synonyms</strong>.</td>
</tr>
</tbody>
</table>

5. Click **Submit**.

The new synonym dictionary appears in the Synonyms related list.

To make new or updated synonym dictionary settings take effect, publish the search profile that you edited. For details on publishing a search profile, see **Publish a search profile**.
Create synonyms

Define terms to treat as equivalent in search queries.

Role required: ais_admin

You must have already created a synonym dictionary. For information on creating synonym dictionaries, see Create a synonym dictionary linked to a search profile.

1. Navigate to **AI Search > AI Search Engine > Dictionaries**.
2. Edit the synonym dictionary that you want to add the new synonym to.
3. In the AI Search Dictionary Terms related list, click **New**.
4. On the form, fill in the fields.

**AI Search Dictionary Term [Synonym view] form**

<table>
<thead>
<tr>
